Cost of hedging is an element that is only present in the hedging instrument and not in the hedged items. From a risk management perspective, entities typically consider the premium paid on a purchased option (which, on inception, is often only time value), the forward element in a forward contract and any foreign currency basis spread, as a cost of hedging rather than a trading position. Costs of hedging represents a source of ineffectiveness in a hedging relationship unless it is excluded from the designated hedging instrument. IFRS 9 defines the accounting treatment for changes in fair value when each of the aforementioned are excluded from a hedging relationship (see chapter 49). [IFRS 9.6.2.4].

The excluded forward elements of forward contracts and foreign currency basis spreads can either be measured at fair value through profit or loss, or be treated as 'costs of hedging', however, excluded time value of options must be accounted as 'costs of hedging'. [IFRS 9.6.5.15, IFRS 9.6.5.16, IFRS 9.B6.5.29-39].

When applying 'costs of hedging' accounting, fluctuations in the fair value of the time value of options, the forward element of forward contracts or foreign currency basis spreads, is recorded in other comprehensive income instead of affecting profit or loss immediately. Although the costs of hedging will ultimately be recognised in profit or loss, this will be in a manner consistent with the risk management activity.

It is important to note that, because this accounting for 'costs of hedging' only applies if the time value of the option, the forward element of forward contracts or foreign currency basis spreads are excluded from the designation of the hedging relationship, the amounts deferred in accumulated other comprehensive income are not part of the cash flow hedge (or foreign currency reserve) but instead a different component of equity. The cash flow hedge reserve (or foreign currency reserve) only includes amounts that are gains or losses on hedging instruments that are determined to be an effective hedge (i.e., amounts that are included in the designation of a hedging relationship) (see chapter 49).

The following extract in Practical example 4-2, from the financial statements of Anglian Water Services Limited, shows the type of disclosure that can be seen in practice.

Practical example 4-2: Anglian Water Services Limited (2024)

United Kingdom

Annual Integrated Report 2024 [extract]

Statutory accounts [extract]

Notes to the financial statements [extract]

17. Financial instruments [extract]

a) Market Risk [extract]

i) Foreign Currency [extract]

...

Fair valuation movements related to foreign currency basis which forms part of the pricing of cross currency interest rate swaps are treated as a cost of hedging for all foreign currency hedge designations within the Group. As such, it is excluded from hedge relationships and is only a source of ineffectiveness where hedge accounting has been interrupted.

The changes in fair value of foreign currency basis spread accumulated in the cash flow hedge reserve, are amortised to profit or loss on a rational basis over the term of the hedging relationship.

21. Hedging reserve [extract]

...

Cost of hedging reserve

	Group	
	2024 £m	2023 £m
At 1 April	1.7	0.3
(Losses)/gains on hedge relationships	(2.7)	1.8
Deferred tax movement on hedge relationships	0.6	(0.4)
At 31 March	(0.4)	1.7

The hedging reserve represents the cumulative effective portion of gains and losses arising on the change in fair value of hedging instruments, excluding those fair value movements identified as costs of hedging within the specific hedge relationship. The cost of hedging reserve captures the movement in the fair value of the cost of hedging component.

The table below provides additional information in relation to the annual movements and cumulative closing positions on the cash flow hedge reserves.

	Group					
	Annual movements		Cumulative reserves			
	Hedged item gain/(loss) £m	Hedge ineffectiveness gain/(loss) £m	Total hedge reserves continuing £m	Total hedge reserves discontinued £m	Deferred tax on hedge reserves £m	Total hedge reserves £m
At 31 March 2024						
Cash flow hedge of interest rate risk	(75.2)	-	3.1	16.0	(4.6)	14.5
At 31 March 2023						
Cash flow hedge of interest rate risk	(26.1)	-	65.2	(39.2)	(6.5)	19.5

4.3.4 Option to designate a credit exposure as measured at fair value through profit or loss

If a financial instrument, or a proportion of it, has been designated as measured at fair value through profit or loss because a credit derivative is used to manage the credit risk of that financial instrument, the following must be disclosed: [IFRS 7.24G]

- A reconciliation of each of the nominal amount and the fair value of the credit derivative at the beginning and end of the period
- The gain or loss recognised in profit or loss on initial designation
- And
- On discontinuation of measuring a financial instrument, or a proportion of it, at fair value through profit or loss, the fair value of that financial instrument that becomes the new carrying amount and the related nominal or principal amount (except for providing comparative information in accordance with IAS 1 or, when applied, IFRS 18, this information need not be given in subsequent periods).

4.3.5 Uncertainty arising from interest rate benchmark (IBOR) reform

Replacing interbank offered rates (IBOR) with alternative rates was one of the recommendations following the financial crisis and many jurisdictions have been making clear progress towards this. IBOR reform gives rise to a number of financial reporting issues, which the IASB approached in two phases. In September 2019, the IASB issued its first amendments to IFRS 9 that were designed to mitigate the effects of these reforms on hedge accounting in the period before financial instruments are issued or modified to reference alternative rates, and these mitigants are addressed in the Supplement: IBOR Reform. Consequential amendments were also made to IFRS 7 requiring information to be disclosed in respect of hedging relationships to which the mitigants in IFRS 9 are applied. The disclosure requirements are discussed in the Supplement: IBOR reform at section 6.1.

Disclosures introduced by the second phase of the IASB's project to address IBOR reform are considered in section 5.7 below.

At the time of writing, IBOR Reform is substantially complete as the most significant IBORs, including all the LIBORs, have now been replaced. However, there remain some local IBORs for which the work to replace them is still in progress or has only very recently been completed, hence the guidance in this chapter remains relevant.

4.4 Statement of financial position

4.4.1 Categories of financial assets and financial liabilities

The carrying amounts of each of the following categories of financial instrument must either be presented on the face of the statement of financial position or disclosed in the notes: [IFRS 7.8]

- Financial assets measured at fair value through profit or loss, showing separately:
 - Those designated as such upon initial recognition
 - And
 - Those mandatorily measured at fair value in accordance with IFRS 9
- Financial liabilities measured at fair value through profit or loss, showing separately:
 - Those designated as such upon initial recognition
 - And
 - Those that meet the definition of held for trading in IFRS 9
- Financial assets measured at amortised cost
- Financial liabilities measured at amortised cost
- And
- Financial assets measured at fair value through other comprehensive income, showing separately:
 - Debt instruments held within a business model to both collect contractual cash flows from, and to sell, the assets
 - The carrying amount of debt instruments measured at fair value through other comprehensive income should not be reduced by a loss allowance and the loss allowance should not be presented separately in the statement of financial position as a reduction of the carrying amount of the financial asset. However, the loss allowance must be disclosed in the notes to the financial statements. [IFRS 7.16A].
 - And
 - Investments in equity instruments designated to be measured as such upon initial recognition

The IASB concluded that such disclosure would assist users in understanding the extent to which accounting policies affect the amounts at which financial assets and financial liabilities are recognised. [IFRS 7.BC14].

Although accounted for identically, the carrying amounts of financial instruments that are mandatorily measured (e.g., classified as held for trading) and those designated at fair value through profit or loss are shown separately because designation is at the discretion of the entity. [IFRS 7.BC15].

A derivative that is designated as a hedging instrument in an effective hedge relationship does not fall within any of the above categories and, strictly, is not required to be included in these disclosures. Disclosure requirements for hedges are set out in section 4.3 above. However, an entity could choose to disclose such derivatives in a separate category alongside the disclosures above.

4.4.2 Financial liabilities designated at fair value through profit or loss

Where a (non-derivative) financial liability has been designated at fair value through profit or loss, i.e., it is not classified as held for trading, the amount of change during the period and cumulatively (i.e., since initial recognition) in its fair value that is attributable to changes in credit risk must be disclosed. This disclosure should be provided for financial liabilities where the change is recognised in other comprehensive income (see Chapter 46), and it should also be provided for financial liabilities where the change is recognised in profit or loss because recognising it in other comprehensive income would create or enlarge an accounting mismatch within profit or loss (see Chapter 46). [IFRS 7.10(a), IFRS 7.10A(a)].

Furthermore, if the disclosure is not considered to represent faithfully the change in the fair value of the financial liability attributable to changes in credit risk, the reasons for reaching this conclusion and the factors believed to be relevant should also be disclosed. [IFRS 7.11(b)].

The IASB concluded that the difference between the carrying amount of such a liability and the amount the entity would be contractually required to pay at maturity to the holder of the obligation should also be disclosed. This disclosure is also required for liabilities where the change in fair value attributable to credit risk is recognised in other comprehensive income and for those where the change is recognised in profit or loss. [IFRS 7.10(b), IFRS 7.10A(b)]. The fair value may differ significantly from the settlement amount, particularly for liabilities with a long duration when the entity has experienced a significant deterioration in creditworthiness subsequent to issuance and the IASB concluded that knowledge of this difference would be useful. Also, the settlement amount is important to some financial statement users, particularly creditors. [IFRS 7.BC22].

Where changes in the fair value of a financial liability attributable to credit risk are recognised in other comprehensive income, any transfers of the cumulative gain or loss within equity must be disclosed, including the reason for such transfers. [IFRS 7.10(c)]. Also, if such a financial liability is derecognised during the period, the amount (if any) presented in other comprehensive income that was realised at derecognition must be disclosed. [IFRS 7.10(d)].

A detailed description of the methods used to calculate the changes in fair value attributable to changes in credit risk should be given, including an explanation of why the method is appropriate. This disclosure is required irrespective of whether those changes are recognised in other comprehensive income or in profit or loss. [IFRS 7.11(a)].

Entities should also provide a detailed description of the methodology or methodologies used to determine whether presenting changes in the fair value of a liability attributable to credit risk in other comprehensive income would create or enlarge an accounting mismatch in profit or loss (see Chapter 46). Where an entity is required to present such changes in profit or loss, this disclosure should include a detailed description of the economic relationship between the financial liability and other financial instrument(s) measured at fair value through profit or loss that are expected to offset those changes. [IFRS 7.11(c)].

4.4.3 Financial assets designated as measured at fair value through profit or loss

Additional disclosure requirements apply to financial assets (or groups of such assets) that are designated at fair value through profit or loss if they would otherwise be measured at fair value through other comprehensive income or at amortised cost, namely: [IFRS 7.9]

- The maximum exposure to credit risk (see section 5.3.3 below) at the reporting date of the financial asset (or group of financial assets)
- The amount by which any related credit derivatives or similar instruments mitigate that maximum exposure to credit risk
- The amount of change during the period and cumulatively (i.e., since initial recognition) in the fair value of the financial assets (or group of financial assets) that is attributable to changes in credit risk (see below)
And
- The amount of change in the fair value of any related credit derivative or similar instrument that has occurred during the period and cumulatively since the financial asset was designated

Calculating the change in fair value attributable to changes in credit risk is approached in much the same way as for financial liabilities (see section 4.4.2 above). It may be determined either as the amount of change in fair value that is not attributable to changes in market conditions that give rise to market risk or by using an alternative method that more faithfully represents the amount of change in its fair value that is attributable to changes in credit risk. [IFRS 7.9(c)].

A detailed description of the chosen method(s), including an explanation of why the method is appropriate, must be disclosed. If the disclosure is not considered to represent faithfully the change in the fair value of the financial asset attributable to changes in credit risk, the reasons for reaching this conclusion and the factors believed to be relevant must be disclosed. [IFRS 7.11(a), IFRS 7.11(b)].

4.4.4 Investments in equity instruments designated at fair value through other comprehensive income

Where investments in equity instruments have been designated to be measured at fair value through other comprehensive income (see Chapter 44), disclosures should be made in accordance with IFRS 7.11A, and where such investments are derecognised during the reporting period, the disclosures should be made in accordance with IFRS 7.11B: [IFRS 7.11A, IFRS 7.11B]

Extract from IFRS 7

Investments in equity instruments designated at fair value through other comprehensive income

- 11A If an entity has designated investments in equity instruments to be measured at fair value through other comprehensive income, as permitted by paragraph 5.7.5 of IFRS 9, it shall disclose for each class of investment:
- (a) which investments in equity instruments have been designated to be measured at fair value through other comprehensive income.
 - (b) the reasons for using this presentation alternative.
 - (c) the fair value at the end of the reporting period.
 - (d) dividends recognised during the period, showing separately those related to investments derecognised during the reporting period and those related to investments held at the end of the reporting period.
 - (e) any transfers of the cumulative gain or loss within equity during the period including the reason for such transfers.
 - (f) the fair value gain or loss presented in other comprehensive income during the period, showing separately the fair value gain or loss related to investments derecognised during the reporting period and the fair value gain or loss related to investments held at the end of the reporting period.
- 11B If an entity derecognised investments in equity instruments measured at fair value through other comprehensive income during the reporting period, it shall disclose:
- (a) the reasons for disposing of the investments.
 - (b) the fair value of the investments at the date of derecognition.
 - (c) the cumulative gain or loss on disposal.
 - (d) any transfers of the cumulative gain or loss within equity during the reporting period related to the investments derecognised during that reporting period.

Applying IFRS 7.11A(c) to each such investment may be onerous if an entity makes significant use of the fair value through other comprehensive income option. However, as noted in section 3.2 above, the concept of materiality does apply to disclosures, therefore this information could be provided separately only for those investments that are themselves material, whilst aggregated disclosures may suffice for immaterial items. In addition, as noted below, recent amendments to IFRS 7 remove the words “of each such investment” from paragraph 11A(c) which will remove this issue once those amendments are adopted.

Paragraphs 11A and 11B of IFRS 7 were amended by the IASB in 2024 as part of the *Amendments to the Classification and Measurement of Financial Instruments - Amendments to IFRS 9 and IFRS 7* and are effective for annual reporting periods beginning on or after 1 January 2026 (note: entities with annual reporting periods beginning before 1 January 2026 can either early adopt all the amendments at the same time or early adopt only the amendments relating to the classification of financial assets and their related disclosures and apply the other amendments (including the ones addressed in this section) from the effective date).

The disclosures required by paragraph 11A will, on adoption of the amendments, be required for each class of investment (see section 3.3 above). The change in fair value recognised in other comprehensive income during the period will also be required, showing separately amounts related to investments derecognised in the reporting period and those held at period-end. [IFRS 7.11A]. This disclosure requirement together with the other requirements in paragraph 11B of IFRS 7, particularly that relating to the cumulative gain or loss on disposal, provide users with information about what are generally considered realised gains or losses. [IFRS 7.BC22K].

The amendments also remove the requirement to disclose the fair value of each investment at the period-end as this was determined to be onerous and was not seen to provide useful information to the users of the financial statements. [IFRS 7.11A(c)]. Consequently, entities are only required to disclose the aggregate fair value for each class of investment at period-end. The considerations of IFRS 7.6 should be used to group financial instruments into classes. [IFRS 7.6].

In addition, the amendments will now require entities to disclose any transfers of cumulative gains or losses within equity for instruments derecognised during the period. [IFRS 7.11B]. This requirement was added to mirror the existing requirement in paragraph IFRS 7.11A(e) to disclose any transfers of the cumulative gain or loss within equity during the period including the reason for such transfers. [IFRS 7.BC22J].

The following example of disclosure is extracted from paragraph IG11A and IG11B of the Implementation Guidance to IFRS 7. [IFRS 7.IG11A, IFRS 7.IG11B].

Extract from IFRS 7

Investments in equity instruments designated at fair value through other comprehensive income (paragraphs 11A and 11B)

IG11A ...

Background

Having met the requirements in paragraph 5.7.5 of IFRS 9 Financial Instruments, Entity A has elected to present subsequent changes in the fair value of its investments in equity instruments in other comprehensive income. In accordance with its accounting policies, Entity A transfers accumulated gains or losses from other comprehensive income to retained earnings only when an investment is derecognised. Entity A has a reporting year end of 31 December.

As at 1 January 20X1 Entity A's equity investments had an aggregate carrying amount of CU800,000, and the cumulative changes in fair value of these investments recognised in accumulated other comprehensive income as at that date were CU200,000. There were no disposals from this portfolio before 1 January 20X1.

On 31 July 20X1 Entity A acquired a non-controlling interest in Entity Y, a non-listed entity, for CU155,000.

On 30 June 20X1 Entity A received CU1,000 of dividend income from Entity X. On 30 September 20X1 Entity A disposed of its investment in Entity X for CU200,000, resulting in a cumulative gain of CU50,000.

Entity A's remaining investments had an aggregate fair value of CU820,000, as at 31 December 20X1. Entity A received total dividend income of CU5,000 from these remaining investments in 20X1.

The total change in fair value of Entity A's equity investments during the period was CU65,000, including CU20,000 relating to its investment in Entity X.

4.4.5 Reclassification

The circumstances in which financial assets should or may be reclassified from one category to another in response to a change in an entity's business model are discussed in Chapter 44. If, in the current or previous reporting periods, any such reclassifications have occurred, the following must be disclosed: [IFRS 7.12B]

Extract from IFRS 7

- 12B An entity shall disclose if, in the current or previous reporting periods, it has reclassified any financial assets in accordance with paragraph 4.4.1 of IFRS 9. For each such event, an entity shall disclose:
- (a) the date of reclassification.
 - (b) a detailed explanation of the change in business model and a qualitative description of its effect on the entity's financial statements.
 - (c) the amount reclassified into and out of each category.

For assets previously measured at fair value through profit or loss that are reclassified so that they are measured at amortised cost or at fair value through other comprehensive income, the following information must be disclosed in each reporting period following reclassification until derecognition: *[IFRS 7.12C]*

Extract from IFRS 7

- 12C For each reporting period following reclassification until derecognition, an entity shall disclose for assets reclassified out of the fair value through profit or loss category so that they are measured at amortised cost or fair value through other comprehensive income in accordance with paragraph 4.4.1 of IFRS 9:
- (a) the effective interest rate determined on the date of reclassification; and
 - (b) the interest revenue recognised.

Where financial assets previously measured at fair value through other comprehensive income have been reclassified since the last annual reporting date so that they are measured at amortised cost, the following must be disclosed:

- The fair value of the financial assets at the end of the reporting period
- And
- The fair value gain or loss that would have been recognised in profit or loss during the reporting period if the financial assets had not been reclassified

The same information should be given where financial assets previously measured at fair value through profit or loss have been reclassified since the last annual reporting date so that they are measured at amortised cost or at fair value through other comprehensive income. *[IFRS 7.12D]*.

4.4.6 Collateral

Where an entity has pledged financial assets as collateral for liabilities or contingent liabilities it should disclose the carrying amount of those assets and the terms and conditions relating to its pledge. This also applies to transfers of non-cash collateral where the transferee has the right, by contract or custom, to sell or repledge the collateral (see Chapter 48). *[IFRS 7.14]*.

When an entity holds collateral (of financial or non-financial assets) and is permitted to sell or repledge the collateral in the absence of default by the owner of the collateral, it should disclose: *[IFRS 7.15]*

- The fair value of the collateral held
- The fair value of any such collateral sold or repledged, and whether the entity has an obligation to return it
- And
- The terms and conditions associated with its use of the collateral

Although some respondents to the exposure draft that preceded IFRS 7 (ED 7 *Financial Instruments: Disclosures*) argued for an exemption from this disclosure in cases where it is impracticable to obtain the fair value of the collateral held, the IASB concluded that it is reasonable to expect an entity to know the fair value of collateral that it holds and can sell even where there is no default. *[IFRS 7.BC25]*.

4.4.7 Compound financial instruments with multiple embedded derivatives

Where an instrument has been issued that contains both a liability and an equity component and the instrument has multiple embedded derivatives whose values are interdependent, such as a callable convertible debt instrument (see Chapter 43), the existence of these features must be disclosed. *[IFRS 7.17]*. Accordingly, the impact on the amounts reported as liabilities and equity will be highlighted, something the IASB sees as important given the acknowledged arbitrary nature of the allocation under IAS 32 of the joint value attributable to this interdependence. *[IFRS 7.BC31]*.

4.4.8 Defaults and breaches of loans payable

Loans payable are defined as “financial liabilities, other than short-term trade payables on normal credit terms”. *[IFRS 7 Appendix A]*. It is considered that disclosures about defaults and breaches of loans payable and other loan agreements provide relevant information about the entity’s creditworthiness and its prospects of obtaining future loans. *[IFRS 7.BC32]*.

Accordingly, for any loans payable recognised at the reporting date, an entity is required to disclose: [IFRS 7.18]

- Details of any defaults during the period of principal, interest, sinking fund, or redemption terms
- The carrying amount of the loans payable in default at the reporting date

And

- Whether the default was remedied, or the terms of the loans payable were renegotiated, before the financial statements were authorised for issue

If, during the period, there were breaches of loan agreement terms other than those described above, the same information must be disclosed if those breaches permitted the lender to demand accelerated repayment (unless the breaches were remedied, or the terms of the loan were renegotiated, on or before the reporting date). [IFRS 7.19].

It is noted that any defaults or breaches may affect the classification of the liability as current or non-current in accordance with IAS 1 (see Chapter 3). [IFRS 7.IG12].

4.4.9 Interests in associates and joint ventures accounted for in accordance with IFRS 9

IAS 28 *Investments in Associates and Joint Ventures* allows an interest in an associate or a joint venture held by a venture capital or similar organisation to be measured at fair value through profit or loss in accordance with IFRS 9 (see Chapter 12). In these circumstances, the disclosure requirements of IFRS 7 do apply to such financial instruments. In addition, IFRS 12 *Disclosure of Interests in Other Entities* contains additional disclosure requirements, over and above those in IFRS 7, which are dealt with in Chapter 14.

4.4.10 Contracts Referencing Nature-dependent Electricity

In 2024, the IASB published *Amendments to IFRS 9 and IFRS 7 - Contracts Referencing Nature-dependent Electricity*. For in-scope contracts, the amendments clarify the application of the own use exception and amend the designation requirements for a hedged item in a cash flow hedging relationship. IFRS 7 has been amended to require the following disclosures in a single note relating to contracts that have been excluded from the scope of IFRS 9 as a result of the amendments:

- Information about contractual features that expose the entity to:
 - Variability in the underlying amount of electricity
 - The risk that the entity would be required to buy electricity during a delivery interval in which the entity cannot use it
 - Information about unrecognised commitments arising from such contracts as at the reporting date, including:
 - The estimated future cash flows from buying electricity under these contracts, disclosed in appropriate time bands
 - Qualitative information about how the entity assesses whether a contract might become onerous, including the assumptions the entity uses in making this assessment
- And
- Qualitative and quantitative information about effects on the entity's financial performance for the reporting period based on the information that the entity used to assess whether it has been a net purchaser of electricity. This includes:
 - The costs arising from purchases of electricity made under the contracts, disclosing separately how much of the purchased electricity was unused at the time of delivery
 - The proceeds arising from sales of unused electricity
 - The costs arising from purchases of electricity made to offset sales of unused electricity. [IFRS 7.30A].

If in-scope contracts have been designated in a cash flow hedging relationship in accordance with the amendments, then when making the disclosures required by IFRS 7.23A (see section 4.3.2 above), an entity must disaggregate the information about the terms and conditions of these hedging instruments by risk category. [IFRS 7.30B].

If information about other contracts referencing nature-dependent electricity is disclosed in other notes in its financial statements (including those designated in a cash flow hedging relationship in accordance with the amendments), the entity must include cross-references to those notes in the single note outlined above. [IFRS 7.30C].

More detailed information about the proposals can be found in Chapter 41 including scoping criteria and amendments to the own use exception. Furthermore, Chapter 49 contains details on applying hedge accounting to power purchase agreements and virtual power purchase agreements. The IFRS 7 disclosure amendments must be applied when the IFRS 9 amendments are applied.

4.5 Fair values

4.5.1 General disclosure requirements

The IASB sees the disclosure of information about the fair value of financial assets and liabilities as being an important requirement. It is explained in the following terms: [IFRS 7.BC36]

Extract from IFRS 7

BC36 Many entities use fair value information internally in determining their overall financial position and in making decisions about individual financial instruments. It is also relevant to many decisions made by users of financial statements because, in many circumstances, it reflects the judgement of the financial markets about the present value of expected future cash flows relating to an instrument. Fair value information permits comparisons of financial instruments having substantially the same economic characteristics, regardless of why they are held and when and by whom they were issued or acquired. Fair values provide a neutral basis for assessing management's stewardship by indicating the effects of its decisions to buy, sell or hold financial assets and to incur, maintain or discharge financial liabilities. The Board decided that when an entity does not measure a financial asset or financial liability in its balance sheet at fair value, it should provide fair value information through supplementary disclosures to assist users to compare entities on a consistent basis.

Therefore, when financial assets or liabilities are not measured on a fair value basis, information on fair values should be given by way of supplementary disclosures to assist users in comparing entities on a consistent basis. [IFRS 7.BC36].

More specifically, except as set out below, the fair value of each class of financial assets and liabilities must be disclosed in a way that permits comparison with the corresponding carrying amounts. [IFRS 7.25]. In providing this disclosure, instruments should be offset only to the extent that their related carrying amounts are also offset in the statement of financial position. [IFRS 7.26]. IFRS 13 contains guidance on determining fair values and includes more extensive disclosure requirements about the fair values disclosed. These are discussed in Chapter 15.

Pragmatically, disclosure of fair values is not required for instruments whose carrying amount reasonably approximates their fair value, for example short-term trade receivables and payables. [IFRS 7.29(a)]. Where an entity has material amounts of longer-term receivables or payables the carrying amount will often not represent a reasonable approximation of fair value and in such cases the use of this concession will not be appropriate. Similarly, disclosure need not be given of the fair value of lease liabilities. [IFRS 7.29(d)].

4.5.2 Day 1 profits

In certain situations, there will be a difference between the transaction price for a financial asset or financial liability and the fair value that would be determined at that date in accordance with IFRS 13 (commonly known as a day 1 profit). [IFRS 7.28]. As set out in Chapter 45, an entity should not recognise a day 1 profit on initial recognition of the financial instrument if the fair value is neither evidenced by a quoted price in an active market for an identical asset or liability (known as a Level 1 input) nor based on a valuation technique that uses only data from observable markets. Instead, the difference will be recognised in profit or loss in subsequent periods in accordance with IFRS 9 and the entity's accounting policy. [IFRS 7.IG14].

Where such a difference exists, IFRS 7 requires disclosure, by class of financial instrument, of: [IFRS 7.28]

- The accounting policy for recognising that difference in profit or loss to reflect a change in factors (including time) that market participants would take into account when setting a price for the financial instrument
 - The aggregate difference yet to be recognised in profit or loss at the beginning and end of the period and a reconciliation of changes in the amount of this difference
- And
- Why it was concluded that the transaction price was not the best evidence of fair value, including a description of the evidence that supports the fair value

In other words, disclosure is required of the profits an entity might think it has made but which it is prohibited from recognising, at least for the time being. This disclosure is shown in the following Illustration based on the implementation guidance. It is rather curious in that it illustrates a day 1 loss, not profit.

Illustration 4-7: Disclosure of deferred day 1 profits

On 1 January 20X0 Company R purchases financial assets that are not traded in an active market for CU15 million which represents their fair value at initial recognition. After initial recognition, R applies a valuation technique to measure the fair value of the financial assets. This valuation technique uses inputs other than data from observable markets. At initial recognition, the same valuation technique would have resulted in an amount of CU14 million, which differs from fair value by CU1 million. R has only one class of such financial assets with existing differences of CU5 million at 1 January 20X0. The disclosure in R's 20X1 financial statements would include the following: [IFRS 7.IG14]

Accounting policies

R uses the following valuation technique to measure the fair value of financial instruments that are not traded in an active market: [insert description of technique - not included in this example]. Differences may arise between the fair value at initial recognition (which, in accordance with IFRS 13 and IFRS 9, is normally the transaction price) and the amount determined at initial recognition using the valuation technique. Any such differences are [description of R's accounting policy - not included in this example].

In the notes to the financial statements

As discussed in note X, [insert name of valuation technique] is used to measure the fair value of the following financial instruments that are not traded in an active market. However, in accordance with IFRS 13 and IFRS 9, the fair value of an instrument at inception is normally the transaction price. If the transaction price differs from the amount determined at inception using the valuation technique, that difference is [description of R's accounting policy - not included in this example].

The differences yet to be recognised in profit or loss are as follows:

	20X1	20X0
	CU m	CU m
Balance at beginning of year	5.3	5.0
New transactions	-	1.0
Recognised in profit or loss during the year	(0.7)	(0.8)
Other increases	-	0.2
Other decreases	(0.1)	(0.1)
Balance at end of year	4.5	5.3

UBS Group AG discloses the following information about recognition of day 1 profits.

Practical example 4-3: UBS Group AG (2023)**Switzerland****Annual Report 2023 [extract]****5 Financial statements [extract]****Consolidated financial statements [extract]****Notes to the UBS Group AG consolidated financial statements [extract]****Additional information [extract]****Note 21 Fair value measurement [extract]****d) Valuation adjustments and other items [extract]****Deferred day-1 profit or loss reserves**

For new transactions where the valuation technique used to measure fair value requires significant inputs that are not based on observable market data, the financial instrument is initially recognized at the transaction price. The transaction price may differ from the fair value obtained using a valuation technique, where any such difference is deferred and not initially recognized in the income statement.

Deferred day-1 profit or loss is generally released into *Other net income from financial instruments measured at fair value through profit or loss* when pricing of equivalent products or the underlying parameters becomes observable or when the transaction is closed out.

The table below summarizes the changes in deferred day-1 profit or loss reserves during the respective period. In accordance with IFRS, no day-1 profit or loss reserves were recognized on positions acquired with the Credit Suisse Group and no significant new positions were originated between the acquisition date and 31 December 2023.

Deferred day-1 profit or loss reserves			
USD m	2023	2022	2021
Reserve balance at the beginning of the year	422	418	269
Profit / (loss) deferred on new transactions	260	299	459
(Profit) / loss recognized in the income statement	(278)	(295)	(308)
Foreign currency translation	0	0	(2)
Reserve balance at the end of the year	404	422	418

4.6 Business combinations

IFRS 3 *Business Combinations* requires an acquirer to disclose additional information about financial instruments arising from business combinations that occur during the reporting period. These requirements are discussed below.

4.6.1 Acquired receivables

Some constituents were concerned that prohibiting the use of an allowance account when accounting for acquired receivables at fair value (see Chapter 45) could make it impossible to determine the contractual cash flows due on those assets and the amount of those cash flows not expected to be collected. They asked for additional disclosure to help in assessing considerations of credit quality used in estimating those fair values, including expectations about receivables that will be uncollectible. [IFRS 3.BC258]. Consequently, the IASB decided to require the following disclosures to be made about such assets acquired in a business combination:

- Fair value of the receivables
- Gross contractual amounts receivable
- And
- The best estimate at the acquisition date of the contractual cash flows not expected to be collected

This information should be provided by major class of receivable, such as loans, direct finance leases and any other class of receivables. [IFRS 3.B64(h)].

Although these requirements will produce some of the information users need to evaluate the credit quality of receivables acquired, the IASB acknowledged that it may not provide all such information. This was seen as an interim measure and the IASB said it would monitor a related FASB project with a view to improving the disclosure requirements in the future. [IFRS 3.BC260]. The FASB project was completed in July 2010, but IFRS 3 was not subsequently changed, although the disclosure requirements in IFRS 7 about credit risk were expanded significantly by IFRS 9 (see section 5.3 below).

4.6.2 Contingent consideration and indemnification assets

The following information about contingent consideration arrangements and indemnification assets (see Chapter 41, respectively) should be given: [IFRS 3.B64(g)]

- The amount recognised as at the acquisition date
- A description of the arrangement and the basis for determining the amount of the payment
- And
- An estimate of the range of outcomes (undiscounted) or, if a range cannot be estimated, that fact and the reasons why a range cannot be estimated. If the maximum amount of the payment is unlimited, that fact must be disclosed

These are requirements of IFRS 3 and apply irrespective of whether such items meet the definition of a financial instrument (which they normally will).

5 Nature and extent of risks arising from financial instruments

IFRS 7 establishes a second key principle, namely: [IFRS 7.31]

Extract from IFRS 7

- 31** An entity shall disclose information that enables users of its financial statements to evaluate the nature and extent of risks arising from financial instruments to which the entity is exposed at the end of the reporting period.

Again, this is supported by related disclosure requirements which focus on qualitative and quantitative aspects of the risks arising from financial instruments and how those risks have been managed. [IFRS 7.32].

Providing qualitative disclosures in the context of quantitative disclosures enables users to link related disclosures and hence form an overall picture of the nature and extent of risks arising from financial instruments. The interaction between qualitative and quantitative disclosures contributes to disclosure of information in a way that better enables users to evaluate an entity's exposure to risks. [IFRS 7.32A].

These risks typically include, but are not limited to, credit risk, liquidity risk and market risk, which are defined as follows: [IFRS 7 Appendix A]

- (a) *Credit risk*, the risk that one party to a financial instrument will cause a financial loss for the other party by failing to discharge an obligation.
- (b) *Liquidity risk*, the risk that an entity will encounter difficulty in meeting obligations associated with financial liabilities that are settled by delivering cash or another financial asset.
- (c) *Market risk*, the risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market prices. It comprises three separate types of risk:
 - (i) *Currency risk*, the risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in foreign exchange rates.

Currency risk (or foreign exchange risk) arises on financial instruments that are denominated in a foreign currency, i.e., in a currency other than the functional currency in which they are measured. For the purpose of IFRS 7, currency risk does not arise from financial instruments that are non-monetary items or from financial instruments denominated in an entity's functional currency.

[IFRS 7.B23]. Therefore, if a parent with the euro as its functional and presentation currency owns a subsidiary with the pound sterling as its functional currency, monetary items held by the subsidiary that are denominated in sterling do not give rise to any currency risk in the consolidated financial statements of the parent.

- (ii) *Interest rate risk*, the risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market interest rates.

It is explained that interest rate risk arises on interest-bearing financial instruments recognised in the statement of financial position (e.g., debt instruments acquired or issued) and on some financial instruments not recognised in the statement of financial position (e.g., some loan commitments).

[IFRS 7.B22].

- (iii) *Other price risk*, the risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market prices (other than those arising from interest rate risk or currency risk), whether those changes are caused by factors specific to the individual financial instrument or its issuer, or factors affecting all similar financial instruments traded in the market.

Other price risk arises on financial instruments because of changes in, for example, commodity prices, equity prices, prepayment risk (i.e., the risk that one party to a financial asset will incur a financial loss because the other party repays earlier or later than expected), and residual value risk (e.g., a lessor of motor cars that writes residual value guarantees is exposed to residual value risk).

[IFRS 7.B25, IFRS 7.IG32].

Two examples of financial instruments that give rise to equity price risk are a holding of equities in another entity, and an investment in a trust, which in turn holds investments in equity instruments. Other examples include certain forward contracts and options to buy or sell specified quantities of an equity instrument and swaps that are indexed to equity prices. The fair values of such financial instruments are affected by changes in the market price of the underlying equity instruments.

[IFRS 7.B26].

The specified disclosures can be provided either in the financial statements or may be incorporated by cross-reference from the financial statements to some other statement that is available to users of the financial statements on the same terms and at the same time, such as a management commentary or risk report (preparation of which might be required by a regulatory authority). Without the information incorporated by cross-reference, the financial statements are incomplete. [IFRS 7.B6, IFRS 7.BC46].

Consistent with the approach outlined in section 3 above, it is emphasised that the extent of these disclosures will depend on the extent of an entity's exposure to risks arising from financial instruments. [IFRS 7.BC41].

Therefore, entities with many financial instruments and related risks should provide more disclosure and those with few financial instruments and related risks may provide less extensive disclosure. [IFRS 7.BC40(b)].

The IASB recognised that entities view and manage risk in different ways and that some entities undertake limited management of risks. Therefore, disclosures based on how risk is managed are unlikely to be comparable between entities and, for some entities, would convey little or no information about the risks assumed.

Accordingly, whilst at a high level the disclosures are approached from the perspective of information provided to management (see section 5.2 below), certain minimum disclosures about risk exposures are specified to provide a common, and relatively easy to implement, benchmark across different entities. Obviously, those entities with more developed risk management systems would provide more detailed information. [IFRS 7.BC42].

It is explained in the Basis for Conclusions that the implementation guidance, which illustrates how an entity might apply IFRS 7, is consistent with the disclosure requirements for banks developed by the Basel Committee (known as Pillar 3), so that banks can prepare, and users receive, a single co-ordinated set of disclosures about financial risk. [IFRS 7.BC41]. The standard was originally written before the financial crisis and there have been a number of subsequent initiatives to improve the reporting of risk by financial institutions, both from a regulatory and a financial reporting perspective, for example as set out in section 8 below.

In developing the standard, the IASB considered various arguments that risk disclosures should not be included within the financial statements (even by cross-reference). For example, concerns were expressed that the information would be difficult and costly to audit and that it did not meet the criteria of comparability, faithful representation and completeness because it is subjective, forward-looking and based on management's judgement. It was also suggested that the subjectivity involved in the sensitivity analyses could undermine the credibility of the fair values recognised in the financial statements. However, the IASB was not persuaded and these arguments were rejected. [IFRS 7.BC43, IFRS 7.BC44, IFRS 7.BC45, IFRS 7.BC46].

5.1 Qualitative disclosures

For each type of risk arising from financial instruments, an entity is required to disclose: [IFRS 7.33(a), IFRS 7.33(b)]

(a) The exposures to risk and how they arise

And

(b) Its objectives, policies and processes for managing the risk and the methods used to measure the risk

Any changes in either (a) or (b) above compared to the previous period, together with the reasons for the change, must be disclosed. These changes may result from changes in exposure to risk or the way those exposures are managed. [IFRS 7.33(c), IFRS 7.IG17].

The type of information that might be disclosed to meet these requirements includes, but is not limited to, a narrative description of: [IFRS 7.IG15]

Extract from IFRS 7

IG15 The type of qualitative information an entity might disclose to meet the requirements in paragraph 33 includes, but is not limited to, a narrative description of:

- (a) the entity's exposures to risk and how they arose. Information about risk exposures might describe exposures both gross and net of risk transfer and other risk-mitigating transactions.
- (b) the entity's policies and processes for accepting, measuring, monitoring and controlling risk, which might include:
 - (i) the structure and organisation of the entity's risk management function(s), including a discussion of independence and accountability;
 - (ii) the scope and nature of the entity's risk reporting or measurement systems;
 - (iii) the entity's policies for hedging or mitigating risk, including its policies and procedures for taking collateral; and
 - (iv) the entity's processes for monitoring the continuing effectiveness of such hedges or mitigating devices.
- (c) the entity's policies and procedures for avoiding excessive concentrations of risk.

It is noted that information about the nature and extent of risks arising from financial instruments is more useful if it highlights any relationship between financial instruments that can affect the amount, timing or uncertainty of an entity's future cash flows. The extent to which a risk exposure is altered by such relationships might be apparent from other required disclosures, but in some cases further disclosures might be useful. [IFRS 7.IG16].

The following extract from the financial statements of Hunting PLC shows the type of disclosure that can be seen in practice.

Practical example 5-1: Hunting PLC (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]

Financial statements [extract]

Notes to the Consolidated Financial Statements [extract]

30. Financial Risk Management [extract]

The Group's activities expose it to certain financial risks, namely market risk (including foreign exchange risk and interest rate risk), as well as credit risk and liquidity risk. The Group's risk management strategy seeks to mitigate potential adverse effects on its financial performance. As part of its strategy, both primary and derivative financial instruments are used to hedge certain risk exposures.

There are clearly defined objectives and principles for managing financial risks established by the Board of Directors, with policies, parameters and procedures covering the specific areas of funding, banking relationships, foreign exchange and interest rate exposures and cash management, together with the investment of surplus cash. The Group's treasury function is responsible for implementing the policies and for providing a centralised service to the Group for funding, foreign exchange and interest rate management and counterparty risk management. It is also responsible for identifying, evaluating and hedging financial risks in close cooperation with the Group's operating companies.

(a) Market Risk: Foreign Exchange Risk

The Group's international base is exposed to foreign exchange risk from its investing, financing and operating activities, particularly in respect of Sterling, Chinese Renminbi, Saudi Arabia Riyal and Canadian Dollars. Foreign exchange risks arise from future commercial transactions and cash flows, and from recognised monetary assets and liabilities that are not denominated in the functional currency of the Group's local operations.

...

(i) Transactional Risk

The exposure to exchange rate movements in significant future commercial transactions and cash flows is hedged by using forward foreign exchange contracts. Certain forward foreign exchange contracts have been designated as hedging instruments of highly probable forecast transactions. Treasury engages with business units to help identify transactional exposures. External hedging activity is then performed by Treasury on behalf of the business units to ensure that transactional risk is managed appropriately and in accordance with Treasury policy. Exposures are also identified and hedged, if necessary, on an ad-hoc basis, such as when a purchase order in a foreign currency is placed. Currency exposures arise where the cash flows are not in the functional currency of the entity. Exposures arising from committed long-term projects beyond a 12-month period are also identified.

...

(ii) Translational Risk

Foreign exchange risk also arises from financial assets and liabilities not denominated in the functional currency of an entity's operations. Forward foreign exchange contracts are used to manage the exposure to changes in foreign exchange rates. Where appropriate, hedge accounting is applied to the forward foreign exchange contracts and the hedged item to remove any accounting mismatch.

Foreign exchange risk also arises from the Group's investments in foreign operations. This has previously been hedged using foreign exchange swaps that have been designated in a net investment hedge to hedge the foreign currency translation risk. The foreign exchange exposure arising from the translation of its net investments in foreign operations into the Group's presentation currency of US Dollars has also previously been managed by designating any borrowings that are not US Dollar denominated as a hedge of the net investment in foreign operations. The foreign exchange exposure primarily arises from Sterling and Canadian Dollar denominated net investments. The accumulated foreign exchange net post-tax gains included in the currency translation reserve in respect of net investment hedges at the beginning and end of the year is \$25.0m.

(b) Market Risk: Interest Rate Risk

Variable interest rates on cash at bank, short-term deposits, overdrafts and borrowings expose the Group to cash flow interest rate risk, and fixed interest rates on loans and short-term deposits expose the Group to fair value interest rate risk. The Group's treasury function manages the Group's exposure to interest rate risk and uses interest rate swaps and caps, when considered appropriate.

(c) Credit Risk

The Group's credit risk arises from its cash at bank and in hand, investments, derivative financial instruments, accrued revenue, outstanding trade receivables, other receivables and contract assets.

At the year-end, the Group had credit risk exposure to a wide range of counterparties. Credit risk exposure is continually monitored and no individual exposure is considered to be significant in the context of the ordinary course of the Group's activities whether through exposure to individual customers, specific industry sectors and/or regions.

(i) Credit Risk: Total Cash and Bank

Hunting PLC's Board approves the treasury policies that determine which counterparties can be used. Due diligence is carried out prior to the authorisation of a bank or financial institution as an approved counterparty. For banks and financial institutions, exposure limits are set for each approved counterparty, as well as the types of transactions that may be entered into. Approved institutions that the Group's treasury function can invest surplus cash with must all have a minimum A2, P2 or F2 short-term rating from Standard & Poor's, Moody's or Fitch rating agencies, respectively.

At the year-end, cash at bank and in hand totalled \$45.5m (2022 – \$29.4m), with \$31.2m (2022 – \$19.7m) deposited with banks with Fitch short-term ratings of F1 to F1+. Of the remaining \$14.3m (2022 – \$9.7m), \$11.6m (2022 – \$6.2m) was held with two financial institutions within mainland China which, given the Group's operations in this jurisdiction, were deemed necessary. Despite not having formal credit ratings from any of the ratings agencies mentioned above, an internal assessment determined that the banks' credit profiles were appropriate for the amounts held on deposit. There are no formal restrictions on this cash as such; however, prior approval would be required from various state authorities in China before any cash could be paid offshore. This cash balance could be used by the Group to service intercompany loans, which total \$1.7m at the year-end. In order for the Group to access the balance of \$9.9m, a dividend would need to be declared.

During the year, the treasury function invested surplus cash in-line with its cash management and investment policies in short-term deposits. The use of these deposits enables the treasury function to diversify its counterparty concentration risk by depositing funds with various financial institutions and improve the yields on a portion of its surplus cash.

...

The credit risk of foreign exchange contracts is calculated before the contract is acquired and compared to the credit risk limit set for each counterparty. Credit risk is calculated as a fixed percentage of the nominal value of the instrument.

(ii) Credit Risk: Receivables

The Group makes sales to a large number of different customers; however a significant proportion of sales are made to service companies in the oil and gas sector. The majority of the Group's customers are based in North America. On a quarterly basis, the Group's entities submit information to the head office on individual receivables balances greater than \$0.2m, on individual receivable balances that are both greater than \$32,500 and 60 days overdue, and on quarterly average receivables balances. At the year-end, trade receivables of \$179.4m (2022 – \$158.9m) comprised individual balances greater than \$0.2m, with no individual customer balance representing more than 9% (2022 – 7%) of the year-end receivables balance of \$204.7m (2022 – \$183.1m).

The risk of customer default for outstanding trade receivables, accrued revenue and contract assets is continuously monitored. Credit account limits are set locally by management and are primarily based on the credit quality of the customer taking into account past experience through trading relationships and the customer's financial position. The probability that a customer would default has remained broadly flat in 2023. The Group used Credit Benchmark software to monitor the creditworthiness and changing credit profiles of its customers. Credit Benchmark uses a similar ratings framework to the main credit ratings agencies for classifying the credit quality of a business. However, Credit Benchmark ratings are based on contributed risk views from leading global financial institutions, including 15 Global Systemically Important Banks domiciled in the US, Continental Europe, Switzerland, the UK, Japan, Canada, Australia and South Africa. The contributions are anonymised, aggregated and published twice monthly in the form of Credit Consensus Ratings and Aggregate Analytics.

Although in most cases the Credit Benchmark consensus rating of a business is based on a number of contributing views, there are instances where there is only a single source on which the rating is based. During 2023, 38% of sales, which is more than \$347m (2022 – 37%/\$263m) of the Group's revenue, were made to customers with a Credit Benchmark investment-grade rating of bbb or higher, as shown in the table below. This includes customers with a single-source rating, whereby the rating is based on only a single source rather than a consensus rating which has been derived from a number of contributing views.

...

To reduce credit risk exposure from outstanding receivables, the Group has taken out credit insurance with an external insurer, subject to certain conditions. Details of the impairment of trade and other receivables can be found in note 18.

5.2 Quantitative disclosures

For each type of risk arising from financial instruments (see section 5 above), entities are required to disclose summary quantitative data about their exposure to that risk at the reporting date. It should be based on the information provided internally to key management personnel of the entity as defined in IAS 24 *Related Party Disclosures* (see Chapter 35), for example, the board of directors or chief executive officer, and should include the matters set out in section 5.3 to section 5.5 below. [IFRS 7.34(a), IFRS 7.34(b)].

This 'management view' approach was adopted by the IASB because it was considered to: [IFRS 7.BC47]

- Provide a useful insight into how the entity views and manages risk
- Result in information that has more predictive value than information based on assumptions and methods that management does not use, for instance, in considering the entity's ability to react to adverse situations
- Be more effective in adapting to changes in risk measurement and management techniques and developments in the external environment
- Have practical advantages for preparers of financial statements because it allows them to use the data they use in managing risk

And

- Be consistent with the approach used in segment reporting (see Chapter 32)

When several methods are used to manage a risk exposure, the information disclosed should use the method(s) that provide the most relevant and reliable information. It is noted, in this context, that IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* discusses relevance and reliability (see Chapter 3). [IFRS 7.B7].

Where the quantitative data disclosed as at the reporting date are unrepresentative of an entity's exposure to risk during the period, further information that is representative should be provided. [IFRS 7.35]. For example, if an entity typically has a large exposure to a particular currency, but at year-end unwinds the position, the entity might disclose a graph that shows the exposure at various times during the period, or it might disclose the highest, lowest, and average exposures. [IFRS 7.IG20].

In developing IFRS 7, the IASB considered whether quantitative information about average risk exposures during the period should be given in all cases. However, they considered that such information is more informative only if the risk exposure at the reporting date is not representative of the exposure during the period. They also considered it would be onerous to prepare. Consequently, they decided that IFRS 7 would only require disclosure by exception, i.e., when the position at the reporting date was unrepresentative of the exposure during the reporting period. [IFRS 7.BC48].

5.3 Credit risk

There are extensive disclosure requirements for financial instruments that are subject to the IFRS 9 impairment requirements (e.g., debt instruments measured at amortised cost or fair value through other comprehensive income). Those requirements are also supplemented by some detailed implementation guidance. The requirements of IFRS 9 relating to the measurement of impairments are dealt with in Chapter 47.

5.3.1 Scope and objectives

The objective of these disclosures is to enable users to understand the effect of credit risk on the amount, timing and uncertainty of future cash flows. To achieve this objective, the disclosures should provide: [IFRS 7.35B]

- Information about the entity's credit risk management practices and how they relate to the recognition and measurement of expected credit losses, including the methods, assumptions and information used to measure those losses (see section 5.3.2 below)
- Quantitative and qualitative information that allows users of financial statements to evaluate the amounts in the financial statements arising from expected credit losses, including changes in the amount of those losses and the reasons for those changes (see section 5.3.3 below)

And

- Information about the entity's credit risk exposure, i.e., the credit risk inherent in its financial assets and commitments to extend credit, including significant credit risk concentrations (see section 5.3.4 below)

An entity will need to determine how much detail to disclose, how much emphasis to place on different aspects of the disclosure requirements, the appropriate level of aggregation or disaggregation and whether additional explanations are necessary to evaluate the quantitative information disclosed. [IFRS 7.35D]. If the disclosures provided are insufficient to meet the objectives above, additional information that is necessary to meet those objectives must be disclosed. [IFRS 7.35E].

To avoid duplication, IFRS 7 allows this information to be incorporated by cross-reference from the financial statements to some other statement that is available to users of the financial statements on the same terms and at the same time, such as a management commentary or risk report. Without the information incorporated by cross-reference, the financial statements are incomplete. [IFRS 7.35C].

A number of the disclosures about credit risk are required to be given by class (see section 3.3 above). In determining these classes, financial instruments in the same class should reflect shared economic characteristics with respect to credit risk. A lender, for example, might determine that residential mortgages, unsecured consumer loans and commercial loans each have different economic characteristics. [IFRS 7.IG21].

Unless otherwise stated, the disclosure requirements set out in section 5.3.2 to section 5.3.4 below are applicable only to financial instruments to which the impairment requirements in IFRS 9 are applied. [IFRS 7.35A].

5.3.2 Credit risk management practices

An entity should explain its credit risk management practices and how they relate to the recognition and measurement of expected credit losses. To meet this objective, it should disclose information that enables users to understand and evaluate: [IFRS 7.35F]

- How it has determined whether the credit risk of financial instruments has increased significantly since initial recognition, including if and how:
 - Financial instruments are considered to have low credit risk, including the classes of financial instruments to which it applies
 - And
 - The presumption that there have been significant increases in credit risk since initial recognition when financial assets are more than 30 days past due has been rebutted
- Its definitions of default, including the reasons for selecting those definitions. This may include: [IFRS 7.B8A]
 - The qualitative and quantitative factors considered in defining default
 - Whether different definitions have been applied to different types of financial instruments
 - And
 - Assumptions about the cure rate, i.e., the number of financial assets that return to a performing status, after a default has occurred on the financial asset
- How the instruments were grouped if expected credit losses were measured on a collective basis
- How it has determined that financial assets are credit-impaired
- Its write-off policy, including the indicators that there is no reasonable expectation of recovery and information about the policy for financial assets that are written off but are still subject to enforcement activity

An asset (or portion thereof) should be written off only if there is no reasonable expectation of recovery [IFRS 9.5.4.4]

And

- How the requirements for the modification of contractual cash flows of financial instruments have been applied, including how the entity:
 - Determines whether the credit risk on a financial asset that has been modified while the loss allowance was measured at an amount equal to lifetime expected credit losses has improved to the extent that the loss allowance reverts to being measured at an amount equal to 12-month expected credit losses
 - And
 - Monitors the extent to which the loss allowance on financial assets meeting the criteria in the previous bullet is subsequently remeasured at an amount equal to lifetime expected credit losses
- Quantitative information that will assist users in understanding the subsequent increase in credit risk of modified financial assets may include information about modified financial assets meeting the criteria above for which the loss allowance has reverted to being measured at an amount equal to lifetime expected credit losses, i.e., a deterioration rate. [IFRS 7.B8B]. Including qualitative information can also be a useful way of meeting this disclosure requirement.

An entity should also explain the inputs, assumptions and estimation techniques used to apply the impairment requirements of IFRS 9. For this purpose, it should disclose: *[IFRS 7.35G]*

- The basis of inputs and assumptions and the estimation techniques used to:
 - Measure 12-month and lifetime expected credit losses
 - Determine whether the credit risk of financial instruments has increased significantly since initial recognition

And

- Determine whether a financial asset is credit impaired

This may include information obtained from internal historical information or rating reports and assumptions about the expected life of financial instruments and the timing of the sale of collateral *[IFRS 7.B8C]* or information about the estimated maximum period considered when determining estimated credit losses in respect of revolving credit facilities.⁸

- How forward-looking information has been incorporated into the determination of expected credit losses, including the use of macroeconomic information

Where relevant, this will include information about the use of multiple economic scenarios in determining those expected credit losses (see Chapter 47).

In rare circumstances, there may be relevant forward-looking information that cannot be incorporated into the determination of significant increases in credit risk or the measurement of expected credit losses because of a lack of reasonable and supportable information. In such cases, disclosures should be made that are consistent with the objective in IFRS 7, i.e., to enable users of the financial statements to understand the credit risk to which the entity is exposed.⁹

And

- Changes in estimation techniques or significant assumptions made during the reporting period and the reasons for those changes

5.3.2.A Application of overlays and post-model adjustments

Banks calculate expected credit losses under IFRS 9 using models which rely on the use of data and the application of judgement. Overlays or post-model adjustments are terms often used to refer to adjustments made to the model output to address shortcomings in the models or limitations on the data. Determining such adjustments requires additional use of judgement.

As a result of macroeconomic events such as the global coronavirus pandemic, many banks have applied such adjustments in calculating expected credit loss due to, for example, models not being calibrated for the severe economic conditions and market uncertainty the banks were facing. These adjustments have often been material and most regulators are keen for banks to provide clear and transparent disclosures about them.

Although neither IAS 1 (or, when applied, IFRS 18) nor IFRS 7 explicitly mention model adjustments as part of the disclosure requirements, this does not mean that disclosures in relation to model adjustments should be omitted. As noted in section 5.3.2 above, IFRS 7.35G contains various disclosure requirements in relation to the significant assumptions and estimates used to calculate the expected credit loss which are just as relevant to post-model adjustments as they are to the underlying models, whether made in response to the coronavirus pandemic or to other situations. In addition, as discussed in Chapter 3, IAS 1.125 (or, when IFRS 18 is applied, IAS 8(2027).31A) requires the disclosure of information about certain assumptions concerning the future and other major sources of estimation uncertainty at the end of the reporting period. *[IAS 1.125, IAS 8(2027).31A]*.

Individual assessments and application of judgement in adjustments to modelled ECL

The table below analyses total ECL allowances by portfolio, separately identifying the amounts that have been modelled, those that have been individually assessed and those arising through the application of judgemental adjustments.

	Modelled ECL £m	Individually assessed £m	Judgements due to:		Total ECL £m
			Inflationary and interest rate risk £m	Other ¹ £m	
At 31 December 2023					
UK mortgages	991	–	61	63	1,115
Credit cards	703	–	92	15	810
Other Retail	866	–	33	46	945
Commercial Banking	1,124	340	–	(282)	1,182
Other	32	–	–	–	32
Total	3,716	340	186	(158)	4,084
At 31 December 2022					
UK mortgages	946	–	49	214	1,209
Credit cards	698	–	93	(28)	763
Other Retail	903	–	53	60	1,016
Commercial Banking	972	1,008	–	(111)	1,869
Other	46	–	–	–	46
Total	3,565	1,008	195	135	4,903

¹ 2022 includes £1 million which was previously reported within judgements due to COVID-19.

Individual assessed ECL

Stage 3 ECL in Commercial Banking is largely assessed on an individual basis by the Business Support Unit using bespoke assessment of loss for each specific client based on potential recovery strategies. While these assessments are based on the Group's latest economic view, the use of Group-wide multiple economic scenarios and weightings is not considered appropriate for these cases due to their individual characteristics. In place of this, a range of case-specific outcomes are considered with any alternative better or worse outcomes that carry a 25 per cent likelihood taken into account in establishing a probability-weighted ECL. At 31 December 2023, individually assessed provisions for Commercial Banking were £340 million (2022: £1,008 million) which reflected a range of £291 million to £413 million (2022: £908 million to £1,140 million), based on the range of alternative outcomes considered.

Application of judgement in adjustments to modelled ECL

Impairment models fall within the Group's model risk framework with model monitoring, periodic validation and back testing performed on model components, such as probability of default. Limitations in the Group's impairment models or data inputs may be identified through the ongoing assessment and validation of the output of the models. In these circumstances, management applies appropriate judgemental adjustments to the ECL to ensure that the overall provision adequately reflects all material risks. These adjustments are determined by considering the particular attributes of exposures which have not been adequately captured by the impairment models and range from changes to model inputs and parameters, at account level, through to more qualitative post-model adjustments. Post-model adjustments are not typically calculated under each distinct economic scenario used to generate ECL, but on final modelled ECL. All adjustments are reviewed quarterly and are subject to internal review and challenge, including by the Audit Committee, to ensure that amounts are appropriately calculated and specific release criteria is identified.

During 2022 the intensifying inflationary pressures, alongside rising interest rates within the Group's outlook created further risks not deemed to be fully captured by ECL models. These pressures played out in 2023 with households experiencing increased interest rates and living costs. These risks, whilst still present, are beginning to subside with inflation now reducing and interest rates now believed to have peaked. As a result, the judgements held in respect of inflationary and interest rate risks are at a slightly reduced level of £186 million (2022: £195 million). Other judgements continue to be applied for broader data and model limitations, both increasing and decreasing ECL. These include incremental risks associated with a material devaluation in commercial real estate prices present since 2022. Given ECL models only capture future price movements, and not the suppressed level, there is a risk that further losses are yet to emerge as well as greater risk on specific sector valuations. At 31 December 2023 judgemental adjustments resulted in net additional ECL allowances totalling £28 million (2022: £330 million).

Judgements due to inflationary and interest rate risk**UK mortgages: £61 million (2022: £49 million)**

There has been only modest evidence of credit deterioration in the UK mortgages portfolio through 2023 despite the high levels of inflation and the rising interest rate environment. Increases in new to arrears and defaults that have emerged are mainly driven by variable rate customers, who have experienced material increases in their monthly payment. Mortgage ECL models use UK Bank Rate as a driver of predicted defaults largely capturing the stretch on customers due to increased payments, and that has contributed materially to the elevated levels of ECL at 31 December 2023. The impact is also partly mitigated by stressed affordability assessments applied at loan origination which means most customers have demonstrated the ability to absorb payment shocks.

However, there remains a potential risk to affordability from continued inflationary pressures combined with higher interest rates, and that this may not be fully captured by the Group's ECL models. The risk remains for customers maturing from low fixed rate deals, the accumulated impact on variable rate product holders, lower levels of real household income and rental cover value. Therefore a judgemental uplift in ECL has been taken in these segments of the mortgages portfolio, either where inflation is expected to present a more material risk, or where segments within the model do not recognise UK Bank Rate as a material driver of predicted defaults.

Credit cards: £92 million (2022: £93 million) and Other Retail: £33 million (2022: £53 million)

The Group's ECL models for credit cards and personal loan portfolios use predictions of wage growth to account for future affordability stress. As elevated inflation erodes nominal wage growth, adjustments have been made to the econometric models to account for real, rather than nominal, income to produce adjusted predicted defaults. These adjustments also include the specific risk to affordability from increased housing costs, not captured by CPI. As these adjustments are made within predicted default models, they are calculated under each economic scenario and impact the staging of assets through increased PDs.

Alongside these portfolio-wide adjustments management has also made an additional uplift to ECL for customers with lower income levels and higher indebtedness deemed most vulnerable to inflationary pressures and interest rate rises. Although this segment of customers has not exhibited any greater deterioration to date, uplifts continue to be applied to recognise that continued inflation and interest rates risks remain.

Other judgements**UK mortgages: £63 million (2022: £214 million)**

These adjustments principally comprise:

Increase in time to repossession: £106 million (2022: £118 million)

Due to the Group suspending mortgage litigation activity between late-2014 and mid-2018 due to policy changes for the treatment of arrears, and as collections strategy normalises post COVID-19 pandemic, the Group's experience of possessions data on which our models rely is limited. This reflects an adjustment made to allow for an increase in the time assumed between default and repossession. A number of defaulted accounts, equivalent in scale to the estimated shortfall in possessions experienced, have had their provision coverage judgementally increased to the level of those accounts already in repossession. A further adjustment is made to accounts which have been in default for more than 24 months, with an arrears balance increase in the last six months. These accounts have their probability of possession judgementally set to an increased level based on observed historical losses incurred on accounts that were of an equivalent status.

Asset recovery values: £nil (2022: £69 million)

The low level of repossession volumes throughout 2020 to 2022 restricted the calibration of Forced Sale Discount (FSD) model parameters which uses the achieved sales price experience over the last 12 months. Over this period management partly incorporated an increasing trend in FSD rates through judgementally extending the observation period. At December 2023 the level of sales volumes observed over the past 12 months has subsequently returned to an adequate level for model calibrations to again be performed removing the need for judgemental adjustment.

Adjustment for specific segments: £23 million (2022: £25 million)

The Group monitors risks across specific segments of its portfolios which may not be fully captured through wider collective models. The judgement for fire safety and cladding uncertainty has been maintained. Though experience remains limited the risk is considered sufficiently material to address through judgement, given that there is evidence of assessed cases having defective cladding, or other fire safety issues.

Adjustment for Stage 2 oversensitivity: £(68) million (2022: £nil)

Management has observed an increasing degree of oversensitivity in the number of recently originated low risk accounts moving to Stage 2 through the PD trigger mechanism. This arises from a blend of factors currently present, with the combination of the Group's current MES assumptions and the uplift approach applied, disproportionately applying greater forward-looking uplifts to recent vintages. Given these accounts have shown no significant movement in observed credit scores and were originated under a similar or more adverse economic outlook, an adjustment has been made pending a model rebuild. Management has judgementally increased the threshold applied to these accounts by one further grade (to what is set out on **page 277**) which results in £6 billion of assets being moved back to Stage 1 which results in a lower 12-month ECL.

Credit cards: £15 million (2022: £(28) million) and Other Retail: £46 million (2022: £60 million)

These adjustments principally comprise:

Lifetime extension on revolving products: Credit cards: £67 million (2022: £82 million) and Other Retail: £10 million (2022: £14 million)

An adjustment is required to extend the lifetime used for Stage 2 exposures on Retail revolving products from a three-year modelled lifetime, which reflected the outcome data available when the ECL models were developed. Incremental defaults beyond year three are calculated through the extrapolation of the default trajectory observed throughout the three years and beyond. The judgement has reduced slightly in the period following refinement to the discounting methodology applied.

Adjustments to loss given defaults (LGDs): Credit cards: £(50) million (2022: £(96) million) and Other Retail: £37 million (2022: £13 million)

A number of adjustments have been made to the loss given default assumptions used within unsecured and motor credit models. For unsecured portfolios, the adjustments reflect the impact of changes in collection debt sale strategy on the Group's LGD models, incorporating up to date customer performance and forward flow debt sale pricing. For motor, the adjustment captures a decline in used car prices.

Commercial Banking: £(282) million (2022: £(111) million)

These adjustments principally comprise:

Corporate insolvency rates: £(292) million (2022: £(35) million)

During 2023, the volume of UK corporate insolvencies continued to exhibit an increasing trend beyond December 2019 levels, revealing a marked misalignment between observed UK corporate insolvencies and the Group's credit performance. This dislocation gives rise to uncertainty over the drivers of observed trends and the appropriateness of the Group's Commercial Banking model response which uses observed UK corporate insolvencies data to anchor future loss estimates to. Given the Group's asset quality remains strong with low new defaults, a negative adjustment is applied by using the long-term average rate. The larger negative adjustment in the period reflects the widening gap between the increasing industry level and the long-term average rate used.

Adjustments to loss given defaults (LGDs): £(105) million (2022: £(105) million)

Following a review on the loss given default approach for commercial exposures, management deems that ECL should be adjusted to mitigate limitations identified in the approach which are causing loss given defaults to be inflated. These include the benefit from amortisation of exposures relative to collateral values at default and a move to an exposure-weighted approach being adopted. These temporary adjustments will be addressed through future model development.

Commercial Real Estate (CRE) price reduction: £67 million (2022: £nil)

Rolling the forecast model forwards into the period has resulted in the material fall in CRE prices seen in late 2022 moving out of the model assumptions used to assess ECL. Given the model uses future changes in the metric as a driver of defaults and loss rates there is a risk that the model benefit that arises does not reflect the residual risk caused by the sustained low level of prices. Management therefore considers it appropriate to judgementally reinstate the CRE price drop within the ECL model assumptions given the materially reduced level in CRE prices could still trigger additional defaults. Within this adjustment management has refined the potential impact on loss rates through capturing updated valuations as well as stressing valuations on specific sectors where evidence suggests valuations may lag achievable levels, notably in cases of stressed sale.

...

5.3.3 Quantitative and qualitative information about amounts arising from expected credit losses

An entity should explain the changes in the loss allowance and reasons for those changes by presenting a reconciliation of the opening balance to the closing balance. This should be given in a table for each relevant class of financial instruments, showing separately the changes during the period for: [IFRS 7.35H]

- The loss allowance measured at an amount equal to 12-month expected credit losses
- The loss allowance measured at an amount equal to lifetime expected credit losses for:
 - Financial instruments for which credit risk has increased significantly since initial recognition but that are not credit-impaired financial assets
 - Financial assets that are credit-impaired at the reporting date (but were not credit-impaired when purchased or originated)
- And
- Trade receivables, contract assets or lease receivables for which the loss allowance is measured using a simplified approach based on lifetime expected credit losses
- And
- Financial assets (or, potentially, loan commitments or financial guarantee contracts - see Chapter 47) that were credit-impaired when purchased or originated

Additionally, the total amount of undiscounted expected credit losses on initial recognition of any such assets during the reporting period should also be disclosed.

In addition, it may be necessary to provide a narrative explanation of the changes in the loss allowance during the period. This narrative explanation may include an analysis of the reasons for changes in the loss allowance during the period, including: [IFRS 7.B8D]

- The portfolio composition
- The volume of financial instruments purchased or originated
- And
- The severity of the expected credit losses

For loan commitments and financial guarantee contracts the loss allowance is recognised as a provision. Information about changes in the loss allowance for financial assets should be shown separately from those for loan commitments and financial guarantee contracts. However, if a financial instrument includes both a loan (i.e., financial asset) and an undrawn loan commitment (i.e., loan commitment) component and the expected credit losses on the loan commitment component cannot be separately identified from those on the financial asset component, the expected credit losses on the loan commitment should be recognised together with the loss allowance for the financial asset. To the extent that the combined expected credit losses exceed the gross carrying amount of the financial asset, the expected credit losses should be recognised as a provision. [IFRS 7.B8E].

An explanation should also be provided of how significant changes in the gross carrying amount of financial instruments during the period contributed to changes in the loss allowance. This information should be provided separately for each class of financial instruments for which loss allowances are analysed (see above). It should also include relevant qualitative and quantitative information. Examples of changes in the gross carrying amount of financial instruments that contribute to changes in the loss allowance may include: [IFRS 7.35I]

- Changes because of financial instruments originated or acquired during the reporting period
 - The modification of contractual cash flows on financial assets that do not result in a derecognition of those financial assets
 - Changes because of financial instruments that were derecognised, including those that were written off during the reporting period
- And
- Changes arising from the measurement of the loss allowance moving from 12-month expected credit losses to lifetime losses (or *vice versa*)

The information disclosed should provide an understanding of the nature and effect of modifications of contractual cash flows on financial assets that have not resulted in derecognition as well as the effect of such modifications on the measurement of expected credit losses. The following information should, therefore, be given: [IFRS 7.35J]

- The amortised cost before the modification and the net modification gain or loss recognised for financial assets for which the contractual cash flows have been modified during the reporting period while they had a loss allowance based on lifetime expected credit losses
- And
- The gross carrying amount at the reporting period of financial assets that have been modified since initial recognition at a time when the loss allowance was based on lifetime expected credit losses and for which the loss allowance has changed during the reporting period to an amount equal to 12-month expected credit losses

These requirements apply to all modifications whether they are as a result of credit related or other commercial reasons. However, if an entity has the ability to separately identify different types of modifications and considers that the separate disclosure of these items is relevant to achieving the overall objective of the disclosures in this section, the entity could provide this additional detail as part of the disclosure.¹⁰

10 Transition Resource Group for Impairment of Financial Instruments, [Meeting Summary](#): 22 April 2015, IASB, paragraph 57(b). Available on the IFRS Foundation's website.

The following Illustration shows how this information might be presented. [IFRS 7.IG20B].

Illustration 5-1: Information about changes in the loss allowance

Mortgage loans - loss allowance	12-month expected credit losses	Lifetime expected credit losses (collectively assessed)	Lifetime expected credit losses (individually assessed)	Credit- impaired financial assets (lifetime expected credit losses)
CU'000				
Loss allowance as at 1 January	X	X	X	X
Changes due to financial instruments recognised as at 1 January:				
- Transfer to lifetime expected credit losses	(X)	X	X	-
- Transfer to credit-impaired financial assets	(X)	-	(X)	X
- Transfer to 12-month expected credit losses	X	(X)	(X)	-
Financial assets that have been derecognised during the period	(X)	(X)	(X)	(X)
New financial assets originated or purchased	X	-	-	-
Write-offs	-	-	(X)	(X)
Changes in models/risk parameters	X	X	X	X
Foreign exchange and other movements	X	X	X	X
Loss allowance as at 31 December	X	X	X	X
Significant changes in the gross carrying amount of mortgage loans that contributed to changes in the loss allowance were:				
<ul style="list-style-type: none"> ▪ The acquisition of the ABC prime mortgage portfolio increased the residential mortgage book by x%, with a corresponding increase in the loss allowance measured on a 12-month basis. ▪ The write off of the CUXX DEF portfolio following the collapse of the local market reduced the loss allowance for financial assets with objective evidence of impairment by CUX. ▪ The expected increase in unemployment in Region X caused a net increase in financial assets whose loss allowance is equal to lifetime expected credit losses and caused a net increase of CUX in the lifetime expected credit losses allowance. 				

The significant changes in the gross carrying amount of mortgage loans are further explained below:

Mortgage loans - gross carrying amount	12-month expected credit losses	Lifetime expected credit losses (collectively assessed)	Lifetime expected credit losses (individually assessed)	Credit impaired financial assets (lifetime expected credit losses)
CU'000				
Gross carrying amount as at 1 January	X	X	X	X
Individual financial assets transferred to lifetime expected credit losses	(X)	-	X	-
Individual financial assets transferred to credit-impaired financial assets	(X)	-	(X)	X
Individual financial assets transferred from credit-impaired financial assets	X	-	X	(X)
Financial assets assessed on collective basis	(X)	X	-	-
New financial assets originated or purchased	X	-	-	-
Write-offs	-	-	(X)	(X)
Financial assets that have been derecognised	(X)	(X)	(X)	(X)
Changes due to modifications that did not result in derecognition	(X)	-	(X)	(X)
Other changes	X	X	X	X
Gross carrying amount as at 31 December	X	X	X	X

Where the loss allowance for trade receivables or lease receivables is measured using a simplified approach based on lifetime expected credit losses, the information about modifications need be given only if those financial assets are modified while more than 30 days past due. [IFRS 7.35A(a)].

To provide an understanding of the effect of collateral and other credit enhancements on the amounts arising from expected credit losses, the following must be disclosed by class of financial instrument: [IFRS 7.35K]

- The amount that best represents the maximum exposure to credit risk at the end of the reporting period without taking account of any collateral held or other credit enhancements (e.g., netting agreements that do not qualify for offset in accordance with IAS 32)
- A narrative description of collateral held as security and other credit enhancements, including:
 - A description of the nature and quality of the collateral held
 - An explanation of any significant changes in the quality of that collateral or credit enhancements as a result of deterioration or changes in the entity's collateral policies during the reporting period
 And
 - Information about financial instruments for which a loss allowance has not been recognised because of the collateral

This might include information about: [IFRS 7.B8G]

- The main types of collateral held as security and other credit enhancements, examples of the latter being guarantees, credit derivatives and netting agreements that do not qualify for offset in accordance with IAS 32
 - The volume of collateral held and other credit enhancements and its significance in terms of the loss allowance
 - The policies and processes for valuing and managing collateral and other credit enhancements
 - The main types of counterparties to collateral and other credit enhancements and their creditworthiness
- And
- Information about risk concentrations within the collateral and other credit enhancements
- And
- Quantitative information about the collateral held as security and other credit enhancements (e.g., quantification of the extent to which collateral and other credit enhancements mitigate credit risk) on financial assets that are credit-impaired at the reporting date

Disclosure of information about the fair value of collateral and other credit enhancements is not required, nor is a quantification of the exact value of the collateral included in the calculation of expected credit losses (i.e., the loss given default). [IFRS 7.B8F]. Furthermore, these requirements do not apply to lease receivables. [IFRS 7.35A(b)].

For a financial asset, the maximum exposure to credit risk is typically the gross carrying amount, net of any amounts offset in accordance with IAS 32 and any impairment losses recognised in accordance with IFRS 9. [IFRS 7.B9]. Activities that give rise to credit risk and the associated maximum exposure to credit risk include but are not limited to: [IFRS 7.B10]

- Granting loans to customers and placing deposits with other entities. In these cases, the maximum exposure to credit risk is the carrying amount of the related financial assets.
- Entering into derivative contracts, e.g., foreign exchange contracts, interest rate swaps and purchased credit derivatives. When the resulting asset is measured at fair value, the maximum exposure to credit risk at the reporting date will equal the carrying amount.
- Granting financial guarantees. In this case, the maximum exposure to credit risk is the maximum amount the entity could have to pay if the guarantee is called on, which may be significantly greater than the amount recognised as a liability.

And

- Making a loan commitment that is irrevocable over the life of the facility or is revocable only in response to a material adverse change. If the issuer cannot settle the loan commitment net in cash or another financial instrument, the maximum credit exposure is the full amount of the commitment. This is because it is uncertain whether the amount of any undrawn portion may be drawn upon in the future. This may be significantly greater than the amount recognised as a liability.

The contractual amount outstanding on financial assets that were written off during the reporting period and which are still subject to enforcement activity must be disclosed. [IFRS 7.35L].

5.3.4 Credit risk exposure

Users should be able to assess an entity's credit risk exposure and understand its significant credit risk concentrations. Therefore, an entity should disclose, by 'credit risk rating grades' (see below), the gross carrying amount of financial assets and the exposure to credit risk on loan commitments and financial guarantee contracts. This information should be provided separately for financial instruments: [IFRS 7.35M]

- For which the loss allowance is measured at an amount equal to 12-month expected credit losses
- For which the loss allowance is measured at an amount equal to lifetime expected credit losses and that are:
 - Financial instruments for which credit risk has increased significantly since initial recognition but are not credit-impaired financial assets
 - Financial assets that are credit-impaired at the reporting date (but were not credit-impaired when purchased or originated).

And

- Trade receivables, contract assets or lease receivables for which the loss allowances are measured using a simplified approach based on lifetime expected credit losses

Information for these assets may be based on a provision matrix. [IFRS 7.35N].

And

- That are financial assets (or, potentially, loan commitments or financial guarantee contracts - see Chapter 47) that were credit-impaired when purchased or originated

These disclosures should distinguish between financial instruments for which the loss allowance is equal to 12-month or lifetime expected credit losses even where the maturity of a financial instrument is twelve months or less in spite of the fact that the loss allowance should be the same under either approach.¹¹

Illustration 5-3: Information about credit risk exposures using a provision matrix

The reporting entity manufactures cars and provides financing to both dealers and end customers. It discloses its dealer financing and customer financing as separate classes of financial instruments and applies the simplified approach to its trade receivables so that the loss allowance is always measured at an amount equal to lifetime expected credit losses. The following table illustrates the use of a provision matrix as a risk profile disclosure under the simplified approach: [IFRS 7.IG20D]

20X1	Trade receivables days past due				
CU'000	Current	More than 30 days	More than 60 days	More than 90 days	Total
Dealer financing					
Expected credit loss rate	0.10%	2%	5%	13%	
Estimated total gross carrying amount at default	CU20,777	CU1,416	CU673	CU235	CU23,101
Lifetime expected credit losses - dealer financing	CU21	CU28	CU34	CU31	CU114
Customer financing					
Expected credit loss rate	0.20%	3%	8%	15%	
Estimated total gross carrying amount at default	CU19,222	CU2,010	CU301	CU154	CU21,687
Lifetime expected credit losses - customer financing	CU38	CU60	CU24	CU23	CU145

Credit risk rating grades are defined as ratings of credit risk based on the risk of a default occurring on the financial instrument. [IFRS 7 Appendix A]. The number of credit risk rating grades used to disclose the information above should be consistent with the number that the entity reports to key management personnel for credit risk management purposes. If past due information is the only borrower-specific information available and past due information is used to assess whether credit risk has increased significantly since initial recognition, an analysis by past due status should be provided for that class of financial assets. [IFRS 7.B8I].

When expected credit losses are measured on a collective basis, it may not be possible to allocate the gross carrying amount of individual financial assets or the exposure to credit risk on loan commitments and financial guarantee contracts to the credit risk rating grades for which lifetime expected credit losses are recognised. In that case, the disclosure requirement above should be applied to those financial instruments that can be directly allocated to a credit risk rating grade and separate disclosure should be given of the gross carrying amount of financial instruments for which lifetime expected credit losses have been measured on a collective basis. [IFRS 7.B8J].

A concentration of credit risk exists when a number of counterparties are located in a geographical region or are engaged in similar activities and have similar economic characteristics that would cause their ability to meet contractual obligations to be similarly affected by changes in economic or other conditions. Information should be provided to enable users to understand whether there are groups or portfolios of financial instruments with particular features that could affect a large portion of that group of financial instruments, such as concentration to particular risks. This could include, for example, loan-to-value groupings, geographical, industry or issuer-type concentrations. [IFRS 7.B8H].

For financial instruments within the scope of IFRS 7 to which the impairment requirements in IFRS 9 are *not* applied, disclosure should be given by class of instrument of the amount that best represents the entity's maximum exposure to credit risk at the reporting date (see section 5.3.3 above). The amount disclosed should not take account of any collateral held or other credit enhancements (e.g., netting agreements that do not qualify for offset in accordance with IAS 32). This disclosure is not required for financial instruments whose carrying amount best represents this amount, [IFRS 7.36(a)], but will be required, for example, for written credit default swaps measured at fair value through profit or loss.

Entities should also provide, by class of financial instrument to which the impairment requirements in IFRS 9 are not applied, a description of collateral held as security and of other credit enhancements, and their financial effect (e.g., a quantification of the extent to which collateral and other credit enhancements mitigate credit risk) in respect of the amount that best represents the maximum exposure to credit risk. This applies irrespective of whether the maximum exposure to credit risk is disclosed separately or is represented by the carrying amount of a financial instrument. [IFRS 7.36(b)]. The requirement may be met by disclosing: [IFRS 7.IG22]

- The policies and processes for valuing and managing collateral and other credit enhancements obtained
 - A description of the main types of collateral and other credit enhancements (examples of the latter being guarantees and credit derivatives, as well as netting agreements that do not qualify for offset in accordance with IAS 32)
 - The main types of counterparties to collateral and other credit enhancements and their creditworthiness
- And
- Information about risk concentrations within the collateral or other credit enhancements

Whilst the standard suggests this information should, or at least could, involve disclosure of quantitative information, the implementation guidance implies more discursive disclosures might suffice in some cases. Therefore, entities will need to make a judgement based on their own specific circumstances.

5.3.5 Collateral and other credit enhancements obtained

When an entity obtains financial or non-financial assets during the period by taking possession of collateral it holds as security, or calling on other credit enhancements such as guarantees, and these assets meet the recognition criteria in other standards, it should disclose for such assets held at the reporting date: [IFRS 7.38]

- The nature and carrying amount of the assets
- And
- When the assets are not readily convertible into cash, its policies for disposing of such assets or for using them in its operations

This disclosure is intended to provide information about the frequency of such activities and the entity's ability to obtain and realise the value of the collateral. [IFRS 7.BC56].

5.3.6 Credit risk: illustrative disclosures

The following Illustration shows what some of the disclosures about credit risk and loss allowances for one class of a bank's lending might look like. In preparing this Illustration the following approach has been taken:

- Although not explicitly required by IFRS 7, in order to provide relevant qualitative and quantitative information (see section 5.3.3 above) and in line with the examples to the standard:
 - A reconciliation of movements in the gross carrying amounts in a tabular format has been provided

And

 - Loans that are assessed on a specific basis and those assessed collectively have been shown separately
 - IFRS 7 does not require disclosure of the proportion of stage 2 loans that are 30 days past due, but this is regarded as useful information by users and has therefore been included
 - In order to avoid excessive detail only the net effect of using multiple scenarios has been provided rather than providing details of the scenarios and their weightings
- And
- In practice the various parameters used are unlikely to be independent and, in line with the EDTF's recommendations (see section 8.1 below), sensitivity to only one parameter has been disclosed

Illustration 5-4: Certain disclosures of impairment allowances by a bank for one class of lending**Small business lending**

The table below shows the credit quality and the maximum exposure to credit risk based on the Bank's internal credit rating system and year-end stage classification. Except for Purchased or Originated Credit Impaired (POCI) loans, the amounts presented are gross of impairment allowances. The table analyses separately those loans which are assessed and measured individually and those which are assessed and measured on a collective basis:

In CU million							20X1	20X0
Internal rating grade	Stage 1 Individual	Stage 1 Collective	Stage 2 Individual	Stage 2 Collective	Stage 3	POCI	Total	Total
Performing								
High grade	1,168	832	-	-	-	-	2,000	2,358
Standard grade	728	340	299	358	-	-	1,725	1,886
Sub-standard grade	-	-	213	321	-	23	557	180
Low grade	-	-	75	194	-	-	269	120
Non-performing								
Individually impaired	-	-	-	-	205	31	236	208
Total	1,896	1,172	587	873	205	54	4,787	4,752

The following is a reconciliation of the gross carrying amounts at the beginning and end of year:

In CU million	Stage 1 Individual	Stage 1 Collective	Stage 2 Individual	Stage 2 Collective	Stage 3	POCI	Total
Gross carrying amount as at 1/1/20X1	1,871	1,129	626	938	188	-	4,752
Assets originated/purchased	167	163	-	-	-	56	386
Assets de-recognised or repaid	(137)	(125)	(59)	(81)	(35)	(4)	(441)
Transfers to Stage 1	16	8	(16)	(8)	-	-	-
Transfers to Stage 2	(48)	(19)	62	19	(14)	-	-
Transfers to Stage 3	(5)	(4)	(36)	(12)	57	-	-
Modifications to contractual cash flows	-	-	-	-	(9)	-	(9)
Change in interest charged but not received	21	12	4	13	27	-	77
Amounts written off	-	-	-	-	(12)	-	(12)
Foreign exchange revaluation	11	8	6	4	3	2	34
At 31/12/20X1	1,896	1,172	587	873	205	54	4,787

The following is a reconciliation of the ECL allowances as at the beginning and end of the year. The effect on ECLs of transfers between stages has been calculated based on the allowances recorded at the date of transfer:

In CU million	Stage 1 Individual	Stage 1 Collective	Stage 2 Individual	Stage 2 Collective	Stage 3	POCI	Total
ECL allowances as at 1/1/20X1	48	41	36	47	79	-	251
Assets originated/purchased	5	15	-	-	-	-	20
Assets de-recognised or repaid	(4)	(12)	(5)	(3)	(4)	-	(28)
Transfers to Stage 1	1	-	(2)	(1)	-	-	(2)
Transfers to Stage 2	(4)	(1)	21	5	-	-	21
Transfers to Stage 3	(1)	(1)	(10)	(4)	20	-	4
Unwind of discount	9	10	5	6	13	-	43
Modifications to contractual cash flows	-	-	-	-	(6)	-	(6)
Changes to models and inputs used for ECL calculations	7	10	6	5	18	3	49
Amounts written off	-	-	-	-	(12)	-	(12)
Foreign exchange	2	2	1	1	1	-	7
At 31/12/20X1	63	64	52	56	109	3	347

Of the CU587m of loans classified as stage 2 on an individual basis, CU37m (1 January: CU33m) of loans and CU17m (1 January: CU16m) of ECLs are more than 30 days past due.

The credit risk for the bank's small business customers is mostly affected by factors specific to individual borrowers, but, given the available information, the ECLs for the majority of the loans are measured on a collective basis. The key inputs in the ECL model, apart from the bank's own credit risk appraisal process, are assumptions about changes in Gross Domestic Product (GDP) and future interest rates. As at 1 January 20X1, the base scenario assumed that GDP will increase by 2.6% in 20X1 and 2.0% in 20X2, with the rate of increase declining over the next four years to 1.5%. GDP grew during 20X1 by only 2.0% and is now forecast to grow by only 1.3% in 20X2, increasing to 1.5% over the next four years. The base rate of interest assumed in the base scenario as at 1 January 20X1 was 1.2% for 20X1 and 1.4% for 20X2, increasing to 2.2% over the next four years. The average rate for 20X1 was 1.4% and the forecast for 20X2 is now 1.5%, increasing to 2.3% over the next four years.

The allowance was calculated using, in addition to the base scenario, an upside scenario and two downside scenarios, all weighted to reflect their likelihood of occurrence. The allowance as at 31 December 20X1, based upon the bank's base case scenario, is CU312.5m. The effect of applying multiple economic scenarios is to increase the allowance by CU34.5m (11%). (As at 1 January the equivalents were: CU230m, CU40m and 14.8%). Based upon past experience, reducing the growth in GDP over the next three years by 1% (keeping interest rates constant) would increase the ECLs by approximately CU14m (1 January: CU18m).

The largest contribution to the increase in ECLs of the portfolio during the year was the update to inputs to models to reflect the deterioration in economic conditions. However, the result of changes in the base scenario has been partly offset by a small reduction in the effect of using multiple economic scenarios.

The following extract from the financial statements of VOLKSWAGEN AKTIENGESELLSCHAFT shows the type of disclosure addressing credit risk that can be seen in practice.

Loss allowance

The Volkswagen Group consistently uses the expected credit loss model of IFRS 9 for all financial assets and other risk exposures.

The expected credit loss model under IFRS 9 takes in both loss allowances for financial assets for which there are no objective indications of impairment and loss allowances for financial assets that are already impaired. For the calculation of impairment losses, IFRS 9 distinguishes between the general approach and the simplified approach.

Under the general approach, financial assets are allocated to one of three stages, plus an additional stage for financial assets that are already impaired when acquired (stage 4). Stage 1 comprises financial assets that are recognized for the first time or for which the probability of default has not increased significantly. The expected credit losses for the next twelve months are calculated at this stage. Stage 2 comprises financial assets with a significantly increased probability of default, while financial assets with objective indications of default are allocated to stage 3. The lifetime expected credit losses are calculated at these stages. Stage 4 financial assets, which are already impaired when acquired, are subsequently measured by recognizing a loss allowance on the basis of the accumulated lifetime expected losses. Financial assets classified as impaired on acquisition remain in this category until they are derecognized.

The Volkswagen Group applies the simplified approach to trade receivables and contract assets with a significant financing component in accordance with IFRS 15. The same applies to receivables under operating or finance leases accounted for under IFRS 16. Under the simplified approach, the expected losses are consistently determined for the entire life of the asset.

The loss allowance on assets measured at fair value in Stage 1 rose by €6 million (previous year: €0 million) in fiscal year 2023 and those in Stage 2 declined by €2 million (previous year: increase of €1 million), resulting in a closing balance of €12 million (previous year: €8 million). Of this amount, €10 million is attributable to Stage 1 (previous year: €4 million) and €3 million to Stage 2 (previous year: €4 million).

The amount contractually outstanding for financial assets that have been derecognized in the current fiscal year and are still subject to enforcement proceedings is €270 million (previous year: €304 million).

...

5.4 Liquidity risk

5.4.1 Information provided to key management

As set out in section 5.2 above, an entity should disclose summary quantitative data about its exposure to risk on the basis of the information provided internally to key management personnel and IFRS 7 emphasises that this requirement applies to liquidity risk too. [IFRS 7.B10A, IFRS 7.BC58A(b)].

Entities should provide an explanation of how the data disclosed are determined. If the outflows of cash (or other financial assets) included in the data could occur significantly earlier than indicated, that fact should be stated and quantitative information should be provided to enable users of the financial statements to evaluate the extent of this risk, unless that information is included in the contractual maturity analyses (see section 5.4.2 below). Similar information should be given if the outflows of cash (or other financial assets) could be for significantly different amounts than those indicated in the data. This might be required, for example, if a derivative is included in the data on a net settlement basis, but the counterparty has the option of requiring gross settlement. [IFRS 7.B10A].

5.4.2 Maturity analyses

To illustrate liquidity risk, the principal minimum numerical disclosures required are: [IFRS 7.39(a), IFRS 7.39(b)]

- A maturity analysis for non-derivative financial liabilities (including issued financial guarantee contracts) that shows their remaining contractual maturities

And

- A maturity analysis for derivative financial liabilities

Where contractual maturities of derivative financial liabilities are essential for an understanding of the timing of the cash flows the maturity analysis shall be based on remaining contractual maturities, otherwise a maturity analysis provided on some other basis is acceptable.

The contractual maturities of the following would be essential for an understanding of the timing of the cash flows: [IFRS 7.B11B]

- An interest rate swap with a remaining maturity of five years in a cash flow hedge of a variable rate financial asset or liability

And

- All loan commitments

Derivatives entered into for trading purposes that are typically settled before their contractual maturity (e.g., in response to fair value movements) are an example of the type of instrument that might not need to be included in the maturity analysis.¹²

These requirements are discussed further in the remainder of this sub-section.

Although these minimum disclosures address only financial liabilities, other aspects of IFRS 7 mean that most financial institutions will be required to disclose a maturity analysis of financial assets also (see section 5.4.3 below).

5.4.2.A Time bands

The time bands to be used in the maturity analyses are not specified. Rather, entities should use their judgement to determine what is appropriate. For example, an entity might determine that the following are appropriate: [IFRS 7.B11]

- Not later than one month
- Later than one month and not later than three months
- Later than three months and not later than one year

And

- Later than one year and not later than five years

In practice, it is rare for entities outside of the financial services sector to present more than one time band covering amounts payable within one year. However, it is quite common for more than one time band to be given covering amounts payable later than one year and within five years, as Unilever and Nestlé have done (see Practical example 5-4 and Practical example 5-5 respectively in section 5.4.2.G below). For banks and similar institutions, an 'on demand' category could also be relevant.

¹² [INFORMATION FOR OBSERVERS](#), Board Meeting: 22 January 2009, London, Project: *Improving Disclosures about Financial Instruments (proposed amendments to IFRS 7)*, Subject: *Proposed amendments on liquidity risk disclosures (Agenda paper 14B)*, IASB, paragraph 32. Available on the IFRS Foundation's website.

IFRS 16 requires lessees to disclose a maturity analysis of lease liabilities applying IFRS 7.39(a) and IFRS 7.B11 separately from the maturity analyses of other financial liabilities. [IFRS 16.58]. Guidance in IFRS 7 illustrates a number of different approaches, each of which takes into account the maturity of the financial liabilities being presented. Two of these examples simply show lease liabilities as a separate line within a table. A third example illustrates an entity with all financial liabilities due within three years except lease liabilities which extend for 25 years. For this entity, two tables are presented, one including all financial liabilities using the following time bands:

- Less than 1 month
- 1-6 months
- 6 months - 1 year
- 1-2 years
- 2-3 years
- And
- More than 3 years

And a second analysing only the lease liabilities but using the following time bands:

- Less than 1 year
- 1-5 years
- 5-10 years
- 10-15 years
- 15-20 years
- And
- 20-25 years [IFRS 7.IG31A].

When a counterparty has a choice of when an amount is paid, the liability should be included on the basis of the earliest date on which the entity can be required to pay. For example, financial liabilities such as demand deposits that an entity can be required to repay on demand should be included in the earliest time band. [IFRS 7.B11C(a)]. This means that the disclosure shows a worst-case scenario, even if there is only a remote possibility that the entity could be required to pay its liabilities earlier than expected, [IFRS 7.BC57], (although the disclosures in section 5.4.3 below may be relevant in these circumstances, i.e., those which are based on the information used by management to manage liquidity risk).

No guidance is given on how to deal with instruments where the issuer has a choice of when an amount is paid. For example, borrowings containing embedded issuer call or issuer prepayment options might be included in the analysis for non-derivative financial liabilities based on the earliest, latest or expected contractual payment dates. Where an entity has a material amount of such instruments, it would be appropriate to explain the basis of the analyses presented.

When an entity is committed to make amounts available in instalments, each instalment should be allocated to the earliest period in which the entity can be required to pay. For example, an undrawn loan commitment would be included in the time band containing the earliest date it could be drawn down. [IFRS 7.B11C(b)].

For issued financial guarantee contracts, the maximum amount of the guarantee included in the maturity analysis should be allocated to the earliest period in which the guarantee could be called. [IFRS 7.B11C(c)].

5.4.2.B Cash flows: general requirements

The amounts that must be disclosed in the maturity analyses are the contractual undiscounted cash flows, for example:

- Gross finance lease obligations (before deducting finance charges)
- Prices specified in forward agreements to purchase financial assets for cash
- Net amounts for pay-floating/receive-fixed interest rate swaps for which net cash flows are exchanged
- Contractual amounts to be exchanged in a derivative financial instrument (e.g., a currency swap) for which gross cash flows are exchanged
- And
- Gross loan commitments

These undiscounted cash flows will differ from the amount included in the statement of financial position because the latter amount is based on discounted cash flows. [IFRS 7.B11D].

When the amount payable is not fixed, the amount disclosed should be determined by reference to the conditions existing at the reporting date. For example, if the amount payable varies with changes in an index, the amount disclosed may be based on the level of the index at the reporting date. [IFRS 7.B11D]. The standard does not explain whether the amount should be based on the spot or forward price of the index and, in practice, both approaches are used. Where a material difference between the two approaches could arise, it would be appropriate to explain the basis on which the information is prepared.

The definition of liquidity risk includes only financial liabilities that will result in the outflow of cash or another financial asset (see section 5 above), which means that financial liabilities that will be settled in the entity's own equity instruments and liabilities within the scope of IFRS 7 that are settled with non-financial assets will not be included in the maturity analysis. [IFRS 7.BC58A(a)].

5.4.2.C Cash flows: borrowings

It follows from the requirements in section 5.4.2.B above that the cash flows included in the analysis of non-derivative financial liabilities in respect of interest-bearing borrowings should reflect coupon, as well as principal, payments (although the standard does not say this explicitly). Quite how perpetual debt obligations should be dealt with in this analysis is not clear because the amount the standard requires to be included in the latest maturity category is infinity.

A number of companies show coupon payments separately from payments of principal, for example, Unilever (see Practical example 5-4 in section 5.4.2.G below). However, separate disclosure is not required, and coupon payments are commonly aggregated with principal payments, as Nestlé and Volkswagen have (see Practical example 5-5 and Practical example 5-6 respectively in section 5.4.2.G below).

The following Illustration shows the cash flows that should be included in the maturity analysis for non-derivative financial liabilities for a simple floating rate borrowing.

Illustration 5-5: Maturity analysis: floating rate borrowing

On 1 January 20X1, Company P borrowed CU100 million from a bank on the following terms: coupons are payable on the entire principal on 30 June and 31 December each year at the annual rate of SONIA plus 1% as determined on the previous 1 January and 1 July; the principal is repayable on 31 December 20X4.

At the end of 20X1, P's reporting period, SONIA is 5% and there is no difference between spot and forward interest rates (i.e., the yield curve is flat). Accordingly, P would include the following cash flows in its maturity analysis:

	CU million
30 June 20X2	3
31 December 20X2	3
30 June 20X3	3
31 December 20X3	3
30 June 20X4	3
31 December 20X4	103
Total	118

5.4.2.D Cash flows: derivatives

In the case of derivatives that are settled by a gross exchange of cash flows, it is not entirely clear whether entities should disclose the related cash inflow as well as the cash outflow, although such information might be considered useful. Furthermore, because the analysis is of financial liabilities, it seems clear that, strictly, cash outflows from a derivative asset that is settled by a gross exchange of cash should not be included. However, the contractual cash flows on these instruments would appear to be no less relevant than on those that have a negative fair value and must be disclosed where relevant.

A number of approaches to these issues were seen in practice, as illustrated in Practical example 5-4 to Practical example 5-7 in section 5.4.2.G below. Unilever and Nestlé both included cash inflows as well as outflows whereas Volkswagen showed only the cash outflows; Unilever included only derivative liabilities whereas Nestlé and Volkswagen included gross-settled derivative assets too. The gross contractual cash outflows disclosed by entities with gross-settled derivatives can be staggering, as illustrated in the Volkswagen practical example 5-6.

The IASB staff has been clear that disclosure of only the outflow on derivatives that were in a liability position was explicitly required. However, IFRS 7 emphasises the need to provide a maturity analysis of assets where such information is necessary to enable users of financial statements to evaluate the nature and extent of the entity's liquidity risk (see section 5.4.3 below). This is likely to bring derivative assets within the scope of the maturity analyses¹³ and, by analogy, related gross cash inflows. Similar issues can arise on commodity contracts that are accounted for under IFRS 9, which will often be settled by exchanging the commodity for cash. An additional complication with these is that one leg of the contract may not involve a cash flow.

Further issues can arise in the case of a derivative liability settled by exchanging net cash flows in a number of future periods. For example, the relevant index for a long-term interest rate swap might predict that in some periods the entity could have cash inflows. Although this issue was identified by the IASB staff,¹⁴ it has not been addressed and it remains unclear whether, and how, these inflows should be included within the analyses.

5.4.2.E Cash flows: embedded derivatives

The application guidance to IFRS 7 explains that where an embedded derivative is separated from a hybrid (combined) financial instrument (see Chapter 42), the entire instrument should be dealt with in the maturity analysis for non-derivative instruments. [IFRS 7.B11A].

No guidance is given for dealing with embedded derivatives separated from non-financial contracts. However, applying a similar approach to those separated from financial instruments would result in them being excluded from the maturity analyses altogether. This is because the hypothecated cash flows of the embedded derivative would be treated as cash flows of the non-financial contract, and such contracts are not within the scope of IFRS 7. This is consistent with the IASB staff analysis when developing the above requirement: they planned to exclude from the maturity analysis all separated embedded derivatives except those for which the hybrid contract was a financial liability because including them was unhelpful in understanding the liquidity information provided.¹⁵

5.4.2.F Cash flows: financial guarantee contracts and written options

For issued financial guarantee contracts, IFRS 7 requires the maximum amount of the guarantee to be included in the maturity analysis, [IFRS 7.B11C(c)], but credit default swaps and written options are not directly addressed.

How we see it

The IASB staff have noted that the question of what to include in the maturity analysis is the same for credit default swaps and written options and, in our view, the maximum amount that could be payable under such instruments must be included in the analysis.¹⁶

5.4.2.G Examples of disclosures in practice

The following extracts from the financial statements of Unilever PLC, Nestlé S.A., VOLKSWAGEN AKTIENGESELLSCHAFT and NatWest Group plc show a variety of ways that companies applied the requirements of IFRS 7 in practice.

13 [INFORMATION FOR OBSERVERS](#), Board Meeting: 16 September 2008, London, Project: *Disclosures*, Subject: *IFRS 7 Financial Instruments: Disclosures, Liquidity risk (Agenda paper 2A)*, IASB, paragraph 34(b); and [INFORMATION FOR OBSERVERS](#), Board Meeting: 22 January 2009, London, Project: *Improving Disclosures about Financial Instruments (proposed amendments to IFRS 7)*, Subject: *Proposed amendments on liquidity risk disclosures (Agenda paper 14B)*, IASB, paragraph 35(a). Available on the IFRS Foundation's website.

3. Liquidity risk

The solvency and liquidity of the Volkswagen Group are secured by rolling liquidity planning, a liquidity reserve, confirmed credit lines and the issuance of securities on the international money and capital markets. The volume of confirmed bilateral and syndicated credit lines stood at €31.3 billion as of December 31, 2023 (previous year: €27.3 billion), of which €0.4 billion (previous year: €1.0 billion) was drawn down.

Local cash funds in certain countries (e.g. China, Brazil, Argentina, South Africa and India) are only available to the Group for cross-border transactions subject to exchange controls. There are no significant restrictions over and above these. The liquidity risk in Argentina rose considerably as a result of the progressive depreciation of the Argentinian peso, especially in December 2023. It cannot be ruled out that the currency will depreciate further in fiscal year 2024.

The following overview shows the contractual undiscounted cash flows from financial instruments:

MATURITY ANALYSIS OF UNDISCOUNTED CASH FLOWS FROM FINANCIAL INSTRUMENTS

€ million	REMAINING CONTRACTUAL MATURITIES			2023	REMAINING CONTRACTUAL MATURITIES			2022 ¹
	up to one year	within one to five years	more than five years		up to one year ¹	within one to five years	more than five years	
Financial liabilities	116,805	111,952	23,572	252,328	86,834	108,078	24,942	219,854
Trade payables	30,890	11	1	30,901	28,721	16	0	28,738
Other financial liabilities	11,374	2,135	107	13,616	17,532	2,479	125	20,136
Derivatives	81,487	88,276	10,295	180,058	79,591	87,649	10,916	178,155
Liabilities associated with assets held for sale	18	0	-	19	114	25	-	139
	240,575	202,373	33,974	476,922	212,792	198,247	35,983	447,023

1 Prior-year figures adjusted (see disclosures on IFRS 17 in the "Effects of new and amended IFRSs" section).

The cash outflows on other financial liabilities include outflows on liabilities for tax allocations amounting to €18 million (previous year: €17 million).

Derivatives comprise both cash flows from derivative financial instruments with negative fair values and cash flows from derivatives with positive fair values for which a gross settlement has been agreed. Derivatives entered into through offsetting transactions are also accounted for as cash outflows. The cash outflows from derivatives for which a gross settlement has been agreed are matched in part by cash inflows. These cash inflows are not reported in the maturity analysis. If these cash inflows were also recognized, the cash outflows presented would be substantially lower. This also particularly applies if hedges have been closed with offsetting transactions.

The cash outflows from obligations from loan commitments and irrevocable credit commitments are presented in the section entitled "Other financial obligations", classified by contractual maturities.

As of December 31, 2023, the maximum potential liability under financial guarantees amounted to €910 million (previous year: €1,185 million). Financial guarantees are assumed to be due immediately in all cases.

Notes to the consolidated financial statements [extract]

12. Financial instruments - maturity analysis [extract]

Assets and liabilities by contractual cash flows up to 20 years

The tables on the following page show the contractual undiscounted cash flows receivable and payable, up to a period of 20 years, including future receipts and payments of interest of financial assets and liabilities by contractual maturity. The balances in the following tables do not agree directly with the consolidated balance sheet, as the tables include all cash flows relating to principal and future coupon payments, presented on an undiscounted basis. The tables have been prepared on the following basis:

Financial assets have been reflected in the time band of the latest date on which they could be repaid, unless earlier repayment can be demanded by NatWest Group. Financial liabilities are included at the earliest date on which the counterparty can require repayment, regardless of whether or not such early repayment results in a penalty. If the repayment of a financial instrument is triggered by, or is subject to, specific criteria such as market price hurdles being reached, the asset is included in the time band that contains the latest date on which it can be repaid, regardless of early repayment. The liability is included in the time band that contains the earliest possible date on which the conditions could be fulfilled, without considering the probability of the conditions being met.

For example, if a structured note is automatically prepaid when an equity index exceeds a certain level, the cash outflow will be included in the less than three months period, whatever the level of the index at the year end. The settlement date of debt securities in issue, issued by certain securitisation vehicles consolidated by NatWest Group, depends on when cash flows are received from the securitised assets. Where these assets are prepayable, the timing of the cash outflow relating to securities assumes that each asset will be prepaid at the earliest possible date. As the repayments of assets and liabilities are linked, the repayment of assets in securitisations is shown on the earliest date that the asset can be prepaid, as this is the basis used for liabilities.

The principal amounts of financial assets and liabilities that are repayable after 20 years or where the counterparty has no right to repayment of the principal are excluded from the table, as are interest payments after 20 years.

The maturity of guarantees and commitments is based on the earliest possible date they would be drawn in order to evaluate NatWest Group's liquidity position.

MFVTPL assets of £125.1 billion (2022 - £145.8 billion) and HFT liabilities of £125.8 billion (2022 - £146.7 billion) have been excluded from the following tables.

2023	0-3 months £m	3-12 months £m	1-3 years £m	3-5 years £m	5-10 years £m	10-20 years £m
Assets by contractual maturity up to 20 years

Commitments (3)	112,807	-	-	-	-	-
	115,627	-	-	-	-	-

...

(1) Other financial assets exclude equity shares.

(2) NatWest Group is only called upon to satisfy a guarantee when the guaranteed party fails to meet its obligations. NatWest Group expects most guarantees it provides to expire unused.

(3) NatWest Group has given commitments to provide funds to customers under undrawn formal facilities, credit lines and other commitments to lend subject to certain conditions being met by the counterparty. NatWest Group does not expect all facilities to be drawn, and some may lapse before drawdown.

5.4.3 Management of associated liquidity risk

In addition to the maturity analyses for financial liabilities, the entity should provide a description of how it manages the liquidity risk inherent in those analyses. [IFRS 7.39(c)]. These disclosures are, in effect, intended to 'reconcile' the maturity analyses which are prepared on a worst-case scenario notion (see section 5.4.2 above) with how an entity actually manages liquidity risk (see section 5.4.1 above).¹⁷

It is emphasised that a maturity analysis of financial assets held for managing liquidity risk (e.g., financial assets that are readily saleable or expected to generate cash inflows to meet cash outflows on financial liabilities) is required if that information is necessary to enable users of financial statements to evaluate the nature and extent of the entity's liquidity risk. [IFRS 7.B11E, IFRS 7.BC58D]. IFRS 7 does not specify the basis on which such an analysis should be provided and, in practice, they are often prepared on the basis of expected, rather than contractual, maturities as this is considered more relevant information.

Other factors that might be considered when making this disclosure include, but are not limited to, whether the entity: [IFRS 7.B11F]

- Has committed borrowing facilities (e.g., commercial paper facilities) or other lines of credit (e.g., stand-by credit facilities) that it can access to meet liquidity needs
 - Holds deposits at central banks to meet liquidity needs
 - Has very diverse funding sources
 - Has significant concentrations of liquidity risk in either its assets or its funding sources
 - Has internal control processes and contingency plans for managing liquidity risk
 - Has instruments that include accelerated repayment terms (e.g., on the downgrade of the entity's credit rating)
 - Has instruments that could require the posting of collateral (e.g., margin calls for derivatives)
 - Has instruments that allow the entity to choose whether it settles its financial liabilities by delivering cash (or another financial asset) or by delivering its own shares
 - Has instruments that are subject to master netting agreements
- Or
- Has accessed, or has access to, facilities under supplier finance arrangements (see section 7.4.3.F below and Chapter 36) that provide the entity with extended payment terms or the entity's suppliers with early payment terms

5.4.4 Puttable financial instruments classified as equity

Certain puttable financial instruments that meet the definition of financial liabilities are classified as equity instruments (see Chapter 43). Despite this classification, the IASB recognises that these instruments give rise to liquidity risk and consequently requires the following disclosures about them: [IAS 1.136A, IFRS 7(2027).19A]

- Summary quantitative data about the amount classified as equity
 - The entity's objectives, policies and processes for managing its obligation to repurchase or redeem the instruments when required to do so by the instrument holders, including any changes from the previous period
 - The expected cash outflow on redemption or repurchase of that class of financial instruments
- And
- Information about how the expected cash outflow on redemption or repurchase was determined

5.5 Market risk

IFRS 7 requires entities to provide disclosure of their sensitivity to market risk in one of two ways which are set out in section 5.5.1 and section 5.5.2 below. The sensitivity analysis should cover the whole of an entity's business, but different types of sensitivity analysis may be provided for different classes of financial instruments. [IFRS 7.B21]. This is considered by the IASB to be simpler and more suitable than the disclosure of terms and conditions of financial instruments previously required by IAS 32 and for which there is no direct equivalent within IFRS 7. [IFRS 7.BC59]. No sensitivity analysis is required for financial instruments that an entity classifies as equity instruments. Such instruments are not remeasured so that neither profit or loss nor equity will be affected by the equity price risk of those instruments. [IFRS 7.B28].

¹⁷ [INFORMATION FOR OBSERVERS](#), Board Meeting: 16 September 2008, London, Project: *Disclosures*, Subject: *IFRS 7 Financial Instruments: Disclosures, Liquidity risk (Agenda paper 2A)*, IASB, paragraph 25. Available on the IFRS Foundation's website.

5.5.1 'Basic' sensitivity analysis

Except where the disclosures set out in section 5.5.2 below are provided, entities should disclose: *[IFRS 7.40]*

- A sensitivity analysis for each type of market risk to which the entity is exposed at the reporting date, showing how profit or loss and equity would have been affected by changes in the relevant risk variable that were reasonably possible at that date

The sensitivity of profit or loss (which arises, for example, from instruments measured at fair value through profit or loss) must be disclosed separately from the sensitivity of equity (which arises, for example, from investments in equity instruments whose changes in fair value are presented in other comprehensive income). *[IFRS 7.B27]*.

This requirement focuses exclusively on accounting sensitivity and does not include market risk sensitivities that do not directly impact profit and loss or equity, e.g., interest rate risk arising on fixed-rate financial assets held at amortised cost. In December 2008, the IASB considered encouraging entities to discuss the effect of changes in the relevant risk variable on economic value that does not manifest in profit and loss or equity but decided not to.¹⁸

The term 'profit or loss' is used in IAS 1 to mean profit after tax. Therefore, it might well be argued that the amounts disclosed should take account of any related tax effects, a view corroborated by the illustrative disclosures in the implementation guidance to IFRS 7 (see Illustration 5-6 below). However, as noted below, the application guidance suggests this requirement should (and the implementation guidance might suggest it could) be met by disclosing the impact on interest expense, a pre-tax measure of profit. *[IFRS 7.B18(a), IFRS 7.IG34]*. Given this conflicting guidance, it is difficult to say that a pre-tax approach fails to comply with the standard and, in practice, both approaches are seen.

Where a post-tax figure is disclosed, it will not always be straightforward to determine the related tax effects, especially for a multinational group, and it may be appropriate to use the guidance in Chapter 29, which deals with the allocation of income tax between profit or loss, other comprehensive income and equity.

How we see it

The disclosure of market risk sensitivity may be made on either a pre-tax or a post-tax basis. This is a policy choice to be made and applied consistently and disclosed in the financial statements.

- The methods and assumptions used in preparing the sensitivity analysis
- And
- Changes from the previous period in the methods and assumptions used, and the reasons for such changes

The standard contains a reminder of the general guidance in section 3.1 above and explains that an entity should decide how it aggregates information to display the overall picture without combining information with different characteristics about exposures to risks from significantly different economic environments. For example, an entity that trades financial instruments might disclose this information separately for financial instruments held for trading and those not held for trading. Similarly, an entity would not aggregate its exposure to market risks from areas of hyperinflation with its exposure to the same market risks from areas of very low inflation. However, an entity that has exposure to only one type of market risk in only one economic environment, would not show disaggregated information. *[IFRS 7.B17]*.

Risk variables that are relevant to disclosing market risk include but are not limited to: *[IFRS 7.IG32]*

- The yield curve of market interest rates
It may be necessary to consider both parallel and non-parallel shifts in the yield curve
- Foreign exchange rates
The standard requires a sensitivity analysis to be disclosed for each currency to which an entity has significant exposure. *[IFRS 7.B24]*.
- Prices of equity instruments
And
- Market prices of commodities

18 [INFORMATION FOR OBSERVERS](#), Board Meeting: December 2008, London, Project: *IFRS 7 Financial Instruments: Disclosures*, Subject: *Minor Amendments (Agenda paper 14)*, IASB, paragraphs 71 to 79; and [IASB Update](#), December 2008. Available on the IFRS Foundation's website.

When disclosing how profit or loss and equity would have been affected by changes in the relevant risk variable, there is no requirement to determine what the profit or loss for the period would have been if the relevant risk variables had been different during the reporting period. The requirement is subtly different because the effect that is disclosed assumes that a reasonably possible change in the relevant risk variable had occurred at the reporting date and had been applied to the risk exposures in existence at that date. For example, if an entity has a floating rate liability at the reporting date, the entity would disclose the effect on profit or loss (i.e., interest expense) for the current year if interest rates had varied by reasonably possible amounts. Furthermore, this disclosure is not required for each change within a range of reasonably possible changes, only at the limits of the reasonably possible range. [IFRS 7.B18].

The following Illustration shows how the amounts to be included in these disclosures in respect of a number of different instruments might be determined - for simplicity, tax effects are ignored.

Illustration 5-6: Illustration of how sensitivity disclosures can be determined

Company X, which has the euro as its functional currency, is party to the following instruments at 31 December 20X1, X's reporting date:

- A €100m floating rate borrowing
- A forward contract to sell US\$10m in July 20X2 that is designated in an effective hedge of a highly probable forecast sale that is denominated in US dollars
- A short-term loan of £10m made to a related party
- An interest rate swap that is not designated as a hedge
- Investments in fixed rate debt securities that are classified as financial assets measured at amortised cost
- Investments in similar securities that are classified as debt instruments measured at fair value through other comprehensive income

And

- Investments in a portfolio of US equities with a fair value of US\$50m

Floating rate borrowing

Changes in interest rates will result in this instrument impacting on X's profit or loss. If X concludes that a reasonably possible change in interest rates is 50 basis points (0.5%), €0.5m [$€100m \times 0.5\%$] would be included in the amount disclosed as the impact on profit or loss of this reasonably possible change.

Forward contract

Changes in exchange rates will have an impact on the fair value (and carrying value) of this instrument, but this would be recognised in other comprehensive income, not profit or loss (assuming ineffectiveness is insignificant). If a reasonably possible change in exchange rates would change the value of the contract by €0.3m, this would be included in the amount disclosed as the impact on equity of this reasonably possible change.

Foreign currency loan

Changes in spot exchange rates will have an impact on the carrying amount of this asset with changes recognised in profit or loss as a result of the application of IAS 21 *The Effects of Changes in Foreign Exchange Rates*. If a reasonably possible change in the exchange rate would alter the carrying value of the contract by €1.0m, this would be included in the amount disclosed as the impact on profit or loss of this reasonably possible change.

If the loan were made to a subsidiary of X that had sterling as its functional currency, the loan itself would eliminate on consolidation but the impact of retranslating it into euros in X's own financial statements would remain in consolidated profit or loss. Therefore, in these circumstances, the loan would still be included in the sensitivity analysis for X's consolidated financial statements.

Interest rate swap

Changes in interest rates will have an impact on the fair value (and carrying value) of this instrument and such changes would be recognised in profit or loss. If a reasonably possible change of 50 basis points in interest rates would change the value of the contract by €0.4m, this would be included in the amount disclosed as the impact on profit or loss of this reasonably possible change.

Fixed rate debt securities

Changes in interest rates will have an impact on the fair value of all these instruments. However, because those classified as measured at amortised cost are not measured at fair value, the carrying amount only of those that are classified as debt instruments measured at fair value through other comprehensive income will change as interest rates move and such change will normally be recognised in other comprehensive income. Therefore, if a reasonably possible 50 basis point change in interest rates would change the fair value of each group of instruments by €0.5m, only the amount in respect of the debt instruments measured at fair value through other comprehensive income would be included in the sensitivity disclosure as an impact on equity. Of course, there would be nothing to preclude disclosure, as additional information (if considered relevant), of the sensitivity of the fair value of those classified as measured at amortised cost to changes in interest rates.

US equity securities

The impact of a reasonably possible change in the market prices of these securities should be included in the amount disclosed as X's sensitivity to equity price risk. Changes in exchange rates might be considered to impact the fair value of these investments. However, as noted at (c)(i) in section 5 above, financial instruments that are non-monetary items do not give rise to foreign currency risk for the purposes of IFRS 7; essentially, the foreign currency risk is seen as part of the market price risk associated with such instruments. Therefore, X should take no account of these investments when disclosing its sensitivity to changes in the euro/US dollar exchange rate. Nevertheless, this information may be provided as additional disclosure where it is considered relevant.

Relevant risk variables for the purpose of this disclosure might include: [IFRS 7.IG33]

- Prevailing market interest rates, for interest-sensitive financial instruments such as a variable-rate loan
Or
- Currency rates and interest rates, for foreign currency financial instruments such as foreign currency bonds

For interest rate risk, the sensitivity analysis might show separately the effect of a change in market interest rates on:

- Interest income and expense
- Other line items of profit or loss (such as trading gains and losses)
And
- When applicable, equity

An entity might disclose a sensitivity analysis for interest rate risk for each currency in which the entity has material exposures to interest rate risk. [IFRS 7.IG34].

In determining what a reasonably possible change in the relevant risk variable is, the economic environment(s) in which the entity operates, and the time frame over which it is making the assessment, should be considered. A reasonably possible change should not include "remote or 'worst case' scenarios or 'stress tests'". Moreover, if the rate of change in the underlying risk variable is stable, the chosen reasonably possible change in the risk variable need not be altered.

For example, assume that interest rates are 5% and an entity determines that a fluctuation in interest rates of ± 50 basis points is reasonably possible. It would disclose the effect on profit or loss and equity if interest rates were to change to 4.5% or 5.5%. In the next period, interest rates have increased to 5.5%. The entity continues to believe that interest rates may fluctuate by ± 50 basis points (i.e., that the rate of change in interest rates is stable). The entity would disclose the effect on profit or loss and equity if interest rates were to change to 5% or 6%. The entity would not be required to revise its assessment that interest rates might reasonably fluctuate by ± 50 basis points, unless there is evidence that interest rates have become significantly more volatile. [IFRS 7.B19(a)].

However, in circumstances when market conditions change significantly, for example as occurred in many markets in the second half of 2008¹⁹ or more recently during 2022 where we have observed rapidly changing interest rates, we would expect an entity to reconsider its assessment of what constitutes a reasonably possible change in a market risk variable. If the entity changes its assessment of what is considered to be a reasonably possible change, ordinarily there would be no need to update the prior year disclosures. For example, where an entity assessed a reasonable possible change in interest rates in the prior year as 100 basis points, but due to changes to interest rates as a result of changing market conditions in the current year the entity believes that a 200 basis points increase is now considered to be a reasonably possible change, the prior year disclosure is not updated. However, we have observed instances where an entity has chosen to present additional sensitivity information for the comparative period based on the current years revised reasonably possible change in a market risk variable.

The time frame over which a reasonably possible change should be assessed is defined by the period until these disclosures will next be presented. This will normally coincide with the next annual reporting period, [IFRS 7.B19(b)], although in some jurisdictions such information may be included in interim reports.

Because the factors affecting market risk will vary according to the specific circumstances of each entity, the appropriate range to be considered in providing a sensitivity analysis of market risk will also vary for each entity and for each type of market risk. [IFRS 7.IG35].

¹⁹ [INFORMATION FOR OBSERVERS](#), Board Meeting: December 2008, London, Project: IFRS 7 Financial Instruments: Disclosures, Subject: *Minor Amendments (Agenda paper 14)*, IASB, paragraph 86. Available on the IFRS Foundation's website.

Where an entity has exposure to other price risk, it might disclose the effect of a decrease in a specified stock market index, commodity price, or other risk variable. For example, if residual value guarantees that are financial instruments are given, the disclosure could include an increase or decrease in the value of the assets to which the guarantee applies. [IFRS 7.B25].

The following Illustration from the implementation guidance shows the type of disclosure that might be provided.

Illustration 5-7: Illustrative disclosure of sensitivity analyses

Interest rate risk

At 31 December 20X1, if interest rates at that date had been 10 basis points lower with all other variables held constant, post-tax profit for the year would have been CU1.7 million (20X0: CU2.4 million) higher, arising mainly as a result of lower interest expense on variable borrowings.

If interest rates had been 10 basis points higher, with all other variables held constant, post-tax profit would have been CU1.5 million (20X0: CU2.1 million) lower, arising mainly as a result of higher interest expense on variable borrowings.

Profit is more sensitive to interest rate decreases than increases because of borrowings with capped interest rates. The sensitivity is lower in 20X1 than in 20X0 because of a reduction in outstanding borrowings that has occurred as the entity's debt has matured (see note X).

Foreign currency exchange rate risk

At 31 December 20X1, if the currency unit had weakened 10% against the US dollar with all other variables held constant, post-tax profit for the year would have been CU2.8 million (20X0: CU6.4 million) lower, and other comprehensive income would have been CU1.2 million (20X0: CU1.1 million) higher.

Conversely, if the currency unit had strengthened 10% against the US dollar with all other variables held constant, post-tax profit would have been CU2.8 million (20X0: CU6.4 million) higher, and other comprehensive income would have been CU1.2 million (20X0: CU1.1 million) lower.

The lower foreign currency exchange rate sensitivity in profit in 20X1 compared with 20X0 is attributable to a reduction in foreign currency denominated debt. Equity is more sensitive in 20X1 than in 20X0 because of the increased use of hedges of foreign currency purchases, offset by the reduction in foreign currency debt.

[IFRS 7.IG36].

The following extracts from the financial statements of Hunting Plc illustrates how one company has addressed this disclosure requirement in respect of certain of its interest rate and foreign currency exposures.

Practical example 5-8: Hunting Plc (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]

Financial statements [extract]

Notes to the Consolidated Financial Statements [extract]

31. Financial Instruments: Sensitivity Analysis [extract]

The following sensitivity analysis is intended to illustrate the sensitivity to changes in market variables on the Group's financial instruments and show the impact on profit or loss and shareholders' equity. Financial instruments affected by market risk include cash at bank and in hand, trade and other receivables, trade and other payables, lease liabilities, borrowings and derivative financial instruments. The sensitivity analysis relates to the position as at 31 December 2023. The analysis excludes the impact of movements in market variables on the carrying value of pension and other post-retirement obligations, provisions and non-financial assets and liabilities of foreign operations.

The following assumptions have been made in calculating the sensitivity analysis:

- Foreign exchange rate and interest rate sensitivities have an asymmetric impact on the Group's results, that is an increase in rates does not result in the same amount of movement as a decrease in rates;
- For floating rate assets and liabilities, the amount of asset or liability outstanding at the balance sheet date is assumed to be outstanding for the whole year;
- Fixed-rate financial instruments that are carried at amortised cost are not subject to interest rate risk for the purpose of this analysis; and
- The carrying values of financial assets and liabilities carried at amortised cost do not change as interest rates change.

Positive figures represent an increase in profit or equity.

(a) Interest Rate Sensitivity

(i) US Interest Rates

The sensitivity rate of 2.0% (2022 – 1.0%) for US interest rates represents management's assessment of a reasonably possible change, based on historical volatility and a review of analysts' research and banks' expectations of future interest rates.

The impact on the consolidated income statement, with all other variables held constant, in applying the sensitivity above results in a \$0.6m (2022 – \$0.1m) increase or decrease in post-tax profit for an increase or decrease in US interest rates. There is no impact on other comprehensive income ("OCI") for a change in US interest rates.

(ii) Other Interest Rates

For all other interest rates, there is an immaterial impact on post-tax profit or loss for any reasonably possible changes in other interest rates, based on historical volatility and a review of analysts' research and banks' expectations of future interest rates. There is no impact on OCI for a change in other interest rates.

(b) Foreign Exchange Rate Sensitivity

Management has considered the impact of changes to the various foreign exchange rates on the exposed financial assets and liabilities disclosed in note 30(a)(i). The sensitivity rates selected range between 3-5% and represent management's assessment of a reasonably possible change, based on historical volatility and a review of analysts' research and banks' expectations of future foreign exchange rates. There is an immaterial impact on post-tax profit or loss and on OCI for any reasonably possible changes in the foreign exchange rates.

5.5.2 Value-at-risk and similar analyses

Where an entity prepares a sensitivity analysis, such as value-at-risk, that reflects interdependencies between risk variables (e.g., interest rates and exchange rates) and uses it to manage financial risks, it may disclose that analysis in place of the information specified in section 5.5.1 above. [IFRS 7.41]. If this disclosure is given, the effects on profit or loss and equity in section 5.5.1 above need not be given. [IFRS 7.BC61].

In these cases, the following should also be disclosed: [IFRS 7.41]

- An explanation of the method used in preparing such a sensitivity analysis, and of the main parameters and assumptions underlying the data provided
- And
- An explanation of the objective of the method used and of limitations that may result in the information not fully reflecting the fair value of the assets and liabilities involved

This applies even if such a methodology measures only the potential for loss and does not measure the potential for gain. Such an entity might comply with the disclosure requirements above by detailing the type of value-at-risk model used (e.g., whether the model relies on Monte Carlo simulations), an explanation about how the model works and the main assumptions (e.g., the holding period and confidence level). Entities might also disclose the historical observation period and weightings applied to observations within that period, an explanation of how options are dealt with in the calculations, and which volatilities and correlations (or, alternatively, Monte Carlo probability distribution simulations) are used. [IFRS 7.B20].

The basic sensitivity analysis considered in section 5.5.1 above incorporates only the effects of financial instruments and other contracts within the scope of IFRS 7. In contrast, value-at-risk and similar analyses can incorporate the effects of items outside the scope of IFRS 7, for example trading inventories, own use contracts and insurance contracts. This is because the standard requires entities to disclose the analysis actually used in the management of the business, which will often include such items.

It has been suggested that disclosure of potential losses due to stress conditions would be of greater use than the disclosure requirements for value-at-risk and similar methodologies that do not contemplate extraordinary market movements. However, in December 2008, the IASB noted this would be inconsistent with the 'basic' sensitivity analysis (see section 5.5.1 above) and decided not to add such a requirement to IFRS 7.²⁰

BP p.l.c. provides the following market risk disclosures which includes the value-at-risk limit it uses to manage that risk.

Practical example 5-9: BP p.l.c. (2023)	United Kingdom
BP Annual Report and Form 20-F 2023 [extract] Financial statements [extract] Notes on the financial statements [extract] 29. Financial instruments and financial risk factors [extract] Financial risk factors [extract]	
...	
(a) Market risk Market risk is the risk or uncertainty arising from possible market price movements and their impact on the future performance of a business. The primary commodity price risks that the group is exposed to include oil, natural gas and power prices that could adversely affect the value of the group's financial assets, liabilities or expected future cash flows. The group has developed a control framework aimed at managing the volatility inherent in certain of its ordinary business exposures. In accordance with the control framework the group enters into various transactions using derivatives for risk management purposes. The major components of market risk are commodity price risk, foreign currency exchange risk and interest rate risk, each of which is discussed below.	
(i) Commodity price risk The group's trading and shipping business is responsible for delivering value across the overall crude, oil products, gas, LNG and power supply chains. As such, it routinely enters into spot and term physical commodity contracts in addition to optimising physical storage, pipeline and transportation capacity. These activities expose the group to commodity price risk which is managed by entering into oil, natural gas and power swaps, options and futures. The group measures market risk exposure arising from its trading positions in liquid periods using value-at-risk techniques based on Monte Carlo simulation models. These techniques make a statistical assessment of the market risk arising from possible future changes in market prices over a one-day holding period within a 95% confidence level. Trading activity occurring in liquid periods is subject to value-at-risk and other limits for each trading activity and the aggregate of all trading activity. The calculation of potential changes in value within the liquid period considers positions, historical price movements and the correlation of these price movements. Models are regularly reviewed against actual fair value movements to ensure integrity is maintained. The value-at-risk measure is supplemented by stress testing and scenario analysis through simulating the financial impact of certain physical, economic and geo-political scenarios. The value-at-risk measure in respect of the aggregated trading positions in liquid periods at 31 December 2023 was \$26 million (2022 \$63 million) whereas the average value-at-risk measure for the period was \$49 million (2022 \$89 million). This measure incorporates the effect of diversification reflecting the offsetting risks across the trading portfolio. Alternative measures are used to monitor exposures which are outside of liquid periods and for which value-at-risk techniques are not appropriate.

²⁰ [INFORMATION FOR OBSERVERS](#), Board Meeting: December 2008, London, Project: *IFRS 7 Financial Instruments: Disclosures*, Subject: *Minor Amendments (Agenda paper 14)*, IASB, paragraphs 80 to 88; and [IASB Update](#), December 2008. Available on the IFRS Foundation's website.

5.5.3 Other market risk disclosures

When the sensitivity analyses discussed in section 5.5.1 and section 5.5.2 above are unrepresentative of a risk inherent in a financial instrument, that fact must be disclosed together with the reason for believing the sensitivity analyses are unrepresentative. *[IFRS 7.42]*.

This can occur when the year-end exposure does not reflect the exposure during the year, *[IFRS 7.42]*, or a financial instrument contains terms and conditions whose effects are not apparent from the sensitivity analysis, e.g., options that remain out of (or in) the money for the chosen change in the risk variable.

[IFRS 7.IG37(a)]. Additional disclosures in this second case might include:

- The terms and conditions of the financial instrument (e.g., the options)
 - The effect on profit or loss if the term or condition were met (i.e., if the options were exercised)
- And
- A description of how the risk is hedged

For example, an entity may acquire a zero-cost interest rate collar that includes an out-of-the-money leveraged written option (e.g., the entity pays ten times the amount of the difference between a specified interest rate floor and the current market interest rate if that current rate is below the floor). The entity may regard the collar as an inexpensive economic hedge against a reasonably possible increase in interest rates. However, an unexpectedly large decrease in interest rates might trigger payments under the written option that, because of the leverage, might be significantly larger than the benefit of lower interest rates. Neither the fair value of the collar nor a sensitivity analysis based on reasonably possible changes in market variables would indicate this exposure. In this case, the entity might provide the additional information described above. *[IFRS 7.IG38]*.

Where financial assets are illiquid, e.g., when there is a low volume of transactions in similar assets and it is difficult to find a counterparty, additional disclosures might be required, *[IFRS 7.IG37(b)]*, for example, the reasons for the lack of liquidity and how the risk is hedged. *[IFRS 7.IG39]*.

A large holding of a financial asset that, if sold in its entirety, would be sold at a discount or premium to the quoted market price for a smaller holding could also require additional disclosure. *[IFRS 7.IG37(c)]*. This might include: *[IFRS 7.IG40]*

- The nature of the security (e.g., entity name)
 - The extent of holding (e.g., 15% of the issued shares)
 - The effect on profit or loss
- And
- How the entity hedges the risk

5.6 Quantitative disclosures: other matters

5.6.1 Concentrations of risk

Concentrations of risk must be disclosed if not otherwise apparent from the disclosures made to comply with the requirements set out in section 5.2 to section 5.5 above. *[IFRS 7.34(c)]*. This should include:

- A description of how management determines concentrations
- A description of the shared characteristic that identifies each concentration (for example, counterparty, geographical area, currency or market)

For example, the shared characteristic may refer to geographical distribution of counterparties by groups of countries, individual countries or regions within countries *[IFRS 7.IG19]*

And

- The amount of the risk exposure associated with all financial instruments sharing that characteristic

Concentrations of risk arise from financial instruments that have similar characteristics and are affected similarly by changes in economic or other conditions. It is emphasised that the identification of concentrations of risk requires judgement taking into account the circumstances of the entity. [IFRS 7.B8]. For example, they may arise from: [IFRS 7.IG18]

- **Industry sectors**

If an entity's counterparties are concentrated in one or more industry sectors (such as retail or wholesale), it would disclose separately exposure to risks arising from each concentration of counterparties.

- **Credit rating or other measure of credit quality**

If an entity's counterparties are concentrated in one or more credit qualities (such as secured loans or unsecured loans) or in one or more credit ratings (such as investment grade or speculative grade), it would disclose separately exposure to risks arising from each concentration of counterparties.

- **Geographical distribution**

If an entity's counterparties are concentrated in one or more geographical markets (such as Asia or Europe), it would disclose separately exposure to risks arising from each concentration of counterparties. And

- **Concentrated counterparties**

A limited number of individual counterparties or groups of closely related counterparties.

Similar principles apply to identifying concentrations of other risks, including liquidity risk and market risk. For example, concentrations of liquidity risk may arise from the repayment terms of financial liabilities, sources of borrowing facilities, reliance on a particular market in which to realise liquid assets or certain supplier financing arrangements where finance provider(s) pay the original suppliers and the entity pays at a later date, where such arrangements result in a concentration of financial liabilities with the finance provider(s). Concentrations of foreign exchange risk may arise if an entity has a significant net open position in a single foreign currency, or aggregate net open positions in several currencies that tend to move together.

[IFRS 7.IG18A].

5.6.2 Operational risk

In developing IFRS 7, the IASB considered whether disclosure of information about operational risk should be required by the standard. However, the definition and measurement of operational risk were considered to be in their infancy and were not necessarily related to financial instruments. Also, such disclosures were believed to be more appropriately located outside the financial statements. Consequently, this issue was deferred for consideration in the management commentary project. [IFRS 7.BC65].

5.6.3 Capital disclosures

The IASB considers that the level of an entity's capital and how it is managed are important factors for users of financial statements to consider in assessing the risk profile of an entity and its ability to withstand unexpected adverse events. It might also affect an entity's ability to pay dividends. Consequently, ED 7 contained proposed disclosures about capital. [IAS 1.BC86].

However, some commentators questioned the relevance of the capital disclosures in a standard dealing with disclosures relating to financial instruments and the IASB noted that an entity's capital does not relate solely to financial instruments and, thus, they have more general relevance. Accordingly, whilst these disclosures were retained, they were included in IAS 1, rather than IFRS 7. [IAS 1.BC88]. Those disclosures required by IAS 1 are dealt with in Chapter 3.

5.7 Interest rate benchmark (or IBOR) reform

Replacing interbank offered rates (IBOR) with alternative rates was one of the recommendations following the financial crisis. IBOR reform gives rise to several financial reporting issues which the IASB approached in two phases. In August 2020, the IASB issued a second set of amendments to IFRS 9 addressing changes made to contractual cash flows, including modifications of financial assets and financial liabilities, and to hedging relationships that occur when interest rate benchmarks are replaced with alternative benchmarks. These amendments, which were effective for periods commencing on or after 1 January 2021 and were available for earlier adoption, are discussed in the Supplement: IBOR Reform. Consequential amendments were made to IFRS 7 to enable users of financial statements to understand the effect of interest rate benchmark reform on an entity's financial instruments and risk management strategy. [IFRS 7.241]. The disclosures that entities should provide are discussed in the Supplement: IBOR Reform at section 6.2.

Disclosures introduced by the first phase of the IASB's project to address IBOR reform are considered in section 4.3.5 above and the Supplement: IBOR Reform at section 6.1.

At the time of writing, IBOR Reform is substantially complete as the most significant IBORs, including all the LIBORs, have now been replaced. However, there remain some local IBORs for which the work to replace them is still in progress or has only very recently been completed, hence the guidance in this chapter remains relevant.

6 Transfers of financial assets

The objective of these requirements, which were introduced into IFRS 7 in October 2010, is that entities must disclose information that enables users of its financial statements: [IFRS 7.42B]

- (a) To understand the relationship between transferred financial assets that are not derecognised in their entirety and the associated liabilities
And
- (b) To evaluate the nature of, and risks associated with, the entity's continuing involvement in derecognised financial assets

The standard specifies detailed disclosure requirements to support objectives (a) and (b) which are discussed below in section 6.2 and section 6.3 respectively. However, these may not be sufficient to meet these objectives, in which case an entity should disclose any additional information, over and above that specified by IFRS 7, that it considers necessary. The entity should decide, in the light of its circumstances, how much additional information it needs to provide to satisfy the information needs of users and how much emphasis it places on different aspects of the additional information. It is necessary to strike a balance between burdening financial statements with excessive detail that may not assist users of financial statements and obscuring information as a result of too much aggregation. [IFRS 7.42H, IFRS 7.B39].

Rather unusually, the standard specifies that these disclosures should be presented in a single note to the financial statements. [IFRS 7.42A]. Presumably this is to prevent entities 'hiding' these disclosures by having the detailed information scattered across a number of notes.

These requirements supplement the other requirements of IFRS 7 and apply when an entity transfers financial assets. They apply for all transferred financial assets that are not derecognised, and for any continuing involvement in a transferred asset, that exist at the reporting date, irrespective of when the related transfer occurred. [IFRS 7.42A].

6.1 The meaning of 'transfer'

For the purposes of applying the disclosure requirements in this section, an entity transfers all or a part of a financial asset (the transferred financial asset) if, and only if, it either: [IFRS 7.42A]

- (a) Transfers the contractual rights to receive the cash flows of that financial asset
Or
- (b) Retains the contractual rights to receive the cash flows of that financial asset but assumes a contractual obligation to pay the cash flows to one or more recipients in an arrangement

The transactions encompassed by (a) should be the same ones that would be regarded as transfers under the derecognition requirements of IFRS 9 (see Chapter 48).

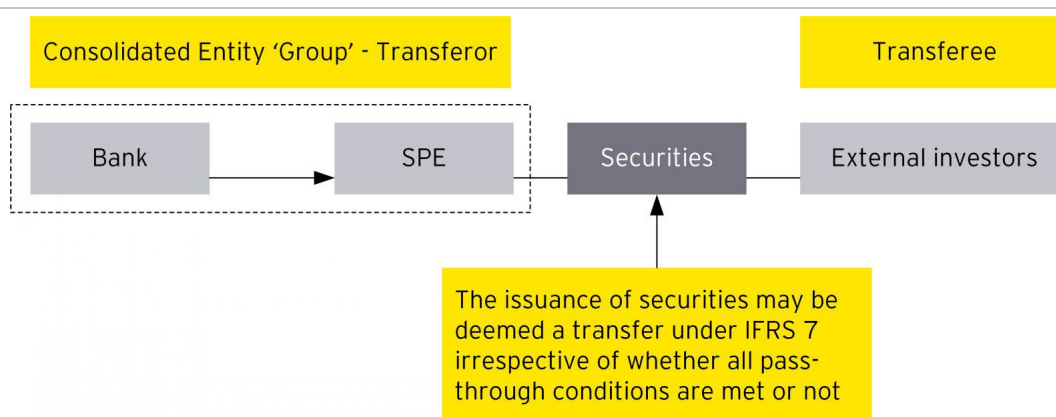

However, the transactions falling within (b) represent a larger group than those which would be regarded as 'pass-through arrangements' under IFRS 9 (see Chapter 48). For instance, an arrangement that does not meet the 'pass-through arrangements' requirements of IFRS 9 could still be considered a transfer under IFRS 7 and therefore be subject to the IFRS 7 disclosure requirements.

6.1.1 Pass-through type arrangements

The following Illustration shows how IFRS 7.42A(b) might be applied to a securitisation of financial assets. [IFRS 7.42A(b)].

Illustration 6-1: Pass-through type transfers

A bank transfers a portfolio of loans to a consolidated special purpose entity (SPE) in exchange for cash and the most junior securities issued by the SPE. The securities issued by the SPE are collateralised by the loan portfolio and the payments due under the securities are contractually linked and dependent on the cash flows from the loan portfolio. The investors do not have recourse to any other assets of the bank and the transfer by the consolidated group to the external investors does not qualify for derecognition. The transferred loans have a carrying amount of CU100 and the securities issued to third parties have a carrying amount of CU80 (net of the junior securities held by the bank of CU20). This raises the question - does the transfer of the portfolio of loans fall within the scope of IFRS 7.42A(b) even though the consolidated group does not pass on all of the cash flows collected from the transferred assets?

A strict reading of IFRS 7.42A(b) may lead to the conclusion that a transfer (for these purposes) has not taken place unless the consolidated group is required to pass through all the cash flows collected from the financial assets. In contrast, an examination of IFRS 9, which contains identical wording to IFRS 7.42A(b) and its Application Guidance and Basis for Conclusions, could be read to indicate that the IASB intended that even an obligation to pay a disproportionate share of the financial assets' cash flows may qualify as a transfer for these purposes. [IFRS 9.3.2.4(b), IFRS 9.B3.2.7, IFRS 9.BCZ3.21, IFRS 9.BCZ3.22].

How we see it

We believe, as a general rule, that when the securities issued have no recourse to the consolidated group beyond the transferred assets, it is more likely that the cash flows would qualify as a transfer for disclosure purposes. In contrast, when the securities issued have recourse to other assets of the consolidated group, it would be reasonable to conclude that the assets represent collateral pledged against the issued securities rather than being considered transferred.

In determining whether a transfer under IFRS 7.42A(b) has taken place in similar circumstances to those set out above, an assessment needs to be made of the degree of contractual linkage between the cash flows due under the securities and the cash flows collected from the assets subject to the transfer. Such an assessment may require significant judgement, considering all the facts and circumstances.

In practice, the facts could be considerably far more complex than Illustration 6-1 above. For example, it is common for SPEs to enter into interest rate/foreign currency swaps with the transferor and/or other external counterparties. Because a swap is a bi-directional derivative (i.e., the cash flows could flow in either direction and therefore, over its life, could be an asset or a liability), the assessment of 'transfer' becomes complicated. In particular, one immediate question arises: what cash flows should be considered for the transfer assessment? Is it only the cash flows coming from the assets that were originally transferred to the SPE? Or is it the collective cash flows of the originally transferred assets and those of the swaps? The answer to this question is particularly relevant for the contractual linkage assessment. If only the cash flows of the original assets transferred to the SPE (i.e., excluding cash flows on the swap(s)) are considered, then the follow up question is whether the existence of the swaps alters the structure of the cash flows such that the cash flows passed on to the note holders could be considered adjusted cash flows (hence, the contractual linkage is deemed modified). In contrast, if the collective cash flows (i.e., those of the originally transferred assets and the swaps) are considered, then the immediate follow up question is what happens when the SPE becomes a net payer of cash on the swaps (i.e., when the swaps flip into a liability)?

If a transaction is not considered to be within the scope of these requirements, the disclosures about collateral discussed in section 4.4.6 above are likely to be applicable.

How we see it

The answers to all of these questions are not straightforward and depend on the specific facts and circumstances. Entities will need to apply significant judgement in these situations.

Reporting entities should disclose the factors considered in making such judgements. In cases where the contractual linkage assessment is not conclusive, reporting entities may find it appropriate to disclose the transaction, for example, in the note disclosure on transfers of financial assets and include a cross-reference to that in the note disclosure on pledged collateral.

Notwithstanding the above, entities could apply a literal reading of the text of IFRS 7.42A(b). In which case, the disclosure requirements of IFRS 7.42D, discussed in section 6.2 below, would not be required. But, since the assets would still be held as collateral against the related liabilities, the requirements in IFRS 7.14 (see in section 4.4.6 above), concerning financial assets pledged as collateral against liabilities, would still apply.

How we see it

We believe, given the over-arching purpose of disclosures about transferred financial assets, taking such a literal view is acceptable only if the nature and carrying amount of the associated liabilities are disclosed and it can be demonstrated that the disclosures in IFRS 7.42D that are not provided are not material to the reader of the financial statements.

6.2 Transferred financial assets that are not derecognised in their entirety

Financial assets may have been transferred in such a way that part or all of the financial assets do not qualify for derecognition. This might occur if:

- The contractual rights to the cash flows have been transferred but substantially all risks and rewards are retained, e.g., a sale and repurchase agreement, so that the assets are not derecognised.
- The rights to the cash flows have been transferred, the risks and rewards partially transferred and control of the assets has been retained so that the assets continue to be recognised to the extent of the entity's continuing involvement.

Or

- An obligation has been assumed to pay the cash flows from the asset to other parties but in a way that does not meet the 'pass-through' requirements (see Chapter 48).

The following disclosures should be given for each class of transferred financial assets that are not derecognised in their entirety: [IFRS 7.42D]

Extract from IFRS 7

Transferred financial assets that are not derecognised in their entirety

- 42D An entity may have transferred financial assets in such a way that part or all of the transferred financial assets do not qualify for derecognition. To meet the objectives set out in paragraph 42B(a), the entity shall disclose at each reporting date for each class of transferred financial assets that are not derecognised in their entirety:
- (a) the nature of the transferred assets.
 - (b) the nature of the risks and rewards of ownership to which the entity is exposed.
 - (c) a description of the nature of the relationship between the transferred assets and the associated liabilities, including restrictions arising from the transfer on the reporting entity's use of the transferred assets.
 - (d) when the counterparty (counterparties) to the associated liabilities has (have) recourse only to the transferred assets, a schedule that sets out the fair value of the transferred assets, the fair value of the associated liabilities and the net position (the difference between the fair value of the transferred assets and the associated liabilities).
 - (e) when the entity continues to recognise all of the transferred assets, the carrying amounts of the transferred assets and the associated liabilities.
 - (f) when the entity continues to recognise the assets to the extent of its continuing involvement (see paragraphs 3.2.6(c)(ii) and 3.2.16 of IFRS 9), the total carrying amount of the original assets before the transfer, the carrying amount of the assets that the entity continues to recognise, and the carrying amount of the associated liabilities.

These disclosures should be given at each reporting date at which the entity continues to recognise the transferred financial assets, regardless of when the transfers occurred. [IFRS 7.B32].

The above requirements clearly apply to transfers of entire financial assets where the transferred assets continue to be recognised in their entirety. They also apply to transfers of entire assets where the transferred assets are recognised to the extent of the transferor's continuing involvement.

However, the derecognition criteria in IFRS 9 are sometimes applied to specified parts of a financial asset (or group of similar financial assets). For example, an entity might transfer a proportion of an entire financial asset, such as 50% of all cash flows on a bond. Similarly, it may transfer specified cash flows from a financial asset, such as all the coupon payments or only the principal payment on a bond, commonly known as an interest strip and principal strip respectively. Furthermore, if the derecognition criteria are met, it is possible for the specified parts of the financial asset to be derecognised whilst the remainder of the asset remains on the statement of financial position (see Chapter 48). This begs the question of whether the disclosure requirements in this section should be applied to such transfers.

Whilst the financial asset has not been derecognised in its entirety, it will normally be the case that the asset has not been transferred in its entirety either. Therefore, it might seem more appropriate for the disclosure requirements to follow the way in which the derecognition requirements of IFRS 9 have been applied, i.e., they should focus on the specified part of the asset that has been transferred. In this case, the entity will consider that the transaction results in partial derecognition only and will, therefore, disclose the information for the amounts derecognised as required by IFRS 7.42D. [IFRS 7.42D].

Nevertheless, in the absence of specific guidance, we believe the alternative view could be supported where the disclosures would address the entire asset (i.e., inclusive of the portion not transferred). In this case, the entity will conclude that the transfer results in full derecognition and IFRS 7.42E (rather than IFRS 7.42D) will therefore apply. In the absence of specific guidance, an entity should establish an accounting policy that it applies consistently to all transactions. [IFRS 7.42D, IFRS 7.42E].

Illustration 6-2: Calculating the carrying amount of assets transferred in pass-through type arrangements

Taking the scenario described in Illustration 6-1 in section 6.1.1 above, if the consolidated group considers that a transfer has taken place and therefore applies the disclosure requirements of IFRS 7.42D, it should disclose the carrying amount of assets transferred as being CU80 with total associated liabilities of CU80, and explain that the associated liabilities have recourse to assets totalling CU100 (i.e., show the effect of the credit enhancement provided by the junior notes). This would be the case if the entity interpreted IFRS 7.42A(b) to mean that a transfer of a portion may qualify as a pass-through transfer, and if the degree of contractual linkage between the securities and the underlying cash flows is deemed to be sufficiently strong.

If, however, the consolidated group concludes that no transfer has taken place and, therefore, it applies the requirements in IFRS 7.14, together with the supplemental information (i.e., the nature and carrying amount of the associated liabilities, as noted earlier) it should disclose the carrying amount of assets pledged as collateral as being CU100 with total associated liabilities of CU80.

How we see it

In our view, these disclosure requirements do not apply where an entity provides non-cash financial assets as collateral to a third party and the transferee's right to control the asset (normally evidenced by its ability to resell or repledge those assets) is conditional on default of the transferor. Instead, the disclosures about collateral set out in section 4.4.6 above would apply.

The following Illustration shows how an entity might meet the quantitative disclosure requirements in IFRS 7.42D(d) and IFRS 7.42D(e) above. [IFRS 7.IG40B].

Illustration 6-3: Quantitative disclosures for transferred assets not fully derecognised

	Financial assets at fair value through profit or loss		Financial assets at amortised cost		Equity investments designated at fair value through OCI
	CU million		CU million		CU million
	Trading assets	Derivatives	Mortgages	Consumer loans	Equity investments
Carrying amount of assets	X	X	X	X	X
Carrying amount of associated liabilities	(X)	(X)	(X)	(X)	(X)
For those liabilities that have recourse only to the transferred assets:					
Fair value of assets	X	X	X	X	X
Fair value of associated liabilities	(X)	(X)	(X)	(X)	(X)
Net position	X	X	X	X	X

6.3 Transferred financial assets that are derecognised in their entirety

An entity may have transferred financial assets in such a way that they are derecognised in their entirety, but the entity has 'continuing involvement' in those assets. Where this is the case, the additional disclosures set out in section 6.3.4 below should be given. In this context, the term continuing involvement has a different meaning to that used in the derecognition requirements of IFRS 9 (see Chapter 48), which is discussed in section 6.3.1 below.

In practice, the application of these requirements might be limited given that few transfers with any form of continuing involvement (as that term is used here) will qualify for full derecognition. One example is a transfer of a readily obtainable financial asset subject to a call option that is neither deeply in the money nor deeply out of the money (see Chapter 48), but others could certainly be encountered in practice.

6.3.1 Meaning of continuing involvement

In this context, continuing involvement arises if, as part of the transfer, the entity retains any of the contractual rights or obligations inherent in the transferred financial asset or obtains any new contractual rights or obligations relating to it. [IFRS 7.42C].

For example, a financial asset transferred subject only to either (a) a deeply out of the money put option granted to the transferee, or (b) a deeply out of the money call option retained by the transferor would be derecognised. This is because substantially all the risks and rewards of ownership have been transferred. [IFRS 9.B3.2.16(g)]. However, the put or call option would constitute continuing involvement in the asset.

Similarly, a readily obtainable asset transferred subject to a call option that is neither deeply in the money nor deeply out of the money would also be derecognised. This is because the entity has neither transferred nor retained substantially all of the risks and rewards of ownership and has not retained control. [IFRS 9.B3.2.16(h)]. However, the call option would constitute continuing involvement in the asset.

The following do not constitute continuing involvement for these purposes: [IFRS 7.42C]

- (a) Normal representations and warranties relating to fraudulent transfer and concepts of reasonableness, good faith and fair dealings that could invalidate a transfer as a result of legal action
- (b) Forward, option and other contracts to reacquire the transferred financial asset for which the contract price (or exercise price) is the fair value of the transferred financial asset

Or

- (c) An arrangement whereby an entity retains the contractual rights to receive the cash flows of a financial asset but assumes a contractual obligation to pay the cash flows to one or more entities in a 'pass-through arrangement' (see Chapter 48)

An entity does not have a continuing involvement in a transferred financial asset if, as part of the transfer, it neither retains any of the contractual rights or obligations inherent in the transferred financial asset nor acquires any new contractual rights or obligations relating to the transferred financial asset. Also, an entity does not have continuing involvement in a transferred financial asset if it has neither an interest in the future performance of the transferred financial asset nor a responsibility under any circumstances to make payments in respect of the transferred financial asset in the future. The term 'payment' in this context does not include cash flows of the transferred financial asset that an entity collects and is required to remit to the transferee. [IFRS 7.B30].

When an entity transfers a financial asset, it may retain the right to service that financial asset for a fee, e.g., by entering into a servicing contract. Such a contract should be assessed in accordance with the guidance above to determine whether it gives rise to continuing involvement for the purposes of these disclosures. For example, a servicer will have continuing involvement in the transferred financial asset if the servicing fee is dependent on the amount or timing of the cash flows collected from the transferred financial asset. Similarly, the right to a fixed fee that would not be paid in full as a result of non-performance of the transferred financial asset would also represent continuing involvement. This is because the servicer has an interest in the future performance of the transferred financial asset. Any such assessment is independent of whether the fee to be received is expected to compensate the entity adequately for performing the servicing. [IFRS 7.B30A].

Continuing involvement in a transferred financial asset may result from contractual provisions in the transfer agreement or in a separate agreement with the transferee or a third party entered into in connection with the transfer. [IFRS 7.B31].

An entity might transfer a fixed rate financial asset and, at the same time, enter into an interest rate swap with the transferee that has the same notional amount as the transferred asset. If payments on the swap are not conditional on payments being made on the transferred financial asset and the notional of the swap is not linked to the notional amount of the loan this would not preclude derecognition. [IFRS 9.B3.2.16(p)].

How we see it

In our view, for the purposes of these disclosures, the interest rate swap would not represent continuing involvement in the transferred assets.

6.3.2 Changes to continuing involvement after time of transfer

The following Illustration shows the analysis that an entity would need to follow where subsequent transactions change the extent of continuing involvement.

Illustration 6-4: Changes in continuing involvement

In 20X1, Entity H transfers financial assets into an SPE in exchange for cash and 100 of the total notes issued by the SPE. Repayment of the notes issued by the SPE is dependent on, and linked to, the payments on the underlying assets. Assume the 100 notes acquired are considered sufficiently small compared to the total notes issued by the SPE such that H is considered to have transferred substantially all the risks and rewards, and so the transfer qualifies for full derecognition. Assume also that the SPE is not controlled by entity H or any of its subsidiaries. The notes acquired by H as part of the transfer are disclosed as a form of continuing involvement.

In 20X2, one of H's subsidiaries (Subsidiary A) had bought 300 notes issued by the SPE in an independent transaction of the transfer and entity H later sold the 100 notes it held. This raises the question does the sale of the 100 notes by entity H result in the consolidated group ceasing to have continuing involvement in the transferred assets?

A reporting entity will be considered to have ceased continuing involvement only if the subsequent purchases and sales of notes were not made in contemplation of each other and were independent from the original transfer of financial assets. Whether subsequent sales and purchases are linked to each other, and whether such purchases are independent of the original transfer, is a matter of judgement that needs to be considered taking into account all facts and circumstances.

Now, let's suppose that entity H makes a subsequent purchase of the 300 notes issued by the SPE instead of Subsidiary A, does the answer change?

Additional analysis is required when the subsequent purchases and sales of notes are made by the same legal entity (e.g., entity H in the above Illustration). In such a case, however, an additional question arises as to how the reporting entity would need to account for its continuing involvement. More specifically, does the reporting entity need to be able to track the sold notes to the specific notes that were acquired as part of the original transfer of financial assets before it concludes that its continuing involvement has ceased? (This assumes the entity first concluded that the subsequent purchases and sales of notes were not made in contemplation of each other and were independent from the original transfer of financial assets).

One view is that a reporting entity needs to have a tracking mechanism, enabling it to associate the transferred notes to the specific notes that were acquired as part of the original transfer of financial assets. If tracking is an issue and it cannot be proven that the notes sold subsequently are the same as those originally purchased as part of the transfer, then it cannot be assumed that the continuing involvement has ceased or reduced.

An alternative view is that a reporting entity may adopt a reasonable basis such as first-in, first-out to account for its continuing involvement.

How we see it

In our view, arrangements that are entered into some time after the financial asset was transferred, which were not contemplated at the time of the transfer would not form a part of these disclosure requirements as such a transaction would be considered to be independent. However, if the subsequent transaction was contingent upon or entered into in contemplation of the initial arrangement and, therefore, considered to be linked to the initial transfer, whether the disclosure requirements may apply or not is a matter of judgement that needs to be considered in light of all facts and circumstances. We believe, in the absence of further guidance, an entity must establish an accounting policy that it applies consistently to similar transactions. The accounting policy adopted must be disclosed.

6.3.3 Continuing involvement from a consolidated perspective

The assessment of continuing involvement in a transferred financial asset should be made at the level of the reporting entity. For example, a subsidiary may transfer to an unrelated third party a financial asset in which the parent of the subsidiary has continuing involvement. In the subsidiary's stand-alone financial statements, the parent's involvement should not be included in the assessment of whether the reporting entity (the subsidiary) has continuing involvement in the transferred asset. However, in the parent's consolidated financial statements, its continuing involvement (or that of another member of the group) in a financial asset transferred by its subsidiary would be included in determining whether the group has continuing involvement in the transferred asset. [IFRS 7.B29].

6.3.4 Disclosure requirements

When an entity derecognises transferred financial assets in their entirety but has continuing involvement in those assets, it should disclose, as a minimum, the following for each type of continuing involvement at each reporting date: [IFRS 7.42E]

- (a) The carrying amount of the assets and liabilities that are recognised in the entity's statement of financial position and represent the entity's continuing involvement in the derecognised financial assets, and the line items in which the carrying amount of those assets and liabilities are recognised
- (b) The fair value of the assets and liabilities that represent the entity's continuing involvement in the derecognised financial assets
- (c) The amount that best represents the entity's maximum exposure to loss from its continuing involvement in the derecognised financial assets, and information showing how the maximum exposure to loss is determined
- (d) The undiscounted cash outflows that would or may be required to repurchase derecognised financial assets (e.g., the strike price in an option agreement) or other amounts payable to the transferee in respect of the transferred assets. If the cash outflow is variable, then the amount disclosed should be based on the conditions that exist at each reporting date.
- (e) A maturity analysis of the undiscounted cash outflows that would or may be required to repurchase the derecognised financial assets or other amounts payable to the transferee in respect of the transferred assets, showing the remaining contractual maturities of the entity's continuing involvement

This analysis should distinguish between cash flows that are required to be paid (e.g., forward contracts), cash flows the entity may be required to pay (e.g., written put options) and cash flows the entity might choose to pay (e.g., purchased call options). [IFRS 7.B34].

Entities should use judgement to determine an appropriate number of time bands in preparing the maturity analysis. For example, it might be determined that the following maturity time bands are appropriate: *[IFRS 7.B35]*

- (i) Not later than one month
- (ii) Later than one month and not later than three months
- (iii) Later than three months and not later than six months
- (iv) Later than six months and not later than one year
- (v) Later than one year and not later than three years
- (vi) Later than three years and not later than five years

And

- (vii) More than five years

If there is a range of possible maturities, the cash flows should be included on the basis of the earliest date on which the entity can be required or is permitted to pay. *[IFRS 7.B36]*.

And

- (f) Qualitative information that explains and supports the quantitative disclosures set out in (a) to (e) above
This should include a description of the derecognised financial assets and the nature and purpose of the continuing involvement retained after transferring those assets. It should also include a description of the risks to which an entity is exposed, including: *[IFRS 7.B37]*
 - (i) A description of how the entity manages the risk inherent in its continuing involvement in the derecognised financial assets
 - (ii) Whether the entity is required to bear losses before other parties, and the ranking and amounts of losses borne by parties whose interests rank lower than the entity's interest in the asset (i.e., its continuing involvement in the asset)

And

 - (iii) A description of any triggers associated with obligations to provide financial support or to repurchase a transferred financial asset

The types of continuing involvement into which these disclosures and those referred to below are analysed should be representative of the entity's exposure to risks. For example, the analysis may be given by type of financial instrument (e.g., guarantees or call options) or by type of transfer (e.g., factoring of receivables, securitisations and securities lending). *[IFRS 7.B33]*.

If an entity has more than one type of continuing involvement in respect of a particular derecognised financial asset the information above may be aggregated and reported under one type of continuing involvement. *[IFRS 7.42F]*.

The following Illustration shows how an entity might meet the quantitative disclosure requirements in (a) to (e) above. *[IFRS 7.IG40B]*.

Illustration 6-5: Quantitative disclosures for transferred assets fully derecognised

Type of continuing involvement	Cash outflows to repurchase transferred (derecognised) assets	Carrying amount of continuing involvement in statement of financial position			Fair value of continuing involvement		Maximum exposure to loss
	CU million	CU million			CU million		CU million
		Financial assets at fair value through profit or loss	Financial assets at fair value through OCI	Financial liabilities at fair value through profit or loss	Assets	Liabilities	
Written put options	(X)			(X)		(X)	X
Purchased call options	(X)	X			X		X
Securities lending	(X)		X	(X)	X	(X)	X
		X	X	(X)	X	(X)	X

Undiscounted cash flows to repurchase transferred assets								
Maturity of continuing involvement								
Type of continuing involvement	CU million							
	Total	Less than 1 month	1-3 Months	3-6 Months	6 Months to 1 year	1-3 Years	3-5 Years	More than 5 years
Written put options	X		X	X	X	X		
Purchased call options	X			X	X	X		X
Securities lending	X	X	X					

In addition to the information above, the following must be disclosed for each type of continuing involvement: [IFRS 7.42G]

- (a) The gain or loss recognised at the date of transfer of the assets
Disclosure should also be given if a gain or loss on derecognition arose because the fair values of the components of the previously recognised asset (i.e., the interest in the asset derecognised and the interest retained by the entity) were different from the fair value of the previously recognised asset as a whole. In that situation, disclosure should be made of whether the fair value measurements included significant inputs that were not based on observable market data. [IFRS 7.B38].
- (b) Income and expenses recognised, both in the reporting period and cumulatively, from the entity's continuing involvement in the derecognised financial assets (e.g., fair value changes in derivative instruments)
And
- (c) If the total amount of proceeds from transfer activity (that qualifies for derecognition) in a reporting period is not evenly distributed throughout the reporting period (e.g., if a substantial proportion of the total amount of transfer activity takes place in the closing days of a reporting period):
 - (i) When the greatest transfer activity took place within that reporting period (e.g., the last five days before the end of the reporting period)
 - (ii) The amount (e.g., related gains or losses) recognised from transfer activity in that part of the reporting period
And
 - (iii) The total amount of proceeds from transfer activity in that part of the reporting period

This information should be provided for each period for which a statement of comprehensive income is presented. [IFRS 7.42G].

Paragraph 42E(c) of IFRS 7 requires disclosure of the amount that best represents the entity's maximum exposure to loss from its continuing involvement in the derecognised financial assets, together with information showing how the maximum exposure to loss is determined as discussed in (c) above. [IFRS 7.42E(c)]. This has led some to question whether an entity can consider its maximum exposure to loss of a written credit derivative to be equal to its gross carrying amount by analogy to IFRS 7.B9 discussed in section 5.3.3 above. The accounting approach to be applied is shown using the Illustration below.

Illustration 6-6: Maximum exposure to loss - written CDSs

An entity transfers a pool of readily obtainable long-term prepayable mortgage-backed securities with significant prepayment risk to a third party. Concurrently, the entity writes a credit default swap referenced to the derecognised assets for the benefit of the transferee. The transfer qualifies for full derecognition on the basis that the entity has not retained substantially all the risks and rewards (i.e., the entity retained credit risk but transferred prepayment risk) and has surrendered control over the transferred assets.

At the end of the current reporting period, the credit derivative has a positive fair value from the perspective of the entity (as the net present value of future premiums is greater than the fair values of the possible credit losses).

The entity cannot consider the maximum exposure to credit loss from the written credit derivative to be equal to the gross carrying amount because, whilst the credit derivative has a positive value at the end of the current period, its value could switch to a significant negative exposure in future. Therefore, in order to meet the disclosure requirement, an entity should disclose the notional amount. Furthermore, the entity needs to disclose, among other things, the events that would trigger the payment under the credit derivative to satisfy the supplemental qualitative information that explain and support the quantitative disclosures, as required by IFRS 7.42E(f).²¹

²¹ See also IFRS 7.B37 and IFRS 7.BC65L.

7 Presentation on the face of the financial statements and related disclosures

Although it requires certain minimum disclosures, IFRS 7 provides little guidance as to where financial instruments and related gains and losses should be presented on the face of the financial statements nor how such items should be disaggregated. Furthermore, the disclosures required need not always reflect how items are presented on the face of the statements. Therefore, for the time being at least, management must use its judgement in deciding how best to present much of the information relating to financial instruments, taking account of the minimum requirements of IFRS 7 and other related standards such as IAS 1.

7.1 Gains and losses recognised in profit or loss

7.1.1 Presentation on the face of the statement of comprehensive income (or income statement)

The effects of an entity's various activities, transactions and other events (including those relating to financial instruments) differ in frequency, potential for gain or loss and predictability. Accordingly, IAS 1 explains, disclosing the components of financial performance assists in providing an understanding of the financial performance achieved and in making projections of future results. [IAS 1.86].

IAS 1, or, when applied, IFRS 18, prescribes requirements for line items to be included on the face of the statement of comprehensive income (or income statement) which include:

- Revenue, presenting separately interest revenue calculated using the effective interest method [IAS 1.82(a), IFRS 18.75(a)(i)]

The IFRS IC clarified in March 2018 that only interest on financial assets measured at amortised cost or on debt instruments measured at fair value through other comprehensive income should be included in the amount of interest revenue presented separately (subject to the effects of qualifying hedging relationships under IFRS 9 which are discussed in section 4.2.2). In particular, it should not include, for example, interest revenue from financial assets measured at fair value through profit or loss.²²

In March 2019, the IFRS IC issued an agenda decision addressing the measurement of revenue arising from the physical settlement of a contract to sell a non-financial asset when that contract is in the scope of IFRS 9 and accounted for at fair value through profit or loss. The IFRS IC concluded that any such revenue should be measured at an amount reflecting the cash price received adjusted by the fair value of the contract at the settlement date - this should equal, or at least approximate, the fair value of the non-financial item delivered at the date of delivery.²³ This is illustrated in Illustration 7-1 below.

- Gains and losses arising from the derecognition of financial assets measured at amortised cost [IAS 1.82(aa), IFRS 18.75(b)(iii)]

In order to determine the amount of this gain or loss, the carrying amount of the financial asset should, in principle, be updated to the date of derecognition. It should, therefore, include a revised estimate of expected credit losses determined as at the date of derecognition. However, as noted in section 3.2 above, considerations of materiality would also need to be taken into account.²⁴

There is no equivalent requirement to present separately gains and losses arising from derecognition of debt instruments measured at fair value through other comprehensive income. However, the amount of such gains and losses should be determined in the same way as for financial assets measured at amortised cost, i.e., by updating expected credit losses to the date of derecognition. [IFRS 9.5.7.11].

- Impairment losses (including reversals of impairment losses or impairment gains) determined in accordance with IFRS 9 [IAS 1.82(ba), IFRS 18.75(b)(ii)]

This will include losses in respect of loan commitments and financial guarantee contracts as well as financial assets.

²² [IFRIC Update](#), March 2018, available on the IFRS Foundation's website.

²³ [IFRIC Update](#), March 2019, available on the IFRS Foundation's website.

²⁴ Transition Resource Group for Impairment of Financial Instruments, [Meeting Summary](#): 22 April 2015, IASB, paragraphs 24 and 25. Available on the IFRS Foundation's website.

Some might argue this line item should also include modification gains or losses, particularly if the reason for the modification was credit related. However, a summary of the April 2015 meeting of the Transition Resource Group for Impairment of Financial Instruments, published on the IASB's website, suggests this would not be appropriate. Instead, it says that if disclosing gains and losses from impairments and modifications on a net basis would provide relevant information (for example, if the reason for the modification was credit-related), this could be dealt with through additional disclosure in the notes.²⁵

The summary also says that modification gains and losses should be presented separately if considered appropriate.²⁶ Consequently, another way in which a net figure could be presented on the face of the income statement involves presenting modification gains and losses (or at least those arising from credit-related events) in a separate line item that is adjacent to the one showing impairment losses and gains, together with a subtotal that includes these two amounts.

Another view is that because modification gains and losses are determined consistently with the effective interest method, they could be presented as a component of interest revenue. However, if the amounts included were material, we would expect separate disclosure of the amounts involved.

It was further noted that the impact of a partial write-off would reduce the gross carrying value of the financial asset and, therefore, would change the calculation of the modification gain or loss. For an example of accounting for a partial write-off see Chapter 47.

- Where a financial asset previously measured at amortised cost is reclassified so that it is measured at fair value through profit or loss, any gain or loss arising from a difference between the previous carrying amount and its fair value at the reclassification date [*IAS 1.82(ca), IFRS 18.75(b)(iv)*]
 - Where a financial asset previously classified at fair value through other comprehensive income is reclassified as measured at fair value through profit or loss, any cumulative gain or loss previously recognised in other comprehensive income that is reclassified to profit or loss [*IAS 1.82(cb), IFRS 18.75(b)(v)*]
- And

- Finance costs [*IAS 1.82(b)*]²⁷

The implementation guidance to IFRS 7 explains that this caption includes total interest expense (see section 4.2.2 above) but may also include amounts associated with non-financial liabilities, for example the unwinding of the discount on long-term provisions (see Chapter 27). [*IFRS 7.IG13*].

The IFRS IC concluded that it is not permissible to present a line item 'net finance costs' (or a similar term) on the face of the statement without showing the finance costs and finance revenue composing it. However, the presentation of finance revenue followed immediately by finance costs and a subtotal, e.g., 'net finance costs', is allowed.²⁸

The demand for safe investments can sometimes result in a negative yield on very high-quality financial assets (e.g., certain government bonds or reserve bank deposits). The IFRS IC has considered this phenomenon and, in January 2015, noted that interest resulting from a negative effective interest rate on a financial asset does not meet the definition of interest revenue because it reflects a gross outflow, not a gross inflow, of economic benefits. Consequently, such expenses should not be presented as interest revenue, but in an appropriate expense classification.²⁹ This might be a separate line item titled, for example, 'financial expenses on liquid short-term assets' or 'other financial expenses' or using another appropriate description. Alternatively, it could be appropriate to include within another expense line, for example, 'other expenses'.

How we see it

In our view, negative interest expense on financial liabilities measured at amortised cost meets the definition of income. Where it arises in the ordinary course of business, it would be presented as interest revenue calculated using the effective interest method. If it does not arise in the course of an entity's ordinary activities, it should be presented in another income line item.

25 Transition Resource Group for Impairment of Financial Instruments, [Meeting Summary](#): 22 April 2015, IASB, paragraph 57(a). Available on the IFRS Foundation's website.

26 Transition Resource Group for Impairment of Financial Instruments, [Meeting Summary](#): 22 April 2015, IASB, paragraph 57(a). Available on the IFRS Foundation's website.

27 IFRS 18 which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. On adoption of IFRS 18 these aspects of IAS 1 are replaced by more specific requirements in paragraphs 59 to 66 of IFRS 18. See Chapter 4 for further details on the requirements of IFRS 18.

29 [IFRIC Update](#), January 2015, available on the IFRS Foundation's website.

Illustration 7-1: Physical settlement of sales contract that is accounted for as a derivative financial instrument

On 1 December 20X1, Entity A enters into a contract to sell a commodity for a fixed price of CU100 on 5 January 20X2. The contract is not considered to be for the entity's normal sale requirements and is therefore accounted for as a derivative in accordance with IFRS 9. At inception, the contract is at the money and its fair value is nil.

Entity A's reporting period ends on 31 December 20X1. On that date, the forward price of the commodity has decreased and, as a result, the fair value of the contract has increased by CU10. Entity A presents gains and losses on commodity contracts accounted for as derivatives within other operating income/expense. Therefore, the following journal is recorded for the year ended 31 December 20X1:

Dr	Derivative asset	CU10	
	Cr	Other operating income/expense	CU10

On 5 January 20X2, Entity A settles the contract by delivering the commodity and receiving CU100 in cash. The fair value of the contract has not changed between 31 December 20X1 and 5 January 20X2 and Entity A presents revenue on delivery of the commodity. The carrying value of the commodity delivered, measured at the lower of cost and net realisable value, is CU85. Therefore, Entity A records the following to reflect the settlement:

Dr	Cash	CU100	
	Cr	Derivative asset	CU10
	Cr	Revenue	CU90
Dr	Cost of sales	CU85	
	Cr	Inventory	CU85

Prior to the IFRS IC finalising the agenda decision in March 2019, referred to above, many entities measured revenue recognised in these circumstances at the cash price receivable (CU100 in this Illustration). They would also have reversed the previously recognised gains or losses on the commodity contract, typically in the line item in which those gains or losses were originally recognised (resulting in other operating expenses of CU10 in this Illustration).

The IFRS IC did not address whether this revenue is within the scope of IFRS 15 *Revenue from Contracts with Customers* and hence whether it should be included in the disclosures required by that standard. In practice, many entities do consider this revenue to be within the scope of IFRS 15 and consequently their financial statements do not necessarily distinguish it from other revenue from contracts with customers that is clearly within scope of IFRS 15.

Another matter the agenda decision does not address is when, or in what circumstances, revenue should be recognised when an entity settles such a sales contract by physical delivery. Some entities do not (or do not in all circumstances) recognise revenue but instead present the settlement of the contract on a net basis. If, in this Illustration, Entity A followed such an approach it would not present revenue of CU90 and cost of sales of CU85, but instead show a net gain on settlement of CU5. In practice, many entities (or components of an entity) that do not present revenue on physical settlement of such contracts are broker-traders that measure their inventory at fair value less costs to sell in accordance with IAS 2 *Inventories* in which case there should be no net gain or loss on settlement.

Additional line items, headings and subtotals should be presented on the face of the statement of comprehensive income (or income statement) when such presentation is relevant to an understanding of the elements of an entity's financial performance. Factors that should be considered include materiality and the nature and function of the components of income and expenses. For example, a financial institution may amend the descriptions to provide information that is relevant to the operations of a financial institution. [IAS 1.85, IAS 1.86]. This may also be relevant where an entity recognises negative interest on financial assets or financial liabilities.³⁰

Any additional subtotals presented should: [IAS 1.85A, IFRS 18.24]

- Comprise line items made up of amounts recognised and measured in accordance with IFRS
 - Be presented and labelled in a manner that makes the line items that constitute the subtotal clear and understandable
 - Be consistent from period to period, as required by IAS 1 (see Chapter 3)
- And
- Not be displayed with more prominence than the subtotals and totals required in IFRS for the statement(s) presenting profit or loss and other comprehensive income

30 [IFRIC Update](#), January 2015, available on the IFRS Foundation's website.

The following items should also be disclosed on the face of the statement of comprehensive income (or income statement) as allocations of profit or loss for the period: [IAS 1.81B(a), IFRS 18.76]

- Profit or loss attributable to non-controlling interests
- And
- Profit or loss attributable to owners of the parent

7.1.2 Further analysis of gains and losses recognised in profit or loss

As noted in section 4.2.2 above, entities are required to disclose total interest income and total interest expense, calculated using the effective interest method, for financial assets and financial liabilities that are not measured at fair value through profit or loss. Whilst leases are included within the scope of IFRS 7, strictly they are not accounted for using the effective interest method (although for many leases the method prescribed in IFRS 16 results in a very similar treatment). Accordingly, where material, it appears that finance income (charges) arising on leases must be disclosed separately from the interest income (expense) disclosed above. In fact, it will sometimes be appropriate to include such items within the same caption on the face of the statement of comprehensive income (or income statement) and include a sub-analysis in the notes, albeit having regard to the restrictions on what may be presented within the separate line item containing interest revenue calculated using the effective interest method - see section 7.1.1 above.

Dividends classified as an expense (for example, those payable to holders of redeemable preference shares) may be presented either with interest on other liabilities or as a separate item. Such items are subject to the requirements of IAS 1. In some circumstances, because of the differences between interest and dividends with respect to matters such as tax deductibility, it is desirable to disclose them separately in the statement of comprehensive income (or income statement). [IAS 32.40].

The following gains and losses reported in profit or loss should also be disclosed:

- The amount of dividends recognised from equity investments designated at fair value through other comprehensive income, showing separately the amounts arising on investments derecognised during the reporting period and those related to investments held at the end of the reporting period [IFRS 7.11A(d)]
- Changes in fair value that relate to instruments measured at fair value through profit or loss (see section 4.2.1 above)

Little guidance is given on disaggregating gains and losses from instruments classified as at fair value through profit or loss. For example, the components of the change in fair value of a debt instrument can include:

- Interest accruals
- Foreign currency retranslation
- Movements arising from changes in the issuer's credit risk
- And
- Changes in market interest rates

An entity is neither required to disaggregate, nor prohibited from disaggregating, these components on the face of the statement of comprehensive income (or income statement) provided the minimum disclosure requirements are met (e.g., see section 4.2 above) and the restrictions on what may be presented within the separate line item containing interest revenue calculated using the effective interest method are followed (see section 7.1.1 above).

How we see it

Given the above, in our view the interest accrual component, say, of a financial liability may be included separately within an interest expense caption or it may be included within the same caption as other components of the gain or loss such as dealing profit. As noted in section 4.1 above, whatever the entity's approach, it must be explained in its accounting policies.

And

- The amount of exchange differences recognised in profit or loss under IAS 21 except for those arising on financial instruments measured at fair value through profit or loss [IAS 21.52(a)]

In IAS 1 or, when applied, IFRS 18, it is explained that when items of income and expense are material, their nature and amount are required to be disclosed separately. [IAS 1.97, IFRS 18.42]. Circumstances that can give rise to separate disclosure include the disposal of investments [IAS 1.98(d)] and the early settlement of liabilities. However, gains and losses must not be reported as extraordinary items, either on the face of the statement of comprehensive income (or income statement) or in the notes. [IAS 1.87].

7.1.3 Offsetting and hedges

IAS 1 or, when applied, IFRS 18, explains that income and expenses must not be offset unless required or permitted by another standard. [IAS 1.32, IFRS 18.44]. This is because offsetting detracts from the ability of users to understand fully the transactions, other events and conditions that have occurred and to assess the entity's future cash flows (except where it reflects the substance of the transaction or other event). [IAS 1.33, IFRS 18.45]. It goes on to explain that gains and losses on the disposal of non-current investments (such as many debt instruments measured at fair value through other comprehensive income) are reported by deducting the carrying amount of the asset and related selling expenses from the proceeds on disposal rather than showing gross proceeds as revenue. [IAS 1.34, IFRS 18.B27]. In the case of debt instruments measured at fair value through other comprehensive income, the profit or loss on disposal will also include any gains and losses that are reclassified from equity. It also explains that gains and losses arising from groups of similar transactions should be reported on a net basis, for example gains and losses arising on financial instruments held for trading or foreign exchange differences. The individual transactions should, however, be reported separately if they are material. [IAS 1.35, IFRS 18.B28].

Whilst IAS 32 prescribes when financial assets and liabilities should be offset in the statement of financial position (see section 7.4.1 below), it contains no guidance on when related income and expenses should be offset. However, IFRS 9 is more prescriptive, specifying the following:

- If a group of hedged items in a cash flow hedge contains no offsetting risk positions and will affect different line items in profit or loss, the gains or losses on the hedging instrument should be apportioned to the line items affected by the hedged items when reclassified to profit or loss.

This might be the case, for example, if a group of foreign currency expense transactions are hedged for foreign currency risk and those expenses will affect, say, both distribution costs and administrative expenses.

The basis of apportionment between line items should be systematic and rational and not result in the grossing up of net gains or losses arising from a single hedging instrument. [IFRS 9.B6.6.13, IFRS 9.B6.6.14].

- If a group of hedged items contains offsetting risk positions, i.e., a net position is hedged and the hedged risk affects different line items in profit or loss, the gains or losses on the hedging instrument should be presented in a line separate from those affected by the hedged items. Consequently, the line item relating to the hedged item will remain unaffected by the hedge accounting. [IFRS 9.6.6.4, IFRS 9.B6.6.13].

This would apply, for example, to a cash flow hedge of a group of foreign currency denominated sales and expenses. The hedging gains or losses would be presented in a line item that is separate from both revenue and the relevant expense line item(s). [IFRS 9.B6.6.15].

Another example would be a fair value hedge of a net position involving a fixed-rate asset and a fixed-rate liability. Hedge accounting would normally involve recognising the net interest accrual on the interest rate swap in profit or loss. In this case, the net interest accrual should be presented in a line item separate from gross interest revenue and gross interest expense.

This is to avoid the grossing up of net gains or losses on a single instrument into offsetting gross amounts and recognising them in different line items. [IFRS 9.B6.6.16].

These requirements imply that gains and losses from hedging instruments in other hedging relationships would be presented in the same line item that is affected by the hedged item (at least to the extent the hedge is effective) rather than being shown separately, although this is not explicitly stated in IFRS 9.

7.1.4 Embedded derivatives

IFRS 9 explicitly states that it does not address whether embedded derivatives should be presented separately in the statement of financial position. [IFRS 9.4.3.4]. However, the standard is silent about the presentation in profit or loss. In practice, it will depend on the nature of both the hybrid and the host whether related gains and losses are included in the same or separate captions within profit or loss.

For example, a borrowing with commodity-linked coupons that is accounted for as a simple debt host and an embedded commodity derivative might give rise to interest expense and other finance income (or expense), respectively, that would often be reported in separate captions within profit or loss. Alternatively, changes in the fair value of an embedded prepayment option in a host borrowing that is accounted for separately may be included in the same caption within profit or loss as interest expense on the host debt instrument if the value of the option varies largely as a result of change in interest rates.

7.1.5 Entities whose share capital is not equity

Gains and losses related to changes in the carrying amount of a financial liability are recognised as income or expense in profit or loss even when they relate to an instrument that includes a right to the residual interest in the assets of the entity in exchange for cash or another financial asset, such as shares in mutual funds and co-operatives (see Chapter 43). Any gain or loss arising from the remeasurement of such an instrument (including the impact of dividends paid, where appropriate) must be presented separately on the face of the statement of comprehensive income (or income statement) when it is relevant in explaining the entity's performance. [IAS 32.41].

The following Illustration shows a format for a statement of comprehensive income (or income statement) that may be used by entities such as mutual funds that do not have equity as defined in IAS 32, although other formats may be acceptable.

Illustration 7-2: Statement of comprehensive income (or income statement) format for a mutual fund

Statement of comprehensive income (income statement) for the year ended 31 December 20X1 [IAS 32.IE32]

	20X1	20X0
	CU	CU
Revenue	2,956	1,718
Expenses (classified by nature or function)	(644)	(614)
Profit from operating activities	2,312	1,104
Finance costs		
- other finance costs	(47)	(47)
- distributions to members	(50)	(50)
Change in net assets attributable to unit holders	2,215	1,007

Although it may not be immediately clear, the final line item in this format is an expense. Therefore, the entity's 'profit or loss' (as that term is used in IAS 1 for 20X1 is CU2,312 - CU47 - CU50 - CU2,215 = CUnil.

The next Illustration shows a format for a statement of comprehensive income (or income statement) that may be used by entities whose share capital is not equity as defined in IAS 32 because the entity has an obligation to repay the share capital on demand, for example co-operatives, but which do have some equity (such as other reserves). Again, other formats may be acceptable.

Illustration 7-3: Statement of comprehensive income (or income statement) format for a co-operative

Statement of comprehensive income (income statement) for the year ended 31 December 20X1 [IAS 32.IE33]

	20X1	20X0
	CU	CU
Revenue	472	498
Expenses (classified by nature or function)	(367)	(396)
Profit from operating activities	105	102
Finance costs		
- other finance costs	(4)	(4)
- distributions to members	(50)	(50)
Change in net assets attributable to members	51	48

In this Illustration, the line item 'Finance costs - distributions to members' is an expense and the final line item appears to be equivalent to 'profit or loss'.

Corresponding statement of financial position formats for both Illustrations are shown in section 7.4.6 below.

7.2 Gains and losses recognised in other comprehensive income

IAS 1 or, when applied, IFRS 18, requires income and expense not recognised within profit or loss to be included in a statement of comprehensive income. [IAS 1.82A, IFRS 18.88-89]. Material items of income and expense and gains and losses that result from financial assets and financial liabilities which are included in other comprehensive income are required to be disclosed separately and must include at least the following:

- The amount of gain or loss attributable to changes in a liability's credit risk for those financial liabilities designated as at fair value through profit or loss [IFRS 7.20(a)(i)]
- The revaluation gain or loss arising on equity investments designated at fair value through other comprehensive income [IFRS 7.20(a)(vii)]
- And
- Revaluation gains or losses arising on debt instruments measured at fair value through other comprehensive income, showing separately: [IFRS 7.20(a)(viii)]
 - The amount of gain or loss recognised in other comprehensive income during the period
 - And
 - The amount reclassified upon derecognition from accumulated other comprehensive income to profit or loss for the period

The application of hedge accounting can also result in the recognition in other comprehensive income of gains and losses arising on hedging instruments and the reclassification thereof. However, when an entity removes such a gain or loss that was recognised in other comprehensive income and includes it in the initial cost or other carrying amount of a non-financial asset or liability, that should not be regarded as a reclassification adjustment and hence should not affect, or be included within, other comprehensive income. [IAS 1.96, IFRS 9.BC6.380]. The following items must also be disclosed on the face of the statement of comprehensive income as allocations of total comprehensive income for the period: [IAS 1.81B(b), IFRS 18.87]

- Total comprehensive income attributable to non-controlling interests
- And
- Total comprehensive income attributable to owners of the parent

7.3 Statement of changes in equity

The following information must be included in the statement of changes in equity: [IAS 1.106(a), IFRS 18.107(a)]

- Total comprehensive income for the period, showing separately the total amounts attributable to owners of the parent and to non-controlling interests
- And
- For each component of equity, a reconciliation between the carrying amount at the beginning and the end of the period, separately disclosing changes resulting from:
 - Profit or loss
 - Other comprehensive income
 - And
 - Transactions with owners acting in their capacity as owners, showing separately:
 - Contributions by and distributions to owners
 - And
 - Changes in ownership interests in subsidiaries that do not result in a loss of control

An analysis of other comprehensive income by item must be presented for each component of equity, either in the statement or in the notes. [IAS 1.106A, IFRS 18.109].

Where hedge accounting is applied, IFRS 7 specifies additional information that must be presented within the reconciliation and analysis noted above or the notes thereto. This is covered in more detail in section 4.3.3 above.

As noted in section 7.2 above, when an entity applying IFRS 9 removes a gain or loss on a cash flow hedge that was recognised in other comprehensive income in order to include it in the initial cost or other carrying amount of a non-financial asset or liability, that adjustment must not be included within other comprehensive income. [IFRS 9.BC6.380]. Such an entry must instead be presented within the statement of changes of equity (because it affects an entity's net assets and hence its equity), albeit separately from other comprehensive income.

The amount of dividends recognised as distributions to owners during the period must be disclosed on the face of the statement of changes in equity or in the notes. [IAS 1.107, IFRS 18.110].

In addition, IAS 32 notes that IAS 1 requires the amount of transaction costs accounted for as a deduction from equity in the period to be disclosed separately.³¹ [IAS 32.39].

If an entity reacquires its own equity instruments from related parties, disclosure must be provided in accordance with IAS 24 (see Chapter 33). [IAS 32.34].

If an entity, such as a mutual fund or a co-operative, has no issued equity instruments, it may still need to present a statement of changes in equity. For example, such an entity may have gains or losses arising on debt instruments measured at fair value through other comprehensive income that are recognised in equity; also, co-operatives, for example, may have a balance on equity.

7.4 Statement of financial position

7.4.1 Offsetting financial assets and financial liabilities

It is common for reporting entities to enter into offsetting arrangements with their counterparties. Offsetting arrangements allow market participants to manage counterparty credit risks and manage liquidity risk. In particular, netting arrangements generally reduce the credit risk exposures of market participants to counterparties relative to their gross exposures. Such mechanisms also permit the management of existing market risk exposures by taking on offsetting contracts with the same counterparty rather than assuming additional counterparty risk by entering into an offsetting position with a new counterparty. Furthermore, for a regulated financial institution, position netting may also have regulatory capital implications.

IAS 1 or, when applied, IFRS 18, sets out a general principle that assets and liabilities must not be offset except where such offset is permitted or required by an accounting standard or interpretation (see Chapter 3). [IAS 1.32, IFRS 18.44]. This general prohibition on offset is due to the fact that net presentation of assets and liabilities generally does not provide a complete depiction of the assets and liabilities of an entity. In particular, offsetting obscures the existence of some assets and liabilities in the statement of financial position and it impacts key financial ratios such as gearing, and measures such as total assets or liabilities.

IAS 32 provides some exceptions to this general rule in the case of financial assets and liabilities. IAS 32 requires a financial asset and a financial liability to be offset if both criteria under IAS 32 paragraph 42 are met.

Extract from IAS 32

Offsetting a financial asset and a financial liability (see also paragraphs AG38A-AG38F and AG39)

- 42 A financial asset and a financial liability shall be offset and the net amount presented in the statement of financial position when, and only when, an entity:
- (a) currently has a legally enforceable right to set off the recognised amounts; and
 - (b) intends either to settle on a net basis, or to realise the asset and settle the liability simultaneously.

...

These two conditions are often called the IAS 32 Offsetting Criteria. There is, however, one exception to the offsetting requirement. This exception arises when a transferred financial asset does not qualify for derecognition. In such a circumstance, the transferred asset and the associated liability must not be offset, [IAS 32.42], even if they otherwise satisfy the offsetting criteria (see Chapter 48).

IAS 32 argues that offset is appropriate in the circumstances set out in (a) and (b) above because the entity has, in effect, a right to, or an obligation for, only a single net future cash flow and, hence, a single net financial asset or financial liability. In other circumstances, financial assets and financial liabilities are presented separately from each other, consistently with their characteristics as resources or obligations of the entity. [IAS 32.43]. Furthermore, the amount resulting from offsetting must also reflect the reporting entity's expected future cash flows from settling two or more separate financial instruments. [IAS 32.BC94].

31 IFRS 18 which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. These aspects of IAS 1 are required to be disclosed in line with IFRS 18 and the cross-reference in IAS 32.39 is amended accordingly.

Offset is not equivalent to derecognition, since offsetting does not result in the financial asset or the financial liability being removed from the statement of financial position, but in net presentation of a net financial asset or a net financial liability. Moreover, no gain or loss can ever arise on offset, but may arise on derecognition. [IAS 32.44].

IAS 32 acknowledges that an enforceable right to set off a financial asset and a financial liability affects the rights and obligations associated with that asset and liability and may affect an entity's exposure to credit and liquidity risk. However, such a right is not, in itself, a sufficient basis for offsetting. The entity may still realise the asset and settle the liability separately and, in the absence of an intention to exercise the right or to settle simultaneously, the amount and timing of an entity's future cash flows are not affected. Similarly, an intention by one or both parties to settle on a net basis without the legal right to do so is not sufficient to justify offsetting because the rights and obligations associated with the individual financial asset and financial liability remain unaltered. [IAS 32.46, IAS 32.AG38E].

IAS 32 elaborates further on the detail of the offsetting criteria as set out in the following subsections.

7.4.1.A Criterion (a): Enforceable legal right of set-off

IAS 32 describes a right of set-off as a debtor's legal right, by contract or otherwise (for example, it may arise as a result of a provision in law or a regulation), to settle or otherwise eliminate all or a portion of an amount due to a creditor by applying against that amount an amount due from the creditor. The enforceability of the right of set-off is thus essentially a legal matter, so that the specific conditions supporting the right may vary from one legal jurisdiction to another. [IAS 32.45]. Care must, therefore, be taken to establish which laws apply to the relationships between the parties.

In unusual circumstances, a debtor (A) may have a legal right to apply an amount due from a third party (B) against an amount due to a creditor (C), provided that there is an agreement among A, B and C that clearly establishes A's right to set off amounts due from B against those due to C. [IAS 32.45]. For example, a foreign branch of a US bank makes a loan to a foreign subsidiary of a US parent with the parent required to deposit an amount equal to the loan in the US bank for the same term. The terms of the transactions may give the bank a legal right to set off the amount due to the parent against the amount owed by the foreign subsidiary. Another example is bank accounts maintained for a group of companies where each member of the group agrees that its credit balance may be the subject of set-off in respect of debit balances of other members of the group. In our experience, not all jurisdictions recognise this type of contractual multilateral set-off arrangement, particularly in bankruptcy scenarios.

A right of set-off may currently be available or it may be contingent on a future event (e.g., the right may be triggered or exercisable only on the occurrence of some future event, such as the default, insolvency or bankruptcy of one of the counterparties). Even if the right of set-off is not contingent on a future event, it may only be legally enforceable in the normal course of business, or in the event of default, or in the event of insolvency or bankruptcy, of one or all of the counterparties. [IAS 32.AG38A].

The revised application guidance makes it clear that, in order for an entity to currently have a legally enforceable right of set-off, the right: [IAS 32.AG38B]

- Must not be contingent on a future event
- And
- Must be legally enforceable in all of the following circumstances:
 - The normal course of business
 - The event of default
 - And
 - The event of insolvency or bankruptcy
- of the entity and all of the counterparties

The nature and extent of the right of set-off, including any conditions attached to its exercise and whether it would remain in the event of default or insolvency or bankruptcy, may vary from one legal jurisdiction to another. Consequently, it cannot be assumed that the right of set-off is automatically available outside of the normal course of business. For example, the bankruptcy or insolvency laws of a jurisdiction may prohibit, or restrict, the right of set-off in the event of bankruptcy or insolvency in some circumstances. [IAS 32.AG38C]. Therefore, contractual provisions, the laws governing the contract, or the default, insolvency or bankruptcy laws applicable to the parties need to be considered to ascertain whether the right of set-off is enforceable in the circumstances set out above. [IAS 32.AG38D]. In assessing whether an agreement meets these conditions, entities will need to make a legal determination, which may involve obtaining legal advice.

The Basis for Conclusions suggests that to meet the criteria for offsetting, these rights must exist for all counterparties. Thus, if one party, including the reporting entity, will not or cannot perform under the contract, the other counterparties will be able to enforce that right to set-off against the party that has defaulted or become insolvent or bankrupt. [IAS 32.BC80]. However, the revised application guidance above appears to focus only on whether the rights of the reporting entity are legally enforceable. It is also clear that the above reference to 'all of the counterparties' pertains to the legal enforceability in the circumstances listed (i.e., the normal course of business, the events of default, insolvency or bankruptcy), and not who holds the set-off right.

How we see it

Normally the standard and its application guidance would prevail over the basis for conclusions, and we consider that the IASB's most likely intention, consistent with the wording in the body and application guidance of the standard, was to require only the reporting entity to have a legal right to set off in the circumstances noted above - including, in the event of the reporting entity's own default, insolvency or bankruptcy.

The requirement that a reporting entity must be able to legally enforce a right of set-off in the event of its own bankruptcy means that the counterparty (or counterparties) to a netting agreement must not have the ability to force gross settlement in the event of the reporting entity's default, insolvency or bankruptcy. It also means that the reporting entity may need to obtain legal advice as to whether its legal right to net settle will survive the bankruptcy laws of the jurisdiction in which it is located.

Many contracts give only the non-defaulting party the right to enforce the netting provisions in case of default, insolvency or bankruptcy of any of the parties to the agreement. Unless the insolvency laws in the relevant jurisdiction would force net settlement, such contracts would fail the IAS 32 criteria because the reporting entity cannot enforce such rights of set-off in the event of its own bankruptcy, regardless of the fact that, in practice, it is highly unlikely that the non-defaulting party would insist on gross settlement. In practice, most of these contracts would not achieve offsetting under IAS 32 anyway, because the legal right of set-off available under such contracts is usually not enforceable in the normal course of business. Generally speaking, these contracts are structured this way because entities do not intend to settle net other than in situations of default. In other circumstances, entities need to determine whether the right to enforce net settlement would survive their own bankruptcy.

A right of set-off that can be exercised only upon the occurrence of a future event is often referred to as a 'conditional' right of set-off. For example, an entity may have a right of set-off that is exercisable on changes to particular legislation or change in control of the counterparties. Conditional rights of set-off such as these do not meet the offsetting criteria and, hence, the financial asset and financial liability subject to such rights of set-off would not qualify to be offset.

As the description of a right of set-off itself envisages an amount being due to each party either now or in the future, the passage of time and uncertainties relating to amounts to be paid do not preclude an entity from currently having a legally enforceable right of set-off. The fact that payments subject to a right of set-off will only arise at a future date is not in itself a condition or form of contingency that prevents offsetting.

[IAS 32.BC83].

However, if the right of set-off is not exercisable during a period when amounts are due and payable, then the entity does not meet the offsetting criterion as it has no right to set off those payments. Similarly, a right of set-off that could disappear or that would no longer be enforceable after a future event that could take place in the normal course of business or in the event of default, or in the event of insolvency or bankruptcy, such as a ratings downgrade, would not meet the currently (legally enforceable) criterion. [IAS 32.BC84].

Some contracts include representation clauses under which the right to set-off is automatically invalidated if any undertakings or representations in the contract turns out to be incorrect in a material respect.

How we see it

We believe such clauses, as mentioned above, would generally not render the right of set-off a conditional right of set-off.

In certain circumstances, an entity may, in order to exercise its right of set-off, need to unilaterally take a procedural action within its control. For example, an entity may be required to notify the counterparty, in the form of a letter in advance, in order to effect net settlement under the terms of the contract. In some cases, an entity may need to apply to a court to effect set-off when a counterparty becomes bankrupt (as a matter of process), although that right is assured and is upheld in the event of default of a counterparty in that jurisdiction.

How we see it

In our view, the mere fact that such actions, as mentioned above, are needed before an entity can exercise the right of set-off would not make the exercisability of that right contingent on a future event. However, in the latter example above, the probability of favourable or unfavourable judgement from the court would have to be assessed separately as part of the 'legal enforceability' requirement to conclude whether the right of set-off meets the offsetting criteria in IAS 32.

Unlike US GAAP, IAS 32 does not specify a particular level of assurance required to meet the 'legally enforceable' criterion. Instead, it leaves such determination to judgement and consideration of the relevant facts and circumstances. In practice, entities are expected, in their day-to-day business, to obtain reasonable assurance on enforceability of contractual rights as part of prudent risk management regardless of the accounting requirements.

7.4.1.B Master netting agreements

It is common practice for an entity that undertakes a number of financial instrument transactions with a single counterparty to enter into a 'master netting arrangement' with that counterparty. These arrangements are typically used by financial institutions to restrict their exposure to loss in the event of bankruptcy or other events that result in a counterparty being unable to meet its obligations. Such an agreement commonly creates a conditional right of set-off that becomes enforceable, and affects the realisation or settlement of individual financial assets and financial liabilities, only following a specified event of default or in other circumstances not expected to arise in the normal course of business. Entities who enter into such master netting agreements, other than not meeting the legal right of set-off requirement, also typically do not intend to settle net in the normal course of business.

Where an entity has entered into such an agreement, the agreement does not provide the basis for the offset of assets and liabilities unless both offsetting criteria are satisfied. [IAS 32.50]. For enforceable master netting arrangements that create a conditional right of set off, this will typically be the case only if the default (or other event specified in the contract) has actually occurred. When financial assets and financial liabilities subject to a master netting arrangement are not offset, the effect of the arrangement falls within the scope of the disclosure requirements of IFRS 7 (see section 7.4.2 below).

7.4.1.C Criterion (b): Intention to settle net or realise the gross amount simultaneously ('the net settlement criterion')

An entity's intention to settle net or settle simultaneously may be demonstrated through its past experience of executing set-off or simultaneous settlement in similar situations, its usual operating practices or by reference to its documented risk policies. Thus, incidental net or simultaneous settlement of a financial asset or financial liability does not meet the criterion above.

The requirement for an intention to settle net or to settle simultaneously is, however, considered only from the reporting entity's perspective.

IAS 32 notes that an entity's intentions with respect to settlement of particular assets and liabilities may be influenced by its normal business practices, the requirements of the financial markets and other circumstances that may limit the ability to settle net or simultaneously. [IAS 32.47]. In practice, even though a reporting entity has the right to settle net, it may settle gross either because of lack of appropriate arrangements or systems to effect net settlement or to facilitate operations, which would likely preclude offsetting.

Simultaneous settlement of two financial instruments may occur through, for example, the operation of a clearing house in an organised financial market or a face-to-face exchange. [IAS 32.48]. The procedures of the clearing house or exchange may provide that the amount to be paid or received for different products be settled gross. However, such payments may be made simultaneously. Hence, even though the parties may make payment or receive payment separately for different product types, settlement occurs at the same moment and there is exposure only to the net amount.

The standard states that the reference to 'simultaneous' settlement in the conditions for offset above is to be interpreted literally, as applying only to the realisation of a financial asset and settlement of a financial liability at the same moment. [IAS 32.48]. For example, the settlement of a financial asset and a financial liability at the same nominal time but in different time zones is not considered to be simultaneous.

Nevertheless, it became apparent to the IASB that there was diversity in practice related to the interpretation of 'simultaneous' settlement in IAS 32. In practice, due to processing constraints, settlement of gross amounts rarely occurs at exactly the same moment, even when using a clearing house or settlement system. Rather, actual settlement takes place over a period of time (e.g., clearing repos and reverse repos in batches during the day). Arguably, therefore, 'simultaneous' is not operational and ignores settlement systems that are established to achieve what is economically equivalent to net settlement. Consequently, IAS 32 has often been interpreted to mean that settlement through a clearing house does meet the simultaneous settlement criterion, even if not occurring at the same moment. The IASB agreed that some, but not all, settlement systems should be seen as equivalent to net settlement and, in order to reduce diversity of accounting treatment, introduced guidance into IAS 32 in December 2011 to clarify how criterion (b) should be assessed in these circumstances. [IAS 32.BC94-BC100].

The amendments explain that if an entity can settle amounts in a manner such that the outcome is, in effect, equivalent to net settlement, the entity will meet the net settlement criterion. This will occur if, and only if, the gross settlement mechanism has features that: (i) eliminate or result in insignificant credit and liquidity risk, and (ii) will process receivables and payables in a single settlement process or cycle. For example, a gross settlement system that has all of the following characteristics would meet the net settlement criterion:

[IAS 32.AG38F]

Extract from IAS 32

- AG38F If an entity can settle amounts in a manner such that the outcome is, in effect, equivalent to net settlement, the entity will meet the net settlement criterion in paragraph 42(b). This will occur if, and only if, the gross settlement mechanism has features that eliminate or result in insignificant credit and liquidity risk, and that will process receivables and payables in a single settlement process or cycle. For example, a gross settlement system that has all of the following characteristics would meet the net settlement criterion in paragraph 42(b):
- (a) financial assets and financial liabilities eligible for set-off are submitted at the same point in time for processing;
 - (b) once the financial assets and financial liabilities are submitted for processing, the parties are committed to fulfil the settlement obligation;
 - (c) there is no potential for the cash flows arising from the assets and liabilities to change once they have been submitted for processing (unless the processing fails-see (d) below);
 - (d) assets and liabilities that are collateralised with securities will be settled on a securities transfer or similar system (for example, delivery versus payment), so that if the transfer of securities fails, the processing of the related receivable or payable for which the securities are collateral will also fail (and *vice versa*);
 - (e) any transactions that fail, as outlined in (d), will be re-entered for processing until they are settled;
 - (f) settlement is carried out through the same settlement institution (for example, a settlement bank, a central bank or a central securities depository); and
 - (g) an intraday credit facility is in place that will provide sufficient overdraft amounts to enable the processing of payments at the settlement date for each of the parties, and it is virtually certain that the intraday credit facility will be honoured if called upon.

The IASB deliberately chose the language above so that it was clear that settlement systems established by clearing houses or other central counterparties should not automatically be assumed to meet the net settlement criterion. Conversely, irrespective of the names used in a particular jurisdiction, other settlement systems may meet the net settlement criterion if that system eliminates or results in insignificant credit and liquidity risk and processes receivables and payables in the same settlement process or cycle. [IAS 32.BC101].

7.4.1.D Situations where offset is not normally appropriate

An entity may enter into a number of different financial instruments designed to replicate, as a group, the features of a single financial instrument (such a replication is sometimes referred to as creating a 'synthetic instrument'). For example, if an entity issues floating rate debt and then enters into a 'pay fixed/receive floating' interest rate swap, the combined economic effect is that the entity has issued fixed rate debt.

IAS 32 argues that each of the individual financial instruments that together constitute a 'synthetic instrument':

- Represents a contractual right or obligation with its own terms and conditions
 - May be transferred or settled separately
- And
- Is exposed to risks that may differ from those to which the other financial instruments in the 'synthetic instrument' are exposed

Accordingly, when one financial instrument in a 'synthetic instrument' is an asset and another is a liability, they are not offset and presented on an entity's statement of financial position on a net basis unless they meet the offsetting criteria. [IAS 32.49(a), IAS 32.AG39].

Other circumstances where the offsetting criteria are generally not met, and therefore offsetting is usually inappropriate, include: [IAS 32.49(b), IAS 32.49(c), IAS 32.49(d), IAS 32.49(e)]

- (a) Financial assets and financial liabilities which arise from financial instruments having the same primary risk exposure (e.g., assets and liabilities within a portfolio of forward contracts or other derivative instruments) but involving different counterparties
- (b) Financial or other assets that are pledged as collateral for non-recourse financial liabilities (see section 7.4.1.F below)
- (c) Financial assets which are set aside in trust by a debtor for the purpose of discharging an obligation without those assets having been accepted by the creditor in settlement of the obligation (e.g., a sinking fund arrangement)

Or

- (d) Obligations incurred as a result of events giving rise to losses that are expected to be recovered from a third party by virtue of a claim made under an insurance policy

Derivative assets and liabilities that are not transacted through central clearing systems are very unlikely to qualify for offsetting. For example, it is rare that they will be settled net in the normal course of business and even where associated offsetting agreements exist, they are usually conditional on the default of one of the counterparties.

7.4.1.E Cash pooling arrangements

Groups often use what are commonly known as cash pooling arrangements. Typically, these will involve a number of subsidiaries within a group each having a legally separate bank account with the same bank that may have positive or negative (overdrawn) balances. In many respects, these accounts will be managed on an aggregated basis, for example interest will normally be determined on a notional basis using the net balance of all accounts; similarly, any overdraft limit will normally apply to the net balance.

These arrangements may or may not give the group a legally enforceable right to set off the balances in these accounts. Clearly, if there is no such right the balances must not be offset in the group financial statements. However, where such a right exists and meets criterion (a) (see section 7.4.1.A), the entity should assess whether there is an intention to settle the balances net or simultaneously, i.e., to what extent criterion (b) is met (see section 7.4.1.C).

The IFRS IC considered criterion (b) for a particular cash pooling arrangement where:

- The group instigated regular physical transfers of balances into a single netting account
 - Such transfers were not required under the terms of the cash-pooling arrangement and were not performed at the reporting date
- And
- At the reporting date, the group expected that its subsidiaries would use their bank accounts before the next net settlement date by placing further cash on deposit or by withdrawing cash to settle other obligations

The IFRS IC observed that the group expects cash movements to take place on individual bank accounts before the next net settlement date because the group expects its subsidiaries to use those bank accounts in their normal course of business. Consequently, to the extent the group did not expect to settle its subsidiaries' period-end account balances on a net basis, it would not be appropriate for the group to assert it had the intention to settle the entire period-end balances on a net basis at the reporting date. Therefore, presenting these balances net would not appropriately reflect the amounts and timings of the expected future cash flows, taking into account the entity's normal business practices.

In other cash-pooling arrangements, a group's expectations regarding how subsidiaries will use their bank accounts before the next net settlement date may be different. Consequently, in those circumstances, the group would be required to apply judgement in determining whether there was an intention to settle on a net basis at the reporting date. The IFRS IC also noted that many different cash pooling arrangements exist in practice and the determination of what constitutes an intention to settle on a net basis would depend on the individual facts and circumstances of each case. The related disclosure requirements (see section 7.4.2 below) should also be considered.³²

7.4.1.F Offsetting collateral amounts

Many central counterparty clearing houses require cash collateral in the form of variation margin to cover the fluctuations in the market value of 'over-the-counter' and exchange-traded derivatives. In 2011, the IASB clarified that the offsetting criteria do not give special consideration to items referred to as 'collateral'. Accordingly, a recognised financial instrument designated as collateral must be set off against the related financial asset or financial liability if, and only if, it meets the offsetting criteria in IAS 32. This might be the case, for instance, if variation margin is used to settle cash flows on derivative contracts. However, the IASB also noted that, if an entity can be required to return or receive back collateral, the entity would not currently have a legally enforceable right of set-off in all relevant circumstances and, therefore, offsetting would not be appropriate. [IAS 32.BC103].

In practice, to set off collateral against related financial assets and liabilities, a reporting entity would also need to assess, among other factors:

- (i) Whether the amounts paid or received (however they might be described) actually represent a partial settlement of the amounts due under the derivative contracts (see below)
 - (ii) Whether the right of offset is legally enforceable in the event of default, insolvency or bankruptcy of either party as well as in the normal course of business
 - (iii) Whether the right to offset the collateral and the open position is conditional on a future event
 - (iv) whether the collateral will form part of the actual net settlement of the underlying contracts
- And
- (v) Whether there is a single process for both the settlement of the underlying contracts and the transfer of the collateral

The analysis of whether payments or receipts, whether described as margin payments or otherwise, are in fact partial settlements of an open derivative position, can require the application of significant judgement, including particularly an assessment of the legal relationship between the clearing member and the clearing house.

Centrally-cleared derivatives can generally be structured and documented as either collateralised-to-market (CTM) or as settled-to-market (STM). The difference between the two types of derivatives is based on the commercial terms used in relation to how counterparty risk arising from movements in the mark to market value of a derivative is managed or settled. The economic cash flows exchanged by counterparties in CTM and STM derivatives would usually be identical (i.e., they include both an initial margin and variation margin amount), however, the difference is the treatment of the variation margin. For a CTM contract, the variation margin transferred is treated as collateral with an equal receivable or payable for a return of the collateral, as the variation margin may be used to settle the derivative contract on close out. For a STM contract, the daily payment or receipt of variation margin is used to settle the daily mark to market movement.

For a STM contract, when the mark to market exposure is settled, this might indicate it is appropriate to regard the variable margin payment as a partial settlement of the derivative resulting in the partial derecognition of the derivative. This situation sometimes occurs with exchange traded futures for which gains and losses on the open position are realised over time as opposed to being accumulated until the final settlement date.

For CTM contracts, the IAS 32 offsetting requirements explained in Section 7.4.1 above would need to be considered to determine whether the cumulative mark to market exposure may be offset against the collateral posted, however, as STM contracts are treated as a partial settlement, there will be nothing to offset.

³² [IFRIC Update](#), March 2016, available on the IFRS Foundation's website.

The accounting outcome for a payment mechanism considered to represent a partial settlement is unlikely to be significantly different from one that is considered to give rise to collateral if the collateral qualifies for offset. However, the regulatory capital consequences can be very different (and the disclosure requirements are different too, see section 7.4.2 below). Consequently, many clearing houses provide their members with a choice of payment mechanisms, one of which is designed to achieve partial settlement and the other the provision of collateral.

7.4.1.G Unit of account

IAS 32 does not specify the 'unit of account' to which the offsetting requirements should be applied. For example, they could be applied to individual financial instruments, such as entire derivative assets or liabilities, or they could be applied to identifiable cash flows arising on those financial instruments. In practice, both approaches are seen with the former being more commonly applied by financial institutions and the latter by energy producers and traders. This diversity became apparent to the IASB during its project that amended IAS 32 in December 2011. Nevertheless, whilst the IASB considered imposing an approach based on individual cash flows (which, on a conceptual level, it favoured), it concluded that the different interpretations applied today do not result in inappropriate application of the offsetting criteria. The Board also concluded that the benefits of amending IAS 32 would not outweigh the costs for preparers. [IAS 32.BC105-BC111]. Accordingly, IAS 32 was not amended, thereby allowing this diversity to continue. Reporting entities must establish an accounting policy and apply that policy consistently.

7.4.2 Offsetting financial assets and financial liabilities: disclosure

This section discusses the requirements of IFRS 7 introduced by the IASB in December 2011. These requirements are similar to requirements introduced into US GAAP by the FASB at around the same time and are intended to assist users in identifying major differences between the effects of the IFRS and US GAAP offsetting requirements (without requiring a full reconciliation). [IAS 32.BC77].

7.4.2.A Objective

The objective of these requirements is to disclose information to enable users of financial statements to evaluate the effect or potential effect of netting arrangements, including rights of set-off associated with recognised financial assets and liabilities, on the reporting entity's financial position. [IFRS 7.13B].

To meet this objective, the minimum quantitative disclosure requirements considered in section 7.4.2.C below may need to be supplemented with additional (qualitative) disclosures. Whether such disclosures are necessary will depend on the terms of an entity's enforceable master netting arrangements and related agreements, including the nature of the rights of set-off, and their effect or potential effect on the entity's financial position. [IFRS 7.B53].

7.4.2.B Scope

The disclosure requirements considered in section 7.4.2.C below are applicable not only to all recognised financial instruments that are set off in accordance with IAS 32 (see section 7.4.1 above), but also to recognised financial instruments that are subject to an enforceable master netting arrangement or 'similar agreement' that covers similar financial instruments and transactions, irrespective of whether they are set off in accordance with IAS 32. [IFRS 7.13A, IFRS 7.B40].

In this context, enforceability has two elements: first, enforceability as a matter of law under the governing laws of the contract; and second, consistency with the bankruptcy laws of the jurisdictions where the reporting entity and counterparty are located. The latter is critical since, regardless of the jurisdiction selected to govern the contract, local insolvency laws in an insolvent counterparty's jurisdiction can override contractual terms in the event of insolvency. Determining whether an agreement is enforceable for the purposes of these disclosures may require judgement based on a legal analysis that is sometimes, but not necessarily, based on legal advice.

These 'similar agreements' include, but are not limited to, derivative clearing agreements, global master repurchase agreements, global master securities lending agreements, and any related rights to financial collateral. The 'similar financial instruments and transactions' include, but are not restricted to, derivatives, sale and repurchase agreements, reverse repurchase agreements, securities borrowing and securities lending agreements. However, loans and customer deposits with the same financial institution would not be within the scope of these disclosure requirements, unless they are set off in the statement of financial position; nor would financial instruments that are subject only to a collateral agreement. [IFRS 7.B41].

The scope of equivalent disclosures in US GAAP is restricted to derivatives, repurchase agreements accounted for as collateralised borrowings and reverse repurchase agreements and securities lending and borrowing arrangements. In November 2012, the IASB considered this and effectively confirmed that the scope of IFRS 7 is broader than US GAAP. As a result, trade or other receivables and payables, such as balances with brokers, that are subject to an umbrella netting arrangement (normally where an entity's customer is also a supplier, and *vice versa*), are likely to fall within the scope of these disclosure requirements. Practical example 7-1 (BP p.l.c.) in section 7.4.2.D below illustrates one company's disclosures about receivables and payables in addition to derivatives.

7.4.2.C Disclosure requirements

To meet the objective in section 7.4.2.A above, the standard requires entities to disclose, at the end of the reporting period, in a tabular format unless another format is more appropriate, the following information separately for recognised financial assets and for recognised financial liabilities: [IFRS 7.13C]

- The gross amounts of those recognised financial assets and recognised financial liabilities within the scope of the disclosures (see section 7.4.2.B above) [Amount (a)]
This excludes any amounts recognised as a result of collateral agreements that do not meet the offsetting criteria in IAS 32. Instead, these will be disclosed in Amount (d) (see below). [IFRS 7.B43].
- The amounts that are set off in accordance with the criteria in IAS 32 when determining the net amounts presented in the statement of financial position [Amount (b)]
These amounts will be disclosed in both the financial asset and financial liability disclosures. However, the amounts disclosed (in, for example, a table) should be limited to the amounts subject to set-off. For example, an entity may have a recognised derivative asset and a recognised derivative liability that meet the offsetting criteria. If the gross amount of the asset is larger than the gross amount of the liability, the financial asset disclosure table will include the entire amount of the derivative asset in Amount (a) and the entire amount of the derivative liability in Amount (b). However, while the financial liability disclosure table will include the entire amount of the derivative liability in Amount (a), it will only include the amount of the derivative asset that is equal to the amount of the derivative liability in Amount (b). [IFRS 7.B44].
- The net amounts presented in the statement of financial position [Amount (c) = Amount (a) - Amount (b)]
For instruments that are within the scope of these disclosure requirements, but which do not meet the offsetting criteria in IAS 32, the amounts included in Amount (c) would equal the amounts included in Amount (a). [IFRS 7.B45].
Amount (c) should be reconciled to the individual line-item amounts presented in the statement of financial position. For example, if an entity determines that the aggregation or disaggregation of individual line-item amounts provides more relevant information, it should reconcile the aggregated or disaggregated amounts included in Amount (c) back to the individual line-item amounts presented in the statement of financial position. [IFRS 7.B46] IFRS 18, when applied, contains additional guidance for determining when to aggregate or disaggregate information within the financial statements (see Chapter 4).
- The amounts subject to an enforceable master netting arrangement or similar agreement that are not included in the amounts subject to set-off above [Amount (d)], including:
 - Amounts related to recognised financial instruments that do not meet some or all of the offsetting criteria in IAS 32 [Amount (d)(i)]
This might include, for example, current rights of set-off where there is no intention to settle the open positions subject to these rights net or simultaneously, or conditional rights of set-off that are enforceable and exercisable only in the event of the default, insolvency or bankruptcy of any of the counterparties. [IFRS 7.B47].
And
 - Amounts related to financial collateral (including cash collateral) [Amount (d)(ii)]
The fair value of those financial instruments that have been pledged or received as collateral must be disclosed. To ensure that the disclosures reflect the maximum net exposure to credit risk, the amendments require the amounts disclosed for financial collateral not offset to include actual collateral received, whether recognised or not as well as actual collateral pledged. The amounts disclosed must not relate to any payables or receivables recognised to return or receive back such collateral. [IFRS 7.B48]. The amounts disclosed for collateral would exclude non-financial collateral, for instance, land and buildings.

References to Amounts (a), (b), *et seq.* can be traced through to Illustration 7-4 in section 7.4.2.D below.

The total amount included in Amount (d) for any instrument is limited to the amount included in Amount (c) for that instrument. [IFRS 7.13D]. In other words, an entity takes into account the effects of over-collateralisation by financial instrument, so that, for example, an over-collateralisation on one asset does not make up for an under-collateralisation on another. To do so, it first deducts the amounts included in Amount (d)(i) from the amount included in Amount (c). It then limits the amounts included in Amount (d)(ii) to the remaining amount in Amount (c) for the related financial instrument. However, if rights to collateral are available to cover multiple contracts with the same counterparty, for example through a cross collateralisation agreement, such rights can be taken into account in arriving at Amount (d)(ii). [IFRS 7.B49].

Entities must provide a description of the rights of set-off associated with the entity's financial instruments included in Amount (d), including the nature and type of those rights. For example, conditional rights would need to be described. For instruments subject to rights of set-off that are not contingent on a future event but that do not meet the remaining criteria in IAS 32, the description should include the reasons why the criteria are not met. For any financial collateral received or pledged, it would be appropriate to disclose the terms of the collateral (such as why the collateral is restricted). [IFRS 7.13E, IFRS 7.B50].

And

- The net amount after deducting Amount (d) from Amount (c) [Amount (e)]

The financial instruments disclosed in accordance with the requirements of paragraph IFRS 7.13C above may be subject to different measurement requirements, for example a payable related to a repurchase agreement may be measured at amortised cost, while a derivative will be measured at fair value. Instruments must be included at their recognised amounts and any resulting measurement differences must be described in the related disclosures. [IFRS 7.B42].

The disclosures may be grouped by type of financial instrument or transaction (e.g., derivatives, repurchase and reverse repurchase agreements or securities borrowing and securities lending agreements). [IFRS 7.B51].

Alternatively, disclosure of Amounts (a) to (c) may be grouped by type of financial instrument with disclosure of Amounts (c) to (e) by counterparty. Amounts that are individually significant in terms of total counterparty amounts must be separately disclosed with the remaining individually insignificant counterparty amounts aggregated into one line item. Names of the counterparties need not be given, although designation of counterparties (Counterparty P, Counterparty Q, Counterparty R, etc.) must remain consistent from year to year for the periods presented to maintain comparability. Qualitative disclosures should be considered so that further information can be given about the types of counterparties. [IFRS 7.B52].

If the above quantitative and qualitative disclosures are included in more than one note to the financial statements, the amendments require the information in the individual notes to be cross-referenced to each other. This is intended to increase the transparency of the disclosures and enhance the value of information. [IFRS 7.13F].

7.4.2.D Offsetting disclosures - illustrative examples

The amendment that introduced the disclosures related to offsetting financial instruments provides the following Illustration showing ways in which an entity might provide the required quantitative disclosures described above. However, these Illustrations do not address all possible ways of applying the disclosure requirements. [IFRS 7.IG40D].

Illustration 7-4: Illustration of offsetting disclosures

Background

An entity has entered into transactions subject to an enforceable master netting arrangement or similar agreement with the following counterparties. The entity has the following recognised financial assets and financial liabilities resulting from those transactions that meet the scope of the disclosure requirements.

Counterparty A:

The entity has a derivative asset (fair value of CU100 million) and a derivative liability (fair value of CU80 million) with Counterparty A that meet the IAS 32 offsetting criteria. Consequently, the gross derivative liability is set off against the gross derivative asset, resulting in the presentation of a net derivative asset of CU20 million in the entity's statement of financial position. Cash collateral has also been received from Counterparty A for a portion of the net derivative asset (CU10 million). The cash collateral of CU10 million does not meet the IAS 32 offsetting criteria, but it can be set off against the net amount of the derivative asset and derivative liability in the case of default and insolvency or bankruptcy, in accordance with an associated collateral arrangement.

Counterparty B:

The entity has a derivative asset (fair value of CU100 million) and a derivative liability (fair value of CU80 million) with Counterparty B that do not meet the IAS 32 offsetting criteria, but which the entity has the right to set off in the case of default and insolvency or bankruptcy. Consequently, the gross amount of the derivative asset (CU100 million) and the gross amount of the derivative liability (CU80 million) are presented separately in the entity's statement of financial position.

Cash collateral has also been received from Counterparty B for the net amount of the derivative asset and derivative liability (CU20 million). The cash collateral of CU20 million does not meet the IAS 32 offsetting criteria, but it can be set off against the net amount of the derivative asset and derivative liability in the case of default and insolvency or bankruptcy, in accordance with an associated collateral arrangement.

Counterparty C:

The entity has entered into a sale and repurchase agreement with Counterparty C that is accounted for as a collateralised borrowing. The carrying amount of the financial assets (bonds) used as collateral and posted by the entity for the transaction is CU79 million and their fair value is CU85 million. The carrying amount of the collateralised borrowing (repo payable) is CU80 million.

The entity has also entered into a reverse sale and repurchase agreement with Counterparty C that is accounted for as a collateralised lending. The fair value of the financial assets (bonds) received as collateral (and not recognised in the entity's statement of financial position) is CU105 million. The carrying amount of the collateralised lending (reverse repo receivable) is CU90 million.

The transactions are subject to a global master repurchase agreement with a right of set-off only in default and insolvency or bankruptcy and, therefore, do not meet the IAS 32 offsetting criteria. Consequently, the related repo payable and repo receivable are presented separately in the entity's statement of financial position.

Trade and other payables	(20,671)	8,381	(12,290)	1,325	61	(10,904)

7.4.3 Assets and liabilities

IAS 1 or, when applied, IFRS 18, does not prescribe the order or format in which items are to be presented on the face of the statement of financial position, but states that the following items relating to financial instruments, are sufficiently different in nature or function to warrant separate presentation: [IAS 1.54, IAS 1.57, IFRS 18.103-104, IFRS 18.106]

- Trade and other receivables
- Cash and cash equivalents
- Other financial assets
- Trade and other payables
- Provisions
- And
- Other financial liabilities

IAS 1 or, when applied, IFRS 18, does not list the loss allowance in respect of financial assets measured at amortised cost as an amount to be separately presented on the face of the statement;³³ rather, it is an integral part of the amortised cost measurement. [IAS 1.33, IFRS 18.45]. However, additional line items, headings and subtotals must be presented on the face of the statement of financial position when the size, nature or function of an item or aggregation of similar items is such that separate presentation is relevant to an understanding of the entity's financial position. Additional line items may also be presented by disaggregating the line items noted above. [IAS 1.55, IAS 1.57(a), IFRS 18.106].

Any additional subtotals presented should: [IAS 1.55A, IFRS 18.24]

- Comprise line items made up of amounts recognised and measured in accordance with IFRS
- Be presented and labelled in a manner that makes the line items that constitute the subtotal clear and understandable
- Be consistent from period to period (see Chapter 3)
- And
- Not be displayed with more prominence than the subtotals and totals required in IFRS for the statement of financial position

33 Transition Resource Group for Impairment of Financial Instruments, [Meeting Summary](#): 11 December 2015, IASB, paragraph 77. Available on the IFRS Foundation's website.

The judgement on whether additional items are presented separately should be based on an assessment of: *[IAS 1.58, IFRS 18.B109]*

- The nature and liquidity of assets
- The function of assets within the entity
- And
- The amounts, nature and timing of liabilities

The descriptions used and the ordering of items or aggregation of similar items may be amended according to the nature of the entity and its transactions, to provide information that is relevant to an understanding of the entity's financial position. For example, a financial institution may amend the descriptions to provide information that is relevant to the operations of a financial institution. *[IAS 1.57(b), IFRS 18.106]*. Consequently, entities need not necessarily use categorisations that are the same as the measurement categories in IFRS 9, something that was stated explicitly in IAS 39. *[IAS 39(2017).45]*.

However, the use of different measurement bases for different classes of assets suggests that their nature or function differs and, therefore, that they must be presented as separate line items. *[IAS 1.59, IFRS 18.B109]*. For example, financial assets measured at amortised cost would normally be presented separately from debt instruments measured at fair value through other comprehensive income, particularly by a financial institution.

As noted in section 7.1.4 above, IFRS 9 explicitly states that it does not address whether embedded derivatives should be presented separately in the statement of financial position. *[IFRS 9.4.3.4]*. Although the guidance in the previous paragraph suggests that embedded derivatives will often be presented separately on the face of the statement of financial position, this will not always be the case, e.g., for the 'puttable instruments' shown in Illustration 7-6 in section 7.4.6 below, which is based on IAS 32.

Further sub-classifications of the line items presented must be disclosed, either on the face of the statement of financial position or in the notes, classified in a manner appropriate to the entity's operations. *[IAS 1.77, IFRS 18.42]*. The detail provided in sub-classifications will depend on the size, nature and function of the amounts involved and will vary for each item. For example, receivables could be disaggregated into amounts receivable from trade customers, receivables from related parties and other amounts. Assets included within receivables that are not financial instruments, such as many prepayments, must also be shown separately. *[IAS 1.78(b), IFRS 18.B111(b)]*.

7.4.3.A Supply chain financing and reverse factoring arrangements - introduction

An increasingly common type of arrangement involves the provision of finance linked to the supply of goods or services which can be referred to by a variety of names including 'supply-chain finance', 'supplier finance', and 'structured payable transactions' which, to some extent, reflects the wide variety of such arrangements. One of the more common types of arrangement, often referred to as 'reverse factoring', will typically contain a number of the following features:

- The arrangement involves a purchaser of goods and/or services, a group of its suppliers and a financial intermediary which enter into tri-partite or a series of bilateral agreements.
- The purchaser is often a large, creditworthy entity that uses a number of suppliers, many of which will have a higher credit risk than the purchaser.
- The arrangement is nearly always initiated by the purchaser rather than the supplier.
- The arrangements operate continuously for all future purchases until the arrangement is cancelled.
- They are often put in place in connection with the purchaser attempting to secure extended payment terms from its suppliers.
- The intermediary/service provider is often a financial institution who will normally make available IT systems to facilitate the arrangement (or secure another party to do this).
- The intermediary makes available to suppliers an optional invoice discounting or factoring facility for invoices accepted or agreed by the purchaser, often on terms that enable the supplier to derecognise the receivable.
- The purchaser will commit to pay the invoice on the due date, sometimes by using a payment facility operated by the intermediary which may be called an irrevocable payment undertaking.
- Interest and cross-default terms are included in the supply agreement to protect the intermediary in the event of the purchaser defaulting or missing the payment date.
- Those interest terms will be similar to ones included in most supply agreements, although they are rarely enforced by suppliers.
- The credit risk the intermediary is taking on is that of the purchaser, but it may be able to charge a higher financing cost to the supplier (in the form of the discount) than it would if lending to the supplier directly.
- And
- It can be difficult to determine the overall financing costs of the arrangement, and who bears those costs, especially if the supply involves items for which the pricing is subjective/unobservable.

The primary accounting concern with these types of arrangement is whether the purchaser should present the resulting financial liability as a trade or similar payable or as a debt-like liability. This determination could have a significant impact on the purchaser's financial position, particularly its leverage or gearing ratios. However, as can be seen from the guidance in section 7.4.3 above, and as acknowledged by the IASB, debt is neither defined in, nor required to be disclosed by, IFRS accounting standards. [IAS 7.BC11]. In fact, the need for clear disclosure of complex supplier arrangements under IFRS accounting standards is something that has been emphasised by a number of European and US regulators.³⁴

More recently, in early 2020, Moody's Investors Service wrote to the IFRS IC highlighting their concerns about the classification and disclosure of liabilities and liquidity risks arising from supply chain financing arrangements such as reverse-factoring and asked the IFRS IC to consider providing guidance.³⁵ The IFRS IC issued in December 2020 an agenda decision setting out its analysis of:

- How an entity presents liabilities to which reverse factoring arrangements relate (i.e., how it presents liabilities to pay for goods or services received when the related invoices are part of a reverse factoring arrangement)
- And
- What information about reverse factoring arrangements an entity should disclose in its financial statements

The IFRS IC described reverse factoring arrangements simply as ones in which a financial institution agrees to pay amounts an entity owes to the entity's suppliers and the entity agrees to pay the financial institution at a date later than suppliers are paid. It addressed four separate matters, as follows:

- (i) Presentation in the statement of financial position
- (ii) Derecognition of a financial liability
- (iii) Presentation in the statement of cash flows
- (iv) Notes to the financial statements

These matters are covered in turn in the sections below.³⁶

7.4.3.B Supply chain financing and reverse factoring arrangements - presentation in the statement of financial position

The IFRS IC noted that an entity must present trade and other payables separately from other financial liabilities. [IAS 1.54, IFRS 18.103-104]. This is because they are sufficiently different in nature or function from each other to warrant separate presentation. [IAS 1.57, IFRS 18.106]. Trade payables are liabilities to pay for goods or services that have been received or supplied and have been invoiced or formally agreed with the supplier. [IAS 37.11(a)]. Some current liabilities, such as trade payables, are part of the working capital used in the entity's normal operating cycle. [IAS 1.70, IFRS 18.B96]. Therefore, an entity must present a financial liability as a trade payable only when it:

- Represents a liability to pay for goods or services
- Is invoiced or formally agreed with the supplier
- And
- Is part of the working capital used in the entity's normal operating cycle

An entity must present separately items of a dissimilar nature or function unless they are immaterial. [IAS 1.29, IFRS 18.42]. Also, line items must be included in the statement of financial position when the size, nature or function of an item (or aggregation of similar items) is such that separate presentation is relevant to an understanding of the entity's financial position. [IAS 1.57(a), IFRS 18.106]. Accordingly, an entity must present:

- Other payables together with trade payables only when those other payables have a similar nature and function to trade payables, for example, when other payables are part of the working capital used in the entity's normal operating cycle
 - And
 - Liabilities that are part of a reverse factoring arrangement separately when the size, nature or function of those liabilities makes separate presentation relevant to an understanding of the entity's financial position
- In assessing whether to present such liabilities separately (including whether to disaggregate trade and other payables) an entity should consider the amounts, nature and timing of those liabilities. [IAS 1.55, IAS 1.58(c), IFRS 18.B109].

34 For example, [Press Release 74/14](#), FRC urges clarity in the reporting of complex supplier arrangements by retailers and other businesses, Financial Reporting Council, December 2014. Available on the Financial Reporting Council's website.

35 Classification and Disclosure of Liabilities and Liquidity Risks Arising from Supply Chain Financing Arrangements, Moody's Investors Service, January 2020.

36 [IFRIC Update](#), December 2020, available on the IFRS Foundation's website.

When assessing whether to present liabilities that are part of a reverse factoring arrangement separately an entity might consider factors including, for example:

- Whether additional security is provided as part of the arrangement that would not be provided without the arrangement
- And
- Whether the terms of liabilities that are part of the arrangement are substantially different from the terms of the entity's trade payables that are not part of the arrangement³⁷

7.4.3.C Supply chain financing and reverse factoring arrangements - derecognition of a financial liability

The agenda decision explains that an entity should assess whether and when to derecognise a liability that is (or becomes) part of a reverse factoring arrangement by applying the derecognition requirements in IFRS 9 (see Chapter 48). If a trade payable to a supplier is derecognised and a new financial liability to a financial institution recognised, the entity should determine how to present that new liability in its statement of financial position by applying IAS 1 as set out in section 7.4.3.B above.³⁸

7.4.3.D Supply chain financing and reverse factoring arrangements - presentation in the statement of cash flows

The agenda decision explains that cash flows from a reverse factoring arrangement should be classified as operating or financing. However, this omits the possibility of the cost of goods or services forming part of the cost of an item of property, plant or equipment, or maybe an intangible asset, in which case the cash flow would be classified as either investing or financing.

The IFRS IC observed that the nature of the liabilities that are part of the arrangement may help in determining the nature of the related cash flows as arising from operating or financing activities. For example, if the related liability is considered to be a trade or other payable that is part of the working capital used in the entity's principal revenue-producing activities, payments to settle the liability would be classified as operating (or possibly investing). In contrast, if the related liability is not a trade or other payable because the liability represents borrowings, payments to settle the liability would be classified as financing.

Investing and financing transactions that do not require the use of cash or cash equivalents must be excluded from the statement of cash flows. Consequently, if a cash inflow and cash outflow occur when an invoice is factored as part of a reverse factoring arrangement, those cash flows are presented in the statement of cash flows. If no cash flows are involved the transaction must be disclosed elsewhere in the financial statements in a way that provides all the relevant information about the financing activity (see section 7.4.3.E below).

[IAS 7.43].³⁹

The treatment of reverse factoring arrangements in the statement of cash flows is discussed further in Chapter 36.

7.4.3.E Supply chain financing and reverse factoring arrangements - notes to the financial statements

The IFRS IC highlighted a number of disclosure requirements that could be relevant for reverse factoring arrangements. Firstly, IAS 7 *Statement of Cash Flows* requires disclosures that enable users of financial statements to evaluate changes in liabilities arising from financing activities, including both changes arising from cash flows and non-cash changes. [IAS 7.44A]. This will be relevant if the cash flows for liabilities that are part of a reverse factoring arrangement were, or future cash flows will be, classified as financing.

³⁷ [IFRIC Update](#), December 2020, available on the IFRS Foundation's website.

³⁸ [IFRIC Update](#), December 2020, available on the IFRS Foundation's website.

³⁹ [IFRIC Update](#), December 2020, available on the IFRS Foundation's website.

Next, reverse factoring arrangements will often give rise to liquidity risk because:

- The entity will have concentrated a portion of its liabilities with one financial institution rather than a diverse group of suppliers.

The entity may also obtain other sources of funding from the financial institution which could increase the risk of the entity having to pay a significant amount, at one time, to one counterparty, especially if it were to encounter any difficulty in meeting its obligations.

Or

- Some suppliers may have become accustomed to, or reliant on, earlier payment of their trade receivables under the reverse factoring arrangement.

If the financial institution were to withdraw the reverse factoring arrangement, those suppliers could demand shorter credit terms which could affect the entity's ability to settle liabilities, particularly if the entity were already in financial distress.

In this context, the IFRS IC drew attention to the requirements in IFRS 7, addressed in more detail in section 5.4 above, for an entity to disclose how exposures to risk arising from financial instruments (including liquidity risk) arise, what the entity's objectives, policies and processes are for managing the risk, summary quantitative data about the entity's exposure to liquidity risk at the end of the reporting period (including further information if this data is unrepresentative of the entity's exposure to liquidity risk during the period) and concentrations of risk.

The IFRS IC also observed that an entity must:

- Disclose the judgements that management has made in assessing how to present liabilities and cash flows related to reverse factoring arrangements if those judgements are among the ones that have the most significant effect on the amounts recognised in the financial statements. [IAS 1.122, IAS 8(2027).27G].

And

- Provide information about reverse factoring arrangements to the extent they have a material effect on an entity's financial statements and such information is relevant to an understanding of those financial statements. [IAS 1.112, IFRS 18.113].

Finally, in this context, the IFRS IC noted that making materiality judgements involves both quantitative and qualitative considerations.⁴⁰

7.4.3.F Supply chain financing and reverse factoring arrangements - amendments to IAS 7 and IFRS 7

In 2023, the IASB published *Supplier Finance Arrangements - Amendments to IAS 7 and IFRS 7* that will require an entity to provide additional disclosures about its supplier finance arrangements. As explained in section 7.4.3.E above, supplier financing arrangements may give rise to additional liquidity risk by concentrating liabilities with one or a small number of financial institutions rather than a large number of suppliers. Therefore, supplier finance arrangements have been added as an example of other factors that might be relevant to disclose when explaining how an entity manages its liquidity risk, see section 5.4.3, [IFRS 7.39(c), IFRS 7.B11F], and when explaining concentrations of liquidity risk. [IFRS 7.34(c), IFRS 7.IG18A(a)(iv)]. The amendments to IAS 7 also require the disclosure of information about an entity's use of supplier finance arrangements and these are discussed at Chapter 36.

The amendments were effective for annual reporting periods commencing on or after 1 January 2024, albeit with certain transitional relief, and early adoption is permitted. Additional information in relation to scope, disclosures and implementation is set out in Chapter 36.

7.4.4 The distinction between current and non-current assets and liabilities

For entities presenting a statement of financial position that distinguishes between current and non-current assets and liabilities, the requirements of IAS 1 for determining whether items are classified as current or non-current are dealt with in Chapter 3. This section deals with five interpretive issues that have arisen in applying those requirements to financial instruments, some of which have resulted in amendments being made to IAS 1. [IAS 1.66, IAS 1.69, IFRS 18.99, IFRS 18.100, IFRS 18.101, IFRS 18.102].

⁴⁰ [IFRIC Update](#), June 2020, available on the IFRS Foundation's website.

Extract from IAS 1

- 66** An entity shall classify an asset as current when:
- (a) it expects to realise the asset, or intends to sell or consume it, in its normal operating cycle;
 - (b) it holds the asset primarily for the purpose of trading;
 - (c) it expects to realise the asset within twelve months after the reporting period; or
 - (d) the asset is cash or a cash equivalent (as defined in IAS 7) unless the asset is restricted from being exchanged or used to settle a liability for at least twelve months after the reporting period.
- An entity shall classify all other assets as non-current.
- 69** An entity shall classify a liability as current when:
- (a) it expects to settle the liability in its normal operating cycle;
 - (b) it holds the liability primarily for the purpose of trading;
 - (c) the liability is due to be settled within twelve months after the reporting period; or
 - (d) it does not have the right at the end of the reporting period to defer settlement of the liability for at least twelve months after the reporting period.
- An entity shall classify all other liabilities as non-current.

Extract from Appendix A of IFRS 9

- | | |
|-------------------------|--|
| Held for trading | A financial asset or financial liability that: |
| (a) | is acquired or incurred principally for the purpose of selling or repurchasing it in the near term; |
| (b) | on initial recognition is part of a portfolio of identified financial instruments that are managed together and for which there is evidence of a recent actual pattern of short-term profit-taking; or |
| (c) | is a derivative (except for a derivative that is a financial guarantee contract or a designated and effective hedging instrument). |

7.4.4.A Derivatives

IAS 1 or, when applied, IFRS 18, requires assets and liabilities held 'primarily for the purpose of trading' to be classified as current. [IAS 1.66(b), IAS 1.69(b), IFRS 18.99(b), IFRS 18.101(b)]. A derivative that is entered into by an entity in order to make a gain from short term price fluctuations is an example of an asset or liability held primarily for the purpose of trading.

Where a derivative is not designated as a hedging instrument in an effective hedge, it is classified for measurement purposes by IFRS 9 as held for trading irrespective of the purpose for which it is held (see Chapter 44). [IFRS 9 Appendix A]. This does not mean that any derivative not designated as a hedging instrument in an effective hedge must always be classified as current because the IFRS 9 classification is for measurement purposes only. [IAS 1.BC38J]. Whilst a derivative held primarily for trading purposes must be presented as current regardless of its maturity date, other derivatives must be classified as current or non-current on the basis of their cash flow settlement date(s). Accordingly, derivatives that have cash flow settlements due to occur less than 12 months from the end of the reporting period must be presented as a current asset or liability. Conversely, derivatives that have a maturity of more than twelve months and are not held for trading must be presented as non-current assets or liabilities. [IAS 1.BC38J]. Settled-to-market derivatives are likely to be presented as current due to their daily settlement mechanism (if they have any fair value to present on the Statement of Financial Position at all).

Derivatives may involve a series of cash flows throughout the duration of the instrument (e.g., interest rate swaps), some may give rise to an exchange of cash flows only at maturity of the instrument (e.g., foreign currency swaps and futures), and others may give rise to daily settlement (e.g., settled-to-market derivatives).

IAS 1 explains that current assets and liabilities include the current portion of non-current financial assets and liabilities suggesting derivatives with staggered payment dates that are not held primarily for the purposes of trading should be split into current and non-current portions. [IAS 1.68, IAS 1.71, IFRS 18.B95, IFRS 18.B97]. The IFRS IC and the IASB have considered how to split into current and non-current components the carrying amount of such derivatives, however, have decided not to address this issue. Consequently, entities will need to apply judgement in determining an appropriate split. Entities would apply the same judgement consistently to similar types of derivatives. In most cases an entity might reasonably determine the split based on how a derivative asset will be realised or a derivative liability will be settled. For example, the current component of a five-year interest rate swap with interest payments exchanged quarterly could be determined as the present value of the expected net interest cash flows of the swap for the forthcoming twelve months after the reporting date.⁴¹

This is illustrated in the example below:

Illustration 7-5: Classification of non-trading derivatives: current vs. non-current

Entity A enters into a loan with quarterly interest payments based on a fixed interest rate, a term of 5 years and annual repayments of principal. To hedge the interest rate risk created by this loan, Entity A also enters into a fixed-floating interest rate swap with the same life, the same notional amount and same timing of cash flows as the loan, however, hedge accounting has not been applied.

The interest rate swap would be classified as held for trading based on the definition in IFRS 9 Appendix A, however, it would be presented as current and non-current based on the requirements of IAS 1.66 and IAS 1.69.

Therefore, the portion of the interest rate swap which is expected to be realised or settled within 12 months would be classified as current with the remainder being classified as non-current.

If the entity had applied hedge accounting, the derivative would be presented in the same way.

If the derivative is an embedded derivative (see Chapter 42), the approach to classification as current or non-current may not be the same for each of the following scenarios:

- The host is a non-derivative financial liability but the embedded derivative is presented as a component of the hybrid instrument.
- The host is a non-financial contract or a non-derivative financial liability and the embedded derivative is presented separately to the host

We discuss the approach of each in turn below.

If the derivative is an embedded derivative that is (i) closely related to the host financial liability and is not accounted for separately; (ii) not considered closely related to the host contract but the whole hybrid contract is a financial liability measured at fair value; or (iii) not considered closely related to the host contract, separated for the purposes of measuring the hybrid financial liability, but presented as a measurement adjustment to the host financial liability, the financial liability would be presented as current or non-current based on the requirements of IAS 1.66 and IAS 1.69. The host contract and any cash flows related to the embedded derivative, would be presented as current or non-current based on an assessment of the combined instrument's cash flows and management's intention for entering into the combined instrument.

If the embedded derivative is not closely related to a host contract and is accounted for separately at fair value, it would be presented as current or non-current based on the requirements of IAS 1.66 and IAS 1.69. The derivative, having been separated from the host contract, is classified and measured separately from the host. However, in most cases, it is not possible to settle or realise an embedded derivative separately from the host contract. In such cases, settlement or realisation will need to be considered in the context of the embedded derivative's link to the host contract, including the identified contractual terms of the embedded derivative and its (imputed) cash flows (see Chapter 42).

41 [INFORMATION FOR OBSERVERS](#) IFRIC meeting: March 2007, London, Project: *Current or non-current presentation of derivatives that are not designated as hedging instruments in effective hedges* (Agenda Paper 9(ii)), IASB, paragraphs 14 and 17; and [INFORMATION FOR OBSERVERS](#) Board Meeting: 11 March 2008, London, Project: *ED Annual improvements process-Comment analysis*, Subject: *IAS 1 Current/non-current classification of derivatives (Q6)* (Agenda paper 8E), IASB, paragraph 12. Available on the IFRS Foundation's website.

There may be situations where a derivative that is not held primarily for the purpose of trading is expected to give rise to net cash inflows within the next 12 months and net cash outflows thereafter (or vice versa). Applying the above approach mechanically could result in a positive current portion and a negative non-current portion, which is difficult to reconcile with the fact that a derivative is normally seen as a single asset or liability and therefore it would not be appropriate to be grossed up in this way.

Notwithstanding the above, some consider that paragraph IAS 1.BC38J supports a basis for classifying a derivative financial instrument that is not held primarily for the purposes of trading wholly as current or non-current on the basis of its ultimate maturity and final settlement date. In particular, it says "... a financial liability that is not held [primarily] for trading purposes... should be presented as current or non-current on the basis of its settlement date. For example, derivatives that have a maturity of more than twelve months ... should be presented as non-current assets or liabilities." [IAS 1.BC38J]⁴². This approach would also avoid some of the complications mentioned above and, in practice, a degree of diversity is seen, with some entities applying this alternative approach.

7.4.4.B Convertible loans

Where an entity issues convertible bonds that are accounted for as an equity component (i.e., the holders' rights to convert the bonds into a fixed number of the issuer's equity instruments) and a liability component (i.e., the entity's obligation to deliver cash to holders at the maturity date), the issue arises whether the liability component should be classified as current or non-current if the conversion option may be exercised at any time before maturity. The previous version of IAS 1 explained that any terms of a liability which could, at the option of the counterparty, result in its settlement by the issue of equity instruments would not affect its classification. [IAS 1.69(d)]. In other words, provided the entity could not be required to settle the liability component in cash within one year, it would be classified as non-current even if the holder could exercise the conversion option (thereby requiring the liability component to be derecognised) within one year.

It has not been clear whether a similar approach could be applied to convertible bonds and similar instruments for which the conversion option is classified as a liability. However, in January 2020, the IASB amended IAS 1 to clarify that the potential settlement of a liability by the issue of equity instruments would affect its classification unless it arises from a counterparty conversion option recognised separately from the liability as an equity component of a compound financial instrument. [IAS 1.76A, IAS 1.76B, IFRS 18.B107, IFRS 18.B108]. This amendment, adoption of which was required for periods beginning on or after 1 January 2024, is likely to change some entities' presentation of, for example, convertible bonds that are denominated in a currency other than their functional currency and for which the conversion option is accounted for as an embedded derivative.

7.4.4.C Long-term loans with repayment on demand terms

IAS 1 or, when applied, IFRS 18 requires liabilities for which the entity does not have the right to defer settlement for at least twelve months after the reporting date to be classified as current. [IAS 1.69(d), IFRS 18.101(d)]. Some long-term loan agreements, particularly in Hong Kong, contain clauses allowing the lender an absolute right to demand repayment at any time before maturity. Historically, borrowers often approached these clauses in the same way as more conventional covenants because the risk of exercise was considered very low (except in situations that might adversely affect the borrower's ability to repay). Consequently, the clause would result in classification of a loan as current only if such adverse matters relating to the borrower existed at the end of the reporting period.⁴³

However, in 2010, the IFRS IC addressed this situation, noting that the requirements of IAS 1 are clear, i.e., such terms always result in the loan being classified as current.⁴⁴

42 The wording in IAS 1.BC38J includes the words "*and are expected to be held for more than twelve months after the reporting period*", however, as part of a subsequent amendment to IAS 1, management intention does not play a role in the classification of liabilities as current or non-current (see Chapter 3) and so the wording in italics is no longer relevant.

43 [IASB Staff Paper 16](#), Project: *IAS 1 Presentation of Financial Statements*, Topic: *Current/non-current classification of callable term loan*, IFRS IC Meeting, September 2010. Available on the IFRS Foundation's website.

44 [IFRIC Update](#), September 2010, available on the IFRS Foundation's website.

7.4.4.D Debt with refinancing or roll over agreements

The previous version of IAS 1 stated that if an entity expects, and has the discretion, to refinance or roll over an obligation for at least twelve months after the reporting period under an existing loan facility, the obligation should be classified as non-current even if it would otherwise be due within a shorter period [IAS 1.73] and the IFRS IC and IASB had been considering the circumstances in which this guidance should apply for some time.

One particular area of concern had been the classification of liabilities arising from a short-term commercial paper programme that is backed by a long-term loan facility. In these arrangements: the commercial paper is typically issued for a term of 90 or 180 days; the issuer will normally attempt to issue new instruments to replace those maturing; and a bank (often the sponsor or manager of the scheme) will have provided the entity with a longer-term loan facility that may be drawn down if any issue of commercial paper is under-subscribed. In this situation, *prima facie* the entity has in place an agreement (the loan facility) that can be used to refinance the short-term liability (from the commercial paper) on a long-term basis and might consider classifying the liability arising from commercial paper as non-current.

However, in 2011 after analysing outreach requests, the IFRS IC noted that there was no charted diversity in practice where an agreement is reached to refinance an existing borrowing with a different lender - here IAS 1.73 is not considered applicable, whatever the terms of the new facility, and the existing borrowing would be classified as current. Therefore, the commercial paper liabilities must be classified as current.⁴⁵ In 2020, the IASB amended IAS 1 to remove the reference in paragraph 73 to 'refinance' and bring the wording of the standard into line with the IFRS IC's view on how it should be (and is being) applied.

7.4.4.E Loan covenants

If an entity does not have the right to defer settlement of the liability for at least twelve months after the reporting period, the liability is reported as current. [IAS 1.69(d), IFRS 18.101(d)]. Furthermore, when an entity breaches a provision of a long-term loan arrangement (commonly called a covenant) on or before the end of the reporting period with the effect that the liability becomes payable on demand, the liability is classified as current because, at the end of the reporting period, it does not have the right to defer settlement for at least twelve months after that date. [IAS 1.74, IFRS 18.B102].

The application of these requirements are discussed in more detail in Chapter 3.

7.4.5 Equity

IAS 1 or, when applied, IFRS 18, explains that the face of the statement of financial position must include line items that present the following amounts within equity: [IAS 1.54(q), IAS 1.54(r), IFRS 18.104]

- Non-controlling interests, presented within equity
- And
- Issued capital and reserves attributable to owners of the parent

As for assets and liabilities, additional line items, headings and subtotals must be presented on the face of the statement of financial position when such presentation is relevant to an understanding of the entity's financial position and additional line items may also be presented by disaggregating the line items noted above.

[IAS 1.55]. Further sub-classifications of the line items presented must be disclosed, either on the face of the statement of financial position or in the notes, classified in a manner appropriate to the entity's operations. [IAS 1.77, IFRS 18.42]. The detail provided in the sub-classifications will depend on the size, nature and function of the amounts involved and will vary for each item. For example, equity capital and reserves should be disaggregated into various classes, such as paid-in capital, share premium and reserves. [IAS 1.78(e), IFRS 18.B111(f)]. A description of the nature and purpose of each reserve within equity must also be provided. [IAS 1.79(b), IFRS 18.130(b)].

⁴⁵ [IFRIC Update](#), January 2011; and [IASB Staff Paper 8](#), Project: *Work in progress*, Topic: *IAS 1 Presentation of Financial Statements - current/non-current classification of debt (rollover agreements) - outreach results*, IFRS IC Meeting, January 2011. Available on the IFRS Foundation's website.

For each class of share capital, the following information must be disclosed, either on the face of the statement of financial position or in the notes: [IAS 1.79(a), IFRS 18.130(a)]

- The number of shares authorised
- The number of shares issued and fully paid, and issued but not fully paid
- Par value per share, or that the shares have no par value
- A reconciliation of the number of shares outstanding at the beginning and at the end of the period
- The rights, preferences and restrictions attaching to that class including restrictions on the distribution of dividends and the repayment of capital
- Shares in the entity held by the entity or by its subsidiaries (treasury shares [IAS 32.34]) or associates
- And
- Shares reserved for issue under options and contracts for the sale of shares, including the terms and amounts

An entity without share capital, such as a partnership or trust, should disclose equivalent information, showing changes during the period in each category of equity interest, and the rights, preferences and restrictions attaching to each category of equity interest, [IAS 1.80, IFRS 18.131], (assuming, of course, it has actually issued instruments that meet the definition of equity).

Where puttable financial instruments and obligations arising on liquidation (see Chapter 43) are reclassified between financial liabilities and equity, entities are required to disclose the amount reclassified into and out of each category and the timing and reason for that reclassification. [IAS 1.80A, IFRS 7(2027).19B]. This requirement was introduced by the amendments to IAS 32 and IAS 1 dealing with the classification of puttable financial instruments and obligations arising on liquidation.

7.4.6 Entities whose share capital is not equity

Continuing Illustration 7-2 and Illustration 7-3 in section 7.1.5 above, the following Illustrations show corresponding statement of financial position formats that may be used by entities such as mutual funds that do not have equity as defined in IAS 32, or entities such as co-operatives whose share capital is not equity as defined in IAS 32 because the entity has an obligation to repay the share capital on demand.

Illustration 7-6: Statement of financial position format for a mutual fund

Statement of financial position at 31 December 20X1 [IAS 32.IE32]

	20X1		20X0	
	CU	CU	CU	CU
Non-current assets (classified in accordance with IAS 1)	91,374		78,484	
Total non-current assets		91,374		78,484
Current assets (classified in accordance with IAS 1)	1,422		1,769	
Total current assets		1,422		1,769
Total assets		92,796		80,253
LIABILITIES				
Current liabilities (classified in accordance with IAS 1)	647		66	
Total current liabilities		(647)		(66)
Non-current liabilities excluding net assets attributable to unit holders (classified in accordance with IAS 1)	280		136	
		(280)		(136)
Net assets attributable to unit holders		91,869		80,051

As for the equivalent income statement format, it may not be immediately clear what the final line item in this format represents. It is, in fact, a liability and, therefore, the entity's 'equity' (as that term is used in IAS 1) at the end of 20X1 is CU92,796 - CU647 - CU280 - CU91,869 = CUnil.

Illustration 7-7: Statement of financial position format for a co-operative**Statement of financial position at 31 December 20X1 [IAS 32.IE33]**

	20X1		20X0	
	CU	CU	CU	CU
ASSETS				
Non-current assets (classified in accordance with IAS 1)	908		830	
Total non-current assets		908		830
Current assets (classified in accordance with IAS 1)	383		350	
Total current assets		383		350
Total assets		1,291		1,180
LIABILITIES				
Current liabilities (classified in accordance with IAS 1)	372		338	
Share capital repayable on demand	202		161	
Total current liabilities		(574)		(499)
Total assets less current liabilities		717		681
Non-current liabilities (classified in accordance with IAS 1)	187		196	
		(187)		(196)
RESERVES*				
Reserves, e.g., revaluation reserve, retained earnings	530		485	
		530		485
		717		681
MEMORANDUM NOTE TOTAL MEMBERS' INTERESTS				
Share capital repayable on demand		202		161
Reserves		530		485
		732		646

* In this Illustration, the entity has no obligation to deliver a share of its reserves to its members.

The line item 'Share capital repayable on demand' is part of the entity's liabilities and the items within 'Reserves' represent its equity.

Although not required by IAS 1 an entity adopting this type of format for its statement of financial position may choose to present an analysis of movements in (or reconciliation of) total members' interests (often defined as equity plus share capital repayable on demand, perhaps adjusted for other balances with members) if this is considered to provide useful information; this would not remove the need to present a statement of changes in equity.

7.5 Statement of cash flows

The implementation guidance to IFRS 9 acknowledges that the terminology in IAS 7 was not updated to reflect publication of the standard but does explain that the classification of cash flows arising from hedging instruments within the statement of cash flows should be consistent with the classification of these instruments as hedging instruments. In other words, such cash flows are classified as operating, investing or financing activities, on the basis of the classification of the cash flows arising from the hedged item. [IFRS 9.IG G.2].

The classification of cash flows arising from supply chain financing and reverse factoring arrangements has been considered by the IFRS IC. This is discussed in section 7.4.3.D above, alongside other presentation and disclosure aspects of such arrangements.

8 Regulatory considerations

Regulators continue to emphasise the importance of clear and transparent disclosures, particularly in respect of entities' exposure to credit risk and the determination of expected credit loss provisions. For example, the Task Force on Disclosures about Expected Credit Losses sponsored by UK regulators published their third Disclosures about Expected Credit Loss (DECL) report⁴⁶ in September 2022, which includes enhancements to recommendations made in their previous report along with illustrative best practice examples to further aid the quality and comparability of disclosures between large UK banks. In addition, ESMA published a report in December 2021 on the application of IFRS 7 and IFRS 9 to banks' expected credit loss disclosures citing room for improvement in the level of compliance, comparability and transparency in disclosures. We expect regulator focus to continue in this area.

Initiatives by other bodies, such as reports and surveys of the Enhanced Disclosure Task Force of the Financial Stability Board (see section 8.1 below) and the Basel Committee on Banking Supervision, may also influence the disclosures provided, particularly by financial institutions, as could other regulatory actions and initiatives.

8.1 Enhanced Disclosure Task Force

The Enhanced Disclosure Task Force ('EDTF') was a private sector group comprising representatives from financial institutions, investors and analysts, credit rating agencies and external auditors. It was formed by the Financial Stability Forum in May 2012 and its objectives included the development of principles for enhanced disclosures about market conditions and risks, including ways to enhance the comparability of those disclosures and identifying those disclosures seen as leading practice.

In October 2012, the EDTF issued its first report⁴⁷ in which seven fundamental principles for achieving enhanced risk disclosures were identified, namely that disclosures should:

- Be clear, balanced and understandable
- Be comprehensive and include all of the bank's key activities and risks
- Present relevant information
- Reflect how the bank manages its risks
- Be consistent over time
- Be comparable among banks
- And
- Be provided on a timely basis

The report also identified 32 detailed recommendations for enhancing risk disclosures, grouped under the following subjects (as well as addressing more general matters):

- Risk governance and risk management strategies/business model
- Capital adequacy and risk-weighted assets
- Liquidity
- Funding
- Market risk
- Credit risk
- And
- Other risks

These were accompanied by illustrative examples as well as observations on, and extracts from, recent reports issued by banks and were followed by three further reports charting the progress of a number of banks in applying the principles and recommendations set out in the first report. The latest of these reports noted that banks should continue to improve their credit risk disclosures. In November 2015, a few months before the EDTF was disbanded having completed its work, it published another report⁴⁸ containing guidance for banks in this area.

46 [Recommendations on a comprehensive set of IFRS 9 Expected Credit Loss disclosures](#), The Taskforce on Disclosures about Expected Credit Losses, 9 September 2022. Available on the Financial Reporting Council's website.

47 [Enhancing the Risk Disclosures of Banks](#), Enhanced Disclosure Task Force, 29 October 2012. Available on the US Financial Stability Board's website.

48 [Impact of Expected Credit Loss Approaches on Bank Risk Disclosures](#), Enhanced Disclosure Task Force, 30 November 2015. Available on the US Financial Stability Board's website.

The aims of the November 2015 guidance were to enhance banks' disclosures, help the market understand the then upcoming change in provisioning based on expected credit losses (whether under IFRS accounting standards or US GAAP) and promote consistency and comparability of disclosures across internationally active banks. It built on the existing fundamental principles and recommendations noted above and addressed the following key areas of user focus:

- Concepts, interpretations, and policies developed to implement the new expected credit loss approaches, including the significant credit deterioration assessment required by IFRS 9
 - The specific methodologies and estimation techniques developed
 - The impact of moving from an incurred to an expected credit loss approach
 - Understanding the dynamics of changes in impairment allowances and their sensitivity to significant assumptions, including those as a result of the application of macro-economic assumptions
 - Any changes made to the governance over financial reporting, and how they link with existing governance over other areas including credit risk management and regulatory reporting
- And
- Understanding the differences between the expected credit losses applied in the financial statements and those used in determining regulatory capital

In particular, it contained additional considerations regarding the application of certain of the existing 32 recommendations. Some of these were temporary, addressing the transition to an expected credit loss framework, and some are more permanent which continue to apply following the adoption of the new accounting standards.

Whilst the EDTF is not a standard setter and its recommendations are not mandatory, regulators in a number of countries have strongly encouraged their implementation, and analysts, investors and other stakeholders continue to show an interest in them. Whilst some of the recommended disclosures overlap with those required by IFRS 7, many of them are not included in any other framework or authoritative guidance. Also, although the recommendations are designed for large international banks, they should be equally relevant for other banks that actively access the major public equity or debt markets. Therefore, all major banks should assess the availability and quality of data that are necessary to provide these disclosures and, more generally, the full range of the EDTF disclosures.

9 Effective dates and transitional provisions

In April 2024, the IASB issued IFRS 18, the new IFRS accounting standard is a result of the IASB's Primary Financial Statements project, which was aimed at improving comparability and transparency of communication in financial statements. It will replace IAS 1. While several sections will be brought forward from IAS 1, with limited wording changes, IFRS 18 introduces new requirements on presentation within the statement of profit or loss, including specified totals and subtotals. It also requires disclosure of management-defined performance measures and includes new requirements for aggregation and disaggregation of financial information based on the identified 'roles' of the primary financial statements and the notes. These new requirements are expected to impact all reporting entities. Narrow scope amendments have been made to IAS 7 and some requirements previously included within IAS 1 have been moved to IAS 8, which will also be renamed IAS 8 *Basis of Preparation of Financial Statements*. IAS 34 will be amended to require disclosure of management-defined performance measures. Minor consequential amendments to other standards have also been made. IFRS 18, and the amendments to the other standards, is effective for annual reporting periods beginning on or after 1 January 2027, but earlier application is permitted and must be disclosed. IFRS 18 will apply retrospectively. See Chapter 4 for further details on the transitional provisions and impact on disclosures because of implementing IFRS 18. This chapter addresses a number of requirements of IAS 1 that are relevant to financial instruments. Where those requirements are brought forward into IFRS 18 (or IAS 8)⁴⁹ without substantive change, references to IFRS 18 (or IAS 8) have been added. Where those matters have changed, this is footnoted and a cross-reference to Chapter 4 added.

In May 2024, the IASB issued *Amendments to IFRS 9 and IFRS 7, Amendments to the Classification and Measurement of Financial Instruments*. The amendments to IFRS 7 require additional disclosures for financial assets and liabilities with contractual terms that reference a contingent event (including those that are ESG-linked) as discussed in section 4.2.3 above, and equity instruments classified at fair value through other comprehensive income, as discussed in section 4.4.4 above. The amendments to IFRS 9 are addressed in Chapter 44. The amendments are effective for annual reporting periods beginning on or after 1 January 2026, however entities with annual reporting periods beginning before 1 January 2026 can either early adopt all the amendments at the same time or early adopt only the amendments relating to the classification of financial assets and their related disclosures and apply the other amendments from the effective date. The amendments apply retrospectively with an adjustment to the opening balance of financial assets and financial liabilities, with the cumulative effect as an adjustment to the retained earnings opening balance. Prior periods are not required to be restated and can only be restated without using hindsight. Entities are required to disclose information about financial assets that changed their measurement category as a result of applying the amendments. At the date of initial application of the amendments, an entity must disclose the measurement category and carrying amount of each class of financial assets, as determined using paragraph 6 of IFRS 7 (see section 3.3 above), immediately before and after the application of the amendments. [IFRS 9.7.2.49].

Below is one example of how this disclosure might look.

Illustration 9-1: Financial assets that changed their measurement category

	Before change in measurement category		After change in measurement category	
	Measurement category	Carrying amount	Measurement category	Carrying amount
		CU'000		CU'000
Class A ^(a)	Fair value through profit or loss	XXX	Amortised cost	YYY

(a) Assume Class A contains financial assets with contingent features that meet the SPPI criteria for the first time as a result of the amendments.

⁴⁹ IAS 8 'Basis of Preparation of Financial Statements' effective for reporting periods beginning on or after 1 January 2027 (with earlier application permitted).

IFRS 19 *Subsidiaries without Public Accountability: Disclosures* was issued by the IASB in May 2024 (and was updated in August 2025) to simplify the preparation of financial statements by eligible subsidiaries. Eligible subsidiaries that elect to apply IFRS 19 are allowed to provide reduced disclosures while still applying the recognition, measurement and presentation requirements in other IFRS accounting standards. IFRS 19 contains certain disclosure requirements that are similar to that of IFRS 7 but these have been scaled down in order to achieve the objective of reduced disclosure requirements for eligible subsidiaries. For example, all entities will be required to disclose the inputs, assumptions and estimation techniques used to calculate the loss allowance and explain the changes in the loss allowance and the reason for such change. [IFRS 19.65-67]. However, only entities that provide financing to customers as a main business activity as defined by IFRS 18 will need to provide disclosures in relation how significant increase in credit risk is determined and entity's definition of default. [IFRS 19.68-71]. IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). See Chapter 4 for further details on IFRS 19, including the relevant eligibility criteria.

In December 2024, the IASB published *Amendments to IFRS 9 and IFRS 7 - Contracts Referencing Nature-dependent Electricity*. The IFRS 7 disclosure amendments must be applied when the amendments to IFRS 9 are applied. If an entity does not restate comparative information, then the entity must not present comparative disclosures. When first applying the amendments, the entity need not disclose the quantitative information that would otherwise be required by paragraph 28(f) of IAS 8.

10 Future developments

The IASB has no active project to comprehensively address the presentation and disclosure of financial instruments. However, we can expect to see a gradual evolution of disclosure requirements in the light of practical experience. For example, the IASB performs post-implementation reviews and issues amendments to clarify requirements or add disclosure requirements.

10.1 Post-implementation Review of IFRS 9 Financial Instruments - Impairment

The IASB completed its *Post-implementation Review of IFRS 9 Financial Instruments - Impairment* in July 2024.⁵⁰ As part of this review, the IASB requested information on the application of the credit risk disclosures of IFRS 7. The summary report published by the IASB concluded that the standard works as intended and provides useful information to users of financial instruments and the requirements can be applied consistently. However, further clarification and application guidance is needed in some areas to support greater consistency in application. As a result, the IASB has added to its research pipeline targeted improvements to the disclosure requirements about credit risk which may result in amendments to IFRS 7 in due course. Additionally, the IASB will consider as part of the Amortised Cost Measurement project, potential clarifications and application guidance about assessing whether changes in expected cash flow of a financial asset should be accounted for as a modification or a derecognition and the intersection of the modification requirements with the requirements for purchased or originated credit impaired financial assets. This outcome of this project may result in amendments to IFRS 7.

10.2 Disclosures about uncertainties: climate-related examples

In July 2025, the IASB released the near-final staff draft *Disclosures about Uncertainties in the Financial Statements Illustrated using Climate-related Examples-Illustrative Examples*⁵¹ to help improve reporting of financial information on climate-related and other uncertainties in the financial statements. The IASB expects the final illustrative examples accompanying IFRS accounting standards to be issued in October 2025. The near-final staff draft contains six proposed examples to IFRS accounting standards that illustrate how an entity applies the requirements in those standards to report the effects of climate-related and other uncertainties in its financial statements. The proposed examples mostly focus on climate-related uncertainties, but the principles and requirements illustrated apply equally to other types of uncertainties.

One of these proposed examples explains how the requirements in paragraphs 35A to 38 of IFRS 7, discussed in more detail in section 5.3 above, can be approached. In this proposed example, an entity is a financial institution that provides a range of products to various types of customers. As part of its credit risk management practices, the entity considers the effects of various risks on its credit risk exposures, including climate-related risks (specifically in this example, drought risk for agricultural customers and risk of flooding for loans secured on real estate). Consequently, the entity considers what information to disclose about the effects of climate-related risks on its exposure to credit risk. For example, an entity might disclose the following:

- An explanation of the entity's credit risk management practices related to climate-related risks and how those practices relate to the recognition and measurement of expected credit losses.
- An explanation of how climate-related risks were incorporated in the inputs, assumptions and estimation techniques used to measure the expected credit loss in Section 5.5 of IFRS 9. For example, an entity may disclose:
 - Information about how climate-related risks were incorporated into the modelling of expected credit losses
 - Or
 - Information about the use of judgement-based adjustments (i.e. overlays or post-model adjustments).
- Information about collateral held as security and other credit enhancements, including information about properties held as collateral that are subject to flood risk and whether that risk is insured.
- Information about concentrations of climate-related risk.

No effective date or transition requirements are proposed as materials accompanying IFRS accounting standards, including illustrative examples, are not an integral part of those standards.

50 [Post Implementation Review IFRS 9 Financial Instruments Impairment July 2024](#). Available on the IFRS Foundation's website.

51 [Near-final staff draft-Disclosures about Uncertainties in the Financial Statements Illustrated using Climate-related Examples](#). Available on the IFRS Foundation's website.

10.3 Financial Instruments with Characteristics of Equity

In November 2023, the IASB published an Exposure Draft *Financial Instruments with Characteristics of Equity* - proposed amendments to IAS 32 *Financial Instruments: Presentation*, IFRS 7: *Financial Instruments: Disclosures* and IAS 1 *Presentation of Financial Statements*. The exposure draft, whose comment period ended in March 2024, proposes enhanced presentation and disclosure requirements for financial liabilities and equity instruments and aims to improve the information provided about features of financial liabilities and equity instruments that would not otherwise be apparent from their classification. The exposure draft therefore proposes to expand the objectives of IFRS 7 to also provide information on how the entity is financed, its capital resources and its ownership structure, including potential dilution of the ownership structure from financial instruments issued at the reporting date. The proposed amendments include significant additions to the existing IFRS 7 disclosure requirements. At the time of writing, the IASB is in the process of discussing the detailed feedback gathered from comment letters and outreach meetings with users of financial statements on the exposure draft. It is currently planned that the final amendments will be issued in 2026. See Chapter 43 for further details and the tentative decisions reached by the IASB.

10.4 Dynamic Risk Management Project

The IASB has for many years had on its agenda a project in relation to Dynamic Risk Management (DRM), that aims to comprehensively address the application of hedge accounting to macro hedges (also known as portfolio hedging), and this is discussed in more detail in Chapter 49. At the time of writing, the IASB plans to issue an exposure draft towards the end of 2025 and we expect the exposure draft to propose adding a number of related disclosure requirements to IFRS 7 where an entity elects to apply DRM hedge accounting, including information about:

- An entity's interest rate risk management strategy and how it is applied dynamically to manage repricing risk
- How an entity's dynamic interest rate risk management activities affect the amount, timing and uncertainty of its future cash flows
- And
- The effect the entity's dynamic interest rate risk management activities have on the financial statements.⁵²

Where an entity that satisfies the requirements in IFRS 9 but chooses not to apply DRM hedge accounting, the IASB proposes that it shall provide a qualitative explanation to enable users of its financial statements to understand how the entity manages its exposure to repricing risk.⁵³

It is expected that entities will also be required to provide specific transition disclosures in the financial statements⁵⁴ about the effects of transitioning to the DRM model.

Appendix B - Defined terms

Extract from IFRS standards - Definitions

12-month expected credit losses	The portion of lifetime expected credit losses that represent the expected credit losses that result from default events on a financial instrument that are possible within the 12 months after the reporting date. <i>[IFRS 9 Appendix A].</i>
amortised cost of a financial asset or financial liability	The amount at which the financial asset or financial liability is measured at initial recognition minus the principal repayments, plus or minus the cumulative amortisation using the effective interest method of any difference between that initial amount and the maturity amount and, for financial assets, adjusted for any loss allowance . <i>[IFRS 9 Appendix A].</i>
contract assets	Those rights that IFRS 15 <i>Revenue from Contracts with Customers</i> specifies are accounted for in accordance with this Standard for the purposes of recognising and measuring impairment gains or losses. <i>[IFRS 9 Appendix A].</i>
credit-adjusted effective interest rate	The rate that exactly discounts the estimated future cash payments or receipts through the expected life of the financial asset to the amortised cost of a financial asset that is a purchased or originated credit-impaired financial asset . When calculating the credit-adjusted effective interest rate, an entity shall estimate the expected cash flows by considering all contractual terms of the financial asset (for example, prepayment, extension, call and similar options) and expected credit losses . The calculation includes all fees and points paid or received between parties to the contract that are an integral part of the effective interest rate (see paragraphs B5.4.1-B5.4.3), transaction costs , and all other premiums or discounts. There is a presumption that the cash flows and the expected life of a group of similar financial instruments can be estimated reliably. However, in those rare cases when it is not possible to reliably estimate the cash flows or the remaining life of a financial instrument (or group of financial instruments), the entity shall use the contractual cash flows over the full contractual term of the financial instrument (or group of financial instruments). <i>[IFRS 9 Appendix A].</i>
credit-impaired financial asset	<p>A financial asset is credit-impaired when one or more events that have a detrimental impact on the estimated future cash flows of that financial asset have occurred. Evidence that a financial asset is credit-impaired include observable data about the following events:</p> <ul style="list-style-type: none"> (a) significant financial difficulty of the issuer or the borrower; (b) a breach of contract, such as a default or past due event; (c) the lender(s) of the borrower, for economic or contractual reasons relating to the borrower's financial difficulty, having granted to the borrower a concession(s) that the lender(s) would not otherwise consider; (d) it is becoming probable that the borrower will enter bankruptcy or other financial reorganisation; (e) the disappearance of an active market for that financial asset because of financial difficulties; or (f) the purchase or origination of a financial asset at a deep discount that reflects the incurred credit losses. <p>It may not be possible to identify a single discrete event- instead, the combined effect of several events may have caused financial assets to become credit-impaired. <i>[IFRS 9 Appendix A].</i></p>

credit loss	The difference between all contractual cash flows that are due to an entity in accordance with the contract and all the cash flows that the entity expects to receive (i.e. all cash shortfalls), discounted at the original effective interest rate (or credit-adjusted effective interest rate for purchased or originated credit-impaired financial assets). An entity shall estimate cash flows by considering all contractual terms of the financial instrument (for example, prepayment, extension, call and similar options) through the expected life of that financial instrument. The cash flows that are considered shall include cash flows from the sale of collateral held or other credit enhancements that are integral to the contractual terms. There is a presumption that the expected life of a financial instrument can be estimated reliably. However, in those rare cases when it is not possible to reliably estimate the expected life of a financial instrument, the entity shall use the remaining contractual term of the financial instrument. <i>[IFRS 9 Appendix A].</i>
credit risk	The risk that one party to a financial instrument will cause a financial loss for the other party by failing to discharge an obligation. <i>[IFRS 7 Appendix A].</i>
credit risk rating grades	Rating of credit risk based on the risk of a default occurring on the financial instrument. <i>[IFRS 7 Appendix A].</i>
currency risk	The risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in foreign exchange rates. <i>[IFRS 7 Appendix A].</i>
derecognition	The removal of a previously recognised financial asset or financial liability from an entity's statement of financial position. <i>[IFRS 9 Appendix A].</i>
derivative	A financial instrument or other contract within the scope of this Standard with all three of the following characteristics. (a) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the 'underlying'). (b) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors. (c) it is settled at a future date. <i>[IFRS 9 Appendix A].</i>
dividends	Distributions of profits to holders of equity instruments in proportion to their holdings of a particular class of capital. <i>[IFRS 9 Appendix A].</i>
effective interest method	The method that is used in the calculation of the amortised cost of a financial asset or a financial liability and in the allocation and recognition of the interest revenue or interest expense in profit or loss over the relevant period. <i>[IFRS 9 Appendix A].</i>

effective interest rate	The rate that exactly discounts estimated future cash payments or receipts through the expected life of the financial asset or financial liability to the gross carrying amount of a financial asset or to the amortised cost of a financial liability . When calculating the effective interest rate, an entity shall estimate the expected cash flows by considering all the contractual terms of the financial instrument (for example, prepayment, extension, call and similar options) but shall not consider the expected credit losses . The calculation includes all fees and points paid or received between parties to the contract that are an integral part of the effective interest rate (see paragraphs B5.4.1-B5.4.3), transaction costs , and all other premiums or discounts. There is a presumption that the cash flows and the expected life of a group of similar financial instruments can be estimated reliably. However, in those rare cases when it is not possible to reliably estimate the cash flows or the expected life of a financial instrument (or group of financial instruments), the entity shall use the contractual cash flows over the full contractual term of the financial instrument (or group of financial instruments). <i>[IFRS 9 Appendix A]</i> .
equity instrument	An equity instrument is any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities. <i>[IAS 32.11]</i> .
expected credit losses	The weighted average of credit losses with the respective risks of a default occurring as the weights. <i>[IFRS 9 Appendix A]</i> .
fair value	The price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. <i>[IFRS 13 Appendix A]</i> .
financial asset	<p>A financial asset is any asset that is:</p> <ul style="list-style-type: none"> (a) cash; (b) an equity instrument of another entity; (c) a contractual right: <ul style="list-style-type: none"> (i) to receive cash or another financial asset from another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favourable to the entity; or (d) a contract that will or may be settled in the entity's own equity instruments and is: <ul style="list-style-type: none"> (i) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. <p>For this purpose the entity's own equity instruments do not include puttable financial instruments classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments. <i>[IAS 32.11]</i>.</p>
financial guarantee contract	A contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payment when due in accordance with the original or modified terms of a debt instrument. <i>[IFRS 9 Appendix A]</i> .

financial instrument	A <i>financial instrument</i> is any contract that gives rise to a financial asset of one entity and a financial liability or equity instrument of another entity. [IAS 32.11].
financial liability	<p>A <i>financial liability</i> is any liability that is:</p> <p>(a) a contractual obligation:</p> <ul style="list-style-type: none"> (i) to deliver cash or another financial asset to another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavourable to the entity; or <p>(b) a contract that will or may be settled in the entity's own equity instruments and is:</p> <ul style="list-style-type: none"> (i) a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose, rights, options or warrants to acquire a fixed number of the entity's own equity instruments for a fixed amount of any currency are equity instruments if the entity offers the rights, options or warrants pro rata to all of its existing owners of the same class of its own non-derivative equity instruments. Also, for these purposes the entity's own equity instruments do not include puttable financial instruments that are classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments. <p>As an exception, an instrument that meets the definition of a financial liability is classified as an equity instrument if it has all the features and meets the conditions in paragraphs 16A and 16B or paragraphs 16C and 16D. [IAS 32.11].</p>
financial liability at fair value through profit or loss	<p>A financial liability that meets one of the following conditions:</p> <ul style="list-style-type: none"> (a) it meets the definition of held for trading. (b) upon initial recognition it is designated by the entity as at fair value through profit or loss in accordance with paragraph 4.2.2 or 4.3.5. (c) it is designated either upon initial recognition or subsequently as at fair value through profit or loss in accordance with paragraph 6.7.1. [IFRS 9 Appendix A].
firm commitment	A binding agreement for the exchange of a specified quantity of resources at a specified price on a specified future date or dates. [IFRS 9 Appendix A].
forecast transaction	An uncommitted but anticipated future transaction. [IFRS 9 Appendix A].
gross carrying amount of a financial asset	The amortised cost of a financial asset , before adjusting for any loss allowance . [IFRS 9 Appendix A].
hedge ratio	The relationship between the quantity of the hedging instrument and the quantity of the hedged item in terms of their relative weighting. [IFRS 9 Appendix A].

held for trading	A financial asset or financial liability that: (a) is acquired or incurred principally for the purpose of selling or repurchasing it in the near term; (b) on initial recognition is part of a portfolio of identified financial instruments that are managed together and for which there is evidence of a recent actual pattern of short-term profit-taking; or (c) is a derivative (except for a derivative that is a financial guarantee contract or a designated and effective hedging instrument). <i>[IFRS 9 Appendix A]</i> .
impairment gain or loss	Gains or losses that are recognised in profit or loss in accordance with paragraph 5.5.8 and that arise from applying the impairment requirements in Section 5.5. <i>[IFRS 9 Appendix A]</i> .
interest rate risk	The risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market interest rates. <i>[IFRS 7 Appendix A]</i> .
interim financial report	Interim financial report means a financial report containing either a complete set of financial statements (as described in IAS 1 <i>Presentation of Financial Statements</i> (as revised in 2007)) or, when applied, IFRS 18 <i>Presentation and Disclosure in Financial Statements</i> or a set of condensed financial statements (as described in this Standard) for an interim period. <i>[IAS 34.4]</i> .
lessee	An entity that obtains the right to use an underlying asset for a period of time in exchange for consideration. <i>[IFRS 16 Appendix A]</i> .
lifetime expected credit losses	The expected credit losses that result from all possible default events over the expected life of a financial instrument. <i>[IFRS 9 Appendix A]</i> .
liquidity risk	The risk that an entity will encounter difficulty in meeting obligations associated with financial liabilities that are settled by delivering cash or another financial asset. <i>[IFRS 7 Appendix A]</i> .
loans payable	Loans payable are financial liabilities, other than short-term trade payables on normal credit terms. <i>[IFRS 7 Appendix A]</i> .
loss allowance	The allowance for expected credit losses on financial assets measured in accordance with paragraph 4.1.2, lease receivables and contract assets , the accumulated impairment amount for financial assets measured in accordance with paragraph 4.1.2A and the provision for expected credit losses on loan commitments and financial guarantee contracts . <i>[IFRS 9 Appendix A]</i> .
market risk	The risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market prices. Market risk comprises three types of risk: currency risk , interest rate risk and other price risk . <i>[IFRS 7 Appendix A]</i> .
modification gain or loss	The amount arising from adjusting the gross carrying amount of a financial asset to reflect the renegotiated or modified contractual cash flows. The entity recalculates the gross carrying amount of a financial asset as the present value of the estimated future cash payments or receipts through the expected life of the renegotiated or modified financial asset that are discounted at the financial asset's original effective interest rate (or the original credit-adjusted effective interest rate for purchased or originated credit-impaired financial assets) or, when applicable, the revised effective interest rate calculated in accordance with paragraph 6.5.10. When estimating the expected cash flows of a financial asset, an entity shall consider all contractual terms of the financial asset (for example, prepayment, call and similar options) but shall not consider the expected credit losses , unless the financial asset is a purchased or originated credit-impaired financial asset , in which case an entity shall also consider the initial expected credit losses that were considered when calculating the original credit-adjusted effective interest rate . <i>[IFRS 9 Appendix A]</i> .

other price risk	The risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market prices (other than those arising from interest rate risk or currency risk), whether those changes are caused by factors specific to the individual financial instrument or its issuer or by factors affecting all similar financial instruments traded in the market. <i>[IFRS 7 Appendix A].</i>
past due	A financial asset is past due when a counterparty has failed to make a payment when that payment was contractually due. <i>[IFRS 9 Appendix A].</i>
purchased or originated credit-impaired financial asset	Purchased or originated financial asset(s) that are credit-impaired on initial recognition. <i>[IFRS 9 Appendix A].</i>
puttable instrument	<i>A puttable instrument is a financial instrument that gives the holder the right to put the instrument back to the issuer for cash or another financial asset or is automatically put back to the issuer on the occurrence of an uncertain future event or the death or retirement of the instrument holder. [IAS 32.11].</i>
reclassification date	The first day of the first reporting period following the change in business model that results in an entity reclassifying financial assets. <i>[IFRS 9 Appendix A].</i>
regular way purchase or sale	A purchase or sale of a financial asset under a contract whose terms require delivery of the asset within the time frame established generally by regulation or convention in the marketplace concerned. <i>[IFRS 9 Appendix A].</i>
transaction costs	Incremental costs that are directly attributable to the acquisition, issue or disposal of a financial asset or financial liability (see paragraph B5.4.8). An incremental cost is one that would not have been incurred if the entity had not acquired, issued or disposed of the financial instrument. <i>[IFRS 9 Appendix A].</i>

Overview	4431
1 Introduction	4432
1.1 Overview of IFRS 17	4432
2 The objective, definitions and scope of IFRS 17	4434
2.1 The objective of IFRS 17	4434
2.2 Definitions	4434
2.3 Scope	4434
2.3.1 Transactions not within the scope of IFRS 17	4436
2.3.1.A Product warranties	4437
2.3.1.B Financial guarantee contracts	4438
2.3.1.C Direct insurance contracts in which the entity is the policyholder	4439
2.3.1.D Credit card contracts (or similar contracts) that provide insurance coverage	4439
2.3.2 Fixed-fee service contracts	4441
2.3.3 Loan contracts that transfer significant insurance risk only on settlement of the policyholder's obligation created by the contract	4442
2.3.4 Other accounting standards which affect insurers	4443
3 The definition of an insurance contract	4445
3.1 The definition	4445
3.2 Uncertain future events	4446
3.3 Payments in kind	4447
3.4 The distinction between insurance risk and financial risk	4447
3.4.1 Insurable interest	4448
3.4.2 Lapse, persistency and expense risk	4449
3.4.3 Insurance of non-insurance risks	4449
3.5 Significant insurance risk	4449
3.5.1 Quantity of insurance risk	4450
3.5.2 The level at which significant insurance risk is assessed	4451
3.5.2.A Self insurance	4451
3.5.2.B Mutual insurers	4451
3.5.2.C Intragroup insurance contracts	4452
3.5.3 Significant additional amounts	4452

3.6	Changes in the level of insurance risk	4453
3.7	Examples of insurance and non-insurance contracts	4454
3.7.1	Examples of insurance contracts	4455
3.7.2	Examples of transactions that are not insurance contracts	4456
4	Combining insurance contracts	4458
5	Separating components from an insurance contract	4460
5.1	Separating embedded derivatives from an insurance contract	4461
5.2	Separating investment components from an insurance contract	4463
5.2.1	The definition of an investment component	4464
5.2.2	Separable investment components	4466
5.2.3	Measurement of the non-distinct investment component	4469
5.3	Goods or services other than insurance contract services	4471
6	Level of aggregation	4473
6.1	Identifying portfolios	4474
6.1.1	Separation of insurance components within an insurance contract	4475
6.2	Groups of insurance contracts	4476
6.2.1	Identifying groups based on profitability	4477
6.2.2	'Annual cohorts'	4479
6.2.2.A	Contracts with intergenerational sharing of risks	4481
6.3	Identifying groups for contracts applying the premium allocation approach	4482
7	Initial recognition	4483
7.1	Initial recognition of insurance and reinsurance contracts issued	4483
7.2	Initial recognition of reinsurance contracts held	4484
7.3	Initial recognition of insurance acquisition cash flows	4486
7.4	Initial recognition of investment contracts with discretionary participation features	4487
8	Measurement - overview	4488
8.1	Overview of the general model	4488
8.2	Modifications to the general model	4489
8.3	Insurance contracts in a foreign currency	4489
9	Measurement - General Model	4494
9.1	The contract boundary	4494
9.1.1	Options to add insurance coverage	4500
9.1.2	Constraints or limitations relevant in assessing repricing	4501
9.1.3	Contract boundary matters related to insurance acquisition cash flows	4502
9.2	Estimates of expected future cash flows	4503
9.2.1	Market variables and non-market variables	4504
9.2.1.A	Market variables	4505
9.2.1.B	Non-market variables	4506
9.2.2	Using current estimates	4506

9.2.3	Cash flows within the contract boundary	4508
9.2.3.A	Premium cash flows	4510
9.2.3.B	Payments to (or on behalf of) a policyholder	4510
9.2.3.C	Payments to (or on behalf of) a policyholder that vary depending on returns on underlying items	4510
9.2.3.D	Payments to (or on behalf of) a policyholder resulting from derivatives	4510
9.2.3.E	Insurance acquisition cash flows	4510
9.2.3.F	Claims handling costs	4511
9.2.3.G	Costs incurred in providing contractual benefits in kind	4511
9.2.3.H	Policy administration and maintenance costs	4511
9.2.3.I	Transaction-based taxes	4511
9.2.3.J	Payments by the insurer in a fiduciary capacity	4511
9.2.3.K	Potential inflows from recoveries	4511
9.2.3.L	An allocation of fixed and variable overheads	4512
9.2.3.M	Costs incurred in providing investment activity, investment-return and investment-related services	4512
9.2.3.N	Any other costs	4513
9.2.4	Cash flows excluded from the contract boundary	4514
9.3	Discount rates	4514
9.3.1	Discount rates consistent with characteristics of cash flows	4517
9.3.2	Current discount rates consistent with observable market prices	4519
9.3.3	'Bottom-up' or 'top-down' approach	4519
9.4	Risk adjustment for non-financial risk	4522
9.4.1	Techniques used to estimate the risk adjustment for non-financial risk	4524
9.4.2	Presentation of the risk adjustment for non-financial risk in the statement of comprehensive income	4527
9.5	Contractual service margin	4527
9.5.1	Initial recognition	4527
9.6	Subsequent measurement	4529
9.6.1	The liability for remaining coverage	4531
9.6.2	The liability for incurred claims	4532
9.6.3	Subsequent measurement of the contractual service margin (for insurance contracts without direct participation features)	4533
9.7	Allocation of the contractual service margin to profit or loss	4536
9.7.1	Allocating the contractual service margin on the basis of coverage units determined by considering both insurance coverage and any investment return service	4544
9.8	Onerous contracts	4546
9.9	Reinsurance contracts issued	4548
9.9.1	The contract boundary of a reinsurance contract issued	4549
9.9.2	Issued adverse loss development covers	4549
9.9.3	Accounting for ceding commissions and reinstatement premiums	4550
9.9.4	Determining the quantity of benefits for identifying coverage units	4553
9.10	Impairment of assets recognised for insurance acquisition cash flows	4554
9.11	Insurance contracts issued by mutual entities	4556

9.12	Amounts receivable from an intermediary	4556
9.13	Other matters	4559
9.13.1	Impairment of insurance receivables	4559
9.13.2	Policyholder loans	4559
10	Premium allocation approach	4560
10.1	Criteria for use of the premium allocation approach	4561
10.1.1	Main sources of difference between the premium allocation approach and the general approach	4562
10.1.1.A	Changing expectations of profitability for the period of remaining coverage	4562
10.1.1.B	Changing interest rates	4562
10.1.1.C	Uneven revenue recognition patterns	4562
10.1.2	Applying materiality for the premium allocation approach eligibility assessment	4563
10.2	Elections under the premium allocation approach	4564
10.3	Measurement of the liability for remaining coverage on initial recognition	4566
10.4	Subsequent measurement - liability for remaining coverage	4568
10.5	Subsequent measurement - liability for incurred claims	4569
11	Reinsurance contracts held	4571
11.1	Level of aggregation	4573
11.2	The boundary of a reinsurance contract held	4573
11.3	Recognition	4577
11.4	Measurement - initial recognition	4577
11.4.1	Initial measurement - fulfilment cash flows	4577
11.4.2	Measurement at initial recognition - contractual service margin	4578
11.4.3	Initial measurement of reinsurance held of underlying insurance contracts that are onerous at initial recognition	4580
11.4.4	Initial measurement of the effect of the risk of non-performance	4583
11.5	Subsequent measurement of reinsurance contracts held	4584
11.5.1	Changes to the contractual service margin that result from changes in estimates of cash flows	4585
11.5.1.A	Subsequent measurement of non-performance risk	4587
11.5.1.B	Subsequent measurement of a loss-recovery component	4587
11.5.2	Allocation of the contractual service margin to profit or loss	4590
11.5.2.A	Retroactive reinsurance	4590
11.6	Premium allocation approach for reinsurance contracts held	4591
11.7	Reinsurance contracts held and the variable fee approach	4592
12	Measurement of contracts with participation features	4593
12.1	Contracts with cash flows that affect or are affected by cash flows to policyholders of other contracts (mutualisation)	4595
12.2	Participating insurance contracts without direct participation features	4598
12.3	Contracts with direct participation features	4599
12.3.1	Definition of an insurance contract with direct participation features	4601
12.3.1.A	A share of a clearly defined pool of underlying items	4601
12.3.1.B	A substantial share of the fair value returns on the underlying items	4602
12.3.1.C	A substantial proportion of any change in the amounts to be paid to the policyholder to vary with the change in fair value of the underlying items	4605

12.3.2	Measurement of the risk adjustment for non-financial risk using the variable fee approach	4605
12.3.3	Measurement of the contractual service margin using the variable fee approach	4605
12.3.4	Allocation of the contractual service margin to profit or loss	4607
12.3.5	Risk mitigation	4607
12.3.6	Disaggregation of insurance finance income or expenses between profit or loss and other comprehensive income	4609
12.4	Investment contracts with discretionary participation features	4610
12.4.1	Contracts with switching features	4612
13	Contract modification and derecognition	4613
13.1	Modifications of insurance contracts	4613
13.2	Derecognition of insurance contracts	4614
13.3	Accounting for derecognition	4615
13.3.1	Derecognition resulting from extinguishment	4615
13.3.2	Derecognition resulting from transfer	4615
13.3.3	Derecognition resulting from modification	4616
13.3.4	Reclassification adjustments arising from derecognition	4617
13.3.5	Contracts applying the premium allocation approach that are derecognised	4617
13.4	Derecognition of assets for insurance acquisition cash flows paid before the related group of insurance contracts is recognised as an asset	4617
14	Acquisition of insurance contracts	4618
14.1	Assets for insurance acquisition cash flows acquired in a business combination within the scope of IFRS 3 or a transfer of insurance contracts that do not form a business	4622
14.2	Subsequent treatment of contracts acquired in their settlement period	4622
14.3	Business combinations under common control	4624
14.4	Portfolio transfers - practical issues	4625
14.4.1	The difference between a business combination and a transfer of insurance contracts that do not form a business	4625
14.4.2	Deferred taxation	4625
14.4.3	Customer lists and relationships not connected to insurance contracts	4626
15	Presentation	4627
15.1	Statement of financial position	4627
15.2	Statement of financial performance	4628
15.2.1	Insurance revenue	4631
15.2.1.A	Insurance revenue related to the provision of services in a period	4633
15.2.1.B	Revenue under the premium allocation approach	4636
15.2.1.C	Income or expense from reinsurance contracts held	4636
15.2.2	Insurance service expense	4637

15.3	Insurance finance income or expenses	4637
15.3.1	Presentation of insurance finance income or expenses in the statement of comprehensive income	4638
15.3.2	Allocating insurance finance income or expenses for contracts except those with direct participation features for which the entity holds the underlying items	4641
15.3.2.A	Allocating insurance finance income or expenses for contracts for which changes that relate to financial risk do not have a substantial effect on the amounts paid to the policyholder	4642
15.3.2.B	Allocating insurance finance income or expense for contracts for which changes in assumptions that relate to financial risk have a substantial effect on amounts paid to policyholders	4643
15.3.3	Allocating insurance finance income or expenses for incurred claims when applying the premium allocation approach	4646
15.3.4	Allocating finance income or expenses for insurance contracts with direct participation features for which the entity holds the underlying items	4646
15.4	Reporting the contractual service margin in interim financial statements	4649
16	Disclosure	4652
16.1	Explanation of recognised amounts	4653
16.1.1	Reconciliations required for contracts applying the general model	4654
16.1.2	Information about contracts to which the entity applies the premium allocation approach	4659
16.1.2.A	Accounting policies adopted for contracts applying the premium allocation approach	4659
16.1.2.B	Reconciliations required for contracts applying the premium allocation approach	4660
16.1.3	Explanation of the total amount of insurance finance income or expenses in each reporting period	4660
16.2	Transition amounts	4661
16.3	Significant judgements made in applying IFRS 17	4662
16.4	Disclosure of accounting policy information	4665
16.5	Disclosure about the nature and extent of risks	4667
16.5.1	Concentrations of risk	4668
16.5.2	Insurance and market risks - sensitivity analysis	4669
16.5.3	Insurance risk - claims development	4670
16.5.4	Credit risk - other information	4672
16.5.5	Liquidity risk - other information	4672
16.5.6	Regulatory disclosures	4674
16.5.7	Disclosures required by IFRS 7 and IFRS 13	4675
16.5.8	Key performance indicators and management performance measures	4675
17	Effective date and transition	4676
17.1	Effective date	4676
17.2	Transition - general requirements	4676
17.2.1	Transitional relief and prohibition - all entities	4678
17.2.1.A	Disclosure relief	4679
17.2.1.B	Prohibition from applying the risk mitigation prior to the transition date	4679
17.2.1.C	Business combinations within the scope of IFRS 3 before initial application of IFRS 17	4679
17.2.2	Disclosures about the effect of transition	4679

17.3	Retrospective application of transition	4680
17.4	Modified retrospective approach	4682
17.4.1	Assessments at inception or initial recognition	4683
17.4.2	Determining the contractual service margin or loss component for groups of insurance contracts without direct participation features	4683
17.4.3	Determining the contractual service margin or loss component for groups of insurance contracts with direct participation features	4686
17.4.4	Insurance finance income or expenses	4688
17.4.4.A	Groups of insurance contracts that include contracts issued more than one year apart	4689
17.4.4.B	Groups of insurance contracts that do not include contracts issued more than one year apart	4690
17.5	Fair value approach	4691
17.5.1	Disaggregated insurance finance income or expenses using the fair value approach	4694
17.5.2	Asset for insurance acquisition cash flows using the fair value approach	4695
17.6	Redesignation of financial assets and financial liabilities - when IFRS 9 has been applied previously	4696
17.6.1	Redesignation of financial assets	4696
17.6.2	Redesignation of financial liabilities	4698
17.7	Entities that have not previously applied IFRS 9	4699
17.7.1	Classification and measurement under the classification overlay	4700

Overview

This chapter deals with IFRS 17 *Insurance Contracts* (IFRS 17 or the standard) which was issued in May 2017 and amended in June 2020 and December 2021. IFRS 17 addresses the recognition, measurement, presentation and disclosure of insurance contracts issued, reinsurance contracts held and investment contracts with discretionary participation features issued.

IFRS 17 is effective for accounting periods beginning on or after 1 January 2023 and supersedes IFRS 4 *Insurance Contracts*. IFRS 4 did not prescribe detailed measurement and recognition requirements for insurance contracts but, instead, largely permitted insurers to continue to use their accounting practices (local GAAP) prior to adoption of IFRS accounting standards. IFRS 17, therefore, represents a fundamental change for insurers which requires the same recognition and measurement model instead of diverse local GAAPs.

The general model in IFRS 17 requires insurance contract liabilities to be measured using discounted probability-weighted current estimates of future cash flows, a risk adjustment for non-financial risk and a contractual service margin representing the profit expected from fulfilling the contracts. Insurance revenue is recognised as services are provided. IFRS 17 also has specific modifications to the general model including a simplified measurement approach, the premium allocation approach, intended for short-term contracts, and an adaptation of the general model, the variable fee approach, for contracts with direct participation features. There are also modifications to the basic measurement rules for reinsurance contracts held, which must be accounted for separately from the underlying insurance contracts issued.

IFRS 17 is a complex standard that covers the accounting for a wide range of contracts that insurers and non-insurers issue globally and provides detailed guidance on many areas (such as contract boundaries, contract aggregation for measurement purposes, modifications of contracts and business combination accounting) on which IFRS 4 was silent. The transition requirements must be applied retrospectively unless impractical and in which case IFRS 17 addresses how insurers deal with impracticability by requiring two alternative approaches to fully retrospective application, a modified retrospective approach and a fair value approach.

The degree of change compared to previous practice under IFRS 4 varies based on existing accounting policies and the types of business insurers write. However, the change is significant for nearly all types of insurance contracts.

What you need to know

- IFRS 17 applies to all entities that issue insurance contracts, not just entities regulated as an insurer. Therefore, non-insurers may be affected by IFRS 17, if they issue contracts that meet the definition of an insurance contract, as they are no longer permitted to use previous accounting practices, such as IFRS 15 *Revenue from Contracts with Customers* or IFRS 9 *Financial Instruments*, unless there is a specific exemption from applying IFRS 17 to those contracts.
- IFRS 17 is effective for annual reporting periods beginning on or after 1 January 2023. The basic principle in the standard is that it must be adopted retrospectively with restatement of the comparative period(s) presented. However, if fully retrospective application is impracticable, two alternative measurement approaches are available.
- IFRS 17 is a complex standard with an accounting model that combines a current balance sheet measurement of insurance contracts with recognition of profit over the period that services are provided.
- IFRS 17 is a significant change for many entities issuing insurance contracts as their previous accounting policies under IFRS 4 differ considerably from those under IFRS 17. The costs involved in implementing IFRS 17 are generally substantial because of the need for significant system changes.

1 Introduction

The International Accounting Standards Board (IASB) issued IFRS 17 in May 2017. In June 2020, IFRS 17 was amended by *Amendments to IFRS 17* (the June 2020 amendments) and in December 2021, IFRS 17 was amended by *Initial Application of IFRS 17 and IFRS 9 - Comparative Information* (the December 2021 amendments). Following these amendments, IFRS 17 became effective for annual periods beginning on or after 1 January 2023, with early application permitted, provided an entity also applied IFRS 9 at the same time.

IFRS 17 superseded IFRS 4, an interim standard that allowed entities to use a wide variety of accounting practices for insurance contracts, that reflected national accounting requirements and variations of those requirements. The IASB had always intended to replace IFRS 4; the differences in accounting treatment across jurisdictions and practices made it difficult for investors and analysts to understand and compare insurers' results. Most stakeholders agreed on the need for a common global insurance accounting standard even though opinions varied as to what it should contain. Long-term and complex insurance risks are difficult to reflect in the measurement of insurance contracts. In addition, insurance contracts are subject to several measurement challenges. Some previous accounting practices under IFRS 4 did not adequately reflect the true underlying financial position or the financial performances of these insurance contracts.

[IFRS 17.BC1, IFRS 17.BC4].

More than 20 years in development, IFRS 17 represents a complete overhaul of accounting for insurance contracts. The standard is intended to increase the transparency of insurers' financial positions and performance and make their financial statements more comparable with both other insurers and other industries.

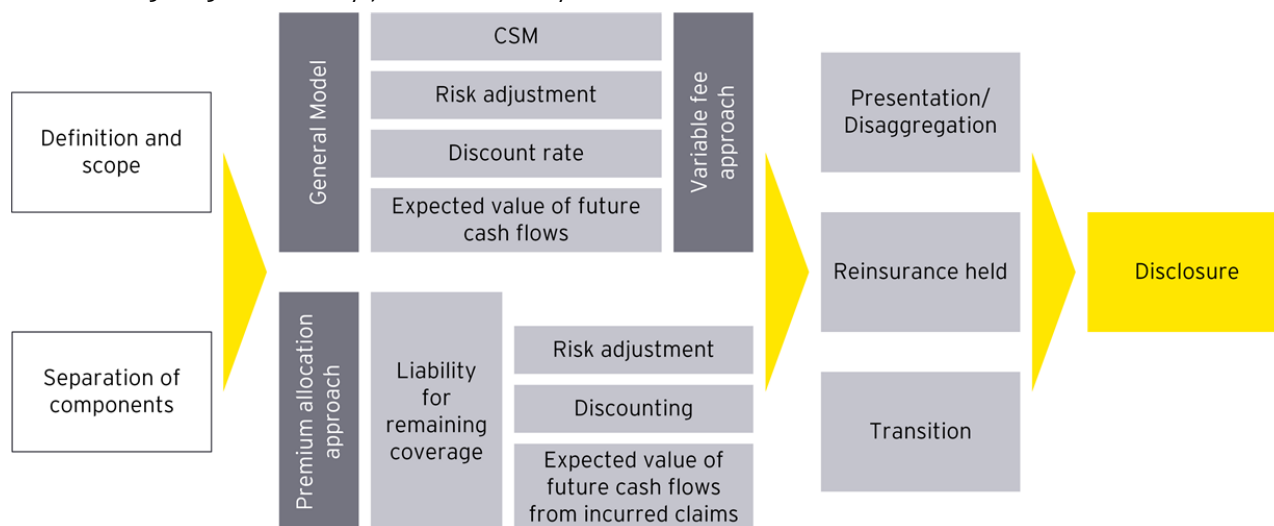

IFRS 17 applies a current value approach to measuring insurance contracts and recognises profit as insurers provide services to policyholders. The profit or loss earned from underwriting activities are reported separately from financing activities. Detailed note disclosures explain how items like new business issued, experience in the year, cash receipts and payments, and changes in assumptions affected the performance and the carrying amount of insurance contracts.

The changes in financial reporting that come with IFRS 17 affects both preparers of financial statements and users. Users of financial statements will now receive more and different information about an entity's insurance contracts in the IFRS financial statements than in the past, which may change the way they assess and compare insurers. Preparers will need to help analysts and other users of their financial statements to interpret IFRS 17 information and understand how it relates to what they received previously when IFRS 4 was applied.

1.1 Overview of IFRS 17

IFRS 17 establishes principles for the recognition, measurement, presentation and disclosure of insurance contracts issued, reinsurance contracts held and investment contracts with discretionary participation features that an entity issues.

The following diagram visually presents the key features of the standard:

IFRS 17 reflects the Board's view that an insurance contract combines features of both a financial instrument and a service contract. In addition, many insurance contracts generate cash flows with substantial variability over a long period. To provide useful information about these features, the Board developed an approach that:

- Combines current measurement of the future cash flows with the recognition of profit over the period that services are provided under the contract
- Presents insurance service results (including presentation of insurance revenue) separately from insurance finance income or expenses
- Requires an entity to make an accounting policy choice on a portfolio basis whether to recognise all insurance finance income or expense for the reporting period in profit or loss or to recognise some of that income or expense in other comprehensive income [IFRS 17.BC16]

Overall, IFRS 17 results in: [IFRS 17.BC26]

- The measurement of the liability for remaining coverage and the resulting profit and revenue recognition for a group of insurance contracts being broadly consistent with IFRS 15 - except that:
 - For insurance contracts without direct participation features, the measurement is updated for changes in financial assumptions
 - For insurance contracts with direct participation features, the measurement is also updated for changes in financial assumptions which include changes in the fair value of the items in which the entity and the policyholder participate ('underlying items')
- The liability for a group of insurance contracts relating to incurred claims being measured is broadly consistent with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*

An entity may apply a simplified measurement approach (the premium allocation approach) to some insurance contracts. This simplified measurement approach allows an entity to measure the amount relating to remaining service by allocating the premium as insurance revenue over the coverage period.

The transition provisions under IFRS 17 require a full retrospective application of the standard unless it is impracticable, in which case, entities must apply either a modified retrospective approach or a fair value approach (see section 17.2 below).

Following the issuance of IFRS 17, the IASB created a Transition Resource Group (TRG). The members of the TRG include financial statement preparers and auditors with both practical and direct knowledge of implementing IFRS 17. The TRG members work in different countries and regions. The TRG's purpose is to:

- Provide a public forum for stakeholders to follow the discussion of questions raised on implementation.
- Inform the IASB in order to help it determine what, if any, action will be needed to address those questions. Possible actions include providing supporting materials such as webinars, case studies and/or referral to the Board or Interpretations Committee.

The TRG met three times in 2018 and once in 2019. As of the date of the last TRG meeting, in April 2019, a total of 127 issues had been submitted by constituents of which the TRG discussed 22 in detail. The rest are questions that:

- Were answered by IASB staff applying only the requirements in IFRS 17
 - Did not meet the submission criteria
- Or
- Were considered through a process other than a TRG discussion (e.g., annual improvements or outreach)

Views expressed by the TRG have been incorporated in this chapter, as appropriate. While TRG members' views are non-authoritative, entities should consider these as they implement the standard. Since IFRS 17 became effective on 1 January 2023, the work of the TRG for IFRS 17 is complete, and support for the implementation and application of IFRS 17 is dealt with through the activities of the IASB and the Interpretations Committee.

The views expressed in this chapter may evolve as implementation continues and additional issues are identified. Conclusions in seemingly similar situations may differ from those reached in the Illustrations contained in this chapter due to differences in the underlying facts and circumstances.

2 The objective, definitions and scope of IFRS 17

2.1 The objective of IFRS 17

The objective of IFRS 17 is to ensure that an entity provides relevant information that faithfully represents the recognition, measurement, presentation and disclosure principles for insurance contracts within its scope. This information gives a basis for users of financial statements to assess the effect that insurance contracts have on the entity's financial position, financial performance and cash flows. [IFRS 17.1].

2.2 Definitions

The definitions that are relevant to the application of IFRS 17 and included within Appendix A of the standard are likewise included in Appendix C of this chapter. A list of these terms is produced below, in alphabetical order.

- Contractual service margin
- Coverage period
- Experience adjustment
- Financial risk
- Fulfilment cash flows
- Group of insurance contracts
- Insurance acquisition cash flows
- Insurance contract
- Insurance contract services
- Insurance contract with direct participation features
- Insurance contract without direct participation features
- Insurance risk
- Insured event
- Investment component
- Investment contract with discretionary participation features
- Liability for incurred claims
- Liability for remaining coverage
- Policyholder
- Portfolio of insurance contracts
- Reinsurance contract
- Risk adjustment for non-financial risk
- Underlying items

2.3 Scope

An entity must apply IFRS 17 to: [IFRS 17.3]

- Insurance contracts, including reinsurance contracts, that it issues
 - Reinsurance contracts it holds
- And
- Investment contracts with discretionary participation features that it issues, provided the entity also issues insurance contracts

How we see it

IFRS 17 does not mention a '*de minimis*' limit on the number of insurance contracts that an entity must issue to ensure that its investment contracts with discretionary participation features are within the scope of IFRS 17.

The IASB's decision, in line with IFRS 4, to retain investment contracts with discretionary participation features within the scope of the insurance contracts standard means that entities account for these contracts under IFRS 17. However, in many cases, the measurement model under IFRS 17 represents a major change from existing accounting practices applied to investment contracts with discretionary participation features under IFRS 4.

IFRS 17 specifies that all references to insurance contracts throughout the standard also apply to: [IFRS 17.4]

- Reinsurance contracts held, except:
 - For references to insurance contracts issued
 - The specific requirements for reinsurance contracts held discussed in section 11 below
- Investment contracts with a discretionary participation feature as set out above except for the reference to insurance contracts and as described in section 12.4 below

In addition, all references to insurance contracts also apply to insurance contracts acquired by an entity in a transfer of insurance contracts or a business combination other than reinsurance contracts held. [IFRS 17.5].

It can be seen from this that IFRS 17 applies to all insurance contracts (as defined in IFRS 17) throughout the duration of those contracts, regardless of the type of entity issuing the contracts. [IFRS 17.BC64]. Consistent with other IFRS accounting standards, IFRS 17 is a transaction-based standard. Consequently, non-insurance entities are within its scope if they issue contracts that meet the definition of an insurance contract.

The Board decided to base its approach to insurance contracts on the type of activity rather than on the type of the entity because: [IFRS 17.BC63]

- A robust definition of an insurer that could be applied consistently from country to country would be difficult to create.
- Entities that might meet the definition frequently have major activities in other areas as well as in insurance, and would need to determine how and to what extent these non-insurance activities would be accounted for in a manner similar to insurance activities or in a manner similar to how other entities account for their non-insurance activities.
- If an entity that issues insurance contracts accounted for a transaction in one way and an entity that does not issue insurance contracts accounted for the same transaction in a different way, comparability across entities would be reduced.

Conversely, contracts that fail to meet the definition of an insurance contract are not within the scope of IFRS 17 (unless they are investment contracts with discretionary participation features and the entity also issues insurance contracts). This will be the case even if such contracts are regulated as insurance contracts under local legislation. If a contract is not within the scope of IFRS 17, then it will need to be accounted for under other appropriate IFRS accounting standards such as IFRS 9 or IFRS 15.

An entity must consider its substantive rights and obligations, whether they arise from a contract, law or regulation, when applying IFRS 17. A contract is an agreement between two or more parties that creates enforceable rights and obligations. Enforceability of the rights and obligations in a contract is a matter of law. Contracts can be written, oral or implied by an entity's customary business practices. Contractual terms include all terms in a contract, explicit or implied, but an entity disregards terms that have no commercial substance (i.e., no discernible effect on the economics of the contract). Implied terms in a contract include those imposed by law or regulation. The practices and processes for establishing contracts with customers vary across legal jurisdictions, industries and entities. In addition, they may vary within an entity (for example, they may depend on the class of customer or the nature of the promised goods or services). [IFRS 17.2]. The Basis for Conclusions observes that these considerations are consistent with IFRS 15 and apply when an entity classifies a contract and when it assesses the substantive rights and obligations for determining the boundary of a contract. [IFRS 17.BC69].

The assessment of whether a contract is an insurance contract will include an assessment of whether the contract contains significant insurance risk (discussed in section 3.5 below). In addition, even if the contract contains significant insurance risk, an entity needs to assess whether the contract also contains embedded derivatives (discussed in section 5.1 below), distinct investment components (discussed in section 5.2 below), or a promise to provide distinct goods or services other than insurance contract services (discussed in section 5.3 below) that need to be separated and accounted for under other IFRS accounting standards.

Contracts within the scope of IFRS 17 are excluded from the scope of the following IFRS accounting standards (except for specific exceptions which are discussed separately elsewhere in this chapter):

- IFRS 7 *Financial Instruments: Disclosures*
- IFRS 9
- IFRS 15
- IAS 32 *Financial Instruments: Presentation*
- IAS 36 *Impairment of Assets*
- IAS 37
- IAS 38 *Intangible Assets*

Any assets for insurance acquisition cash flows (see section 7.3 below) are also excluded from the scope of IAS 38.

Contracts within the scope of IFRS 17 are excluded from the measurement provisions of IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*.

Contracts within the scope of IFRS 17 are not excluded from the scope of IFRS 13 *Fair Value Measurement* which means that any reference to fair value in IFRS 17 is fair value as defined and measured under IFRS 13. However, IFRS 17 does not generally require that insurance liabilities are measured at fair value except on transition in certain circumstances and, in those circumstances, IFRS 13's measurement requirements are modified to exclude the demand deposit floor (see section 17.5 below).

How we see it

IFRS 4 allowed entities to use their previous accounting policies for contracts that met the definition of an insurance contract. Hence, many non-insurance entities, such as banks and service companies, applied similar measurement guidance to that for their non-insurance contracts (e.g., IFRS 9 or IFRS 15), to account for their insurance contracts. Many contracts issued by non-insurers that were previously within the scope of IFRS 4 are also within the scope of IFRS 17. Since IFRS 17 has specific recognition, measurement and presentation requirements for insurance contracts, non-insurers that issue contracts within the scope of IFRS 17 are no longer able to apply previous accounting practices to these contracts but will have to apply the requirements of IFRS 17 instead. The effect of applying IFRS 17 to such contracts could be significant for some non-insurance entities.

The scope of IFRS 17 excludes various items that may meet the definition of insurance contracts. These are discussed in section 2.3.1 below. IFRS 17 also allows an entity a choice of applying IFRS 17 or another IFRS accounting standard to some contracts as discussed in sections 2.3.2 and 2.3.3 below.

2.3.1 Transactions not within the scope of IFRS 17

IFRS 17 excludes the following transactions that may meet the definition of insurance contracts: [IFRS 17.7]

- Warranties provided by a manufacturer, dealer or retailer in connection with the sale of its goods or services to a customer (see section 2.3.1.A below).
- Employers' assets and liabilities that arise from employee benefit plans, and retirement benefit obligations reported by defined benefit retirement plans (these are accounted for under IAS 19 *Employee Benefits*, IFRS 2 *Share-based Payment* and IAS 26 *Accounting and Reporting by Retirement Benefit Plans*).
- Contractual rights or contractual obligations contingent on the future use of, or right to use, a non-financial item (for example, some licence fees, royalties, variable and other contingent lease payments and similar items (these are accounted for under IFRS 15, IFRS 16 *Leases* and IAS 38).
- Residual value guarantees provided by the manufacturer, dealer or retailer and lessees' residual value guarantees embedded in a lease (they are accounted for under IFRS 15 and IFRS 16). However, stand-alone residual value guarantees that transfer insurance risk are not addressed by other IFRS accounting standards and are within the scope of IFRS 17. [IFRS 17.BC87(d)].
- Financial guarantee contracts, unless the issuer has previously asserted explicitly that it regards such contracts as insurance contracts and has used accounting applicable to insurance contracts (see section 2.3.1.B below).
- Contingent consideration payable or receivable in a business combination. Contingent consideration in a business combination is required to be recognised at fair value at the acquisition date with subsequent remeasurements of non-equity consideration included in profit or loss. [IFRS 3.58].
- Insurance contracts in which the entity is the policyholder, unless those contracts are reinsurance contracts held (see section 2.3.1.C below).
- Credit card contracts (or similar contracts) that provide insurance coverage (see section 2.3.1.D below).

The main scope exclusions are discussed below.

How we see it

IFRS 17 excludes residual value guarantees provided by a manufacturer, dealer or retailer, from its scope, whereas they had not been excluded from the scope of IFRS 4. This change brings residual value guarantees into line with product warranties by enabling manufacturers, dealers and retailers to apply IFRS 15 and IAS 37 and to avoid some of the complexities of the IFRS 17 general model, such as the accounting for the contractual service margin.

2.3.1.A Product warranties

Warranties provided by a manufacturer, dealer or retailer in connection with the sale of its goods or services to a customer are outside the scope of IFRS 17. [IFRS 17.7(a)]. Such warranties might provide a customer with assurance that the related product will function as the parties intended because it complies with agreed-upon specifications (called 'assurance-type warranties'), or they might provide the customer with a service in addition to the assurance that the product complies with agreed-upon specifications (called 'service-type warranties'). [IFRS 17.BC89, IFRS 15.B28].

IFRS 15.B28-B33 sets out the accounting treatment for these two types of warranties. For some entities the assessment as to whether the warranty is outside the scope of IFRS 17 will be straightforward. For other entities, we believe judgement might be needed to determine whether the scope exception applies as discussed in Chapter 28.

Without this exception, many product warranties would have been covered by IFRS 17 as they would normally meet the definition of an insurance contract. The Basis for Conclusions observes that the IASB excluded them from the scope of IFRS 17 because if the standard were to apply, entities would generally apply the premium allocation approach to such contracts, which would result in accounting similar to that which would result from applying IFRS 15. Further, in the Board's view, accounting for such contracts in the same way as other contracts with customers would provide comparable information for the users of financial statements for the entities that issue such contracts. Hence, the Board concluded that changing the existing accounting for these contracts would impose costs and disruption for no significant benefit. [IFRS 17.BC90].

Conversely, a product warranty is within the scope of IFRS 17 if it is not issued by a manufacturer, dealer or retailer in connection with the sale of its goods or services to a customer. See section 3.7.1 below.

Other types of warranty are not specifically excluded from the scope of IFRS 17. A warranty issued by a vendor to the purchaser of a business as part of the sale agreement (e.g., an indemnity clause for contingent liabilities related to tax computations of the acquired entity) is an example of a warranty that would not fall within the scope of IFRS 17 as such a warranty does not result in the transfer of a pre-existing risk (see section 3.4 below).

Accounting judgement as to whether warranties are within the scope of IFRS 17 is illustrated in Practical example 2-1 below.

Practical example 2-1: Rolls-Royce Holdings plc (2023)

CONSOLIDATED FINANCIAL STATEMENTS AND NOTES [extract]

NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]

1 Accounting policies [extract]

Revisions to IFRS applicable in 2023 [extract]

IFRS 17 Insurance Contracts [extract]

...

The Group has reviewed whether its arrangements meet the accounting definition of an insurance contract. While some contracts, including Civil Aerospace LTSAs, may transfer an element of insurance risk, they relate to warranty and service type agreements that are issued in connection with the Group's sales of its goods or services and therefore will remain accounted for under the existing revenue and provisions standards. The Directors have judged that such arrangements entered into after the original equipment sale remain sufficiently related to the sale of the Group's goods and services to allow the contracts to continue to be measured under IFRS 15 *Revenue from Contracts with Customers* and IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*.

...

How we see it

An extended warranty offered to a customer by a manufacturer, dealer or retailer concurrent with the sale of goods (e.g., a three-year extended warranty offered in addition to a one-year manufacturer's guarantee) would be a service-type warranty and outside the scope of IFRS 17. However, if the service-type warranty was issued by a subsidiary separate from the subsidiary selling the goods, the warranty would be outside the scope of IFRS 17 in the consolidated financial statements of the group but within the scope of IFRS 17 in the separate financial statements of the subsidiary (unless the fixed fee service exemption is applied in the financial statements of the subsidiary - see section 2.3.2 below).

2.3.1.B Financial guarantee contracts

A financial guarantee contract as defined by IFRS 9 is as follows: *[IFRS 9 Appendix A]*

Extract from IFRS 9

Appendix A

Defined terms

financial guarantee contract	A contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payment when due in accordance with the original or modified terms of a debt instrument.
------------------------------	---

These contracts transfer credit risk and may have various legal forms, such as a guarantee, some types of letters of credit, a credit default contract or an insurance contract. *[IFRS 17.BC91]*.

Financial guarantee contracts are excluded from the scope of IFRS 17 unless the issuer has previously asserted explicitly that it regards such contracts as insurance contracts and has used accounting applicable to insurance contracts. If so, the issuer may elect to apply either IFRS 17 or IAS 32, IFRS 7 and IFRS 9 to such financial guarantee contracts. The issuer may make that on a choice contract by contract basis, but the choice for each contract is irrevocable. *[IFRS 17.7(e)]*.

This accounting policy election is the same as was previously available in IFRS 4. The Board decided to carry forward to IFRS 17 the option to account for a financial guarantee contract as if it were an insurance contract, without any substantive changes, because the option has worked in practice and results in consistent accounting for economically similar contracts issued by the same entity. The Board did not view it as a high priority to address the inconsistency that results from accounting for financial guarantee contracts differently depending on the issuer. *[IFRS 17.BC93]*.

The IASB was concerned that entities other than credit insurers could elect to apply IFRS 4 to financial guarantee contracts and consequently (if their accounting policies permitted) recognise no liability on inception. Therefore, it imposed the restrictions outlined above. *[IFRS 9.BC22.12]*. The application guidance to IFRS 9 contains further information on these restrictions where it is explained that assertions that an issuer regards contracts as insurance contracts are typically found throughout the issuer's communications with customers and regulators, contracts, business documentation as well as in their financial statements. Furthermore, insurance contracts are often subject to accounting requirements that are distinct from the requirements for other types of transaction, such as contracts issued by banks or commercial companies. In such cases, an issuer's financial statements would typically include a statement that the issuer had used those accounting requirements, i.e., ones normally applied to insurance contracts. *[IFRS 9.B2.6]*. Nevertheless, other companies did consider it appropriate to apply IFRS 4 rather than IFRS 9 to these contracts.

It is observed in the Basis for Conclusions that some credit-related contracts lack the precondition for payment that the holder has suffered a loss. One example of such a contract is one that requires payments in response to changes in a specified credit rating or credit index. The Board concluded that those contracts are derivatives and do not meet the definition of an insurance contract. Therefore, such contracts will continue to be accounted for as derivatives under IFRS 9. The Board noted that these contracts were outside the scope of the policy choice in IFRS 4 carried forward into IFRS 17, so continuing to account for them as derivatives would not create further diversity. *[IFRS 17.BC94]*.

Accounting for financial guarantee contracts by issuers that have not elected to use IFRS 17 is discussed in Chapter 41.

Accounting for the revenue associated with financial guarantee contracts issued in connection with the sale of goods is dealt with under IFRS 15. *[IFRS 9.B2.5(c)]*.

How we see it

In our view, on transition to IFRS 17, an entity that has previously asserted explicitly that it regards financial guarantee contracts as insurance contracts and has used accounting applicable to insurance contracts may reconsider its previous election regarding accounting for financial guarantee contracts made under IFRS 4 and decide whether it would prefer to account for those contracts under IFRS 17 or IFRS 9. This is because there are no specific transition provisions either within IFRS 17 or IFRS 9 as to whether previous elections made under a different IFRS accounting standard, i.e., IFRS 4, should be continued. Hence, IFRS 17 would not prevent an entity from making new elections on application of IFRS 17. However, an entity which had not previously asserted explicitly that it regards such contracts as insurance contracts or which had not previously used accounting applicable to insurance contracts (i.e., IAS 39 *Financial Instruments: Recognition and Measurement* or IFRS 9 accounting was applied under IFRS 4) may not reconsider its previous election (either implicitly or explicitly made).

It is likely that insurers that have previously issued financial guarantee contracts and accounted for them under an insurance accounting and regulatory framework will meet the requirement to have asserted explicitly that these contracts are regarded as insurance contracts and hence will be able to reconsider its previous election. It is unlikely that an entity not subject to an insurance accounting and regulatory framework would meet this requirement because it would not have previously made the necessary assertions.

2.3.1.C Direct insurance contracts in which the entity is the policyholder

Accounting by policyholders of direct insurance contracts (i.e., those that are not reinsurance contracts) is excluded from the scope of IFRS 17. However, holders of reinsurance contracts (cedants) are required to apply IFRS 17. [IFRS 17.7(g)].

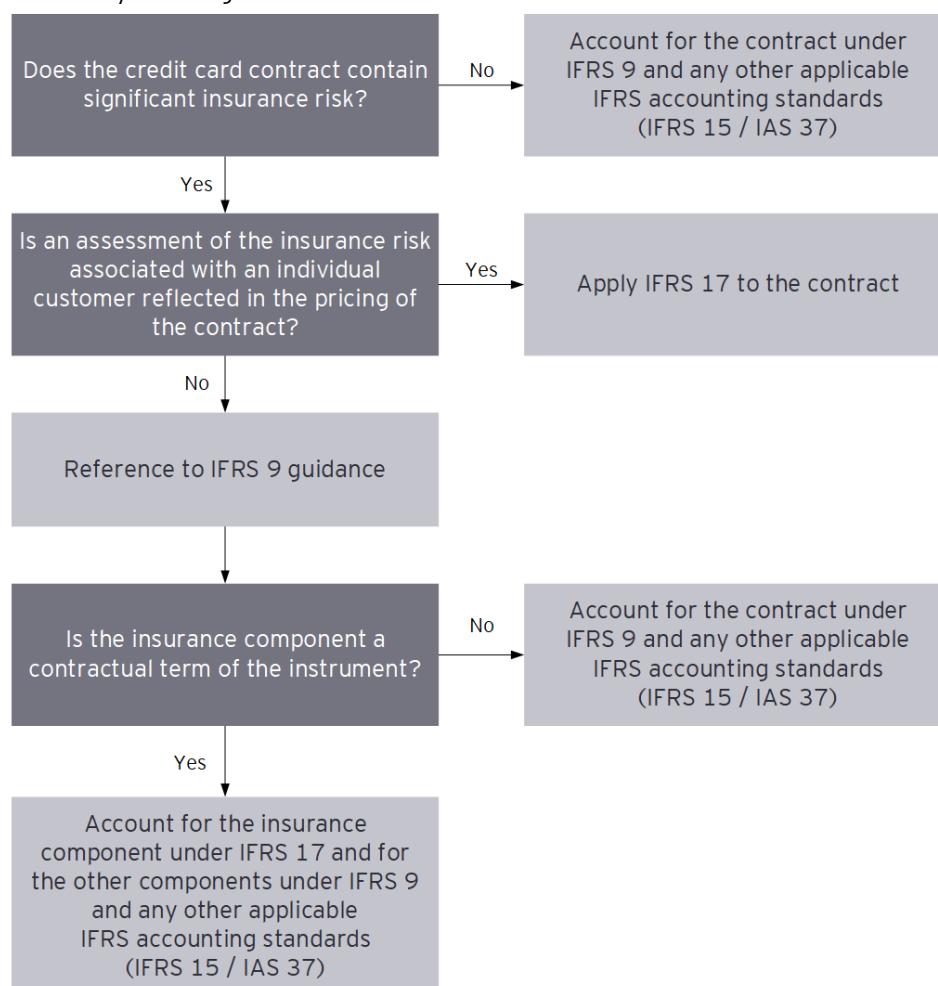

The IASB originally intended to address accounting by policyholders of direct insurance contracts in IFRS 17. The Basis for Conclusions observes that other IFRS accounting standards include requirements that may apply to some aspects of contracts in which the entity is the policyholder. For example, IAS 37 sets out the requirements for reimbursements from insurance contracts held that provide cover for expenditure required to settle a provision and IAS 16 *Property, Plant and Equipment* sets out the requirements for some aspects of reimbursement under an insurance contract held that provides coverage for the impairment or loss of property, plant and equipment. Furthermore, IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*¹ specifies a hierarchy that an entity must use when developing an accounting policy if no IFRS accounting standard applies specifically to an item. Accordingly, the Board did not view work on policyholder accounting as a high priority. [IFRS 17.BC66].

2.3.1.D Credit card contracts (or similar contracts) that provide insurance coverage

Credit card contracts (or similar contracts that provide credit or payment arrangements) that provide services that meet the definition of an insurance contract are excluded from the scope of IFRS 17 if, and only if, the entity does not reflect an assessment of the insurance risk associated with an individual customer in setting the price of the contract with that customer. If excluded from IFRS 17, these contracts would be within the scope of IFRS 9 and other applicable IFRS accounting standards. However, if, and only if, the insurance component is a contractual term of such a financial instrument (rather than, say, required by local legislation), IFRS 9 requires an entity to separate and apply IFRS 17 to that insurance component. [IFRS 17.7(h), IFRS 9.2.1(e)(iv)].

¹ The consequential amendments resulting from IFRS 18 Presentation and Disclosure in Financial Statements, once effective, changes the title of IAS 8 to 'Basis of Preparation of Financial Statements' to better reflect the amended content of IAS 8. See Chapter 4 for further details on the requirements of IFRS 18.

This can be illustrated by the diagram below:

An example of a credit card contract (or similar contract) that provides insurance coverage is one in which the regulation of the jurisdiction where the entity issuing the credit card operates requires the entity to provide coverage for some purchases made by the customer using the credit card. Under this coverage the entity:

- Must refund the customer for some claims against a supplier in respect of a misrepresentation or breach of the purchase agreement (for example, if the goods are defective or if the supplier fails to deliver the goods) if the supplier does not rectify
- And
- Is entitled to be indemnified by the supplier for any loss suffered in satisfying its liability with its customer

As a result, according to the regulation, the entity and the supplier are jointly and severally liable to the customer, i.e., the customer can choose whether to claim from the entity or from the supplier. In addition, subject to a maximum amount, the customer can claim from the entity or from the supplier an amount in excess of the amount paid using the specific credit card (for example, the entire purchase price, even if only part of the purchase price was paid using the credit card, and any additional costs reasonably incurred as a result of the supplier failure). Normally, the entity does not charge any fee to the customer or charges an annual fee to the customer that does not reflect an assessment of the insurance risk associated with that individual customer.

This insurance coverage is not subject to the product warranty exemption (see section 2.3.1.A above) because the credit card issuer is required to compensate the customer for a loss unrelated to the performance of the credit card.

The insurance coverage described above differs from:

- The insurance coverage that an entity issuing a credit card contract sells to its customers as an agent, such as travel insurance or roadside assistance provided by another party (the principal). A credit card contract that includes this insurance coverage is not within the scope of IFRS 17.
- The insurance coverage that an entity issuing a credit card contract sells to its customers as a principal and meets the specified conditions for a fixed-fee service contract (see section 2.3.2 below).
- The insurance coverage that an entity issuing a credit card provides for the settlement of the customer's obligation created by the contract, such as a waiver of the loan balance if the customer dies (see section 2.3.3 below).²

In adding this scope exclusion to IFRS 17, the Board noted that IFRS 9 and IFRS 17 both have requirements that address credit risk and insurance risk, which are the prominent features of such contracts.

Furthermore, the Board was aware that in applying IFRS 4, which had different criteria for separating components of an insurance contract compared to IFRS 17, most entities separated the components of such contracts. For example, an entity applying IFRS 4 might account for the credit card component applying IFRS 9, the insurance component applying IFRS 4, and any other service components applying IFRS 15. Acknowledging that entities had already identified methods to separate the components of such contracts, the Board concluded that changing the existing accounting for these contracts would impose costs and disruption to entities that typically do not issue contracts in the scope of IFRS 17, other than some credit card contracts and similar contracts that meet the definition of an insurance contract, for no significant benefit. [IFRS 17.BC94B].

Under IFRS 9, an entity is required to separate and apply IFRS 17 to an insurance coverage component, if and only if, that component is a contractual term of that financial instrument (rather than required by regulation). In the Board's view, applying IFRS 17 to the insurance coverage components in credit card (or similar) contracts that include insurance coverage as part of the contractual terms will result in the most useful information for users of financial statements. In addition, it will increase comparability between insurance coverage provided as part of the contractual terms of a credit card contract and insurance coverage provided as a separate stand-alone contract. Other IFRS accounting standards, such as IFRS 15 or IAS 37, might apply to other components of the contract, such as service components or insurance components required by law or regulation. [IFRS 17.BC94C].

2.3.2 Fixed-fee service contracts

A fixed-fee service contract is one in which the level of service depends on an uncertain event but the fee does not. Examples include roadside assistance programmes and maintenance contracts in which the service provider agrees to repair specified equipment after a malfunction. Such contracts can meet the definition of an insurance contract because: [IFRS 17.BC95]

- It is uncertain whether, or when, assistance or a repair will be needed
 - The owner is adversely affected by the occurrence
- And
- The service provider compensates the owner if assistance or repair is needed

Although these contracts may meet the definition of insurance contracts, their primary purpose is to provide services for a fixed fee. IFRS 17 permits entities a choice of applying IFRS 15 instead of IFRS 17 to such contracts that it issues if, and only if, they meet specified conditions. The entity may make that choice contract by contract, but the choice for each contract is irrevocable. The conditions are: [IFRS 17.8]

- The entity does not reflect an assessment of the risk associated with an individual customer in setting the price of the contract with that customer.
 - The contract compensates the customer by providing services, rather than by making cash payments to the customer.
- And
- Insurance risk transferred by the contract arises primarily from the customer's use of services, rather than from uncertainty over the cost of those services.

² [IASB Staff paper 2D](#): Project: *Amendments to IFRS 17 Insurance Contracts*, Paper topic: *Credit Cards that provide Insurance coverage*, IASB meeting, March 2019, paragraphs 5-7. Available on the IFRS Foundation's website.

The Board had proposed originally to exclude fixed fee service contracts whose primary purpose is the provision of services from the scope of IFRS 17. However, some stakeholders noted that some entities issue both fixed-fee service contracts and other insurance contracts. For example, some entities issue both roadside assistance contracts and insurance contracts for damage arising from accidents. Therefore, the Board decided to allow entities a choice of whether to apply IFRS 15 or IFRS 17 to fixed-fee service contracts to enable such entities to account for both types of contract in the same way. In the view of the Board, if IFRS 17 is applied to fixed-fee service contracts, entities would generally apply the premium allocation approach (see section 10 below) to such contracts which would result in accounting similar to that resulting from applying IFRS 15. [IFRS 17.BC96, IFRS 17.BC97].

The accounting policy choice between applying IFRS 17 or IFRS 15 applies only to fixed-fee service contracts. When an entity charges a fee which varies with the level of service provided (e.g., an elevator service contract that levies a fee per breakdown according to the work required), then the contract is unlikely to transfer significant insurance risk and it would be a service contract within the scope of IFRS 15.

How we see it

The Basis for Conclusions mentions that the choice of whether to apply IFRS 15 or IFRS 17 was introduced to assist entities that issue both roadside assistance contracts and insurance contracts in being able to apply IFRS 17 to all contracts issued. However, it is possible that other types of fixed-fee service contracts are now within the scope of IFRS 17 as the choice between IFRS 15 and IFRS 17 is only available where the specified conditions are met.

Whether an individual risk assessment is present or not may require the exercise of judgement. In many cases, service agreements are priced to reflect some form of risk assessment. If an entity charges each policyholder the same fee to service the same asset ('community priced'), then the risk assessment is performed at a portfolio level rather than the individual customer level. However, if the fixed fee for servicing is based on the specific condition of the asset (for example, the age of motor vehicle) and/or the policyholder (for example, claims history), this would be indicators of an individual risk assessment that reflects the nature of an insurance contract rather than a service contract.

2.3.3 Loan contracts that transfer significant insurance risk only on settlement of the policyholder's obligation created by the contract

Some contracts meet the definition of an insurance contract but limit the compensation for the insured event to the amount otherwise required to settle the policyholder's obligation created by the contract (for example, loans with death waivers). An entity must choose to apply either IFRS 17 or IFRS 9 to such contracts that it issues unless such contracts are excluded from the scope of IFRS 17.7 (see section 2.3.1 above). The entity must make that choice for each portfolio of insurance contracts (see section 6.1 below), and the choice for each portfolio is irrevocable. [IFRS 17.8A].

Examples of such contracts are:

- Mortgages when the outstanding balance of the mortgage is waived if the borrower dies and the consideration for the life assurance coverage is part of the overall interest rate charged on the mortgage.
- Lifetime mortgages (sometimes called equity release mortgages) where the entity's recourse is limited to the mortgaged property. If the property is sold for less than the mortgage balance (when the customer dies or moves into long-term care) then the loss is borne by the entity.
- Student loan contracts where repayments are income and/or life contingent and may not be made at all if the borrower's income never exceeds the repayment threshold or the borrower dies.
- A loan provided to a customer to buy a non-financial asset which is repaid through low instalments over the period of the loan with a final, higher 'balloon' payment at maturity. At maturity the customer can choose to return the non-financial asset to the entity instead of making the 'balloon' payment and the supplier is exposed to a loss if the value of the non-financial asset received is less than the 'balloon' amount.

This accounting policy choice was added to IFRS 17 because of stakeholder concerns that such contracts are typically issued by non-insurers. Such entities might be expected to be in a less advanced stage of IFRS 17 implementation and might not have fully assessed the implications of IFRS 17 on their business. In addition, these contracts do not usually have the legal form of insurance contracts. It is observed in the Basis for Conclusions that applying either IFRS 17 or IFRS 9 would provide useful information about such contracts. Hence, the Board concluded that requiring an entity to apply IFRS 17 to those contracts, when the entity had previously been applying an accounting policy consistent with IFRS 9 or IAS 39 to those contracts (or *vice versa*), could impose costs and disruption with no significant benefit. [IFRS 17.BC94E].

It is further observed in the Basis for Conclusions that the accounting policy choice for each portfolio was made irrevocable in order to mitigate the lack of comparability that might otherwise arise between similar contracts issued by the same entity, and between similar contracts issued by different entities.

[IFRS 17.BC94F].

2.3.4 Other accounting standards which affect insurers

IFRS 17 does not address other aspects of accounting by insurers, such as accounting for financial assets held by insurers and financial liabilities issued by insurers which are within the scope of IFRS 7, IFRS 9 and IAS 32. However, some other IFRS accounting standards provide optional measurement exceptions for investments included within investment funds that provide investors with benefits determined by units in that fund including, but not limited to, the underlying items related to insurance contracts with direct participation features and investment contracts with discretionary participation features (see sections 12.3 and 12.4 below) as follows:

- IFRS 9 requires that if an issued financial liability is part reacquired, such a purchase must result in derecognition of that part of the financial liability that is reacquired. However, some entities operate, either internally or externally, an investment fund that provides investors with benefits determined by units in the fund and recognise financial liabilities for the amounts to be paid to those investors. Similarly, some entities issue groups of insurance contracts with direct participation features and those entities hold the underlying items. Some such funds or underlying items include the entity's own financial liabilities (for example, a corporate bond issued). Despite the usual requirements in IFRS 9 for the derecognition of financial liabilities re-acquired, an entity may elect not to derecognise its financial liability that is acquired by such a fund or is an underlying item when, and only when, the entity repurchases its financial liability for that specific purpose (i.e., to be held by such a fund or held as an underlying item). Instead, the entity may elect to continue to account for that instrument as a financial liability and to account for the repurchased instrument as if the instrument were a financial asset and measure it at fair value through profit or loss. That election is irrevocable and is made on an instrument-by-instrument basis. For the purposes of this election, insurance contracts include investment contracts with discretionary participation features in the scope of IFRS 17. [IFRS 9.3.3.4, IFRS 9.3.3.5]. See Chapter 48.
- IAS 16 requires each class of owner-occupied property to be measured either under the cost model or a revaluation model with revaluation gains recognised in other comprehensive income. Some entities operate, either internally or externally, an investment fund that provides investors with benefits determined by units in the fund. Similarly, some entities issue groups of insurance contracts with direct participation features and hold the underlying items. Some such funds or underlying items include owner-occupied property. Despite the normal requirements of IAS 16, the entity may elect to measure such owner-occupied properties using the fair value model in accordance with IAS 40 *Investment Property* (i.e., at fair value through profit or loss). For the purposes of this election, insurance contracts include investment contracts with discretionary participation features. An entity treats owner-occupied property measured using the IAS 40 fair value model as a separate class of property, plant and equipment. [IAS 16.29, IAS 16.29A, IAS 16.29B]. See Chapter 19.
- IAS 28 *Investments in Associates and Joint Ventures* permits a separate election, at initial recognition of the associate or joint venture, to measure an associate or joint venture at fair value through profit or loss in accordance with IFRS 9 if it is held by, or held indirectly through, an entity that is a venture capital organisation, or a mutual fund, unit trust or similar entity including investment-linked insurance funds. An example of an investment-linked insurance fund is a fund held by an entity as the underlying items for a group of insurance contracts with direct participation features. For the purposes of this election, insurance contracts include investment contracts with discretionary participation features. [IAS 28.18]. See Chapter 12.

- IAS 32 requires that if an entity reacquires its own equity instruments, those shares ('treasury shares') are deducted from equity and no gain or loss is recognised in profit or loss on the purchase, sale, issue or cancellation of an entity's own equity instruments. Some entities operate, either internally or externally, an investment fund that provides investors with benefits determined by units in the fund and recognise financial liabilities for the amounts to be paid to those investors. Similarly, some entities issue groups of insurance contracts with direct participation features and those entities hold the underlying items. Some such funds or underlying items include the entity's treasury shares. Despite the normal requirements of IAS 32, an entity may elect not to deduct from equity a treasury share that is included in such a fund or is an underlying item when, and only when, an entity reacquires its own equity instrument for such purposes. Instead, the entity may elect to continue to account for that reacquired treasury share as equity and to account for the reacquired instrument as if the instrument were a financial asset and measure it at fair value through profit or loss in accordance with IFRS 9 (this means that the entity's shares are recognised both as equity and as a financial instrument). That election is irrevocable and made on an instrument-by-instrument basis. For the purposes of this election, insurance contracts include investment contracts with discretionary participation features. *[IAS 32.33, IAS 32.33A]. See Chapter 43.*
- IAS 40 permits an entity to separately elect between the fair value model or the cost model for all investment property backing liabilities that pay a return linked directly to the fair value of, or returns from, specified assets including that investment property (e.g., insurance contracts with direct participation features). *[IAS 40.32A].* The choice to use either the fair value model or the cost model for all other investment property is a separate election. *[IAS 40.30]. See Chapter 20.*

3 The definition of an insurance contract

3.1 The definition

The term defined by IFRS 17 is as follows: [IFRS 17 Appendix A]

Extract from IFRS 17

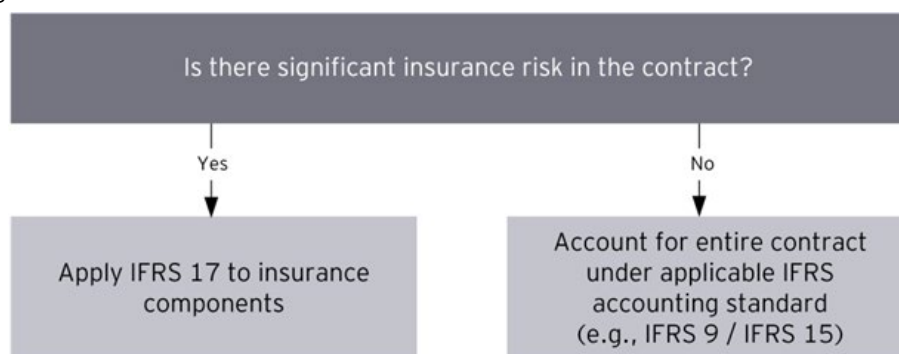

Appendix A

Defined terms

insurance contract

A contract under which one party (the issuer) accepts significant **insurance risk** from another party (the **policyholder**) by agreeing to compensate the **policyholder** if a specified uncertain future event (the **insured event**) adversely affects the **policyholder**.

This definition determines which contracts are within the scope of IFRS 17 as opposed to other IFRS accounting standards.

The definition of an insurance contract is the same as the definition in IFRS 4 except for two clarifications. [IFRS 17.BC67]. Therefore, most contracts that were insurance contracts under IFRS 4 are expected to be insurance contracts under IFRS 17, although IFRS 17 does not contain transitional provisions that 'grandfather' conclusions on the classification as insurance contract made under IFRS 4 (except for the consequential amendments to IFRS 3 *Business Combinations* - see section 14 below).

The two clarifications made by IFRS 17 to the application guidance explaining the definition of an insurance contract require that: [IFRS 17.BC67]

- An insurer should consider the time value of money in assessing whether the additional benefits payable in any scenario are significant (see section 3.5 below)
- A contract does not transfer significant insurance risk if there is no scenario with commercial substance in which the insurer can suffer a loss on a present value basis (see section 3.5 below)

Both of the two clarifications referred to above are intended to ensure that the determination of insurance risk is made on a present value basis as it was considered that IFRS 4 was unclear on the matter. Additionally, the definition of significant insurance risk (see section 3.5 below) uses the word 'amounts' instead of 'benefits' in order to capture payments that may not necessarily be payable to policyholders (for example claim handling expenses).

The definition of an insurance contract is discussed in more detail, as follows: [IFRS 17.B2]

- Uncertain future events (see section 3.2 below)
- Payments in kind (see section 3.3 below)
- The distinction between insurance risk and financial risks (see section 3.4 below)
- Significant insurance risk (see section 3.5 below)
- Changes in the level of insurance risk (see section 3.6 below)
- Examples of insurance and non-insurance contracts (see section 3.7 below)

Frequently asked questions

Question 3-1: Would IFRS 17 apply to, among others, service contracts including a form of EBITDA guarantee?

(TRG meeting September 2018 - Agenda paper no. 11, Log S33)

The submission described a specific fact pattern of an entity that provides hotel management services. The service fee that the entity charges is determined as a percentage of gross hotel revenue. The entity also guarantees the hotel owner a specified level of EBITDA. To the extent that the actual hotel EBITDA is below the specified level, the entity is obligated to make payments to the hotel owner. The amount payable under the guarantee may exceed the amount of the service fee receivable. The submission asks whether the guarantee provided by the entity is within the scope of IFRS 17.

The IASB Staff noted a contract is assessed against the definition of an insurance contract and the scope requirements of IFRS 17. The definition of an insurance contract in IFRS 17 is the same as the definition of an insurance contract in IFRS 4, with clarifications to the related guidance in Appendix B of IFRS 4. When assessing whether the contract meets the definition of an insurance contract, an assessment is made as to whether the contract transfers significant insurance risk. When assessing whether an insurance contract is within the scope of IFRS 17, an assessment is made as to whether any of the scope exclusions of IFRS 17 are applicable. IFRS 17 includes a scope exclusion for warranties provided by a manufacturer, dealer or retailer in connection with the sale of its services to a customer and also excludes contractual obligations contingent on the future use of a non-financial item (for example, contingent payments), as stated in IFRS 17.7 (see section 2.3.1 above).

How we see it

A service provider, such as a hotel operator, can be a 'retailer' under the product warranty scope exclusion (see section 2.3.1.A above). However, to qualify for the scope exclusion, the hotel operator must be providing a warranty in connection with the sale of its own services to the customer rather than providing income protection for the customer. Hence the entity would need to determine the nature of its services provided to the customer based on the terms and conditions of the contractual arrangement.

As discussed in sections 2.3.1.D and 2.3.3 above, IFRS 17 has a scope exclusion for certain credit card contracts (or similar contracts) that provide insurance coverage and an accounting policy choice to apply either IFRS 9 or IFRS 17 to loan contracts that transfer significant insurance risk only on settlement of the policyholder's obligation created by the contract.

3.2 Uncertain future events

Uncertainty (or risk) is the essence of an insurance contract. Accordingly, IFRS 17 requires at least one of the following to be uncertain at the inception of an insurance contract: *[IFRS 17.B3]*

(a) The probability of an insured event occurring

(b) When the insured event will occur

Or

(c) How much the entity will need to pay if the insured event occurs

An insured event will be one of the following:

- The discovery of a loss during the term of the contract, even if the loss arises from an event that occurred before the inception of the contract
- A loss that occurs during the term of the contract, even if the resulting loss is discovered after the end of the contract term *[IFRS 17.B4]*

Or

- The determination of the ultimate cost of a claim which has already occurred but whose financial effect is uncertain *[IFRS 17.B5]*

This last type of insured event above arises from 'retroactive' contracts, i.e., those providing insurance coverage against an adverse development of an event which has occurred prior to the policy inception date. An example is a reinsurance contract that covers an insurer against adverse development of claims that are already reported by its policyholders but still need to be settled. In those contracts, the insured event is the determination of the ultimate cost of those claims. The implications of this on measurement is discussed in section 11.5.2.A below.

3.3 Payments in kind

Some insurance contracts require or permit payments to be made in kind. In such cases, the entity provides goods or services to the policyholder to settle the entity's obligation to compensate the policyholder for insured events. Such contracts are insurance contracts, even though the claims are settled in kind, and are treated the same way as insurance contracts when payment is made directly to the policyholder. For example, some insurers replace a stolen article directly rather than compensating the policyholder for the amount of its loss. Another example is when an entity uses its own hospitals and medical staff to provide medical services covered by the insurance contract. [IFRS 17.B6].

Although these are insurance contracts, if they meet the conditions for fixed-fee service contracts (see section 2.3.2 above) entities can elect to apply either IFRS 15 or IFRS 17.

3.4 The distinction between insurance risk and financial risk

The definition of an insurance contract refers to 'insurance risk' which is defined as "risk, other than financial risk, transferred from the holder of a contract to the issuer". [IFRS 17 Appendix A].

A contract that exposes the reporting entity to financial risk without significant insurance risk is not an insurance contract. [IFRS 17.B7]. 'Financial risk' as defined by IFRS 17 is as follows: [IFRS 17 Appendix A]

Extract from IFRS 17

Appendix A

Defined terms

financial risk

The risk of a possible future change in one or more of a specified interest rate, financial instrument price, commodity price, currency exchange rate, index of prices or rates, credit rating or credit index or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract.

It is important to make a distinction between non-financial risk and financial risk because this affects the measurement and presentation of insurance contracts. Under the general model (see section 9 below) and the premium allocation approach (see section 10 below), the effect of, and changes in, financial risk are treated differently to the effect of, and changes in, non-financial risks (e.g., insurance risk). For contracts with direct participation features, a distinction between non-financial risk and financial risk is also made but this distinction has different consequences in terms of the measurement model (see section 12 below). An example of a question concerning the distinction between non-financial risk and financial risk was a submission to the TRG that asked whether changes in fulfilment cash flows as a result of changes in inflation assumptions should be treated as changes in non-financial risk (and adjust the contractual service margin) or changes in financial risk for contracts measured under the general model (see Question 15-3 in section 15.3 below).

An example of a non-financial variable that is not specific to a party to the contract is an index of earthquake losses in a particular region or an index of temperatures in a particular city. An example of a non-financial variable that is specific to a party to the contract is the occurrence or non-occurrence of a fire that damages or destroys an asset of that party. Furthermore, the risk of changes in the fair value of a non-financial asset is not a financial risk if the fair value reflects changes in the market prices for such assets (i.e., a financial variable) and the condition of a specific non-financial asset held by a party to the contract (i.e., a non-financial variable). For example, if a guarantee of the residual value of a specific car exposes the guarantor to the risk of changes in that car's condition, that risk is insurance risk, not financial risk. [IFRS 17.B8]. This is illustrated in Illustration 3-1 below.

Contracts that expose the issuer to both financial risk and significant insurance risk can be insurance contracts. For example, many life insurance contracts guarantee a minimum rate of return to policyholders, creating financial risk, and at the same time promise death benefits that may significantly exceed the policyholder's account balance, creating insurance risk in the form of mortality risk. Such contracts are insurance contracts. [IFRS 17.B9].

Under some contracts, an insured event triggers the payment of an amount linked to a price index. Such contracts are insurance contracts provided that the payment contingent on the insured event could be significant. [IFRS 17.B10]. This is illustrated in Illustration 3-2 below.

The definition of an insurance contract requires risk to be transferred from the policyholder to the insurer. This means that the insurer must accept, from the policyholder, a risk to which the policyholder was already exposed. Any new risk created by the contract for the entity or the policyholder is not insurance risk. [IFRS 17.B11]. For example, a construction contract may contain a clause requiring a builder to pay the customer a penalty (sometimes referred to as 'liquidated damages') if the builder fails to perform under the contract. The quantum of the damages could result in the builder suffering a loss under the contract. This is not an insurance contract for the builder because the risk of paying the penalty has been created by the construction contract itself rather than being a pre-existing risk to which the customer was already exposed.

Illustration 3-1: Residual value insurance

Entity A issues a contract to Entity B that provides a guarantee of the fair value at a future date of an aircraft (a non-financial asset) held by Entity B. Entity A is not the manufacturer, dealer or retailer of the aircraft and also is not the lessee of the aircraft (residual value guarantees given by a lessee under a lease are within the scope of IFRS 16).

This is an insurance contract (unless changes in the condition of the asset have an insignificant effect on its value). The risk of changes in the fair value of the aircraft is not a financial risk because the fair value reflects not only changes in market prices for similar aircraft but also the condition of the specific asset held.

However, if the contract compensated Entity B only for changes in market prices and not for changes in the condition of Entity B's asset, the contract would be a derivative and within the scope of IFRS 9.

Illustration 3-2: Contract with life contingent annuity linked to price index

Entity A issues a life-contingent annuity the value of which is linked to a cost of living index.

The contract is an insurance contract because the payment is triggered by an uncertain future event - the survival of the person who receives the annuity. The link to the price index is a derivative, but it also transfers insurance risk because the number of payments to which the index applies depends on the survival of the annuitant. If the resulting transfer of insurance risk is significant, the derivative meets the definition of an insurance contract in which case it should not be separated from the host contract (see section 5.1 below).

3.4.1 Insurable interest

For a contract to be an insurance contract, the insured event must have an adverse effect on the policyholder. [IFRS 17.B12]. In other words, there must be an 'insurable interest'. [IFRS 17.BC73].

The IASB considered whether it should eliminate the notion of insurable interest and replace it with the notion that insurance involves assembling risks into a pool in which they can be managed together.

[IFRS 17.BC74]. However, the IASB decided to retain the notion of insurable interest contained in IFRS 4, because without the reference to 'adverse effect', the definition might have captured any prepaid contract to provide services with uncertain costs. In addition, the notion of insurable interest is needed to avoid including gambling in the definition of insurance. Furthermore, the definition of an insurance contract is a principle-based distinction, particularly between insurance contracts and those used for hedging. [IFRS 17.BC75].

The adverse effect on the policyholder is not limited to an amount equal to the financial impact of the adverse event. So, for example, the definition includes 'new for old' insurance coverage that pays the policyholder an amount that permits the replacement of a used or damaged asset with a new asset. Similarly, the definition does not limit payment under a life insurance contract to the financial loss suffered by a deceased's dependents, nor does it preclude the payment of predetermined amounts to quantify the loss caused by a death or accident. [IFRS 17.B12].

A contract that requires a payment if a specified uncertain event occurs which does not require an adverse effect on the policyholder as a precondition for payment, is not an insurance contract. Such contracts are not insurance contracts even if the holder of the contract uses the contract to mitigate an underlying risk exposure. For example, if the holder of the contract uses a derivative to hedge an underlying financial or non-financial variable correlated with the cash flows from an asset of the entity, the derivative is not conditional on whether the holder is adversely affected by a reduction in the cash flows from the asset. Conversely, the definition of an insurance contract refers to an uncertain future event for which an adverse effect on the policyholder is a contractual precondition for payment. A contractual precondition does not require the insurer to investigate whether the uncertain event actually caused an adverse effect, but it does permit the insurer to deny payment if it is not satisfied that the event caused an adverse effect.

[IFRS 17.B13].

Illustration 3-3: Reinsurance contract with 'original loss warranty' clause

Entity A agrees to issue a contract to Entity B to provide reinsurance cover for CU5m against losses suffered. The insurance losses suffered by Entity B, which are recoverable under the contract, are limited to those arising from events where the industry-wide insured loss exceeds a threshold of CU100m (sometimes described as an 'original loss warranty'). This means that only losses suffered by Entity B up to CU5m from events exceeding an industry-wide insured loss of CU100m can be recovered under the contract.

Assuming insurance risk is significant, this is an insurance contract as Entity B can only recover its own insurance claims arising from those events.

If the contract allowed Entity B to claim up to CU5m every time there was an event with an industry-wide loss exceeding a threshold of CU100m, regardless of whether Entity B had suffered insurance claims from that event, then this would not be an insurance contract because there would be no insurable interest in the arrangement.

3.4.2 Lapse, persistency and expense risk

Lapse or persistency risk (the risk that the policyholder will cancel the contract earlier or later than the issuer had expected in pricing the contract) is not insurance risk. This is because the resulting variability in the payment to the policyholder is not contingent on an uncertain future event that adversely affects the policyholder. [IFRS 17.B14].

Similarly, expense risk (the risk of unexpected increases in the administrative costs incurred by the issuer associated with the servicing of a contract, rather than in the costs associated with insured events) is not insurance risk because an unexpected increase in expenses does not adversely affect the policyholder.

[IFRS 17.B14].

Therefore, a contract that exposes an entity to lapse risk, persistency risk or expense risk is not an insurance contract unless it also exposes the entity to significant insurance risk. [IFRS 17.B15].

3.4.3 Insurance of non-insurance risks

If the issuer of a contract which does not contain significant insurance risk mitigates the risk of that contract by using a second contract to transfer part of that first contract's risk to another party, this second contract exposes that other party to insurance risk. This is because the policyholder of the second contract (the issuer of the first contract) is subject to an uncertain event that adversely affects it and thus it meets the definition of an insurance contract. [IFRS 17.B15].

Illustration 3-4: Insurance of non-insurance risks

Entity A agrees to compensate Entity B for losses on one or more contracts issued by Entity B that do not transfer significant insurance risk. The contract issued by Entity A to compensate Entity B is a direct insurance if it transfers significant insurance risk from Entity B to Entity A, and so Entity B is a policyholder of an insurance contract issued by Entity A and not the holder of a reinsurance contract. IFRS 17 does not apply if the entity is the holder of an insurance contract that is not a reinsurance contract (see section 2.3.1.C above).

3.5 Significant insurance risk

A contract is an insurance contract only if it transfers 'significant insurance risk'. [IFRS 17.B17]. Insurance risk is further discussed by IFRS 17 as follows: [IFRS 17.B18, IFRS 17.B19]

Extract from IFRS 17

B18 Insurance risk is significant if, and only if, an insured event could cause the issuer to pay additional amounts that are significant in any single scenario, excluding scenarios that have no commercial substance (ie no discernible effect on the economics of the transaction). If an insured event could mean significant additional amounts would be payable in any scenario that has commercial substance, the condition in the previous sentence can be met even if the insured event is extremely unlikely, or even if the expected (ie probability-weighted) present value of the contingent cash flows is a small proportion of the expected present value of the remaining cash flows from the insurance contract.

B19 In addition, a contract transfers significant insurance risk only if there is a scenario that has commercial substance in which the issuer has a possibility of a loss on a present value basis. However, even if a reinsurance contract does not expose the issuer to the possibility of a significant loss, that contract is deemed to transfer significant insurance risk if it transfers to the reinsurer substantially all the insurance risk relating to the reinsured portions of the underlying insurance contracts.

The additional amounts described above are determined on a present value basis. If an insurance contract requires payment when an event with uncertain timing occurs and if the payment is not adjusted for the time value of money, there may be scenarios in which the present value of the payment increases, even if its nominal value is fixed. An example is insurance that provides a fixed death benefit when the policyholder dies, with no expiry date for the cover (often referred to as whole-life insurance for a fixed amount). It is certain that the policyholder will die, but the date of death is uncertain. Payments may be made when an individual policyholder dies earlier than expected. Because those payments are not adjusted for the time value of money, significant insurance risk could exist even if there is no overall loss on the portfolio of contracts. Similarly, contractual terms that delay timely reimbursement to the policyholder can eliminate significant insurance risk. An entity must use the discount rates required as discussed in section 9.3 below to determine the present value of the additional amounts. [IFRS 17.B20].

IFRS 17 does not prohibit a contract from being an insurance contract if there are restrictions on the timing of payments or receipts. However, the existence of restrictions on the timing of payments may mean that the policy does not transfer significant insurance risk if it results in the lack of a scenario that has commercial substance in which the issuer has a possibility of a loss on a present value basis.

3.5.1 Quantity of insurance risk

No quantitative guidance supports the determination of 'significant' in IFRS 17. This was a deliberate decision because the IASB considered that if quantitative guidance was provided, it would create an arbitrary dividing line that would result in different accounting treatments for similar transactions that fall marginally on different sides of that line and would, therefore, create opportunities for accounting arbitrage. [IFRS 17.BC78].

The IASB also rejected defining the significance of insurance risk by reference to the definition of materiality within the *Conceptual Framework for Financial Reporting* because, in its opinion, a single contract, or even a single book of similar contracts, would rarely generate a loss that would be material to the financial statements as a whole. Consequently, IFRS 17 defines the significance of insurance risk in relation to individual contracts (see section 3.5.2 below). [IFRS 17.BC79].

The IASB also rejected the notion of defining the significance of insurance risk by expressing the expected (probability weighted) average of the present values of the adverse outcomes as a proportion of the expected present value of all outcomes, or as a proportion of the premium. This definition would mean that a contract could start as a financial liability and become an insurance contract as time passes or probabilities are reassessed. This idea would have required the constant monitoring of contracts over their life to see whether they continued to transfer insurance risk. The IASB considered that it would be too burdensome to require an entity to continuously monitor whether a contract meets the definition of an insurance contract over its duration. Consequently, as discussed in section 3.6 below, an assessment of whether significant insurance risk has been transferred is normally required only at the inception of a contract. [IFRS 17.BC80].

IFRS 4 contained an illustrative example which implied that insured benefits must be greater than 101% of the benefits payable if the insured event did not occur for there to be insurance risk in an insurance contract. [IFRS 4.IG2 Example 1.3]. However, no equivalent example has been included in IFRS 17.

Some jurisdictions have their own guidance as to what constitutes significant insurance risk. However, other jurisdictions offer no quantitative guidance. The Board observed that some US GAAP practitioners apply a guideline that a reasonable possibility of a significant loss is at least a 10% probability of a loss of at least 10% of premium. [IFRS 17.BC77]. It is not disputed in the Basis for Conclusions that a 10% probability of a loss of at least a 10% of premium results in a transfer of significant insurance risk. Indeed, the words 'extremely unlikely' and 'a small proportion' (see section 3.5 above) suggests that the IASB envisages that significant insurance risk could exist at a lower threshold than a 10% probability of a loss of at least 10% of premium.

How we see it

The lack of a quantitative definition of significant insurance risk means that insurers must apply their own judgement as to what constitutes significant insurance risk. Although the IASB did not want to create an 'arbitrary dividing line', the practical impact of this lack of guidance is that insurers have to apply their own criteria to determine what constitutes significant insurance risk and there will probably be diversity in practice as to what these dividing lines are, at least at the margins.

There is no specific requirement under IFRS 17 for insurers to disclose any thresholds used in determining whether a contract contains significant insurance risk. However, IFRS 17 requires an entity to disclose the significant judgements made in applying IFRS 17 (see section 16.3 below) whilst IAS 1 *Presentation of Financial Statements*³ requires an entity to disclose the judgements that management has made in the process of applying the entity's accounting policies that have the most significant effect on the amounts recognised in the financial statements (see Chapter 3).

3.5.2 The level at which significant insurance risk is assessed

Significant insurance risk must be assessed by individual contract, rather than by portfolios or groups of contracts or by reference to materiality to the financial statements. Thus, insurance risk may be significant even if there is a minimal probability of significant losses for a portfolio or group of contracts. [IFRS 17.B22]. There is no exception to the requirement for assessment at an individual contract level, unlike IFRS 4 which permitted an insurer to make an assessment based on a small book of contracts if those contracts were relatively homogeneous.

The IASB decided to define significant insurance risk in relation to a single contract rather than at a higher level of aggregation because, although contracts are usually managed on a portfolio basis, the contractual rights and obligations arise from individual contracts. Materiality by reference to the financial statements was considered an inappropriate basis to define significant insurance risk because a single contract, or even a single book of similar contracts, would rarely generate a material loss in relation to the financial statements as a whole. See section 3.5.1 above.

See section 4 below on when it may be necessary to combine a set or series of contracts as a whole to report the substance.

If an insurance contract is separated into non-insurance components and insurance components (see section 5 below), IFRS 17 is applied only to the remaining components of the host insurance contract. [IFRS 17.13].

A contract which has insignificant insurance risk as a whole is likely to be accounted for under either IFRS 9 or IFRS 15. IFRS 15 contains guidance for separating contracts that are partially within the scope of IFRS 15 and partially within the scope of another IFRS accounting standard which implies that it might be possible, subject to materiality considerations, for the part of a service contract that contains insurance risk to be accounted for under IFRS 17. [IFRS 15.7(b)].

3.5.2.A Self insurance

An insurer can accept significant insurance risk from a policyholder only if it issues an insurance contract to an entity separate from itself. Therefore, 'self-insurance' (i.e., retaining a risk that could have been covered by insurance) such as a self-insured deductible where the policyholder cannot claim for losses below the excess limit of an insurance policy, is not insurance because there is no insurance contract with a third party. [IFRS 17.B27(c)].

Accounting for self-insurance and related provisions is covered by IAS 37 which requires that a provision is recognised only if there is a present obligation as a result of a past event, if it is probable that an outflow of resources will occur and a reliable estimate can be determined. [IAS 37.14].

3.5.2.B Mutual insurers

A mutual insurer accepts risk from each policyholder and pools that risk. Although policyholders bear the pooled risk collectively in their capacity as owners, the mutual has still accepted the risk that is the essence of an insurance contract and therefore IFRS 17 applies to those contracts. [IFRS 17.B16]. Accounting for insurance contracts issued by mutual entities is discussed in section 9.11 below.

³ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

3.5.2.C Intragroup insurance contracts

Where there are insurance contracts between entities in the same group, these are eliminated in the consolidated financial statements as required by IFRS 10 *Consolidated Financial Statements*. However, for the individual or separate financial statements of the issuer or holder, there is an insurance contract. [IFRS 17.B27(c)]. If any intragroup insurance contract is reinsured with a third party that is not part of the group, this third-party reinsurance contract must be accounted for as a direct insurance contract in the consolidated financial statements of a non-insurer because the intragroup contract will be eliminated on consolidation. This residual direct insurance contract (i.e., the policy with the third party) is outside the scope of IFRS 17 from the viewpoint of the consolidated financial statements of a non-insurer because policyholder accounting is excluded from IFRS 17 as discussed in section 2.3.1.C above.

Illustration 3-5: Insurance provided by group company

Parent A pays an insurance premium to Subsidiary B in exchange for an insurance contract within the scope of IFRS 17. Subsidiary B invests the premiums received and pays claims incurred under the insurance contract to Parent A.

In the consolidated financial statements of Group A, IFRS 17 does not apply since the group has not issued an insurance contract. The transactions between Parent A and Subsidiary B are eliminated on consolidation in accordance with IFRS 10.B86 (see Chapter 8). Claims from third parties against Parent A which are covered by the intra-group insurance contract are accounted for under IAS 37 (see section 3.5.2.A above).

In the separate financial statements of Parent A, IFRS 17 does not apply as Parent A is the holder of an insurance contract. IFRS 17 would also not apply if Parent A was the holder of an insurance contract issued by a third-party insurer (i.e., an insurer outside Group A). See section 2.3.1.C above.

In the separate, individual, or consolidated financial statements of Subsidiary B, IFRS 17 applies as Subsidiary B has issued an insurance contract.

How we see it

Reporting entities should carefully consider the consequences of intragroup contracts in financial statements prepared under IFRS accounting standards, other than the consolidated financial statements, e.g., separate financial statements or individual financial statements of subsidiaries. For example, as shown in Illustration 3-5 above, a subsidiary may have to recognise and measure its insurance liabilities under IFRS 17 for the purpose of its own IFRS financial statements even if those insurance liabilities have been eliminated on consolidation.

3.5.3 Significant additional amounts

The 'additional amounts that are significant in any single scenario' described in section 3.5 above refer to the present value of amounts that exceed those that would be payable if no insured event occurred (excluding scenarios that lack commercial substance). These additional amounts include claims handling and claims assessment costs but exclude: [IFRS 17.B21]

- The loss of the ability to charge the policyholder for future service. For example, in an investment-linked life contract, the death of the policyholder means that the entity can no longer perform investment management services and collect a fee for doing so. However, the economic loss for the entity does not result from insurance risk. Consequently, the potential loss or future investment management fees are not relevant when assessing how much insurance risk is transferred by a contract.
- The waiver on death of charges that would be made on cancellation or surrender of the contract. Because the contract brought these charges into existence, their waiver does not compensate the policyholder for a pre-existing risk. Hence, they are not relevant in determining how much insurance risk is transferred by a contract.
- A payment conditional on an event that does not cause a significant loss to the holder of the contract. For example, where the issuer must pay CU1m if an asset suffers physical damage causing an insignificant economic loss of CU1 to the holder. The holder, in this case, has transferred to the insurer the insignificant insurance risk of losing CU1. At the same time, the contract creates non-insurance risk that the issuer will need to pay an additional CU999,999 if the specified event occurs. Because there is no scenario in which an insured event causes a significant loss to the holder of the contract, the issuer does not accept significant insurance risk from the holder and this contract is not an insurance contract.
- Possible reinsurance recoveries - the insurer must account for these separately.

It follows from this that if a contract pays a death benefit exceeding the amount payable on survival (excluding any waiver or surrender charges mentioned above), the contract is an insurance contract unless the additional death benefit is insignificant (judged by reference to the contract rather than to an entire portfolio of contracts). Similarly, an annuity contract that pays out regular sums for the rest of a policyholder's life is an insurance contract, unless the aggregate life-contingent payments are insignificant because the insurer could suffer a significant loss on an individual contract if the annuitant survives longer than expected. [IFRS 17.B23].

Frequently asked questions

Question 3-2: Is the risk related to a premium waiver provision a pre-existing risk of the policyholder transferred to the entity by the contract and therefore an insurance risk, or a new risk created by the contract?

(TRG meeting September 2018 - Agenda paper no. 07, Log S78)

The TRG members considered a submission which discussed whether a contract that contains a provision that waives the payment of a premium under certain circumstances is an insurance contract. In such cases, the main insured event in the contract differs from the event triggering a premium waiver. For example, the primary coverage may be a term life contract covering mortality risk and premiums are waived if the policyholder has been disabled for six consecutive months, although the policyholder continues to receive the benefits originally promised under the insurance contract despite the waiver of premiums. The TRG members agreed with the IASB staff analysis and observed that:

- There is an insurance risk when an entity provides a waiver of premiums if a specified event occurs
- The waiver of premiums differs from the situations discussed above (i.e., the economic loss of the ability to charge the policyholder for future service and the waiver, on death, of contract surrender or cancellation charges)

This is because the risk of the events giving rise to the waiver exists before the contract is issued. It is not a risk created by the contract and the contract does not increase the potential adverse effects. In addition, the events that trigger a waiver are contractual pre-conditions without which the entity can deny the waiver.

The TRG members observed that the consequences of such a waiver of premiums are:

- The inclusion of a clause in an investment contract in which premiums are waived by contractual pre-conditions makes the investment contract an insurance contract.
- And
- The inclusion of such a waiver in a contract that would also be an insurance contract without the waiver, would impact the quantity of benefits provided by the contract and therefore the coverage period, affecting the recognition of the contractual service margin in profit or loss.

Question 3-3: Should an entity exclude from insurance revenue, premiums waived as a result of an insured event or should it account for them as part of insurance service expense (i.e., an incurred claim)?

(TRG meeting April 2019 - Agenda paper no. 02, Log S117)

The IASB staff clarified, and the TRG agreed that, to the extent that a premium waiver results from an insured event, it is a claim and, therefore, recognised as an insurance service expense.

3.6 Changes in the level of insurance risk

IFRS 17 requires the assessment of whether a contract transfers significant insurance risk to be made only once. The Basis for Conclusions states that this assessment is made 'at inception'. [IFRS 17.BC80]. We interpret this phrase to mean that the assessment is made when the contract is issued rather than the start of the coverage period since a contract can be recognised at an earlier date than the start of the coverage period (see section 7 below).

As the assessment of significant insurance risk is made only once, a contract that qualifies as an insurance contract remains an insurance contract until all rights and obligations are extinguished, i.e., discharged, cancelled or expired, unless the contract is derecognised because of a modification (see section 13 below). [IFRS 17.B25]. This applies even if circumstances have changed such that insurance contingent rights and obligations have expired. The IASB considered that requiring insurers to set up systems to continually assess whether contracts continue to transfer significant insurance risk imposed a cost that far outweighed the benefit that would be gained from going through the exercise. [IFRS 17.BC80]. For a contract acquired in a business combination or transfer, the assessment of whether the contract transfers significant insurance risk is made at the date of acquisition or transfer (see section 14 below).

For some contracts, the transfer of insurance risk to the issuer occurs after a period of time. [IFRS 17.B24]. Once such a contract becomes an insurance contract, it remains an insurance contract until extinguishment as discussed above.

Frequently asked questions

Question 3-4: How should the exercise of an option to convert a contract to a different type of contract be treated?

(TRG meeting April 2019 - Agenda paper no. 02, Log S107)

The submission asked how a contract which transfers insurance risk after a period of time, as discussed in IFRS 17.B24, should be classified. The Staff analysis explained that for a contract to meet the definition of an insurance contract, there needs to be a transfer of significant insurance risk.

IFRS 17.B24 explains that contracts that transfer insurance risk only after an option is exercised do not meet the definition of insurance contracts at inception. An entity should consider the requirements of other IFRS accounting standards in order to account for such contracts until they become insurance contracts. A contract which only transfers insurance risk after a period of time is different from an insurance contract that provides an option to add further insurance coverage, discussed in Agenda Paper 3 of the May 2018 TRG meeting.

Some stakeholders suggested to the IASB that a contract should not be accounted for as an insurance contract if the insurance-contingent rights and obligations expire after a very short time. IFRS 17 addresses aspects of this by requiring that scenarios that lack commercial substance are ignored in the assessment of significant insurance risk and stating that there is no significant transfer of insurance risk in some contracts that waive surrender penalties on death (see sections 3.5.3 above and 12.4.1 below). [IFRS 17.BC81].

The following Illustration is based on the example in IFRS 17, of a contract where the transfer of insurance risk only occurs after a period of time. [IFRS 17.B24].

Illustration 3-6: Deferred annuity with policyholder election

Entity A issues a deferred annuity contract which provides a specified investment return to the policyholder and includes an option for the policyholder to use the proceeds of the investment on maturity to buy a life-contingent annuity at the same rates that Entity A charges other new annuitants at the time the policyholder exercises that option.

This is not an insurance contract at inception because it does not contain significant insurance risk. Entity A remains free to price the annuity on a basis that reflects the insurance risk that will be transferred to it at that time. Such a contract transfers insurance risk to the issuer only after the option is exercised. Consequently, the cash flows that would occur on the exercise of the option fall outside the boundary of the contract and before exercise there are no insurance cash flows within the boundary of the contract. Consequently, on inception, the contract is a financial instrument within the scope of IFRS 9.

However, if the contract specifies the annuity rates (or a basis other than market rates for setting the annuity rates), the contract transfers insurance risk to Entity A (the issuer) on issuance because Entity A is exposed to the risk that the annuity rates will be unfavourable when the policyholder exercises the option. In that case, the cash flows that would occur when the option is exercised are within the boundary of the contract.

3.7 Examples of insurance and non-insurance contracts

This section contains examples given in IFRS 17 of insurance and non-insurance contracts.

3.7.1 Examples of insurance contracts

The following are examples of contracts that are insurance contracts, if the transfer of insurance risk is significant: [IFRS 17.B26]

- Insurance against theft or damage.
- Insurance against product liability, professional liability, civil liability or legal expenses.
- Life insurance and prepaid funeral plans (although death is certain, it is uncertain when death will occur or, for some types of life insurance, whether death will occur within the period covered by the insurance). Although prepaid funeral plans that provide benefits in kind might be fixed fee service contracts, they may not meet the conditions required by IFRS 17 to use IFRS 15 accounting (see section 2.3.2 above) because insurance risk arises primarily from the uncertainty over the cost of the service.
- Life-contingent annuities and pensions (contracts that provide compensation for the uncertain future event - the survival of the annuitant or pensioner - to assist the annuitant or pensioner in maintaining a given standard of living, which would otherwise be adversely affected by his or her survival).
- Insurance against disability and medical costs.
- Surety bonds, fidelity bonds, performance bonds and bid bonds (i.e., contracts that provide compensation if another party fails to perform a contractual obligation, for example an obligation to construct a building). Accounting for these contracts and consideration as to whether they are insurance contracts or loan commitments under IFRS 9 is contained in Chapter 41. These types of bonds differ from financial guarantee contracts in that the latter are based on underlying financial obligations, rather than non-financial ones (see section 2.3.1.B above).
- Product warranties issued by another party for goods sold by a manufacturer, dealer or retailer are within the scope of IFRS 17. However, as discussed in section 2.3.1.A above, product warranties issued directly by a manufacturer, dealer or retailer are outside the scope of IFRS 17 and are instead within the scope of IFRS 15 or IAS 37.
- Title insurance (insurance against the discovery of defects in title to land that were not apparent when the insurance contract was issued). In this case, the insured event is the discovery of a defect in the title, not the defect itself.
- Travel assistance (compensation in cash or in kind to policyholders for losses suffered in advance of, or during travel).
- Catastrophe bonds that provide for reduced payments of principal, interest or both if a specified event adversely affects the issuer of the bond (unless the specified event does not create significant insurance risk, for example if the event is a change in an interest rate or a foreign exchange rate).
- Insurance swaps and other contracts that require a payment based on changes in climatic, geological and other physical variables that are specific to a party to the contract.

These examples are not intended to be an exhaustive list.

The following illustrative examples, based on examples contained previously in IFRS 4, provide further guidance on situations where there is significant insurance risk.

Illustration 3-7: Guarantee fund established by contract

A guarantee fund is established by contract. The contract requires all participants to pay contributions to the fund so that it can meet obligations incurred by participants (and, perhaps, others). Participants would typically be from a single industry, e.g., insurance, banking or travel.

The contract that establishes the guarantee fund is an insurance contract.

This example contrasts with Illustration 3-11 in section 3.7.2 below, where a guarantee fund has been established by law and not by contract.

Illustration 3-8: No market value adjustment (MVA) for maturity benefits

A contract permits the issuer to deduct an MVA, a charge which varies depending on a market index, from surrender values or death benefits. The contract does not permit the issuer to deduct an MVA for maturity benefits.

The policyholder obtains an additional survival benefit because no MVA is applied at maturity. That benefit is a pure endowment because the insured person receives a payment on survival to a specified date, but beneficiaries receive nothing if the insured person dies before then. If the risk transferred by that benefit is significant, the contract is an insurance contract.

Illustration 3-9: No market value adjustment (MVA) for death benefits

A contract permits the issuer to deduct an MVA from surrender values or maturity payments. The contract does not permit the issuer to deduct an MVA for death benefits.

The policyholder obtains an additional death benefit because no MVA is applied on death. If the risk transferred by that death benefit is significant, the contract is an insurance contract.

3.7.2 Examples of transactions that are not insurance contracts

The following are examples of transactions that are not insurance contracts: *[IFRS 17.B27]*

- Investment contracts that have the legal form of an insurance contract but do not transfer significant insurance risk to the issuer. For example, life insurance contracts in which the insurer bears no significant mortality or morbidity risk are not insurance contracts. Investment contracts with discretionary participation features do not meet the definition of an insurance contract. However, they are within the scope of IFRS 17 provided they are issued by an entity that also issues insurance contracts (see section 12.4 below).
- Contracts that have the legal form of insurance but return all significant risk back to the policyholder through non-cancellable and enforceable mechanisms that adjust future payments by the policyholder as a direct result of insured losses, for example, some financial reinsurance contracts or some group contracts. Such contracts are normally financial instruments or service contracts.
- Self-insurance, in other words retaining a risk that could have been covered by insurance. See section 3.5.2.A above.
- Contracts (such as gambling contracts) that require a payment if an unspecified uncertain future event occurs, but do not require, as a contractual precondition for payment, that the event adversely affects the policyholder. However, this does not preclude the specification of a predetermined payout to quantify the loss caused by a specified event such as a death or an accident. See section 3.4.1 above.
- Derivatives that expose one party to financial risk but not insurance risk, because the derivatives require that party to make payment based solely on the changes in one or more of a specified interest rate, a financial instrument price, a commodity price, a foreign exchange rate, an index of prices or rates, a credit rating or a credit index or other variable, provided that, in the case of a non-financial variable, the variable is not specific to a party to the contract.
- Credit-related guarantees that require payments even if the holder has not incurred a loss on the failure of a debtor to make payments when due.
- Contracts that require a payment that depends on a climatic, geological or any other physical variable not specific to a party to the contract (commonly described as weather derivatives).
- Contracts that provide for reduced payments of principal, interest or both, that depend on a climatic, geological or any other physical variable that is not specific to a party to the contract (commonly referred to as catastrophe bonds).

An entity must apply other IFRS accounting standards, such as IFRS 9 and IFRS 15, to the contracts described above. *[IFRS 17.B28]*.

The credit-related guarantees and credit insurance contracts referred to above can have various legal forms, such as that of a guarantee, some types of letters of credit, a credit default contract or an insurance contract. As discussed in section 2.3.1.B above, those contracts are insurance contracts if they require the issuer to make specified payments to reimburse the holder for a loss that the holder incurs because a specified debtor fails to make payment when due to the policyholder applying the original or modified terms of a debt instrument. However, such insurance contracts are excluded from the scope of IFRS 17 unless the issuer has previously asserted explicitly that it regards the contracts as insurance contracts and has used accounting applicable to insurance contracts. *[IFRS 17.B29]*.

Credit-related guarantees and credit insurance contracts that require payment, even if the policyholder has not incurred a loss on the failure of the debtor to make payments when due, are outside the scope of IFRS 17 because they do not transfer significant insurance risk. Such contracts include those that require payment: *[IFRS 17.B30]*

- Regardless of whether the counterparty holds the underlying debt instrument
- Or
- On a change in the credit rating or the credit index, rather than on the failure of a specified debtor to make payments when due

The following Illustrations, based on examples contained previously in IFRS 4, illustrate further situations where IFRS 17 is not applicable.

Illustration 3-10: Investment contract linked to asset pool

Entity A issues an investment contract in which payments are contractually linked (with no discretion) to returns on a pool of assets held by the issuer (Entity A).

This contract is within the scope of IFRS 9 because the payments are based on asset returns and there is no transfer of significant insurance risk.

Illustration 3-11: Guarantee fund established by law

Guarantee funds established by law exist in many jurisdictions. Typically, they require insurers to contribute funds into a pool in order to pay policyholder claims in the event of insurer insolvencies. They may be funded by periodic (usually annual) levies or by levies only when an insolvency arises. The basis of the funding requirement varies although typically most are based on an insurer's premium income.

The commitment of participants to contribute to the fund is not established by contract so there is no insurance contract. Obligations to guarantee funds are within the scope of IAS 37.

Illustration 3-12: Right to recover future premiums

Entity A issues an insurance contract which gives it an enforceable and non-cancellable contractual right to recover all claims paid out of future premiums, with appropriate compensation for the time value of money.

Insurance risk is insignificant because all claims can be recovered from future premiums. Consequently, the insurer cannot suffer a significant loss and the contract is a financial instrument within the scope of IFRS 9.

Illustration 3-13: Market value adjustment (MVA) without death or maturity benefits

A contract permits the issuer to deduct an MVA from surrender payments. The contract does not permit an MVA for death and maturity benefits. The amount payable on death or maturity is the amount originally invested plus interest.

The policyholder obtains an additional benefit because no MVA is applied on death or maturity. However, that benefit does not transfer insurance risk from the policyholder because it is certain that the policyholder will live or die and the amount payable on death or maturity is adjusted for the time value of money. Therefore, the contract is an investment contract because there is no significant insurance risk. This contract combines the two features discussed in section 3.7.1 above. When considered separately, these two features transfer insurance risk. However, when combined, they do not transfer insurance risk. Therefore, it is not appropriate to separate this contract into two insurance components. [IFRS 17.9].

If the amount payable on death were not adjusted in full for the time value of money, or were adjusted in some other way, the contract might transfer significant insurance risk.

4 Combining insurance contracts

Extract from IFRS 17

Combination of insurance contracts

- 9 A set or series of insurance contracts with the same or a related counterparty may achieve, or be designed to achieve, an overall commercial effect. In order to report the substance of such contracts, it may be necessary to treat the set or series of contracts as a whole. For example, if the rights or obligations in one contract do nothing other than entirely negate the rights or obligations in another contract entered into at the same time with the same counterparty, the combined effect is that no rights or obligations exist.

[IFRS 17.9].

This requirement is intended to prevent entities entering into contracts that individually transfer significant insurance risk, but collectively do not and accounting for part(s) of what is effectively a single arrangement as separate insurance contracts.

Parties are considered to be related for the purpose of combining contracts when they meet the definition of related parties in IAS 24 *Related Party Disclosures*.

Frequently asked questions

Question 4-1: When may it be necessary to treat a set or series of insurance contracts as a whole, applying IFRS 17.9?

(TRG meeting May 2018 - Agenda paper no. 01, Log S47)

The TRG members discussed the analysis of an IASB staff paper and observed that:

- A contract with the legal form of a single contract would generally be considered on its own to be a single contract in substance. However, there may be circumstances where a set or series of insurance contracts with the same or a related counterparty reflect a single contract in substance.
- The fact that a set or series of insurance contracts with the same counterparty are entered into at the same time is not, in itself, sufficient to conclude that they achieve, or are designed to achieve, an overall commercial effect. Determining whether it is necessary to treat a set or series of insurance contracts as a single contract involves significant judgement and careful consideration of all relevant facts and circumstances. No single factor is determinative in applying this assessment.
- The following considerations might be relevant in assessing whether a set or series of insurance contracts achieve, or are designed to achieve, an overall commercial effect:
 - The rights and obligations are different when looked at together compared to individually, for example, if the rights and obligations of one contract negate the rights and obligations of another contract.
 - The entity is unable to measure one contract without considering the other. This may be the case where there is interdependency between the different risks covered in each contract and the contracts lapse together. When cash flows are interdependent, separating them can be arbitrary.
- The existence of a discount, in itself, does not mean that a set or series of contracts achieve an overall commercial effect.
- The TRG members also observed that the principles for combining insurance contracts in IFRS 17.9 are consistent with the principles for separating insurance components from a single contract, as discussed at the February 2018 meeting of the TRG (see section 5 below).

How we see it

The TRG discussion clarifies that in order for an entity to combine a set or series of insurance contracts, those contracts need firstly to be entered into with the same or a related counterparty. If this requirement is not met, the set or series of insurance contracts cannot be combined under this specific guidance in IFRS 17. If this requirement is met, this fact, in and of itself, is not sufficient to conclude that the set or series of insurance contracts should be combined.

Determining whether it is necessary to combine a set or series of insurance contracts into a single contract involves significant judgement and careful consideration of all relevant facts and circumstances. Examples of facts and circumstance to consider in determining whether the contracts were designed to achieve an overall commercial effect are:

- Are the two contracts each priced based upon a single risk; or priced in contemplation of the entire transaction?
- Does the lapse of one contract change the rights and obligations of the other contract(s)?
- Does measuring the contracts separately result in one/some of the contract(s) being onerous whereas when measured as a whole the contract is profitable?
- Do both the direct and ceded policies cover the same underlying insurance risks, and would they be impacted similarly by the underlying insured events?
- Are the rights and obligations different when looked at together, compared to when looked at individually, for example through a guarantee or indemnification provided to the insurer?

Illustration 4-1: Combination of insurance contracts

Insurance Company A enters into an insurance policy with Insured B. Company A simultaneously enters into a fronting agreement with Captive Insurer C, a related party of Insured B. The purpose of the fronting agreement is to reinsure 100% of the insurance risk from A's insurance policy with B. However, A would be legally required to honour the obligations imposed by the insurance policy with B if C failed to indemnify A.

Insurance Company A should consider whether it should combine the insurance policy with Insured B and the reinsurance contract with Captive Insurer C, taking into consideration the factors identified by the TRG (see Question 4-1 above).

How we see it

The guidance on the combination of insurance contracts may impact the accounting for fronting arrangements with related parties as follows:

- In Illustration 4-1 above, if the insurance contract is not combined with the reinsurance contract, the two contracts will be accounted for on a gross basis. The liabilities under the insurance policy may consequently not exactly offset the reinsurance asset due to, for example, different measurement models (the insurance contract might be eligible for the premium allocation approach but the reinsurance contract might not, or *vice versa*), contract boundary, coverage period and allowing for the risk of non-performance within the measurement of the reinsurance contract.
- In Illustration 4-1 above, if the insurance contract is combined with the reinsurance contract, the single arrangement will be accounted for on a net basis under IFRS 17. However, if the combined arrangement does not meet the criteria for significant insurance risk transfer, it would not be within the scope of IFRS 17.

In addition to the specific guidance on combining contracts in IFRS 17, it may be necessary to consider whether the reporting entity is acting as an agent or principal in relation to the insurance contract services being provided. Where the entity merely acts as an agent on behalf of the other parties of an arrangement through, for example, a tripartite arrangement or a series of agreements, it would be necessary to account for the contracts on that basis in order to reflect the economic substance of a set or series of insurance contracts, even if a related party situation is not present. Concluding that an insurance company is acting as an agent is not expected to be common because the entity that holds a reinsurance contract does not normally have a right to reduce the amounts it owes to the underlying policyholder by amounts it expects to receive from the reinsurer, i.e., the entity commonly retains the primary responsibility for fulfilling the insurance contract services to its policyholders. While IFRS 17 does not include specific guidance on how to determine whether an entity is acting as an agent or a principal, guidance in IFRS 15.B34-B38 might be relevant under the IAS 8.11 hierarchy. When an entity acts as an agent in respect of an insurance contract, the accounting for that insurance contract by the entity would be outside of the scope of IFRS 17.

5 Separating components from an insurance contract

Insurance contracts may contain one or more components that would be within the scope of another IFRS accounting standard if they were separate contracts. Such components may be embedded derivatives, an investment component or a component for services other than insurance contract services.

IFRS 17 requires an insurer to identify and separate components in certain circumstances. When separated, those components must be accounted for under the relevant IFRS accounting standard instead of under IFRS 17. [IFRS 17.10]. The IASB considers that accounting for such components separately using other applicable IFRS accounting standards makes them more comparable to similar contracts that are issued as separate contracts and allows users of financial statements to better compare the risks undertaken by entities in different businesses or industries. [IFRS 17.BC99].

Therefore, an insurer must:

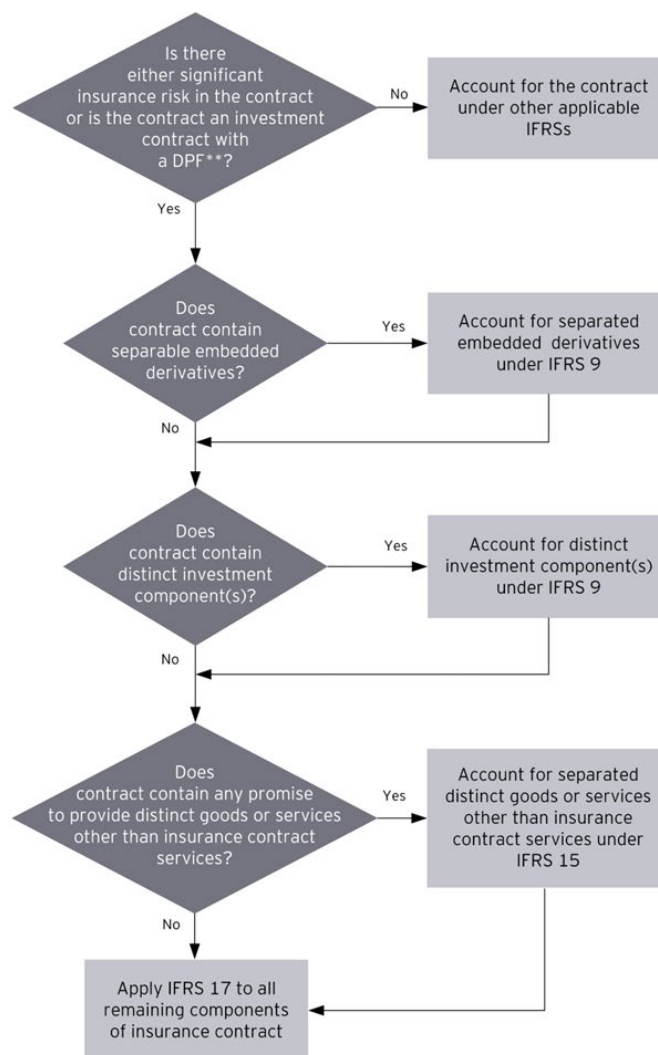

- Apply IFRS 9 to determine whether there is an embedded derivative to be separated and, if there is, account for that separate derivative (see section 5.1 below)
- Separate from a host insurance contract, an investment component if, and only if, that investment component is distinct and apply IFRS 9 to account for the separated component, unless it is an investment contract with discretionary participation features (see section 5.2 below), [IFRS 17.11],
And then
- Separate from the host insurance contract, any promise to transfer to a policyholder distinct goods or services other than insurance contract services applying IFRS 15.7 (see section 5.3 below) [IFRS 17.12]

After separating the components described above (i.e., distinct non-insurance components), an entity applies IFRS 17 to all remaining components of the host insurance contract. [IFRS 17.13]. The recognition and measurement criteria of IFRS 17 are discussed in sections 7 and 8 below. Non-distinct investment components are accounted for under IFRS 17. However, they are disaggregated (i.e., excluded) from insurance revenue and insurance service expenses (see section 5.2.3 below).

The diagrams below illustrates the approach to separating non-insurance components:

* Disaggregation is the exclusion of a non-distinct investment component from insurance revenue and insurance service expenses.

** Investment contracts with Discretionary Participation Features (DPF) are within the scope of IFRS 17 if the entity that issues them also issues insurance contracts. See sections 2.3 and 12.4.

5.1 Separating embedded derivatives from an insurance contract

An entity applies IFRS 9 to determine whether to separate an embedded derivative from a host insurance contract. An embedded derivative is a component of a hybrid contract that also includes a non-derivative host, meaning that some of the cash flows of the combined instrument vary in a way similar to a stand-alone derivative. An embedded derivative causes some or all of the cash flows that otherwise would be required by the contract to be modified. This is determined according to a specified interest rate, financial instrument price, commodity price, foreign exchange rate, price or rate index, credit rating or index, or other variable, provided that, in the case of a non-financial variable, the variable is not specific to a party to the contract. [IFRS 9.4.3.1].

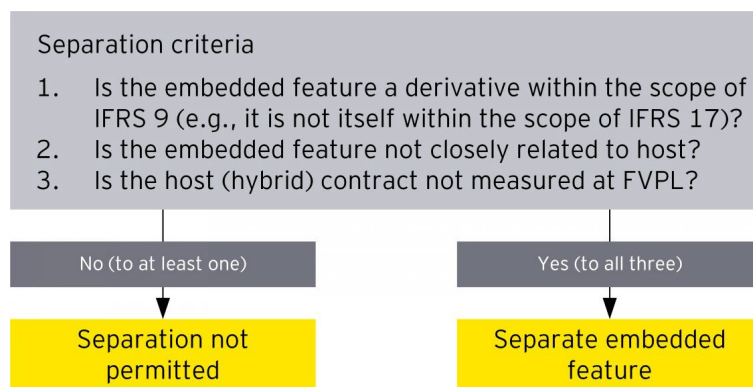

IFRS 9 requires separation of an embedded derivative from its host if, and only if: [IFRS 9.4.3.3]

- A separate instrument with the same terms as the embedded feature meets the definition of a derivative within the scope of IFRS 9 (this would not be the case if the embedded derivative is itself an insurance contract within the scope of IFRS 17).
- The economic characteristics and risks of the embedded derivative are not closely related to the economic characteristics and risks of the host insurance contract. According to IFRS 9, a derivative embedded in an insurance contract relates closely to the host insurance contract if the embedded derivative and host insurance contract are so interdependent that an entity cannot measure the embedded derivative separately (without considering the host contract). [IFRS 9.B4.3.8(h)].

And

- The hybrid contract is not measured at fair value with changes in fair value recognised in profit or loss (i.e., a derivative that is embedded in a financial liability at fair value through profit or loss is not separated).

The diagram below illustrates the embedded derivative decision tree:

The Board believes that accounting separately for some embedded derivatives in insurance contracts: *[IFRS 17.BC104]*

- Ensures that contractual rights and obligations that create similar risk exposures are treated alike whether or not they are embedded in a non-derivative host contract
- Counters the possibility that entities might seek to avoid the requirement to measure derivatives at fair value by embedding a derivative in a non-derivative host contract

IFRS 4 had previously required IFRS 9 or IAS 39 to be applied to derivatives embedded in a host insurance contract unless the embedded derivative was itself an insurance contract. *[IFRS 4.7]*. IFRS 17 does not contain a statement that such embedded derivatives (i.e., derivatives that are insurance contracts themselves) are excluded from IFRS 9. However, any derivative that itself is an insurance contract is scoped out by IFRS 9 and, therefore, would not be subject to the embedded derivative separation guidance of IFRS 9 but accounted for under IFRS 17. *[IFRS 9.2.1(e)(i)]*.

A derivative is a financial instrument within the scope of IFRS 9 with all three of the following characteristics: *[IFRS 9 Appendix A]*

- Its value changes in response to a change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to the underlying of the contract
- It requires no initial net investment or an initial net investment that would be smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors
- It is settled at a future date

The following are examples of embedded derivatives that may be found in insurance contracts:

- Benefits, such as death benefits, linked to equity prices or an equity index
- Options to take life-contingent annuities at guaranteed rates
- Guarantees of minimum interest rates in determining surrender or maturity values
- Guarantees of minimum annuity payments where the annuity payments are linked to investment returns or asset prices
- A put option for the policyholder to surrender a contract. These can be specified in a schedule, based on the fair value of a pool of interest-bearing securities or based on an equity or commodity price index
- An option to receive a persistency bonus (an enhancement to policyholder benefits for policies that remain in-force for a certain period)
- An industry loss warranty where the loss trigger is an industry loss as opposed to an entity specific loss
- A catastrophe trigger where a trigger is defined as a financial variable such as a drop in a designated stock market
- An inflation index affecting policy deductibles
- Contracts where the currency of claims settlement differs from the currency of loss
- Contracts with fixed foreign currency rates

The following Illustration shows an embedded derivative in an insurance contract that is not required to be separated and accounted for under IFRS 9.

Illustration 5-1: Death or annuity benefit linked to equity prices or index

A contract has a death benefit linked to equity prices or an equity index that is payable only on death or when annuity payments begin, and not on surrender or maturity.

The equity-index feature meets the definition of an insurance contract (unless the life-contingent payments are insignificant) because the policyholder benefits only when the insured event occurs. Therefore, the derivative and the host insurance contract are interdependent and the derivative is closely related to the insurance contract. The embedded derivative is not required to be separated and accounted for under IFRS 9 but remains within the scope of IFRS 17. [IFRS 9.B4.3.8(h)].

The following Illustration shows an embedded derivative in an insurance contract that is required to be separated and accounted for under IFRS 9.

Illustration 5-2: Policyholder option to surrender contract for value based on a market index

An insurance contract gives the policyholder the option to surrender the contract for a surrender value based on an equity or commodity price or index (i.e., the surrender amount is indexed to the value of equity instruments or the price of a commodity).

The option is not closely related to the host insurance contract because the surrender value is derived from an index and is not interdependent with the insurance contract. Therefore, the surrender option is required to be accounted for under IFRS 9. [IFRS 9.B4.3.5(c), IFRS 9.B4.3.5(d)].

The meaning of 'closely related' is discussed more generally in Chapter 42.

IFRS 17 removed the exception in IFRS 4 that allowed an insurer not to separate and measure at fair value, a policyholder's option to surrender an insurance contract for a fixed amount (or for an amount based on a fixed amount and an interest rate), even if the exercise price differed from the carrying amount of the host insurance liability. [IFRS 4.8]. Instead, the requirements of IFRS 9 are used to determine whether an entity needs to separate a surrender option. [IFRS 17.BC105(b)].

How we see it

Although IFRS 17 did not carry forward the exception from separating and measuring at fair value, a policyholder's option to surrender an insurance contract for a fixed amount (or for an amount based on a fixed amount and an interest rate), the value of a typical surrender option and the host insurance contract are likely to be interdependent because one component cannot be measured or exist without the other. Therefore, in practice, this change may not result in separation of the surrender option from the host insurance contract.

5.2 Separating investment components from an insurance contract

IFRS 17 introduces the concept of an investment component, which is defined differently compared to the notion of a deposit component included in IFRS 4. [IFRS 4.10].

An investment component is the amount an insurance contract requires the entity to repay to a policyholder in all circumstances, regardless of whether an insured event occurs. [IFRS 17 Appendix A].

IFRS 17 requires distinct investment components to be separated from the host insurance contract and accounted for under IFRS 9. Investment components that are not distinct are accounted for under IFRS 17. However, investment components accounted for under IFRS 17 are excluded from the insurance service result (i.e., they are not accounted for as either insurance revenue or insurance service expenses). See section 5.2.3 below. [IFRS 17.85].

5.2.1 The definition of an investment component

Frequently asked questions

Question 5-1: How to determine whether an insurance contract includes an investment component.
(TRG meeting April 2019 - Agenda paper no. 01, Log S85, S90 and S112)

The submissions ask how to:

- Determine whether an insurance contract includes an investment component
- Assess whether an investment component is distinct (see section 5.2.2 below)
- Determine the amount of an investment component (see section 5.2.3 below)

In determining whether the contract requires the entity to make a payment in all circumstances, the Staff observed that:

- IFRS 17 requires an entity to assess at inception whether an investment component is separated from an insurance contract. To make that assessment, the entity determines whether the contract includes an investment component at inception.
- Different events can trigger a payment to a policyholder under an insurance contract. For example, a payment could be due because the policyholder terminates the contract, an insured event occurs, or the contract reaches its maturity. The insurance contract includes an investment component only if a payment would occur in all circumstances. For example, a non-cancellable contract that requires an entity to pay an amount when the policyholder dies, includes an investment component because the entity is required to pay the amount in all circumstances. The amount to be paid in this case is a claim for a future event that is the death of the policyholder (although the timing is uncertain). However, a non-cancellable contract that requires an entity to pay an amount only if the policyholder survives to a specified age but does not require the entity to pay any amount if the policyholder dies before that, does not include an investment component. The amount to be paid in this case is a claim for an insured event, i.e., the survival of the policyholder.
- IFRS 17 states that an entity needs to assess the insurance risk excluding scenarios that have no commercial substance (i.e., no discernible effect on the economics of the transaction). Hence, for the purpose of determining whether an insurance contract includes an investment component, the entity needs to assess whether scenarios in which no payments are made have commercial substance. The entity does not consider a scenario for which no payment is made if that scenario has no commercial substance.
- In some scenarios, the amount of the payment could be zero. However, this does not necessarily mean that no investment component exists. For example, an entity would need to consider whether a scenario in which the amount of payment is zero arises from:
 - A payment that an entity makes to the policyholder early in the coverage period that might reduce the investment component to zero later in the coverage period.
 - The policyholder's decision to use a payment due from the entity to settle amounts due to the entity. This might be the case when the policyholder decides to terminate a contract early in the coverage period and uses a surrender amount to pay surrender charges that are equal to or higher than the surrender amount, or when the policyholder has the option to use a surrender amount to buy insurance coverage, such as an annuity. In the staff's view, the fact that the policyholder chooses to use a payment it is due to fund payments to the entity does not mean the entity is not required to make payments in all circumstances. This is because settling amounts due on a net or gross basis does not affect the outcome of the assessment of whether an investment component exists.
 - A payment amount may be made to a policyholder upon cancellation of a contract that is calibrated to reflect outstanding future periods in which a service is provided. Such a payment may indicate that the policyholder is entitled to a premium refund reflecting its consumption of service over the life of the contract. In this case, the payments may represent a refund of premiums for unused coverage rather than an investment component.

Any payments on cancellation that represent premium refunds for unused coverage rather than an investment component are not required to be disclosed separately from the investment component. See section 16.1.1 below. [IFRS 17.103(c)].

The following Illustrations are based on examples of insurance contracts from the April 2019 TRG meeting that further illustrate whether an insurance contract includes an investment component.

Illustration 5-3: Investment component in a life cover contract

In exchange for a single premium of CU1,000 paid by a 60 year-old policyholder, the life cover contract promises to pay an amount of CU2,000 when the policyholder reaches 80 years old or when the policyholder dies before reaching 80 years old. The policyholder cannot terminate the contract.

The life cover contract includes an investment component because the contract requires the insurer to make a payment to the policyholder in all circumstances, i.e., whether the policyholder reaches 80 years old or dies before reaching 80 years old.

Illustration 5-4: Investment component in immediate annuity contract

In exchange for premiums, the immediate annuity contract with a guarantee payment period promises to make regular payments to the policyholder for the remainder of the policyholder's life, or the estate of the policyholder for a remaining guaranteed period if the policyholder dies before the end of the guaranteed period (for example, if the guaranteed period is three years and the policyholder dies at the end of Year 1, the estate will continue to receive regular payments for two years). This example assumes that the policyholder cannot terminate the contract.

The immediate annuity contract with a guaranteed payment period includes an investment component. The staff observe that the contract requires the entity to make a payment in all circumstances i.e., regular payments to the policyholder or to the estate of the policyholder for the guaranteed period.

Illustration 5-5: Investment component in deferred annuity contract

The deferred annuity contract promises to pay a surrender amount to the policyholder if the policyholder dies or terminates the contract before reaching 60 years old or, if the policyholder reaches 60 years old, to make regular payments to the policyholder for the remainder of the policyholder's life. In addition, if the policyholder dies before reaching 80 years old, the contract requires the entity to pay an amount at least equal to the amount accumulated to the policyholder through deposits less payments already made. It is assumed that if the policyholder reaches 80 years old, the regular payments received between the ages of 60 years old and 80 years old at least equal the amount accumulated through deposits and the amount accumulated through deposits does not accrue interest after the policyholder reaches 60 years old. The policyholder cannot terminate the contract after reaching 60 years old.

The deferred annuity contract includes an investment component because the contract requires the entity to pay a fixed amount in all circumstances, either a surrender amount if the policyholder dies or terminates the contract before reaching 60 years old or an amount that is equal to the amount accumulated by the policyholder through deposits, if the policyholder dies between the ages of 60 and 80 or reaches 80 years old.

Illustration 5-6: Pure protection contract

In exchange for premiums, the pure protection contract promises to pay a fixed amount of CU1,000 to the policyholder on the death of the policyholder, if the policyholder dies within a 5-year coverage period or a variable surrender amount to the policyholder if the policyholder opts to surrender the contract before the end of Year 4. No amount is paid to the policyholder if the policyholder keeps the contract to Year 5 and survives.

The pure protection contract does not contain an investment component because there are circumstances with commercial substance in which no amount is paid.

A contract which does not require a payment to a policyholder if it continues to the end of the coverage period without a claim being made, does not contain an investment component. There may be a payment upon surrender but this payment is regardless of whether the insured event occurs. However, because there is no payment on maturity, there is a scenario where no payment to the policyholder is made (provided this scenario has commercial substance). Therefore, a pure protection contract does not contain an investment component because there are circumstances with commercial substance in which no amount is paid. The same would apply to a contract where there is no payment upon death before maturity (i.e., a pure endowment contract).

5.2.2 Separable investment components

Many insurance contracts have an implicit or explicit investment component that would, if it were a separable financial instrument, be within the scope of IFRS 9. However, the Board decided that it would be difficult to routinely separate such investment components from insurance contracts. [IFRS 17.BC108].

Accordingly, IFRS 17 requires an entity to separate from a host insurance contract an investment component if, and only if, that investment component is distinct from the host insurance contract. [IFRS 17.11(b)]. The Board concluded that, in all cases, entities would be able to measure the stand-alone value for a separated investment component by applying IFRS 9. [IFRS 17.BC109].

The words 'if, and only if' mean that voluntary separation of investment components which are not distinct is prohibited. This is a change from IFRS 4, which permitted voluntary unbundling of deposit components if the deposit component could be measured separately. The Board considered whether to permit an entity to separate a non-insurance component when not required to do so by IFRS 17; for example, some investment components with interrelated cash flows, such as policy loans. Such components may have been separated when applying previous accounting practices. However, the Board concluded that it would not be possible to separate in a non-arbitrary way, a component that is not distinct from the insurance contract nor would such a result be desirable. The Board also noted that when separation ignores interdependencies between insurance and non-insurance components, the sum of the values of the components may not always equal the value of the contract as a whole, even on initial recognition. That would reduce the comparability of the financial statements across entities. [IFRS 17.BC114].

An investment component is distinct if, and only if, both of the following conditions are met: [IFRS 17.B31]

- The investment component and the insurance component are not highly interrelated.
- A contract with equivalent terms is sold, or could be sold, separately in the same market or the same jurisdiction, either by entities that issue insurance contracts or by other parties. The entity must take into account all information reasonably available in making this determination. However, the entity is not required to undertake an exhaustive search to identify whether an investment component is sold separately.

An investment component and an insurance component are highly interrelated if, and only if: [IFRS 17.B32]

- The entity is unable to measure one component without considering the other. For example, if the value of one component varies according to the value of the other, an entity must apply IFRS 17 to account for the combined investment and insurance components.

Or

- The policyholder is unable to benefit from one component unless the other is also present. For example, if the lapse or maturity of one component in a contract causes the lapse or maturity of the other, the entity must apply IFRS 17 to account for the combined investment and insurance components.

Frequently asked questions

Question 5-2: How to assess whether an investment component is distinct.

(TRG meeting April 2019 - Agenda paper no. 01, Log S85, S90 and S112)

The submissions ask how to:

- Determine whether an insurance contract includes an investment component (see section 5.2.1 above)
- Assess whether an investment component is distinct
- Determine the amount of an investment component (see section 5.2.3 below)

Assessing whether an investment component is distinct, the Staff considered the two criteria in IFRS 17.B31.

TRG members discussed the analysis on assessing whether an investment component is distinct and observed that an investment component within an insurance contract is not distinct if the investment component and the insurance component are highly interrelated, i.e., when:

- It is not possible to measure one component without considering the other. This could be the case when the contract requires the entity to make payments for which either the amount or the timing depend on the insured event. IFRS 17.BC10(a) explains that ignoring interdependencies between components of an insurance contract would have the result that the sum of the values of the components may not always equal the value of the contract as a whole, even on initial recognition. Thus, if the value of one component varies according to the value of the other component the resulting measurement might not be meaningful for one of (or for both) the components.
- The policyholder cannot benefit from one component if the other is not present. The lapse or maturity of one component causing the lapse or maturity of the other component is sufficient to conclude that the two components are highly interrelated. For example, the lapse of the insurance component causing the lapse of the investment component is sufficient to conclude that the two components are highly interrelated, even if the lapse of the investment component does not cause the lapse of the insurance component. A contractual term preventing the policyholder from cancelling the investment component or the insurance component or both may indicate that the policyholder cannot benefit from one component without the other.

TRG members also observed that the hurdle for separation of investment components from an insurance contract is high.

The following Illustrations are based on examples of insurance contracts from the April 2019 TRG meeting that further illustrate whether an investment component within an insurance contract is distinct.

Illustration 5-7: Investment component in a life cover contract

In exchange for a single premium of CU1,000 paid by a 60 year-old policyholder, the life cover contract promises to pay an amount of CU2,000 when the policyholder reaches 80 years old or when the policyholder dies before reaching 80 years old. The policyholder cannot terminate the contract.

The value of the insurance component varies according to the value of the investment component because the insured event in this example is the timing of death. Although the payment of CU2,000 is certain, it is uncertain when the policyholder will die and, therefore whether the entity will pay the amount of CU2,000 before the policyholder reaches 80 years old and how soon that may be after the inception of the contract. Therefore, the entity cannot measure the insurance component without considering the investment component and, as a result, the investment component is not distinct and the entity cannot separate it from the insurance contract.

The IASB staff further observed that the policyholder cannot benefit from one component when the other component is not present because both components lapse together.

Illustration 5-8: Investment component in deferred annuity contract

The deferred annuity contract promises to pay a surrender amount to the policyholder if the policyholder dies or terminates the contract before reaching 60 years old or, if the policyholder reaches 60 years old, to make regular payments to the policyholder for the remainder of the policyholder's life. In addition, if the policyholder dies before reaching 80 years old, the contract requires the entity to pay an amount at least equal to the amount accumulated to the policyholder through deposits less payments already made. It is assumed that if the policyholder reaches 80 years old, the regular payments received between the ages of 60 years old and 80 years old at least equal the amount accumulated through deposits and the amount accumulated through deposits does not accrue interest after the policyholder reaches 60 years old. The policyholder cannot terminate the contract after reaching 60 years old.

In this contract the investment component is: (i) a surrender amount if the policyholder dies or terminates the contract before reaching 60 years old; or (ii) an amount that is equal to the amount accumulated by the policyholder through deposits, if the policyholder reaches 60 years old. The insurance component is possible payments exceeding the amount accumulated by the policyholder through deposits.

If the policyholder dies after reaching 60 years old and before reaching 80 years old, the entity makes a payment reflecting the amount accumulated by the policyholder through deposits. The timing of that payment depends on the death of the policyholder. Therefore, the entity cannot measure the investment contract without considering the insurance component. As a result, the investment component is not distinct and the entity cannot separate it from the insurance contract.

The IASB staff also observed that the death of the policyholder causes the maturity of both the insurance component in the contract and the investment component in the contract.

The following Illustration is based on Example 4 in the Illustrative Examples to IFRS 17: [IFRS 17.IE43-50]

Illustration 5-9: Insurance contract with an account balance and a minimum death benefit

An entity issues a whole life insurance contract with an account balance. The contract does not have a fixed term. The entity receives a premium of CU1,000 when the contract is issued. The account balance is increased annually by voluntary amounts paid by the policyholder, increased or decreased by amounts calculated using the returns from specified assets and decreased by fees charged by the entity (e.g., asset management fees).

The contract promises to pay the following:

- A death benefit of CU5,000 plus the amount of the account balance if the insured person dies during the coverage period
- And
- The account balance, if the contract is cancelled (i.e., there are no surrender charges)

The entity has a claims processing department to process the claims received and an asset management department to manage investments. An investment product that has equivalent terms to the account balance, but without the insurance coverage, is sold by another financial institution.

The contract contains an investment component because an amount is paid to the policyholder in all circumstances (i.e., either the account balance if the contract is cancelled or the death benefit plus the account balance if the insured person dies during the coverage period).

The existence of an investment product with equivalent terms indicates that the components may be distinct. However, if the right to provide death benefits provided by the insurance coverage either lapses or matures at the same time as the account balance, the insurance and investment components are highly interrelated and are therefore not distinct. Consequently, the account balance would not be separated from the insurance contract and would be accounted for by applying IFRS 17.

Claims processing activities are part of the activities the entity must undertake to fulfil the contract and the entity does not transfer a good or service to the policyholder because the entity performs those activities. Thus, the entity would not separate the claims processing component from the insurance contract.

Asset management activities, similar to claims processing activities, are part of the activities the entity must undertake to fulfil the contract and the entity does not transfer a good or service other than insurance contract services to the policyholder because the entity performs those activities. Thus, the entity would not separate the asset management component from the insurance contract.

How we see it

An account balance in a savings-type insurance contract is a clear example of a repayable contract feature that would typically be an investment component. There are various other repayable amounts that may also meet the definition of an investment component depending on the applicable circumstances, for example guaranteed annuity payments and no-claim bonuses.

The requirements in IFRS 17 for separating investment components do not specifically address the issue of contracts artificially separated through the use of side letters, the separate components of which should be considered together. However, IFRS 17 does state that it may be necessary to treat a set or series of contracts as a whole in order to report the substance of such contracts. For example, if the rights or obligations in one contract do nothing other than entirely negate the rights or obligations of another contract entered into at the same time with the same counterparty, the combined effect is that no rights or obligations exist (see section 4 above).

5.2.3 Measurement of the non-distinct investment component

A distinct investment component is accounted for under IFRS 9. See section 5.2 above. A non-distinct investment component is accounted for under IFRS 17.

Although an entity applies IFRS 17 to account for both the combined investment and insurance components of an insurance contract if those components are highly interrelated (i.e., non-distinct), insurance revenue and insurance service expenses presented in profit or loss must exclude any non-distinct investment component. [IFRS 17.85, IFRS 17.BC108(b)].

IFRS 17 does not explain how to determine the amount of non-distinct investment components that an entity is required to exclude from insurance revenue and insurance service expense. This issue was discussed at the April 2019 meeting of the TRG.

Frequently asked questions

Question 5-3: How to determine the amount of an investment component.

(TRG meeting April 2019 - Agenda paper no. 01, Log S85, S90 and S112)

The submissions ask how to:

- Determine whether an insurance contract includes an investment component (see section 5.2.1 above)
- Assess whether an investment component is distinct (see section 5.2.2 above)
- Determine the amount of an investment component

The Staff observed that there could be circumstances in which the investment component is not explicitly identified by the contractual terms or where the amount of the investment component varies over time. The Staff observed that, in these circumstances, an approach for determining the investment component that is based on a present value basis as at the time of making this determination would be consistent with the requirements of IFRS 17.B21, which refers to the present value of significant additional amounts that result in a contract being defined as an insurance contract (see section 3.5.3 above). The staff consider that if the amounts that would be payable if no insurance event had occurred are determined on a present value basis, it would be consistent to determine the investment component on a present value basis too.

The TRG members observed that:

- In some cases, it may be reasonable to determine the amount of the investment component that an entity is required to exclude from insurance revenue and insurance service expenses using the explicit amount identified by contractual terms. For example, the amounts of a non-distinct investment component can be identified as an explicit surrender amount or explicit guaranteed payments.
- In other cases, it may be appropriate to determine the amount of the investment component that an entity is required to exclude from insurance revenue and insurance service expenses on a present value basis at the time of making the determination. For example, in an uncancellable contract that requires an entity to pay the policyholder an amount when the policyholder dies or reaches the age of 80 (see Illustrations 5-3 in section 5.2.1 and Illustration 5-7 in section 5.2.2 above), using the present value of the payments the contract requires the entity to make at the age of 80 as the amount of the investment component would result in a reasonable outcome because death in the early periods of coverage would reflect a higher insurance claim than in later periods.

The TRG members also observed that if an entity uses an explicit surrender amount for determining the amounts to be excluded from insurance revenue and insurance service expense, it should not be required to determine whether a part of that amount reflects a premium refund. The TRG members noted that both an investment component and a premium refund will be excluded from revenue and expenses recognised from a contract in these circumstances. In addition, there is no requirement to separately disclose any premium refund from the non-distinct investment component.

IFRS 17 requires an entity to determine the amount of a non-distinct investment component only at the time insurance revenue and incurred claims are recognised and to exclude the amounts so identified from insurance revenue and insurance service expenses. [IFRS 17.BC34]. Accordingly, when a claim is incurred, IFRS 17 requires an entity to determine how much of that claim is an investment component. An entity should also determine whether it was expected to become payable in that period. The contractual service margin for a group of insurance contracts without direct participation features is adjusted for differences between any investment component expected to become payable in the period (adjusted for the effect of the time value of money and financial risk) and the actual investment component that becomes payable in the period (see section 9.6 below). The result is that the net effect on the contractual margin is the effect of the change in timing of the repayment of the investment component. This means the entity would have to be able to determine the differences between any investment component expected to become payable in the period and the actual investment component that becomes payable. [IFRS 17.B96, IFRS 17.BC235].

How we see it

Although it is observed in the Basis for Conclusions that non-distinct investment components need be identified only at the time insurance revenue and incurred claims are recognised, so as to exclude the amount of the investment components so identified, an entity may also need to identify any non-distinct investment component before an incurred claim is recognised in order to determine whether it was expected to become payable in a period.

5.3 Goods or services other than insurance contract services

After applying IFRS 9 to embedded derivatives and separating a distinct investment component from a host insurance contract, an entity is required to separate from the host insurance contract any promise to transfer to a policyholder distinct goods or services other than insurance contract services (i.e., non-insurance services) by applying the requirements of IFRS 15 for a contract that is partially within the scope of IFRS 15 and partially within the scope of other IFRS accounting standards. *[IFRS 17.12]*.

This means that, on initial recognition, an entity must: *[IFRS 17.12]*

- Apply IFRS 15 to attribute the cash inflows between the insurance component and any promises to provide distinct goods or services other than insurance contract services
- And
- Attribute the cash outflows between the insurance component and any promised goods or services other than insurance contract services accounted for applying IFRS 15 so that:
 - Cash outflows that relate directly to each component are attributed to that component
 - Any remaining cash outflows are attributed on a systematic and rational basis, reflecting the cash outflows the entity would expect to arise if that component were a separate contract

The allocation of the cash inflows between the host insurance contract and the distinct good or service other than an insurance contract service should be based on the stand-alone selling price of the components. The Board believes that, in most cases, entities would be able to determine an observable stand-alone selling price for the bundled goods or services if those components meet the separation criteria. *[IFRS 17.BC111]*. If the stand-alone selling price is not directly observable, an entity would need to estimate the stand-alone selling price of each component to allocate the transaction price. This stand-alone selling price might not be directly observable if the entity does not sell the insurance and the goods or components separately, or if the consideration charged for the two components together differs from the stand-alone selling prices for each component. In this case, applying IFRS 15 results in any discounts and cross-subsidies being allocated to components proportionately or on the basis of observable evidence. *[IFRS 17.BC112]*. IFRS 17 requires that cash outflows should be allocated to their related component, and that cash outflows not clearly related to one of the components should be systematically and rationally allocated between components. Insurance acquisition cash flows and some fulfilment cash flows relating to overhead costs do not clearly relate to one of the components. A systematic and rational allocation of such cash flows is consistent with the requirements in IFRS 17 for allocating acquisition and fulfilment cash flows that cover more than one group of insurance contracts to the individual groups of contracts, and is also consistent with the requirements in other IFRS accounting standards for allocating the costs of production, e.g., the requirements in IFRS 15 and IAS 2 *Inventories*. *[IFRS 17.BC113]*.

For the purpose of separation, an entity does not consider activities that it must undertake to fulfil a contract unless the entity transfers a good or service other than insurance contract services to the policyholder as those activities occur. For example, an entity may need to perform various administrative tasks to set up a contract. The performance of those tasks does not transfer a service to the policyholder as the tasks are performed. *[IFRS 17.B33]*.

A good or service other than an insurance contract service promised to a policyholder is distinct if the policyholder can benefit from the good or service either on its own or together with other resources readily available to the policyholder. Readily available resources are goods or services that are sold separately (by the entity or by another entity), or resources that the policyholder has already got (from the entity or from other transactions or events). *[IFRS 17.B34]*.

A good or service other than insurance contract service that is promised to the policyholder is not distinct if: *[IFRS 17.B35]*

- The cash flows and risks associated with the goods or services are highly interrelated with the cash flows and risks associated with the insurance components in the contract
- The entity provides a significant service in integrating the goods or non-insurance services with the insurance components

The Board considered, but rejected, the possibility to separate non-insurance components that are not distinct because it would not be possible to separate, in a non-arbitrary way, a component that is not distinct from the insurance contract nor would such a result be desirable. [IFRS 17.BC114].

The following Illustration is based on Example 5 in the Illustrative Examples to IFRS 17: [IFRS 17.IE51-55]

Illustration 5-10: Separating components from a stop-loss contract with claims processing services

An entity issues a stop loss contract to a policyholder (which is an employer). The contract provides health coverage for the policyholder's employees, with these features:

- Insurance coverage of 100% for the aggregate claims from employees exceeding CU25m (the 'stop loss' threshold). The employer will self-insure claims from employees up to CU25m.
- Claims processing services for employees' claims during the next year, regardless of whether these have exceeded the stop-loss threshold of CU25m. The entity is responsible for processing the health insurance claims of employees on behalf of the employer.

Analysis

The entity considers whether to separate the claims processing services from the insurance contract. Similar services to process claims on behalf of customers are available in the market.

The criteria for identifying distinct non-insurance services are met in this example because:

- Claims processing services, similar to those for employers' claims on behalf of the employer, are sold as a stand-alone service without any insurance coverage.
- These services benefit the policyholder independently of the insurance coverage. Had the entity not agreed to provide those services, the policyholder would have to process its employees' medical claims itself or engage other service providers.
- Cash flows associated with claims processing services are not highly interrelated with the cash flows of the insurance coverage, and the entity does not provide for a significant service of integrating claims processing services with the insurance components.

Accordingly, the entity separates the claims processing services (for all claims) from the insurance contract and accounts for them by applying IFRS 15.

The following Illustration is Based on Example 4 in the Illustrative Examples to IFRS 17: [IFRS 17.IE43-50]

Illustration 5-11: Separating components from a life insurance contract with an account balance

An entity issues a life insurance contract with an account balance and receives a premium of CU1,000 when the contract is issued. The account balance increases annually by voluntary amounts paid by the policyholder and is credited with returns from specified assets and decreased by fees charged by the entity (e.g., asset management fees).

The contract promises to pay:

- A death benefit of CU5,000 plus the amount of the account balance, if the insured person dies during the coverage period
- And
- The account balance, if the contract is cancelled (i.e., there are no surrender charges)

The entity uses a claims processing department to process the claims received and an asset management department to manage investments. Other financial institutions offer investment products whose terms are equivalent to the account balance, but without the insurance coverage.

Analysis

The existence of an investment product with equivalent terms indicates that the components may be distinct. However, if the right to provide death benefits provided by the insurance coverage either lapses or matures at the same time as the account balance is returned, the insurance and investment components are highly interrelated and therefore not distinct. Consequently, there would be no separation of an account balance and insurance contract, and the account balance would be accounted for by applying IFRS 17. Amounts related to the investment component would not be presented as insurance revenue or insurance service expenses.

An entity must undertake claims processing and asset management activities to fulfil the contract and does not transfer distinct goods or services to the policyholder simply because the entity performs these. Thus, the entity would not separate these components from the insurance contract.

6 Level of aggregation

IFRS 17 defines the level of aggregation to be used for measuring insurance contracts and their related profitability. This is a key issue in identifying onerous contracts and in determining the recognition of profit or loss and presentation in the financial statements.

The starting point for aggregating contracts is to identify portfolios of insurance contracts. A portfolio comprises contracts that are subject to similar risks and managed together. [IFRS 17.14].

IFRS 17 then requires an entity to divide the contracts in each portfolio on initial recognition into the following groups: [IFRS 17.16]

- Those contracts that are onerous at initial recognition (except for those contracts subject to the premium allocation approach where an entity can assume no contracts are onerous at initial recognition unless facts and circumstances indicate otherwise - see section 9.8 below)
- Those contracts that have no significant possibility of becoming onerous subsequently
- And
- All remaining contracts in the portfolio

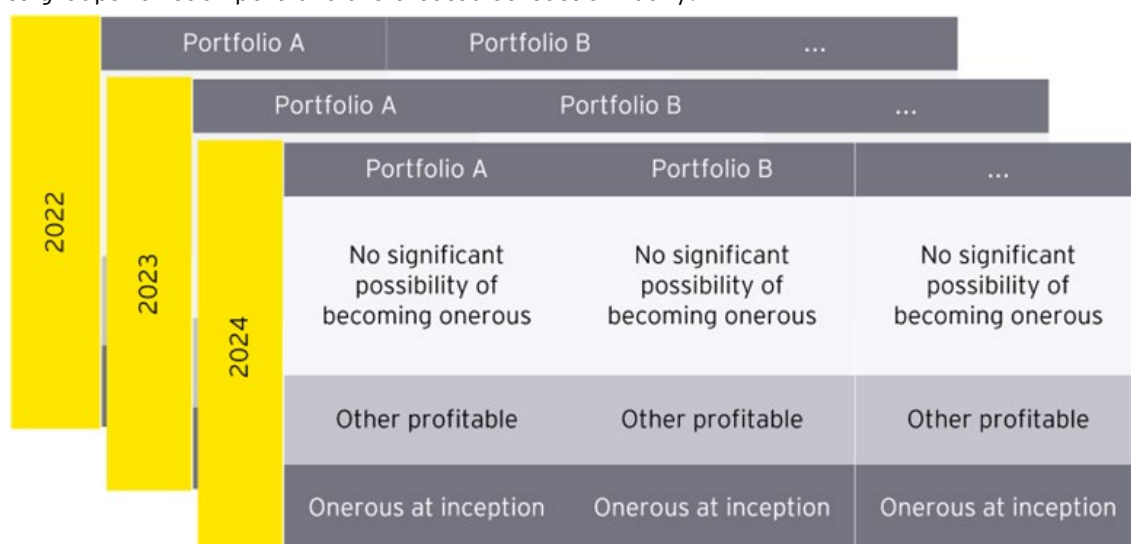

This can be illustrated as follows:

An entity is permitted, but not required, to divide the portfolio into more groups based on profitability if its internal reporting provides information of profitability at a more detailed level. See section 6.2.1 below. [IFRS 17.21].

Groups of contracts are established at initial recognition and are not reassessed. [IFRS 17.24].

An entity is prohibited from grouping contracts issued more than one year apart (except in certain circumstances when applying IFRS 17 for the first time, see sections 17.4 and 17.5 below). [IFRS 17.22]. This is commonly referred to as the 'annual cohort' requirement (see section 6.2.2 below). This means that separate groups for each portfolio are created at least annually.

Entities implementing IFRS 17 raised concerns relating to the level of aggregation requirements. The Board, therefore, considered whether to amend the requirements, and if so, how. Having considered a number of possible amendments, the Board reaffirmed its view that the benefits of the level of aggregation requirements significantly outweigh the costs. The Board decided to retain the requirements unchanged. [IFRS 17.BC139A, IFRS 17.BC139B]. See section 6.2.2 below.

To measure a group of contracts, an entity may estimate the fulfilment cash flows (see section 8 below) at a higher level of aggregation than the group or portfolio. This assumes the entity is able to include the appropriate fulfilment cash flows in the measurement of the group by allocating such estimates to groups of contracts.

How we see it

The level of aggregation is important because it determines the extent to which expected gains or losses arising from individual contracts may be offset with expected gains and losses of other contracts. It also determines the pattern of profit recognition over time.

Separating contracts issued more than one year apart is a new concept compared to many existing insurance accounting practices. In addition to operational challenges, maintaining separate 'cohorts' limit an entity's ability to offset profits and losses (or spread different levels of profitability) arising from different generations of contracts in a portfolio. The application of the aggregation level under IFRS 17 will, therefore, strongly affect requirements for process, systems and data when implementing the standard.

6.1 Identifying portfolios

A portfolio comprises contracts that are subject to similar risks and managed together. Contracts have similar risks if the entity expects their cash flows will respond similarly in amount and timing to changes in key assumptions. Contracts within a product line would be expected to have similar risks and, thus, would be in the same portfolio if they were managed together. Contracts in different product lines (for example, single premium-fixed annuities as opposed to regular-term life insurance) would not be expected to have similar risks and would be in different portfolios. [IFRS 17.14].

Deciding which contracts have similar risks is a matter of judgement. Many insurance products provide a basic level of insurance cover with optional add-ons (or riders) at the discretion of the policyholder. For example, a homeowner insurance policy may provide legal cost protection or additional accidental damage cover at the policyholder's discretion in return for additional premiums. The question arises as to the point at which policies of a similar basic type have been tailored to the level at which the risks have become dissimilar. Rider benefits issued and priced separately from the host insurance contract may need to be accounted for as separate contracts because they, in substance, represent new contracts (see section 6.1.1 below).

IFRS 17 defines financial risks and insurance risk (a non-financial risk). Financial risk is defined to include "The risk of a possible change in... [a] currency exchange rate". [IFRS 17 Appendix A]. In September 2022, the IFRS IC observed that when IFRS 17 requires an entity to consider or reflect only particular risks (for example, only non-financial risk), it explicitly refers to the risks to be considered or reflected. Consequently, the IFRS IC concluded that, because IFRS 17.14 refers to 'similar risks' without specifying any particular types of risk, an entity is required to consider all risks - including currency exchange rate risk - when identifying portfolios of insurance contracts. However, 'similar risks' do not mean 'identical risks'. An entity could therefore identify portfolios of contracts that include contracts subject to different currency exchange rate risk. The IFRS IC observed that what an entity considers to be 'similar risks' will depend on the nature and extent of the risks in the entity's insurance contracts. See Question 8-1 in section 8.3 below for further detail on this agenda decision.

For presentation purposes only, insurance contracts are aggregated in the statement of financial position at portfolio level (see section 15 below).

How we see it

The definition of portfolio may differ from how this term is defined under IFRS 4. An entity's practice under IFRS 4 for identifying portfolios may not be consistent with the IFRS 17 requirement that contracts with different risks will be in different portfolios. Practices applied under IFRS 4 for recognising losses from onerous contracts were based on wider groupings of contracts than those in IFRS 17. For example, liability adequacy tests were often applied at product or legal entity level. We believe the level of aggregation requirements under IFRS 17 will lead to a more granular grouping and, as such, the requirements under IFRS 17 are likely to result in earlier identification of losses compared to the reporting under IFRS 4.

6.1.1 Separation of insurance components within an insurance contract

Insurers may combine different types of products or coverages with different risks into one insurance contract. Examples include a contract for both life and disability insurance and one for both pet and home insurance. In some situations, separating a single insurance contract into separate risk components may be required for regulatory reporting purposes. Although IFRS 17 provides guidance on separating non-insurance components within an insurance contract (see section 5 above), the standard is silent as to whether an insurance contract can be separated into different insurance components (i.e., allocated to different portfolios for aggregation purposes) and, if so, the basis for such a separation.⁴

Frequently asked questions

Question 6-1: Is it permitted to separate different insurance components from the host insurance contract and measure the components separately?

(TRG meeting February 2018 - Agenda paper no. 01, Log S02)

Some entities may combine, for example, home and motor insurance in a single contract for certain policyholders and also issue these products separately in the market to other policyholders. IFRS 17 seems to imply that, in these circumstances, the entity would have three portfolios (home, motor, and home & motor insurance) because the contracts contain three different types of risk. However, IFRS 17 refers to groups of insurance contracts and is silent as to whether an insurance contract may be separated into different 'sub-insurance components' voluntarily. The TRG members discussed the analysis of an IASB staff paper and observed that:

- The lowest unit of account that is used in IFRS 17 is the contract that includes all insurance components.
- Entities would usually design contracts in a way that reflects their substance. Therefore, a contract with the legal form of a single contract would generally be considered a single contract in substance.

However:

- There may be circumstances where the legal form of a single contract would not reflect the substance of its contractual rights and obligations.
- Overriding the contract unit of account presumption by separating insurance components of a single insurance contract involves significant judgement and careful consideration of all relevant facts and circumstances. It is not an accounting policy choice.
- Combining different types of products or coverages that have different risks into one legal insurance contract is not, in itself, sufficient to conclude that the legal form of the contract does not reflect the substance of its contractual rights and obligations. Similarly, the availability of information to separate cash flows for different risks is not sufficient to conclude that the contract does not reflect the substance of its contractual rights and obligations.
- The fact that a reinsurance contract held provides cover for underlying contracts that are included in different groups is not, in itself, sufficient to conclude that accounting for the reinsurance contract held as a single contract does not reflect the substance of its contractual rights and obligations.

The TRG members also observed that considerations that might be relevant in the assessment of whether the legal form of a single contract reflects the substance of its contractual rights and contractual obligations include:

- Interdependency between the different risks covered
- Whether components lapse together
- Whether components can be priced and sold separately

The TRG members observed that an example of when it may be appropriate to override the presumption that a single legal contract is the lowest unit of account is when more than one type of insurance cover is included in one legal contract solely for the administrative convenience of the policyholder and the price is simply the aggregate of the standalone prices for the different insurance covers.

⁴ [IASB Staff paper 2C](#): Project: *Insurance Contracts*, Paper topic: *Responding to the external editorial review*, IASB meeting, February 2017, Issue A8. Available on the IFRS Foundation's website.

The TRG submission provided a specific fact pattern of a contract containing a long term life coverage with annual renewable health riders. At each annual renewal date, the entity can reassess the risks and can set a price that fully reflects those risks with respect to renewable health riders but cannot reprice or cancel the life coverage of the contract. The following factors indicate its substance as a single contract:

- The renewable health riders are not sold separately
- If the life coverage is cancelled by the policyholder, the renewable riders are cancelled at the same time
- And
- The renewable riders are rarely cancelled and most of them remain until the end of the coverage period of the life contract.

Therefore, in relation to this example:

- The contract is included in its entirety in a single portfolio and in a single group and is not split to reflect the ways its components would be allocated to portfolios and groups if they were issued as separate contracts
- The cash flows within the boundary of the contract would be assessed for the contract in its entirety. The assessment of when a substantive obligation to provide the policyholder with services ends will be performed for the contract in its entirety. Therefore, in this example, cash flows related to the premiums within the contract boundaries include cash flows related to the renewable health riders beyond the annual re-pricing date
- And
- The contract would be evaluated against the criteria for applying the premium allocation approach in its entirety.

How we see it

We expect that, in some cases, an insurer that issues combined contracts would choose not to separate them because of the practical difficulties in separating cash flows between components and the loss of the potential for offsetting adverse changes in assumptions on some risks with favourable changes in other risks. However, in other situations, for example, for some types of group business and reinsurance contracts, the combination of different coverages into a single contract may be for the purpose of administrative convenience. In these cases, it may be a better reflection of the substance of the arrangement to record premiums and claims and manage for different risks included in one legal contract separately. Separation into sub-insurance components is an important aspect of the application of the level of aggregation under IFRS 17 and requires closer analysis to see whether and to what extent such separation should be applied.

Some regulatory frameworks require entities to report some, or all, risks of a combined risk insurance contract separately. If accounted for as a single contract under IFRS 17, then the regulatory separation would give rise to a difference between accounting and regulatory reporting.

6.2 Groups of insurance contracts

A group of insurance contracts is the main unit of account for determining measurement. Measurement of insurance contracts occurs at the group level within each portfolio (see section 8 below) and each portfolio, to the extent relevant, will consist usually of a minimum of three separate types of groups.

An entity will typically enter into transactions for individual contracts, not groups of contracts. Therefore, IFRS 17 includes requirements that specify how to recognise groups that include contracts issued in more than one reporting period (see section 6.2.2 below) and how to derecognise contracts from within a group (see section 13.3 below). [IFRS 17.BC139].

Once groups are established at initial recognition an entity must not reassess the composition of the groups subsequently. Additional contracts are added to the group after initial recognition of the group following the criteria discussed in section 7 below. [IFRS 17.24]. A group of contracts must comprise a single contract if that is the result of applying the requirements. [IFRS 17.23].

To measure a group of contracts, an entity may estimate the fulfilment cash flows (see section 9.2 below) at a higher level of aggregation than the group or portfolio, provided that the entity is able to include the appropriate fulfilment cash flows in the measurement of the group by allocating such estimates to groups of contracts. [IFRS 17.24].

An entity need not determine the grouping of each contract individually. If an entity has reasonable and supportable information to conclude that all contracts in a set of contracts will be in the same group, it may perform the classification based on measuring this set of contracts ('top-down'). If the entity does not have such reasonable and supportable information, it must determine the group to which contracts belong by evaluating individual contracts ('bottom-up'). [IFRS 17.17].

The Board concluded that groups should be established on the basis of profitability in order to avoid offsetting of profitable and unprofitable contracts because information about onerous contracts provided useful information about an entity's pricing decisions. [IFRS 17.BC119].

In making this requirement to separate groups based on profitability, the Board: [IFRS 17.BC123].

- Did not want entities to depict one type of contract as cross-subsidised by a different type of contract, but also did not want to recognise losses for claims developing as expected within a group of similar contracts.
- Did not want the contractual service margin of an expired contract to exist as part of the average contractual service margin of a group long after coverage provided by the contract ended, but also did not want to recognise a disproportionate amount of contractual service margin of contracts lapsing as expected within a group of similar contracts.

Hence, the Board concluded that a balance could be achieved in principle by: [IFRS 17.BC124].

- Requiring contracts in a group to have future cash flows the entity expects will respond similarly in amount and timing to changes in key assumptions meaning that losses on insurance contracts for one type of insurance risk would not be offset by gains on insurance contracts for a different type of insurance risk and would provide useful information about the performance of contracts insuring different types of risk.
- Requiring contracts in a group to have similar expected profitability meaning that loss-making contracts could not be grouped with profitable contracts, whether at initial recognition or if changes in conditions make a previously profitable group loss-making. Such a requirement would provide information about loss-making groups of insurance contracts. See section 6.2.1 below.
- Requiring groups not to be reassessed after initial recognition.

6.2.1 Identifying groups based on profitability

To divide a portfolio into the three minimum groups on inception based on an assessment of profitability will require judgement, using quantitative factors, qualitative factors or a combination of such factors. For example, identifying (sets of) contracts that can be grouped together could require some form of expected probability-weighted basis of assessment as insurance contracts are measured on this basis (see section 9 below). Alternatively, it may be possible to do this assessment based on the characteristics of the types of policyholders that are more or less prone to make claims than other types of policyholders (e.g., based on age, gender, geographical location or occupation). Therefore, this assessment is likely to represent a significant effort for insurers and is likely to differ from any form of aggregation used previously under IFRS 4, when many entities would not have performed aggregation at a level lower than portfolio.

For contracts issued to which an entity does not apply the premium allocation approach, an entity must assess whether contracts that are not onerous at initial recognition have no significant possibility of becoming onerous: [IFRS 17.19]

- Based on the likelihood of changes in assumptions which, if they occurred, would result in the contract becoming onerous
- Using information about estimates prepared by the entity's internal reporting. Hence, in assessing whether contracts that are not onerous at initial recognition have no significant possibility of becoming onerous:
 - An entity must not disregard information provided by its internal reporting about the effect of changes in assumptions on different contracts on the possibility of their becoming onerous
 - However, an entity is not required to gather additional information beyond that provided by the entity's internal reporting about the effect of changes in assumptions on different contracts

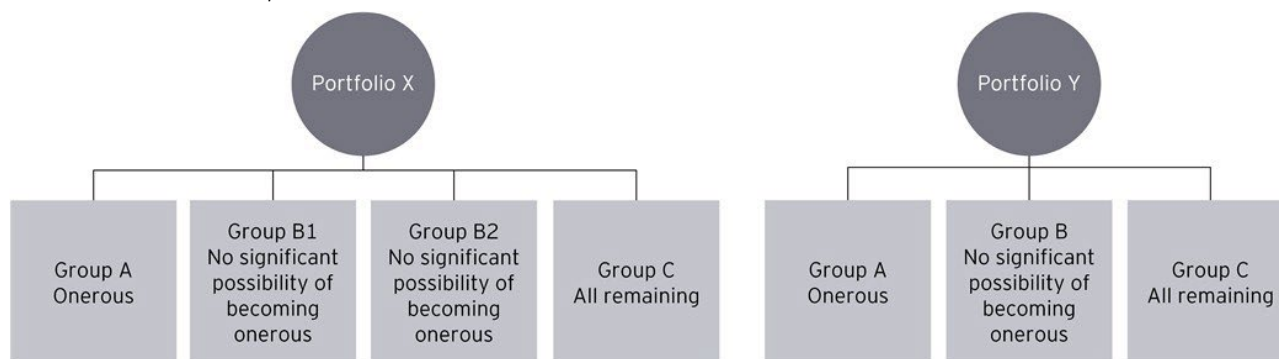

The objective of the requirement to identify contracts that are onerous at initial recognition is to identify contracts that are onerous measured as individual contracts. An entity typically issues individual contracts and it is the characteristics of the individual contracts that determine how they should be grouped. However, the Board concluded this does not mean that the contracts must be measured individually. If an entity can determine, using reasonable and supportable information, that a set of contracts will all be in the same group, the entity can measure that set to determine whether the contracts are onerous or not, because there will be no offsetting effects in the measurement of the set. The same principle applies to the identification of contracts that are not onerous at initial recognition and that have no significant possibility of becoming onerous subsequently. The objective is to identify such contracts at an individual contract level, but this objective can be achieved by assessing a set of contracts if the entity can conclude using reasonable and supportable information that the contracts in the set will all be in the same group.

[IFRS 17.BC129].

An entity is permitted, but not required, to subdivide the groups into further groups. For example, an entity may choose to divide portfolios into: [IFRS 17.21]

- More groups that are not onerous at initial recognition if the entity's internal reporting provides information that distinguishes:
 - Different levels of profitability
 - Or
 - Different possibilities of contracts becoming onerous after initial recognition
- And
- More than one group of contracts that are onerous at initial recognition if the entity's internal reporting provides information at a more detailed level about the extent to which the contracts are onerous

This can be illustrated, as follows:

If contracts within a portfolio fall into different groups only because law or regulation specifically constrains the entity's practical ability to set a different price or level of benefits for policyholders with different characteristics, the entity may include these contracts in the same group. [IFRS 17.20]. This expedient has been provided because the Board concluded that it would not provide useful information to group separately contracts that an entity is required by law or regulation to group together for determining the pricing or level of benefits. In the Board's opinion, all market participants will be constrained in the same way, particularly if such entities are unable to provide insurance coverage solely on the basis of differences in that characteristic. [IFRS 17.BC132].

This expedient must not be applied by analogy to other items. [IFRS 17.20]. For example, an entity might set the price for contracts without considering differences in a specific characteristic because it believes using that characteristic in pricing may result in a law or regulation prohibiting its use in the future or because doing so is likely to fulfil a public policy objective. These practices, sometimes referred to as 'self-regulatory practices', do not qualify for grouping exception caused by regulatory constraints. [IFRS 17.BC133].

Each group (or sub-group) of insurance contracts is measured separately (whether under the general model discussed in section 9 below, the premium allocation approach discussed in section 10 below, reinsurance contracts held discussed in section 11 below or the variable fee approach discussed in section 12.3 below).

Frequently asked questions

Question 6-2: How should 'no significant possibility' be interpreted, as set out in IFRS 17.16(b)? (*TRG meeting May 2018 - Agenda paper no. 07, Log S35*)

The IASB staff observed that the term 'no significant possibility' (of becoming onerous) should be interpreted in the context of the objective of the unit of account requirement. The objective is to identify contracts with no significant possibility of becoming onerous at initial recognition in order to group such contracts separately from contracts that are onerous at initial recognition and any remaining contracts in the portfolio that are not onerous at initial recognition. 'No significant possibility of becoming onerous' is different from 'significant insurance risk' and the concept of significant insurance risk should not be used by analogy.

Illustration 6-1: Identifying groups when profitability constrained by law

An insurer is not permitted by law to price car insurance based on gender. Assume that the premium/risk relationship for motor contracts differs materially depending on gender. Without the relief provided by IFRS 17.20, the insurer would be required to split the motor contracts into separate groups based on gender as profitability varies by gender. However, IFRS 17.20 allows the insurer to combine them in one group as the law constrains the entity's ability to set a different price based on gender and, hence, equalise profitability.

How we see it

The issuance of contracts that an entity expects to be onerous will be more visible under IFRS 17 due to the requirement to include these contracts in a separate group and disclose losses arising from onerous contracts issued in the reporting period as well as the movement in the loss component of all such contracts. Insurers may issue contracts that are priced below the amount needed to recover the expected fulfilment costs and acquisition expenses for several reasons, for example:

- The entity may place an implicit value on expected profits from policy renewals that are outside the contract boundary (see section 7.1 below) but, from which, the insurer expects to make an appropriate level of profit in the longer term.
- An individual contract may be priced to make an expected loss in the context of other contracts with the same policyholder or related parties, e.g., other family members, such that the insurer expects to make an appropriate level of profit from the package of policies.
- An entity may price contracts at a loss for commercial reasons, such as securing a targeted market position.

Pricing information is important in identifying contracts or sets of contracts that an entity expects to be onerous at initial recognition. This may pose some challenges as, historically, insurers have separated pricing and reserving processes. The identification of contracts expected to be onerous when issued may require system and process changes and greater coordination between front and back office.

IFRS 17 is clear that contracts can be grouped together if regulatory restraints on pricing or benefits are the sole reason that those contracts (or sets of contracts) would be in separate groups. Therefore, if an entity applies this expedient and groups underlying contracts together, it should be able to prove that no other factor exists that would have resulted in different groupings.

6.2.2 'Annual cohorts'

An entity is prohibited from grouping contracts *issued* (emphasis added) more than one year apart (except in certain circumstances when grouping insurance contracts on transition using either the modified retrospective approach or the fair value approach - see sections 17.4 and 17.5 below, respectively). To achieve this, the entity must, if necessary, further divide the groups described in section 6.2.1 above. [IFRS 17.22].

The prohibition on grouping together contracts that have been issued more than one year apart is one of the more contentious requirements of IFRS 17. It was included because the Board was concerned that, without it, entities could have perpetually open portfolios and this could: lead to a loss of information about the development of profitability over time; result in the contractual service margin persisting beyond the duration of contracts in the group; and consequently, result in profits not being recognised in the correct periods. [IFRS 17.BC136]. The Board acknowledges in the Basis for Conclusions that using a one-year issuing period was an operational simplification given for cost-benefit reasons. [IFRS 17.BC137].

The Board considered whether prohibiting groups from including contracts issued more than one year apart would create an artificial divide for contracts with cash flows that affect or are affected by cash flows to policyholders of contracts in another group (sometimes referred to as ‘mutualisation’). Some stakeholders asserted that such a division would distort the reported result of those contracts and would be operationally burdensome. However, the Board concluded that applying the requirements of IFRS 17 to determine the fulfilment cash flows for groups of such contracts provides an appropriate depiction of the results of such contracts. The Board acknowledged that, for contracts that fully share risks, the groups together will give the same results as a single combined risk-sharing portfolio. Therefore, it considered whether IFRS 17 should give an exception to the requirement to restrict groups to include only contracts issued within one year. However, the Board concluded that setting the boundary for such an exception would add complexity to IFRS 17 and create the risk that the boundary would not be robust or appropriate in all circumstances. Hence, IFRS 17 does not include such an exception. Nonetheless, the Board noted that the requirements specify the amounts to be reported, but not the methodology to be used to arrive at those amounts. Therefore, it may not be necessary for an entity to restrict groups in this way to achieve the same accounting outcome in some circumstances. [IFRS 17.BC138].

There is no requirement in IFRS 17 that an entity must use the same issue period for each group. The period for a cohort could also be shorter than twelve months. As the cohort period is one of the factors that determines the composition of a group of contracts, the prohibition to subsequently reassess the composition of a group also applies to the cohort period. [IFRS 17.24].

The IASB considered, but rejected, a suggestion to amend the annual cohort requirement to base it on the date contracts are ‘recognised’, instead of the date they are ‘issued’. In doing so, the Board confirmed that it intended annual cohorts to be determined based on the date of issue of the contract and not the date of initial recognition. This is because the objective of the annual cohort requirement is to facilitate timely recognition of profits, losses and trends in profitability. The profitability of a contract is initially set when the contract is issued, based on facts and circumstances at that date, for example interest rates, underwriting expectations and pricing. Hence, the Board concluded that determining annual cohorts based on the date that contracts are issued is necessary to provide useful information about trends in profitability. [IFRS 17.BC139T].

This means, for example, that a profitable contract issued on 1 January 2022 which has a coverage period beginning 1 January 2022 will be in the same annual cohort (i.e., group) as a profitable contract issued on 1 January 2022 which has a coverage period beginning on 1 January 2025 (assuming both contracts are part of the same portfolio). However, a profitable contract issued on 1 January 2023 (within the same portfolio) with a coverage period beginning 1 January 2023 will be in a different group from the other contracts as it was issued more than one year apart from the issue date of the other two contracts. As a result, if an entity issues profitable contracts for coverage that does not start for several years and premiums are not due until the coverage starts, the date of initial recognition will be several years after the date of issue.

The IASB staff acknowledge that the use of the term ‘issued’ has consequences for the practical relief available for determining the discount rate at the date of initial recognition of the group, since the weighted average discount rates used only cover the period that the contracts were issued which cannot exceed one year (see section 9.3 below). The IASB staff observed that these effects are a consequence of the unit of account being the group of insurance contracts rather than the individual contract, and an entity could choose to further divide the annual cohort and thereby avoid these effects.

How we see it

IFRS 17 requires that groups of contracts do not include any contracts that are issued more than one year apart. This could cause practical challenges with tracking the issue date of contracts because the date of issuance is not necessarily the same as the date of initial recognition of a contract. An example would be contracts that are expected to be profitable and which are issued in advance of the beginning of the coverage period and before the date when the first premium is due. This could give rise to practical issues, for example, if a contract is issued in one annual period, but is initially recognised in another.

One way to divide the groups is to use an annual period that coincides with an entity’s financial reporting period (e.g., contracts issued between 1 January and 31 December comprise a group for an entity with an annual reporting period ending 31 December). However, IFRS 17 does not require any particular approach for setting the annual period and entities may also use a period less than twelve months when grouping insurance contracts. In addition, an entity that produces interim financial statements is not required to restrict the grouping of contracts issued to those contracts which were issued in that interim period since the restriction on grouping contracts is based on a maximum of one year (see section 6 above).

6.2.2.A Contracts with intergenerational sharing of risks

Some stakeholders have expressed the view that the level of aggregation requirements artificially segregate portfolios and will not properly depict business performance, particularly when applying the annual cohort requirement to insurance contracts with risk sharing between different generations of policyholders. As a result, the IASB reconsidered the IFRS 17 aggregation requirements during its deliberations on the June 2020 amendments to IFRS 17 but decided that the requirements should be unchanged.

In the Board's view, intergenerational sharing of risk between policyholders is reflected in the fulfilment cash flows and therefore, also reflected in the contractual service margin of each generation of mutualised contracts, as discussed in section 12.1 below. However, each generation of contracts may be more or less profitable for an entity than other generations. Even if the policyholders across all annual cohorts share equally in the returns, the amount of the entity's share in those returns created by each generation may differ, reflecting the contractual terms of each annual cohort and the economic conditions during the coverage period of each annual cohort. For example, an entity's share of 20% of the returns of underlying items is a higher amount for annual cohorts for which the coverage period includes periods in which the returns are 5% than it is for annual cohorts for which the coverage period includes only periods in which the fair value returns are 1%. Accordingly, removing the requirement for annual cohorts for those groups of contracts with intergenerational sharing of risks between policyholders would average higher or lower profits across generations, resulting in a loss of information about changes in profitability over time.

[IFRS 17.BC139J].

The Basis for Conclusions notes that two aspects of applying the annual cohort requirement to some contracts with intergenerational sharing of risks between policyholders that could increase the costs of applying the requirement and reduce the benefits of the resulting information were identified. These are:

[IFRS 17.BC139K]

- Distinguishing between the effect of sharing of risks and the effect of discretion
- Allocating changes in the amount of the entity's share of the fair value of underlying items across annual cohorts that share in the same pool of underlying items

The aspect of the annual cohort requirement in respect of the first bullet point above relates to circumstances in which an entity has discretion over the portion of the fair value returns on underlying items that is paid to policyholders and the portion that is retained by the entity. For example, an entity may be required under the terms of the insurance contracts to pay policyholders a minimum of 90% of the total fair value returns on a specified pool of underlying items with discretion to pay more to policyholders. The Board acknowledged that an entity that has such discretion is required to apply additional judgement to allocate changes in fulfilment cash flows between groups in a way that appropriately reflects the effect of sharing of risks and the effect of the discretion. However, an entity would be required to make that judgement to measure new contracts recognised in the period even if the entity was not required to apply the annual cohort requirement. [IFRS 17.BC139L].

The concern set out in the second bullet point above relates to insurance contracts with direct participation features. For those contracts an entity adjusts the contractual service margin for changes in the amount of the entity's share of the fair value of underlying items. IFRS 17 does not include requirements on how to allocate those changes across annual cohorts that share in the same pool of underlying items. The Board observed that an entity needs to exercise judgement to identify an allocation approach that provides useful information about the participation of each annual cohort in the underlying items and to avoid allocation approaches that do not provide useful information. [IFRS 17.BC139M].

In the Board's view, the information that results from the judgements an entity makes in determining the allocation approaches discussed above will provide useful insights about how management expects businesses to develop and could assist users of financial statements to hold management to account based on those expectations. [IFRS 17.BC139N].

The Board also considered that the benefits of the information provided by the annual cohort requirement are particularly high for some specific insurance contracts with intergenerational sharing of risks. Those specific contracts: [IFRS 17.BC139O]

- Include features such as financial guarantees on the returns from underlying items and/or other cash flows that do not vary with returns on underlying items (for example, insurance claims)
- Do not share the effect of changes in those features between the entity and policyholders or share the effect between the entity and policyholders in a way that does not result in the entity's share being small

The Board observed that information about the effect of financial guarantees is particularly important in low interest rate environments. The Board acknowledged that for some insurance contracts with substantial intergenerational sharing of risks, it is likely to be rare for the effect of financial guarantees and other cash flows that do not vary with returns on underlying items to cause an annual cohort to become onerous. However, it is exactly that rarity that makes the information particularly useful to users of financial statements when such an event occurs and information about the effect of financial guarantees is particularly important when interest rates are low. *[IFRS 17.BC139P]*.

How we see it

The IASB decided not to create any specific exceptions to the annual cohorts for contracts with inter-generational mutualisation (i.e., mutualised contracts). As specific practical issues may arise when applying the annual cohort requirement to these types of products, entities would need to find practical ways to apply the annual cohorts in a suitable manner considering the available guidance and the specific circumstances of their jurisdiction. However, an exemption exists in EU-adopted IFRS accounting standards (see Chapter 1).

6.3 Identifying groups for contracts applying the premium allocation approach

For a group of insurance contracts to which the premium allocation approach applies (see section 10 below), an entity assesses aggregation of insurance contracts as discussed in sections 6.1 and 6.2 above except that the entity must assume that no contracts in the portfolio are onerous at initial recognition unless facts and circumstances indicate otherwise. *[IFRS 17.18]*.

An entity assesses whether contracts that are not onerous at initial recognition have no significant possibility of becoming onerous subsequently by assessing the likelihood of changes in applicable facts and circumstances.

7 Initial recognition

7.1 Initial recognition of insurance and reinsurance contracts issued

Extract from IFRS 17

- 25 An entity shall recognise a group of insurance contracts it issues from the earliest of the following:
- (a) the beginning of the coverage period of the group of contracts;
 - (b) the date when the first payment from a policyholder in the group becomes due; and
 - (c) for a group of onerous contracts, when the group becomes onerous.

[IFRS 17.25].

If there is no contractual due date, the first payment from the policyholder is deemed to be due when it is received. *[IFRS 17.26].*

An entity is required to determine whether any contracts form a group of onerous contracts before the earlier of the first two dates above (i.e., before the earlier of the beginning of the coverage period and the date when the first payment from a policyholder in the group is due) if facts and circumstances indicate there is such a group. *[IFRS 17.26].*

In recognising a group of insurance contracts in a reporting period, an entity must include only contracts that individually meet one of the above-mentioned recognition criteria. *[IFRS 17.28].* This clarifies that an individual contract has to be recognised initially and measured at a time which is specific to the contract. This means that the date of initial recognition of an individual contract added to a group of insurance contracts has to be determined for that individual insurance contract using the measurement assumptions at that date, rather than determined by the date of initial recognition of the group to which individual contracts will be added.

In addition, an entity must make estimates for the discount rates at the date of initial recognition (see section 9.3 below) and for the coverage units provided in the reporting period (see section 9.7 below). *[IFRS 17.28].*

An entity may include more contracts in the group after the end of a reporting period (subject to the constraint that contracts within a group cannot be issued more than a year apart (see section 6.2.2 above). An entity must add contracts to the group in the reporting period in which the contracts meet the recognition criteria set out above, applied to each contract individually. *[IFRS 17.28].*

When new contracts are added to a group, this may result in a change to the determination of the weighted average discount rates at the date of initial recognition (see section 9.3 below). An entity must apply any revised discount rates from the start of the reporting period in which the new contracts are added to the group. *[IFRS 17.28].* There is no retrospective 'catch-up' adjustment for previous reporting periods, the effect of any change in average discount rates is therefore recognised prospectively.

For reinsurance contracts held, the group consists of the reinsurance contracts, not the underlying direct contracts which are subject to the reinsurance.

Illustration 7-1: Determining the date of recognition of a group of insurance contracts**Example 1**

An entity issues a group of insurance contracts to policyholders beginning on 25 December 20X3. The coverage period of the group begins on 1 January 20X4 and the first premium from a policyholder in the group is due on 5 January 20X4. The group of insurance contracts is not onerous.

The group of insurance contracts is recognised on 1 January 20X4 (i.e., the start of the coverage period of the group) which is earlier than the date that the first premium is due.

Example 2

An entity issues a group of insurance contracts to policyholders beginning on 25 December 20X3. The coverage period of the group begins on 1 January 20X4 and the first premium from a policyholder in the group is due on 30 December 20X3. The group of insurance contracts is not onerous.

The group of insurance contracts is recognised on 30 December 20X3 (i.e., the date that the first premium is due) which is earlier than the date of the beginning of the coverage period. However, if the entity has a reporting date of 31 December 20X3, only those contracts within the group issued as at the reporting date will be recognised in the financial statements for the period ending 31 December 20X3.

Example 3

An entity issues a group of insurance contracts to policyholders beginning on 25 December 20X3. On 25 December 20X3, the entity determines that the group of insurance contracts is onerous. The coverage period of the group begins on 1 January 20X4 and the first premium from a policyholder in the group is due on 5 January 20X4.

The group of insurance contracts is recognised on 25 December 20X3, which is when the group of insurance contracts is determined to be onerous. However, if the entity has a reporting date of 31 December 20X3, only those contracts within the group that are issued as at the reporting date will be recognised in the financial statements for the period ending 31 December 20X3.

How we see it

The issue date of a contract is when an entity is bound by the terms of the contract and, as such, has a contractual obligation to accept risk. The issue date is typically before the beginning of the coverage period and due date for the initial premium. However, IFRS 17 only requires recognition of issued insurance contracts before the coverage period or premium due date if facts and circumstances indicate that the contracts in the group are onerous. Allowing entities to recognise insurance contracts after the entity has accepted risk represents a practical expedient introduced by the Board to allow entities to continue their existing recognition practices. However, an entity is required to consider whether facts and circumstances indicate that insurance contracts it has issued are onerous at issue date or any other time before they would otherwise be recognised.

Assessing expected profitability is performed on initial recognition of contracts as they are assigned to a group of contracts. The contracts all then stay within that same group until they are derecognised. This means that contracts assigned to a particular group on initial recognition are not reallocated to another group if their profitability characteristics change subsequently (e.g., from profitable to loss-making).

7.2 Initial recognition of reinsurance contracts held

IFRS 17 states that for a group of reinsurance contracts held the requirements discussed in section 7.1 above do not apply. [IFRS 17.62, IFRS 17.62A].

Extract from IFRS 17**Recognition**

- 62 Instead of applying paragraph 25, an entity shall recognise a group of reinsurance contracts held from the earlier of the following:
- (a) the beginning of the coverage period of the group of reinsurance contracts held; and
 - (b) the date the entity recognises an onerous group of underlying insurance contracts applying paragraph 25(c), if the entity entered into the related reinsurance contract held in the group of reinsurance contracts held at or before that date.
- 62A Notwithstanding paragraph 62(a), an entity shall delay the recognition of a group of reinsurance contracts held that provide proportionate coverage until the date that any underlying insurance contract is initially recognised, if that date is later than the beginning of the coverage period of the group of reinsurance contracts held.

A group of reinsurance contracts itself cannot be onerous (see section 11.4 below).

IFRS 17 does not include guidance on when a contract provides proportionate coverage. In the Basis for Conclusions, it is observed that many reinsurance arrangements are designed to cover the claims incurred under underlying insurance contracts written during a specified period. In some cases, the reinsurance contract held covers the losses of separate contracts on a proportionate basis. In other cases, the reinsurance contract held covers aggregate losses from a group of underlying contracts that exceed a specified amount. [IFRS 17.BC304].

When a reinsurance contract held provides proportionate coverage, the initial recognition of the (group of) reinsurance contract(s) will, as a simplification, be later than the beginning of the coverage period if no underlying contracts have been recognised as at that date. [IFRS 17.BC305(a)].

However, when the group of reinsurance contracts held covers aggregate losses arising from a group of insurance contracts over a specified amount, the group of reinsurance contracts held is recognised when the coverage period of the group of reinsurance contracts begins. In these contracts, the entity benefits from coverage - in case the underlying losses exceed the threshold - from the beginning of the group of reinsurance contracts held because such losses accumulate throughout the coverage period. In the Board's view, the coverage benefits the entity from the beginning of the coverage period of the group of reinsurance contracts held because such losses accumulate throughout the coverage period.

[IFRS 17.BC305(b)].

Illustration 7-2: Recognition of reinsurance contract held providing proportionate coverage

An entity holds a reinsurance contract in respect of a term life insurance portfolio on a quota share basis whereby 20% of all premiums and all claims from the underlying insurance contracts are ceded to the reinsurer. The reinsurance contract is considered to be a group for the purpose of aggregation and incepts on 1 January 20X4. The first underlying insurance contract is recognised on 1 February 20X4.

As the reinsurance contract held provides proportionate coverage, initial recognition of the contract is delayed until the later of the beginning of the coverage period of the contract and the initial recognition of any underlying contract, i.e., 1 February 20X4.

Illustration 7-3: Recognition of reinsurance contract held which does not provide proportionate coverage

An entity holds a reinsurance contract which provides excess of loss protection for a motor insurance portfolio. In exchange for a fixed premium of CU100, the reinsurance contract provides cover for claims arising from individual events in the portfolio in excess of CU500 up to a limit of CU200. The reinsurance contract is considered to be a group for the purpose of aggregation and incepts on 1 January 20X4. The first underlying motor insurance contract is recognised on 1 February 20X4.

As the reinsurance contract held does not provide proportionate coverage (because neither the premiums nor the claims are a proportion of the premiums and claims from the underlying insurance contracts) the contract is recognised at the beginning of the coverage period of the contract, i.e., 1 January 20X4.

Illustration 7-4: Recognition of reinsurance contract held when the underlying insurance contracts are onerous

An entity holds a reinsurance contract in respect of a term life insurance portfolio on a quota share basis, whereby 20% of all premiums and all claims from the underlying insurance contracts are ceded to the reinsurer. The reinsurance contract is considered to be a group for the purpose of aggregation. The reinsurance contract was entered into on 1 December 20X3 and incepts on 1 January 20X4. The first underlying insurance contract was entered into on 1 December 20X3 and incepted on 1 January 20X4. On 15 December 20X3, the group of underlying insurance contracts are determined to be onerous.

As the group of underlying insurance contracts are onerous and the reinsurance held was entered into at the same time as the underlying insurance contracts, the date of initial recognition of the reinsurance contract held is 15 December 20X3.

How we see it

The recognition requirements for reinsurance contracts held that provide proportionate coverage are meant to simplify recognition and measurement for these contracts. Circumstances in which the first underlying ceded contract is recognised shortly after the reinsurance contract is written will result in similar timing of recognition for proportionate and 'other-than-proportionate' reinsurance contracts. In other cases, there may be a greater difference in the timing of recognition.

As mentioned above, IFRS 17 does not include guidance on when a contract provides proportionate coverage. Entities would, therefore, need to consider how it will determine whether a contract provides proportionate coverage or not. The guidance as per IFRS 17.BC304 referenced above, could provide a useful input to this consideration.

7.3 Initial recognition of insurance acquisition cash flows

Insurance acquisition cash flows are defined by IFRS 17 as follows: *[IFRS 17 Appendix A]*

Extract from IFRS 17

Appendix A

Defined terms

Insurance acquisition cash flows

Cash flows arising from the costs of selling, underwriting and starting a **group of insurance contracts** (issued or expected to be issued) that are directly attributable to the **portfolio of insurance contracts** to which the group belongs. Such cash flows include cash flows that are not directly attributable to individual contracts or **groups of insurance contracts** within the portfolio.

Any insurance acquisition cash flows paid at the date of initial recognition of the group of insurance contracts are recognised as part of the contractual service margin of the group of insurance contracts (see section 9.5 below).

Any insurance acquisition cash flows an entity expects to pay after the related group of insurance contracts is recognised are part of the fulfilment cash flows of the group of insurance contracts (see section 9.2 below).

However, an entity must recognise an asset for insurance acquisition cash flows paid (or insurance acquisition cash flows for which a liability has been recognised under another IFRS accounting standard) before the related group of insurance contracts is recognised, unless it elects to expense those acquisition cash flows as incurred for premium allocation approach contracts (see section 10 below). The entity must recognise such an asset for each related group of insurance contracts. *[IFRS 17.28B]*. The entity needs to allocate insurance acquisition cash flows to an existing or future group of insurance contracts using a systematic and rational method. *[IFRS 17.28A]*.

If an entity recognises in a reporting period only some of the insurance contracts expected to be included in the group (see section 6.2 above), it must determine the related portion of an asset for insurance acquisition cash flows for the group on a systematic and rational basis considering the expected timing of recognition of contracts in the group. *[IFRS 17.28D]*.

The systematic and rational method of allocating insurance acquisition cash flows to groups referred to above must be used to allocate: *[IFRS 17.B35A]*

- Insurance acquisition cash flows that are directly attributable to a group of insurance contracts:
 - To that group
 - And
 - To groups that will include insurance contracts that are expected to arise from renewals of the insurance contracts in that group
- Insurance acquisition cash flows directly attributable to a portfolio of insurance contracts, other than those allocated above, to groups in the portfolio

The last bullet point above means that insurance acquisition cash flows directly attributable to a portfolio of insurance contracts, but not directly attributable to a group of insurance contracts are systematically and rationally allocated to existing or future groups of insurance contracts in the portfolio. *[IFRS 17.BC184B]*.

The Basis for Conclusions notes that, in some situations, an entity issues an insurance contract with a short coverage period, such as one year, but might incur high up-front costs, such as commissions to sales agents, relative to the premium the entity will charge for that short coverage contract. The entity agrees to those costs because it anticipates that some policyholders will renew their contracts. Often, the costs are fully directly attributable to the initial insurance contract issued because they are non-refundable and are not contingent on the policyholder renewing the contracts. In some circumstances, such commissions are higher than the premium charged and the application of the Board considered that recognising a loss in those circumstances would provide useful information to policyholders as it reflects that the entity does not have the right to charge policyholders to renew the contracts or to reclaim the commission from the sales agents if policyholders choose not to renew their contracts. *[IFRS 17.BC184C, IFRS 17.BC184D]*.

This requirement also provides useful information to users of financial statements about insurance acquisition cash flows. This approach depicts the payment of up-front costs such as commission as an asset that an entity expects to recover through expected renewals of contracts. The asset reflects the right of an entity to not pay again, costs it has already paid to obtain renewals. The information resulting from the requirement is comparable to the information provided by IFRS 15 for the incremental costs of obtaining a contract. *[IFRS 17.BC184E]*.

The Board considered whether it should develop requirements to specify how to allocate insurance acquisition cash flows to expected renewals of contracts. However, it concluded that requiring an allocation applying a systematic and rational method, consistent with the requirements for allocating fixed and variable overheads (see section 9.2.3.L below), was sufficient. *[IFRS 17.BC184F]*.

An entity might add insurance contracts to a group of insurance contracts across more than one reporting period. In such circumstances, the entity must derecognise the portion of an asset for insurance acquisition cash flows that relates to insurance contracts added to the group in that period and continue to recognise an asset for insurance acquisition cash flows to the extent that the asset relates to insurance contracts expected to be added to the group in a future reporting period. *[IFRS 17.B35C]*.

Impairment and derecognition of insurance acquisition cash flow assets are discussed in sections 9.10 and 13.4 below, respectively.

7.4 Initial recognition of investment contracts with discretionary participation features

The date of initial recognition of an investment contract with discretionary participation features (see section 12.3 below) is the date that the entity becomes party to the contract. This is consistent with the requirements for recognition of a financial instrument in IFRS 9 and is likely to be earlier than the date of initial recognition for an insurance contract. *[IFRS 17.71]*.

8 Measurement - overview

IFRS 17 has a default approach to measuring groups of insurance contracts (which is the unit of account for measurement as discussed in section 6.2 above) described in this chapter as the 'general model'. The general model does not distinguish between so-called short duration and long duration (or life and non-life) insurance contracts. It also does not distinguish between insurance products.

IFRS 17 also includes modifications and a simplification to the general model that are applicable in specific circumstances (see section 8.2 below).

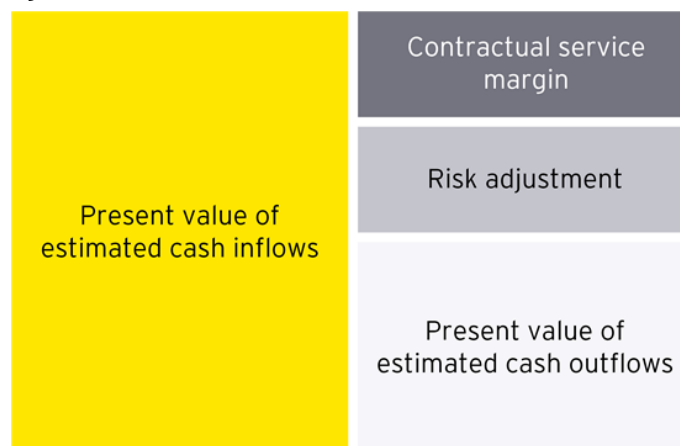

The basic revenue recognition principle under IFRS 17 is that no profit is recognised on initial recognition of a group of insurance contracts, but that a loss must be recognised if the group of contracts is onerous (see section 7 above for the timing of initial recognition). Subsequently, profit and revenue are recognised as services are provided under the contract.

8.1 Overview of the general model

The general model measures a group of insurance contracts as the sum of the following components, or 'building blocks', for each group of insurance contracts: [IFRS 17.32]

- Fulfilment cash flows, which comprise:
 - Estimates of expected future cash flows over the life of the contract (see section 9.2 below)
 - An adjustment to reflect the time value of money and the financial risks related to the future cash flows to the extent that the financial risks are not included in the estimates of the future cash flows (see section 9.3 below)
 - A risk adjustment for non-financial risk (see section 9.4 below)
- A contractual service margin representing unearned profit an entity will recognise as it provides service under the insurance contracts in the group (see section 9.5 below)

This is illustrated in the diagram below:

After initial recognition of a group of insurance contracts, the carrying amount of the group at each reporting date is the sum of:

- The liability for remaining coverage, comprising:
 - The fulfilment cash flows related to future service allocated to the group at that date
 - The contractual service margin of the group at that date
- And
- The liability for incurred claims comprising the fulfilment cash flows related to past service allocated to the group at that date

The components of the liability for remaining coverage and the liability for incurred claims are, as follows:

Liability for remaining coverage	Liability for incurred claims
Contractual service margin	
Risk adjustment	Risk adjustment
Present value of estimated cash flows	Present value of estimated cash flows

The general model is discussed further in section 9 below.

8.2 Modifications to the general model

An entity must apply the general model to all groups of insurance contracts except as follows: [IFRS 17.29]

- A simplified or premium allocation approach may be applied for groups of insurance contracts meeting either of the specified criteria for that approach (see section 10 below)
- For groups of reinsurance contracts held, an entity must apply either the general model or the premium allocation approach as modified by separate measurement requirements (see section 11 below)
- An adaptation of the general model, the 'variable fee approach' is applied to insurance contracts with direct participation features (see section 12 below)
- For groups of investment contracts with discretionary participation features, an entity applies the general model (as modified) because of the lack of insurance risk in the contracts (see section 12.4 below)

8.3 Insurance contracts in a foreign currency

Extract from IFRS 17

- 30 When applying IAS 21 *The Effects of Changes in Foreign Exchange Rates* to a group of insurance contracts that generate cash flows in a foreign currency, an entity shall treat the group of contracts, including the *contractual service margin*, as a monetary item.

[IFRS 17.30].

The Basis for Conclusions observes that, without this requirement, the contractual service margin (see section 9.5 below) might otherwise be classified as a non-monetary item, because it is similar to a prepayment for goods and services. However, in the Board's view, it was simpler to treat all components of the measurement of an insurance contract in the same way. Since the measurement in IFRS 17 is largely based on cash flow estimates, the Board concluded that it was more appropriate to view the insurance contract as a whole as a monetary item. [IFRS 17.BC277]. The Board's conclusion that the insurance contract is a monetary item does not change if an entity measures a group of insurance contracts using the simplified approach (i.e., the premium allocation approach) for the measurement of the liability for remaining coverage. [IFRS 17.BC278].

Treating insurance contracts as monetary items means that groups of insurance contracts in a foreign currency are retranslated to the entity's functional currency using the exchange rate applying at each reporting date. Exchange differences arising on retranslation are accounted for in profit or loss. IFRS 4 contained no similar assertion and, therefore, many insurers, following the guidance on monetary and non-monetary items in IAS 21 *The Effects of Change in Foreign Exchange Rates*, treated unearned premium provisions (i.e., deferred revenue) and deferred acquisition costs in a foreign currency as non-monetary items and did not retranslate these balances subsequent to initial recognition.

Exchange differences arising applying IAS 21 on changes in the carrying amount of groups of insurance contracts are included in profit or loss, unless they relate to changes in the carrying amount of groups of insurance contracts that have been included in other comprehensive income (when disaggregation of insurance finance income and expenses is applied - see section 15.3 below), in which case they are included in other comprehensive income. [IFRS 17.92].

Frequently asked questions

Question 8-1: Should an entity consider currency exchange risks when applying IFRS 17 to identify portfolios of insurance contracts?

In September 2022, the IFRS IC discussed a request which asked whether an entity considers currency exchange risks when applying IFRS 17 to identify portfolios of insurance contracts.

The IFRS IC noted that IFRS 17 requires an entity to recognise and measure groups of insurance contracts. The first step in establishing groups of insurance contracts is to identify portfolios of insurance contracts. Paragraph 14 of IFRS 17 states that “a portfolio comprises contracts subject to similar risks and managed together”. The request asks whether currency exchange rate risks are among the risks an entity considers when assessing whether insurance contracts are ‘subject to similar risks’.

IFRS 17 defines financial risks and insurance risk (a non-financial risk). Financial risk is defined to include “The risk of a possible change in... [a] currency exchange rate”. When IFRS 17 requires an entity to consider or reflect only particular types of risks (for example, only non-financial risk), it explicitly refers to the risks to be considered or reflected. Therefore, the IFRS IC concluded that, because paragraph 14 of IFRS 17 refers to ‘similar risks’ without specifying any particular types of risk, an entity is required to consider all risks - including currency exchange risks - when identifying portfolios of insurance contracts. However, ‘similar risks’ does not mean ‘identical risks’. Therefore, an entity could identify portfolios of contracts that include contracts subject to different currency exchange rate risks. The IFRS IC observed that what an entity considers to be ‘similar risks’ will depend on the nature and extent of the risks in the entity’s insurance contracts.

Question 8-2: How should an entity apply IAS 21 in conjunction with IFRS 17 in measuring a group of insurance contracts that generate cash flows in more than one currency?

In September 2022, the IFRS IC discussed a request which asked how to account for insurance contracts with cash flows in more than one currency.

Measuring a multi-currency group of insurance contracts

An entity measures a group of insurance contracts at the total of the fulfilment cash flows and the contractual service margin. Paragraph 30 of IFRS 17 states that “when applying IAS 21...to a group of insurance contracts that generate cash flows in a foreign currency, an entity shall treat the group of contracts, including the contractual service margin, as a monetary item”.

Paragraph 8 of IAS 21 defines monetary items as “units of currency held and assets and liabilities to be received or paid in a fixed or determinable number of units of currency” and paragraph 20 describes a foreign currency transaction as “a transaction that is denominated or requires settlement in a foreign currency”. Paragraphs 21-24 of IAS 21 require an entity to:

- Recognise on initial recognition a foreign currency transaction in the functional currency at the spot exchange rate at the date of the transaction
 - Determine the carrying amount of a monetary item in conjunction with other relevant IFRS accounting standards
- And
- Translate at the end of the reporting period foreign currency monetary items into the functional currency using the closing rate

The requirements in both IFRS 17 and IAS 21 refer to transactions or items that are denominated or require settlement in a single currency. IFRS accounting standards include no explicit requirements on how to determine the currency denomination of transactions or items with cash flows in more than one currency.

Therefore, the IFRS IC observed that, in measuring a multi-currency group of insurance contracts, an entity:

- Applies all the measurement requirements in IFRS 17 to the group of insurance contracts, including the requirement in paragraph 30 to treat the group - including the contractual service margin - as a monetary item.
- Applies IAS 21 to translate at the end of the reporting period the carrying amount of the group - including the contractual service margin - at the closing rate (or rates).
- Uses its judgement to develop and apply an accounting policy that determines on initial recognition the currency or currencies in which the group - including the contractual service margin - is denominated (currency denomination). The entity could determine that the group - including the contractual service margin - is denominated in a single currency or in the multiple currencies of the cash flows in the group.

The entity develops an accounting policy on currency denomination that results in information that is relevant and reliable (as described in paragraph 10 of IAS 8) and is applied consistently for similar transactions, other events and conditions (paragraph 13 of IAS 8). The accounting policy is based on the entity's specific circumstances and the terms of the contracts in the group. The entity cannot simply presume that the contractual service margin for the group is denominated in the functional currency. Such a presumption would, in effect, fail to treat the contractual service margin as a monetary item as required by paragraph 30 of IFRS 17.

Single-currency denomination versus multi-currency denomination

The entity's accounting policy on currency denomination determines which effects of changes in exchange rates are changes in financial risk accounted for applying IFRS 17 and which of these effects are exchange differences accounted for applying IAS 21.

A single-currency denomination treats:

- Changes in exchange rates between the currency of the cash flows and the currency of the group of contracts as changes in financial risk that an entity accounts for applying IFRS 17.
- And
- Changes in exchange rates between the currency of the group of contracts and the functional currency as exchange differences that an entity accounts for applying IAS 21.

A multi-currency denomination treats all changes in exchange rates as exchange differences that an entity accounts for applying IAS 21.

In applying IFRS 17, there is a single contractual service margin for the group of insurance contracts. Appendix A to IFRS 17 defines the contractual service margin as representing "the unearned profit the entity will recognise as it provides insurance contract services under the insurance contracts in the group." Accordingly, under a multi-currency denomination, the entity would:

- Assess whether the group of contracts is onerous considering the contractual service margin as a single amount.
- Prevent the carrying amount of the contractual service margin being negative by, when necessary to do so, recognising a loss.
- And
- Determine the amount of the contractual service margin to recognise in profit or loss by applying a single method of determining the coverage units provided in the current period and expected to be provided in the future to the amounts denominated in the multiple currencies. This would result in the entity allocating each of the currency amounts of the contractual service margin translated into the functional currency equally to each coverage unit.

Conclusion

In the light of its analysis, the IFRS IC considered whether to add to the work plan a standard-setting project on how to account for the foreign currency aspects of insurance contracts. The IFRS IC observed that it has not obtained evidence that such a project would be sufficiently narrow in scope that the IASB or the IFRS IC could address it in an efficient manner. Consequently, the IFRS IC decided not to add a standard-setting project to the work plan. In accordance with paragraph 8.7 of the Due Process Handbook, at its October 2022 meeting, the IASB discussed, and did not object to, this agenda decision.⁵

The following Illustration is based on an Illustrative Example in an IASB staff paper.

⁵ [IFRIC Update](#), September 2022, *Addendum to IFRIC Update-Committee's agenda decisions*. Available on the IFRS Foundation's website.

Illustration 8-1: Multi-currency groups of insurance contracts

These are the two approaches identified by the Interpretations Committee⁶ which could be applied to multi-currency groups of insurance contracts.

Single-currency denomination

A group of insurance contracts (including the contractual service margin) with cash flows in more than one currency, is denominated in a single currency, such as the currency of the premiums or the predominant cash flows ('single-currency denomination' approach).

**Multi-currency denomination**

A group of insurance contracts (including the contractual service margin) is denominated in multiple currencies, reflecting the currencies of the fulfilment cash flows ('multi-currency denomination' approach).

⁶ [IASB Staff paper 2](#): Project: *Multi-currency Groups of Insurance Contracts (IFRS 17 and IAS 21)*, Paper topic: *Comments on tentative agenda decision*, IFRS IC meeting, September 2022. Available on the IFRS Foundation's website.

How we see it

In the absence of specific guidance in IAS 21 and IFRS 17 on how to apply IAS 21 to a group of insurance contracts that are impacted by cash flows of multiple currencies, the IFRS IC concluded that the entity must use judgement in developing and applying an accounting policy that results in information that is relevant and reliable based on the two currency denomination approaches identified by the Committee. The two approaches considered identified by the IFRS IC are:

- Denominate a group of insurance contracts (including the contractual service margin) with cash flows in more than one currency, in a single currency, such as the currency of the premiums or the predominant cash flows ('single-currency denomination').
- Denominate a group of insurance contracts (including the contractual service margin) in multiple currencies, reflecting the currencies of the fulfilment cash flows ('multi-currency denomination').

The IFRS IC focused on addressing the main features of these approaches. However, the IFRS IC felt it should not address the more detailed mechanical issues. Therefore, entities will need to determine in more detail how to implement these currency accounting policies following the principles set out in the agenda decision.

The accounting policy selected by an entity will impact how it treats the effect of changes in exchange rates, including, where applicable, the disaggregation in the statement of comprehensive income between profit or loss and other comprehensive income. Where changes in exchange rates are accounted for applying IFRS 17, the effect of these changes are treated as insurance finance income or expenses following the requirements of IFRS 17. Where changes in exchange rates are treated as exchange differences accounted for applying IAS 21, the effects of changes in exchange rates are included in the statement of profit or loss, unless they relate to changes in the carrying amount of groups of insurance contracts in other comprehensive income, in which case these effects are also included in other comprehensive income.

Entities should apply judgement to determine the appropriate line item(s) in which exchange differences are recorded as neither IAS 21 nor IFRS 17 specify where exchange differences on insurance contract liabilities accounted for under IAS 21 should be presented in the statement of financial performance (see also Chapter 16). This policy should be applied consistently. However, foreign currency risk is considered to be financial risk by IFRS 17 and so presenting exchange differences arising from insurance contracts in insurance service expenses would not be appropriate.

The Committee's observations about measuring a multi-currency group of insurance contracts appear to also apply to contracts measured under the variable fee approach, although the difference between the two currency denomination approaches means that the outcome for dealing with exchange differences under the variable fee approach is likely to be different compared to the general model. As such, for an insurance contract with direct participation features, additional considerations will be necessary in determining how to deal with the effects of exchange differences for each of the currency denomination policies.

9 Measurement - General Model

As explained in section 8.1 above, the general model is based on the following building blocks for each group of insurance contracts: *[IFRS 17.32]*

- Fulfilment cash flows, which comprise:
 - Estimates of expected future cash flows over the life of the contract (see section 9.2 below)
 - An adjustment to reflect the time value of money and the financial risks related to the future cash flows to the extent that the financial risks are not included in the estimates of the future cash flows (see section 9.3 below)
- And
- A risk adjustment for non-financial risk (see section 9.4 below)
- A contractual service margin, representing the unearned profit on the group of contracts (see section 9.5 below)

The contractual service margin is released to profit or loss over the period that services are provided to the policyholder. Therefore, at initial recognition, no profit should normally be recognised. However, a loss is recognised if the group of contracts is onerous at the date that the group is determined to be onerous (see section 6 above). Measurement of onerous contracts is discussed in section 9.8 below. The contractual service margin for insurance contracts with direct participation features is adjusted over the service period in a different way from the contractual service margin for insurance contracts without direct participation features. Contracts with direct participation features are discussed in section 12.3 below. Once the contractual service margin is utilised, the group of insurance contracts will be measured using only the fulfilment cash flows.

9.1 The contract boundary

This section deals with the general requirements of IFRS 17 to establish the contract boundary. Identifying the contract boundary under IFRS 17 is fundamental to the measurement of the fulfilment cash flows of a group of contracts. Contract boundary issues specifically related to reinsurance contracts issued are discussed in section 9.9.1 below. Contracts boundary issues related to reinsurance contracts held are discussed in section 11.2 below.

Extract from IFRS 17

- BC159 The measurement of a group of insurance contracts includes all the cash flows expected to result from the contracts in the group, reflecting estimates of policyholder behaviour. Thus, to identify the future cash flows that will arise as the entity fulfils its obligations, it is necessary to draw a contract boundary that distinguishes whether future premiums, and the resulting benefits and claims, arise from:
- (a) existing insurance contracts. If so, those future premiums, and the resulting benefits and claims, are included in the measurement of the group of insurance contracts; or
 - (b) future insurance contracts. If so, those future premiums, and the resulting benefits and claims, are not included in the measurement of the group of existing insurance contracts.

[IFRS 17.BC159].

A liability or asset relating to expected premiums or expected claims outside the boundary of the existing insurance contract must not be recognised. Such amounts relate to future insurance contracts. *[IFRS 17.35]*. However, an asset must be recognised for acquisition cash flows paid before the related group of insurance contracts is recognised (see section 7.3 above and section 9.1.3 below).

Estimates of cash flows in a scenario must include all cash flows within the boundary of an existing contract and no other cash flows. In determining the boundary of a contract, an entity must consider its substantive rights and obligations and whether they arise from a contract, law or regulation (see section 2.3 above).

[IFRS 17.B61].

When an issuer of an insurance contract is required by the contract to renew or otherwise continue the contract, it must assess whether premiums and related cash flows that arise from the renewed contract are within the boundary of the original contract. *[IFRS 17.B63].*

The principle of a contract is that it binds one or both of the parties. If both parties are bound equally, the boundary of the contract is generally clear. Similarly, if neither party is bound, it is clear that no genuine contract exists. Therefore: [IFRS 17.BC160]

- The outer limit of the existing contract is the point at which the entity is no longer required to provide coverage and the policyholder has no right of renewal. Beyond that outer limit, neither party is bound.
- The entity is no longer bound by the existing contract at the point at which the contract confers on the entity the practical ability to reassess the risk presented by a policyholder and, as a result, the right to set a price that fully reflects that risk.

An entity has the practical ability to set a price at a future date (a renewal date) that fully reflects the risk in the contract from that date in the absence of constraints that prevent the entity from setting the same price it would for a new contract with the same characteristics as the existing contract issued on that date, or if it can amend the benefits to be consistent with the price it will charge. Similarly, an entity has the practical ability to set a price when it can reprice an existing contract so that the price reflects overall changes in the risks in a portfolio of insurance contracts, even if the price set for each individual policyholder does not reflect the change in risk for that specific policyholder. When assessing whether the entity has the practical ability to set a price that fully reflects the risks in the contract or portfolio, it must consider all the risks that it would consider when underwriting equivalent contracts on the renewal date for the remaining service. In determining the estimates of future cash flows at the end of a reporting period, an entity must reassess the boundary of an insurance contract to include the effect of changes in circumstances on the entity's substantive rights and obligations. [IFRS 17.B64].

However, if an entity has the practical ability to reassess the risk presented by a policyholder but does not have the right to set a price that fully reflects the reassessed risk, the contract still binds the entity. Thus, that point of reassessment would lie within the boundary of the existing contract, unless the restriction on the entity's ability to reprice the contract is so minimal that it is expected to have no commercial substance (i.e., the restriction has no discernible effect on the economics of the transaction). In the Board's view, a restriction with no commercial substance does not bind the entity. [IFRS 17.BC161].

It may be more difficult to decide the contract boundary if the contract binds one party more tightly than the other. Examples of circumstances in which it is more difficult include: [IFRS 17.BC162]

- An entity may price a contract so that the premiums charged in early periods subsidise the premiums charged in later periods, even if the contract states that each premium relates to an equivalent period of coverage. This would be the case if the contract charges level premiums and the risks covered by the contract increase with time. The Board concluded that the premiums charged in later periods would be within the boundary of the contract because, after the first period of coverage, the policyholder has obtained something of value, namely the ability to continue coverage at a level price despite increasing risk.
- An insurance contract might bind the entity, but not the policyholder, by requiring the entity to continue to accept premiums and provide coverage (without the ability to reprice the contract) but permitting the policyholder to stop paying premiums, although possibly incurring a penalty. In the Board's view, the premiums the entity is required to accept and the resulting coverage it is required to provide fall within the boundary of the contract.
- An insurance contract may permit an entity to reprice the contract on the basis of general market experience (for example, mortality experience), without permitting the entity to reassess the individual policyholder's risk profile (for example, the policyholder's health). In this case, the insurance contract binds the entity by requiring it to provide the policyholder with something of value - continuing insurance coverage without the need to undergo underwriting again. Although the terms of the contract are such that the policyholder has a benefit in renewing the contract, and the entity expects that renewals will occur, the contract does not require the policyholder to renew the contract.

Even if an entity is prevented from repricing an existing contract using an individual policyholder's risk assessment, where it is able to reprice to fully reflect the risks of the portfolio as a whole, the repriced cash flows are outside the contract boundary provided both criteria for repricing at a portfolio level mentioned above are met. [IFRS 17.BC163].

As a result of the above context, IFRS 17 specifies that cash flows are within the boundary of an insurance contract if they arise from substantive rights and obligations that exist during the reporting period in which the entity can compel the policyholder to pay the premiums or in which the entity has a substantive obligation to provide the policyholder with insurance contract services.

Extract from IFRS 17

- 34 Cash flows are within the boundary of an insurance contract if they arise from substantive rights and obligations that exist during the reporting period in which the entity can compel the policyholder to pay the premiums or in which the entity has a substantive obligation to provide the policyholder with insurance contract services (see paragraphs B61-B71). A substantive obligation to provide insurance contract services ends when:
- (a) the entity has the practical ability to reassess the risks of the particular policyholder and, as a result, can set a price or level of benefits that fully reflects those risks; or
 - (b) both of the following criteria are satisfied:
 - (i) The entity has the practical ability to reassess the risks of the portfolio of insurance contracts that contain the contract and, as a result, can set a price or level of benefits that fully reflects the risk of that portfolio; and
 - (ii) The pricing of the premiums up to the date when the risks are reassessed does not take into account the risks that relate to periods after the reassessment date.

[IFRS 17.34].

The assessment of the contract boundary is made in each reporting period. This is because an entity updates the measurement of the group of insurance contracts to which the individual contract belongs and, hence, the portfolio of contracts in each reporting period. For example, in one reporting period an entity may decide that a renewal premium for a portfolio of contracts is outside the contract boundary because the restriction on the entity's ability to reprice the contract has no commercial substance. However, if circumstances change so that the same restrictions on the entity's ability to reprice the portfolio take on commercial substance, the entity may conclude that future renewal premiums for that portfolio of contracts are within the boundary of the contract. [IFRS 17.BC164].

Frequently asked questions

Question 9-1: How to interpret the term 'contract boundary' described in IFRS 17.34 in the context of contracts with annual repricing mechanisms.

(TRG meeting February 2018 - Agenda paper no. 02, Log S22)

The submission describes specified fact patterns of two insurance contracts. In these fact patterns, the insurance fees are repriced annually at a portfolio level using step-rated fee tables. Hence, risk is assessed at a portfolio of insurance contracts level rather than an individual contract level, and therefore IFRS 17.34(a) is not applicable. The contract boundary is instead determined based on the assessment of risk applying IFRS 17.34(b).

TRG members discussed the analysis in the staff paper and noted that:

- IFRS 17.34(a) refers to the practical ability to reassess the risks of the policyholder (i.e., policyholder risk). IFRS 17.34(b) should be read as an extension of the risk assessment in IFRS 17.34(a) from the individual to portfolio level, without extending policyholder risks to all types of risks and considerations applied by an entity when pricing a contract. The staff noted that policyholder risk includes both the insurance risk and the financial risk transferred from the policyholder to the entity and, therefore, excludes lapse risk and expense risk.
- For the specified fact patterns of the two contracts described in the submission, the conclusion in the paper is that an entity can reset annually the premiums of the portfolios to which both of the example contracts belong to reflect the reassessed risk of those portfolios. The entity has the practical ability to reassess the risks of the specific portfolio of insurance contracts that contains the contract and, as a result, can set a price that fully reflects the risk of that portfolio and meets the requirements of IFRS 17.34(b)(i). In the fact pattern presented, premiums increase in line with age each year based on a step-rated table, i.e., the contract does not charge level premiums. Consequently, the staff analysis assumes that the requirements in IFRS 17.34(b)(ii) are also met. Accordingly, for those two contracts, the cash flows resulting from the renewal terms should not be included within the boundary of the existing insurance contract.
- If, conversely, the fact patterns of the two contracts described in the submission was varied such that the entity instead has a practical ability to reassess risks only at a general level (e.g., for a general community) and, as a result, can set a price for the portfolio of insurance contracts that contains the contract (e.g., using a generic step-rate table), then this would provide the individual policyholders within the portfolios with a substantive right and consequently, the cash flows resulting from these renewal terms should be included within the boundary of the existing contract.

TRG members observed that, in practice, some entities use a step-rated premium table for pricing that averages out the pricing between the different levels on the table (i.e., between the different steps). All relevant facts and circumstances would need to be considered in assessing whether the requirements in IFRS 17.34(b)(ii) are met.

TRG members also observed that the two examples described are for specific fact patterns. In practice, the features of contracts and their repricing might be different from those examples. The facts and circumstance of each contract should be assessed to reach an appropriate conclusion applying the requirements of IFRS 17.

Question 9-2: Whether the reference to a 'portfolio of insurance contracts' in IFRS 17.34(b) is a 'portfolio of insurance contracts' as defined in Appendix A of IFRS 17?

(TRG meeting April 2019 - Agenda paper no. 02, Log S86)

The submission asked whether the reference to a 'portfolio of insurance contracts' in IFRS 17.34(b) is a 'portfolio of insurance contracts' as defined in Appendix A of IFRS 17. The submission noted the discussion of Agenda Paper 2 at the February 2018 TRG meeting (see Question 9-1 above) and stated that some stakeholders think that a 'portfolio of insurance contracts' should be interpreted at a more granular level than is defined in Appendix A of IFRS 17 for the purpose of applying IFRS 17.34(b) (for example, at a group of insurance contracts level). The TRG agreed with the Staff's analysis that a 'portfolio of insurance contracts' is a defined term in Appendix A of IFRS 17. There is no difference between the use of that defined term in IFRS 17.14 and IFRS 17.34.

Question 9-3: What is the interrelation between the requirements in IFRS 17.35 (cash flows that are outside the boundary of an insurance contract) and the requirements in IFRS 17.B64 (reassessment of the boundary of an insurance contract at each reporting date)?

(TRG meeting September 2018 - Agenda paper no. 05, Log S66)

The submission considered how to account for cash flows of an insurance contract issued that, at initial recognition, are outside the boundary of the contract when facts or circumstances change over time. In particular, the staff paper considered the interaction between the statement in IFRS 17.35 that cash flows outside the boundary of a contract at initial recognition are cash flows of a new contract and the final sentence of IFRS 17.B64 which permits an entity to re-assess the boundary of an insurance contract to include the effect of changes in circumstances. The IASB staff observed that:

- The requirements in the two paragraphs are different because they address two different circumstances.
- When IFRS 17.35 applies, additional cash flows will be recognised as a new contract when the recognition criteria of a new group of contracts are met.
- IFRS 17.B64 discusses the assessment of the practical ability of an entity to reprice a contract considering constraints that might limit that ability and, therefore, applies to the reassessment of the contract boundary in this context. For example, a contract boundary reassessment may occur when, in one reporting period, repricing restrictions that have no commercial substance but in the next reporting period, facts and circumstances come to light that would have led to a different conclusion at inception (if known then). When IFRS 17.B64 applies, the fulfilment cash flows are updated to reflect changes in cash flows that are within the (revised) contract boundary. When such changes relate to future service, they are recognised by adjusting the carrying amount of the contractual service margin of the group of contracts to which the contract belongs.

The TRG members agreed with the IASB staff observations but noted the apparent conflict between the two paragraphs which stems from a lack of clarity of the meaning of IFRS 17.B64. IASB staff observed that the meaning of the last sentence in IFRS 17.B64 should be considered in the context of the preceding sentences in IFRS 17.B64, B61 to B63 and the Basis for Conclusions. The TRG members also expressed different views as to the applicability of the distinction between IFRS 17.35 and B64 in circumstances where cash flows that are outside the contract boundary at initial recognition relate to an additional type of coverage that may be provided over the coverage period of the contract.

Question 9-4: Are cash flows related to free additional coverage within the boundary of the insurance contracts purchased by policyholders?

(TRG meeting September 2018 - Agenda paper no. 11, Log S62)

The IASB staff discussed a question submitted to the TRG regarding a type of entity in which parties become members by purchasing an insurance contract. Members of the entity are also provided with free additional insurance coverage. The entity can cancel the free additional insurance coverage at any time and the question arises as to whether cash flows related to the free additional coverage are within the boundary of the insurance contracts purchased by policyholders. The IASB staff concluded that the right of an entity to cancel coverage at any time means that the entity does not have a substantive obligation to provide future service related to the free additional insurance coverage. The expected cash flows related to future free additional insurance coverage are, therefore, not included in the boundary of the insurance contract and are not included in the liability for remaining coverage. If the entity has a substantive obligation for the free additional insurance coverage that has already been provided, such as unpaid claims, the cash flows related to that coverage are within the boundary of the contract and are included in the liability for incurred claims.

Question 9-5: Are cash flows within the boundary of a group insurance contract, if those cash flows relate to periods after the entity can cancel the group insurance policy?

(TRG meeting September 2018 - Agenda paper no. 08, Log S61)

The TRG members considered an IASB staff paper which discussed a submission about the boundary of a contract for an agreement between an entity and an association or bank (referred to as a group insurance policy), under which the entity provides insurance coverage to members of an association or to customers of a bank (referred to as 'certificate holders').

In the case of group association policies, the insurance entity has a policy with an association or bank to sell insurance coverage to individual members or customers. Although the legal contract is between the entity and the association or bank, the insurance coverage for each certificate holder is priced as if it were an individual contract. In the case of group creditor policies with a bank, the entity can sell insurance coverage to individual customers of the bank. These policies have the same facts and circumstances as the group association policy, other than insurance cover being linked to the remaining outstanding balance of the loan or mortgage issued by the bank to the certificate holder. The entity pays the remaining outstanding loan balance to the bank when an insured event occurs (rather than the certificate holder or their beneficiaries who are liable for paying the outstanding balances). In the fact pattern submitted, the entity can terminate the policy with a 90-day notice period. In such arrangements, the question arises as to whether the cash flows related to periods after the notice period of 90 days are within the boundary of an insurance contract and whether the policyholder is the bank (or association) or the individual certificate holders.

The TRG members agreed with the analysis and conclusion of the staff paper including the steps that an entity should perform in its analysis and observed that:

- For group insurance policies an entity should consider whether the policyholder is the association or bank, or the certificate holders. This is the case regardless of whether that compensation is received directly or indirectly by paying amounts on the policyholder's behalf.
- For group insurance policies, an entity should consider whether the arrangement reflects a single insurance contract or multiple insurance contracts (i.e., with each certificate holder). Rebutting the presumption that the contract is a single contract by separating components requires judgement and careful consideration of all facts and circumstances (see section 6.1.1 above).
- For the group insurance policies described in the submission, the following facts and circumstances are indicative that the arrangement reflects multiple insurance contracts (i.e., an insurance contract with each certificate holder) for the purpose of applying IFRS 17:
 - The insurance coverage is priced and sold separately
 - Other than being members of the association or customers of the bank the individuals are not related to one another
 - Purchase of the insurance coverage is an option for each individual
- An entity should assess the boundary of each insurance contract. For the group insurance policies described in the submission, the entity's substantive obligation to provide services under the contract ends at the point the entity can terminate the contract. This means that, in these examples, the substantive obligation ends after 90 days and cash flows within the boundary are those related to the obligation to provide services over the period of 90 days. The certificate holder's expectation that the group insurance policy will not be terminated earlier than the contract term is not relevant to the assessment of the contract boundary.

The TRG members also observed that, in practice, there are many group insurance contracts with different terms and the assessment of whether a group insurance policy arrangement reflects a single insurance contract or multiple insurance contracts should be applied to group insurance policies considering all relevant facts and circumstances.

Illustration 9-1: Contract boundary of a stepped premium life insurance contract

An entity issues a group of annual insurance contracts which provide cover for death, and total and permanent disablement. The cover is guaranteed renewable every year (i.e., the entity must accept renewal) for twenty years regardless as to changes in health of the insured. However, the premiums increase annually with the age of the policyholder and the insurer may increase premium rates annually provided that the increase is applied to the entire portfolio of contracts (premium rates for an individual policyholder cannot be increased after the policy is underwritten).

Analysis

The contract boundary is one year.

The guaranteed renewable basis means that the entity has a substantive obligation to provide the policyholder with services. However, the substantive obligation ends at the end of each year. This is because the entity has the practical ability to reassess the risks of the portfolio that contains the contract. Therefore, the entity can set a price that reflects the risk of that portfolio and the pricing of the premiums for coverage up to the date when the risks are reassessed does not take into account the risks that relate to premiums after the reassessment date (as premiums are adjusted annually for age). Therefore, both criteria mentioned above are satisfied.

Illustration 9-2: Contract boundary of a level premium life insurance contract

An entity issues a group of insurance contracts which provide cover for death, and total and permanent disablement. The cover is guaranteed renewable (i.e., the entity must accept renewal) for twenty years regardless as to changes in health of the insured. The premium rates are level for the life of the policy irrespective of policyholder age. Therefore, the insurer will generally 'overcharge' younger policyholders and 'undercharge' older policyholders. In addition, the insurer may increase premium rates annually provided that the increase is applied to the entire portfolio of contracts (premium rates for an individual policyholder cannot be increased after the policy is underwritten).

Analysis

The contract boundary is twenty years.

The guaranteed renewable basis means that the entity has a substantive obligation to provide the policyholder with services. The substantive obligation does not end until the period of the guaranteed renewable basis expires. Although the entity has the practical ability to reassess the risks of the portfolio that contains the contract and, therefore, can set a price that reflects the risk of that portfolio, the pricing of the premiums does take into account the risks that relate to premiums after the reassessment date. The entity charges premiums in the early years to recover the expected cost of death claims in later years. Therefore, the second criterion in IFRS 17.34(b)(ii) for drawing a shortened contract boundary when an entity can reassess the premiums or benefits for a portfolio of insurance contracts is not satisfied.

How we see it

Establishing the boundary of a contract is crucial as it determines the cash flows that will be included in its measurement. Drawing a contract boundary at the point where the entity has the practical ability to reprice (or amend the benefits under the contract) to fully reflect the risks of the policyholder may not reflect the entity's expectations about future cash flows from renewals. This could result in contracts being reported as onerous even when an insurer expects to recover all costs from future renewals.

An entity's ability to reprice an individual insurance contract (and a policyholder's option not to renew the contract) creates a contract boundary. This means that, if premiums are received from the policyholder after the contract boundary date (i.e., the contract continues beyond the boundary period) this will be treated as the recognition of a new contract - even if the rights and obligations of the entity and the policyholder are included within the single original policy document. The result would be that payments and related future cash flows will be recognised as new separate contracts. This is likely to result in a change from how entities dealt with future premiums under IFRS 4.

9.1.1 Options to add insurance coverage

As discussed in section 3.6 above, for some contracts, the transfer of insurance risk to the issuer occurs after a period of time. Consider the example of a contract that provides a specified investment return and includes an option for the policyholder to use the proceeds of the investment on maturity to buy a life-contingent annuity at the same rates the entity charges other new annuitants at the time the policyholder exercises that option. Such a contract transfers insurance risk to the issuer only after the option is exercised, because the entity remains free to price the annuity on a basis that reflects the insurance risk that will be transferred to the entity at that time. Consequently, the cash flows that would occur on the exercise of the option fall outside the boundary of the contract, and before exercise, there are no insurance cash flows within the boundary of the contract. However, if the contract specifies the annuity rates (or a basis other than market rates for setting the annuity rates), the contract transfers insurance risk to the issuer because the issuer is exposed to the risk that the annuity rates will be unfavourable to the issuer when the policyholder exercises the option. In that case, the cash flows that would occur when the option is exercised are within the boundary of the contract. *[IFRS 17.B24]*.

Frequently asked questions

Question 9-6: How should an option to add coverage to an existing coverage on terms that are not guaranteed be accounted for?

(TRG meeting May 2018 - Agenda paper no. 03, Log S36)

The TRG discussed an IASB staff paper that analysed how to determine the contract boundary of insurance contracts that include an option to add insurance coverage at a later date. The TRG members observed that:

- An option to add insurance coverage at a future date is a feature of the insurance contract.
- An entity should focus on substantive rights and obligations arising from that option to determine whether the cash flows related to the option are within or outside the contract boundary.
- Unless the entity considers that an option to add coverage at a future date is a separate contract, the option is an insurance component that is not measured separately from the remainder of the insurance contract.
- If an option to add insurance coverage is not a separate contract and the terms are guaranteed by the entity, the cash flows arising from the option would be within the boundary of the contract because the entity cannot reprice the contract to reflect the reassessed risks when it has guaranteed the price for one of the risks included in the contract.
- If an option to add insurance coverage is not a separate contract and the terms are not guaranteed by the entity, the cash flows arising from the option might be either within or outside of the contract boundary, depending on whether the entity has the practical ability to set a price that fully reflects the reassessed risks of the entire contract. The analysis in the IASB staff paper: (i) assumed that the option to add insurance coverage at a future date created substantive rights and obligations; and (ii) noted that, if an entity does not have the practical ability to reprice the whole contract when the policyholder exercises the option to add coverage, the cash flows arising from the premiums after the option exercise date would be within the contract boundary. The TRG members expressed different views about whether an option with terms that are not guaranteed by the entity would create substantive rights and obligations.
- If the cash flows arising from an option to add coverage at a future date are within the contract boundary, the measurement of a group of insurance contracts is required to reflect, on an expected value basis, the entity's current estimates of how the policyholders in the group will exercise the option.

Question 9-7: Which are the cash flows within the boundary of each of two specific fact patterns of health insurance contracts for which the policyholder has a right to terminate a contract, which results in its lapse, and a right to reinstate the contract?

(TRG meeting April 2019 - Agenda paper no. 02, Log S126)

The submission describes two specific fact patterns of health insurance contracts for which the policyholder has a right to terminate a contract, which results in its lapse, and a right to reinstate the contract. The policyholder's right to reinstate the contract is either exercised by paying the premiums that were not paid since the contract has lapsed until the reinstatement date or by exercising an option that the policyholder acquired after the contract has lapsed. In the latter case, the option is repriced annually based on the latest mortality table. In both cases, when the insurance contract is reinstated, it is reinstated without further underwriting or repricing of the premiums.

The IASB staff declined to provide further analysis of the specific transaction, but observed that an entity should assess whether its substantive obligation to provide services ends when a contract with such features lapses applying the criteria set out in section 9.1 above (and discussed further above) and that cash flows related to the unexpired portion of the coverage period, such as the expected reinstatement of contracts, are part of the liability for remaining coverage.

9.1.2 Constraints or limitations relevant in assessing repricing

As discussed in section 9.1 above, when assessing whether an entity has the practical ability to set a price that fully reflects the risks in the contract or portfolio, it must consider all the risks that it would consider when underwriting equivalent contracts on the renewal date for the remaining service. In determining the estimates of future cash flows at the end of a reporting period, an entity must reassess the boundary of an insurance contract to include the effect of changes in circumstances on the entity's substantive rights and obligations. [IFRS 17.B64].

Frequently asked questions

Question 9-8: What constraints or limitations, other than those arising from the terms of an insurance contract, would be relevant in assessing the practical ability of an entity to reassess the risks of the particular policyholder (or of the portfolio of insurance contracts that contains the contract) and set a price or level of benefits that fully reflects those risks?

(TRG meeting May 2018 - Agenda paper no. 03, Log S43 and S49)

The TRG members observed that:

- A constraint that equally applies to new contracts and existing contracts would not limit an entity's practical ability to reprice existing contracts to reflect their reassessed risks.
- When determining whether it has the practical ability to set a price at a future date that fully reflects the reassessed risks of a contract or portfolio, an entity must (i) consider contractual, legal and regulatory restrictions; and (ii) disregard restrictions that have no commercial substance.
- IFRS 17 does not limit pricing constraints to contractual, legal and regulatory constraints. Market competitiveness and commercial considerations are factors that an entity typically considers when pricing new contracts and repricing existing contracts. As such, sources of constraints may also include market competitiveness and commercial considerations, but constraints are irrelevant to the contract boundary if they apply equally to new and existing policyholders in the same market.
- A constraint that limits an entity's practical ability to price or reprice contracts differs from choices that an entity makes (pricing decisions) which may not limit the entity's practical ability to reprice existing contracts in the way envisaged by IFRS 17.B64.

The TRG members also observed that an entity should apply judgement to decide whether commercial considerations are relevant when considering the contract boundary requirements of IFRS 17.

9.1.3 Contract boundary matters related to insurance acquisition cash flows

As discussed in section 7.3 above, in some circumstances, an insurer may pay insurance acquisition cash flows on insurance contracts which are expected to last for many years but where the contract boundary is much shorter. For example, an insurer may pay significant up-front insurance acquisition cash flows in the first year of a contract on the basis that the contract will last for a number of years, but the contract boundary may be only one year (e.g., because of the reasons explained in Illustration 9-1 above). In some cases, part of the commission is refundable from the agent if the future renewals do not occur as expected. In other circumstances, the commission is not refundable.

IFRS 17 requires an entity to allocate insurance acquisition cash flows to groups of insurance contracts using a systematic and rational method (see section 7.3 above) unless, as permitted under the premium allocation approach (see section 10.1 below), it chooses to recognise them as an expense. [IFRS 17.28A].

At the end of each reporting period, an entity must revise amounts allocated to each group using the systematic and rational method specified above to reflect any changes in assumptions that determine the inputs to the method of allocation used. The entity must not change amounts allocated to a group of insurance contracts after all contracts have been added to the group. [IFRS 17.B35B].

How we see it

As discussed in section 7.3 above, IFRS 17 does not contain specific requirements explaining how to allocate parts of the acquisition cash flows to anticipated contract renewals of different groups of insurance contracts on a systematic and rational basis. Therefore, the determination of such an allocation is a matter of judgement.

A distinction can be made when an insurer has paid an intermediary separately for exclusivity or future services as these costs are not attributable to an insurance contract and these payments would be outside the scope of IFRS 17 and may be within the scope of another IFRS accounting standard.

See sections 9.9.1 and 11.2 below for a discussion on matters related to the assessment of contract boundary, specifically as they relate to reinsurance contracts issued and held, respectively.

9.2 Estimates of expected future cash flows

The first element of the building blocks in the general model discussed in section 8 above is an estimate of the future cash flows over the life of each contract.

Extract from IFRS 17

B37 The objective of estimating future cash flows is to determine the expected value, or probability-weighted mean, of the full range of possible outcomes, considering all reasonable and supportable information available at the reporting date without undue cost or effort. Reasonable and supportable information available at the reporting date without undue cost or effort includes information about past events and current conditions, and forecasts of future conditions (see paragraph B41). Information available from an entity's own information systems is considered to be available without undue cost or effort.

[IFRS 17.B37].

All the future cash flows within the boundary of each contract in a group are included within the measurement estimate (see section 9.1 above). [IFRS 17.33]. However, the fulfilment cash flows must not reflect the non-performance risk (i.e., own credit) of the entity. [IFRS 17.31]. As discussed in section 6 above, an entity is permitted to estimate the future cash flows at a higher level of aggregation than a group and then allocate the resulting fulfilment cash flows to individual groups of contracts.

The estimates of future cash flows must: [IFRS 17.33]

- Incorporate, in an unbiased way, all reasonable and supportable information available without undue cost or effort about the amount, timing and uncertainty of those future cash flows. To do this, an entity estimates the expected value (i.e., the probability-weighted mean) of the full range of possible outcomes.
- Reflect the perspective of the entity, provided that the estimates of any relevant market variables are consistent with observable market prices for those variables (see section 9.2.1 below).
- Be current - the estimates must reflect conditions existing at the measurement date, including assumptions at that date about the future (see section 9.2.2 below).
- Be explicit - the entity must estimate the adjustment for non-financial risk separately from the other estimates. The entity must also estimate the cash flows separately from the adjustment for the time value of money and financial risk, unless the most appropriate measurement technique combines these estimates (see section 9.4 below).

The starting point for an estimate of future cash flows is a range of scenarios that reflects the full range of possible outcomes. Each scenario specifies the amount and timing of the cash flows for a particular outcome, and the estimated probability of that outcome. The cash flows from each scenario are discounted and weighted by the estimated probability of that outcome to derive an expected present value. Consequently, the objective is not to develop a most likely outcome, or a more-likely-than-not outcome, for future cash flows. [IFRS 17.B38].

When considering the full range of possible outcomes, the objective is to incorporate all reasonable and supportable information available without undue cost or effort in an unbiased way, rather than to identify every possible scenario. In practice, developing explicit scenarios is unnecessary if the resulting estimate is consistent with the measurement objective of considering all reasonable and supportable information available without undue cost or effort when determining the mean. For example, if an entity estimates that the probability distribution of outcomes is broadly consistent with a probability distribution that can be described completely with a small number of parameters, it will be sufficient to estimate the smaller number of parameters. Similarly, in some cases, relatively simple modelling may give an answer within an acceptable range of precision, without the need for many detailed simulations. However, in some cases, the cash flows may be driven by complex underlying factors and may respond in a non-linear fashion to changes in economic conditions. This may happen if, for example, the cash flows reflect a series of interrelated options that are implicit or explicit. In such cases, more sophisticated stochastic modelling is likely to be necessary to satisfy the measurement objective. [IFRS 17.B39].

The scenarios developed must include unbiased estimates of the probability of catastrophic losses under existing contracts. Those scenarios exclude possible claims under possible future contracts. [IFRS 17.B40].

An entity must estimate the probabilities and amounts of future payments under existing contracts on the basis of information obtained including: [IFRS 17.B41]

- Information about claims already reported by policyholders.
- Other information about the known or estimated characteristics of the insurance contracts.
- Historical data about the entity's own experience, supplemented when necessary with historical data from other sources. Historical data is adjusted to reflect current conditions, for example, if:
 - The characteristics of the insured population differ (or will differ, for example, because of adverse selection) from those of the population that has been used as a basis for the historical data
 - There are indications that historical trends will not continue, that new trends will emerge, or that economic, demographic and other changes may affect the cash flows that arise from the existing insurance contracts
 Or
 - There have been changes in items such as underwriting procedures and claims management procedures that may affect the relevance of historical data to the insurance contracts
- Current price information, if available, for reinsurance contracts and other financial instruments (if any) covering similar risks, such as catastrophe bonds and weather derivatives, and recent market prices for transfers of insurance contracts. This information must be adjusted to reflect the differences between the cash flows that arise from those reinsurance contracts or other financial instruments, and the cash flows that would arise as the entity fulfils the underlying contracts with the policyholder.

As a change to many accounting practices under IFRS 4, IFRS 17 does not contain an explicit deferred acquisition cost asset, for costs which relate to contracts that have already been recognised. Instead, paid insurance acquisition cash flows are included as a 'negative liability' within the measurement of the contractual service margin on initial recognition (see section 9.2.3.E below). Because the contractual service margin can never be negative for insurance contracts issued, there is no longer a need to perform any separate recoverability assessments for acquisition costs deferred once they have been included in the measurement of the group of insurance contracts. A recoverability assessment is necessary for the asset held for insurance acquisition cash flows paid before the related group of insurance contracts is recognised (see section 7.3 above and section 9.10 below).

Consistent with IFRS 4, catastrophe provisions and equalisation provisions (provisions generally build up over years following a prescribed regulatory formula which are permitted to be released in years when claims experience is high or abnormal) are not permitted to the extent that they relate to contracts that are not in-force at the reporting date (i.e., future claims would be outside the boundary of the existing contract). Although IFRS 17 prohibits the recognition of these provisions as a liability, it does not prohibit their segregation as a component of equity. Consequently, insurers are free to designate a proportion of their equity as an equalisation or catastrophe reserve. When a catastrophe or equalisation provision has a tax base, but is not recognised in the IFRS financial statements, then a taxable temporary difference will arise that is accounted for under IAS 12 *Income Taxes*.

How we see it

The estimates of future cash flows must be on an expected value basis and, therefore, should be unbiased. This means that they should not include any additional estimates above the probability-weighted mean for 'uncertainty', 'prudence' or an implicit or explicit management loading for risk. A risk adjustment for non-financial risk (see section 9.4 below) is determined separately to reflect the compensation for bearing the non-financial risk resulting from the uncertain amount and the timing of the cash flows.

Techniques such as stochastic modelling may be more robust or easier to implement if there are significant interdependencies between cash flows that vary based on returns on assets and other cash flows. Judgement is required to determine the technique that best meets the objective of consistency with observable market variables in specific circumstances.

9.2.1 Market variables and non-market variables

IFRS 17 identifies two types of variables that can affect estimates of cash flow: [IFRS 17.B42]

- Market variables (i.e., those that can be observed in, or derived directly from, markets (for example, prices of publicly traded securities and interest rates))
- Non-market variables (i.e., all other variables, such as the frequency and severity of insurance claims and mortality)

Market variables will generally give rise to financial risk (e.g., observable interest rates) and non-market variables will generally give rise to non-financial risk (e.g., mortality rates). However, this will not always be the case, there may be assumptions that relate to financial risks for which variables cannot be observed in, or derived directly from, markets (e.g., interest rates that cannot be observed in, or derived directly from, markets). [IFRS 17.B43].

9.2.1.A Market variables

Market variables are variables that can be observed in, or derived directly from markets (e.g., prices of publicly traded securities and interest rates).

Estimates of market variables must be consistent with observable market prices at the measurement date. An entity must maximise the use of observable inputs and must not substitute its own estimates for observable market data except in the limited circumstances as permitted by IFRS 13. [IFRS 13.79].

Consistent with IFRS 13, if variables need to be derived (e.g., because no observable market variables exist) they must be as consistent as possible with observable market variables. [IFRS 17.B44].

Market prices blend a range of views about possible future outcomes and also reflect the risk preferences of market participants. Consequently, they are not a single-point forecast of the future outcome. If the actual outcome differs from the previous market price, this does not mean that the market price was 'wrong'. [IFRS 17.B45].

An important application of market variables is the notion of a replicating asset or a replicating portfolio of assets. A replicating asset is one whose cash flows exactly match, in all scenarios, the contractual cash flows of a group of insurance contracts in amount, timing and uncertainty. In some cases, a replicating asset may exist for some of the cash flows that arise from a group of insurance contracts. The fair value of that asset reflects both the expected present value of the cash flows from the asset and the risk associated with those cash flows. If a replicating portfolio of assets exists for some of the cash flows that arise from a group of insurance contracts, the entity can use the fair value of those assets to measure the relevant fulfilment cash flows instead of explicitly estimating the cash flows and discount rate. [IFRS 17.B46]. IFRS 17 does not require an entity to use a replicating portfolio technique. However, if a replicating asset or portfolio does exist for some of the cash flows that arise from insurance contracts and an entity chooses to use a different technique, the entity must satisfy itself that a replicating portfolio technique would be unlikely to lead to a materially different measurement of those cash flows. [IFRS 17.B47].

Techniques other than a replicating portfolio technique, such as stochastic modelling techniques, may be more robust or easier to implement if there are significant interdependencies between cash flows that vary based on returns on assets and other cash flows. Judgement is required to determine the technique that best meets the objective of consistency with observable market variables in specific circumstances. In particular, the technique used must result in the measurement of any options and guarantees included in the insurance contracts being consistent with observable market prices (if any) for such options and guarantees. [IFRS 17.B48].

Frequently asked questions

Question 9-9: Should 'risk neutral' or 'real world' scenarios be used for stochastic modelling techniques to project future returns on assets, applying IFRS 17.B48?

(TRG meeting May 2018 - Agenda paper no. 07, Log S14)

The IASB staff responded to a submission to the TRG which asked whether 'real world' or 'risk neutral' scenarios should be used in stochastic modelling when, for example, measuring options and guarantees. Real world scenarios are those based on an assumed distribution that is intended to reflect realistic assumptions about actual future asset returns. Risk neutral scenarios are those based on an underlying assumption that, on average, all assets earn the same risk-free return. A risk neutral approach uses a range of scenarios reflecting the assumed volatility of returns for an asset price consistent with volatility implied by option prices.

The IASB staff clarified that IFRS 17 does not require an entity to divide estimated cash flows into those that vary based on the returns on underlying items and those that do not (see section 9.3 below) and, if not divided, the discount rate should be appropriate for the cash flows as a whole. The IASB staff observed that any consideration beyond this is actuarial (i.e., operational measurement implementation) in nature and, therefore, does not fall within the remit of the TRG. The TRG members did not disagree with the IASB staff's observations.

How we see it

The application guidance is clear that although market variables will generally provide a measurement basis for financial risks (e.g., observable interest rates) this will not always be the case. The same is true for non-financial risks and non-market variables. For example, some non-financial risks could be observable in markets, whereas not all financial risks will be observable.

In practice, we believe that the use of a replicating portfolio approach is likely to be rare as IFRS 17 refers to the need to consider the approach only when an asset exists whose cash flows exactly match those of the liability (or a portion thereof).

9.2.1.B Non-market variables

Non-market variables are all other variables (other than market variables) such as the frequency and severity of insurance claims and mortality.

Estimates of non-market variables must reflect all reasonable and supportable evidence available without undue cost or effort, both external and internal. [IFRS 17.B49]. Non-market external data (e.g., national mortality statistics) may have more or less relevance than internal data (e.g., internally developed mortality statistics), depending on the circumstances. [IFRS 17.B50].

Estimated probabilities for non-market variables must not contradict observable market variables. For example, estimated probabilities for future inflation rate scenarios must be as consistent as possible with probabilities implied by market interest rates. [IFRS 17.B51].

In some cases, an entity may conclude that market variables vary independently of non-market variables. If so, the entity must consider scenarios that reflect the range of outcomes for the non-market variables, with each scenario using the same observed value of the market variable. [IFRS 17.B52].

In other cases, market variables and non-market variables may be correlated. For example, there may be evidence that lapse rates (a non-market variable) are correlated with interest rates (a market variable). Similarly, there may be evidence that claim levels for house or car insurance are correlated with economic cycles and, therefore, with interest rates and expense amounts. The entity must ensure that the probabilities for the scenarios and the risk adjustments for the non-financial risk that relate to the market variables are consistent with the observed market prices that depend on those market variables.

[IFRS 17.B53].

Illustration 9-3: Persuasiveness of internal and national mortality statistics

An entity that issues life insurance contracts does not rely solely on national mortality statistics. It considers all other reasonable and supportable internal and external information available without undue cost or effort when developing unbiased estimates of probabilities for mortality scenarios for its insurance contracts. For example:

- Internal mortality statistics may be more persuasive than national mortality data if national data is derived from a large population that is not representative of the insured population. This could be because the demographic characteristics of the insured population could significantly differ from those of the national population, meaning that an entity would need to place more weight on the internal data and less weight on the national statistics.
- Conversely, if the internal statistics are derived from a small population with characteristics that are believed to be close to those of the national population, and the national statistics are current, an entity must place more weight on the national statistics. [IFRS 17.B50].

9.2.2 Using current estimates

In estimating each cash flow scenario and its probability, an entity must use all reasonable and supportable information available without undue cost or effort. [IFRS 17.B54]. Undue cost and effort is discussed in section 17.4 below.

An entity must review the estimates that it made at the end of the previous reporting period and update them. In doing so, an entity considers whether: [IFRS 17.B54]

- The updated estimates faithfully represent the conditions at the end of the reporting period
- Or
- The changes in estimates faithfully represent the changes in conditions during the period. For example, suppose that estimates were at one end of a reasonable range at the beginning of the period. If the conditions have not changed, shifting the estimates to the other end of the range at the end of the period would not faithfully represent what happened during the period. If an entity's most recent estimates are different from its previous estimates, but conditions have not changed, it must assess whether the new probabilities assigned to each scenario are justified. In updating its estimates of those probabilities, the entity must consider both the evidence that supported its previous estimates and all newly available evidence, giving more weight to the more persuasive evidence.

The probability assigned to each scenario must reflect the conditions at the end of the reporting period. Consequently, applying IAS 10 *Events after the Reporting Period*, an event occurring after the end of the reporting period that resolves an uncertainty that existed at the end of the reporting period does not provide evidence of the conditions that existed at that date. [IFRS 17.B55].

Current estimates of expected cash flows are not necessarily identical to the most recent actual experience. For example, suppose that mortality experience in the reporting period was 20% worse than the previous mortality experience and previous expectations of mortality experience. Several factors could have caused the sudden change in experience, including: [IFRS 17.B56]

- Lasting changes in mortality
- Changes in the characteristics of the insured population (for example, changes in underwriting or distribution, or selective lapses by policyholders in unusually good health)
- Random fluctuations
- Identifiable non-recurring causes

An entity must investigate the reasons for the change in experience and develop new estimates of cash flows and probabilities in the light of the most recent experience, the earlier experience and other information. The result for the example above, when mortality experience worsened by 20% in the reporting period, would typically be that the expected present value of death benefits changes, but not by as much as 20%. However, if mortality rates continue to be significantly higher than the previous estimates for reasons that are expected to continue, the estimated probability assigned to the high-mortality scenarios will increase. [IFRS 17.B57].

Estimates of non-market variables must include information about the current level of insured events and information about trends. For example, mortality rates have consistently declined over long periods in many countries. The determination of the fulfilment cash flows reflects the probabilities that would be assigned to each possible trend scenario, taking account of all reasonable and supportable information available without undue cost or effort. [IFRS 17.B58].

In a similar manner, if cash flows allocated to a group of insurance contracts are sensitive to inflation, the determination of the fulfilment cash flows must reflect current estimates of possible future inflation rates. Because inflation rates are likely to be correlated with interest rates, the measurement of fulfilment cash flows must reflect the probabilities for each inflation scenario in a way that is consistent with the probabilities implied by the market interest rates used in estimating the discount rate (see section 9.2.1.A above). [IFRS 17.B59].

When estimating the cash flows, an entity must take into account current expectations of future events that might affect those cash flows. The entity must develop cash flow scenarios that reflect those future events, as well as unbiased estimates of the probability of each scenario. However, an entity must not take into account current expectations of future changes in legislation that would change or discharge the present obligation or create new obligations under the existing insurance contract until the change in legislation is substantively enacted. [IFRS 17.B60].

Illustration 9-4: Faithful representation of conditions at the reporting date and changes in the period

If conditions have not changed in a period, shifting a point estimate from one end of a reasonable range at the beginning of the period to the other end of the range at the end of the period would not faithfully represent what has happened during the period.

If the most recent estimates are different from previous estimates, but conditions have not changed, an entity must assess whether the new probabilities assigned to each scenario are justified. In updating its estimates of those probabilities, the entity considers both the evidence that supported its previous estimates and all newly available evidence, giving more weight to the more persuasive evidence.

An entity must not update probabilities for claim events to reflect actual claims that took place after the reporting date but before the financial statements are finalised. For example, there may be a 20% probability at the end of the reporting period that a major storm will strike during the remaining six months of an insurance contract. After the end of the reporting period, but before the financial statements are authorised for issue, a major storm strikes. The fulfilment cash flows under that contract must not reflect hindsight (i.e., the storm that occurred in the next period). Instead, the cash flows included in the measurement includes the 20% probability apparent at the end of the reporting period (with disclosure, applying IAS 10, that a non-adjusting event occurred after the end of the reporting period). [IFRS 17.B55, IAS 10.10, IAS 10.11].

9.2.3 Cash flows within the contract boundary

As discussed in section 9.1 above, estimates of cash flows include all cash flows within the boundary of an insurance contract and in determining the contract boundary, an entity must consider its substantive rights and obligations and whether those rights and obligations arise from contract, law or regulation.

Many insurance contracts have features that enable policyholders to take actions that change the amount, timing, nature or uncertainty of the amounts they will receive. Such features include renewal options, surrender options, conversion options and options to stop paying premiums while still receiving benefits under the contracts. The measurement of a group of insurance contracts must reflect, on an expected value basis, the entity's current estimates of how the policyholders in the group will exercise the options available, and the risk adjustment for non-financial risk (see section 9.4 below) must reflect the entity's current estimates of how the actual behaviour of the policyholders may differ from the expected behaviour. This requirement to determine the expected value applies regardless of the number of contracts in a group; for example it applies even if the group comprises a single contract. Therefore, the measurement of a group of insurance contracts must not assume a 100% probability that policyholders will: [IFRS 17.B62]

- Surrender their contracts, if there is some probability that some of the policyholders will not
- Or
- Continue their contracts, if there is some probability that some of the policyholders will not

The Basis for Conclusions states that IFRS 17 does not require or allow the application of a deposit floor when measuring insurance contracts. If a deposit floor were to be applied, the resulting measurement would ignore all scenarios other than those involving the exercise of policyholder options in the way that is least favourable to the entity. This would contradict the principle that an entity should incorporate in the measurement of an insurance contract future cash flows on a probability-weighted basis. [IFRS 17.BC166]. The expected cash outflows include outflows over which the entity has discretion. [IFRS 17.BC168]. The Board considered whether payments that are subject to the entity's discretion meet the definition of a liability in the *Conceptual Framework for Financial Reporting* (the Conceptual Framework). The contract, when considered as a whole, clearly meets the Conceptual Framework's definition of a liability. Some components, if viewed in isolation, may not meet the definition of a liability. However, in the Board's view, including such components in the measurement of insurance contracts would generate more useful information for users of financial statements. [IFRS 17.BC169].

Cash flows within the boundary of an insurance contract are those that relate directly to the fulfilment of the contract, including cash flows for which the entity has discretion over the amount or timing. IFRS 17 provides the following examples of such cash flows: [IFRS 17.B65]

- Premiums - see section 9.2.3.A below
- Payments, including claims and non-distinct investment components, to a policyholder - see section 9.2.3.B below
- Payments to a policyholder that vary based on underlying items (including non-distinct investment components) - see section 9.2.3.C below
- Payments to a policyholder resulting from derivatives - see section 9.2.3.D below
- Insurance acquisition cash flows - see section 9.2.3.E below
- Claims handling costs - see section 9.2.3.F below
- Costs incurred in providing contractual benefits in kind - see section 9.2.3.G below
- Policy administration and maintenance costs - see section 9.2.3.H below
- Transaction-based taxes and levies - see section 9.2.3.I below
- Payments by the insurer of tax in a fiduciary capacity - see section 9.2.3.J below
- Potential cash inflows from recoveries - see section 9.2.3.K below
- An allocation of fixed and variable overheads - see section 9.2.3.L below
- Costs the entity will incur in providing an investment activity, an investment-return service or an investment-related service - see section 9.2.3.M below
- Any other costs specifically chargeable to the policyholder - see section 9.2.3.N below

The Board decided not to include only insurance cash flows that are incremental at a contract level as that would mean that entities would recognise different contractual service margins and expenses depending on the way they structure their acquisition activities. [IFRS 17.BC182(a)]. For example, different liabilities would be reported if the entity had an internal sales department rather than outsourcing sales to external agents as the costs of an internal sales department, such as fixed salaries, are less likely to be incremental than amounts paid to an agent.

At initial recognition of an insurance contract, the fulfilment cash flows will include estimates for these cash flows. Subsequently, as services are provided under the contract, the liability for remaining coverage is reduced and insurance revenue is recognised except for those changes that do not relate to services provided in the period (premiums received, investment component changes, changes related to transaction-based taxes, insurance finance income or expenses, and insurance acquisition cash flows). See section 15.2.1 below.

Frequently asked questions

Question 9-10: Are cash flows still within the boundary of the contract if those cash flows relate to periods when insurance coverage is no longer provided and where the policyholder bears all the risks related to the investment services?

(TRG meeting September 2018 - Agenda paper no. 11, Log S79)

The submission considered, in particular, whether cash flows should be considered to be within the boundary of the contract if those cash flows arise in periods in which the investment component exists but no insurance coverage is provided. The IASB staff observed that cash flows within the boundary of a contract may relate to periods in which coverage is no longer provided, such as when claims are expected to be settled in the future that relate to premiums that were within the boundary of the contract. Periods of coverage may also be outside the boundary of a contract if, for example, an entity can fully reprice premiums.

How we see it

The list of cash flows within the boundary of an insurance contract is more extensive than permitted under many local GAAPs (and, hence, applied previously under IFRS 4). For example, some local GAAPs permit only incremental costs to be included. Some local GAAPs also permit an accounting policy choice whether or not to expense as incurred or defer over the policy period certain costs such as insurance acquisition cash flows. IFRS 17 does not allow a choice as to whether or not to include these cash flows when they are within the boundary of the insurance contract.

9.2.3.A Premium cash flows

Premium cash flows include premium adjustments, instalment premiums from a policyholder and any additional cash flows that result from those premiums. *[IFRS 17.B65(a)].*

How we see it

Some insurance contracts charge a higher premium to policyholders who pay by (say) monthly instalments compared to those who pay a single amount on policy inception. The increased amount billed to those paying by instalments may include an implicit interest charge. Under IFRS 4, accounting practices for the higher premium charged to those who pay by instalments have been diverse. Under IFRS 17, the fulfilment cash flows arising from any incremental premium chargeable to policyholders is insurance revenue as it does not meet the definition of insurance finance income or expenses (see section 15.3 below) nor is it a distinct non-insurance service as the insurance and financing are not usually sold separately (see section 5.3 above).

9.2.3.B Payments to (or on behalf of) a policyholder

These payments include claims that have already been reported but have not yet been paid (i.e., reported claims), claims for events that have occurred but for which claims have not been reported (i.e., incurred but not reported (IBNR) claims) and all future claims for which an entity has a substantive obligation.

[IFRS 17.B65(b)]. These claim payments also include any non-distinct investment components, although the non-distinct investment components are excluded from insurance revenue and insurance service expenses (see section 5.2 above).

9.2.3.C Payments to (or on behalf of) a policyholder that vary depending on returns on underlying items

Some insurance contracts give policyholders the right to share in the returns on specified underlying items. *[IFRS 17.B65(c)].* Underlying items are items that determine some of the amounts payable to a policyholder. Underlying items can comprise any items, e.g., a reference portfolio of assets, the net assets of the entity, or a specified subset of the net assets of the entity. *[IFRS 17 Appendix A].*

Payments to policyholders that vary depending on returns from underlying items are found most frequently in contracts with participation features. These are discussed in section 12 below. These payments also include any non-distinct investment components, although the non-distinct investment components are excluded from insurance revenue and insurance service expenses (see section 5.2 above).

9.2.3.D Payments to (or on behalf of) a policyholder resulting from derivatives

Examples of such derivatives include options and guarantees embedded into the contract, to the extent that those options and guarantees are not separated from the contract (see section 5.1 above). *[IFRS 17.B65(d)].*

9.2.3.E Insurance acquisition cash flows

These cash flows comprise an allocation of insurance acquisition cash flows attributable to the portfolio to which the contract belongs. *[IFRS 17.B65(e)].*

There is no restriction on insurance acquisition cash flows to those resulting from successful efforts. So, for example, the directly attributable costs of an underwriter of a portfolio of motor insurance contracts do not need to be apportioned between those costs relating to efforts that result in the issuance of a contract and those relating to unsuccessful efforts. The Basis for Conclusions observes that the Board considered whether to restrict insurance acquisition cash flows included in the measurement of a group of insurance contracts to those cash flows directly related to the successful acquisition of new or renewed insurance contracts. However, it was concluded that this was not consistent with an approach that measured profitability of a group of contracts over the duration of the group and, in addition, the Board wanted to avoid measuring liabilities and expenses at different amounts depending on how an entity structures its insurance activities. *[IFRS 17.BC183].*

Changes in estimates of insurance acquisition cash flows are adjusted against the liability for remaining coverage, but do not adjust insurance revenue as they do not relate to services provided by the entity. *[IFRS 17.B123(a)(v)]*. Separately, insurance revenue related to insurance acquisition cash flows is determined by allocating (or amortising) the portion of the premiums that relates to recovering these cash flows to each reporting period in a systematic way on the basis of passage of time, with a corresponding entry to insurance service expenses (i.e., DR insurance service expense, CR insurance revenue). *[IFRS 17.B125]*. See section 15.2.1 below.

9.2.3.F Claims handling costs

These are costs that an entity will incur in investigating, processing and resolving claims under existing insurance contracts (as opposed to claim payments to policyholders - see section 9.2.3.B above). Claims handling costs include legal and loss adjusters' fees and the internal costs of investigating claims and processing claims payments. *[IFRS 17.B65(f)]*.

9.2.3.G Costs incurred in providing contractual benefits in kind

These costs are those related to the type of payments in kind discussed in section 3.3 above. *[IFRS 17.B65(g)]*.

9.2.3.H Policy administration and maintenance costs

These costs include the costs of billing premiums and handling policy changes (for example, conversions and reinstatements). Such costs also include recurring commissions that are expected to be paid to intermediaries if a particular policyholder continues to pay the premiums within the boundary of the insurance contract. *[IFRS 17.B65(h)]*.

9.2.3.I Transaction-based taxes

These include such taxes as premium tax, value added taxes and goods and service taxes and levies (such as fire service levies and guarantee fund assessments) that arise directly from existing insurance contracts, or that can be attributed to them on a reasonable and consistent basis. *[IFRS 17.B65(i)]*. See also section 9.2.3.J below.

Premium or sales taxes are typically billed to the policyholder and then passed onto the tax authorities with the insurer usually acting as an agent for the tax authorities. The cash flows within the contract boundary would, therefore, include both the tax inflow and the tax outflow. Guarantee fund or similar assessments are usually billed to the insurer directly based on a calculation made by the tax authority often derived from the insurer's market share of particular types of insurance business. There is usually only a cash outflow for these assessments.

Changes in cash flows that relate to transaction-based taxes collected on behalf of third parties (such as premium taxes, value added taxes and goods and services taxes) adjust the liability for remaining coverage (i.e., are included within the balance of portfolios of insurance contracts included in the statement of financial position), but do not adjust insurance revenue as these do not relate to services expected to be covered by the consideration received by the entity. *[IFRS 17.B123(a)(iii)]*.

9.2.3.J Payments by the insurer in a fiduciary capacity

These are payments (and related receipts) made by the insurer to meet tax obligations of the policyholder. *[IFRS 17.B65(j)]*. In some jurisdictions, the insurer is required to make these payments (e.g., to pay the policyholder's tax on gains made on underlying items). Income tax obligations which are not paid in a fiduciary capacity (e.g., the insurer's own income tax obligations) are not cash flows within the boundary of an insurance contracts. See section 9.2.4 below.

9.2.3.K Potential inflows from recoveries

Some insurance contracts permit the insurer to sell, usually damaged, property acquired in settling the claim (salvage). The insurer may also have the right to pursue third parties for payment of some or all costs (subrogation). Potential cash inflows from recoveries (i.e., both salvage and subrogation) on future claims covered by existing insurance contracts are included in the cash flows within the boundary of an insurance contract. The same applies to potential cash inflows from recoveries on past claims, to the extent that they do not qualify for recognition as separate assets under the criteria of another IFRS accounting standard. *[IFRS 17.B65(k)]*.

9.2.3.L An allocation of fixed and variable overheads

Fixed and variable overheads included in the cash flows within the boundary of an insurance contract include the directly attributable costs of: *[IFRS 17.B65(l)]*

- Accounting
- Human resources
- Information technology and support
- Building depreciation
- Rent
- Maintenance and utilities

These overheads must be allocated to groups of contracts using methods that are systematic and rational and are consistently applied to all costs that have similar characteristics.

Other IFRS accounting standards govern the accounting treatment of some of the fixed or variable overheads, for example:

Fixed and variable overheads	Applicable IFRS
Human resources	IAS 19
Information technology	IAS 16/IAS 38
Depreciation	IAS 16/IFRS 16/IAS 38
Other allocated overhead amounts	IFRS 9 or another IFRS accounting standard

IFRS 17 will therefore interact with the recognition and measurement principles of other IFRS accounting standards. For example, an entity might include building depreciation costs in the fulfilment cash flows and will treat these as insurance service expenses under IFRS 17, recognising an incurred insurance service expense and corresponding revenue. See section 15.2.1 below for a discussion on the interaction between IFRS 17 and other IFRS accounting standards.

9.2.3.M Costs incurred in providing investment activity, investment-return and investment-related services

These are costs the entity will incur: *[IFRS 17.B65(ka)]*

- Performing investment activities, to the extent the entity performs these activities to enhance benefits from insurance coverage for policyholders. Investment activities enhance benefits from insurance coverage if the entity performs those activities expecting to generate an investment return from which policyholders will benefit if an insured event occurs.
- Providing investment-return services to policyholders of insurance contracts without direct participation features (see section 9.7.1 below).
- Providing investment-related services to policyholders of insurance contracts with direct participation features (see section 12.3.4 below).

Investment activity costs that an entity incurs are included in the fulfilment cash flows to the extent that the entity incurs those costs to provide investment-return services or investment-related services. It is acknowledged in the Basis for Conclusions that an entity may also incur investment activity costs to enhance benefits from insurance coverage from customers. Therefore, IFRS 17 specifies that an entity is required to include investment activity costs in the fulfilment cash flows to the extent that the entity performs those activities to enhance benefits from insurance coverage for policyholders. In determining whether investment activity costs enhance benefits from insurance coverage for policyholders, an entity needs to apply judgement in a similar manner to when it determines whether an investment-return service exists (see section 9.7.1 below). *[IFRS 17.BC283]*.

Costs resulting from investment activity performed for the benefit of shareholders, rather than policyholders, are excluded from the list above. Therefore, it can be inferred by omission that the IASB does not consider shareholder-related investment costs to be fulfilment cash flows directly related to insurance contracts.

How we see it

When applying judgement as to whether investment activities enhance benefits from insurance coverage for policyholders, an entity would have to determine whether performing the investment activities enhances insurance benefits payable to policyholders and should be included in the fulfilment cash flows, or that it does not enhance insurance benefits payable to policyholders and should not be included in the fulfilment cash flows. Considerations in applying this judgement might include whether there is an implicit or explicit enhancement of benefits when pricing the product reflecting the likely investment return achieved, the level of investment activities undertaken, whether and how future benefits to policyholder are affected by investment returns and the time period between receipt of premiums and payment of benefits.

9.2.3.N Any other costs

These are any other costs specifically chargeable to the policyholder under the insurance contract.

[IFRS 17.B65(m)].

In some cases, income tax paid by an entity, even though not paid in a fiduciary capacity, is specifically chargeable to the policyholder under the terms of the contract. Such a tax, which can be described as a 'policyholder tax', arises for example, when an entity pays income tax on assets that are underlying items to insurance contracts, and charges the policyholder for its share of that income tax.

'Other costs' include income tax payments and receipts that are specifically chargeable to the policyholder under the terms of an insurance contract (see section 9.2.4 below for tax not specifically chargeable to the policyholder under the terms of an insurance contract). The consequence of this is that:

- An entity will continue to apply IAS 12 to those income tax payments to measure the amounts of such income tax payments to be included in the fulfilment cash flows.
- An entity will recognise insurance revenue for the consideration paid by the policyholder for these tax payments and receipts consistent with the recognition of insurance revenue for other incurred expenses. The IASB staff's view is that for income tax payments specifically chargeable to the policyholder under the contract terms, when the tax expense is incurred applying IAS 12, the entity will treat it as an incurred expense applying IFRS 17⁷ (see also section 15.2.1 below). Although the amount charged to the policyholder is part of insurance revenue, the related income tax charge incurred in the period will be included within income tax (not insurance service expenses) and will be income tax payable and not part of the liability for incurred claims.

How we see it

IFRS 17.B121 distinguishes between (a)(i) 'insurance service expenses' and (a)(ia) income tax. This was needed as income tax cannot be presented as insurance services expenses as, under IAS 1, income tax needs to be presented separately in profit or loss. Therefore, incurred income tax expenses should be presented in the income tax expense line item on the face of the statement of profit or loss and not within the insurance service expenses.

⁷ [IASB Staff paper 2F](#): Project: *Amendments to IFRS 17*, Paper topic: *Other topics raised by respondents to the Exposure Draft Amendments to IFRS 17*, IASB meeting, February 2020, paragraph 15. Available on the IFRS Foundation's website.

9.2.4 Cash flows excluded from the contract boundary

Having provided a list of cash flows that are within the boundary of an insurance contract, IFRS 17 then provides a list of cash flows that must not be included when estimating the cash flows that will arise as an entity fulfils an existing insurance contract. These are as follows: [IFRS 17.B66]

- Investment returns. Investments are recognised, measured and presented separately
- Cash flows (payments or receipts) that arise under reinsurance contracts held. Reinsurance contracts held are recognised, measured and presented separately (see section 11 below)
- Cash flows that may arise from future insurance contracts, i.e., cash flows outside the boundary of existing contracts (see section 9.2.3 above)
- Cash flows relating to costs that cannot be directly attributed to the portfolio of insurance contracts that contain the contract, such as some product development and training costs. Such costs are recognised in profit or loss when incurred
- Cash flows that arise from abnormal amounts of wasted labour or other resources that are used to fulfil the contract. Such costs are recognised in profit or loss when incurred
- Income tax payments and receipts the insurer does not pay or receive in a fiduciary capacity or that are not specifically chargeable to the policyholder under the terms of the contract (see section 9.2.3.N above for tax specifically chargeable to the policyholder under the terms of the contract)
- Cash flows between different components of the reporting entity, such as policyholder funds and shareholder funds, if those cash flows do not change the amount that will be paid to the policyholders
- Cash flows arising from components separated from the insurance contract and accounted for using other applicable IFRS accounting standards (see section 5 above)

How we see it

Investment returns are not part of the fulfilment cash flows of a contract because measurement of the contract does not depend on the assets that the entity holds. However, where a contract includes direct participation features or other types of contracts where payments to a policyholder vary depending on returns on underlying items, the measurement of the fulfilment cash flows includes the effect of returns from underlying items on those cash flows.

9.3 Discount rates

The second element of measuring fulfilment cash flows under the general model (discussed in section 9 above) is an adjustment (i.e., a discount) to the estimates of future cash flows to reflect the time value of money and financial risks related to those cash flows (to the extent that they are not included in the cash flow estimates). The adjustment is made by discounting estimated future cash flows. Discount rates must: [IFRS 17.36]

- Reflect the time value of money, characteristics of the cash flows and liquidity characteristics of the insurance contract
- Be consistent with observable current market prices (if any) for financial instruments with cash flows whose characteristics are consistent with those of the insurance contracts (e.g., timing, currency and liquidity)
- Exclude the effect of factors that influence such observable market prices, but do not affect the future cash flows of the insurance contracts

The discount rates calculated according to the requirements above must be determined, as follows:

[IFRS 17.B72, IFRS 17.B73]

Insurance liability measurement component	Discount rate for liability
Fulfilment cash flows	Current rate at reporting date
Changes in the fulfilment cash flows for contracts without direct participation features that relate to future service and affect the contractual service margin (including insurance and reinsurance contracts issued and reinsurance contracts held)	Rate at date of initial recognition of group
Contractual service margin interest accretion for contracts without direct participation features (including insurance and reinsurance contracts issued and reinsurance contracts held)	Rate at date of initial recognition of group
Changes in the fulfilment cash flows for contracts with direct participation features that relate to future service and affect the contractual service margin	Current rate at reporting date
Liability for remaining coverage under the premium allocation approach for groups of insurance contracts with a significant financing component	Rate at date of initial recognition of group
Loss component for onerous contracts (see section 9.8 below)	IFRS 17 does not specify. For contracts accounted for under the general model, the entity has an accounting policy choice between current rates and the rate at date of initial recognition of the group. This choice should be applied to all contracts under the general model. For contracts with direct participation features, current rate at the reporting date must be used.
Insurance finance income or expenses	Discount rate used for profit and loss amount when disaggregating between profit or loss and other comprehensive income
Insurance finance income or expenses for which disaggregation between profit or loss and other comprehensive income is optional, and for which changes in financial risk do not have a substantial effect on amounts paid to policyholders (see section 15.3.1 below)	Rate at date of initial recognition of group
Insurance finance income or expenses for which disaggregation between profit or loss and other comprehensive income is optional, and for which changes in financial risk assumptions have a significant effect on amounts paid to policyholders (see section 15.3.1 below)	Rate that allocates the remaining revised finance income or expense over the duration of the group at a constant rate ('effective yield approach') or, for contracts that use a crediting rate, uses an allocation based on the amounts credited in the period and expected to be credited in future periods ('projected crediting approach').
Insurance finance income or expenses for which disaggregation between profit or loss and other comprehensive income is optional for incurred claims of groups of contracts applying the premium allocation approach (see section 15.3.3 below)	Rate at date of incurred claim
Insurance finance income or expenses for which disaggregation between profit or loss and other comprehensive income is optional for groups of insurance contracts with direct participation features for which the entity holds the underlying items (see section 15.3.4 below)	Amount that eliminates accounting mismatches with income or expenses on the underlying items, i.e., the net of the two should be nil ('current period book yield approach').

IFRS 17 does not specify requirements for accretion of interest on assets for insurance acquisition cash flows. The Board decided against specifying such requirements because doing so would be inconsistent with IFRS 15. [IFRS 17.BC184H]. Consequently, entities have an accounting policy choice as to whether to accrete interest on such assets and the rate to use for such accretion.

For insurance contracts without direct participation features, the Board concluded that changes in the effects of the time value of money and financial risk do not affect the amount of unearned profit. This is the case even if the payments to policyholders vary with returns on underlying items through a participation mechanism. Accordingly, the entity does not adjust the contractual service margin to reflect the effects of changes in these assumptions and hence a discount rate at initial recognition of the group is used.

[IFRS 17.BC228].

When discount rates reflect the rate at initial recognition of the group, such rates must consider contracts added to the group after its initial recognition. This can be achieved by applying rates that correspond to the initial recognition date over the period that the contracts in the group are issued, or a weighted average rate that reflects these rates which apply over the period that contracts in the group are issued, which cannot exceed one year. [IFRS 17.B73]. As explained in section 7 above, this can result in a change in the discount rates during the period of the contracts as newly recognised contracts are added to the group. When contracts are added to a group in a subsequent reporting period (because the period of the group spans across two reporting periods) and weighted average discount rates are revised, an entity must apply the revised discount rates from the start of the reporting period in which the new contracts are added to the group. [IFRS 17.28]. This means that there is no retrospective catch-up adjustment for previous reporting periods (see section 15.4 below).

In some jurisdictions, a liquid risk-free yield curve (or interest rate) might be negative. An entity uses the current market rates even if those are negative and this results in the present value of future payments exceeding, rather than being lower than the value of the undiscounted fulfilment cash flows.

Frequently asked questions

Question 9-11: How to account for the difference that may arise between the current discount rate of each contract when it joins the group and the weighted average discount rates used at initial recognition?

(TRG meeting April 2019 - Agenda paper no. 02, Log S93)

The IASB staff observed that entities which apply the other comprehensive income disaggregation option use the discount rates determined at the date of initial recognition of a group of insurance contracts to determine the amounts recognised in profit or loss using a systematic allocation. An entity is permitted to use weighted average discount rates over the period that contracts in a group are issued to determine the discount rate at the date of initial recognition of a group of contracts. The weighted average discount rate used should achieve the outcome that the amounts recognised in other comprehensive income over the duration of the group of contracts total zero.

Question 9-12: Should an entity use an effective yield rate or a yield curve, specifically, in terms of IFRS 17.B72(e)(i) for a group of insurance contracts for which changes in assumptions that relate to financial risk do not have a substantial effect on the amounts paid to policyholders?

(TRG meeting May 2018 - Agenda paper no. 07, Log S29)

IFRS 17 does not state whether the discount rate should be a yield curve or a single discount rate. The IASB staff confirmed that, in applying the discount rate determined at the date of initial recognition to nominal cash flows that do not vary based on returns from underlying items, IFRS 17 does not mandate the use of an effective yield rate or a yield curve. In response to the IASB staff, a few TRG members commented that using an effective yield rate compared to using a yield curve could result in a significant difference to insurance finance income or expense to be included in profit or loss over the reporting periods subsequent to initial recognition.

How we see it

As mentioned above, there is no retrospective catch-up adjustment from the weighted average discount rates at initial recognition for previous reporting periods. As discussed in section 15.4 below, the frequency of an entity's reporting period and the accounting policy choice available under IFRS 17.B137, would determine what is the 'previous reporting period' in this respect. When an entity chooses a Period-To-Date (PTD) approach, the previous reporting period would be the interim reporting period, so no catch-up is applied regarding any previous interim or annual reporting period. Conversely, if an entity chooses a Year-To-Date (YTD) approach, the previous reporting period would be determined by reference to the annual reporting period. Both approaches will however, ultimately result in the same weighted average discount rate at initial recognition.

IFRS 17 requires that the discount rates applied reflect the characteristics of the liability. One such relevant characteristic is timing and duration of the cash flows, which would be particularly prominent for long-term liabilities. Typically, the characteristics of timing and duration may be reflected through the use of a yield curve. Possible practical considerations of this might be:

- Whether a different method could be applied to some types of (cash flows of) participating contracts.
- Whether an entity could use an approach to convert a curve into a single rate as a practical simplification for some types of products. However, this requires careful consideration as an entity would still have to substantiate in every reporting period, whether the IFRS 17 discount rate principles are satisfied. As such, there will be a number of challenges to such an approach.
- Whether to use a flat rate for short-term liabilities as for such liabilities, the impact of the timing may not be significant. However, it would be a practical expedient that requires a definition of 'short' for these purposes. In addition, materiality aspects may have to be considered.

Discount rates used for regulatory purposes may be a starting point to determine the discount rate curve (or components of that curve) for use under IFRS 17. However, an entity would have to decide if, or to what extent, such an estimate would be consistent with the requirements in IFRS 17 and make any adjustments necessary. In going through this process, entities should be aware of the reference in IFRS 17 to the requirements in IFRS 13 on the consideration of observable market prices and the use of estimation techniques.

9.3.1 Discount rates consistent with characteristics of cash flows

Estimates of discount rates must be consistent with other estimates used to measure insurance contracts to avoid double counting or omissions; for example: [IFRS 17.B74]

- Cash flows that do not vary based on the returns on any underlying items must be discounted at rates that do not reflect any such variability
- Cash flows that vary based on the returns on any financial underlying items must be:
 - Discounted using rates that reflect that variability
 - Or
 - Adjusted for the effect of that variability and discounted at a rate that reflects the adjustment made
- Nominal cash flows (i.e., those that include the effect of inflation) must be discounted at rates that include the effect of inflation
- Real cash flows (i.e., those that exclude the effect of inflation) must be discounted at rates that exclude the effect of inflation

However, discount rates must not reflect the non-performance (i.e., own credit) risk of the entity. [IFRS 17.31]. The requirement for discount rates to be consistent with the characteristics of the cash flows of insurance contracts is from the perspective of the entity. IFRS 17 requires an entity to disregard its own credit risk when measuring the fulfilment cash flows. [IFRS 17.31, IFRS 17.BC197].

Cash flows that vary based on the returns on underlying items must be discounted using rates that reflect that variability, or adjusted for the effect of that variability and discounted at a rate that reflects the adjustment made. The variability is a relevant factor regardless of whether it arises because of contractual terms or because the entity exercises discretion, and regardless of whether the entity holds the underlying items. [IFRS 17.B75].

Cash flows that vary with returns on underlying items with variable returns, but that are subject to a guarantee of a minimum return, do not vary solely based on the returns on the underlying items, even when the guaranteed amount is lower than the expected return on the underlying items. Hence, an entity must adjust the rate that reflects the variability of the returns on the underlying items for the effect of the guarantee, even when the guaranteed amount is lower than the expected return on the underlying items. [IFRS 17.B76].

IFRS 17 does not require an entity to divide estimated cash flows into those that vary based on the returns on underlying items and those that do not. If an entity does not divide the estimated cash flows in this way, the entity must apply discount rates appropriate for the estimated cash flows as a whole, e.g., using stochastic modelling techniques or risk-neutral measurement techniques. [IFRS 17.B77].

For cash flows of insurance contracts that do not vary based on the returns on underlying items, the discount rate reflects the yield curve in the appropriate currency for instruments that expose the holder to no or negligible credit risk, adjusted to reflect the liquidity characteristics of the group of insurance contracts. That adjustment must reflect the difference between the liquidity characteristics of the group of insurance contracts and the liquidity characteristics of the assets used to determine the yield curve. Yield curves reflect assets traded in active markets that the holder can typically sell readily at any time without incurring significant costs. In contrast, under some insurance contracts the entity cannot be forced to make payments earlier than the occurrence of insured events, or dates specified in the contracts. [IFRS 17.B79].

Frequently asked questions

Question 9-13: Should the liability for any minimum interest rate guarantees made to policyholders be measured through adjusting the discount rate (rather than through adjustments to the cash flows)?

(TRG meeting May 2018 - Agenda paper no. 07, Log S38)

The IASB staff stated that although IFRS 17 requires the time value of a guarantee to be reflected in the measurement of fulfilment cash flows, it does not require the use of a specific approach to achieve this objective. Financial risk is included in the estimates of future cash flows or in the discount rate used to adjust the cash flows. Judgement is required to determine the technique for measuring market variables and the technique must result in the measurement of any options and guarantees being consistent with observable market prices. Any consideration beyond this is actuarial (i.e., operational measurement implementation) in nature. The TRG members did not disagree with the IASB staff's observations.

How we see it

IFRS 17 does not require an entity to divide estimated cash flows into those that vary based on the returns on underlying items and those that do not. By not dividing the cash flows, an entity avoids the complexity of having to disentangle cash flows that may be interrelated. However, if an entity does not divide the estimated cash flows in this way, it should apply discount rates for the estimated cash flows as a whole in a way that is consistent with the principles of the standard; for example, using stochastic modelling or risk-neutral measurement techniques. Both approaches, dividing or not dividing cash flows, have their own conceptual and practical implications, so entities should carefully assess what methods will be most suited to their particular circumstances.

Entities should be aware that, even for participating contracts, at least some of the cash flows to policyholders are independent of returns on underlying items; for example, payments for fixed death benefit or expenses of the entity that do not vary with the underlying items.

9.3.2 Current discount rates consistent with observable market prices

Discount rates must include only relevant factors, i.e., factors that arise from the time value of money, the characteristics of the cash flows and the liquidity characteristics of the insurance contracts. Such discount rates may not be directly observable in the market. Hence, when observable market rates for an instrument with the same characteristics are not available, or observable market rates for similar instruments are available but do not separately identify the factors that distinguish the instrument from the insurance contracts, an entity must estimate the appropriate rates. IFRS 17 does not require a particular estimation technique for determining discount rates. In applying an estimation technique, an entity must: [IFRS 17.B78]

- Maximise the use of observable inputs and reflect all reasonable and supportable information on non-market variables available without undue cost or effort, both external and internal. In particular, the discount rates used must not contradict any available and relevant market data, and any non-market variables used must not contradict observable market variables.
- Reflect current market conditions from the perspective of a market participant
- Exercise judgement to assess the degree of similarity between the features of the insurance contracts being measured and the features of the instrument for which observable market prices are available and adjust those prices to reflect the differences between them

How we see it

It is unlikely that there will be an observable market price for a financial instrument with the same characteristics as an insurance contract in terms of the timing and nature of the estimated cash flows. An entity will need to exercise judgement to assess the degree of similarity between the features of the insurance contracts measured and those of the instruments for which observable market prices are available and adjust those prices to reflect the differences. This will require establishing a robust estimation process for discount rates, including related controls for determining the inputs to discount rates based on the conditions at the reporting date.

Some insurance contracts will have a contract boundary which extends beyond the period for which observable market data is available. In these situations, the entity will have to determine an extrapolation of the discount rate yield curve beyond that period. IFRS 17 provides no specific guidance on estimation techniques to extrapolate the discount rate curve. In practice, multiple techniques exist. IFRS 17 indicates that applying an appropriate estimation technique requires judgement, weighing the principle to use the best information available and adjusting for information about market participant assumptions that is reasonably available. In these situations, the entity will have to extrapolate the discount rate yield curve beyond the observable period, taking care to consider the reference in IFRS 17 to the fair value methodology included in IFRS 13.

9.3.3 'Bottom-up' or 'top-down' approach

IFRS 17 proposes two basic methods for determining discount rates for cash flows of insurance contracts that do not vary based on the returns on underlying items, as follows:

A 'bottom-up' approach

The 'bottom-up' approach determines discount rates by adjusting a liquid risk-free yield curve to reflect the differences between the liquidity characteristics of the financial instruments that underlie the rates observed in the market and the liquidity characteristics of the insurance contracts. [IFRS 17.B80].

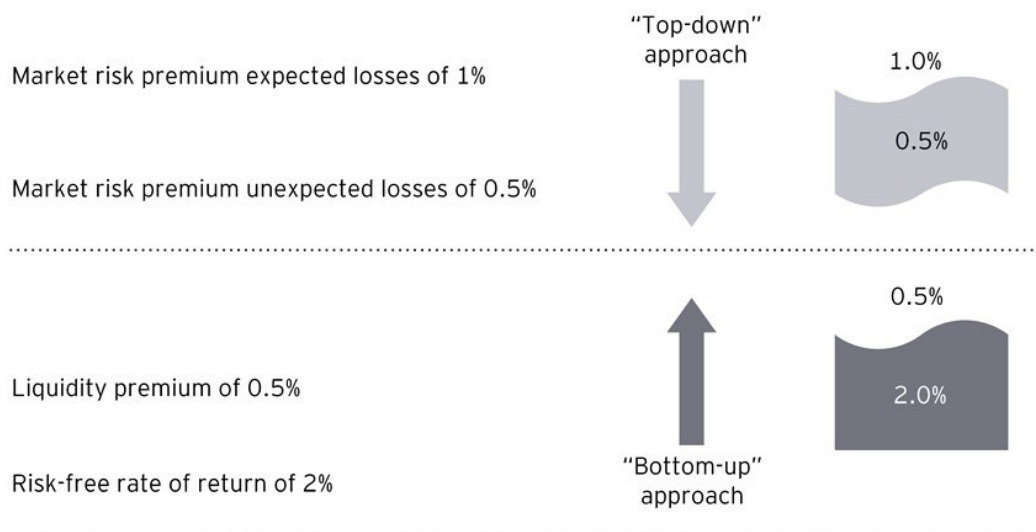

A 'top-down' approach

The 'top-down' approach determines the appropriate discount rates for insurance contracts based on a yield curve that reflects the current market rates of return implicit in a fair value measurement of a reference portfolio of assets. An entity must adjust that yield curve to eliminate any factors that are not relevant to the insurance contracts, but is not required to adjust the yield curve for differences in liquidity characteristics of the insurance contracts and the reference portfolio. [IFRS 17.B81].

In theory, when considering all required adjustments, both the 'top-down' and 'bottom-up' approaches should give the same result although in practice this is not necessarily the case.

An example of the approaches giving the same result is illustrated below, where the overall liability discount rate is 2.5% in each case. The example assumes that there are no differences between the liquidity characteristics of the liability and the reference portfolio of assets. The 'top down' approach starts with a current asset yielding 4% and this rate is reduced by 1.5% for expected and unexpected losses while the 'bottom up' approach starts with a risk-free rate of 2% which is increased by a liquidity premium of 0.5%.

Assume a current asset yield of a reference instrument of 4% composed of:

In estimating the yield curve on a 'top down' basis, an entity uses measurement bases consistent with IFRS 13, as follows: [IFRS 17.B82]

- If there are observable market prices in active markets for assets in the reference portfolio, an entity must use those prices
- If a market is not active, an entity must adjust observable market prices for similar assets to make them comparable to market prices for the assets being measured
- If there is no market for assets in the reference portfolio, an entity must apply an estimation technique. For such assets an entity must:
 - Develop unobservable inputs using the best information available in the circumstances. Such inputs might include the entity's own data and, in the context of IFRS 17, the entity might place more weight on long-term estimates than on short-term fluctuations
 - And
 - Adjust the data to reflect all information about market participant assumptions that is reasonably available

In adjusting the yield curve, an entity must adjust market rates observed in recent transactions in instruments with similar characteristics for movements in market factors since the transaction date, and must adjust observed market rates to reflect the degree of dissimilarity between the instrument being measured and the instrument for which transaction prices are observable. For cash flows of insurance contracts that do not vary based on the returns on the assets in the reference portfolio, such adjustments include: [IFRS 17.B83]

- Adjusting for differences between the amount, timing and uncertainty of the cash flows of the assets in the portfolio and the amount, timing and uncertainty of the cash flows of the insurance contracts
- And
- Excluding market risk premiums for credit risk, which are relevant only to the assets included in the reference portfolio

In principle, for cash flows of insurance contracts that do not vary based on the returns of the assets in the reference portfolio, there must be a single illiquid risk-free yield curve that eliminates all uncertainty about the amount and timing of cash flows. However, in practice, the top-down approach and the bottom-up approach may result in different yield curves, even in the same currency. This is because of the inherent limitations in estimating the adjustments made under each approach, and the possible lack of an adjustment for different liquidity characteristics in the top-down approach. An entity is not required to reconcile the discount rate determined under its chosen approach with the discount rate that would have been determined under the other approach. [IFRS 17.B84].

No restrictions are specified on the reference portfolio of assets used in the top-down approach. However, fewer adjustments would be required to eliminate factors that are not relevant to the insurance contracts when the reference portfolio of assets has similar characteristics. For example, if the cash flows from the insurance contracts do not vary based on the returns on underlying items, fewer adjustments would be required if an entity used debt instruments as a starting point rather than equity instruments. For debt instruments, the objective would be to eliminate from the total bond yield the effect of credit risk and other factors that are not relevant to the insurance contracts. One way to estimate the effect of credit risk is to use the market price of a credit derivative as a reference point. [IFRS 17.B85].

When the Board considered feedback from entities implementing IFRS 17 as part of the June 2020 amendments, it also considered feedback from users of financial statements that the principle-based requirements for determining discount rates could limit comparability between entities. The Board made no amendments to IFRS 17 in response to that feedback. In the Board's view, requiring an entity to determine discount rates using a rules-based approach would result in outcomes that are appropriate only in some circumstances. IFRS 17 requires entities to apply judgement when determining the inputs most applicable in the circumstances. To enable users of financial statements to understand the discount rates used, and to facilitate comparability between entities, IFRS 17 requires entities to disclose information about the methods used and judgements applied. [IFRS 17.BC205A, IFRS 17.BC205B].

Frequently asked questions

Question 9-14: When using a top-down approach to determine discount rates, should the reference portfolio of assets reflect the liquidity characteristics of the insurance contracts? If using an own portfolio of assets as the reference portfolio, should the effect of purchasing and selling assets during the reporting period be reflected in the discount rates used for insurance contracts?

(TRG meeting September 2018 - Agenda paper no. 02, Log S65, S72)

The TRG members discussed an IASB staff paper which responded to a submission that asked whether, in applying a top-down approach to determine the discount rates for insurance contracts with cash flows that do not vary based on the returns of underlying items:

- An entity could use the assets it holds as a reference portfolio of assets
- An entity could ignore the liquidity characteristics of insurance contracts
- Changes in the assets the entity holds could result in changes in the discount rates used to measure insurance contracts under specific circumstances

The TRG members agreed with the IASB staff analysis and conclusion in this paper that an entity can use the assets it holds as a reference portfolio when determining a top-down discount rate to measure its insurance liabilities. The TRG members observed that:

- IFRS 17 does not specify restrictions on the reference portfolio of assets used in applying a top-down approach to determine discount rates and also does not define 'a reference portfolio of assets'. Consequently, a portfolio of assets an entity holds can be used as a reference portfolio to determine the discount rates provided that the discount rates achieve the objectives of reflecting the characteristics of the insurance contracts and are consistent with observable current market prices.
- IFRS 17 requires that discount rates reflect, among other factors, the liquidity characteristics of the insurance contracts. However, when using the top-down approach, as a simplification, IFRS 17 permits an entity not to adjust the yield curve derived from a reference portfolio of assets for differences between the liquidity characteristics of the insurance contracts and those of the reference portfolio. The IASB expected a reference portfolio of assets typically to have liquidity characteristics that more closely match the liquidity characteristics of a group of insurance contracts than would be the case for highly-liquid, high-quality bonds.
- In determining the appropriate discount rates for cash flows that do not vary based on underlying items, an entity ensures that at each reporting date, those discount rates reflect the characteristics of the insurance contracts, even when the entity chooses to use a portfolio of assets that it holds to determine the discount rates.
- An entity needs to make adjustments to the yield curve of the reference portfolio of assets at each reporting date to eliminate any effect on discount rates of credit risk and differences in liquidity characteristics of the insurance contracts and the reference portfolio. However, if the entity uses the simplification and does not make any adjustments to the reference portfolio curve to reflect differences in liquidity characteristics between the reference portfolio and the insurance contracts, then fluctuations in the liquidity of the reference portfolio will be mirrored in changes in discount rates used to measure the group of insurance contracts.

- The TRG members also observed that, when an entity uses the simplification related to liquidity (i.e., the top-down approach discussed above), small changes in discount rates that result from changes in the composition of the reference portfolio could result in significant changes to the insurance contract liabilities measured using those rates, particularly with respect to long-term insurance contracts.

Both the IASB staff and the TRG members note that IFRS 17 contains disclosure requirements for qualitative and quantitative information about the significant judgements and changes in those judgements (see section 16.3 below) and consider that, if the effect of illiquidity were to be significant, entities would be expected to disclose such information in their financial statements.

Question 9-15: Would it be appropriate, if applying the top-down discount rate approach, to determine discount rates at initial recognition of each group using a target asset mix that the entity plans to invest in for that group as the reference portfolio of assets, and subsequently, using the actual asset mix covering all underwriting years as the reference portfolio of assets?

(TRG meeting April 2019 - Agenda paper no. 02, Log S91)

The IASB staff observed that identifying a reference portfolio that will enable an entity to meet the objectives required for setting a discount rate is dependent on specific facts and circumstances and providing specific application guidance is not within the remit of the TRG.

How we see it

In the bottom-up approach, entities will need to determine an appropriate method to adjust the observable market information in a way that reflects the difference in liquidity characteristics of the insurance contracts compared to those of the observable instrument. The liquidity characteristics will depend on the specific nature of a contract. For example, annuities in payment are generally viewed as very illiquid as they cannot be surrendered and only expire on the annuitant's death. Different methods to estimate an illiquidity premium may be available in practice.

9.4 Risk adjustment for non-financial risk

The third element of measuring fulfilment cash flows in the general model (see section 9 above) is a risk adjustment for non-financial risk.

The risk adjustment for non-financial risk is the compensation that the entity requires for bearing the uncertainty about the amount and timing of cash flows that arise from non-financial risk. [IFRS 17.37]. Non-financial risk is risk arising from insurance contracts other than financial risk, which is included in the estimates of future cash flows or the discount rate used to adjust the cash flows. The risks covered by the risk adjustment for non-financial risk are insurance risk and other non-financial risks such as lapse risk and expense risk. [IFRS 17.B86].

In theory, the risk adjustment for non-financial risk for insurance contracts measures the compensation that the entity would require to make it indifferent between: [IFRS 17.B87]

- Fulfilling a liability that has a range of possible outcomes arising from non-financial risk
- And
- Fulfilling a liability that will generate fixed cash flows with the same expected present value as the insurance contracts

In developing the objective of the risk adjustment for non-financial risk, the Board concluded that a risk adjustment for non-financial risk must not represent: [IFRS 17.BC209]

- The compensation that a market participant would require for bearing the non-financial risk that is associated with the contract. This is because the measurement model is not intended to measure the current exit value or fair value, which reflects the transfer of the liability to a market participant. Consequently, the risk adjustment for non-financial risk must be determined as the amount of compensation that the entity, not a market participant, would require.
- An amount that would provide a high degree of certainty that the entity would be able to fulfil the contract. Although such an amount might be appropriate for some regulatory purposes, it is not compatible with the Board's objective of providing information that will help users of financial statements make decisions about providing resources to the entity.

The risk adjustment for non-financial risk reflects the entity's perception of the economic burden of its non-financial risks; it is not a current exit value or fair value, which reflects the transfer to a market participant. [IFRS 17.BC209]. Therefore, the risk adjustment for non-financial risk reflects the compensation the entity would require for bearing the non-financial risk arising from the uncertain amount and timing of the cash flows, the risk adjustment for non-financial risk also reflects: [IFRS 17.B88]

- The degree of diversification benefit the entity includes when determining the compensation it requires for bearing that risk
- Both favourable and unfavourable outcomes, in a way that reflects the entity's degree of risk aversion

The purpose of the risk adjustment for non-financial risk is to measure the effect of uncertainty in the cash flows that arise from insurance contracts, other than uncertainty arising from financial risk. Consequently, the risk adjustment for non-financial risk must reflect all non-financial risks associated with the insurance contracts. It must not reflect the risks that do not arise from the insurance contracts, such as general operational risk. [IFRS 17.B89].

The risk adjustment for non-financial risk must be included in the measurement in an explicit way. The risk adjustment for non-financial risk is conceptually separate from the estimates of future cash flows and the discount rates that adjust those cash flows. The entity must not double-count the risk adjustment for non-financial risk by, for example, also including the risk adjustment for non-financial risk implicitly when determining the estimates of future cash flows or the discount rates. The yield curve (or range of yield curves) used to discount cash flows that do not vary based on the returns on underlying items which are required to be disclosed (see section 16.3 below) must not include any implicit adjustments for non-financial risk. [IFRS 17.B90].

Frequently asked questions

Question 9-16: Does the risk adjustment for non-financial risk take into account uncertainty related to how management will apply discretion?

(TRG meeting April 2019 - Agenda paper no. 02, Log S110)

The IASB staff observed that the risk adjustment for non-financial risk does not reflect risks that do not arise from insurance contracts such as general operational risk. Paragraphs B98 and B99 of IFRS 17 distinguish between a change in the discretionary cash flows, that is regarded as relating to future service, and changes in assumptions that relate to financial risk on an entity's commitment. Therefore, uncertainty related to how management applies discretion for a group of insurance contracts, if not considered a general operational risk, should be captured in the risk adjustment for non-financial risk (e.g., to the extent management discretion reduces the amount it would charge for uncertainty, the discretion would reduce the risk adjustment for non-financial risk). The risk adjustment for non-financial risk should reflect both favourable and unfavourable outcomes in a way that reflects the entity's degree of risk aversion.

Illustration 9-5: Risk adjustment for non-financial risk

Compensation an entity requires to be indifferent between fixed and variable outcomes

The risk adjustment for non-financial risk would measure the compensation the entity would require to make it indifferent between fulfilling a liability that, because of non-financial risk, has a 50% probability of being CU90 and a 50% probability of being CU110, and fulfilling a liability that is fixed at CU100. As a result, the risk adjustment for non-financial risk conveys information to users of financial statements about the amount charged by the entity for the uncertainty arising from non-financial risk about the amount and timing of cash flows. [IFRS 17.B87].

9.4.1 Techniques used to estimate the risk adjustment for non-financial risk

IFRS 17 does not specify the estimation technique(s) used to determine the risk adjustment for non-financial risk. This is because the Board decided that a principle-based approach, rather than identifying specific techniques, would be consistent with its approach on how to determine a similar risk adjustment for non-financial risk in IFRS 13. Furthermore, the Board concluded that limiting the number of risk-adjustment techniques would conflict with its desire to set principles-based IFRS accounting standards and, given that the objective of the risk adjustment is to reflect an entity-specific perception of non-financial risk, specifying a level of aggregation that was inconsistent with the entity's view would also conflict with that requirement. [IFRS 17.BC213].

Therefore, the risk adjustment under IFRS 17 must be determined based on the principle of the compensation that the entity requires for bearing the uncertainty arising from non-financial risk inherent in the cash flows that arise as the entity fulfils the group of insurance contracts. According to this principle, the risk adjustment for non-financial risk reflects any diversification benefit the entity considers when determining the amount of compensation that it requires for bearing that uncertainty. [IFRS 17.BC214].

IFRS 17 states that risk adjustment for non-financial risk has the following characteristics: [IFRS 17.B91]

- Risks with low frequency and high severity will result in higher risk adjustments for non-financial risk than risks with high frequency and low severity
- For similar risks, contracts with a longer duration will result in higher risk adjustments for non-financial risk than contracts with a shorter duration
- Risks with a wider probability distribution will result in higher risk adjustments for non-financial risk than risks with a narrower distribution
- The less that is known about the current estimate and its trend, the higher the risk adjustment will be for non-financial risk
- To the extent that emerging experience reduces uncertainty about the amount and timing of cash flows, risk adjustments for non-financial risk will decrease and *vice versa*

Extract from IFRS 17

B92 An entity shall apply judgement when determining an appropriate estimation technique for the risk adjustment for non-financial risk. When applying that judgement, an entity shall also consider whether the technique provides concise and informative disclosure so that users of financial statements can benchmark the entity's performance against the performance of other entities. Paragraph 119 requires an entity that uses a technique other than the confidence level technique for determining the risk adjustment for non-financial risk to disclose the technique used and the confidence level corresponding to the results of that technique.

[IFRS 17.B92].

It is likely that some entities will want to apply a cost of capital approach technique to estimate the risk adjustment for non-financial risk because this will be the basis of local regulatory capital requirements. It is observed in the Basis for Conclusions that although the usefulness of a confidence level technique diminishes when the probability distribution is not statistically normal, as is often the case for insurance contracts, the cost of capital approach would be more complicated to calculate than a confidence level disclosure. However, the Board expects that many entities will have the information necessary to apply the cost of capital technique. [IFRS 17.BC217]. This implies that the Board is anticipating that some, or perhaps many, entities will use a cost of capital technique to measure the risk adjustment for non-financial risk.

When the Board considered feedback from entities implementing IFRS 17, it also considered feedback from users of financial statements that the principles-based requirements for determining the risk adjustment for non-financial risk could limit comparability between entities. The Board made no amendments to IFRS 17 in response to that feedback, for the same reason it made no amendments in response to similar feedback on discount rates (see section 9.3 above). [IFRS 17.BC214A].

How we see it

IFRS 17 does not prescribe particular techniques for estimating the risk adjustment of a group of contracts. The standard incorporates guidance with the aim of aiding entities in selecting an appropriate method. Selecting an appropriate technique will be a matter of judgement. In making this judgement, the entity should consider the specific risk characteristics of the group of insurance contracts under consideration.

Changes in the risk adjustment will reflect several factors, for example: release from risk as time passes, changes in an entity's risk appetite (the amount of compensation it requires for bearing uncertainty), changes in expected variability in future cash flows, and diversification between risks. Entities will need to distinguish between changes in the risk adjustment relating to current and past service (reflected immediately in profit or loss) and those relating to future service (which adjust the contractual service margin - see section 9.5 below).

Different entities may determine different risk adjustments for similar groups of insurance contracts because the risk adjustment for non-financial risk is an entity specific perception, rather than a market participant's perception, based on the compensation that a particular entity requires for bearing the uncertainty about the amount and timing of the cash flows that arise from non-financial risks.

Accordingly, to allow users of financial statements to understand how entity-specific assessments of risk aversion might differ from entity to entity, disclosure is required of the confidence level used to determine the risk adjustment for non-financial risk or, if a technique other than confidence level is used, the technique used and the confidence level corresponding to the technique (see section 16.3 below).

Frequently asked questions

Question 9-17: Which level is the risk adjustment for non-financial risk required to be determined: in (a) the individual financial statements of entities that are part of a consolidated group (i.e., parent and subsidiary entities that issue insurance contracts), and (b) the consolidated financial statements of the group of entities?

(TRG meeting May 2018 - Agenda paper no. 02, Log S46)

IFRS 17 does not specify the level within an insurance group at which to determine the risk adjustment for non-financial risk. Therefore, the question arises as to whether, in the individual financial statements of a subsidiary, the risk adjustment for non-financial risk should reflect the degree of risk diversification available to the entity or to the consolidated group as a whole and whether, in the consolidated financial statements of a group of entities, the risk adjustment for non-financial risk issued by entities in the group should reflect the degree of risk diversification available only to the consolidated group as a whole. This issue was discussed by the TRG and the results of the discussion were as follows:

- In respect of individual financial statements, the degree of risk diversification that occurs at a level higher than the issuing entity level is required to be considered if, and only if, it is considered when determining the compensation the issuing entity would require for bearing non-financial risk related to the insurance contracts it issues. Equally, risk diversification that occurs at a level higher than the issuing entity level must not be considered when determining the risk adjustment for non-financial risk if it is not considered when determining the compensation the issuing entity would require for bearing non-financial risk related to the insurance contracts it issues.
- In respect of consolidated financial statements, the IASB staff opinion is that the risk adjustment for non-financial risk should be the same as the risk adjustment for non-financial risk at the individual entity level because determining the compensation that the entity would require for bearing non-financial risk related to insurance contracts issued by the entity is a single decision that is made by the entity that is party to the contract (i.e., the issuer of the insurance contract). However, differing views were expressed by TRG members. Some TRG members agreed with the IASB staff but other TRG members read the requirements as requiring different measurement of the risk adjustment for non-financial risk for a group of insurance contracts at different reporting levels if the issuing entity would require different compensation for bearing non-financial risk than the consolidated group would require. The TRG members also observed that, in some cases, the compensation an entity requires for bearing non-financial risk could be evidenced by capital allocation in a group of entities.

Subsequently, the Board considered whether it should clarify its intention in respect of determining the risk adjustment for non-financial risk in the consolidated financial statements of a group of entities in response to those different views. The Board concluded that doing so would address only some differences that could arise in the application of the requirements for determining the risk adjustment for non-financial risk, given the high degree of judgement required to apply those requirements. The Board concluded that practice needs to develop in this area. If necessary, the Board will seek to understand how the requirements are being applied as part of the Post-implementation Review of IFRS 17.

[IFRS 17.BC214C].

Question 9-18: For insurance contracts issued by an industry pool, should the risk adjustment for non-financial risk be determined at the association (pool) level or at the individual member entity level and could the risk adjustment for non-financial risk be measured differently in the financial statements of the members when compared to the financial statements of the pool?

(TRG meeting September 2018 - Agenda paper no. 09, Log S52)

In the fact pattern an association manages two industry pools:

- Pool 1 - in which some members are appointed to issue contracts on behalf of all members
- Pool 2 - to which members can choose to transfer some insurance contracts they have issued

The IASB staff considered that there should be only one risk adjustment for each insurance contract and that the risk adjustment is either at an individual member level or at an association level, depending on who has issued the contract. Consistent with the discussion in Question 9-17 above, some TRG members disagreed with the IASB staff's view that there is one single risk adjustment for a group of insurance contracts that reflects the degree of diversification that the issuer of the contract considers in determining the compensation required for bearing non-financial risk. Those TRG members expressed the view that each entity would consider the compensation it would require for non-financial risk, rather than the compensation required by the association. This would mean that the risk adjustment would not necessarily be determined by the entity that issued the contract (e.g., the pool or individual member of the association that priced the risk). As noted above, the IASB did not amend or clarify IFRS 17 on this matter.

Question 9-19: Should the effect of reinsurance held be considered in calculating the risk adjustment for non-financial risk for contracts that have been reinsured?

(TRG meeting April 2019 - Agenda paper no. 02, Log S118)

The IASB staff observed that the risk adjustment for non-financial risk reflects the degree of diversification benefit the entity includes when determining the compensation it requires for bearing that risk. Therefore, if an entity considers reinsurance when determining the compensation it requires for bearing non-financial risk related to underlying insurance contracts, the effect of reinsurance (both cost and benefit) would be reflected in the risk adjustment for non-financial risk of the underlying insurance contracts.

The IASB staff further observed that IFRS 17 requires that the risk adjustment for non-financial risk for reinsurance contracts held represents the amount of risk being transferred by the holder of the group of reinsurance contracts to the issuer of those contracts. Therefore, the risk adjustment for non-financial risk of the reinsurance contract held could not be nil, unless:

- The entity considers reinsurance when determining the compensation it requires for bearing non-financial risk related to underlying insurance contracts
- And
- The cost of acquiring the reinsurance is equal or less than the expected recoveries

The TRG members agreed with the IASB staff observations that if an entity considers reinsurance when determining the compensation it requires for non-financial risk, the effect of the reinsurance would be included in the risk adjustment and that the measurement of the risk adjustment for non-financial risk of a reinsurance contract held is the amount of risk transferred to the reinsurer.

How we see it

The risk adjustment reflects diversification benefits the entity considers when determining the amount of compensation it requires for bearing that uncertainty. This approach implies that diversification benefits could reflect effects across groups of contracts, or diversification benefits at an even higher level of aggregation. However, when determining the risk adjustment at a level more aggregated than a group of contracts, an entity must establish an appropriate method for allocating the risk adjustment to the underlying groups. This will form part of the requirements for systems and processes that an entity will need to develop when implementing the standard.

In addition, since IFRS 17 does not specify the level of aggregation at which to determine the risk adjustment for non-financial risk, the question arises as to whether the risk adjustment for non-financial risk could be negative for a group of insurance contracts. This situation could, in theory, arise where a diversification benefit is allocated between two or more groups of insurance contracts and the additional diversification risk for one group may be negative as the insurer would accept a lower price for taking on these liabilities given that it reduces the risk for the entity in total. IFRS 17 is silent as to whether a risk adjustment could be negative. However, a negative risk adjustment would normally be inappropriate as it would not reflect the purpose of the risk adjustment for non-financial risk which is to measure the effect of uncertainty in the cash flows (see section 9.4 above). So, for example, a risk adjustment should not reduce fulfilment cash flows below the best estimate of the expected future cash flows.

9.4.2 Presentation of the risk adjustment for non-financial risk in the statement of comprehensive income

The change in risk adjustment for non-financial risk is not required to be disaggregated between the insurance service result and the insurance finance income or expenses. When an entity decides not to disaggregate the change in the risk adjustment for non-financial risk, the entire change must be included as part of the insurance service result. Changes in the risk adjustment for non-financial risk that relate to future service adjust the contractual service margin. [IFRS 17.81, IFRS 17.B96(d), IFRS 17.B97(a)(ii)].

When the risk adjustment for non-financial risk is disaggregated between profit or loss and other comprehensive income, the method of disaggregation is determined by the disaggregation policy applied to that portfolio (see section 15.3.1 below). If disaggregation is applied, any adjustments to the contractual service margin are determined using the rate at initial recognition.

9.5 Contractual service margin

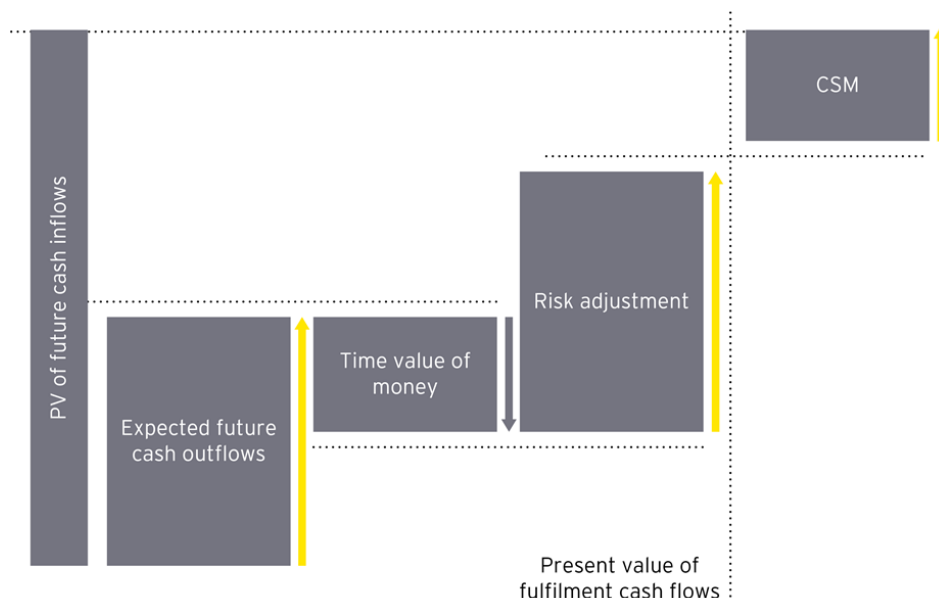

The fourth element of the building blocks in the general model (see section 9 above) is the contractual service margin. The contractual service margin is a new concept to IFRS accounting standards, introduced in IFRS 17 to identify the expected profitability of a group of contracts and recognise this profitability over time in an explicit manner, based on the pattern of services provided under the contract.

The contractual service margin is a component of the asset or liability for the group of insurance contracts that represents the unearned profit the entity will recognise as it provides insurance contract services in the future. Hence, the contractual service margin would usually be calculated at the level of a group of insurance contracts rather than at an individual insurance contract level.

9.5.1 Initial recognition

An entity must measure the contractual service margin on initial recognition of a group of insurance contracts at an amount that, unless the group of contracts is onerous (see section 9.8 below) or where there is insurance revenue and expenses recognised from the derecognition of an asset for other cash flows (see section 15.2.1.A below), results in no income or expenses arising from: [IFRS 17.38]

- Initial recognition of an amount for the fulfilment cash flows (see section 9.2 above)
- Any cash flows arising from the contracts in the group at that date
- The derecognition at the date of initial recognition of:
 - Any asset recognised for insurance acquisition cash flows (see section 7.3 above)
 - And
 - Any other asset or liability previously recognised for cash flows related to the group of contracts

The approach above on initial recognition applies to contracts with and without participation features, including investment contracts with discretionary participation features. A contractual margin is not specifically identified for contracts subject to the premium allocation approach although the same principle of profit recognition applies (i.e., no day 1 gain and recognition over the coverage period as insurance contract services are provided) (see section 10 below).

For groups of reinsurance contracts held, the calculation of the contractual service margin at initial recognition is modified to take into account the fact such groups are usually assets rather than liabilities and that a margin payable to the reinsurer, rather than making profits, is an implicit part of the premium (see section 11 below).

For insurance contracts acquired in a transfer of insurance contracts or in a business combination within the scope of IFRS 3, an entity must apply the above in accordance with the requirements for acquisitions of insurance contracts. [IFRS 17.39]. The contractual service margin at initial recognition is calculated as the difference between the consideration and the fulfilment cash flows at the date of the acquisition (see section 14 below).

Before the recognition of a group of insurance contracts, an entity might be required to recognise an asset or liability for cash flows related to the group of insurance contracts other than insurance acquisition cash flows either because of the occurrence of the cash flows or because of the requirements of another IFRS accounting standard. Cash flows are related to the group of insurance contracts if those cash flows would have been included in the fulfilment cash flows at the date of initial recognition of the group had they been paid or received after that date. To apply the requirement in the last bullet point above, an entity must derecognise such an asset or liability to the extent that the asset or liability would not be recognised separately from the group of insurance contracts if the cash flow or the application of the IFRS accounting standard occurred at the date of initial recognition of the group of insurance contracts. [IFRS 17.B66A]. For example, an entity that recognised a liability for premiums received in advance of the recognition of a group of insurance contracts would derecognise that liability when the entity recognises a group of insurance contracts to the extent the premiums relate to the contracts in the group. The performance obligation that was depicted by the liability would not be recognised separately from the group of insurance contracts had the premium been received on the date of initial recognition of the group. No insurance revenue arises on the derecognition of the liability.

How we see it

As a result of the measurement requirements, the contractual service margin on initial recognition is the balancing number needed to avoid a day 1 profit. The contractual service margin cannot depict unearned losses. Instead, IFRS 17 requires an entity to recognise a loss in profit or loss for onerous groups of contracts (see section 9.8 below).

Contracts accounted for under IFRS 17 will be the only type of contracts under IFRS accounting standards that will explicitly disclose the expected remaining profitability. The notion of the contractual service margin is a unique feature of the standard. The way users will evaluate and appreciate the contractual service margin is expected to be a key aspect of the decision-usefulness of the IFRS 17 accounting model.

9.6 Subsequent measurement

The carrying amount of a group of insurance contracts at the end of each reporting period must be the sum of: [IFRS 17.40]

- The liability for remaining coverage comprising:
 - The fulfilment cash flows related to future service allocated to the group at that date, measured applying the requirements discussed in section 9.2 above - see section 9.6.1 below
 - The contractual service margin of the group at that date, measured applying the requirements discussed in section 9.6.3 below
- The liability for incurred claims, comprising the fulfilment cash flows related to past service allocated to the group at that date, measured applying the requirements discussed in section 9.2 above - see section 9.6.2 below

Hence, after initial recognition, the fulfilment cash flows comprise two components:

- Those relating to future service (the liability for remaining coverage)
- Those relating to past service (the liability for incurred claims)

Frequently asked questions

Question 9-20: Should an entity's obligation to pay amounts subject to insurance risk after an incurred claim be treated as a liability for remaining coverage or a liability for incurred claims?

(TRG meeting September 2018 - Agenda paper no. 01, Log S63)

In some circumstances an incurred claim can create insurance risk for an entity that would not exist if no claim was made. Two examples cited of this situation are:

- Insurance coverage for disability that provides an annuity for the period when a policyholder is disabled
- Insurance coverage for fire that provides compensation for the cost of rebuilding a house after a fire

The question, therefore, arises whether the entity's obligation to pay these amounts, that are subject to insurance risk, should be treated as a liability for incurred claims or a liability for remaining coverage.

One view is that the insured event is the uncertain event that the policyholder becomes disabled or the uncertain occurrence of a fire. Consequently, the liability for incurred claims is the entity's obligation to pay for a policyholder's claim on becoming disabled or for a fire. The amount of the claim (i.e., the total payments under the annuity or the cost of rebuilding the house) is uncertain but such features are clearly envisaged under IFRS 17 by the inclusion of a risk adjustment for non-financial risk in the liability for incurred claims. In contrast, the liability for remaining coverage is the entity's obligation to pay valid claims relating to accident/illness that have not yet occurred causing disability or the entity's obligation to pay claims relating to fire events that have not yet occurred.

The alternative view is that the insured events are the uncertain event of the policyholder becoming disabled following an accident/illness in the period and the uncertain event of the policyholder remaining disabled and eligible to claim or the uncertain event of a claim for the uncertain amount of the cost of rebuilding a house damaged by fire. Consequently, the liability for incurred claims is the entity's obligation to settle a claim already made by a policyholder for the period of disability or to pay for a policyholder's cost of rebuilding the house. The amount to settle the claims as they are made is relatively certain and not subject to insurance risk (and in the case of annuities expected to be small assuming annuities are paid monthly). In contrast, the liability for remaining coverage is the entity's obligation to pay claims for future periods of disability both for policyholders that are already disabled or those yet to become disabled or to pay claims relating to fires that have not yet occurred and to pay claims for the cost of building a house for buildings already damaged by fire events. This treatment would be consistent with the treatment of such contracts acquired after the policyholder becomes disabled or after a fire event (i.e., cover for events that have already occurred but which financial effect is still uncertain).

The TRG members discussed an IASB staff paper which argued that both approaches represent valid interpretations of IFRS 17 and are a matter of judgement for the entity as to which interpretation provides the most useful information about the service provided to the policyholder.

The TRG members observed that:

- The classification of an obligation as a liability for incurred claims or a liability for remaining coverage does not affect the determination of fulfilment cash flows. However, the classification does affect the determination of the coverage period. Consequently, the classification affects whether some changes in fulfilment cash flows adjust the contractual service margin, as well as the allocation of the contractual service margin.
- The definitions in IFRS 17 allow an entity to use judgement when determining whether the obligation to pay an annuity after a disability event and the obligation to pay the costs of rebuilding a house after a fire event are part of the liability for remaining coverage or liability for incurred claims.
- It is a matter of judgement for an entity to develop an accounting policy that reflects the insurance service provided by the entity to the policyholder under the contract in accordance with IFRS 17. The requirements of IAS 8 apply and hence the entity should apply an approach consistently for similar transactions and over time.
- Whatever approach an entity applies, IFRS 17 requires disclosure of significant judgements made in applying the standard and requires disclosures relating to the contractual service margin, which will enable users to understand the effects of the approach required.
- These observations are also relevant when law or regulation impose a requirement for an entity to settle a claim by life-contingent annuity.

Although leaving the decision open to the entity allows preparers to determine which approach provides more useful information given the facts and circumstances around their products, the accounting policy choice may result in identical contracts being accounted for differently in the financial statements of different insurers.

How we see it

It is likely that life insurers would often prefer to elect that the liability for remaining coverage is the entity's obligation to pay claims for future periods of disability both for policyholders that are already disabled or those yet to become disabled consistent with the long-term nature of many of their contracts. In contrast, it is likely that non-life insurers would often prefer to elect that the liability for remaining coverage is the entity's obligation to pay claims relating to events that have not yet occurred as this is similar to most existing non-life practices under IFRS 4. This will have important consequences for property and casualty insurers when they acquire contracts that have liabilities in their settlement period.

9.6.1 The liability for remaining coverage

The liability for remaining coverage is defined by IFRS 17 as follows: [IFRS 17 Appendix A]

Extract from IFRS 17

Appendix A

Defined terms

liability for remaining coverage	An entity's obligation to:
	(a) investigate and pay valid claims under existing insurance contracts for insured events that have not yet occurred (ie the obligation that relates to the unexpired portion of the insurance coverage); and
	(b) pay amounts under existing insurance contracts that are not included in (a) and that relate to:
	(i) insurance contract services not yet provided (ie the obligations that relate to future provision of insurance contract services); or
	(ii) any investment components or other amounts that are not related to the provision of insurance contract services and that have not been transferred to the liability for incurred claims .

At initial recognition, the liability for remaining coverage includes all remaining cash inflows and outflows under an insurance contract. Subsequently, at each reporting date, the liability for remaining coverage, excluding the contractual service margin, is re-measured using the fulfilment cash flow requirements discussed in section 9.2 above. That is, it comprises the present value of the best estimate of the cash flows required to settle the obligation together with an adjustment for non-financial risk. The fulfilment cash flows for the liability for remaining coverage for contracts without direct participation features are discounted at the date of initial recognition of the group (under both the general model and the premium allocation approach where applicable) (see section 9.3 above).

An entity must recognise income and expenses for the following changes in the carrying amount of the liability for remaining coverage: [IFRS 17.41]

- Insurance revenue - for the reduction in the liability for remaining coverage because of services provided in the period (see section 15.2.1 below for measurement)
- Insurance service expenses - for losses on groups of onerous contracts, and reversals of such losses (see section 9.8 below)
- Insurance finance income or expenses - for the effect of the time value of money and the effect of financial risk (see section 15.3 below)

How we see it

Usually, the fulfilment cash flows should reduce over the contract period as the insurance contract services still to be provided decline. When future insurance contract services can no longer occur, then the fulfilment cash flows of the liability for remaining coverage should be nil. An exception to this may occur where premiums for past service remain outstanding at a reporting date. In this case, even though all insurance contract services have been provided, the liability for remaining coverage could still contain an amount for the premiums receivable.

9.6.2 The liability for incurred claims

The liability for incurred claims is defined by IFRS 17 as follows: [IFRS 17 Appendix A]

Extract from IFRS 17

Appendix A

Defined terms

liability for incurred claims	An entity's obligation to:
	(a) investigate and pay valid claims for insured events that have already occurred, including events that have occurred but for which claims have not been reported, and other incurred insurance expenses; and
	(b) pay amounts that are not included in (a) and that relate to:
	(i) insurance contract services that have already been provided; or
	(ii) any investment components or other amounts that are not related to the provision of insurance contract services and that are not in the liability for remaining coverage .

At initial recognition of a group of contracts, the liability for incurred claims is usually nil as no insured events covered under the contracts have occurred. Subsequently, at each reporting date, the liability for incurred claims is measured using the fulfilment cash flow requirements discussed in sections 9.2 and 9.4 above. That is, it comprises the present value of the expected cash flows required to settle the obligation together with an adjustment for non-financial risk. This includes future cash flows relating to past events allocated to the group of contracts (including expenses) as discussed in section 9.2.3 above.

The liability for incurred claims under the general model, including claims arising from contracts with direct participation features, is discounted at a current rate (i.e., the rate applying as at the reporting date). The liability for incurred claims under the premium allocation approach need not be discounted if certain conditions are met (see section 10.5 below). Otherwise, the liability for incurred claims under the premium allocation approach is also discounted at a current rate.

There is no direct relationship between the liability for incurred claims and the liability for remaining coverage. That is, the creation of a liability for incurred claims (or a reduction in the value of incurred claims) does not necessarily result in an equal and opposite reduction to the liability for remaining coverage. There is no contractual service margin attributable to the liability for incurred claims as the contractual service margin relates to remaining (i.e., future) service provided over the coverage period and incurred claims relate to past service.

Consequently, the establishment of a liability for incurred claims should give rise to the following accounting entry:

	CU	CU
Dr Insurance service expense - profit or loss	X	
Cr Liability for incurred claims		X

Subsequent to initial recognition, an entity must recognise income and expenses for the following changes in the carrying amount of the liability for incurred claims: [IFRS 17.42]

- Insurance service expenses - for the increase in the liability because of claims and expenses incurred in the period, excluding any investment components (see section 15.2.2 below)
- Insurance service expenses - for any subsequent changes in fulfilment cash flows relating to incurred claims and incurred expenses (see section 15.2.2 below)
- Insurance finance income or expenses - for the effect of the time value of money and the effect of financial risk (see section 15.3 below)

Disclosure of the liability for incurred claims is required showing the development of actual claims compared with previous estimates of the liability for incurred claims, except for those claims for which uncertainty about the amount and timing of payments is typically resolved within one year (see section 16.5.3 below).

How we see it

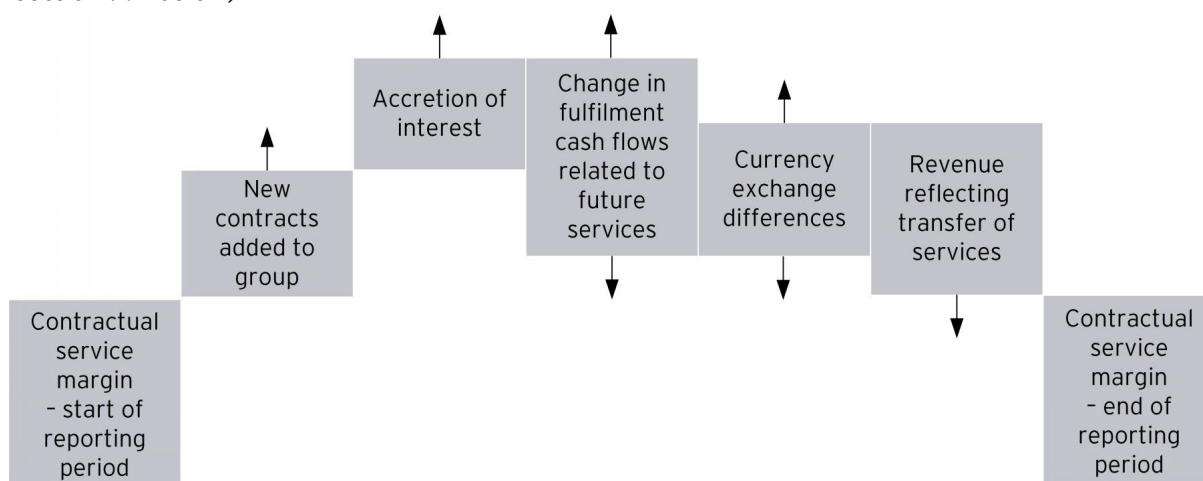

IFRS 17 does not distinguish between or require separate disclosure of the components of the liability for incurred claims which represent claims notified to the insurer (sometimes described as 'outstanding claims') and claims incurred but not reported (sometimes described as 'IBNR claims'). IFRS 17 also does not distinguish between, or require, separate disclosure of those components of the liability for incurred claims that represent the entity's liability for expected payments to the policyholder and those that represent an allocation of expenses, for example, claims handling costs.

9.6.3 Subsequent measurement of the contractual service margin (for insurance contracts without direct participation features)

The contractual service margin at the end of the reporting period represents the profit in the group of insurance contracts that has not yet been recognised in profit or loss because it relates to the future service to be provided under the contracts in the group. [IFRS 17.43].

At the end of each reporting period, the carrying amount of the contractual service margin of a group of insurance contracts without direct participation features comprises the carrying amount at the start of the reporting period adjusted for: [IFRS 17.44]

- The effect of any new contracts added to the group (see section 7 above)
- Interest accreted on the carrying amount of the contractual service margin during the reporting period, measured at the discount rates at initial recognition (see section 9.3 above)
- The changes in fulfilment cash flows relating to future service (see below), except to the extent that:
 - Such increases in the fulfilment cash flows exceed the carrying amount of the contractual service margin, giving rise to a loss (see section 9.8 below)
 - Or
 - Such decreases in the fulfilment cash flows are allocated to the loss component of the liability for remaining coverage (see section 9.8 below)
- The effect of any currency exchange differences (see section 8.3 above) on the contractual service margin
- The amount recognised as insurance revenue because of the transfer of insurance contract services in the period, determined by the allocation of the contractual service margin remaining at the end of the reporting period (before any allocation) over the current and remaining coverage period (see section 9.7 below)

IFRS 17 does not specify the order in which the calculations above need to be performed. This means that the choice as to which order to perform calculations can have an impact on the statement of comprehensive income, for example, there will be more interest accretion if an entity performs interest accretion after adding new contracts rather than before. However, IFRS 17.44(e) states that the amount recognised as insurance revenue because of the transfer of insurance services in the period is determined by the allocation of the contractual margin remaining at the end of the period. The use of the word 'end' implies that this should be the last step.

The changes in fulfilment cash flows that relate to future events which adjust the contractual service margin for a group of insurance contracts without direct participation features are, as follows: [IFRS 17.B96]

- Experience adjustments arising from premiums received in the period that relate to future service, and related cash flows such as insurance acquisition cash flows and premium-based taxes, measured at the discount rates applying at the date of initial recognition.
- Changes in estimates of the present value of the future cash flows in the liability for remaining coverage (except those changes described in IFRS 17.B97(a), discussed below) measured at the discount rates applying at the date of initial recognition.
- Differences between any investment component expected to become payable in the period and the actual investment component or loan to a policyholder that becomes payable in the period. Those differences are determined by comparing (i) the actual investment component that becomes payable in the period with (ii) the payment in the period that was expected at the start of the period plus any insurance finance income or expenses related to that expected payment before it becomes payable. Hence, the contractual service margin is not adjusted for insurance finance income or expenses that depict the effect on the investment component of the time value of money and financial risk between the beginning of the period and the unexpected payment or non-payment of the investment component. [IFRS 17.BC235fn28].
- Differences between any loan to a policyholder expected to become repayable in the period and the actual loan to a policyholder that becomes repayable in the period. Those differences are determined by comparing (i) the actual loan to a policyholder that becomes repayable in a period with (ii) the repayment in the period that was expected at the start of the period plus any insurance finance income or expenses related to that expected repayment before it becomes repayable.
- Changes in the risk adjustment for non-financial risk that relate to future service. An entity is not required to disaggregate the change in the risk adjustment for non-financial risk between (i) a change related to non-financial risk and (ii) the effect of the time value of money and changes in the time value of money (see section 9.4.2 above). If an entity does make such a disaggregation, it must adjust the contractual service margin for the change related to non-financial risk, measured at the discount rates applying at the date of initial recognition. This means that in case of disaggregation the contractual service margin is not adjusted for changes in the risk adjustment for non-financial risk that result from the effect of the time value of money and changes in the time value of money. [IFRS 17.BC224fn27].

In respect of investment components, the Board did not regard as useful information, for example, the recognition of a gain for a delay in repaying an investment component accompanied by a loss that adjusts the contractual service margin for the expected later repayment. Acceleration or delay in repayments of investment components only gives rise to a gain or loss for the entity to the extent that the amount of the repayment is affected by its timing. As IFRS 17 does not require an entity to determine the amount of an investment component until a claim is incurred, accordingly, when a claim is incurred, IFRS 17 requires an entity to determine how much of that claim is an investment component, and whether it was expected to become payable in that period. IFRS 17 requires any unexpected repayment of an investment component to adjust the contractual service margin. The contractual service margin will also be adjusted for changes in future estimates of cash flows which will include (but not separately identify) the reduction in future repayments of investment components. This achieves the desired result of the net effect on the contractual service margin being the effect of the change in timing of the repayment of the investment component. [IFRS 17.BC235].

The contractual service margin for contracts without direct participation features must not be adjusted for the following changes in fulfilment cash flows because they do not relate to future service: [IFRS 17.B97]

- The effect of the time value of money and changes in the time value of money, and the effect of financial risk and changes in financial risk. These effects comprise:
 - The effect, if any, on estimated future cash flows
 - The effect, if disaggregated, on the risk adjustment for non-financial risk
 - The effect of a change in discount rate
- Changes in estimates of fulfilment cash flows in the liability for incurred claims
- Experience adjustments, except those described above that relate to future service

IFRS 17 observes that some changes in the contractual service margin offset changes in the fulfilment cash flows for the liability for remaining coverage, resulting in no change in the total carrying amount of the liability for remaining coverage. To the extent that changes in the contractual service margin do not offset changes in the fulfilment cash flows for the liability for remaining coverage, an entity must recognise income and expenses for the changes, applying the requirements in section 9.6.1 above. [IFRS 17.46].

The terms of some insurance contracts without direct participation features give an entity discretion over the cash flows to be paid to policyholders. A change in the discretionary cash flows is regarded as relating to future service, and accordingly adjusts the contractual service margin. To determine how to identify a change in discretionary cash flows, an entity must specify at inception of the contract the basis on which it expects to determine its commitment under the contract; for example, based on a fixed interest rate, or on returns that vary based on specified asset returns. [IFRS 17.B98].

An entity must use that specification to distinguish between the effect of changes in assumptions that relate to financial risk on that commitment (which do not adjust the contractual service margin) and the effect of discretionary changes to that commitment (which adjust the contractual service margin). [IFRS 17.B99].

If an entity cannot specify at inception of the contract what it regards as its commitment under the contract and what it regards as discretionary, it must regard its commitment to be the return implicit in the estimate of the fulfilment cash flows at inception of the contract, updated to reflect current assumptions that relate to financial risk. [IFRS 17.B100].

Frequently asked questions

Question 9-21: For insurance contracts without direct participation features, is a difference between the expected and the actual crediting rate applied to a policyholder's account balance included in insurance finance income or expenses, or does it adjust the contractual service margin applying IFRS 17.B96(c)?

(TRG meeting September 2018 - Agenda paper no. 11, Log S57)

The submission was focused on insurance contracts without direct participation features for which the account balance is expected to be payable in the future and ignores the effect of any discretion. The IASB staff observed that IFRS 17.B96 is applicable for differences between any investment component expected to become payable in the period and the actual investment component that becomes payable in the period. However, in the fact pattern provided, the account balance is not expected to become payable in the period and does not become payable in the period and, therefore, the requirement to adjust the contractual service margin does not apply in that period.

Question 9-22: Do all premium experience adjustments relate to future service and therefore adjust the contractual service margin, or is an entity required to identify whether the experience adjustment relates to current, past, or future service?

(TRG meeting September 2018 - Agenda paper no. 04, Log S77)

The submission asked how differences between expected premiums and actual premiums (i.e., premium experience adjustments) which relate to current or past service should be accounted for (i.e., should these adjust the contractual service margin or be recognised in the statement of profit or loss immediately as part of either insurance revenue or insurance service expenses?).

The TRG members agreed with the analysis in the IASB staff paper and observed that:

- Applying the general model, experience adjustments arising from premiums received in the period that relate to future services adjust the contractual service margin. Premium adjustments related to current or past service should be recognised immediately in the statement of profit or loss as part of insurance revenue.
- Although premium experience adjustments are not specifically referenced in IFRS 17.B124, the purpose of that paragraph is to demonstrate an alternative analysis of insurance revenue as determined by IFRS 17.B123 (see section 15.2.1.A below). Hence, applying the requirements in IFRS 17 should result in premium experience adjustments relating to current and past service being included in insurance revenue despite the lack of a specific reference in IFRS 17.B124.
- For the premium allocation approach, the requirements for allocating premium adjustments above apply to expected premium receipts, including premium experience adjustments (see section 15.2.1.B below).

The TRG members also observed that:

- Given that an entity is required to disclose an analysis of insurance revenue recognised in the period, an additional line item may be necessary in the reconciliation to reflect the effect of premium experience adjustments on the revenue recognised in the period (see section 16.1.1 below).
- In some circumstances, judgement may be required to determine whether premium experience adjustments relate to future service and therefore adjust the contractual service margin rather than are recognised in the statement of profit or loss.

IFRS 17 contains a specific reference to experience adjustments for premium receipts consistent with the TRG comments. See section 15.2.1.A below.

How we see it

The requirement to accrete interest on the contractual service margin at historic rates for groups of contracts without direct participation features creates a data challenge for entities because they need to store and accurately apply a potentially large number of discount rates at initial recognition. The number of historic discount rates that need to be tracked may be greater for participating contracts without direct participation features. The reason is that the rate applied to adjust the contractual service margin for changes in fulfilment cash flows is more likely to differ from the rate to accrete interest on the contractual service margin as the former should reflect the characteristics of the specific liabilities rather than a risk-free rate.

Deciding whether a premium experience adjustment relates to future service, or is part of the coverage provided in past (or current) periods, may not always be clear and may require judgement. For example, attributing expected premium receipts that are overdue to past or future coverage might not be obvious in all situations.

IFRS 17 contains the principle that changes in fulfilment cash flows relating to past service should not adjust the contractual service margin but be recorded in profit or loss for the period. However, in our view, the definitions in Appendix A of the liability for remaining coverage and the liability for incurred claims are not prescriptive as to whether they include premiums related to past service. If changes in expected future premiums included in the liability for remaining coverage relate to past service (see section 9.6.1 above) these changes could be recognised as insurance revenue in the period. This result in a treatment consistent with that of premium experience adjustments. Similarly, experience adjustments from non-distinct investment components that relate to past service could also be reported in profit or loss.

Alternatively, if premiums related to past service are recorded in the liability for incurred claims (see section 9.6.2 above), then the effects of these adjustments are not recorded in insurance revenue but in insurance service expenses.

IFRS 17 requires that changes in financial assumptions should not adjust the contractual service margin under the general model. However, when financial assumptions have changed since initial recognition, the question arises, how to measure the impact on cash flows resulting from changes in non-financial assumptions when adjusting the contractual service margin. In our view, in situations where the effects of changes in financial risk have an effect on estimated future cash flows, determining the changes in fulfilment cash flows resulting from changes in non-financial assumptions when adjusting the contractual service margin for changes related to future services could either be performed using (i) financial assumptions at inception or (ii) using financial assumptions at initial recognition prospectively with actual financial experience used up to the measurement date (i.e., 'prospective lock-in'). This should be applied consistently to all financial risks that affect future cash flows under the general model, as an accounting policy choice at the reporting entity level. It should also be disclosed, if applicable, as material accounting policy information.

9.7 Allocation of the contractual service margin to profit or loss

Determining how to release the contractual service margin to profit or loss is a key aspect of IFRS 17 and one of the key challenges implementing the standard.

The basic principle is that an amount of the contractual service margin for a group of insurance contracts is recognised in profit or loss in each period to reflect the insurance contract services provided under the group of insurance contracts in that period.

The amount recognised in profit or loss is determined by: [IFRS 17.B119]

- Identifying the coverage units in the group. The number of coverage units in a group is the quantity of insurance contract services provided by the contracts in the group, determined by considering for each contract the quantity of the benefits provided under a contract and its expected coverage period
 - Allocating the contractual service margin at the end of the period (before recognising any amounts in profit or loss to reflect the insurance contract services provided in the period) equally to each coverage unit provided in the current period and expected to be provided in the future
- And
- Recognising in profit or loss the amount allocated to coverage units provided in the period

It is observed in the Basis for Conclusions that the Board views the contractual service margin as depicting the unearned profit for coverage and other services provided over the coverage period. Insurance coverage is the defining service provided by insurance contracts and an entity provides this service over the whole of the coverage period, and not just when it incurs a claim. Consequently, the contractual service margin is recognised over the coverage period in a pattern that reflects the provision of coverage as required by the contract. To achieve this, the contractual service margin for a group of insurance contracts remaining (before any allocation) at the end of the reporting period is allocated over the coverage provided in the current period and expected remaining future coverage, on the basis of coverage units, reflecting the expected duration and quantity of benefits provided by contracts in the group. The Board considered whether: [IFRS 17.BC279]

- The contractual service margin must be allocated based on the pattern of expected cash flows or on the change in the risk adjustment for non-financial risk caused by the release of risk. However, the Board decided the pattern of expected cash flows and the release of the risk adjustment for non-financial risk are not relevant factors in determining the satisfaction of the performance obligation of the entity. They are already included in the measurement of the fulfilment cash flows and do not need to be considered in the allocation of the contractual service margin. Hence, the Board concluded that coverage units better reflect the provision of insurance coverage.

And

- The contractual service margin must be allocated before any adjustments made because of changes in fulfilment cash flows that relate to future service. However, the Board concluded that allocating the amount of the contractual service margin adjusted for the most up-to-date assumptions provides the most relevant information about the profit earned from service provided in the period and the profit to be earned in the future from future service.

The Board also considered whether the allocation of the contractual service margin based on coverage units would result in profit being recognised too early for insurance contracts with fees determined based on the returns on underlying items. For such contracts, IFRS 17 requires the contractual service margin to be determined based on the total expected fee over the duration of the contracts, including expectations of an increase in the fee because of an increase in underlying items arising from investment returns and additional policyholder contributions over time. The Board rejected the view that the allocation based on coverage units results in premature profit recognition. The Board noted that the investment component of such contracts is accounted for as part of the insurance contract only when the cash flows from the investment component and from insurance and other services are highly interrelated and hence cannot be accounted for as distinct components. In such circumstances, the entity provides multiple services in return for an expected fee based on the expected duration of contracts, and the Board concluded the entity should recognise that fee over the coverage period as the insurance services are provided, not when the returns on the underlying items occur. [IFRS 17.BC280].

IFRS 17 requires the contractual service margin remaining at the end of the reporting period to be allocated equally to the coverage units provided in the period and the expected remaining coverage units. IFRS 17 does not specify whether an entity should consider the time value of money in determining that equal allocation and consequently does not specify whether that equal allocation should reflect the timing of the expected provision of the coverage units. The Board concluded that should be a matter of judgement by an entity. [IFRS 17.BC282].

Consistent with the requirements in IFRS 15, the settlement of a liability is not considered to be a service provided by the entity. Thus, the recognition period for the contractual service margin is the coverage period over which the entity provides the coverage promised in the insurance contract, rather than the period over which the liability is expected to be settled. The risk margin the entity recognises for bearing risk is recognised in profit or loss as the entity is released from risk in both the coverage period and the settlement period. [IFRS 17.BC283]. For contracts with a coverage period of one year, this means that the contractual service margin will be released over that one-year period (possibly, a single reporting period). For longer-term contracts, with a coverage period lasting many years, an entity will have to use judgement in order to determine an appropriate allocation of the contractual service margin to each reporting period.

Frequently asked questions

Question 9-23: How should the contractual service margin be allocated to coverage units provided in the current period and expected to be provided in the future applying IFRS 17.B119(b).

(TRG meeting February 2018 - Agenda paper no. 07, Log S09)

The IASB staff observed that the contractual service margin is allocated equally to each coverage unit provided in the current period and expected to be provided in the future. Therefore, the allocation is performed at the end of the period, identifying coverage units that were actually provided in the current period and coverage units that are expected at this date to be provided in the future.

Question 9-24: What is the definition of 'quantity of benefits' in IFRS 17.B119(a) for use in determining the amortisation pattern of the contractual service margin?

(TRG meeting February 2018 and May 2018 - Agenda papers no. 05, Log S01)

In May 2018, the TRG analysed an IASB staff paper that contained the IASB staff's views on sixteen examples of different types of insurance contracts. The TRG members observed that:

- IFRS 17 established an objective for coverage units which was to reflect the services provided in a period under a group of insurance contracts. However, it does not establish detailed requirements, and it would not be possible to develop detailed requirements that would apply appropriately to the wide variety of insurance products existing globally.
- The determination of coverage units is not an accounting policy choice but involves judgement and estimates to best achieve the principle of reflecting the services provided in each period. Those judgements and estimates should be applied systematically and rationally.
- The analysis of the examples in the IASB Staff paper depends on the fact patterns in that paper and would not necessarily apply to other fact patterns. The method that best reflects the services provided in each period would be a matter of judgement based on facts and circumstances.
- In considering how to achieve the principle, the TRG members observed:
 - The period in which an entity bears insurance risk is not necessarily the same as the insurance coverage period.
 - Expectations of lapses of contracts are included in the determination of coverage units because they affect the expected duration of the coverage. Consistently, coverage units reflect the likelihood of insured events occurring to the extent that they affect the expected duration of coverage for contracts in the group.
 - Because the objective is to reflect the insurance services provided in each period, different levels of service across periods should be reflected in the determination of coverage units.
 - Determining the quantity of benefits provided under a contract requires an entity to consider the benefits expected to be received by the policyholder, not the costs of providing those benefits expected to be incurred by the entity.
 - A policyholder benefits from the entity standing ready to meet valid claims, not just from making a claim if an insured event occurs. The quantity of benefits provided therefore relates to the amounts that can be claimed by the policyholder.
 - Different probabilities of an insured event occurring in different periods do not affect the benefit provided in those periods of the entity standing ready to meet valid claims for that insured event. Different probabilities of different types of insured events occurring might affect the benefit provided by the entity standing ready to meet valid claims for the different types of insured events.
 - IFRS 17 does not specify a particular method or methods to determine the quantity of benefits. Different methods may achieve the objective of reflecting the services provided in each period, depending on facts and circumstances.

The TRG members considered that the following methods might achieve the objective if they are reasonable proxies for the services provided under the groups of insurance contracts in each period:

- A straight-line allocation over the passage of time, but reflecting the number of contracts in a group
- A method based on the maximum contractual cover in each period
- A method based on the amount the entity expects the policyholder to be able to validly claim in each period if an insured event occurs
- Methods based on premiums. However, premiums will not be reasonable proxies when comparing services across periods if they are receivable in different periods to those in which insurance services are provided, or if they reflect different probabilities of claims for the same type of insured event in different periods rather than different levels of service of standing ready to meet claims. Additionally, premiums will not be reasonable proxies when comparing contracts in a group if they reflect different levels of profitability in contracts. The level of profitability in a contract does not affect the services provided by the contract.
- Methods based on expected cash flows. However, methods that result in no allocation of the contractual service margin to periods in which the entity is standing ready to meet valid claims do not meet the objective.

Question 9-25: How does an entity determine the amount of the contractual service margin (i.e., the quantity of benefits) to recognise in profit or loss in a period because of the transfer of insurance coverage for survival in that period?

(IFRS IC final agenda decision June 2022)

In 2022, the IFRS IC was asked to consider a fact pattern of a group of annuity contracts under which the policyholder of each contract:

- (a) Pays the premium upfront and has no right to cancel the contract or seek a refund
 - (b) Receives a periodic payment from the start of the annuity period for as long as the policyholder survives (for example a fixed amount of CU100 for each year that the policyholder survives)
- And
- (c) Receives no other services under the contract (for example, no other types of insurance coverage or investment-return service)

The fact pattern referred to groups of contracts for which the annuity period starts immediately after contract inception ('immediate annuity') and also those for which the annuity period starts on a specified date after contract inception ('deferred annuity'). For example, a contract entered into in 2022 for which the annuity period starts in 2042.

Applicable requirements in IFRS 17

Paragraph 44(e) of IFRS 17 requires an entity to adjust the carrying amount of the contractual service margin for the amount recognised as insurance revenue because of the transfer of insurance contract services in the period. The entity determines this amount by allocating the contractual service margin over the current and remaining coverage period applying paragraph B119 of IFRS 17.

Paragraph B119 of IFRS 17 states that an entity recognises in profit or loss in each period an amount of the contractual service margin to reflect the insurance contract services provided under the group of insurance contracts in that period. The amount is determined by:

- (a) Identifying the coverage units in the group. The number of coverage units in a group is the quantity of insurance contract services provided by the contracts in the group, determined by considering for each contract the quantity of the benefits provided under a contract and its expected coverage period.
- (b) Allocating the contractual service margin at the end of the period equally to each coverage unit provided in the current period and expected to be provided in the future.
- (c) Recognising in profit or loss the amount allocated to coverage units provided in the period.

The definition of insurance contract services in Appendix A to IFRS 17 describes insurance coverage as 'coverage for an insured event'. An insured event is defined as 'an uncertain future event covered by an insurance contract that creates insurance risk'.

Methods for applying the requirements to the fact pattern

The request sets out two methods of determining, for each contract in the group, the quantity of benefits of insurance provided in the current period and expected to be provided in the future.

Method 1

Current period - determined based on the annuity payment the policyholder is able to validly claim in the current period.

Expected to be provided in the future - determined based on the present value of the annuity payments the policyholder is expected to be able to validly claim in the future until the end of the coverage period (the balance of expected future annuity payments as at the end of the current period).

Method 2

Current period - determined based on the total of: (i) the annuity payment the policyholder is able to validly claim in the current period, and (ii) the present value of the annuity payments the policyholder is expected to be able to validly claim in the future until the end of the coverage period (the balance of the expected future annuity payments as at the end of the current period).

Expected to be provided in the future - determined based on the present value of the balances of the expected future annuity payments at the beginning of each future period, until the end of the coverage period.

Applying paragraph B119(a) of IFRS 17, an entity:

- (a) Identifies the insurance contract services to be provided under the group of contracts. In the fact pattern described in the request, insurance coverage for survival is the only insurance contract service provided under the group of contracts.
- (b) Considers the expected coverage period for each contract in the group. In the fact pattern described in the request, the expected coverage period would reflect the entity's expectations of how long the policyholder will survive.
- (c) Considers the quantity of the benefits provided under each contract in the group.

IFRS 17 does not prescribe a method for determining the quantity of the benefits provided under a contract. Instead, an entity is required to use a method that meets the principle in paragraph B119 of reflecting the insurance contract services provided in each period. In selecting a method that meets that principle, an entity considers (a) the benefits provided to the policyholder under a contract with respect to the insurance contract services provided, and (b) when those benefits are provided. Different methods may achieve the principle depending on the facts and circumstances.

In the fact pattern described in the request, the terms of the annuity contract provide the policyholder with the right to claim a periodic amount (CU100 in the example) from the start of the annuity period for as long as the policyholder survives. Consequently, the IFRS IC observed that:

- (a) The benefits provided to the policyholder under the contract with respect to the insurance coverage for survival are the policyholder's right to claim a periodic amount for as long as they survive. The policyholder also benefits from transferring to the entity the risk related to the uncertainty about how long they will survive. However, IFRS 17 requires an entity to account for that insurance risk in the risk adjustment for non-financial risk, separately from the contractual service margin.
- (b) The benefits of being able to claim a periodic amount are provided to the policyholder in each year of the policyholder's survival from the start of the annuity period:
 - (i) The policyholder has no right to claim an amount for surviving in periods before the start of the annuity period. The entity accepts insurance risk from inception of the contract but provides no benefits to the policyholder in the form of amounts that can be claimed until the annuity period starts. Paragraphs BC140-BC141 of the Basis for Conclusions on IFRS 17 explain that an entity can accept insurance risk before it is obliged to perform an insurance coverage service.
 - (ii) Survival in one year does not provide the policyholder with the right to claim amounts that compensate the policyholder for surviving in future years; that is, the policyholder's right to claim amounts in future years is contingent on the policyholder surviving in those future years.

The IFRS IC's conclusion

The IFRS IC concluded that, in applying IFRS 17 to determine the quantity of the benefits of insurance coverage for survival provided under each annuity contract, a method based on the amount of the annuity payment the policyholder is able to validly claim (Method 1) meets the principle in paragraph B119 of IFRS 17 of reflecting the insurance coverage provided in each period by:

- Assigning a quantity of the benefits only to periods for which the entity has an obligation to investigate and pay valid claims for the insured event (survival of the policyholder).
- And
- Aligning the quantity of the benefits provided in a period with the amount the policyholder is able to validly claim in each period.

A method based on the present value of expected future annuity payments (Method 2) does not meet the principle in paragraph B119 of IFRS 17 of reflecting the insurance coverage provided in each period because it would:

- Assign a quantity of the benefits to periods for which the entity has no obligation to investigate and pay valid claims for the insured event (for example, to the deferral period of a deferred annuity contract).
- And
- Misrepresent the quantity of the benefits provided in a period by considering amounts the policyholder is able to claim and benefit from only in future periods.

The request asked only about the recognition of the contractual service margin in profit or loss. For the annuity contracts described in the request, the entity accepts insurance risk related to the uncertainty about how long the policyholder will survive. The IFRS IC noted that the entity would apply other requirements in IFRS 17 to recognise in profit or loss—separately from the contractual service margin—the risk adjustment for non-financial risk, representing the entity's compensation for bearing insurance risk and other non-financial risks. The IFRS IC did not discuss these other requirements.

Under a group of annuity contracts, an entity could provide other insurance contract services to policyholders in addition to insurance coverage for survival—for example, insurance coverage for death in a deferral period or an investment-return service. The conclusion in this agenda decision applies to insurance coverage for survival, regardless of other services provided. If the contracts provide other insurance contract services, the entity would also need to consider the pattern of transfer of those services to the policyholder.

The IFRS IC concluded that the principles and requirements in IFRS accounting standards provide an adequate basis for an issuer of a group of annuity contracts as described in the request to determine the amount of the contractual service margin to recognise in profit or loss in a period because of the transfer of insurance coverage for survival in that period. Consequently, the IFRS IC decided not to add a standard-setting project to the work plan.

In accordance with paragraph 8.7 of the Due Process Handbook, at its July 2022 meeting, the IASB discussed, and did not object to, this agenda decision.⁸

The examples below, discussed by the TRG in the May 2018 meeting, apply the principles above to specific fact patterns for insurance contracts issued without direct participation features. Examples for reinsurance contracts issued, reinsurance contracts held and insurance contracts with direct participation features are discussed in sections 9.9.4, 11.5.2 and 12.3.4 below respectively.

Illustration 9-6: Credit life loan insurance

A life insurance policy pays a death benefit equal to the principal and interest outstanding on a loan at the time of death. The balance of the loan will decline because of contractually scheduled payments and cannot be increased.

Applying the principles above, the method suggested for determining the quantity of benefits is the cover for the contractual balance outstanding because it is both the maximum contractual cover and the amount the entity expects the policyholder to be able to make a valid claim for if the insured event occurs.

Illustration 9-7: Credit life product with variable amount of cover

A credit life insurance policy where the amount payable on an insured event varies (for example, claims might relate to an outstanding credit card balance). In these cases, the sum assured will vary over time, rather than simply reducing. In addition, the sum assured may be limited based on the lender's credit limits.

Applying the principles above, the methods suggested for determining the quantity of benefits are either the constant cover of the contractual maximum amount of the credit limit or cover based on the expected credit card balances (i.e., the amount the entity expects the policyholder to be able to make a valid claim for if the insured event occurs).

⁸ [IFRIC Update](#), June 2022, available on the IFRS Foundation's website.

Illustration 9-8: Mortgage loss cover

An insurance contract provides cover for five years for default losses on a mortgage, after recovering the value of the property on which the mortgage is secured. The balance of the mortgage will decline because of contractually scheduled payments and cannot be increased.

Applying the principles above, the methods suggested for determining the quantity of benefits are either the maximum contractual cover (the contractual balance of mortgage) or the amount the entity expects the policyholder to be able to make a valid claim for if the insured event occurs (the contractual balance of the mortgage less the expected value of the property).

Illustration 9-9: Product warranty

A five-year warranty coverage insurance contract provides for replacement of a purchased item if it fails to work properly within five years of the date of purchase. Claims are typically skewed toward the end of the coverage period as the purchased item ages.

Applying the principles above, the quantity of benefits is constant over the five year coverage period if the price of replacement product is expected to remain constant. However, if the cost of the replacement product rises over the coverage period (e.g., inflation costs) then the coverage units should include expectations about the cost of replacing the item.

Illustration 9-10: Extended product warranty

Extended warranty policies cover the policyholders after the manufacturer's original warranty has expired. The policies provide new for old cover in the event of a major defect to the covered asset.

Applying the principles above, the expected coverage duration does not start until the manufacturer's original warranty has expired. The policyholder cannot make a valid claim to the entity until then.

Illustration 9-11: Health cover

An insurance contract provides health cover for 10 years for specified types of medical costs up to CU1m over the life of the contract, with the expected amount and expected number of claims increasing with age.

Applying the principles above, the expected coverage duration is the 10 year period during which cover is provided, adjusted for any expectations of the limit being reached during the ten years and lapses. For determining the quantity of benefits the following two methods are suggested:

- Comparing the contractual maximum amount that could have been claimed in the period with the remaining contractual maximum amount that can be claimed as a constant amount for each future coverage period. So, if a claim of CU100,000 were made in the first year, at the end of the year the entity would compare CU1m coverage provided in the year with coverage of CU900,000 for the following nine years, resulting in an allocation of 1/9.1 of the contractual service margin for the first year.
Or
- Comparing the maximum amount that could be claimed in the period with the expected maximum amounts that could be claimed in each of the future coverage periods, reflecting the expected reduction in cover because of claims made. This approach involves looking at the probabilities of claims in different periods to determine the expected maximum amounts in future periods. However, in this fact pattern, the probability of claims in one period affects the amount of cover for future periods, thereby affecting the level of service provided in those periods.

Illustration 9-12: Transaction liability

A transaction liability policy will pay claims for financial losses arising as a result of breaches of representations and warranties made in a specified and executed acquisition transaction. The policy period (contract term) is for 10 years from the policy start date. The insurer will pay claims for financial losses reported during the 10-year policy period up to the maximum sum insured.

Applying the principles above, the insured event is the discovery of breaches of representations and warranties (consistent with the definition of title insurance - see section 3.7 above). Coverage starts at the moment the contract is signed and lasts for 10 years. The IASB staff rejected the view that the coverage period is just one day (i.e., the transaction closing date, which is the date on which the representations and warranties were made).

Illustration 9-13: Combination of different types of cover

This example assumes there are five different contracts (A-E) in a single group of insurance contracts. Each contract has a different combination of four coverages (accidental death, cancer diagnosis, surgery and inpatient treatment). Each contract has a different coverage period. Coverages have a high level of interdependency in the same insurance contract; if a coverage of an insurance contract in the group of insurance contracts lapses, other coverages of the same insurance contract lapse simultaneously. Presented in the table below is the summary of the contracts:

Contract	Coverage				Coverage period
	Accidental death	Cancer diagnosis	Surgery	Inpatient treatment	
A	Cover of 2000	Cover of 1000	Cover of 500	Cover of 50	2 years
B	N/A	Cover of 1000	Cover of 500	N/A	5 years
C	N/A	N/A	Cover of 500	Cover of 50	2 years
D	N/A	N/A	Cover of 500	Cover of 50	5 years
E	Cover of 2000	N/A	N/A	N/A	10 years

The entity charges the same annual premium amount for each type of cover, and the total annual premium amount for a contract is the sum of the premiums for each type of cover included in the contract.

Applying the principles above, the expected coverage duration is the period in which cover is provided, adjusted for expectations of lapses. The quantity of benefits for each contract is the sum of all the levels of cover provided. So, based on the cover set out in the table, the total coverage units for contract A for each year would be CU3,550 (i.e., 2,000 + 1,000 + 500 + 50) and for contract B 1,500 (i.e., 1,000 + 500). Methods which do not reflect the different amounts of cover provided by each contract would not appear to be valid. A method based on annual premiums may be valid depending on the factors mentioned in the TRG analysis above.

In this example, in all scenarios the coverage period is the same for all coverage components so the probability of the insured event does not affect the coverage period and can be ignored. If the coverage period for the various covers is different, then the probability of the insured event becomes relevant as some coverage components will expire before other coverage components.

Illustration 9-14: Life contingent annuity

A life contingent pay out annuity pays a fixed monthly amount of CU10 each period until the annuitant dies.

Applying the principles above, the expected coverage duration is the probability weighted average expected duration of the contract. The expected coverage duration is reassessed in each period. The quantity of benefits is the fixed monthly amount of CU10. An approach that does not reassess the expected coverage period would appear to be inconsistent with the current measurement principle of IFRS 17.

The IASB staff rejected the view that there is a constant level of benefits provided over the life of the annuitant and that the contractual service margin should be amortised straight line over the remaining expected life of the annuitant (i.e., the quantity of benefits is CU10 per year and the coverage period is the length of time until there will no longer be any payments made to the policyholder which is estimated at 40 years) because it does not reflect the expected duration of the contract. The IASB staff also rejected the view that the contract is a series of individual promises to pay a fixed amount at a future point in time if the annuitant is still alive at that point in time because it requires an entity to split a contract into multiple individual contracts and also does not appear to require reassessment of the expected coverage duration.

Illustration 9-15: Forward purchase of fixed rate annuity

A forward contract to buy an annuity in the future at a fixed rate. The premium is payable when the annuity is bought. If the policyholder dies, or cancels the contract, before the date the annuity can be purchased, the policyholder receives no benefit.

Applying the principles above, the entity bears insurance risk from the date the forward contract is issued, but the coverage period does not start until the date the annuity starts (as a claim cannot be made before that date). The insured event is that the policyholder lives long enough (i.e., survives) to receive payments under the annuity.

How we see it

IFRS 17 is silent on whether an entity should allocate the contractual service margin to profit or loss using coverage units that reflect the time value of money. In our view, both methods (i.e., considering time value of money and not considering it) are acceptable, but an entity must apply the method consistently as an accounting policy choice.

Following the TRG discussion referred to above, we expect entities will have to apply judgement based on the specific product characteristics in determining the quantity of benefits underlying coverage units in a way that best depicts the provision of insurance contract services over the coverage period of the group of contracts.

9.7.1 Allocating the contractual service margin on the basis of coverage units determined by considering both insurance coverage and any investment return service

IFRS 17 defines insurance contract services as the following services that an entity provides to the policyholder of an insurance contract: *[IFRS 17 Appendix A]*

- Coverage for an insured event (insurance coverage)
 - For insurance contracts without direct participation features, the generation of an investment return for the policyholder, if applicable (investment-return service)
- And
- For insurance contracts with direct participation features, the management of underlying items on behalf of the policyholder (investment-related service)

As the contractual service margin is recognised in profit or loss to reflect the provision of insurance contract services, this means that the period over which the contractual service margin is amortised includes both the period in which the entity provides insurance contract services and the period over which it provides an investment-return service (for insurance contracts without direct participation features) or an investment-related service (for insurance contracts with direct participation features). The coverage period of insurance contracts with direct participation features is discussed in section 12.3.4 below.

Extract from IFRS 17

- B119B** Insurance contracts without direct participation features may provide an investment-return service if, and only if:
- (a) an investment component exists, or the policyholder has a right to withdraw an amount;
 - (b) the entity expects the investment component or amount the policyholder has a right to withdraw to include an investment return (an investment return could be below zero, for example in a negative interest rate environment); and
 - (c) the entity expects to perform investment activity to generate that investment return.

[IFRS 17.B119B].

In this regard, a right to withdraw an amount from the entity includes a policyholder's right to:

- Receive a surrender value or refund of premiums on cancellation of a policy
- Or
- Transfer an amount to another insurance provider *[IFRS 17.BC283C]*

In IFRS 17, as issued in 2017, the coverage period of an insurance contract without direct participation features included only the period in which an entity provided insurance contract services and did not include the period in which an entity provided investment return-services. In May 2018, most TRG members disagreed that insurance contracts under the general model should be treated as providing only insurance services. Stakeholders also expressed concerns that contracts which provide insurance coverage that ends significantly before the investment-return service ended would result in 'front-end' revenue recognition and deferred annuity contracts with an account balance accumulating in the period before the annuity payments start could result in 'back-end' revenue recognition if insurance coverage is provided only during the annuity periods. As a result, the Board was persuaded that some insurance contracts outside the scope of the variable fee approach (i.e., those that do not contain direct participation features) provide an investment-return service and that recognising the contractual service margin considering both insurance coverage and an investment-return service will provide useful information to users of the financial statements. [IFRS 17.BC283B].

The Board admits that specifying conditions for an investment-return service creates the risk that an appropriate outcome may not be achieved in all scenarios (for example, entities might also conclude that an investment-return service exists in circumstances in which the Board would conclude otherwise such as when an entity provides only custodial services relating to an investment component). Balancing those potential risks, the Board decided to specify conditions that are necessary to identify, but not determinative of, the existence of an investment-return service. An entity is required to apply judgement, considering the facts and circumstances, to determine whether an insurance contract meets the conditions to provide an investment-return service. [IFRS 17.BC283D, IFRS 17.BC283E].

For the purpose of amortising the contractual service margin, the period of investment-return service ends at or before the date that all amounts due to current policyholders relating to those services have been paid, without considering payments to future policyholders included in the fulfilment cash flows as a result of mutualisation (see section 12.1 below). [IFRS 17.B119A].

Illustration 9-16: Forward purchase of fixed rate annuity

An insurance contract matures in year 10 and pays the customer the account value at maturity. The contract also includes a death benefit that varies depending on which year in the 10-year period the death occurs. Specifically, if the customer dies in years 1-5, the customer's beneficiary would receive a death benefit that is the higher of 110% of the premium paid or the accumulated account value (assume that the death benefit for years 1-5 results in significant insurance risk). However, if the customer dies in years 6-10 the customer's beneficiary receives only the account value. There is no surrender penalty.

Does the insurer only have to consider years 1-5 for determining the coverage units to determine the amortisation of the contractual service margin? Or does the insurer need to consider all 10 years for determining coverage units and amortisation of the contractual service margin?

IFRS 17 states that coverage units should be determined reflecting the benefits to the policyholder during the period of both the insurance coverage and the investment return services (i.e., 10 years). Under IFRS 17 as issued in 2017, the insurer would have only considered years 1-5 for determining the coverage units since that reflected the period of the insurance benefits and IFRS 17 was amended in June 2020 as shown in the diagram below.

Recognition of profit considering both insurance coverage and investment-return service

Year	1	2	3	4	5	6	7	8	9	10
IFRS 17 (as amended in June 2020)	Insurance coverage									
	Investment-return service									
	Recognition of profit									

Recognition of profit considering insurance coverage only

Year	1	2	3	4	5	6	7	8	9	10
IFRS 17 (as originally issued)	Insurance coverage									
	Investment component									
	Recognition of profit									

Illustration 9-17: Deferred annuity contract without an investment component which provides an investment-return service

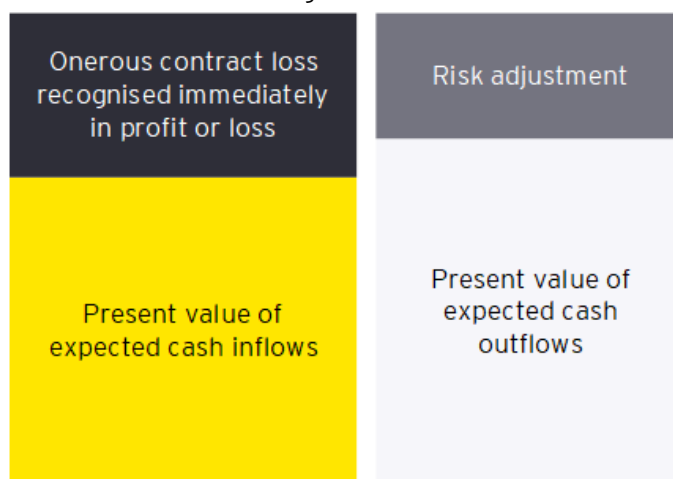

A deferred annuity contract is a contract under which premiums are paid up-front. The premiums earn a return during the accumulation phase and the accumulated amount can be converted into an annuity at a fixed conversion rate at a future date. The accumulation phase could be a substantial number of years. During the accumulation phase the policyholder has the right to transfer the accumulated amount to another annuity provider or to receive the accumulated amount if (s)he dies. After conversion into an annuity, there is no period of guaranteed payments, i.e., if the policyholder dies after conversion, but before the first annuity payment the policyholder receives nothing. Hence, the contract does not have an investment component. However, although there is no investment component, the policyholder has the right during the accumulation phase to withdraw an amount from the entity that includes an investment return. (An investment-return service can only exist if the contract includes an investment component or if the policyholder has a right to withdraw an amount from the entity).

How we see it

IFRS 17 does not contain specific guidance on how to determine the coverage units for investment-return or investment-related services and how these services are weighted with services from insurance coverage. The TRG did also not discuss this matter in detail. Therefore, entities will have to apply judgement in determining coverage units in a way that reflects the investment services provided to the policyholders and how these services are combined with insurance coverage services if a contract includes both types of services.

9.8 Onerous contracts

An insurance contract is onerous at the date of initial recognition if the fulfilment cash flows allocated to the contract, including any previously recognised insurance acquisition cash flows and any cash flows arising from the contract at the date of initial recognition in total are a net outflow.

As discussed in section 7 above, a loss must be recognised on initial recognition of a group of insurance contracts if that group is onerous. As discussed in section 6.2 above, an entity should group such contracts separately from contracts that are not onerous.

When a group of insurance contracts is onerous, an entity should recognise a loss component and book the corresponding loss in profit or loss for the net outflow for the group of onerous contracts, resulting in the carrying amount of the liability for remaining coverage of the group being equal to the fulfilment cash flows and the contractual service margin of the group being zero. [IFRS 17.47].

Subsequent to initial recognition, a group of insurance contracts becomes onerous (or more onerous) if the following amounts exceed the carrying amount of the contractual service margin: [IFRS 17.48]

- Unfavourable changes relating to future service in the fulfilment cash flows allocated to the group arising from changes in estimates of future cash flows and the risk adjustment for non-financial risk
- For a group of insurance contracts with direct participation features, the decrease in the amount of the entity's share of the fair value of the underlying items

An entity must recognise a loss in profit or loss to the extent of that excess.

For losses under onerous groups of insurance contracts recognised either on initial recognition or subsequently, an entity must establish (or increase) a loss component of the liability for remaining coverage for an onerous group depicting the losses recognised. A 'loss component' means a notional record of the losses attributable to each group of onerous insurance contracts. The liability for the expected loss is contained within the liability for remaining coverage for the onerous group (as it is within the fulfilment cash flows). Keeping a record of the loss component of the liability for remaining coverage is necessary in order to account for subsequent reversals, if any, of the onerous group and any loss component is required to be separately disclosed (see section 16.1.1 below). The loss component determines the amounts that are presented in profit or loss as reversals of losses on onerous groups and are consequently excluded from the determination of insurance revenue and, instead, credited to insurance service expenses. [IFRS 17.49].

After an entity has recognised a loss on an onerous group of insurance contracts, it must allocate: [IFRS 17.50]

- The subsequent changes in fulfilment cash flows of the liability for remaining coverage on a systematic basis between:
 - The loss component of the liability for remaining coverage
 - The liability for remaining coverage, excluding the loss component
- Solely to the loss component until that component is reduced to zero:
 - Any subsequent decrease relating to future service in fulfilment cash flows allocated to the group arising from changes in estimates of future cash flows and the risk adjustment for non-financial risk
 - Any subsequent increases in the amount of the entity's share of the fair value of the underlying items

IFRS 17 does not specify the order in which an entity allocates the fulfilment cash flows in the bullet points above (i.e., whether IFRS 17.50(a) or 50(b) is applied first). [IFRS 17.IE95(c)].

An entity must adjust the contractual service margin only for the excess of the decrease over the amount allocated to the loss component.

The subsequent changes in the fulfilment cash flows of the liability for remaining coverage to be allocated are: [IFRS 17.51]

- Estimates of the present value of future cash flows for claims and expenses released from the liability for remaining coverage because of incurred insurance service expenses
- Changes in the risk adjustment for non-financial risk recognised in profit or loss because of the release from risk
- Insurance finance income or expenses

The systematic allocation required above must result in the total amounts allocated to the loss component being equal to zero by the end of the coverage period of a group of contracts (since the loss component will have been realised in the form of incurred claims). [IFRS 17.52].

IFRS 17 does not prescribe specific methods to track the loss component. The IASB considered whether to require specific methods but concluded that any such methods would be inherently arbitrary. The IASB, therefore, decided to require an entity to make a systematic allocation of changes in the fulfilment cash flows for the liability for remaining coverage that could be regarded as affecting either the loss component or the rest of the liability. [IFRS 17.BC287].

How we see it

Tracking the loss component of the liability for remaining coverage for each group of onerous contracts will be a new and complex task, particularly for many life insurers. Most non-life insurers will be familiar with the concept of releasing provisions for unearned premiums and unexpired risks, and we expect that tracking a loss component should be easier for short duration contracts. Maintaining the loss component is not equivalent to maintaining a negative contractual service margin because the purpose of the loss component is to separately account for and present the shortfall in the insurance liability and, in contrast to the contractual service margin, is not directly driven by the performance of services under the group of contracts.

Changes in the liability for remaining coverage due to insurance finance income or expenses, release from risk, and incurred claims and other insurance service expenses, need to be allocated between the loss component and the remainder of the liability for remaining coverage on a systematic basis. An entity could allocate the effect of these changes to the loss component in proportion to the total liability, although other bases could be appropriate. Whichever approach is adopted, it should be applied consistently. This also implies that insurance finance income or expenses must be allocated to the loss component to reflect the accretion of interest.

Changes in the liability for incurred claims are not allocated to the liability for remaining coverage.

Illustration 9-18: Application of the loss component for a group of onerous contracts

An entity determines that a group of insurance contracts without direct participation features is onerous at initial recognition. On initial recognition, the fulfilment cash flows (disregarding discounting and other adjustments) are a net cash outflow of CU50. Therefore, this is recognised as a loss in profit or loss. There is no contractual service margin. The loss component of the liability for remaining coverage is CU50.

At the entity's next reporting date, it calculates that the fulfilment cash flows for the liability for remaining coverage have decreased by CU60. Applying IFRS 17.50, the entity decides that it will first allocate the subsequent changes in fulfilment cash flows of the liability for remaining coverage in a systematic way between the loss component and the liability for remaining coverage excluding the loss component. The entity then decides to allocate any subsequent decrease relating to future service in the fulfilment cash flows solely to the loss component. As a result of the systematic allocation, CU40 adjusts the loss component of the liability for remaining coverage by a release (i.e., a credit) to profit or loss. The remaining CU20 reduction does not adjust the loss component of the liability for remaining coverage. Consequently, at the reporting date, the loss component of the liability for remaining coverage is CU10 (i.e., CU50 less CU40).

How we see it

IFRS 17 clearly implies that insurance finance income or expenses should be allocated to the loss component to reflect the accretion of interest. Even though the total liability for remaining coverage is measured using current rate, the standard is not explicit on what discount rate - a current rate or a rate at inception - should be used for allocating insurance finance income or expenses to the loss component. An entity should therefore make an accounting policy choice on this matter that is applied consistently for contracts accounted for under the general model.

When the entity applies a current rate for allocating insurance finance income or expenses to the loss component, it should also determine an accounting policy on whether it records the remeasurement of the loss component in profit or loss at the current rate, or whether it disaggregates this effect between insurance service result and insurance finance income or expense using the rate determined at inception. It should apply this accounting policy consistently to contracts accounted for under the general model (see section 15.2.1.A below).

However, for contracts with direct participation features, the loss component should be determined at the current rate, consistent with the measurement model, with the resulting effects included in insurance service result (see sections 12.3.3 and 15.3 below).

9.9 Reinsurance contracts issued

A reinsurance contract is a contract issued by one entity (the reinsurer) to compensate another entity for claims arising from one or more insurance contracts issued by that other entity (underlying contracts).

[IFRS 17 Appendix A].

The requirements for recognition and measurement of reinsurance contracts issued are the same as for insurance contracts. This means that the issuer should make an estimate of the fulfilment cash flows including estimates of expected future cash flows. At initial recognition (and at each reporting date) this will include estimates of future cash flows arising from underlying insurance contracts expected to be issued by the reinsured entity (and covered by the issued reinsurance contract) that are within the contract boundary of the reinsurance contract. This is because the issuer of the reinsurance contract has a substantive obligation to provide insurance cover (i.e., services) for those unissued policies. However, the unit of account for measurement is the reinsurance contract rather than the underlying individual direct contracts.

9.9.1 The contract boundary of a reinsurance contract issued

The terms and conditions of reinsurance contracts create specific application questions as to the contract boundary. This section discusses the application to reinsurance contracts issued; for the general principles see section 9.1 above. For the matters that relate more specifically to reinsurance contracts held, see section 11.2 below.

Frequently asked questions

Question 9-26: What is the contract boundary of a reinsurance contract that contains a break clause?

(TRG meeting February 2018 - Agenda paper no. 03, Log S15)

Some reinsurance contracts issued may contain break clauses which allow either party to cancel the contract at any time following a specified notice period. TRG members observed that, in an example of a reinsurance contract where the reinsurer can terminate coverage at any time with a three-month notice period, the initial contract boundary for the issuer of the reinsurance contract would exclude cash flows related to underlying insurance premiums outside of that three-month notice period.

Question 9-27: From the perspective of the cedant, is there is an expectation of a symmetrical treatment of the contract boundary between the reinsurer and the cedant for the examples discussed at the May 2018 meeting for reinsurance held?

(TRG meeting September 2018 - Agenda paper no. 11, Log S75)

This example is similar to the example discussed at the May 2018 TRG meeting. See Questions 11-3 and Question 11-4 in section 11.2 below. The May 2018 example was from the perspective of the cedant. The September 2018 example is from the perspective of the reinsurer. The contract boundary is the same from each perspective because:

- When the cedant has a right to receive services, the reinsurer has an obligation to provide services
- When the cedant has an obligation to pay premiums, the reinsurer has a right to compel premiums

The submission to the IASB staff in September 2018 included an additional fact pattern in which there is (or there is not) a unilateral right for the reinsurer to amend the rate of the ceding commission it pays, in addition to unilateral termination rights. The IASB staff observed that in this fact pattern, the existence of the right to terminate the contract with a three month notice period determines the cash flows within the contract boundary regardless of the existence of a right to amend the rate of the ceding commission if the contract is not terminated. Therefore, the same accounting would apply to the additional fact pattern provided.

9.9.2 Issued adverse loss development covers

For reinsurance contracts which cover events that have already occurred, but for which the financial effect is uncertain, IFRS 17 states that the insured event is the determination of the ultimate costs of the claim. [IFRS 17.B5].

Frequently asked questions

Question 9-28: How should insurance revenue and insurance service expenses be presented for insurance contracts acquired in conjunction with a business combination or similar acquisition in their settlement period. More specifically, should revenue reflect the entire expected claims or not?

(TRG meeting February 2018 - Agenda paper no. 07, Log S04)

The IASB staff stated that for insurance contracts that cover events that have already occurred but the financial effect of which is uncertain, the claims are incurred when the financial effect is certain. This is not when an entity has a reliable estimate if there is still uncertainty involved. Conversely this is not necessarily when the claims are paid if certainty has been achieved prior to settlement. Accordingly, insurance revenue would reflect the entire expected claims as the liability for remaining coverage reduces because of services provided. If some cash flows meet the definition of an investment component, those cash flows will not be reflected in insurance revenue or insurance service expenses.

This results in entities accounting differently for similar contracts, depending on whether those contracts are issued originally by the entity or whether the entity acquired those contracts in their settlement period. Assuming a long settlement period, the potential consequences of this distinction include:

- An entity applies the general model for contracts acquired in their settlement period because the period over which claims would develop is much longer than one year, whilst entities expect to apply the premium allocation approach for similar contracts that they issue.
- An entity recognises revenue for the contracts acquired in their settlement period over the period the claims are expected to develop, while revenue is not recognised over this period for similar contracts issued.

The TRG members observed that, although the requirements in IFRS 17 are clear, applying the requirements reflects a significant change from existing practice and this change results in implementation complexities and costs.

In May 2018, the IASB staff prepared an outreach report which included implementation concerns regarding the subsequent treatment of insurance contracts issued and acquired in their settlement period. Subsequently, the IASB decided not to change IFRS 17 for this issue but has amended IFRS 17 to provide transitional relief for these contracts when the modified retrospective approach (see section 17.4 below) or the fair value approach (see section 17.5 below) is applied.

This issue is not specific to reinsurance contracts issued, it is also relevant to direct adverse development covers issued.

How we see it

Some reinsurance contracts issued (as well as direct insurance contracts issued) may contain a mixture of both retrospective and prospective coverage. In these circumstances an entity would need to apply judgement as to: (i) the portfolio of contracts to which a contract with such a mixture should be allocated; and (ii) whether the legal contract containing both types of cover must be split into separate retrospective and prospective components, with each component allocated to different portfolios, applying the guidance discussed in section 6.1.1 above.

9.9.3 Accounting for ceding commissions and reinstatement premiums

Reinsurance contracts include common types of commissions due from a reinsurer to a cedant. These include both:

- Commissions that are not contingent on claims
- Commissions that are contingent on claims

Questions have arisen as to how these commissions should be accounted for in the financial statements of the reinsurer.

Frequently asked questions

Question 9-29: How should ceding commissions paid by the reinsurer to the cedant be treated in the reinsurer's statement of financial performance?

The submission considers whether the treatment is different for fixed commissions and commissions that are not fixed

(TRG meeting September 2018 - Agenda paper no. 03, Log S55)

The submission asked how the following should be accounted for in the financial statements of the reinsurer:

- Common types of commission due to the cedant
- Reinstatement premiums charged to the cedant in order to continue coverage following the occurrence of an insured event

The TRG members discussed the analysis in an IASB staff paper and observed that:

- The requirements in IFRS 17.86 for the presentation of income and expenses from reinsurance contracts held are based on the economic effects of exchanges between the reinsurer and the cedant and it would be appropriate to apply an assessment of the economic effect of such exchanges to reinsurance contracts issued as well.
- The economic effect of amounts exchanged between a reinsurer and a cedant that are not contingent on claims is equivalent to the effect of charging a different premium. Therefore, these amounts would be recognised as part of insurance revenue.
- The economic effect of amounts exchanged between a reinsurer and a cedant that are contingent on claims is equivalent to reimbursing a different amount of claims than expected. Therefore, these amounts would be recognised as part of insurance service expenses.
- Unless a cedant provides a distinct service to the reinsurer that results in a cost to the reinsurer for selling, underwriting and starting a group of reinsurance contracts that it issues, a ceding commission is not an insurance acquisition cash flow of the insurer. The IASB staff observed that, unlike insurance acquisition costs that are paid to a third-party intermediary, ceding commissions are paid by the reinsurer to the cedant who is the policyholder of the contract.
- Amounts exchanged between the reinsurer and the cedant that are not contingent on claims may meet the definition of an investment component if they are repaid to the cedant in all circumstances. However, an amount deducted from the initial premium up-front is not an investment component (although the impact on insurance revenue is the same).

The TRG members observed that applying the requirements in IFRS 17 for amounts exchanged between a reinsurer and a cedant has practical implications because the requirements are different from existing practice. The TRG members also observed that applying the requirements of IFRS 17 may affect key performance measures currently used to assess the performance of reinsurers.

- Applying the guidance above in practice to the reinsurer:
 - A ceding commission charged as a fixed amount or as a percentage of premiums on the underlying insurance contracts is a reduction in insurance revenue. If paid after the premium is received, the ceding commission may meet the definition of an investment component, provided the amounts are repaid to the policyholder in all circumstances.
 - A commission contingent on claims (i.e., excluding any minimum amounts that are, in effect, non-contingent, see Illustration 9-19 below) is part of claims and recognised as part of insurance service expenses.
 - A mandatory reinstatement premium contingent on a claim amount and settled net with the claims paid to the cedant is equivalent to reimbursing a different amount of claims to the cedant and should be recognised as part of insurance service expenses when incurred.
 - A voluntary reinstatement premium which is not contingent on claims (i.e., the cedant can decide not to pay the additional premium and the contract terminates) is equivalent to the effect of charging a higher premium to extend the contract coverage to an additional period, or higher level of exposure, and is recognised as insurance revenue. The IASB staff observed that when the reinsurer has no right to exit or reprice the contract (the reinstatement premium is at predetermined rates), the expected cash flows related to the reinstatement premium are within the boundary of the initial reinsurance contract and voluntary reinstatement premiums cannot be considered cash flows related to a future contract.

The following flow chart may assist in the assessment of how to account for exchanges between a reinsurer and a cedant.

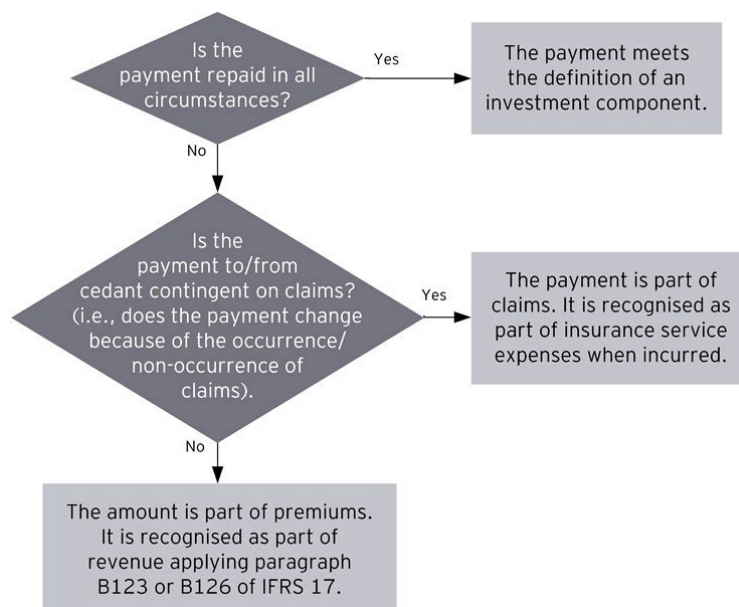

Illustration 9-19: Accounting for reinsurance commissions

Example 1

A reinsurer receives reinsurance premiums of CU6,000. The reinsurer is obligated to pay a ceding commission of 30% of the reinsurance premium (CU1,800). The premium is paid net of the ceding commission at initial recognition. No further ceding commission is payable.

As the ceding commission is charged as a fixed amount and not dependent on claims it is a reduction in insurance revenue. Insurance revenue is therefore CU4,200 (i.e., CU6,000 less CU1,800). The ceding commission is not an investment component because it is settled net of the premium at initial recognition.

Example 2

A reinsurer receives reinsurance premiums of CU6,000 at initial recognition. The reinsurer is obligated to pay a sliding scale ceding commission of between 20% and 40% of the reinsurance premium, contingent on the loss ratio of the contract. If the loss ratio is above 75% then there is a minimum commission of 20% (CU1,200) and if the loss ratio is below 55% there is a maximum commission of 40% (CU2,400). A provisional commission of CU1,800 is deducted from the premium of CU6,000 at initial recognition.

The maximum amount of the sliding scale commission of CU2,400 is not contingent on claims as it will always be received by the cedant as either a claim payment or a commission payment. Hence, insurance revenue is CU3,600 for this contract (i.e., CU6,000 less CU2,400). As in Example 1, the provisional commission of CU1,800 is not an investment component because it is settled net of the premium. The remaining commission amount of CU600 is treated as an investment component as it is repaid to the cedant at a future date after the premium has been paid.

Example 3

A reinsurer receives reinsurance premiums of CU1,000. The reinsurer is obligated to pay a profit commission of 25% (profit = reinsurance premium minus claims incurred by the reinsurer under the contract). Any profit commission amounts are paid at the end of the coverage period.

The maximum amount of the profit commission of CU250 (i.e., 25% of CU1,000) is not contingent on claims as it will always be received by the cedant either as a claim payment or a commission payment. Hence, insurance revenue is CU750 for this contract (i.e., CU1,000 less CU250). The maximum commission amount of CU250 is treated as an investment component as it is repaid to the cedant at a future date after the premium has been paid.

How we see it

During the TRG discussions, the IASB staff observed that the requirements for the presentation of income or expenses from reinsurance contracts held are based on the economic effect of exchanges between the reinsurer and the cedant. Therefore, the assessment of the economic effect of such exchanges included in the Illustration above would apply to both reinsurance contracts issued and reinsurance contracts held.

9.9.4 Determining the quantity of benefits for identifying coverage units

As discussed in section 9.7.1 above, the question of how to determine the quantity of benefits for coverage units was discussed by the TRG in both February 2018 and May 2018. In May 2018, the TRG analysed an IASB staff paper that contained the IASB staff's views on sixteen examples of different types of insurance contracts. The following Illustrations apply the principles discussed in section 9.7.1 above to specific fact patterns for reinsurance contracts issued.

Illustration 9-20: Proportional reinsurance issued

A reinsurance contract issued provides proportional cover for underlying contracts issued during the contract period. The reinsurance contract issued is for a period of one year. Underlying contracts are written uniformly throughout the year and are annual policies that are reasonably homogenous and provide relatively even cover over their one-year coverage periods.

Applying the principles in section 9.7.1 above, the expected coverage duration of the reinsurance contract issued is two years. This is because the reinsurer has a substantive obligation to provide services under the contract for a period of two years as the risks attaching over a single policy year will cover two years of exposure to risk. A valid method for determining the quantity of benefits (over which to amortise the contractual service margin) is the amount for which the policyholder has the ability to make a valid claim. This is because the pattern of coverage should reflect the expected pattern of underwriting of the underlying contracts because the level of service provided depends on the number of underlying contracts in-force. Therefore, the more contracts in-force, the higher the level of service.

Illustration 9-21: Reinsurance adverse development of claims with claim limit

A reinsurance adverse development cover contract will pay claims in excess of a stated aggregate amount on a group of underlying property and casualty contracts where the claim event has already occurred. There is a total aggregate limit to the amount payable under the contract. Because there is uncertainty in the ultimate amount and timing of the final settlements of the underlying claims, the insured event is the determination of the ultimate cost of settling those claims.

Applying the principles in section 9.7.1 above, the expected coverage duration would be the period from inception of the contract to the time at which the limit of cover is expected to be reached, adjusted for expected lapses, if any. Valid methods for determining the quantity of benefits (for amortising the contractual service margin) are:

- Comparing the contractual maximum amount that could have been claimed in the period with the remaining contractual maximum amount that can be claimed as a constant amount for each future coverage period
Or
- Comparing the expected amount of underlying claims covered in the period with the expected amount of underlying claims remaining to be covered in future periods

A straight-line method over the expected coverage duration might not be valid because it would not reflect the different levels of cover provided across periods.

Illustration 9-22: Reinsurance adverse development of claims without claim limit

A reinsurance adverse development cover contract will pay claims in excess of a stated aggregate amount on a group of underlying property and casualty contracts where the claim event has already occurred. There is no total aggregate limit to the amount payable under the contract. Because there is uncertainty in the ultimate amount and timing of the final settlements of the underlying claims, the insured event is the determination of the ultimate cost of settling those claims.

Applying the principles in section 9.7.1 above, the expected coverage duration would be the period to when the financial effect of the claims becomes certain. This may be before the claims are paid if certainty has been achieved prior to the actual payment. An entity will need to estimate the expected duration of the period in which claims will be made and payments will be made to estimate the fulfilment cash flows. Valid methods for determining the quantity of benefits are:

- Equal benefits in each coverage period, which would end at the date of the last expected settlement payment
Or
- Compare the expected amount of underlying claims covered in the period with the expected amount of underlying claims remaining to be covered in future periods
Or
- If the underlying claims were of equal size, comparing the number of underlying claims covered in the period with the number of underlying claims remaining to be covered in future periods

9.10 Impairment of assets recognised for insurance acquisition cash flows

As discussed in section 7.3 above, an entity must recognise as an asset insurance acquisition cash flows paid (or insurance acquisition cash flows for which a liability has been recognised under another IFRS accounting standard) before the related group of insurance contracts is recognised.

As a result, IFRS 17 requires an entity to assess the recoverability of any insurance acquisition cash flow asset recognised before the related group of insurance contracts is recognised at the end of each reporting period, if facts and circumstances indicate the asset may be impaired. If an entity identifies an impairment loss, the entity must adjust the carrying amount of the asset and recognise any impairment loss identified in profit or loss. If an impairment loss is reversed, an entity must adjust the carrying amount of the asset and recognise the reversal of any such loss in profit or loss. [IFRS 17.28E, IFRS 17.28F].

In assessing the recoverability: [IFRS 17.B35D]

- An entity must recognise that impairment loss in profit or loss and reduce the carrying amount of an asset for insurance acquisition cash flows so that the carrying amount of each asset does not exceed the expected net fulfilment cash inflows (see section 9.2 above) for the related group of insurance contracts.
- When an entity allocates insurance acquisition cash flows to groups of insurance contracts that will include insurance contracts that are expected to arise from renewals of the insurance contracts in that group, the entity must recognise an impairment loss in profit or loss and reduce the carrying amount of the related assets for insurance acquisition cash flows to the extent that:
 - The entity expects those insurance acquisition cash flows to exceed the net fulfilment cash inflows for the expected renewals
 - The excess determined in the preceding bullet point has not already been recognised as an impairment loss applying the requirements above for assets directly attributable to a group

An entity must recognise in profit or loss a reversal of some or all of an impairment loss previously recognised applying the requirements above and increase the carrying amount of the asset, to the extent that the impairment conditions no longer exist or have improved. [IFRS 17.28F].

It is observed in the Basis for Conclusions that the impairment test is intended to be consistent with the impairment test for capitalised contract costs in IFRS 15 (see Chapter 28) and therefore an entity recognises an impairment loss in profit or loss and reduces the carrying amount of an asset for insurance acquisition cash flows so that it does not exceed the expected net cash inflow for the related group.

[IFRS 17.BC184J].

The Basis for Conclusions also observes that an asset for insurance acquisition cash flows is measured at a group level. An impairment test at a group level compares the carrying amount of an asset for insurance acquisition cash flows allocated to a group with the expected net cash inflow of the group. That net cash inflow includes cash flows for contracts unrelated to any expected renewals but expected to be in that group. The Board, therefore, decided to require an additional impairment test specific to cash flows for expected renewals. The additional impairment test results in the recognition of any impairment losses when the entity no longer expects the renewals supporting the asset to occur or expects the net cash inflows to be lower than the amount of the asset. Without the additional impairment test, cash flows unrelated to any expected renewals might prevent the recognition of such an impairment loss. [IFRS 17.BC184K].

Illustration 9-23: Applying the two impairment tests for an insurance acquisition cash flow asset

At the beginning of Year 1 an entity pays commissions of CU38 relating to a group of contracts yet to be issued. Those commissions meet the definition of insurance acquisition cash flows.

The commissions are directly attributable to insurance contracts the entity expects to issue later in Year 1 (Group 1). The entity expects that some policyholders of those insurance contracts that will be issued in Year 1 will renew those contracts in Year 2 (Group 2), Year 3 (Group 3) and Year 4 (Group 4). Accordingly, at the beginning of Year 1, the entity allocates the commissions of CU38 on a systematic and rational basis to the expected future groups of insurance contracts as follows:

- Group 1 - CU25
- Group 2 - CU5
- Group 3 - CU5
- Group 4 - CU3

The entity recognises an asset for insurance acquisition cash flows of CU38 at the beginning of Year 1.

At the end of Year 1, the entity derecognises the asset of CU25 allocated to Group 1 and includes the insurance acquisition cash flows in the measurement of Group 1. At the end of Year 1, there are no facts and circumstances indicating that the assets for insurance acquisition cash flows allocated to each of Groups 2 to 4 may be impaired. Therefore, at the end of Year 1, the carrying amount of the asset for insurance acquisition cash flows is CU13 (i.e., CU5 + CU5 + CU3 as per above).

At the end of Year 2, the entity derecognises the asset of CU5 allocated to Group 2 and includes the insurance acquisition cash flows in the measurement of Group 2. At the end of Year 2, facts and circumstances indicate that the asset for insurance acquisition cash flows for Groups 3 and 4 may be impaired. The carrying amount of the asset for insurance acquisition cash flows subject to impairment testing is CU8 (i.e., CU5 + CU3 as per above).

To perform the impairment tests the entity estimates the following amounts:

	Year 3 (Group 3)	Year 4 (Group 4)
	CU	CU
Expected net fulfilment cash inflows		
Expected renewals	3	1
Other than renewals (new contracts to be issued)	6	1
Total expected net cash inflows	9	2
Asset for insurance acquisition cash flows	5	3
Impairment	-	(1)

Applying the additional impairment test specific to insurance acquisition cash flows allocated to expected contract renewals, the entity compares the amount of insurance acquisition cash flows allocated to expected renewals to the total expected net cash inflows for those expected renewals, as follows:

	Year 3 (Group 3)	Year 4 (Group 4)	Total
	CU	CU	CU
Expected net fulfilment cash inflows			
Amount of insurance acquisition cash flows allocated to expected renewals	5	3	8
Expected net cash inflows for expected renewals	3	1	4
Impairment			(4)

Accordingly, the entity recognises an expense in profit or loss an impairment of CU4 comprising of:

[IFRS 17.B35D]

- CU1 identified applying IFRS 17.B35D(a)
- And
- CU4 identified applying IFRS 17.B35D(b)(i) less CU1 already identified above applying IFRS 17.B35D(ii)

After recognising the total impairment loss of CU4, the entity will allocate the total amount of insurance acquisition cash flows remaining in assets of CU4 to groups of contracts still to be recognised (Group 3 and Group 4) on a systematic and rational basis.

How we see it

As discussed in sections 7.3 and 9.1.3 above, IFRS 17 does not contain specific requirements for how to allocate the acquisition cash flows to different (future) groups of insurance contracts on a systematic and rational basis. Therefore, determining such an allocation will be a matter of judgement based on facts and circumstances.

The standard requires that an entity revises the amounts of the asset for insurance acquisition cash flows allocated to each (future) group of insurance contract according to the applied systematic and rational method. The impairment test for the insurance acquisition cash flows allocated to a (future) group would be applied after carrying through any revised allocation. Such revised allocation may reduce the risk of an impairment of the amount of insurance acquisition cash flows allocated to a particular (future) group, although the entity would have to perform any revisions consistent with the systematic and rational basis for allocation.

9.11 Insurance contracts issued by mutual entities

A mutual entity accepts risks from each policyholder and pools those risks. However, a defining feature of a mutual entity is that the most residual interest of the entity is due to a policyholder and not to a shareholder. Thus, the fulfilment cash flows of an insurer that is a mutual entity generally include the rights of policyholders to the whole of any surplus of assets over liabilities. This means that, for an insurer that is a mutual entity, there must, in principle, normally be no equity remaining and no net comprehensive income reported in any accounting period. [IFRS 17.BC265]. In addition, the Basis for Conclusions clarifies that not all entities that may be described as mutual entities have the feature that the most residual interest of the entity is due to a policyholder. [IFRS 17.BC265fn33].

Payments to policyholders with a residual interest in a mutual entity vary depending on the returns on underlying items - the net asset of the mutual entity. These cash flows (i.e., the payments that vary with the underlying items) are within the boundary of an insurance contract. [IFRS 17.B65(c)]. Although policyholders with a residual interest in the entity bear the pooled risk collectively, the mutual, as a separate entity has accepted risk from each individual policyholder and therefore the risk adjustment for non-financial risk for these contracts reflects the compensation the mutual entity requires for bearing the uncertainty from non-financial risk in those contracts. However, because the net cash flows of the mutual entity are returned to policyholders, applying IFRS 17 to contracts with policyholders with a residual interest in the mutual entity will result in no contractual service margin for those contracts.

Mutual entities may also issue insurance contracts that do not provide the policyholder with a residual interest in the mutual entity. Consequently, groups of such contracts are expected to have a contractual service margin. Determining whether a contract provides the policyholder with a residual interest in the mutual entity requires consideration of all substantive rights and obligations.

The IASB also suggested that to provide useful information about its financial position a mutual can distinguish between: [IFRS 17.BC269]

- Liabilities attributable to policyholders in their capacity as policyholders
- Liabilities attributable to policyholders with the most residual interest in the entity

The statement of financial performance could include a line item "income or expenses attributable to policyholders in their capacity as policyholders before determination of the amounts attributable to policyholders with the most residual interest in the entity".

The IASB decided not to develop specific guidance for, or defining mutual entities because: [IFRS 17.BC269B]

- A core principle of IFRS 17 is the requirement to include in the fulfilment cash flows all the expected future cash flows that arise within the boundary of insurance contracts, including discretionary cash flows and those due to future policyholders
- If entities were required to account for the same insurance contract differently depending on the type of entity issuing the contract, comparability among entities would be reduced
- A robust definition of a mutual entity to which different requirements would apply would be difficult to create

9.12 Amounts receivable from an intermediary

Most insurers use intermediaries as a link between them and a policyholder to arrange an insurance contract. In many of these arrangements, the policyholder pays the cash premiums to the intermediary but the contract between the insurer and the intermediary allows the intermediary to pay the premiums to the insurer at a later date. In some situations, when the policyholder has paid the premiums to the intermediary, the policyholder has not discharged its obligation to the insurer. In other situations, when the policyholder has paid the premiums to the intermediary, the policyholder has discharged its obligation under the insurance contract and the insurer is obliged to provide insurance contract services to the policyholder. Normally, if the policyholder has discharged its obligation under the insurance contract and the intermediary fails to pay the premiums to the insurer, the insurer does not have the right to recover the premiums from the policyholder, or to cancel the insurance contract. IFRS 17 is silent on whether future cash flows within the boundary of an insurance contract are removed from the measurement of a group of insurance contracts only when these cash flows are recovered or settled in cash.

Frequently asked questions

Question 9-30: Are premiums receivable from an intermediary when a policyholder has discharged its obligation to an insurer within the scope of IFRS 9 or IFRS 17?

In September 2023, the IFRS IC discussed two submissions that asked how an entity that issues insurance contracts (insurer) applies the requirements in IFRS 17 and IFRS 9 to premiums receivable from an intermediary.

In the fact pattern described in the requests, an intermediary acts as a link between an insurer and a policyholder to arrange an insurance contract between them. The policyholder has paid in cash the premiums to the intermediary, but the insurer has not yet received in cash the premiums from the intermediary. The agreement between the insurer and the intermediary allows the intermediary to pay the premiums to the insurer at a later date.

When the policyholder paid the premiums to the intermediary, the policyholder discharged its obligation under the insurance contract and the insurer is obliged to provide insurance contract services to the policyholder. If the intermediary fails to pay the premiums to the insurer, the insurer does not have the right to recover the premiums from the policyholder, or to cancel the insurance contract.

The requests asked whether, in the submitted fact patterns, the premiums receivable from the intermediary are future cash flows within the boundary of an insurance contract and included in the measurement of the group of insurance contracts applying IFRS 17 or are a separate financial asset applying IFRS 9. The requests set out two views.

Under the first view (View 1), the insurer determines that the premiums receivable from the intermediary are future cash flows within the boundary of an insurance contract. Applying View 1, when the policyholder pays the premiums to the intermediary:

- For a group of contracts to which the premium allocation approach does not apply, the insurer continues to treat the premiums receivable from the intermediary as future cash flows within the boundary of an insurance contract and, applying IFRS 17, include them in the measurement of the group of insurance contracts until recovered in cash.

And

- For a group of contracts to which the premium allocation approach applies, the insurer does not increase the liability for remaining coverage. The liability for remaining coverage is increased only when the insurer receives the premiums in cash from the intermediary.

Under the second view (View 2), because the payment by the policyholder discharges its obligation under the insurance contract, the insurer considers the right to receive premiums from the policyholder to be settled by the right to receive premiums from the intermediary. The insurer therefore determines that the premiums receivable from the intermediary are not future cash flows within the boundary of an insurance contract but, instead, a separate financial asset. Applying View 2, when the policyholder pays the premiums to the intermediary:

- For a group of contracts to which the premium allocation approach does not apply, the insurer removes the premiums from the measurement of the group of insurance contracts and, applying IFRS 9, recognises a separate financial asset.

And

- For a group of contracts to which the premium allocation approach applies, the insurer increases the liability for remaining coverage and, applying IFRS 9, recognises a separate financial asset.

Applying the requirements in IFRS accounting standards

The Committee observed that IFRS 17 is the starting point for an insurer to consider how to account for its right to receive premiums under an insurance contract.

Paragraph 33 of IFRS 17 requires an insurer to include in the measurement of a group of insurance contracts an estimate of all the future cash flows within the boundary of each contract in the group. Paragraph B65 explains that cash flows within the boundary of an insurance contract are those that relate directly to the fulfilment of the contract, including premiums from a policyholder.

The Committee observed that paragraph B65 of IFRS 17 does not distinguish between premiums to be collected directly from a policyholder and premiums to be collected through an intermediary. In applying IFRS 17, premiums from a policyholder collected through an intermediary are therefore included in the measurement of a group of insurance contracts.

Paragraph 34 of IFRS 17 specifies that cash flows are within the boundary of an insurance contract if they arise from substantive rights and obligations that exist during the reporting period in which the entity can compel the policyholder to pay the premiums or in which the entity has a substantive obligation to provide the policyholder with insurance contract services.

In the fact pattern described in the requests, the insurer has not recovered the premiums in cash, but the policyholder has discharged its obligation under the insurance contract. The Committee observed that IFRS 17 is silent on whether future cash flows within the boundary of an insurance contract are removed from the measurement of a group of insurance contracts only when these cash flows are recovered or settled in cash.

Therefore, the Committee observed that, in accounting for premiums receivable from an intermediary when payment by the policyholder discharges the policyholder's obligation under the insurance contract, an insurer develops and applies an accounting policy in accordance with IAS 8 to determine that:

- Cash flows are removed when the cash flows are recovered or settled in cash (View 1)
- Or
- When the policyholder's obligation under the insurance contract is discharged (View 2)

IFRS 17 and IFRS 9 deal differently with the measurement, presentation and disclosure of expected credit losses from premiums receivable from an intermediary. The Committee considered that, depending on which view (View 1 or View 2) an insurer applies, it is required to apply all the measurement and disclosure requirements in the applicable IFRS accounting standards. Therefore, an insurer applies either IFRS 17 (including paragraph 131 that requires disclosure of information about the credit risk that arises from contracts within the scope of IFRS 17) or IFRS 9 (and the requirements in IFRS 7) to the premiums receivable from an intermediary.

Conclusion

In light of its analysis, the Committee considered whether to recommend that the IASB considers adding a standard-setting project on when cash flows are removed from the measurement of a group of insurance contracts to the work plan. The Committee noted that any such project would involve assessing whether changes to the Standards would have unintended consequences. This assessment may take considerable time and effort to complete because it would involve, among other steps, analysing a broad range of contracts (not only those set out in the fact pattern described in the requests). The Committee observed that the application of either View 1 or View 2 when accounting for premiums paid by a policyholder and receivable from an intermediary would provide users of financial statements with useful information based on the requirements in IFRS 17 or IFRS 9.

Consequently, the Committee concluded that a project would not be sufficiently narrow in scope that the IASB or the Committee can address it in an efficient manner. The Committee therefore decided not to recommend that the IASB considers adding a standard-setting project to the work plan.⁹ At its October 2023 meeting, the IASB discussed and did not object to, the agenda decision.

How we see it

When a policyholder has paid premiums to an intermediary but has not discharged its obligation to an insurer until the intermediary has remitted the premiums to the insurer, the premium receivables remain in the scope of IFRS 17. This is because, the right to receive premiums from the policyholder has not been settled by the right to receive premiums from the intermediary and the conditions underlying View 2 above have therefore not been satisfied.

Other receivables due from intermediaries, such as amounts withheld to pay future claims or loans made by the insurer to the intermediary are within the scope of IFRS 9 since no obligation to the policyholder has been settled.

9.13 Other matters

9.13.1 Impairment of insurance receivables

IFRS 17 does not refer to impairment of insurance receivables (e.g., amounts due from policyholders or agents in respect of insurance premiums).

A premium receivable (including premium adjustments and instalment premiums) is a right arising from an insurance (or reinsurance) contract. Rights and obligations under contracts within the scope of IFRS 17 are excluded from the scope of IFRS 9 (see section 2.3 above). As a premium receivable is a cash flow it is measured on an expected present value basis (see section 9.2 above) which must include an assessment of credit risk. This cash flow is remeasured at each reporting date. Receivables from insurance contracts are not required to be disclosed separately on the statement of financial position but are subsumed within the overall insurance contract balances (see section 15 below).

9.13.2 Policyholder loans

Some insurance contracts permit the policyholder to obtain a loan from the insurer with the insurance contract acting as collateral for the loan. Under IFRS 4, policyholder loans may have been separated from insurance contract balances and shown as separate assets. IFRS 17 regards a policyholder loan as an example of an investment component with interrelated cash flows which is not separated from the host insurance contract. [IFRS 17.BC114]. Consequently, a policyholder loan is included within the overall insurance contract balance and is part of the fulfilment cash flows (and is not within the scope of IFRS 9).

The repayment or receipt of amounts lent to and repaid by policyholders does not give rise to insurance revenue (see section 15.1 below). However, the contractual service margin is adjusted for any difference between a loan to a policyholder expected to become payable or repayable in a period and the actual loan that becomes payable or repayable in a period, after adjusting for insurance finance income or expense related to that expected payment or repayment before it becomes payable or repayable (see section 9.6.3 above).

A waiver of a loan to a policyholder would be treated the same way as any other claim.

There may be situations when an insurance policy is collateral for a stand-alone loan, not stemming from the contractual terms of an insurance contract and not highly interrelated with an insurance contract. Such a loan would be within the scope of IFRS 9.

10 Premium allocation approach

The premium allocation approach is an optional simplified form of measuring an eligible group of insurance contracts issued, reinsurance contracts issued or reinsurance contracts held. The eligibility is assessed for each group of insurance contracts and the election is made for each eligible group. However, the ability to use the premium allocation approach for reinsurance contracts held must be assessed separately from the use of the premium allocation approach for the related underlying insurance contracts covered by reinsurance (see section 11.6 below).

The IASB considers the premium allocation approach similar to the customer consideration approach in IFRS 15. [IFRS 17.BC289]. Therefore, compared to the general model, using the premium allocation approach results in a simpler accounting method is:

- The premium allocation approach does not require separate identification of the elements (i.e., the four building blocks, see section 8.1 above) of the general model until a claim is incurred. Only a total amount for a liability for remaining coverage on initial recognition is determined (see section 10.3 below).
- After initial recognition, the liability for remaining coverage is recognised over the coverage period on the basis of the passage of time unless the expected pattern of release from risk differs significantly from the passage of time, in which case, it must be recognised based on the expected timing of incurred claims and benefits (see section 10.4 below).
- An entity need only assess whether a group of insurance contracts is onerous if facts and circumstances indicate that the group is onerous. In contrast, the general model requires an assessment of whether a group of contracts is onerous at each reporting date after the initial recognition of a group (see section 9.8 above). The carrying amount of the liability for remaining coverage under the premium allocation approach will be the same as under the general model for groups of contracts that are onerous.
- An entity also has certain accounting elections available once an entity decides to use the premium allocation approach for a group of insurance contracts (see section 10.2 below).

How we see it

The premium allocation approach is intended to produce an accounting outcome similar to that of the unearned premium approach used by many non-life or short-duration insurers under IFRS 4. The results from this approach are therefore likely to be more readily understood within the context of many short-duration contracts. However, there are some important differences:

- The liability for remaining coverage is measured using premiums received minus any insurance acquisition cash flows at the measurement date. The word 'received' is interpreted literally, rather than interpreted to mean amounts due (see section 10.3 below). Under IFRS 4, the unearned premium provision would have often been set up based on premiums receivable, with a separate asset recorded for the premium receivable.
- No separate asset is recognised for deferred acquisition costs, except for those assets in respect of insurance acquisition cash flows paid before the related group of insurance contracts is recognised (see section 7.3 above). Instead, any acquisition cash flows are subsumed within the liability for remaining coverage, unless the entity elects to expense insurance acquisition cash flows (see section 10.1 below).
- Most non-life or short-duration insurers would not have discounted their insurance liabilities under IFRS 4.
- The fulfilment cash flows model required for incurred claims, which is the same as the general model except for a simplification in respect of the time value of money (see section 10.5 below), is likely to be different than the incurred claim model used under IFRS 4.

10.1 Criteria for use of the premium allocation approach

The premium allocation approach is permitted if, and only if, at the inception of the group of contracts, one of the following conditions are met: [IFRS 17.53]

- The entity reasonably expects that such simplification would produce a measurement of the liability for remaining coverage for the group that would not differ materially from the measurement that would be produced applying the requirements for the general model discussed in section 7 above (i.e., the fulfilment cash flows related to future service plus the contractual service margin).

OR

- The coverage period of each contract in the group (including insurance contract services arising from all premiums within the contract boundary determined at that date applying the requirements discussed in section 9.1 above) is one year or less.

The second condition means that all contracts with a coverage period of one year or less qualify for the premium allocation approach, regardless of whether the first condition is met. However, for insurance contracts with a coverage period greater than one year (e.g., long-term construction insurance contracts, long-term disability insurance contracts or extended warranty-type contracts), entities will need to apply judgement in interpreting the meaning of 'that would not differ materially' (see section 10.1.2 below).

The first criterion above is not met if, at the inception of the group of contracts, an entity expects significant variability in the fulfilment cash flows that would affect the measurement of the liability for the remaining coverage during the period before a claim is incurred. Variability in the fulfilment cash flows increases with, for example: [IFRS 17.54]

- The extent of future cash flows related to any derivatives embedded in the contracts
- The length of the coverage period of the group of contracts

A discussion identifying the main sources of variability between the premium allocation approach and the general model is included in section 10.1.1 below. A discussion of the meaning of 'differ materially in these circumstances' is included in section 10.1.2 below.

Frequently asked questions

Question 10-1: Is an entity required or permitted to reassess a contract's eligibility for the premium allocation approach and as a result to revoke its election to apply the approach?

(TRG meeting April 2019 - Agenda paper no. 2, Log S123)

No. An entity may apply the premium allocation approach to some insurance contracts provided that certain criteria are met at inception. As required by IFRS 17.53, the criteria are assessed for each group and the election is made for each group meeting the criteria. Given the eligibility criteria are assessed *at inception*, the standard does not require or permit reassessment of the eligibility criteria or the election to apply the approach subsequent to initial recognition.

If an entity applied the premium allocation approach to a contract that is subsequently modified to such an extent that the contract no longer meets the eligibility criteria, the entity must derecognise the original contract and recognise the modified contract as a new contract, applying IFRS 17 or other applicable standards. [IFRS 17.72(c)].

How we see it

The eligibility criteria required for use of the premium allocation approach under IFRS 17 means that not all contracts regulated as 'non-life' or 'short-duration' by local regulators will qualify for that approach.

Contracts with a coverage period of one year or less are always eligible for the premium allocation approach. Those with a coverage period of more than a year may also be eligible. However, an entity must determine, at inception of a group of contracts, that the measurement of the liability for remaining coverage at each reporting date measured under the premium allocation approach will not be materially different from the outcome under the general model.

IFRS 17 does, in principle, not prohibit an entity from applying the premium allocation approach to eligible groups of contracts that would otherwise be required to apply the variable fee approach. However, the situations where such variable fee contracts would be eligible is likely to be limited to groups of contracts with a coverage period of one year or less. For groups of contracts with a coverage period of more than a year it will be very difficult to demonstrate that the outcome under the premium allocation approach will not be materially different from that under the variable fee model given the specific nature of contracts with direct participation features.

10.1.1 Main sources of difference between the premium allocation approach and the general approach

The first criterion for use of the premium allocation approach discussed in section 10.1 above involves a comparison of the liability for remaining coverage under the general model and the premium allocation approach over the expected period of the liability for remaining coverage. This assessment is made at inception and is not reassessed subsequently.

Under all situations the liability for incurred claims is the same between the premium allocation approach and general model. This means that after the coverage period has expired there will be no difference between the two approaches, unless the election not to discount incurred claims, discussed in section 10.2 below, is used. However, several situations exist under which the premium allocation approach and the general model could produce different measurements for the liability for remaining coverage during the coverage period, and therefore could impact the eligibility of the premium allocation approach. These must be considered when designing the approach used for assessing the applicability of the premium allocation approach. Three examples of potential sources of differences are, as follows:

- Changing expectations of profitability for the period of remaining coverage - see section 10.1.1.A below
- Changing interest rates - see section 10.1.1.B below
- Uneven revenue recognition - see section 10.1.1.C below

10.1.1.A Changing expectations of profitability for the period of remaining coverage

When the expectation of the remaining profitability changes during the coverage period of a group of insurance contracts, so that it is still profitable, the results can differ under the premium allocation approach and general model. In this situation, the premium allocation approach will not recognise this improvement or deterioration in profitability in an explicit way until the exposure is earned, whereas the general model will recognise a portion of this change in expectations now through the unwinding of the contractual service margin even though the exposure has not yet been earned.

The significance of this difference will vary depending on how likely it is that the expected profitability of the remaining coverage might change and how much it may vary by. However, if the change in expectation of future profitability is to such an extent that the contract becomes onerous under the general model, then both approaches will give the same results.

10.1.1.B Changing interest rates

Under the premium allocation approach, if there is a significant financing component, an amount should be included for accretion of interest although this is based on the interest rate at the date of initial recognition of the group (see section 9.3 above). As a result, the premium allocation approach never considers the current interest rates for the liability for remaining coverage, unlike the general model. So, if the discount rate changes significantly from the initial recognition of the contract this will result in a difference in the liability for remaining coverage between the premium allocation approach and the general model. The impact of this difference and its significance will depend on various factors including how large the discounting impact was originally, how large a change might reasonably be expected in the currency of the liabilities during the coverage period and the length of term of the liabilities. Longer-tailed contracts are more likely to be affected by discounting than shorter-tailed contracts.

10.1.1.C Uneven revenue recognition patterns

Under the premium allocation approach, revenue is based on the passage of time or expected pattern of release of risk (see section 10.4 below). However, under the general model, the contractual service margin is allocated based on coverage units reflecting the expected quantity of benefits and duration of each group of insurance contracts (see section 9.7 above).

One example of where differences in revenue recognition between the two approaches could occur is for contracts in which the claims vary due to seasonality, and therefore the timing of claims occurring would not be evenly spread over coverage period based on the passage of time. This could arise if the release of risk is 'significantly different from the passage of time'. For example, property insurance contracts exposed to catastrophes tend to have uneven earnings patterns.

Illustration 10-1: Comparison of the liability for remaining coverage under the general model and the premium allocation approach when there are changes in expected cash flows

Consider a group of contracts measured in accordance with the general model. A premium of CU2,000 is received at the beginning of a two-year coverage period. The entity estimates fulfilment cash flows in years 1 and 2 will be CU900 each year. The opening contractual service margin is CU200 [CU2,000 - CU900 - CU900 = CU200] (for illustration purposes, discount and risk adjustment are ignored).

The entity incurs claims in year one, as expected, of CU900. At the end of year one, the entity assumes that cash flows in the following year of coverage will increase from the previous estimate of CU900 to CU950. In terms of IFRS 17.44(c), this change in the fulfilment cash flows relates to future services and consequently reduces the contractual service margin from CU200 to CU150. The amount recognised as insurance revenue because of the transfer of services in the period, determined by the allocation of the contractual service margin remaining at the end of the reporting period (before any allocation) over the current and remaining coverage period applying IFRS 17.B119 amounts to CU75 (CU150 ÷ 2).

	Contractual service margin
	CU
At beginning of year 1	200
Adjustment for future service	(50)
Allocation to profit or loss	(75)
At the end of year 1	75

The liability for remaining coverage at the end of year 1, in accordance with the general model, would be CU950 + CU75 = CU1,025.

Revenue in year 1 would be CU975 [expected insurance service expense of CU900 + release of the contractual service margin of CU75]. Revenue in year 2 would be CU1,025 [expected insurance service expense of CU950 + release of the contractual service margin of CU75].

If the entity had applied the premium allocation approach, it would have allocated CU1,000 to profit or loss in year 1 (assuming that the expected release of risk would still not be differing significantly from the release of risk at the end of year 1) as revenue and the liability for remaining coverage at the end of year 1 would be CU1,000, i.e., a different amount compared with the general model.

This example illustrates that requirement in the general model to allocate an amount of the contractual service margin in profit or loss after making adjustments for changes in expected cash flows relating to future service can cause the liability for remaining coverage (in accordance with the general model) to differ from the liability for remaining coverage (in accordance with the premium allocation approach).

10.1.2 Applying materiality for the premium allocation approach eligibility assessment

In order to qualify for the premium allocation approach under the first criterion in section 10.1 above, the measurement for the liability for remaining coverage must not 'differ materially' from that produced applying the general model. Materiality is defined in IAS 1 and IAS 8 (by cross reference to IAS 1) as follows: [IAS 1.7, IAS 8.5]

Extract from IAS 1

7 The following terms are used in this Standard with the meanings specified:

...

Material:

Information is material if omitting, misstating or obscuring it could reasonably be expected to influence decisions that the primary users of general purpose financial statements make on the basis of those financial statements, which provide financial information about a specific reporting entity.

...

In addition to the general requirements of IAS 1 and IAS 8, there are specific materiality requirements in IFRS 17. Eligibility for the application of the premium allocation approach must be assessed for each group of insurance contracts, [IFRS 17.53], and therefore materiality is considered at the group of contracts level. If the measurement of the liability for remaining coverage is not materially different for a group of insurance contracts measured using the premium allocation approach compared to that calculated using the general model in a range of scenarios that have a reasonable possibility of occurring, then the premium allocation approach can be adopted for that particular group.

How we see it

As IFRS 17 does not contain any further specific guidance on how to determine whether outcomes are materially different, judgement will need to be applied in setting the thresholds and determining how these thresholds are applied.

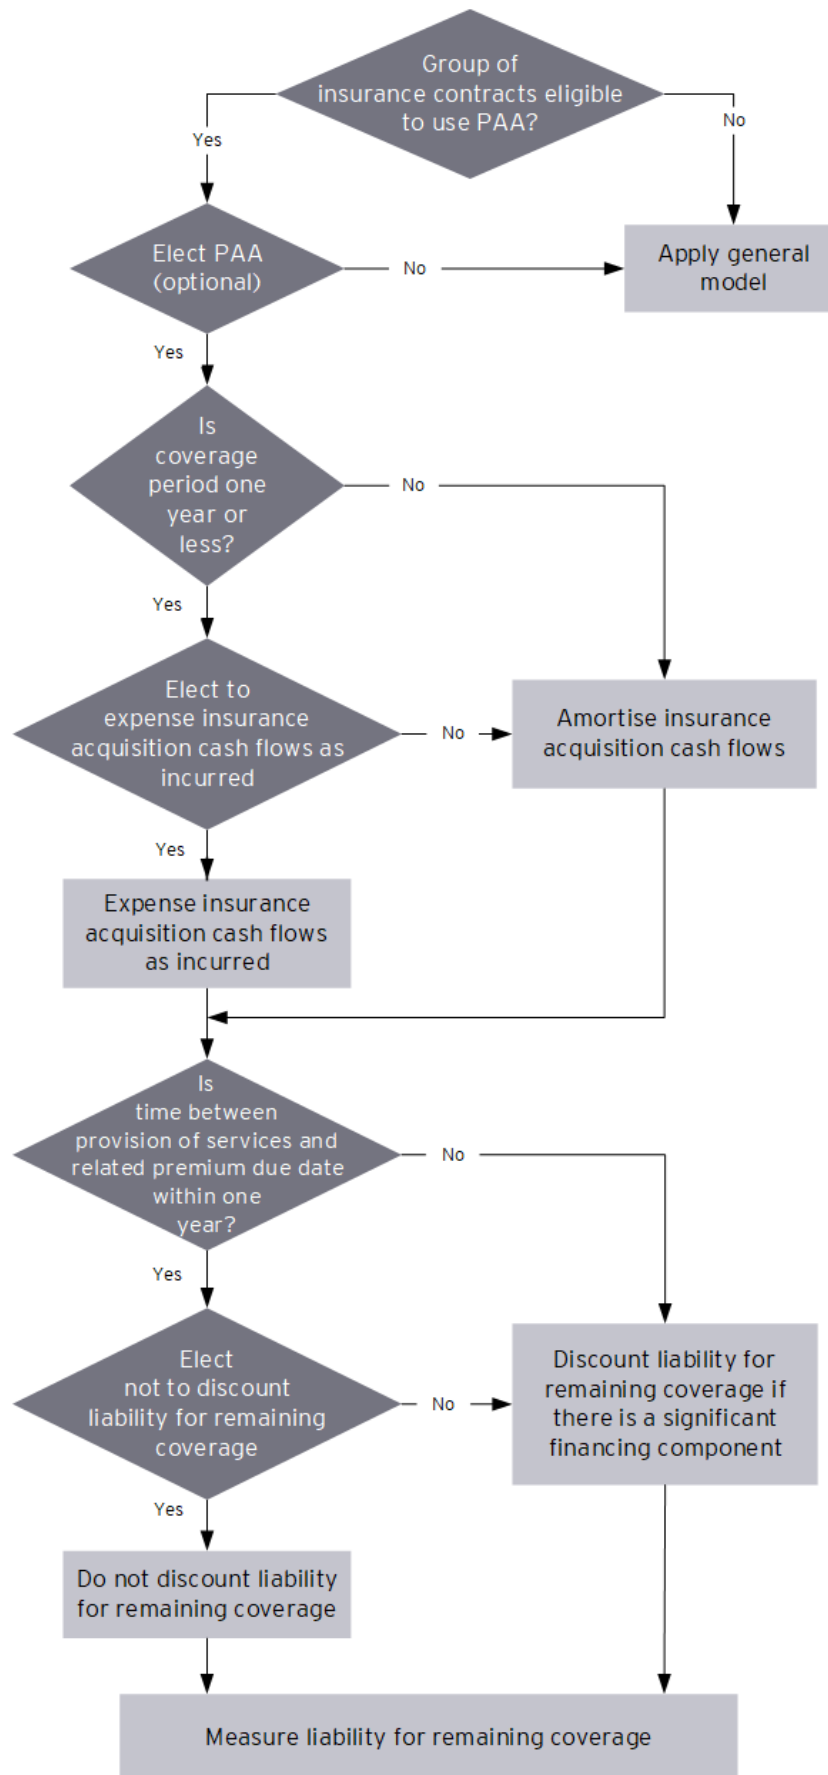

IFRS 17 also does not contain any specific guidance on what 'reasonably expects' entails. Therefore, an entity needs to apply judgement in identifying the range of relevant scenarios within the context of the specific features and circumstances of the group (e.g., duration of the contracts, expected profitability, volatility of profitability, earnings pattern, payment pattern, currency, etc.). The future scenarios should reflect the variability in the fulfilment cash flows the entity expects that would affect the measurement of the liability for remaining coverage during the period before a claim is incurred.

10.2 Elections under the premium allocation approach

Once an entity decides to use the premium allocation approach for a group of contracts, the following elections are available for the group, in certain circumstances:

- Whether to recognise insurance acquisition cash flows as an expense when it incurs those costs or to include those cash flows within the liability for remaining coverage (and hence amortise those cash flows over the coverage period). An entity is able to recognise insurance acquisition cash flows as an expense when it incurs those costs, provided that the coverage period of each contract in the group on initial recognition is no more than one year. Otherwise, acquisition cash flows must be included within the liability for remaining coverage. [IFRS 17.59(a)].
- Whether or not to adjust the liability for remaining coverage to reflect the time value of money and the effect of financial risk. An entity is not required to adjust the liability for remaining coverage to reflect the time value of money and the effect of financial risk if, at initial recognition, the entity expects that the time between providing each part of the services and the related premium due date is no more than one year. Otherwise, the liability for remaining coverage must be adjusted to reflect the time value of money and the effect of financial risk using the discount rates as determined on initial recognition if the insurance contracts in the group have a significant financing component. [IFRS 17.56].
- Whether or not adjust the liability for incurred claims for the time value of money and the effect of financial risk if those cash flows are expected to be paid or received within one year or less from the date that the claims are incurred (see section 10.5 below).

The diagram below shows the elections that are available for the liability for remaining coverage for groups of contracts measured in accordance with the premium allocation approach.

10.3 Measurement of the liability for remaining coverage on initial recognition

An entity measures the liability for remaining coverage on initial recognition of a group of insurance contracts eligible for the PAA that are not onerous, as follows: *[IFRS 17.55(a)]*

- The premium, if any, received at initial recognition
Minus
- Any insurance acquisition cash flows at that date, unless the entity is eligible and chooses to recognise the payments as an expense (provided coverage period is a year or less)
Plus or minus
- Any amount arising from the derecognition at that date of:
 - Any asset for insurance acquisition cash flows that the entity paid before the related group of insurance contracts is recognised (see section 7.3 above)
And
 - Any other asset or liability previously recognised for cash flows related to the group of contracts (see section 9.5.1 above)

Premium received means 'received' rather than receivable or due (see FAQ 10-2 below).

The carrying amount of the liability for remaining coverage must be adjusted to reflect the time value of money and the effect of financial risk when the insurance contracts in the group have a significant financing component. The discount rate is the rate at the date of initial recognition of the group determined using the requirements discussed in section 9.3 above. An entity is permitted to adjust the liability for remaining coverage to reflect the time value of money and the effect of financial risk irrespective of whether the contracts in the group have a significant financing component. However, an entity is not required to adjust the carrying amount of the liability for remaining coverage to reflect the time value of money and the effect of financial risk if, at initial recognition, the entity expects that the time between providing each part of the service and the related premium due date is no more than one year. *[IFRS 17.56]*.

If the entity is not able, or chooses not, to recognise insurance acquisition cash flows as an expense when incurred (see section 10.2 above) the insurance acquisition cash flows are included in the measurement of the liability for remaining coverage. The effect of recognising insurance acquisition cash flows as an expense when incurred, increases the liability for remaining coverage. There would be an increased profit or loss expense at the date the expense is incurred (which may be before the initial recognition of the contract) followed by an increase in profit released from the liability for remaining coverage over the coverage period.

An entity applying the premium allocation approach must assume that no contracts in the portfolio are onerous at initial recognition, unless facts and circumstances indicate otherwise. An entity must assess whether contracts that are not onerous at initial recognition have no significant possibility of becoming onerous subsequently by assessing the likelihood of changes in applicable facts and circumstances.

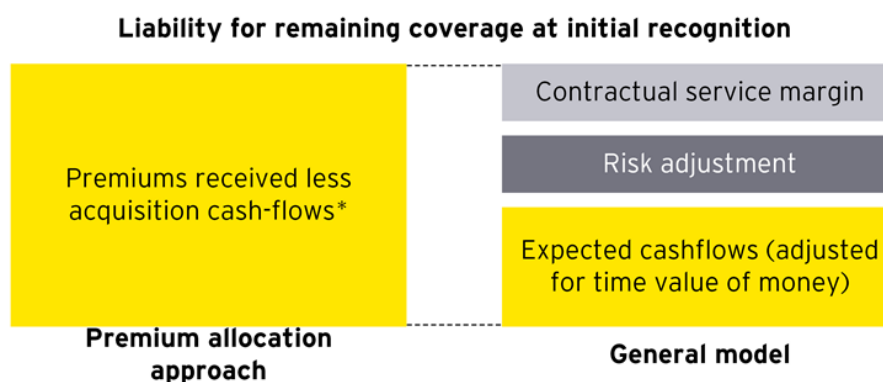

[IFRS 17.18].

If at initial recognition and at any time during the coverage period, facts and circumstances indicate that a group of insurance contracts is onerous, an entity must calculate the difference between: *[IFRS 17.57]*

- The carrying amount of the liability for the remaining coverage as determined above
And
- The fulfilment cash flows (see sections 9.2 to 9.4 above) that relate to the remaining coverage of the group of contracts

Any difference arising is recognised as a loss in profit or loss and increases the liability for remaining coverage. *[IFRS 17.58]*. In performing the fulfilment cash flows calculation, above, if an entity does not adjust the liability for incurred claims to reflect the time value of money and the effect of financial risk, it must also not include any such adjustment in the fulfilment cash flows. *[IFRS 17.57(b)]*.

The following diagram provides an overview of the premium allocation approach on initial recognition compared to the general model, assuming the entity does not expense insurance acquisition cash flows as incurred:

* For groups of contracts that are not onerous and for which the entity chooses not to expense acquisition cash flows as incurred.

Frequently asked questions

Question 10-2: Do paragraphs 55(a)(i) and 55(b)(i) of IFRS 17 preclude the recognition of future premiums already invoiced but not yet paid and future premiums not yet invoiced in the measurement of the liability for remaining coverage applying the premium allocation approach?

(TRG meeting February 2018 - Agenda paper no. 7, Log S23 and May 2018 - Agenda paper no. 6, Appendix A, Topic 2 S27)

Yes. The TRG members agreed with the IASB staff view that the words 'premiums, if any, received' in IFRS 17.55(a)(i) and 55(b)(i) means premiums actually received at the reporting date. It does not include premiums due or premiums expected. However, the TRG members noted that applying these requirements reflects a significant change from existing practice and this change will result in implementation complexities and costs. However, the IASB concluded not to amend the standard.

Illustration 10-2: Measurement at initial recognition of a group of insurance contracts using the premium allocation approach

An entity issues a group of insurance contracts on 1 July 20X1. The insurance contracts have a coverage period of 10 months that ends on 30 April 20X2. The entity's annual reporting period ends on 31 December each year and the entity prepares interim financial statements as of 30 June each year.

The entity expects to receive premiums of CU1,220 and to pay directly attributable acquisition cash flows of CU20. It is anticipated that no contracts will lapse during the coverage period and that facts and circumstances do not indicate that the group of contracts is onerous.

The group of insurance contracts qualifies for the premium allocation approach. As the time between providing each part of the coverage and the related premium due is no more than a year, the entity chooses not to adjust the carrying amount of the liability for remaining coverage to reflect the time value of money and the effect of financial risk (therefore no discounting or interest accretion is applied). Further, the entity chooses to recognise the insurance acquisition cash flows as an expense when it incurs the relevant costs. All other amounts, including the investment component, are ignored for simplicity.

On initial recognition, assuming the premiums were received and the acquisition cash flows paid, the liability for remaining coverage is CU1,220 (i.e., the premium received). The acquisition cash flows of CU20 are expensed as incurred. If the premiums were not received on initial recognition (i.e., they are receivable at a later date) then the liability for remaining coverage is CU0.

How we see it

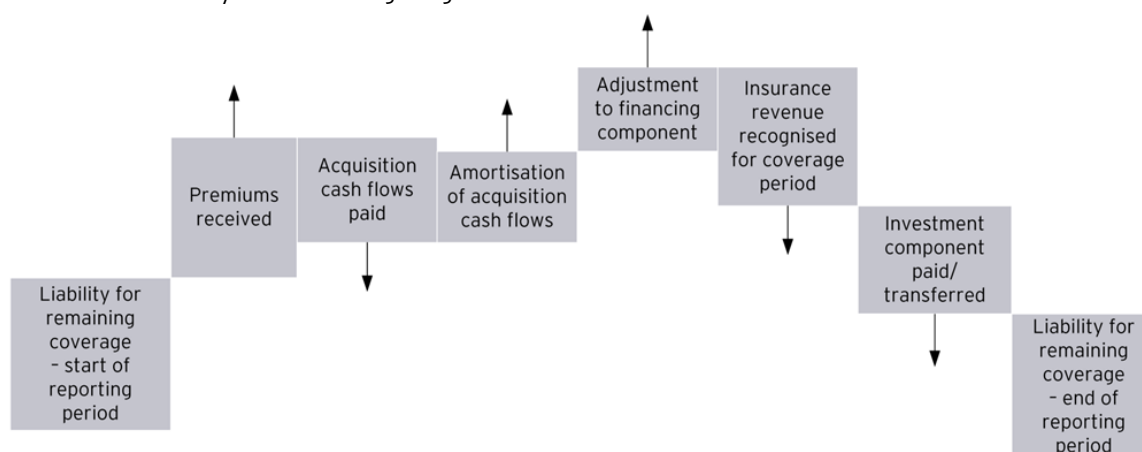

If the entity does not expense insurance acquisition cash flows as incurred, these cash flows will reduce the liability for remaining coverage. Therefore, the effect of recognising insurance acquisition cash flows as an expense when incurred results in a higher liability for remaining coverage. This will reduce the likelihood of any subsequent onerous contract loss. There would be an increased profit or loss expense at the date the cost is incurred followed by an increase in profit released from the liability for remaining coverage over the coverage period.

10.4 Subsequent measurement - liability for remaining coverage

At the end of each subsequent reporting period, assuming the group of insurance contracts is not onerous, the carrying amount of the liability is the carrying amount at the start of the reporting period: [IFRS 17.55(b)]

- Plus the premiums received in the period
- Minus insurance acquisition cash flows, unless the entity is eligible and chooses to recognise the payments as an expense (see section 10.2 above)
- Plus any amounts relating to amortising insurance acquisition cash flows recognised as an expense in the reporting period, unless the entity is eligible and chooses to recognise the payments as an expense when incurred
- Plus any adjustment to a financing component, if any (see below)
- Minus the amount recognised as insurance revenue for services provided in that period
- Minus any investment component paid or transferred to the liability for incurred claims

This can be illustrated by the following diagram:

If a group of insurance contracts was onerous at initial recognition, then an entity would continue to compare the carrying amount of the liability for remaining coverage as calculated above with the fulfilment cash flows and recognise any further deficits or surpluses (to the extent that the fulfilment cash flows still exceed the liability for remaining coverage on a cumulative basis) in profit or loss.

Under the premium allocation approach, insurance revenue for the period is the amount of expected premium receipts (excluding any investment component and after adjustment to reflect the time value of money and the effect of financial risk, if applicable) allocated to the period for services provided. An entity must allocate the expected premium receipts to each period of insurance contract services: [IFRS 17.B126]

- On the basis of the passage of time
- But
- If the expected pattern of release of risk during the coverage period differs significantly from the passage of time (which might be the case, for example, if risk of claims were skewed towards a particular time of year such as the 'hurricane season'), on the basis of the expected timing of incurred insurance service expenses

An entity must change the basis of allocation between the two methods (passage of time and incurred insurance service expenses) as necessary if facts and circumstances change. [IFRS 17.B127].

How we see it

The liability for remaining coverage may be an asset balance if premiums are received after the recognition of revenue. This is because revenue is determined by the provision of services, independent of the receipt of cash.

An entity needs to apply judgement in interpreting 'differs significantly from the passage of time' when determining the appropriate basis for allocating insurance revenue to the period for services provided.

A change in the basis of allocating insurance between the two methods (passage of time and expected timing of incurred insurance service expenses) results from new information and accordingly is not a correction of an error and will be accounted for prospectively as a change in accounting estimate (see section 15.2.1.B below).

The following Illustration shows the subsequent measurement of a group of insurance contracts using the premium allocation approach assuming the same fact pattern as Illustration 10-2 in section 10.3 above.

Illustration 10-3: Measurement subsequent to initial recognition of a group of insurance contracts using the premium allocation approach

Assuming the same fact pattern as Illustration 10-2 in section 10.3 above.

On initial recognition, the entity receives all premiums and pays all acquisition cash flows. The entity expects to be released from risk evenly over the 10-month contract period. At the reporting date (31 December 2023), the contract is still not expected to be onerous.

For the six-month reporting period ending on 31 December 20X3, the entity recognises insurance revenue of CU732 (i.e., 60% of CU1,220). The insurance acquisition cash flows of CU20 are recognised as insurance service expense (as per Illustration 10-2 above, the entity has chosen to recognise the acquisition cash flows as incurred and not over the passage of time).

At 31 December 20X3, the liability for remaining coverage is CU488 (i.e., CU1,220 - CU732 or 40% of CU1,220). Note that, alternatively, if premiums were not received/paid until 1 January 20X4, the liability for remaining coverage would be an asset of CU732 at 31 December 20X3.

For the six-month reporting period ending 30 June 20X4, the entity recognises the remaining CU488 as insurance revenue and there is no liability for remaining coverage at 30 June 20X4.

Frequently asked questions

Question 10-3: How should differences between expected premiums and actual premiums which relate to current or past service be accounted for applying the premium allocation approach?

(TRG meeting September 2018 - Agenda paper no. 4, Log S53)

The TRG agreed with an IASB staff paper which stated that any premium experience adjustments under the premium allocation approach are part of expected premium receipts. Therefore, in applying paragraph B126 of IFRS 17, these are allocated to insurance revenue on the basis of either the passage of time or the expected release from risk (see above). If the expected pattern of release of risk differs significantly from the passage of time, the expected premium receipts are allocated over the coverage period on the basis of the expected timing of the incurred insurance service expense.

How we see it

The approach to allocate premium experience adjustments (i.e., the difference between the premium receipt expected and the actual premium cash flows received in the period) to insurance revenue on the basis of either the passage of time or the expected release from risk does not appear to preclude an entity from allocating any premium experience adjustment to both past and future services and, hence, recognise the resulting revenue relating to past services in the current period. Splitting the premium experience adjustment between past and future periods adds complexity.

IFRS 17, for the general model, contains the principle that changes in fulfilment cash flows relating to past service should not adjust the contractual service margin but be recorded in profit or loss for the period (see section 9.6.3 above). Considering this principle, when applying the premium allocation approach, it would be appropriate to also record changes in expected future premiums of the liability for remaining coverage that relate to past service in profit or loss as an adjustment to insurance revenue for the period. This would result in a treatment consistent with that of premium experience adjustments under the general model.

10.5 Subsequent measurement - liability for incurred claims

The liability for incurred claims for a group of insurance contracts subject to the premium allocation approach (which should usually be nil on initial recognition) is measured in the same way as the liability for incurred claims using the general model (i.e., a discounted estimate of future cash flows with a risk adjustment for non-financial risk). See section 9.6.2 above.

However, an entity is not required to adjust the future cash flows for the time value of money and the effect of financial risk if those cash flows (for that group of insurance contracts) are expected to be paid or received in one year or less from the date the claims are incurred. [IFRS 17.59(b)]. This is a separate election from the choice not to adjust the carrying amount of the liability for remaining coverage to reflect the time value of money and the effect of financial risk at initial recognition (see section 10.2 above).

When insurance finance income or expenses is included entirely in profit or loss, incurred claims are discounted at current rates (i.e., the rate at the reporting date). When insurance finance income or expenses is disaggregated between profit or loss and other comprehensive income (see section 15.3 below) the amount of insurance finance income or expenses included in profit or loss is determined using the discount rate at the date of the incurred claim (see section 9.3 above).

Frequently asked questions

Question 10-4: Why is the option in IFRS 17.59(b) where an entity is not required to adjust future cash flows in the liability for incurred claims for the time value of money and the effect of financial risk if those cash flows are expected to be paid or received in one year or less from the date the claims are incurred, limited to groups of contracts applying the premium allocation approach?

(TRG meeting September 2018 - Agenda paper no. 11, Log S64)

This practical expedient is a simplification that applies only to groups of insurance contracts accounted for applying the premium allocation approach which is a simplified approach. Applying the requirements of IFRS 17 to contracts applying the general model, subject to materiality considerations, an entity is required to adjust the estimates of future cash flows to reflect the time value of money and the effect of financial risk.

Illustration 10-4: Subsequent measurement of the liability for incurred claims using the premium allocation approach

Assuming the same fact pattern as Illustration 10-2 above.

For the six-month reporting period ending on 31 December 20X3, there were claims of CU636 incurred, including a risk adjustment for non-financial risk related to those claims of CU36. None of the claims have been paid at the reporting date. The claims will be paid within one year after the claims are incurred. Therefore, the entity chooses not to adjust the liability for incurred claims for the time value of money and the effect of financial risk.

At 31 December 20X3, the liability for incurred claims is CU636, which is also the amount for incurred claims recorded in profit or loss as insurance service expenses.

For the six-month reporting period ending on 30 June 20X4, there were claims incurred of CU424, including a risk adjustment for non-financial risk related to those claims of CU24. During the period claims of CU800 were paid.

At 30 June 20X4 the total liability for incurred claims and the risk adjustment for non-financial risk is CU260 (i.e., CU636 + CU400 + CU24 - CU800). The total incurred claims recognised in profit or loss as insurance service expenses for the six-month reporting period ending on 30 June 20X4 is CU424 (i.e., CU400 + CU24).

How we see it

It is possible that a group of insurance contracts may exist for which the entity would be eligible not to adjust the liability for remaining coverage for time value of money (because the contract does not contain a significant financing component or it does contain a significant financing component but each part of the coverage and the related premium due date are within one year) but for which it may have to discount the liability for incurred claims (because the claims are not expected to settle within one year or less from the date in which they are incurred). This would likely be the case for products with short coverage periods and long-tail claim settlement periods.

IFRS 17 does not state whether the discounting election above relating to the liability for incurred claims is irrevocable or not. There may be circumstances in which groups of claims that were expected originally to be settled within one year (and, hence, not discounted) subsequently turn out to take much longer to settle. In those circumstances, an entity should start discounting the claims in the period in which it identifies such change and account for the impact of the change prospectively (as this is a change in estimate).

11 Reinsurance contracts held

IFRS 17 defines a reinsurance contract as follows: [IFRS 17 Appendix A].

Extract from IFRS 17

Appendix A

Defined terms

reinsurance contract

An **insurance contract** issued by one entity (the reinsurer) to compensate another entity for claims arising from one or more **insurance contracts** issued by that other entity (underlying contracts).

IFRS 17 requires a reinsurance contract held to be accounted for separately from the underlying insurance contracts to which it relates. This is because an entity that holds a reinsurance contract (a cedant) does not normally have a right to reduce the amounts it owes to the underlying policyholder by amounts it expects to receive from the reinsurer. It is acknowledged in the Basis for Conclusions that separate accounting for the reinsurance contracts and their underlying insurance contracts might create mismatches that some regard as purely accounting, for example, on the timing of recognition, the measurement of the reinsurance contracts and the recognition of profit. However, the Board concluded that accounting for a reinsurance contract held separately from the underlying insurance contracts gives a faithful representation of the entity's rights and obligations and the related income and expenses from both contracts. [IFRS 17.BC298]. Examples of potential accounting mismatches are:

- Contract boundaries for reinsurance held may differ from those of the underlying direct insurance contracts. As a result, accounting for reinsurance held requires the cedant (insurer) to estimate cash flows for underlying direct contracts that have not been issued yet but are within the boundary of the reinsurance contract held (see section 11.2 below).
- Underlying insurance contracts may meet one of the criteria to apply the premium allocation approach, but the related reinsurance contracts do not, possibly because the contract boundary of the reinsurance contract held differs from that of the underlying insurance contracts (see section 11.6 below).
- Reinsurance contracts held cannot be accounted for under the variable fee approach even if the underlying direct insurance contracts are accounted for under the variable fee approach (see section 11.7 below).

A modified version of the general model is applied by cedants for reinsurance contracts held. This is to reflect that: [IFRS 17.BC302]

- Groups of reinsurance contracts held are usually assets rather than liabilities
- Entities holding reinsurance contracts generally pay a margin to the reinsurer as an implicit part of the premium rather than making profits from the reinsurance contracts

Most reinsurance contracts held will be 'loss making' if the underlying insurance contracts to which they relate are profitable. Given that IFRS 17 does not permit gains on initial recognition of insurance contracts issued, it would seem inappropriate to require anticipated losses on related reinsurance contracts held to be expensed on initial recognition. This would create an accounting mismatch.

The following table includes a comparison between the general model for insurance contracts issued and modifications of the general model for reinsurance contracts held:

General model for insurance contracts issued	Modifications of general model for reinsurance contracts held
Recognition	
<p>A group of insurance contracts issued is recognised from the earlier of: (see section 7 above)</p> <ul style="list-style-type: none"> ▪ The beginning of the coverage period of the group of contracts Or ▪ The date when the first payment from a policyholder in the group becomes due Or ▪ For a group of onerous contracts, when the group becomes onerous 	<p>A group of reinsurance contracts held is recognised from the earlier of:</p> <ul style="list-style-type: none"> ▪ The beginning of the coverage period of the group of reinsurance contracts held Or ▪ The date the entity recognises an onerous group of underlying insurance contracts, if the entity entered into the related reinsurance contract held in the group of reinsurance contracts entered into at or before that date <p>(A simplification exists for proportionate reinsurance (see section 11.3 below))</p>
Measurement	
<p>The contract boundary requirements under the general model also apply to reinsurance contracts held (see section 11.2 below). However, due to different terms and conditions of the reinsurance contracts held, contract boundaries for reinsurance held may differ from those of the underlying direct insurance contracts.</p>	
<p>Assumptions used for measurement must be consistent with the assumptions used for measurement of the underlying insurance contracts issued (see section 11.4.1 below).</p>	
<p>The risk adjustment for non-financial risk reflects the compensation that the insurer requires for bearing the uncertainty about the amount and timing of the cash flows that arises from non-financial risk (see section 9.4 above).</p>	<p>The risk adjustment for non-financial risk reflects the amount of the risk transferred from the insurer to the reinsurer. <i>[IFRS 17.64]</i>.</p>
<p>The non-performance risk of the insurer must not be reflected in the fulfilment cash flows of the insurance contracts issued (see section 9.2 above). However, an assessment of credit risk of amounts due from policyholders or agents must be reflected in the fulfilment cash flows (see section 9.13.1 above).</p>	<p>Non-performance risk of the reinsurer must be included in the measurement of the fulfilment cash flows of the reinsurance contracts held (see section 11.4.4 below).</p>
<p>Day 1 gains are initially recognised in the statement of financial position as a contractual service margin and recognised in profit or loss as the insurer renders services. In contrast, all day 1 losses are recognised in profit or loss immediately.</p>	<p>All day 1 differences are initially recognised in the statement of financial position as a contractual service margin and recognised in profit or loss as the reinsurer renders services, except for:</p> <ul style="list-style-type: none"> ▪ Any portion of a day 1 difference (i.e., the net cost of purchasing reinsurance cover) that relates to events before initial recognition of the reinsurance contract held Or ▪ Any day 1 gain on initial recognition of the reinsurance contract held which is expected to recover the losses at initial recognition of onerous underlying insurance contracts. (See section 11.4 below)
<p>Changes in the fulfilment cash flows adjust the contractual service margin if they relate to future coverage and other future services (see section 9.7 above).</p>	<p>Changes in the fulfilment cash flows adjust the contractual service margin if they relate to future coverage and other future services. However, changes in fulfilment cash flows are recognised in profit or loss if the related changes in the underlying contracts are also recognised in profit or loss when the underlying contracts are onerous (see section 11.5 below).</p>

How we see it

Key considerations arising for insurers will be the extent of any accounting mismatches arising from the different treatment of reinsurance contracts held compared to the underlying insurance contracts.

Accounting mismatches may arise from the requirement to account for reinsurance contracts held separately from the underlying insurance contracts. One example of this is that a different measurement model (general model, variable fee approach or premium allocation approach) could be applied to the underlying insurance contracts, than the one applied to the reinsurance held contract (general model or premium allocation approach).

11.1 Level of aggregation

An entity must divide portfolios of reinsurance contracts held by applying the same criteria as for insurance contracts issued discussed in section 6 above, with the provision that references to onerous contracts (see section 9.8 above) must be replaced with a reference to contracts on which there is a net gain on initial recognition. [IFRS 17.61]. This appears to mean that a portfolio of reinsurance contracts held must be divided at least into:

- A group of contracts on which there is a net gain on initial recognition (i.e., a net inflow), if any
- A group of contracts that have no significant possibility of a net gain arising subsequent to initial recognition, if any
- A group of the remaining contracts in the portfolio

An entity is not allowed to group contracts purchased more than a year apart. A group of contracts is not reassessed after initial recognition. It is acknowledged by IFRS 17 that, for some reinsurance contracts held, applying the general model, as modified, will result in a group that comprises a single contract.

[IFRS 17.61].

A reinsurance contract held cannot be onerous. Therefore, the requirements for onerous contracts in the general model (see section 9.8 above) do not apply. [IFRS 17.68].

Frequently asked questions

Question 11-1: Should a reinsurance contract held be separated into components for measurement purposes to reflect the underlying contracts covered? For example, should a reinsurance contract held that provides coverage to underlying contracts that are included in different groups of insurance contracts be separated?

(TRG meeting February 2018 - Agenda paper no. 1, Log S19)

In the context of considering separation of insurance components within a single insurance contract (see section 6.1.1 above), the TRG observed that the fact that a reinsurance contract held provides cover for underlying contracts that are included in different groups is not in itself, sufficient to conclude that accounting for the reinsurance contract held as a single contract does not reflect the substance of its contractual rights and obligations.

11.2 The boundary of a reinsurance contract held

The contract boundary requirements of IFRS 17 (see section 9.1 above) also apply to reinsurance contracts held.

Frequently asked questions

Question 11-2: Should the boundary of a reinsurance contract held include anticipated cash flows from unissued underlying contracts?

(TRG meeting February 2018 - Agenda paper no. 3, Log S18)

Yes. In some cases, reinsurance contracts held offer protection for underlying contracts that an entity has not yet issued. The question arises as to whether the boundary of a reinsurance contract held should include those anticipated cash flows from unissued underlying contracts (which will not have been recognised as underlying insurance contracts by the entity).

In February 2018, this issue was discussed by the TRG who agreed with the IASB staff's conclusion that the application of the contract boundary requirements to reinsurance contracts held means that cash flows within the boundary of a reinsurance contract held arise from substantive rights and obligations of the entity, i.e., the holder of the contract. Therefore:

- A substantive right to receive services from the reinsurer ends when the reinsurer has the practical ability to reassess the risks transferred to the reinsurer and can set a price or level of benefits for the contract to fully reflect the reassessed risk, or when the reinsurer has a substantive right to terminate the contract.
- Accordingly, the boundary of a reinsurance contract held could include cash flows from underlying contracts covered by the reinsurance contract that are expected to be issued by the cedant in the future.

This means that an entity will need to estimate the fulfilment cash flows of contracts it expects to issue that will give rise to cash flows within the boundary of the reinsurance contracts that it holds. Some stakeholders argued that this will result in an accounting mismatch between the direct insurance contracts issued and the reinsurance contracts held. However, the Basis for Conclusions states that the IASB disagreed that differences between the carrying amount of the reinsurance contract held and the underlying insurance contracts are accounting mismatches. The carrying amount of a reinsurance contract held is nil before any cash flows occur or any service is received. Thereafter any difference that arise between the carrying amount of the reinsurance contract held and the underlying insurance contracts are not accounting mismatches, but differences caused by: *[IFRS 17.BC309E]*

- The provision of coverage, for example because the reinsurer provides coverage for less than 100% of the risks the entity covers
- The timing of cash flows
- Interest accreted on the contractual service margin of the reinsurance contract held from an earlier period than, and at a different discount rate from, the interest accreted on the contractual service margin of the underlying insurance contracts, reflecting the different effects of the time value of money on the contractual service margin and fulfilment cash flows

The TRG members observed that applying this requirement is likely to result in operational complexity because it is a change from existing practice under IFRS 4. This increase in cost and complexity resulting from a change in existing practice is acknowledged in the Basis for Conclusions, but the IASB concluded that the benefits of appropriately reflecting an entity's rights and obligations as the holder of a reinsurance contract outweigh those costs. *[IFRS 17.BC309F]*.

Question 11-3: What is the boundary of a reinsurance contract held with a break clause that allows either party to cancel the contract at any time following a specified notice period?

(TRG meeting February 2018 - Agenda paper no. 3, Log S15; TRG meeting September 2018 - Agenda paper no. 5)

Some reinsurance contracts held may contain break clauses which allow either party to cancel the contract at any time following a specified notice period. In February 2018, the TRG members observed that, in an example of a reinsurance contract which:

- Is issued and recognised on 1 January
- Covers a proportion of all risks arising from underlying insurance contracts issued in a 24-month period
- Provides the unilateral right to both the cedant and the reinsurer to terminate the contract with a three-month notice period to the other party with respect to only new business ceded

The initial contract boundary would exclude cash flows related to premiums outside of that three-month notice period.

In September 2018, the IASB staff clarified to TRG members that if, at the end of the three months, neither the entity nor the reinsurer had given notice to terminate the reinsurance contract with respect to new business ceded, this would not cause a reassessment of the contract boundary. This is because the contract boundary determination at initial recognition (i.e., three months) was not based on an assessment of the practical ability to set a price that fully reflected the risk in the contract. (In other words, a contract boundary is only reassessed if there has been a change in circumstances which affect the assessment of whether an entity's substantive rights and obligations have commercial substance). The cash flows related to underlying contracts that are expected to be issued and ceded in the next three-month period are cash flows outside the existing contract boundary. In response to a concern that this may result in daily reinsurance contracts being recognised for every day that passes in which either party does not exercise its termination right, the IASB staff observed that reinsurance contracts held are recognised only when the recognition criteria are met (i.e., when the coverage period begins). The contract boundary is determined at initial recognition and, in this example, that will result in a new reinsurance contract held being recognised after the end of the first three-month period with a contract boundary of cash flows arising from contracts expected to be issued in the following three months. Both of these contracts held could belong to a single annual group of contracts applying the level of aggregation criteria.

The submission to the IASB staff in September 2018 included a fact pattern in which there is a unilateral right for the reinsurer to amend the rate of the ceding commission it pays, in addition to unilateral termination rights. The IASB staff observe that in this fact pattern, the existence of the right to terminate the contract with a three-month notice period determines the cash flows within the contract boundary regardless of the existence of a right to amend the rate of the ceding commission if the contract is not terminated. Therefore, the same accounting would apply to this additional fact pattern.

Question 11-4: How should the boundary of a reinsurance contract held be determined when the reinsurer has the right to reprice remaining coverage prospectively?

(TRG meeting May 2018 - Agenda paper no. 4, Log S39)

The TRG discussed an IASB staff paper concerning the determination of the boundary of a reinsurance contract held when the reinsurer has the right to reprice remaining coverage prospectively. In the fact pattern provided, the reinsurer can adjust premium rates at any time, subject to a minimum three-month notice period and could choose either: (i) not to exercise the right to reprice, in which case, the holder of the reinsurance contract is committed to continue paying premiums to the reinsurer; or (ii) to exercise the right to reprice, in which case, the holder has the right to terminate coverage.

The TRG members observed that:

- For reinsurance contracts held, cash flows are within the contract boundary if they arise from substantive rights and obligations that exist during the reporting period in which the entity (i.e., the holder) is compelled to pay amounts to the reinsurer or in which the entity has a substantive right to receive services from the reinsurer.
- A right to terminate coverage that is triggered by the reinsurer's decision to reprice the reinsurance contract is not relevant when considering whether a substantive obligation to pay premiums exists. Such a right is not within the entity's control and therefore the entity would continue to be compelled to pay premiums for the entire contractual term.
- The entity's expectations about the amount and timing of future cash flows, including with respect to the probability of the reinsurer repricing the contract, would be reflected in the fulfilment cash flows.

The TRG members also observed that, although the fact pattern in this example was limited in scope, it demonstrates the principle that both rights and obligations need to be considered when assessing the boundary of a contract. This means, for the current fact pattern, the boundary of the reinsurance contract held would reflect the expected contract boundary of the underlying contracts and should not end at the first point at which the reinsurer has the right to increase premium rates.

Illustration 11-1: The contract boundary of reinsurance contracts held

On 1 January, the insurer enters into a 100% proportionate reinsurance cover for a group of underlying insurance contracts it expects to issue over the next two years. The reinsurance contract includes a unilateral right to both the cedant and the reinsurer to terminate the contract with a six-month notice period to the other party with respect only to new business ceded.

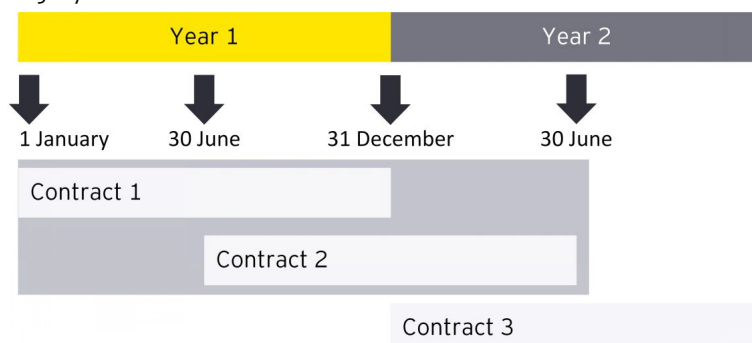

An insurer expects to issue three one-year insurance contracts all within year one of the two-year period covered by the reinsurance contract. These contracts were issued on 1 January, 30 June and 31 December in year one respectively with their coverage period starting at the same date. 1 January in year one is the beginning of the coverage period of the group of underlying insurance contracts (IFRS 17.25(a)). The coverage period for the group of underlying insurance contracts is from 1 January in year one to 30 December in year two. Assume the group of underlying insurance contracts is measured using the general model.

The reinsurance contract held is recognised on 1 January in year one. In this example the reinsurance contract held, as a single contract, is identified as a group of insurance contracts.

The contract boundary of the reinsurance contract held recognised on 1 January in year one includes cash flows related to premiums inside the six-month notice period. In applying the measurement requirements of IFRS 17.32-36 to the reinsurance contract held, the insurer uses consistent assumptions to measure the estimates of the present value of the future cash flows for the reinsurance contracts held and the estimates of the present value of the future cash flows for the first two contracts, issued on 1 January and 30 June in year one, included in the group of underlying insurance contracts. The present value of the future cash flows of the reinsurance contract held would exclude cash flows related to premiums for the third contract, issued on 31 December.

The coverage period for the reinsurance contract held recognised on 1 January in year one is equal to the coverage period for the group of underlying insurance contracts, from 1 January in year one to 29 June in year two. However, the reinsurance contract held recognised on 1 January excludes the underlying contract issued on 31 December of year one.

The contract boundary and coverage period of the reinsurance contract held, recognised on 1 January in year one, is illustrated by the grey block in the Illustration below:

**Illustration 11-2: Coverage period for proportional reinsurance treaty that protects an insurer for contracts it issues in a year**

An insurer holds a proportional reinsurance treaty that protects it for claims arising from underlying insurance contracts it issues in a year. Each of the underlying insurance contracts has a coverage period of one year. However, the reinsurance treaty provides coverage for claim events that can occur in a period of up to two years. Consequently, the coverage period for the reinsurance contract held is the two-year period.

How we see it

In some cases, reinsurance contracts held will offer protection for underlying contracts that an entity has not yet issued. If the reinsurance cash flows arising from the anticipated underlying contracts are within the boundary of a reinsurance contract, the measurement of the reinsurance contract will reflect those cash flows - as the standard requires that future cash flows within the boundary be taken into account. An entity will need to estimate the fulfilment cash flows of contracts it expects to issue that will give rise to cash flows within the boundary of the reinsurance contracts that it holds. The estimates must be adjusted as time passes and the underlying direct contracts that are subject to reinsurance are actually issued. Reinsurance fulfilment cash flows for future underlying contracts expected to be issued include an estimate of the amount of risk adjustment an entity expects will be transferred to the reinsurer when underlying contracts are recognised, as well as future fulfilment cash flows such as estimated reinsurance premiums and claim recovery cash flows.

11.3 Recognition

The recognition requirements for an insurance contract issued are modified for the purposes of the recognition of reinsurance contracts held. [IFRS 17.62]. See section 7.2 above. In short, an entity must recognise a group of reinsurance contracts held from the earlier of the following:

- The beginning of the coverage period of the group of reinsurance contracts held, or if the reinsurance contracts provide proportionate coverage at the later of the beginning of the coverage period of the group, or the initial recognition of any underlying contract
- And
- The date the entity recognises an onerous group of underlying insurance contracts applying IFRS 17.25(c), if the entity entered into the related reinsurance contract held in the group of reinsurance contracts held at or before that date and, in all other cases, from the beginning of the coverage period of the group

Regarding the first criterion, for groups of reinsurance contracts held that provide proportionate coverage, the entity must not recognise the group of reinsurance contracts until it has recognised at least one of the underlying contracts. [IFRS 17.62A].

In contrast, for contracts which do not provide proportionate coverage, the recognition date is usually the start of the coverage period except if the underlying group of contracts is onerous. In these contracts the entity benefits from coverage from the beginning of the group of reinsurance contracts held because such losses accumulate throughout the coverage period. [IFRS 17.BC305(b)]. An example of such a contract is one that provides cover for aggregate losses from a single event, in excess of a predetermined limit and with a fixed payable premium.

11.4 Measurement - initial recognition

11.4.1 Initial measurement - fulfilment cash flows

A reinsurance contract held must be measured using the same criteria for fulfilment cash flows and contractual service margin as an insurance contract issued to the extent that the underlying contracts are also measured using this approach. However, the entity must use consistent assumptions to measure the estimates of the present value of future cash flows for the group of both the reinsurance contracts held and the underlying insurance contracts. [IFRS 17.63].

Frequently asked questions

Question 11-5: Paragraph 63 of IFRS 17 requires the use of assumptions for the measurement of the estimates of the present value of the future cash flows for a group of reinsurance contracts held that are consistent with those used to measure the underlying insurance contracts. Does this mean that the use of an identical discount rate is required?

(TRG meeting February 2018 - Agenda paper no. 7, Log S17)

No. The TRG agreed with the IASB staff, that 'consistent' in this context does not necessarily mean 'identical' (i.e., the use of an identical discount rate for measurement of the group of underlying insurance contracts and the related group of reinsurance contracts held was not mandated). The extent of dependency between the cash flows of the reinsurance contract held and the underlying contracts should be evaluated in applying the requirements of IFRS 17.63.

Question 11-6: What discount rate should be used to measure the present value of future cash flows of a reinsurance contract held if the liquidity characteristics of the underlying contracts are different from those of the reinsurance contract held?

(TRG meeting May 2018 - Agenda paper no. 7, Log S40)

The TRG agreed with the IASB staff when they noted that consistency is required to the extent that the same assumptions apply to both the underlying contracts and the reinsurance contracts held. In the IASB staff's view, this requirement does not require or permit the entity to use the same assumptions used (e.g., the same discount rates) for measuring the underlying contracts when measuring the reinsurance contracts held if those assumptions are not valid for the term of the reinsurance contracts held. If different assumptions apply for reinsurance contracts held, the entity uses those different assumptions when measuring the contract.

11.4.2 Measurement at initial recognition - contractual service margin

In determining the contractual service margin on initial recognition, the requirements of the general model are modified to reflect the fact that there is no unearned profit but, instead, a net gain or net cost on purchasing the reinsurance.

Hence, on initial recognition, unless the net cost of purchasing reinsurance coverage relates to events that occurred before the purchase of the group of reinsurance contracts, the entity must recognise any net cost or net gain on purchasing the group of reinsurance contracts held as a contractual service margin measured at an amount equal to the sum of: *[IFRS 17.65]*

- The fulfilment cash flows
- The amount derecognised at that date of any asset or liability previously recognised for cash flows related to the group of reinsurance contracts held
- Any cash flows arising at that date
- And
- Any income recognised in profit or loss when an entity recognises a loss on initial recognition of an onerous group of underlying contracts (see section 11.4.3 below)

If expected cash outflows to a reinsurer exceed the sum of expected inflows and the risk adjustment, the contractual service margin represents a net cost of purchasing reinsurance.

If expected cash inflows from the reinsurer plus the risk adjustment exceed expected outflows, the contractual service margin represents a net gain of purchasing reinsurance.

If the net cost of purchasing reinsurance coverage relates to events that occurred before the purchase of the group of reinsurance contracts held, an entity must recognise such a cost immediately in profit or loss as an expense. [IFRS 17.65A].

It is stated in the Basis for Conclusions that the IASB decided that the net expense of purchasing reinsurance should be recognised over the coverage period as services are received unless the reinsurance covers events that have already occurred. For reinsurance contracts held which cover events that have already occurred, the Board concluded that entities should recognise the whole of the net expense at initial recognition, to be consistent with the treatment of the net expense of purchasing reinsurance before an insured event has occurred. The Board acknowledged that this approach does not treat the coverage period of the reinsurance contract consistently with the view that for some insurance contracts the insured event is the discovery of a loss during the term of the contract, if that loss arises from an event that had occurred before the inception of the contract. However, the Board concluded that consistency of the treatment of the net expense across all reinsurance contracts held would result in more relevant information.

[IFRS 17.BC312].

These accounting requirements above can be summarised as follows:

Fact pattern on initial recognition	Accounting for net gain or cost
Expected cash inflows exceed expected cash outflows	Contractual service margin recognised for net gain (i.e., credit balance)
Expected cash outflows exceed expected cash inflows	Contractual service margin recognised for net cost (i.e., debit balance)
Expected cash outflows exceed expected cash inflows and coverage relates to events that occurred before the purchase of the group of reinsurance contracts held	Net cost immediately recognised in profit or loss as an expense

How we see it

IFRS 17 provides no guidance as to how a cedant should account for the net cost of a reinsurance contract held, which provides both prospective and retroactive coverage. In these circumstances, an entity would need to apply judgement as to the portfolio to which a contract providing both prospective and retrospective coverage should be allocated and whether the legal contract could be split into separate retrospective and prospective insurance components, with each component allocated to different portfolios as an in-substance separate contract for accounting purposes, applying the guidance discussed in section 6.1.1 above.

Measurement of a reinsurance contract held on initial recognition is shown by the following Illustration. The initial recognition of reinsurance contracts in situations where a group of underlying insurance contracts is onerous at initial recognition as discussed in section 11.4.3 below.

The following Illustration is based on Example 11 in the Illustrative Examples to IFRS 17: [IFRS 17.IE124-129]

Illustration 11-3: Measurement on initial recognition of groups of reinsurance contracts held

An entity enters into a reinsurance contract that, in return for a premium of CU300m, covers 30% of each claim from the underlying insurance contracts. The underlying insurance contracts are issued at the same time as the entity enters into the reinsurance contract. Applying the relevant criteria, the entity considers that the group comprises a single contract held. For simplicity, this example disregards the risk of non-performance of the reinsurer and all other amounts.

The entity measures the estimates of the present value of future cash flows for the group of reinsurance contracts held using assumptions consistent with those used to measure the estimates of the present value of the future cash flows for the group of the underlying insurance contracts, as shown in the table below:

	Underlying contracts	Reinsurance contracts
	CU million	CU million
Estimates of the present value of future cash inflows	1,000	270
Estimates of the present value of future cash outflows/premium paid	(900)	(300)
Risk adjustment for non-financial risk	(60)	18
Contractual service margin (liability)/asset	(40)	12
Insurance contract asset/(liability) on initial recognition	-	-

The entity measures the present value of the future cash inflows consistent with the assumptions of the cash outflows of the underlying insurance contracts. Consequently, the estimate of cash inflows is CU270m (i.e., 30% of CU900m). The risk adjustment is determined to represent the amount of risk being transferred by the holder of the reinsurance contract to the issuer of the contract. Consequently, the risk adjustment, which is treated as an inflow rather than an outflow, is CU18m (i.e., estimated to be 30% of 60).

The contractual service margin is an amount equal to the sum of the fulfilment cash flows and any cash flows arising at that date. In this example, there is a net loss on purchasing the reinsurance and the contractual service margin is in an asset position.

Alternatively, If the premium was only CU260m, there would be a net gain of CU28m on purchasing the reinsurance and the contractual service margin would represent a liability of CU28m to eliminate the net gain on inception.

	Underlying contracts	Reinsurance contracts
	CU million	CU million
Estimates of the present value of future cash inflows	1,000	270
Estimates of the present value of future cash outflows/premium paid	(900)	(260)
Risk adjustment for non-financial risk	(60)	18
Contractual service margin liability	(40)	(28)
Insurance contract asset/(liability) on initial recognition	-	-

11.4.3 Initial measurement of reinsurance held of underlying insurance contracts that are onerous at initial recognition

An entity must adjust the contractual service margin of a group of reinsurance contracts held and, as a result, it must recognise income when the entity recognises a loss at initial recognition of an onerous group of underlying contracts or on addition of onerous underlying insurance contracts to that group. [IFRS 17.66A]. This requirement applies to all reinsurance contracts held and is irrespective of the measurement model used by the underlying contracts.

It is clarified in the Basis for Conclusions that, for this accounting to apply, an entity must enter into the reinsurance contract held before or at the same time as it recognises the onerous underlying insurance contracts. The Board concluded that it would not be appropriate for an entity to recognise a recovery of loss when the entity does not hold a reinsurance contract. [IFRS 17.BC315C]. This does not preclude the entity from recognising a gain for contracts that are added to the onerous underlying group subsequently, as these underlying contracts are initially recognised after the entity entered into the reinsurance contract held.

The amount of the adjustment to the contractual service margin of a group of reinsurance contracts held and resulting income is determined by multiplying: [IFRS 17.B119D]

- The loss recognised on the underlying contracts
- And
- The percentage of claims on underlying insurance contracts the entity expects to recover from the group of reinsurance contracts held

How we see it

The calculation of the gain from loss recovery on initial recognition makes no distinction between cash flows of the underlying group of insurance contracts that are covered by the reinsurance contract and those cash flows that are not covered. Presumably, this is because at initial recognition it would be difficult to identify what proportion of a loss on a group of underlying contracts results from covered cash flows and what proportion arises from uncovered cash flows. However, for subsequent measurement, the treatment of those cash flows that are covered by the reinsurance agreement and those that are not differs (see section 11.5.1.B below).

An entity must also establish (or adjust) a loss-recovery component of the asset for remaining coverage for a group of reinsurance contracts held depicting the recovery of losses recognised applying the requirements above. The loss-recovery component determines the amounts that are presented in profit or loss as reversals of recoveries of losses from reinsurance contracts held and are, consequently, excluded from the allocation of premiums paid to the reinsurer. [IFRS 17.66B].

An entity might include in an onerous group of insurance contracts, both onerous insurance contracts covered by a group of reinsurance contracts held and onerous insurance contracts not covered by the group of reinsurance contracts held. In such cases, the entity must apply a systematic and rational method of allocation to determine the portion of losses recognised on the group of insurance contracts that relates to insurance contracts covered by the group of reinsurance contracts held. [IFRS 17.B119E].

Similarly, reinsurance contracts held may provide cover across different groups of underlying insurance contracts. For example, a motor reinsurance contract held may provide protection for underlying insurance contracts within a portfolio comprising both onerous contracts and those not expected to become onerous. Some reinsurance contracts are written on a 'whole account' basis and cover all of an insurer's underlying groups of insurance contracts. IFRS 17 does not provide guidance as to how to measure the reinsurance contract in these circumstances. Consequently, an insurer will have to use judgement in weighting the underlying cash flows from different insurance groups to the reinsurance contract.

IFRS 17 does not require an entity to track insurance contracts at a lower level than the level of the group of insurance contracts. Accordingly, the Board specified that, in these circumstances, an entity applies a systematic and rational method of allocation to determine the portion of losses on a group of insurance contracts that relates to underlying insurance contracts covered by a reinsurance contract held. Requiring a systematic and rational method of allocation is consistent with other requirements in IFRS 17. [IFRS 17.BC315H].

The loss recovery requirements add complexity to IFRS 17 because it requires an entity to track a loss-recovery component. However, the Board concluded that the added complexity was justified given the strong stakeholder support for the information that entities will provide to users of financial statements. In addition, the Board noted that the loss-recovery component of a reinsurance contract held is treated similarly to the loss component on insurance contracts issued. [IFRS 17.BC315G].

The following Illustration, based on Example 12C in the Illustrative Examples on IFRS 17, shows the application of these requirements at initial measurement. [IFRS 17.IE138A-138K].

Illustration 11-4: Initial measurement of a group of reinsurance contracts held that provides coverage for groups of underlying insurance contracts, including an onerous group

At the beginning of Year 1, an entity enters into a reinsurance contract that in return for a fixed premium covers 30% of each claim from the groups of underlying insurance contracts. The reinsurance held is the only contract in the group. The underlying insurance contracts are issued at the same time as the entity enters into the reinsurance contract held. For simplicity it is assumed that no contracts will lapse before the end of the coverage period, there are no changes in estimates and all other amounts, including the effect of discounting, the risk adjustment for non-financial risk and the risk of non-performance of the reinsurer are ignored.

Some of the underlying insurance contracts are onerous at initial recognition. Thus, the entity establishes a group comprising the onerous contracts. The remainder of the underlying insurance contracts are expected to be profitable and, in this example, the entity establishes a single group comprising the profitable contracts.

The coverage period of the underlying insurance contracts and the reinsurance contract held is three years from the beginning of Year one. Service is provided evenly over the coverage periods.

The entity expects to receive CU1,110 on the underlying insurance contracts immediately after initial recognition. Claims on the underlying insurance contracts are expected to be incurred evenly across the coverage period and are paid immediately after claims are incurred.

The entity measures the group of underlying insurance contracts on initial recognition, as follows:

	Profitable group of insurance contracts	Onerous group of insurance contracts	Total
	CU	CU	CU
Estimates of the present value of future cash inflows	900	210	1,110
Estimates of the present value of future cash outflows	(600)	(300)	(900)
Fulfilment cash flows	300	(90)	210
Contractual service margin	(300)	-	(300)
Insurance contract asset/(liability) on initial recognition	-	(90)	(90)
Loss on initial recognition	-	90	90

The entity establishes a group comprising a single reinsurance contract held that provides proportionate coverage. The entity pays a premium of CU315 to the reinsurer immediately after initial recognition. The entity expects to receive recoveries of claims from the reinsurer on the same day that the entity pays claims on the underlying insurance contracts.

Applying IFRS 17, the entity measures the estimates of the present value of the future cash flows for the group of reinsurance contracts held using assumptions consistent with those used to measure the estimates of the present value of the future cash flows for the groups of underlying insurance contracts. Consequently, the estimate of the present value of the future cash inflows is CU270 (recovery of 30% of the estimates of the present value of the future cash outflows for the groups of underlying insurance contracts of CU900).

The entity measures the group of reinsurance contracts held on initial recognition as follows:

	Initial recognition
	CU
Estimates of present value of future cash inflows (recoveries) being $900 \times 30\%$	270
Estimates of present value of future cash outflows (premiums)	(315)
Fulfilment cash flows	(45)
Contractual service margin of the reinsurance contract held (before the loss recovery adjustment)	45
Loss-recovery component (being $90 \times 30\%$)	27 (a)
Contractual service margin of the reinsurance contract held (after the loss-recovery adjustment)	72 (b)
Reinsurance contract asset on initial recognition	27 (c)
Income on initial recognition	(27) (a)

- (a) Applying IFRS 17, the entity adjusts the contractual service margin of the reinsurance contract held and recognises income to reflect the loss recovery. The entity determines the adjustment to the contractual service margin and the income recognised as CU27 (the loss of CU90 recognised for the onerous group of underlying insurance contracts multiplied by 30%, the fixed percentage of claims the entity expects to recover).
- (b) The contractual service margin of CU45 is adjusted by CU27, resulting in a contractual service margin (after adjustment) of CU72, reflecting a net cost on the reinsurance contract held.
- (c) The reinsurance contract asset of CU27 comprises the fulfilment cash flows of CU45 (net outflows) and a contractual service margin reflecting a net cost of CU72. The entity establishes a loss-recovery component of the asset for remaining coverage of CU27 depicting the recovery of losses recognised.

How we see it

Under the loss recovery requirements of IFRS 17, insurers will need to identify the extent to which changes in fulfilment cash flows of a group reinsurance contracts held relate to corresponding changes of underlying groups of contracts that have been recognised in profit or loss. Where an onerous group of insurance contracts includes both onerous contracts covered by the reinsurance contracts held and onerous contracts not covered by the reinsurance contracts held, this will require a means of allocating the changes in fulfilment cash flows of an onerous group of underlying contracts between them. This could give rise to significant operational complexity. An entity could consider subdividing groups of insurance contracts issued or reinsurance contracts held into further groups of contracts in order to facilitate such allocations.

11.4.4 Initial measurement of the effect of the risk of non-performance

In addition to using consistent assumptions, an entity must make the following modifications in calculating the fulfilment cash flows:

- Estimates of the present value of the future cash flows for the group of reinsurance contracts held must reflect the effect of any risk of non-performance by the issuer of the reinsurance contract, including the effects of collateral and losses from disputes. [IFRS 17.63]. This is because an entity holding a reinsurance contract faces the risk that the reinsurer may default or may dispute whether a valid claim exists for an insured event. [IFRS 17.BC308]. The estimates of expected losses from non-performance risk are based on expected values over the lifetime of the reinsurance asset.
- The estimate of the risk adjustment for non-financial risk must be determined so that it represents the amount of risk being transferred by the cedant to the reinsurer. [IFRS 17.64].

The requirement to reflect the non-performance risk on an expected value basis is similar to the requirement in IFRS 9 to provide for expected credit losses on certain financial instruments. However, IFRS 9 does not apply to rights under a contract within the scope of IFRS 17, such as a receivable due under a reinsurance contract held (see section 2 above). Consequently, the IFRS 9 credit loss model does not apply. Instead, non-performance risk is reflected on an expected value basis over the estimated lifetime of the insurance contract using the guidance for expected values as part of the fulfilment cash flows (see section 9.13.1 above).

Frequently asked questions

Question 11-7: For reinsurance contracts held, is the risk of non-performance of the reinsurer considered within the estimates of the present value of future cash flows or the risk adjustment for non-financial risk?

(TRG meeting May 2018 - Agenda paper no. 7, Log S42)

The TRG agreed with the IASB staff that the risk of non-performance must be contained within the estimates of the present value of future cash flows. The risk adjustment does not include an adjustment for the risk of non-performance.

Question 11-8: Should non-performance risks of a reinsurer such as insolvency and dispute risk be identified as financial or non-financial risks and what impact does this determination have on the measurement of the risk adjustment for reinsurance contracts held?

(TRG meeting April 2019 - Agenda paper no. 2, Log S119)

IFRS 17.63 discusses the estimates of the present value of the future cash flows of a reinsurance contract held and specifically requires that those estimates should include the effect of any risk of non-performance by the issuer of the reinsurance contract including the effects of collateral and losses from disputes. Applying IFRS 17.64, the risk adjustment for non-financial risk of a reinsurance contract held reflects only the risks that the cedant transfers to the reinsurer. The risk of non-performance by the reinsurer is not a risk transferred to the reinsurer, nor does it reduce the risk transferred to the reinsurer. It is only reflected in the present value of the future cash flows of the reinsurance contract held, similar to the treatment of financial risks.

IFRS 17.63 does not provide specific requirements on how to determine the effect of any risk of non-performance. IFRS 17.67 requires that changes in the fulfilment cash flows related to the risk of non-performance do not adjust the contractual service margin, therefore an entity recognises them in profit or loss. This treatment is consistent with the accounting treatment for financial risks.

How we see it

According to IFRS 13, the risk of non-performance is the risk that an entity will not fulfil its obligation. This risk includes, but is not limited to, the entity's own credit risk. IFRS 17.63 requires that an entity must include in the estimates of the present value of the future cash flows for the group of reinsurance contracts held, the effect of any risk of non-performance by the issuer of the reinsurance contract, including the effects of collateral and losses from disputes. As such, the risks of an entity not fulfilling its obligation could be influenced by different factors (including both the ability to pay and dispute over the amount contractually due). Evaluating what gives rise to the risk of non-performance involves the application of judgement because it depends on the specific circumstances of the reinsurance arrangement.

Even though the risk of non-performance should not be incorporated in the risk adjustment, changes in fulfilment cash flows that relate to the risk of non-performance will affect the measurement of the risk adjustment for non-financial risk to the extent that the underlying expected cash flows have reduced (e.g., because of insolvency of a reinsurer). This is because the risk inherent in those revised cash flows may have changed. As a result, we would expect the risk adjustment for non-financial risk to be calculated on the expected fulfilment cash flows after the fulfilment cash flows have been adjusted for the effect of non-performance.

11.5 Subsequent measurement of reinsurance contracts held

Instead of applying the subsequent measurement requirements of the general model, an entity must measure the contractual service margin at the end of the reporting period for a group of reinsurance contracts held as follows: [IFRS 17.66]

Change in the carrying amount of the contractual service margin of a group of reinsurance contracts held in a period	
The carrying amount determined at the start of the reporting period.	X/(X)
The effect of new contracts added to the group.	X/(X)
Interest accreted on the carrying amount of the contractual service margin, measured at discount rates determined at the date of initial recognition of a group of contracts using the discount rates as determined by the general model (see section 9.3 above).	X/(X)
Income recognised in profit or loss when an entity offsets a loss on an onerous group of underlying contracts (see section 11.4.3 above).	(X)
Reversals of a loss-recovery component recognised (see section 11.4.3 above) to the extent those reversals are not changes in the fulfilment cash flows of the group of reinsurance contracts held.	X
Change in fulfilment cash flows measured at the discount rates applied on initial recognition (see section 9.3 above) to the extent that the change relates to future service, unless (see section 11.5.1 below): <ul style="list-style-type: none"> ▪ The change results from a change in fulfilment cash flows allocated to a group of underlying insurance contracts that does not adjust the contractual service margin for the group of underlying insurance contracts. Or ▪ The change results from applying the onerous contract requirements to the measurement of a group of underlying insurance contracts using the premium allocation approach. 	X/(X)
The effect of any currency exchange differences arising on the contractual service margin.	X/(X)
The amount recognised in profit or loss because of services received in the period determined by the allocation of the contractual service margin remaining at the end of the reporting period (before any allocation) over the current and remaining coverage period of the group of reinsurance contracts held (see section 11.5.2 below).	(X)/X
The carrying amount determined at the end of the reporting period.	X/(X)

Consistent with the requirements for insurance contracts issued (see section 9.6.3 above) IFRS 17 does not specify the order in which the calculations above need to be performed. This means that the choice as to which order to perform the calculations can have an impact on the statement of comprehensive income, for example, there will be more interest accretion if an entity performs interest accretion after adding new contracts rather than before. However, IFRS 17.66(e) states that the amount recognised in profit or loss because of services received in the period is determined by the allocation of the contractual margin remaining at the end of the period after all other steps. The use of the word 'end' implies that this must be the last step.

11.5.1 Changes to the contractual service margin that result from changes in estimates of cash flows

The contractual service margin of a group of insurance contracts issued can never be negative. In contrast, IFRS 17 does not include a limit on the amount by which the contractual service margin of a group of reinsurance contracts held could be adjusted as a result of changes in estimates of cash flows. In the Board's view, the contractual service margin for a group of reinsurance contracts held is different from that for a group of insurance contracts issued. The contractual service margin for the group of reinsurance contracts held depicts the expense the entity incurs when purchasing reinsurance coverage rather than the profit it will make by providing services under the insurance contract. Accordingly, the Board placed no limit on the amount of the adjustment to the contractual service margin for the group of reinsurance contracts held, subject to the amount of premium paid to the reinsurer. [IFRS 17.BC314].

It is stated in the Basis for Conclusions that the Board considered the situation that arises when the underlying group of insurance contracts becomes onerous after initial recognition because of adverse changes in estimates of fulfilment cash flows relating to future service. In such a situation, the entity recognises a loss on the group of underlying insurance contracts (this situation would also apply to the subsequent accounting of underlying direct contracts that were already onerous at their initial recognition). The Board concluded that corresponding changes in cash inflows from a group of reinsurance contracts held should not adjust the contractual service margin of the group of reinsurance contracts held, with the result that the entity recognises no net effect of the loss and gain in the profit or loss for the period. This means that, to the extent that the change in the fulfilment cash flows of the group of underlying contracts is matched with a change in fulfilment cash flows on the group of reinsurance contracts held, there is no net effect on profit or loss. [IFRS 17.BC315].

These requirements are shown by the following Illustration, based on Examples 12A and 12B in IFRS 17. [IFRS 17.IE130-138].

Illustration 11-5: Measurement subsequent to initial recognition of groups of reinsurance contracts held

An entity enters into a reinsurance contract that, in return for a fixed premium, covers 30% of each claim from the underlying insurance contracts (the entity assumes that it could transfer 30% of non-financial risk from the underlying contracts to the reinsurer). In this example, the effect of discounting, the risk of the reinsurer's non-performance, and other amounts are disregarded for simplicity. Applying the relevant criteria, the entity considers that the group comprises a single contract held.

Immediately before the end of year one, the entity measures the group of underlying insurance contracts and the reinsurance contract held, as follows:

	Insurance contract liability	Reinsurance contract asset
	CU million	CU million
Fulfilment cash flows (before the effect of any change in estimates)	300	(90)
Contractual service margin	100	(25)
Insurance contract liability/(reinsurance contract asset) immediately before the end of year one	400	(115)

In this example, the difference between the contractual service margin for the reinsurance contract held of CU25m and 30% of the underlying group of insurance contracts of CU30m ($30\% \times \text{CU}100\text{m}$) arises because of a different pricing policy between the underlying group of insurance contracts and the reinsurance contract held.

Example A

At the end of year one, the entity revises its estimates of the fulfilment cash flows of the underlying group of contracts. The entity estimates there is an increase in the fulfilment cash flows of the underlying contracts of CU50m and a decrease in the contractual service margin by the same amount (the group of underlying insurance contracts is not onerous).

The entity increases the fulfilment cash flows of the reinsurance contract held by 30% of the change in fulfilment cash flows of the underlying group of insurance contracts (CU15m = 30% of CU50m).

Applying IFRS 17.66, the entity adjusts the contractual service margin of the reinsurance contract held by the whole amount of the change in the fulfilment cash flows of this reinsurance contract held of CU15m from CU(25)m to CU(10)m. This is because the whole change in the fulfilment cash flows allocated to the group of underlying insurance contracts adjusts the contractual service margin of those underlying insurance contracts. Therefore, at the end of year one, the entity measures the insurance contract liability and the reinsurance contract asset, as follows:

	Insurance contract liability	Reinsurance contract asset
	CU million	CU million
Fulfilment cash flows (including the effect of any change in estimates)	350	(105)
Contractual service margin	50	(10)
Insurance contract liability/(reinsurance contract asset) immediately before the end of year one	400	(115)

These changes do not affect estimates of profit or loss as all changes in the fulfilment cash flows go to the contractual service margin.

Example B

At the end of year one, the entity revises its estimates of the fulfilment cash flows of the underlying group of contracts. The entity estimates that there is an increase in the fulfilment cash flows of the underlying group of insurance contracts of CU160m. This change makes the underlying group of insurance contracts onerous and the entity decreases the contractual service margin by CU100m to zero and recognises the remaining CU60m as a loss in profit or loss.

The entity increases the fulfilment cash flows of the reinsurance contract held by CU48m which equals 30% of the fulfilment cash flows of the underlying group of insurance contracts (CU48m=30% of CU160m).

Applying IFRS 17.66, the entity adjusts the contractual service margin of the reinsurance contract held for the change in fulfilment cash flows that relate to future services to the extent this change results from a change in the fulfilment cash flows of the group of underlying insurance contracts that adjusts the contractual service margin for that group.

Consequently, the change in the fulfilment cash flows of the reinsurance contract held of CU48m is recognised as follows, by:

- Adjusting the contractual service margin of the reinsurance contract held for CU30m of the change in the fulfilment cash flows. The CU30m is equivalent to the change in the fulfilment cash flows that adjusts the contractual service margin of the underlying contracts of CU100m (CU30m = 30% × CU100m). Consequently, the contractual service margin of the reinsurance contract held of CU5m equals the contractual service margin on initial recognition of CU25m adjusted for the part of the change in the fulfilment cash flows of CU30m (CU5m = CU(25)m + CU30m). This represents a contractual service margin 'asset'.
- Recognising the remaining change in the fulfilment cash flows of the reinsurance contract held, CU18m (i.e., CU48m - CU30m) immediately in profit or loss.

Therefore, at the end of year one, using these alternative estimates, the entity measures the insurance contract liability and the reinsurance contract asset, as follows:

	Insurance contract liability	Reinsurance contract asset
	CU million	CU million
Fulfilment cash flows (including the effect of any change in estimates)	460	(138)
Contractual service margin	-	5
Insurance contract liability/(reinsurance contract asset) at the end of year one	460	(133)
The effect on profit or loss will be:		
Profit/(loss) at the end of year one	(60)	18

11.5.1.A Subsequent measurement of non-performance risk

Any changes in expected credit losses are economic events that must be reflected as gains and losses in profit or loss when they occur. To this end, IFRS 17 prohibits changes in fulfilment cash flows that relate to the risk of non-performance adjusting the contractual service margin. In the Board's view, differences in expected credit losses do not relate to future service. [IFRS 17.67]. Accordingly, this results in consistent accounting for expected credit losses between reinsurance contracts held and purchased and originated credit-impaired financial assets accounted for in accordance with IFRS 9 (which does not apply to rights and obligations arising under a contract within the scope of IFRS 17 such as a receivable due under a reinsurance contract held - see section 2.3 above and also section 16.1.1 below). [IFRS 17.BC309].

As noted in section 11.4.4 above, the risk adjustment for non-financial risk does not include an adjustment for the risk of non-performance (which is already contained within the estimates of the present value of future cash flows). However, changes in fulfilment cash flows that relate to the risk of non-performance will affect the risk adjustment for non-financial risk to the extent that the underlying expected cash flows have reduced because the risk inherent in those revised cash flows has changed.

Illustration 11-6: Changes in reinsurance contract held balances caused by non-performance

An insurer (i.e., the cedant) holds a 100% quota share reinsurance contract. Assume the group of reinsurance contracts held consists of this single contract. Further assume that the present value of future cash inflows of the reinsurance contract held amounts to CU73, that consists of CU75, less CU2 as an estimate of non-performance. The risk adjustment for non-financial risk of the reinsurance contract held amounts to CU10. As a result, the reinsurance contract asset amounts to CU83.

As a result of a credit event, the reinsurer becomes insolvent. The insurer is an ordinary creditor of the reinsurer and the insurer's best estimate is that it will receive only 20% in any CU of the 'gross' claim of CU75. Assume that under the entity's method for estimating the risk adjustment, an expected cash flow of CU15 (consisting of CU75, less CU60 (80%) as an estimate of non-performance) would result in a risk adjustment for non-financial risk of 2.

The risk adjustment for non-financial risk following the credit event amounts to CU2 as the insurer should calculate the risk adjustment for non-financial risk using the fulfilment cash flows it expects, which in this case would be the net cash flows of CU15. As a result, the reinsurance contract asset now amounts to CU17. Therefore, there is an overall loss of CU66 (CU83 less CU17) to be recorded in the statement of comprehensive income (see section 16.1.1 below for further detail).

11.5.1.B Subsequent measurement of a loss-recovery component

As discussed in section 11.4.3 above, at initial recognition, an entity must establish (or adjust) a loss-recovery component of the asset for remaining coverage for a group of reinsurance contracts held depicting the recovery of losses recognised. This loss-recovery component must be accounted for in a manner consistent with the loss component of the group of underlying insurance contracts issued. As such, after the entity has established a loss component, it must adjust the loss-recovery component to reflect changes in the loss component of an onerous group of underlying insurance contracts.

The carrying amount of the loss-recovery component must not exceed the portion of the carrying amount of the loss component of the onerous group of underlying insurance contracts that the entity expects to recover from the group of reinsurance contracts held. [IFRS 17.B119F].

A loss-recovery component reverses, consistent with reversal of the loss component of underlying groups of contracts issued, even when those reversals are not changes in the fulfilment cash flows of the group of reinsurance contracts held. Such reversals adjust the contractual service margin. [IFRS 17.66(bb)]. For example, a loss-recovery component might be reversed by a change in fulfilment cash flows in the underlying group of insurance contracts that has no corresponding change in fulfilment cash flows in the reinsurance contract held (e.g., because of a favourable change in expense assumptions not covered under the reinsurance agreement).

How we see it

IFRS 17.66(bb) states that reversals of a loss-recovery component of a group of reinsurance contracts held that arise from non-covered cash flows should adjust the contractual service margin of the group of reinsurance contracts held. However, IFRS 17 does not, within this context, refer to increases in the loss-recovery component that arise from cash flows that are not covered by the reinsurance contract. This appears to indicate that, after initial recognition, a loss-recovery component of a group of reinsurance contracts held is adjusted only for changes in non-covered cash flows when those changes result in a decrease in the loss component on the underlying group of contracts. For subsequent measurement, the loss recovery guidance of IFRS 17 can only result in decreases of the loss component for changes in non-covered cash flows, but not increases. The loss-recovery component can subsequently only be increased for changes in cash flows that are covered under the terms of the reinsurance contract held. This subsequent treatment of the loss-recovery component therefore differs from the way that a loss-recovery component is set up on initial recognition (see section 11.4.3 above).

The following Illustration based on Example 12C in the Illustrative Examples on IFRS 17 shows how this operates in practice. [IFRS 17.IE138L, IFRS 17.IE138M].

Illustration 11-7: Measurement subsequent to initial recognition of groups of reinsurance contracts held

Assuming the same fact pattern as Illustration 11-5 above.

At the end of Year one, the entity measures the insurance contract liability and the reinsurance contract asset, as follows:

	Insurance contract liability		Reinsurance contract asset
	Profitable group of insurance contracts	Onerous group of insurance contracts	
	CU million	CU million	CU million
Estimates of future cash inflows (recoveries)	-	-	(180)
Estimates of present value of future cash outflows (claims)	400	200	-
Fulfilment cash flows	400	200	(180)
Contractual service margin	200	-	(48)
Insurance contract liability/ (reinsurance contract asset) immediately before the end of year one	600	200	(228)

Applying IFRS 17.66(e) and B119, the entity determines the amount of the contractual service margin recognised in profit or loss for the service received in Year one as CU24m, which is calculated by dividing the contractual service margin on initial recognition of CU72m by the coverage period of three years.

Consequently, the contractual service margin of the reinsurance contract held at the end of Year one of CU48m equals the contractual service margin on initial recognition of CU72m minus CU24m.

At the end of Year two, the entity revises its estimates of the remaining fulfilment cash outflows of the groups of underlying insurance contracts. The entity estimates that the fulfilment cash flows of the groups of underlying insurance contracts increase by 10%, from future cash outflows of CU300m (see Illustration 11-5 in section 11.5.1 above) to future cash outflows of CU330m. Consequently, the entity estimates the fulfilment cash flows of the reinsurance contract held also increase from future cash inflows of CU9 m to future cash inflows of CU99m.

At the end of Year two, the entity measures the insurance contract liability and the reinsurance contract asset, as follows:

	Insurance contract liability		Reinsurance contract asset
	Profitable group of insurance contracts	Onerous group of insurance contracts	
	CU million	CU million	CU million
Estimates of future cash inflows (recoveries)	-	-	(99)
Estimates of present value of future cash outflows (claims)	220	110	-
Fulfilment cash flows	220	110	(99)
Contractual service margin	90	-	(21)
Insurance contract liability/ (reinsurance contract asset)	310	110	(120)
Recognition of loss and recovery of loss		(10)	3

As a result of the changes in the estimates of the remaining fulfilment cash flows:

- The entity increases the expected remaining cash outflows of the groups of underlying insurance contracts by 10% for each group (CU30m in total) and increases the expected remaining cash inflows of the reinsurance contract held by 10% of the expected recoveries of CU90m (CU9m).
- Applying IFRS 17.44(c), the entity adjusts the carrying amount of the contractual service margin of the profitable group of underlying insurance contracts of CU200m by CU20m for the changes in fulfilment cash flows relating to future service. Applying IFRS 17.44(e), the entity also adjusts the carrying amount of the contractual service margin by CU90m for the amount recognised as insurance revenue ((CU200m - CU20m = CU180m) ÷ 2). The resulting contractual service margin at the end of Year two is CU90m (CU200m - CU20m - CU90m).
- Applying IFRS 17.48, the entity recognises in profit or loss an amount of CU10m for the changes in the fulfilment cash flows relating to future services of the onerous group of underlying insurance contracts.
- Applying IFRS 17.66(c)(i), the entity adjusts the contractual service margin of the reinsurance contract held for the change in fulfilment cash flows that relate to future service unless the change results from a change in fulfilment cash flows allocated to a group of underlying insurance contracts that does not adjust the contractual service margin for that group. Consequently, the entity recognises the change in the fulfilment cash flows of the reinsurance contract held of CU9m by:
 - Recognising immediately in profit or loss CU3m of the change in the fulfilment cash flows of the reinsurance contract held (30% of the CU10m change in the fulfilment cash flows of the onerous group of underlying insurance contracts that does not adjust the contractual service margin of those contracts).

And

 - Adjusting the contractual service margin of the reinsurance contract held by CU6m of the change in the fulfilment cash flows (CU9m - CU3m).

Consequently, the contractual service margin of the reinsurance contract held of CU(21m) equals the contractual service margin at the end of Year one of CU(48m) adjusted for CU6m and for CU21m of the contractual service margin recognised for the service received in Year two (CU(21)m = (CU(48)m + CU6m) ÷ 2).

As discussed in section 11.4.3 above, an entity might include in an onerous group of insurance contracts both onerous insurance contracts covered by a group of reinsurance contracts held and onerous insurance contracts not covered by the group of reinsurance contracts held. To adjust the contractual service margin for changes in fulfilment cash flows allocated to a group of underlying insurance contracts that do not adjust the contractual service margin for that group of underlying insurance contracts, an entity must apply a systematic and rational method of allocation to determine the portion of losses recognised on the group of insurance contracts that relate to insurance contracts covered by the group of reinsurance contracts held. [IFRS 17.B119E].

11.5.2 Allocation of the contractual service margin to profit or loss

The principles for release of the contractual service margin for reinsurance contracts held follows the same principles as for insurance and reinsurance contracts issued, i.e., the contractual service margin is released to profit or loss as the reinsurer renders service. For a reinsurance contract held, the period that the reinsurer renders service is the coverage period of the reinsurance contract which includes both the period of insurance coverage as well as the period of any investment return service.

The line item in profit or loss to which the contractual service margin is released will depend upon the policy choice for the presentation of income and expenses from a group of reinsurance contracts held - see section 15.2.1.C below.

Frequently asked questions

Question 11-9: For reinsurance contracts held, are coverage units determined based on the services provided by the reinsurer, or the coverage units of the underlying insurance contracts?

(TRG meeting, May 2018 - Agenda paper no. 7, Log S41)

Applying IFRS 17.B119, the coverage units of a group of insurance contracts are determined based on the quantity of coverage provided by the contracts in that group. For a group of reinsurance contracts held, this is the coverage received by the insurer from the reinsurer under those reinsurance contracts held, and not the coverage provided by the insurer to its policyholders through the underlying insurance contracts. When determining the quantity of benefits received from a reinsurance contract held, an entity may consider relevant facts and circumstances related to the underlying insurance contracts.

See section 9.9.4 above for an example of determining the quantity of benefits for identifying coverage units in proportional reinsurance issued.

11.5.2.A Retroactive reinsurance

For retroactive reinsurance contracts held, the coverage period of the underlying insurance contracts may have expired prior to the inception of the reinsurance contract held. In respect of these contracts, the coverage is provided against an adverse development of an event that has already occurred. [IFRS 17.B5]. This means that the contractual service margin must be released over the expected settlement period of the claims of the underlying insurance contracts (since that is, in effect, the coverage period for the reinsurance contract).

Since incurred claims are treated as a liability for incurred claims on the underlying direct/assumed side, but as part of the liability for remaining coverage on the reinsurance held side, the question arises as to whether this creates an asymmetry in the recognition of changes in claims between the direct contract issued (relating to past service) and the reinsurance contract held. There should be no asymmetry because IFRS 17.66 (see section 11.5.1 above) indicates that the contractual service of reinsurance contracts held is not adjusted by the change that results from a change in fulfilment cash flows allocated to a group of underlying insurance contracts that does not adjust the contractual service margin for the group of underlying insurance contracts. These fulfilment cash flows include the liability for incurred claims, as changes in the liability for incurred claims do not adjust the contractual service margin for the underlying contracts as there is no contractual service margin on the liability for incurred claims. Accordingly, any change in the fulfilment cashflows of the reinsurance contract held due to the changes of the liability for incurred claims of the underlying contracts will impact profit or loss and not the contractual service margin of the reinsurance contract held. This is shown by the following illustration:

Illustration 11-8: Treatment of changes in reinsurance recoveries arising from past events

Company A (the cedant) has a liability for incurred claims of CU100. It decides to enter into a reinsurance contract under which it cedes 50% of the liability for incurred claims.

The cedant pays a reinsurance premium of CU55 to the reinsurer at inception and cedes an amount of CU50 (i.e., 50%) of its liability for incurred claims. This results in a net cost of reinsurance of CU5 at initial recognition. The net cost of CU5 goes immediately through profit or loss following IFRS 17.65A (net cost of purchasing reinsurance coverage recognised as an expense).

In Year one, the liability for incurred claims of the underlying direct contracts increases from CU100 to CU115. As a consequence, the share of liability for incurred claims ceded to the reinsurer increases by CU7.5 (50% of CU15) and implies a favourable change (increase) in the asset for remaining coverage of the reinsurance contract held of CU7.5.

The favourable change in the asset for remaining coverage of CU7.5 should be credited directly to profit or loss to match the treatment for the change of the underlying liability for incurred claims and not to the contractual service margin. This accounting (i.e., direct to profit or loss) should be the same if the deviation was unfavourable.

11.6 Premium allocation approach for reinsurance contracts held

An entity may use the premium allocation approach (see section 10 above), adapted to reflect the features of reinsurance contracts held that differ from insurance contracts issued, for example, the generation of expenses or a reduction in expenses rather than revenue, to simplify the measurement of a group of reinsurance contracts held if, at the inception of the group: [IFRS 17.69]

- The entity reasonably expects that the resulting measurement would not differ materially from the result of applying the requirements in the general model for reinsurance contracts held, as discussed above
- Or
- The coverage period of each contract in the group of reinsurance contracts held (including coverage from all premiums within the contract boundary determined at that date applying the definition in the general model) is one year or less

Assessment of the eligibility for groups of reinsurance contracts held to be able to use the premium allocation approach is independent on whether the entity applies the premium allocation approach to the underlying groups of insurance contracts issued by an entity. Therefore, for example, reinsurance contracts which are written on a twelve month risks attaching basis (i.e., the underlying insurance contracts subject to the reinsurance contract incept over a twelve month period) will have a contract boundary of up to two years if each of the underlying insurance contracts have a coverage period of one year (see Illustration 11-2 in section 11.2 above). The two year contract boundary means that those reinsurance contracts held will not meet the twelve month criterion for use of the premium allocation approach and would have to qualify for the premium allocation approach on the basis that the resulting measurement would not differ materially from the result of applying the requirements of the general model. As a consequence, a mismatch in measurement models may arise if the underlying contracts are accounted for under the premium allocation approach while the reinsurance contract needs to be accounted for under the general model.

IFRS 17 confirms that an entity cannot meet the first condition above if, at the inception of the group, an entity expects significant variability in the fulfilment cash flows that would affect the measurement of the asset for remaining coverage during the period before a claim is incurred. Variability in the fulfilment cash flows increases with, for example: [IFRS 17.70]

- The extent of future cash flows relating to any derivatives embedded in the contracts
- And
- The length of the coverage period of the group of reinsurance contracts held

When a group of reinsurance contracts held is accounted for applying the premium allocation approach and an entity has a group of underlying insurance contracts that are onerous on initial recognition (see section 11.4.3 above), the carrying amount of the asset for remaining coverage is adjusted instead of the contractual service margin. [IFRS 17.70A].

How we see it

IFRS 17 provides for the recognition of a reinsurance loss-recovery component at initial recognition of a group of onerous underlying insurance contracts when the group of reinsurance contracts held is accounted for under the premium allocation approach. However, the standard does not include guidance on the *subsequent* treatment of a loss-recovery component when the group of reinsurance contracts held is accounted for under the premium allocation approach. Following the requirements for the loss-recovery component under the general model, the carrying amount of the loss-recovery component must not exceed the portion of the carrying amount of the loss component of the onerous group of underlying insurance contracts that an entity expects to recover from the group of reinsurance contracts held. Therefore, the loss-recovery component should be nil if the loss component of the onerous group of underlying insurance contracts is nil. On this basis, the loss-recovery component recognised at initial recognition should be reduced to nil in line with reductions in the onerous group of underlying insurance contracts.

Furthermore, analogising from the requirements for the loss-recovery component under the general model, an entity would not be precluded from subsequently recording or increasing a loss-recovery component for changes in the loss component of an onerous group of underlying contracts when a group of reinsurance contracts held is accounted for under the premium allocation approach. In doing so, an entity would need to determine the loss-recovery component in way that is adapted to the specific mechanics of the premium allocation approach but consistent with the principles of the loss-recovery component under the general model.

11.7 Reinsurance contracts held and the variable fee approach

An entity is not permitted to use the variable fee approach for reinsurance contracts held. The variable fee approach also cannot be applied to reinsurance contracts issued. [IFRS 17.B109]. Therefore, this will cause an accounting mismatch when an entity has reinsured contracts subject to the variable fee approach discussed in section 12.3 below. It is stated in the Basis for Conclusions that the IASB considers that the entity and the reinsurer do not share in the returns on underlying items and, as such, the criteria for the variable fee approach are not met, even if the underlying insurance contracts issued are insurance contracts with direct participation features. The IASB decided not to modify the scope of the variable fee approach to include reinsurance contracts held as it was considered that such an approach would be inconsistent with the Board's view that a reinsurance contract held should be accounted for separately from the underlying contracts issued. [IFRS 17.BC248].

12 Measurement of contracts with participation features

Many entities issue participating contracts (referred to in IFRS 17 as contracts with participation features), in which both the policyholder and the entity benefit from the financial return on the premiums paid by sharing the performance of the underlying items over the contract period. Participating contracts can include cash flows with different characteristics, for example:

- Cash flows that do not vary with returns from underlying items, such as death benefits and financial guarantees
- Cash flows that vary with returns from underlying items - either via a contractual link to the returns on underlying items or through an entity's right to exercise discretion in determining payments to policyholders

Insurance entities in many countries have issued contracts with participation features. An example of an insurance contract with a participation feature is a contract with a death cover in which the policyholder pays annual premiums into an account held by the insurer and receives the higher of a specified death benefit or the account balance (less fees), the return on which is based on the return generated by specified investments. Participating contracts may also contain discretionary participation features. In some countries, insurance companies must return to the policyholders at least a specified proportion of the investment profits on certain contracts but may give more. In other countries, bonuses are added to the policyholder account at the discretion of the insurer. In a third example, insurance companies distribute realised investment gains to the policyholder, but have discretion over the timing of realising the gains. These gains are normally based on the investment return generated by the underlying assets, and sometimes include an allowance for profits made on other contracts.

For measurement and presentation purposes, IFRS 17 does not distinguish between those participating insurance contracts that have discretionary features and those insurance contracts which do not have discretionary features. This is a change from IFRS 4, which had separate requirements for insurance contracts with discretionary participating features.

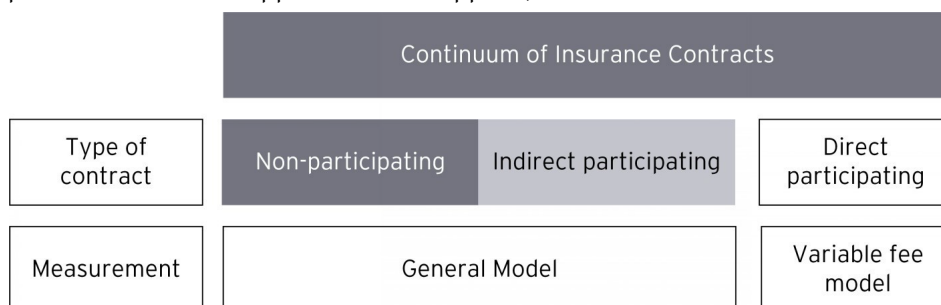

IFRS 17 includes:

- A mandatory adaptation to the general model (the variable fee approach) for insurance contracts that include direct participation features (see section 12.3 below).
- As part of the variable fee approach, a different method for determining the insurance finance income or expenses recorded in profit or loss when insurance finance income or expenses is disaggregated between profit or loss and other comprehensive income and when the underlying items are held (see section 15.3 below).
- Specific requirements within the general model for investment contracts with discretionary participation features (see section 12.4 below).

Insurance contracts without direct participation features are not permitted to be accounted for under the variable fee approach, even if such contracts contain participation features (sometimes referred to as indirect participating contracts). For example, an insurance contract where the profit sharing is not based on a share of a clearly identified pool of underlying items. Consequently, there will be a difference between the recognition of insurance revenue for insurance contracts without direct participation features but that have some asset dependent cash flows, and for insurance contracts with direct participation features accounted for using the variable fee approach. Different discount rates must also be used for re-measuring the contractual service margin (see section 9.3 above).

Contracts with participation features, including those contracts that meet the criteria for the variable fee approach, are not excluded from applying the premium allocation approach, but IFRS 17 appears to assume that they will typically not meet the eligibility criteria (as the coverage period may be significantly in excess of one year).

The following diagram compares accounting for direct participating contracts to other insurance contracts (assuming the premium allocation approach is not applied).

Reinsurance contracts issued and held cannot be insurance contracts with direct participation features for the purposes of IFRS 17 (see section 11.7 above). [IFRS 17.B109].

Many participating contracts also contain an element of discretion, which means that the entity can choose whether to pay additional benefits to policyholders. However, contracts without participation features may also contain an element of discretion. As discussed in section 9.2 above, the expected cash outflows of an insurance contract includes outflows over which the entity has discretion. IFRS 4 permitted the discretionary component of an insurance contract with participation features to be classified in its entirety as either a liability or as equity. [IFRS 4.34(b)]. As a result, under IFRS 4, many insurers classified the entire contract (including amounts potentially due to shareholders) as a liability. This treatment is not available under IFRS 17 as insurers are required to split the liability and equity components. Under IFRS 17, entities must make a best estimate of the liability due to policyholders (both current and future) under the contracts and amounts attributable to shareholders are part of shareholders' equity.

The following are two examples of contracts with a participation feature:

Illustration 12-1: Unitised with-profits policy

Premiums paid by the policyholder are used to purchase units in a 'with-profits' fund at the current unit price. The insurer guarantees that each unit added to the fund will have a minimum value which is the bid price of the unit. This is the guaranteed amount. In addition, the insurer may add two types of bonuses to the with-profits units. These are a regular bonus, which may be added daily as a permanent increase to the guaranteed amount, and a final bonus that may be added on top of those guaranteed amounts when the with-profits units are cashed in. Levels of regular and final bonuses are adjusted twice per year. Both regular and final bonuses are discretionary amounts and are generally set based on expected future returns generated by the funds.

Illustration 12-2: Participation policy with minimum interest rates

An insurance contract provides that the insurer must annually credit each policyholder's 'account' with a minimum interest rate (3%). This is the guaranteed amount. The insurer then has discretion regarding whether and what amount of the remaining undistributed realised investment returns from the assets backing the participating policies are distributed to policyholders in addition to the minimum. The contract states that the insurer's shareholders are only entitled to share up to 10% in the underlying investment results associated with the participating policies. As that entitlement is up to 10%, the insurer can decide to credit the policyholders with more than the minimum sharing rate of 90%. Once any additional interest above the minimum interest rate of 3% is credited to the policyholder it becomes a guaranteed liability.

How we see it

Determining how to faithfully represent the complex features of some participating contracts was one of the greatest challenges the IASB faced in finalising IFRS 17.

It is important to note that the differences between the variable fee approach for direct participation contracts and the general model applied to all other contracts exist for subsequent measurement only. As the requirements for initial measurement are the same for both models, any differences in measurement on initial recognition between contracts would be the result of differences in the terms and conditions of those contracts, but not the application of the two different measurement models.

12.1 Contracts with cash flows that affect or are affected by cash flows to policyholders of other contracts (mutualisation)

Entities should consider whether the cash flows of insurance contracts in one group affect the cash flows to policyholders of contracts in another group. In practice, this effect is often referred to as 'mutualisation', even though this term is not defined in IFRS 17. The standard uses the term 'risk sharing'. The economic effect of risk sharing is that a large population of policyholders effectively act together as a loss-absorbing 'buffer' when an adverse event occurs. The insurer itself incurs a loss only if the loss-absorbing capacity of the large population of policyholders is exhausted (i.e., the insurer, and ultimately its shareholders, act as risk-taker of last resort). As such, mutualised contracts result in policyholders subordinating their claims or cash flows to those of other policyholders, thereby reducing the direct exposure of the entity to a collective risk.

IFRS 17 observes that some insurance contracts affect the cash flows to policyholders of other contracts by requiring: [IFRS 17.B67]

- The policyholder to share the returns on some specified pool of underlying items
- And
- Either:
 - The policyholder to bear a reduction in their share of the returns on the underlying items because of payments to policyholders of other contracts that share in that pool, including payments arising under guarantees made to policyholders of those other contracts
 - Or
 - Policyholders of other contracts bear a reduction in their share of returns on the underlying items because of payments to the policyholder, including payments arising from guarantees made to the policyholder

Sometimes, such contracts will affect the cash flows to policyholders of contracts in other groups. The fulfilment cash flows of each group reflect the extent to which the contracts in the group cause the entity to be affected by expected cash flows, whether to policyholders in that group or to policyholders in another group. Hence, the fulfilment cash flows for a group: [IFRS 17.B68]

- Include payments arising from the terms of existing contracts to policyholders of contracts in other groups, regardless of whether those payments are expected to be made to current or future policyholders
- And
- Exclude payments to policyholders in the group that have been included in the fulfilment cash flows of another group

For example, to the extent that payments to policyholders in one group ('first group') are reduced from a share in the returns on underlying items of CU350 to CU250 because of payments of a guaranteed amount to policyholders in another group ('second group'), the fulfilment cash flows of the first group would include the payments of CU100 (i.e., would be CU350) and the fulfilment cash flows of the second group would exclude CU100 of the guaranteed amount. [IFRS 17.B69].

The reference to future policyholders is necessary because sometimes the terms of an existing contract are such that the entity is obliged to pay to policyholders amounts based on underlying items, but with discretion over the timing of the payments. That means that some of the amounts based on underlying items may be paid to policyholders of contracts that will be issued in the future that share in the returns on the same underlying items, rather than to existing policyholders. From the entity's perspective, the terms of the existing contract require it to pay the amounts, even though it does not yet know when or to whom it will make the payments. [IFRS 17.BC172].

Illustration 12-3: Risk sharing and guarantees

An insurer has issued participating contracts to two policyholders, A and B, that share in the same pool of underlying assets. The insurer has discretion as to how to share the returns of the underlying assets, but is bound by the minimum return guarantee in each individual contract. The terms of the contracts are the same, except that A's minimum return guarantee is 10% and B's is 5%. The pay-out of the returns to policyholder A and B are interdependent as both policyholders share in the same pool of underlying assets.

Assume the actual return from the underlying items is 8%. For A, the 8% of actual return from the underlying items is less than the minimum return guarantee of 10%. The opposite is true for B. Based on the contractual terms for both policyholders, A receives 10% (minimum return guarantee), and B receives the residual return of 6% (8% less 2% additional return paid to A). Thus, the amount paid to B is reduced in order to satisfy the minimum return promised to A, i.e., there is interdependency between the two pay-outs.

In this example, the insurer does not have to pay the difference between the actual returns and the minimum return guarantee to A. Instead, policyholder B absorbs a loss (or rather, misses out on an opportunity gain) to the benefit of the shareholders of the insurer. However, the insurer would need to pay the shortfall if the return from the underlying assets is insufficient to pay the minimum return guarantee of both policyholders. In this example, if the return is less than 7.5%, the minimum guarantees of both A and B could not be paid from this return in full and therefore the insurer would need to step in to pay the shortfall.

Different practical approaches can be used to determine the fulfilment cash flows of groups of contracts that affect or are affected by cash flows to policyholders of contracts in other groups. In some cases, an entity might be able to identify the change in the underlying items and resulting change in the cash flows only at a higher level of aggregation than the groups. In such cases, the entity must allocate the effect of the change in the underlying items to each group on a systematic and rational basis. [IFRS 17.B70].

After all insurance contract services have been provided to the contracts in a group, the fulfilment cash flows may still include payments expected to be made to current policyholders in other groups or future policyholders. An entity is not required to continue to allocate such fulfilment cash flows to specific groups, but can, instead, recognise and measure a liability for such fulfilment cash flows arising from all groups. [IFRS 17.B71].

The Board considered whether to provide specific guidance on amounts that have accumulated over many decades in participating funds and whose 'ownership' may not be attributable definitively between shareholders and policyholders. It concluded that it was not necessary. In principle, IFRS 17 requires an entity to estimate the cash flows in each scenario. If that requires difficult judgements or involves unusual levels of uncertainty, an entity would consider those matters in deciding what disclosures it must provide to satisfy the disclosure objective in IFRS 17 (see section 16 below). [IFRS 17.BC170].

The Board also considered whether prohibiting groups from including contracts issued more than one year apart would create an artificial divide for contracts with cash flows that affect, or are affected by, cash flows to policyholders in another group. The Board acknowledged that, for contracts that fully share risks, the groups together will give the same results as a single combined risk-sharing portfolio and therefore considered whether IFRS 17 should give an exception to the requirement to restrict groups to include only contracts issued within one year. However, the Board concluded that setting the boundary for such an exception would add complexity to IFRS 17 and create the risk that the boundary would not be robust or appropriate in all circumstances. Nonetheless, the Board noted that the requirements specify the amounts to be reported, not the methodology to be used to arrive at those amounts. Therefore, it may not be necessary for an entity to restrict groups in this way to achieve the same accounting outcome in some circumstances. [IFRS 17.BC138]. Details about IFRS 17's requirements for annual cohorts and inter-generational sharing of risk is contained in section 6.2.2.A above.

Frequently asked questions

Question 12-1: For annual groups of contracts that all share in the return of a specified pool of underlying items, with some of the return contractually passing from one group of policyholders to another, in what circumstances would measuring the contractual service margin at a higher level than an annual cohort level, such as a portfolio level, achieve the same accounting outcome as measuring the contractual service margin at an annual cohort level applying IFRS 17.22?

(TRG meeting September 2018 - Agenda paper no. 10, Log S74)

The TRG members discussed the IASB staff paper and observed that:

- When a specified pool of underlying items consists of insurance contracts issued to the policyholders that share in the returns of that pool, the criteria for mutualisation are met regardless of whether the policyholders' share is 100% of the return of the pool of underlying items or only part of the pool of underlying items.
- The criteria for mutualisation are also met when a specified pool of underlying items do not include the insurance contracts issued to those policyholders (for example, where underlying items are financial assets), if the contracts require policyholders to bear a reduction in their share of the returns on the underlying items because of payments to policyholders of other contracts that share in that pool.
- For contracts that share in 100% of the return of a pool of underlying items consisting of insurance contracts issued to those policyholders, the contractual service margin will be nil. Therefore, measuring the contractual service margin at a higher level than the annual cohort level, such as a portfolio level, would achieve the same accounting outcome as measuring the contractual service margin at an annual cohort level.
- Conversely when contracts share to a lesser extent in the return on a pool of underlying items consisting of insurance contracts issued to those policyholders, an entity could be affected by the expected cash flows of each contract issued. Therefore, the contractual service margin of the groups of contracts (at annual cohort level) may differ from the contractual service margin measured at a higher level, such as a portfolio level. To assess whether measuring the contractual service margin at a higher level would achieve the same accounting outcome as measuring the contractual service margin at an annual cohort level, an entity would need to determine what the effect would be (i.e., the accounting outcome would need to be the same in all circumstances, regardless of how assumptions and experience develop over the life of the contract).

In addition, TRG members expressed concern that, in practice, cash flows would be determined at a higher level of measurement than in the examples provided in the IASB staff paper and then the entity would have to allocate the effect of the change in the underlying items to each group on a systematic and rational basis.

Question 12-2: How should the exercise of an option to convert a contract to a different type of contract be treated? For example, an insurance contract that can be converted to an annuity contract, or a term life contract (similar in nature to contracts that are accounted applying the general model) that can be converted to a permanent life contract (similar in nature to contracts that are accounted for applying the variable fee approach).

(TRG meeting April 2019 - Agenda paper no. 02, Log S98)

The Staff analysis observed that previous TRG meetings are helpful in considering the accounting for such contracts, including:

- Agenda Paper 3 of the May 2018 TRG meeting (see Question 9-6 above), which analyses when cash flows arising from an option are within the boundary of the contract and notes that the exercise of a right included in the terms of a contract is not a contract modification [IFRS 17.72].
- Agenda Paper 5 of the September 2018 TRG meeting (see Question 9-3 above), which analyses when cash flows are outside of the contract boundary at initial recognition and facts and circumstances change over time, the exercise of an option that is in the contract boundary and the exercise of an option that is outside the contract boundary.

Accordingly, the assessment of whether an insurance contract is accounted for applying the general model or the variable fee approach is made at inception by applying the definition of an insurance contract with direct participation features in IFRS 17 to a contract in its entirety.

How we see it

Mutualisation applies only in the specific circumstances where policyholders are contractually required to share with policyholders of other contracts the returns on the same specified pool of underlying items. Cash flows to policyholders of contracts without participation features will typically be independent of amounts paid to other contracts. For example, holders of motor insurance contracts are generally not affected by amounts paid to holders of other motor insurance contracts issued by the same entity.

The standard does not limit the application of mutualisation to contracts with direct participation features, so, in principle, it could apply to other types of participating contracts too. However, meeting the criteria of mutualisation will arguably be more challenging the more the contract features are dissimilar to those of a contract with direct participation features.

To the extent mutualisation applies across groups of contracts written in different reporting periods, an entity will be able to offset losses on some groups with profits from other groups when measuring the affected groups. The question arises as to whether an entity will achieve the same outcome by measuring the affected groups together based on the combined risk sharing of those groups. Although the standard does not prohibit the use of practical expedients that would achieve the same outcome, an entity would have to substantiate the measurement outcome in the same way, considering all relevant aspects of the measurement. For example, an entity must not only consider the effect of loss recognition, but also the release pattern of the contractual service margin over the coverage period.

12.2 Participating insurance contracts without direct participation features

Insurance contracts without direct participation features must apply the general model without adaptation, even though such contracts may have participation features (also referred to as indirect participating contracts).

The terms of some insurance contracts without direct participation features give an entity discretion over the cash flows to be paid to policyholders. A change in discretionary cash flows is regarded as relating to future service, and, accordingly, adjusts the contractual service margin. To determine how to identify a change in discretionary cash flows, an entity must specify at inception of the contract, the basis on which it expects to determine its commitment under the contract, for example, the commitment could be based on a fixed interest rate, or returns that vary based on specified asset returns. [IFRS 17.B98].

An entity must use that specification to distinguish between the effect of changes in assumptions that relate to financial risk on that commitment (which do not adjust the contractual service margin) and the effect of discretionary changes to that commitment (which adjust the contractual service margin). [IFRS 17.B99].

If an entity cannot specify at inception of the contract, what it regards as its commitment under the contract and what it regards as discretionary, it must consider its commitment to be the return implicit in the estimate of the fulfilment cash flows at inception of the contract, updated to reflect current assumptions for financial risk. [IFRS 17.B100].

Illustration 12-4: Adjusting the contractual service margin for the effects of a change in discretionary cash flows

Entities A and B issue identical groups of insurance contracts without direct participation features one day before a reporting period ends. The contracts have a coverage period of five years. The policyholder receives the higher of a fixed death benefit or an account balance if he or she dies during the coverage period or an account balance at the end of the coverage period if he or she survives the coverage period. The contracts transfer significant insurance risk, although for the purposes of illustrating the effect of discretion over amounts credited to policyholder account balances, we disregard the death benefit cost.

At contract inception, the entities:

- Receive premiums of CU1,000
- Specify that their commitment under the contract is to credit interest to the account balances at a rate equal to the return on an internally specified pool of assets, minus a 2% spread
- Expect investment returns from the specified pool of assets to be 10% a year
- Expect to pay benefits at maturity of the contracts of CU1,469 (i.e., to credit interest at the rate of 8% a year for five years ($CU1,000 \times 1.08^5 = CU1,469$))
- Recognise fulfilment cash flows of CU912 ($CU1,469 \div 1.1^5$)
- Recognise a contractual service margin of CU88 ($CU1,000 - CU912$)

At the first subsequent reporting date (one day later), both entities revise their expectations of returns from the specified pool of assets downward from 10% to 9% a year.

Entity A's stated policy is that it will maintain its 2% spread. Therefore, Entity A:

- Expects to credit interest to the account balances of its policyholders at the rate of 7% a year
- Expects to pay benefits at maturity of CU1,403 ($\text{CU1,000} \times 1.07^5 = \text{CU1,403}$)
- Measures fulfilment cash flows at the reporting date of CU912 ($\text{CU1,403} \div 1.09^5 = \text{CU912}$)
- Maintains the contractual service margin of the group of contracts at CU88 because the measurement of fulfilment cash flows has not changed (assume accretion of interest and release of contractual service margin to profit or loss in one day is insignificant)

Entity B decides to apply its discretion and reduce the spread that it deducts from the return on the specified pool of assets from 2% to 1% a year. Therefore, Entity B:

- Expects to credit interest to the account balances of its policyholders at the rate of 8% a year (9% expected annual return, minus 1% spread)
- Expects to pay benefits at maturity of CU1,469 ($\text{CU1,000} \times 1.08^5 = \text{CU1,469}$)
- Measures fulfilment cash flows at the reporting date of CU956 ($\text{CU1,469} \div 1.09^5 = \text{CU956}$)
- Adjusts the contractual service margin for the group of contracts from CU88 to CU44 to reflect the adjustment to fulfilment cash flows resulting from an increase in fulfilment cash flows caused by its discretion to change the basis of policyholder payments ($\text{CU912} - \text{CU956} = -\text{CU44}$, contractual service margin of $\text{CU88} - \text{CU44} = \text{CU44}$)

12.3 Contracts with direct participation features

IFRS 17 identifies a separate set of insurance contracts with participation features described as insurance contracts with direct participation features. These contracts apply an adapted version of the general model, commonly referred to as the 'variable fee' approach.

For contracts using the variable fee approach, the changes in the contractual service margin are mostly driven by the movements in the assets 'backing' the contracts or other profit-sharing items (referred to as 'underlying items') rather than by the fulfilment cash flows of the insurance contract liability. Use of the variable fee approach instead of the general model is mandatory for those insurance contracts that meet the criteria of the variable fee approach (see section 12.3.1 below). The assessment of eligibility for the variable fee approach should be performed at individual contract level although in practice this could be applied to 'clusters' of contracts as long as the outcome would not be different. The Board observed that one assessment should be sufficient for an entity to determine whether the criteria are met for each contract in a set of homogenous contracts issued in the same market conditions and priced on the same basis. [IFRS 17.BC249D].

The variable fee approach applies to insurance contracts that meet its criteria; the fact that participation features are discretionary does not necessarily preclude contracts from meeting the criteria. However, contracts with participation features are significantly different across jurisdictions. Not all contracts with participation features will meet the criteria to be accounted for as direct participation contracts.

Conceptually, insurance contracts with direct participation features are contracts under which an entity's obligation to the policyholder is the net of: [IFRS 17.B104]

- The obligation to pay the policyholder an amount equal to the fair value of the underlying items
And
- A variable fee that the entity will deduct from the obligation in exchange for the future service provided by the insurance contract comprising:
 - The amount of the entity's share of the fair value of the underlying items, less
 - Fulfilment cash flows that do not vary based on the returns on underlying items

Under this approach: [IFRS 17.BC243]

- Changes in the estimates of the obligation to pay the policyholder an amount equal to the fair value of the underlying items are recognised in profit or loss or other comprehensive income, just as would changes in the fair value of most underlying items.
- Changes in the estimates of the variable fee for future service and changes in estimates of cash flows relating to future service would be accounted for constantly. Accordingly, changes in the entity's share of underlying items adjust the contractual service margin so that the changes are recognised in profit or loss over the coverage period.
- The financial statements of the entity report a net investment return only to the extent that the return on the assets the entity holds (if measured at fair value thought profit or loss) do not match the returns on the promised underlying items.

The Board concluded that returns to the entity from underlying items should be viewed as part of the compensation the entity charges the policyholder for service provided under the insurance contract, rather than as a share of returns from an unrelated investment, in a narrow set of circumstances in which the policyholders directly participate in a share of the returns on the underlying items. In such cases, the fact that the fee for the contract is determined by reference to a share of the returns on the underlying items is incidental to its nature as a fee. The Board concluded that depicting the gains and losses on the entity's share of the underlying items as part of a variable fee for service faithfully represents the nature of the contractual arrangement. [IFRS 17.BC244].

IFRS 17 requires the contractual service margin for insurance contracts with direct participation features to be updated for more changes than those affecting the contractual service margin for other insurance contracts. In addition to the adjustments made for other insurance contracts, the contractual service margin for insurance contracts with direct participation features is also adjusted for the effect of changes in: [IFRS 17.BC240]

- The entity's share of the underlying items
- And
- Financial risks other than those arising from the underlying items, for example, the effect of financial guarantees

The Board decided that these differences are necessary to give a faithful representation of the different nature of the fee in these contracts. The Board concluded that, for many insurance contracts, it is appropriate to depict the gains and losses on any investment portfolio related to the contracts in the same way as gains and losses on an investment portfolio unrelated to insurance contracts. [IFRS 17.BC241].

Illustration 12-5: The 'variable fee approach' compared to the general model

A group of contracts with participating features was written at the beginning of the year, in which the entity received premiums in total of CU1,000, which was used to purchase financial assets. The policyholder participates in 90% and the entity in 10% of the assets' return.

At initial recognition, the expected present value of the cash outflows is CU900 and the contractual service margin is CU100. Assume the CU900 represents a non-distinct investment component.

Over the contract term of three years, the change in the fair value of the underlying financial assets amount to a net gain of CU30, of which the policyholders received CU27 (90% × CU30) and the entity CU3 (10% × CU30). In addition, the entity incurred, cumulatively over the three-year period, cash flows that do not vary based on the returns on underlying items of CU2.

Assuming the impact of all other variables over the three-year period to be negligible, the cumulative results reported in the entity's statement of profit or loss can be illustrated, as follows:

	Cumulative results over the three-year term	
	General model	Variable fee approach
	CU	CU
Insurance revenue*	100	103
Insurance service expenses*	(2)	(2)
Insurance service result	98	101
Investment income (IFRS 9)	30	30
Insurance finance and expense	(27)	(30)
Net financial result	3	-

* The insurance revenue and insurance services expenses exclude the non-distinct investment component of CU900.

Under the general model, the subsequent change in the entity's share of the underlying items would not form part of the contractual service margin and would have emerged as part of the net finance result as incurred. In terms of the 'variable fee approach', a change in the entity's share of the underlying items forms part of the contractual service margin and subsequently released to insurance revenue over the coverage period.

12.3.1 Definition of an insurance contract with direct participation features

An entity must assess whether a contract has direct participation features using its expectations at inception of the contract and must not reassess the conditions, unless the contract is modified (see section 13.1 below for modifications). [IFRS 17.B102]. As noted in section 12.3 above, the assessment is made at individual contract level.

Insurance contracts with direct participation features are insurance contracts that are substantially investment-related service contracts under which an entity promises an investment return based on underlying items (i.e., items that determine some of the amounts payable to a policyholder). Hence, these contracts are defined as insurance contracts for which: [IFRS 17.B101]

- The contractual terms specify that the policyholder participates in a share of a clearly identified pool of underlying items (see section 12.3.1.A below).
- The entity expects to pay the policyholder an amount equal to a substantial share of the fair value returns from the underlying items (see section 12.3.1.B below).
- The entity expects a substantial proportion of any change in the amounts paid to the policyholder to vary with the change in fair value of the underlying items (see section 12.3.1.C below).

When an insurance contract is acquired in a business combination or transfer, the criteria as to whether the contract applies the variable fee approach is assessed at the business combination or transfer date (see section 14 below).

Situations where cash flows of insurance contracts in a group affect the cash flows of contracts in other groups are discussed in section 12.1 above.

How we see it

Participating contracts differ significantly between jurisdictions. Not all participating contracts will meet the criteria to be accounted for under the variable fee approach. An entity will need to exercise judgement when determining whether a contract contains direct participation features and, therefore, will be accounted for applying the variable fee approach based on the specific facts and circumstances. However, while the degree to which a contract may meet or fail the eligibility criteria will vary, the outcome is binary. Examples of products that are generally expected to be in scope are UK-style with-profits contracts, unit-linked contracts and Continental European contracts with 90% participation.

12.3.1.A A share of a clearly defined pool of underlying items

The pool of underlying items can comprise any items, for example, a reference portfolio of assets, the net assets of the entity, or a specified subset of the net assets of the entity, as long as they are clearly identified by the contract. An entity need not hold the identified pool of underlying items (although there are accounting consequences of this - see section 15.3.1 below). However, a clearly identified pool of underlying items does not exist when: [IFRS 17.B106]

- An entity can change the underlying items that determine the amount of the entity's obligation with retrospective effect
Or
- There are no underlying items identified, even if the policyholder could be provided with a return that generally reflects the entity's overall performance and expectations, or the performance and expectations of a subset of assets the entity holds. An example of such a return is a crediting rate or dividend payment set by the entity at the end of the period to which it relates. In this case, the obligation to the policyholder reflects the crediting rate or dividend amounts the entity has set and does not reflect identified underlying items.

The word 'share' referred to in the section heading above does not preclude the existence of the entity's discretion to vary amounts paid to the policyholder. However, the link to the underlying items must be enforceable. [IFRS 17.B105].

For the variable fee approach to be applied, the contract must specify a determinable fee and because of this a clearly identified pool of underlying items must exist. Without a determinable fee, which can be expressed as a percentage of portfolio returns or portfolio asset values rather than only as a monetary amount, the share of the return on the underlying items the entity retains would be entirely at the discretion of the entity and, in the IASB's view, this would not be consistent with being equivalent to a fee. [IFRS 17.BC245(a)]. However, IFRS 17 does not mention a stated minimum determinable fee.

The standard does not require that an entity measures the underlying items at fair value in the statement of financial position. There is also no restriction on the type of asset which can be an underlying item. This means that underlying items can be, for example, a subsidiary of the group, assets such as financial assets measured at amortised cost or non-participating insurance contracts measured in accordance with the general model in IFRS 17. In February 2020, the IASB confirmed that non-participating insurance contracts held as underlying items are measured in accordance with IFRS 17 rather than at fair value on the grounds that creating an exception for these assets would add significant complexity to IFRS 17.¹⁰ However, as discussed in section 12.3.1.B below, a substantial portion of the fair value returns of underlying items, regardless of how they are measured for accounting purposes, must be payable to the policyholder.

12.3.1.B A substantial share of the fair value returns on the underlying items

The entity should expect to pay to the policyholder an amount equal to a substantial share of the fair value returns on the underlying items. The Basis for Conclusions further clarifies that it would not be a faithful representation to depict an obligation to pay an amount equal to the fair value of the underlying items if the policyholder does not expect to receive a substantial part of the fair value returns on the underlying items.

[IFRS 17.BC245(b)(i)].

IFRS 17 provides no specific quantitative threshold for 'substantial'. However, an entity must interpret the word 'substantial' as in both 'substantial share' and 'substantial proportion' (see section 12.3.1.C below):

[IFRS 17.B107]

- In the context of the objective of insurance contracts with direct participation features being contracts under which the entity provides investment-related services and is compensated for the services by a fee that is determined by reference to the underlying items
- And
- Assess the variability in the amounts:
 - Over the duration of the insurance contract
 - On a present value probability-weighted average basis, not a best or worst outcome basis

IFRS 17 further explains that if, for example, the entity expects to pay a substantial share of the fair value returns on underlying items, subject to a guarantee of a minimum return, there will be scenarios in which:

[IFRS 17.B108]

- The cash flows that the entity expects to pay to the policyholder vary with the changes in the fair value of the underlying items because the guaranteed return and other cash flows that do not vary based on the returns on underlying items do not exceed the fair value return on the underlying items
- The cash flows that the entity expects to pay to the policyholder do not vary with the changes in the fair value of the underlying items because the guaranteed return and other cash flows that do not vary based on the returns on underlying items exceed the fair value return on the underlying items

The entity's assessment of the variability will reflect a present value probability-weighted average of all these scenarios.

As many participating contracts contain guarantees, the question as to whether a contract is one with direct participation features or not depends on the effect of the guarantee on the expected value of the cash flows at inception. It does not mean that there can be no scenarios in which the guarantee 'kicks in'. Instead, it does mean that the effect of those scenarios on a probability-weighted basis should be such that a substantial share of the expected returns payable to the policyholder is still based on the fair value of the underlying items. Considering the impact of options and guarantees on the eligibility criteria will have to be based on the specific facts and circumstances and requires the use of judgement.

When the cash flows of insurance contracts in a group affect the cash flows to policyholders of contracts in other groups (see section 12.1 above), an entity must assess whether the conditions for meeting the classification of the contracts as insurance contracts with direct participation features are met by considering the cash flows that the entity expects to pay to the policyholders. [IFRS 17.B103].

¹⁰ [IASB Staff paper 2F](#): Project: *Amendments to IFRS 17*, Paper topic: *Other topics raised by respondents to the Exposure Draft Amendments to IFRS 17*, IASB meeting, February 2020, Appendix A, paragraph 1. Available on the IFRS Foundation's website.

How we see it

If underlying items are not measured on a fair value basis in an entity's financial statements, this does not preclude them from qualifying for the variable fee approach. The eligibility depends on the expectation of payments of a substantial share of the fair value returns to the policyholder rather than the accounting measurement of the underlying items.

Frequently asked questions

Question 12-3: Would contracts where the return is based on an amortised cost measurement of the underlying items fail the definition of insurance contract with direct participation features?

(TRG meeting February 2018 - Agenda paper no. 7, Log S26)

The IASB staff observed that contracts which provide a return that is based on an amortised cost measurement of the underlying items would not automatically fail the definition of an insurance contract with direct participation features. Entities' expectations of returns would be assessed over the duration of the contract and, therefore, returns based on an amortised cost measurement might equal returns based on the fair value of the underlying items over the contract duration.

The TRG members agreed with the IASB staff's conclusion that the variable fee approach could be met when the return is based on amortised cost measurement of the underlying items.

Question 12-4: For a unit-linked insurance contract for which the entity charges an asset management fee, determined as a percentage of the fair value of the underlying items at the end of each period, and a premium for mortality cover, by reducing the underlying items at the beginning of each period, how does the entity determine what is a substantial share of the fair value returns?

(TRG meeting April 2019 - Agenda paper no. 2, Log S115)

The submission asked, firstly, how to determine the share of the fair value returns on the underlying items ignoring the fixed premium charge for mortality cover and, secondly, whether and how the premium for mortality cover deducted from the underlying items impacts the calculation of the fair value returns. IFRS 17.B101(b) requires that the entity expects to pay to the policyholder an amount equal to a substantial share of the fair value returns on the underlying items as a condition for meeting the definition of an insurance contract with direct participation features.

The IASB staff stated that, in this example, the fixed annual charge for mortality cover is, in effect, an amount paid out of the policyholder's share and, therefore, the policyholder's share includes that charge.

However, to determine whether the definition of an insurance contract with direct participation features is met, an entity also needs to consider whether it expects a substantial proportion of any change in the amounts paid to the policyholder to vary with the change in the fair value of the underlying items (see section 12.3.1.C below). For the purposes of this condition, an entity considers changes in any amounts to be paid to the policyholder regardless of whether they have been paid from the underlying items or not. The TRG members observed that a distinguishing feature in this example is that the premium for mortality is fixed rather than varying with the fair value of the underlying items. The IASB staff confirmed that the analysis might differ had the charge varied with the fair value of the underlying items. The TRG members also observed that when determining whether an insurance contract is in the scope of the variable fee approach, in some circumstances it may be necessary to consider the way a charge is determined, rather than the way it is labelled in the contract, to identify what the charge represents. The IASB staff also noted that one of the other conditions of assessing eligibility for the variable fee approach is that a substantial proportion of the changes in amounts paid to policyholders should vary with the changes in the fair value of the underlying items, regardless of whether they have been paid from the underlying items or not.

Illustration 12-6: Calculation of the expected fair value returns with and without mortality charge

This Illustration shows how an entity calculates the expected fair value returns on the underlying items applying IFRS 17.B101(b).

Without mortality charge

An insurance contract gives the policyholder the returns on underlying items, after paying an annual management fee of 0.75% of the fair value of the underlying items. The expected duration of the contract is five years and the expected annual returns on underlying items are 5%. The expected account balance is calculated in the following table:

Year	1	2	3	4	5	Total
	CU	CU	CU	CU	CU	CU
Opening balance	15,000	15,632	16,290	16,977	17,692	
Returns on underlying items	750	782	815	849	885	4,081
Annual management fee	(118)	(123)	(128)	(134)	(139)	(642)
Closing balance	15,632	16,290	16,977	17,692	18,437	

To apply IFRS 17.B101(b), the expected fair value returns are CU4,081, of which the entity expects to pay to the policyholder CU3,437 (CU18,437 - CU15,000).

With mortality charge

An insurance contract gives the policyholder the returns on underlying items, after paying an annual management fee of 0.75% of the fair value of the underlying items. The expected duration of the contract is 5 years and the expected annual returns on underlying items are 5%. An annual charge for mortality cover of CU100 reduces the underlying items at the start of each year. The expected account balance is calculated in the following table:

Year	1	2	3	4	5	Total
	CU	CU	CU	CU	CU	CU
Opening balance	15,000	15,527	16,076	16,648	17,245	
Mortality charge	(100)	(100)	(100)	(100)	(100)	(500)
Returns on underlying items	745	771	799	827	857	3,999
Annual management fee	(118)	(122)	(127)	(131)	(136)	(634)
Closing balance	15,527	16,067	16,648	17,245	17,866	

To apply IFRS 17.B101(b) the expected fair value returns are CU3,999. The entity expects to pay to the policyholders CU2,866 (CU17,866 - CU15,000) having deducted the mortality charge. Hence, in total, the share of the fair value returns the entity expects to pay to the policyholder is CU3,366 (CU2,866 + CU500).

How we see it

Many participating contracts contain options and guarantees. An option may, for example, include a policyholder's right to change a particular financial benefit to another type of financial benefit under potentially favourable terms. A guarantee could entitle the policyholder to a specified minimum annual return. An entity would need to apply IFRS 9 to determine whether, and if so, how an embedded derivative is required to be separated.

The impact that non-distinct options and guarantees have on the eligibility criteria for the variable fee approach will require the use of judgement. The question as to whether a contract includes direct participation features can depend on the effect of these guarantees and options on the expected value of the cash flows at inception. In order to qualify for the variable fee approach, the effect of scenarios that result in the guarantee being payable, on a probability-weighted basis, should be such that a substantial share of the expected returns payable to the policyholder are still based on the fair value of the underlying items.

12.3.1.C A substantial proportion of any change in the amounts to be paid to the policyholder to vary with the change in fair value of the underlying items

The entity should expect that a substantial proportion of any change in the amounts to be paid to the policyholder will vary with the change in fair value of the underlying items. It would not be a faithful representation to depict an obligation to pay an amount equal to the fair value of the underlying items if the entity were not to expect changes in the amount to be paid to vary with the change in fair value of the underlying items. [IFRS 17.BC245(b)(ii)].

The discussion in section 12.3.1.B above applies here, including how to apply the words 'substantial proportion'.

12.3.2 Measurement of the risk adjustment for non-financial risk using the variable fee approach

IFRS 17's guidance for the measurement of the risk adjustment for non-financial risk (see section 9.4 above) does not prescribe how the risk adjustment should be calculated for contracts where the entity shares in the results from underlying items with policyholders. The risk adjustment for non-financial risk is the compensation that the entity requires for bearing the uncertainty about the amount and timing of cash flows that arise from non-financial risk as the entity fulfils the insurance contract. Consequently, the risk adjustment for non-financial risk should reflect only the risk of the entity and not also the additional risk of the policyholder. However, the entity's risk is not limited to the shareholder's share in the underlying items but would also include the risk of any returns which do not vary with underlying items (e.g., the effect of guarantees).

12.3.3 Measurement of the contractual service margin using the variable fee approach

At initial recognition, the contractual service margin for a group of insurance contracts with direct participation features is measured in the same way as a group of insurance contracts without direct participation features (i.e., as a balancing figure intended to eliminate any day 1 profits unless the contract is onerous - see section 9.5 above). The contractual service margin is also adjusted based on changes in the fair value of underlying items, which includes the impact of discount rate changes rather than discount rates at the measurement date of the group (see section 9.3 above). [IFRS 17.B113(a)].

At the end of a reporting period, for insurance contracts with direct participation features, the carrying amount of the contractual service margin of a group of contracts equals the carrying amount at the start of the reporting period adjusted, as follows: [IFRS 17.45]

Change in the carrying amount of the contractual service margin in a period under the variable fee approach	
Contractual service margin at the beginning of the period	X
Effect of new contracts added to the group (see section 7 above)	X/(X)
Change in the amount of the entity's share of the change in the fair value of the underlying items (see section 12.3.1 above), except to the extent that: <ul style="list-style-type: none"> ▪ The entity elects to and applies risk mitigation (see section 12.3.5 below) ▪ The decrease in the amount of the entity's share of the fair value of the underlying items exceeds the carrying amount of the contractual service margin, giving rise to an onerous contract loss (see section 9.8 above) Or <ul style="list-style-type: none"> ▪ The increase in the amount of the entity's share of the fair value of the underlying items reverses any onerous contract loss above 	X/(X)
Change in fulfilment cash flows relating to future service, except to the extent that: <ul style="list-style-type: none"> ▪ Risk mitigation is applied (see section 12.3.5 below) ▪ Such increases in the fulfilment cash flows exceed the carrying amount of the contractual service margin, giving rise to an onerous contract loss (see section 9.8 above) Or <ul style="list-style-type: none"> ▪ Such decreases in the fulfilment cash flows are allocated to the loss component of the liability for remaining coverage 	X/(X)

Change in the carrying amount of the contractual service margin in a period under the variable fee approach

Effect of currency exchange differences (see section 8.3 above)	X/(X)
The amount recognised as insurance revenue because of the transfer of insurance contract services in the period, determined by the allocation of the contractual service margin remaining at the end of the reporting period (before any allocation) over the current and remaining coverage period	(X)
Contractual service margin at the end of the period	X

As discussed in section 9.6.3 above, IFRS 17 does not specify the order in which the calculations above need to be performed. However, IFRS 17.44(e) states that the amount recognised as insurance revenue because of the transfer of insurance services in the period is determined by the allocation of the contractual margin remaining at the end of the period. The use of the word 'end' implies that this should be the last step.

IFRS 17 further states that:

- Changes in the obligation to pay the policyholder an amount equal to the fair value of the underlying items do not relate to future service and do not adjust the contractual service margin [IFRS 17.B111]
- Changes in the amount of the entity's share of the fair value of the underlying items relate to future service and adjust the contractual service margin [IFRS 17.B112]

Changes in fulfilment cash flows that do not vary based on returns on underlying items comprise: [IFRS 17.B113]

- The change in the effect of the time value of money and financial risks not arising from the underlying items. An example of this would be the effect of financial guarantees. These relate to future service and adjust the contractual service margin except to the extent that the entity applies risk mitigation.
- Other changes in estimates of fulfilment cash flows. An entity applies the same requirements consistent with insurance contracts without direct participation features to determine what extent they relate to future service and therefore adjust the contractual service margin (see section 9.6.3 above).

An entity is not required to identify the separate components of the adjustments to the contractual service margin resulting from changes in the entity's share of the fair value of underlying items that relate to future service and changes in the fulfilment cash flows relating to future service. Instead, a combined amount may be determined for some or all of the adjustments. [IFRS 17.B114].

Except in situations when a group of contracts is onerous, or to the extent the entity applies the risk mitigation exception (see section 12.3.5 below), the effect of the general model and the variable fee approach may be compared, as follows:

Comparison of	General model	Variable fee approach
Insurance finance income or expenses (total) recognised in statement of financial performance	<ul style="list-style-type: none"> ▪ Change in the carrying amount of fulfilment cash flows arising from the time value of money and financial risk ▪ Accretion of interest on the contractual service margin at rate at initial recognition ▪ Any difference between the present value of a change in fulfilment cash flows measured at current rates and rates at initial recognition that adjust the contractual service margin 	Change in the fair value of underlying items
Changes in the carrying amount of fulfilment cash flows arising from the time value of money and financial risk	Recognised immediately in the statement of financial performance [IFRS 17.87, IFRS 17.88, IFRS 17.89]	Adjusts the contractual service margin unless risk mitigation applies (in which case it adjusts profit or loss or other comprehensive income) [IFRS 17.87(c), IFRS 17.B113(b)]
Discount rates for accretion of, and adjustment to, the contractual service margin	Rates determined at initial recognition	Rate included in the balance sheet measurement (i.e., current rates) [IFRS 17.B113(a)]

How we see it

Under the variable fee approach, an entity is not required to identify the separate components of the adjustments to the contractual service margin resulting from changes in the entity's share of the fair value of underlying items that relate to future service and changes in the fulfilment cash flows relating to future service. Not making this split might be easier administratively. However, disaggregating this change might provide useful information, better reflect the sources of measurement changes, and result in greater consistency with the insurance contract roll-forward analyses for contracts accounted for under the general model.

An entity that does not separate the changes in its share of the fair value of underlying items from changes in the policyholder's share is likely to need to disclose the roll-forward of the carrying amount of insurance contracts with direct participation features separately from the roll-forward for other insurance contracts, because the gross amounts of insurance finance income or expenses and changes in fulfilment cash flows relating to future services (including the policyholders' share of the change in the fair value of underlying items), may be significantly different in size and nature from corresponding amounts for contracts subject to the general model.

12.3.4 Allocation of the contractual service margin to profit or loss

The contractual service margin for an insurance contract with direct participation features is allocated to profit or loss using the same methodology discussed in section 9.7 above for the general model. That is, by identifying the coverage units in the group and releasing the contractual service margin in profit or loss to reflect the insurance contract services in the period.

IFRS 17 defines insurance contract services in respect of contracts with direct participation features as: *[IFRS 17 Appendix A]*

- Coverage for an insured event (insurance coverage)
- The management of underlying items on behalf of the policyholder (investment-related service)

This means that the period over which the contractual service margin is amortised for contracts with direct participation features includes both the period in which the entity provides coverage and the period over which it provides an investment-related service.

For the purpose of amortising the contractual service margin, the period of investment-related service ends at or before the date that all amounts due to current policyholders relating to those services have been paid, without considering payments to future policyholders included in the fulfilment cash flows as a result of mutualisation (see section 12.1 above). *[IFRS 17.B119A]*.

Illustration 12-7: Insurance services and investment component with different durations

An insurance contract with direct participation features matures in year 10 and pays the customer the account value at maturity. The contract also includes a death benefit that varies depending on which year in the 10-year period the death occurs. Specifically, if the customer dies in years 1 to 5, the customer's beneficiary would receive a death benefit that is the higher of 110% of the premium paid or the accumulated account value (assume that the death benefit for years 1 to 5 results in significant insurance risk). However, if the customer dies in years 6 to 10, the customer's beneficiary receives only the account value. There is no surrender penalty.

The insurer needs to consider all 10 years for determining coverage units and amortisation of the contractual service margin as over that period insurance contract services are provided rather than only during years 1-5.

See also section 12.2 above for discussion of insurance contracts without direct participation features.

12.3.5 Risk mitigation

For contracts with direct participation features, IFRS 17 requires changes in the shareholder's share of underlying items and cash flows that do not vary with underlying items (together part of the variable fee of a such contract) to adjust the contractual service margin (see section 12.3.3 above). However, amounts payable to policyholders that do not vary with underlying items create risks for an entity, particularly if the amounts payable are independent of the amounts that the entity receives from investments, for example, if the insurance contract includes guarantees. An entity is also at risk from possible changes in its share of the fair value returns on underlying items and may purchase derivatives to mitigate such risks. When applying IFRS 9, such derivatives are measured at fair value through profit or loss. Consequently, an accounting mismatch arises because the change in the carrying amount of the insurance liability (i.e., the hedged item) does not go through profit or loss. A similar accounting mismatch arises if the entity uses instruments other than derivatives to mitigate risk such as reinsurance contracts held because the variable fee approach cannot be used for reinsurance contracts held. *[IFRS 17.BC250, IFRS 17.BC251, IFRS 17.BC252, IFRS 17.BC253]*.

To address these mismatches, IFRS 17 permits entities relief from the requirements of the variable fee approach. This relief allows an entity to choose not to recognise a change in the contractual service margin to reflect some or all of the changes in the time value of money or the effect of financial risk on:

[IFRS 17.B115]

- The amount of the entity's share of the underlying items if the entity mitigates the effect of financial risk on that amount using derivatives or reinsurance contracts held
- The changes in fulfilment cash flows that do not vary based on the returns on underlying items arising from a change in the effect of the time value of money and financial risk, for example, the effect of financial guarantees, if the entity mitigates the effect of financial risk on those fulfilment cash flows using derivatives, non-derivative financial instruments measured at fair value through profit or loss, or reinsurance contracts held

See Illustration 12-5 in section 12.3 above for a comparison between the general model and the variable fee approach.

An entity that elects to use this approach must determine the eligible fulfilment cash flows in a group of contracts in a consistent manner in each reporting period. [IFRS 17.B117].

When risk mitigation is applied using derivatives or non-derivative financial instruments, any insurance finance income or expenses arising must be included in profit or loss. If an entity mitigates the effect of financial risk using reinsurance contracts held, it must apply the same accounting policy for the presentation of insurance finance income or expenses as the entity applies to the reinsurance contracts held (i.e., profit or loss if disaggregation is not applied or split between profit or loss and other comprehensive income if disaggregation is applied - see section 15.3 below). [IFRS 17.B117A].

Use of this relief is conditional on the entity having a previously documented risk management objective and strategy for mitigating the financial risk described above. In applying that objective and strategy:

[IFRS 17.B116]

- An economic offset exists between the insurance contracts and the derivative, non-derivative financial instrument measured at fair value, or reinsurance contract held (i.e., the values of the insurance contracts and the risk mitigating items generally move in opposite directions because they respond in a similar way to the changes in the risk being mitigated). An entity must not consider accounting measurement differences in assessing the economic offset.
- Credit risk does not dominate the economic offset.

If, and only if, any of the conditions above cease to be met, an entity must cease to apply the risk mitigation accounting prospectively from that date. An entity must not make any adjustment for changes previously recognised in profit or loss. [IFRS 17.B118]. This means that an entity can discontinue the use of risk mitigation option only if any of the eligibility criteria cease to apply and not on a voluntary basis. Therefore, the entity would apply risk mitigation consistently until the criteria for risk mitigation are no longer met. This is intended to be aligned with the hedge accounting discontinuation requirements in IFRS 9 as IFRS 9 does not allow an entity to discontinue hedge accounting unless the hedging relationship ceases to meet the qualifying criteria.¹¹

The Board considered but rejected feedback that an entity should be permitted to apply the risk mitigation option when it uses non-derivative financial instruments measured at fair value through other comprehensive income. The Board noted that, in most circumstances, the risk mitigation option would not resolve perceived mismatches between amounts recognised in profit or loss for insurance contracts with direct participation features using the other comprehensive income option in IFRS 17 and assets measured at fair value through other comprehensive income. In addition, the proposal would have resulted in the ineffectiveness of the risk mitigation strategy being recognised in other comprehensive income. That would be inconsistent with the hedge accounting requirements in IFRS 9. The Board observed that an entity could avoid mismatches by applying both the fair value option in IFRS 9 (to designate financial assets at fair value through profit or loss) and the risk mitigation option in IFRS 17. The Board was also not persuaded by the view that an entity should be permitted to apply the risk mitigation option when it uses non-derivative financial instruments to mitigate the effect of financial risk on the entity's share of the fair value of the underlying items. For instance, when the entity mitigates such financial risk by investing premiums in assets other than the underlying items, e.g., through an investment in fixed rate bonds. In the Board's view, permitting an entity to apply the risk mitigation option in that circumstance would contradict the principle that an entity need not hold the underlying items for the variable fee approach to apply. [IFRS 17.BC256D, IFRS 17.BC256E, IFRS 17.BC256F].

11 [IASB Staff paper 2D](#): Project: *Amendments to IFRS 17 Insurance Contracts*, Paper topic: *Annual improvements*, IASB meeting, April 2019, paragraph 10. Available on the IFRS Foundation's website.

How we see it

The exemption, in the case of risk mitigation, from the requirement of the variable fee approach to adjust the contractual service margin for changes in financial assumptions relating to future service is an important feature. It was introduced to reduce accounting mismatches that would otherwise arise from economic risk mitigation where movements in the fair value of derivatives, reinsurance contracts held, or non-derivative financial instruments are reported in profit or loss. However, there is little guidance about the practical application of this approach. For example, how to interpret and apply the provision for 'some or all' changes in the time value of money or financial risk to be excluded from the contractual service margin when an entity mitigates financial risk using the eligible instruments.

12.3.6 Disaggregation of insurance finance income or expenses between profit or loss and other comprehensive income

As discussed in section 15.3 below, entities have an accounting policy choice, per portfolio of insurance contracts, between:

- Including insurance finance income or expenses in profit or loss
- Or
- Disaggregating insurance finance income or expenses between profit or loss and other comprehensive income

For insurance contracts with direct participation features, when disaggregation is selected, allocation of the insurance finance income or expenses between profit or loss and other comprehensive income is different depending on whether or not the underlying items are held, as follows:

- If the underlying items are not held, then the insurance finance income or expenses included in profit or loss is calculated using a systematic allocation arising from the estimates of future cash flows that can be determined in one of two ways (known as the 'effective yield approach' and the 'projected crediting approach'). See section 15.3.2 below.
- If the underlying items are held, then the insurance finance income or expenses included in profit or loss is an amount that eliminates accounting mismatches with income and expenses on the underlying items held. This means that the expenses or income from the movement of the insurance liability should exactly match the income or expenses included in profit or loss for the underlying items, resulting in the net of the two separately presented items being nil. This approach is sometimes referred to as the 'current period book yield approach'. (See section 15.3.4. below).

Frequently asked questions

Question 12-5: For a direct participating contract that shares returns with policyholders by paying dividends, on what basis should the adjustment to the CSM reflect changes related to non-economic experience on underlying items be measured and in applying the current period book yield approach to disaggregate insurance finance income or expense, is the adjustment limited to financial income or expenses on the underlying items held?

(TRG meeting April 2019 - Agenda paper no. 2, Log S114)

The submission described a specific fact pattern for a contract applying the variable fee approach where the entity shares returns on underlying items with policyholders by paying dividends. The dividend scale varies based on the market value returns with respect to economic experience of the investments, and on a statutory basis for the non-economic experience (such as from expenses and reinsurance contracts held). Two questions were asked. Firstly, in determining the adjustment to be made to the contractual service margin under the variable fee approach for the shareholder's share in underlying items, should the change in the non-economic experience on the underlying items be determined on an IFRS, statutory or fair value basis? Secondly, when an entity applies the current period book yield approach under IFRS 17.89 to disaggregate insurance finance income or expenses between profit or loss and other comprehensive income, is this limited to financial income or expense on underlying items held or should it include all income or expense arising from underlying items? The IASB staff observed that under the variable fee approach an entity adjusts the contractual service margin of a group of contracts based on changes in the fair value of underlying items. Therefore, a statutory basis or an IFRS measure (which are not fair value measurements) cannot be used to determine the adjustment to the contractual service margin.

The IASB staff also observed that, when disaggregation is applied under IFRS 17.89 and B134, the amount of income or expense included in profit or loss should exactly match the income or expense included in profit or loss for the underlying items, resulting in the net of the two separately presented items being nil. Therefore, income or expense on underlying items is not limited to financial income or expense.

12.4 Investment contracts with discretionary participation features

An investment contract with discretionary participation features does not contain significant insurance risk and is, therefore, a financial instrument. Nevertheless, these contracts are within the scope of IFRS 17, provided the entity also issues insurance contracts. [IFRS 17.3(c)].

There is no *de minimis* limit on the number of insurance contracts that an entity must issue in order to ensure that its investment contracts with discretionary participation features are within the scope of IFRS 17. In theory, an entity need only issue one insurance contract.

An investment contract with discretionary participation features is defined by IFRS 17 as follows: [IFRS 17 Appendix A]

Extract from IFRS 17

Appendix A

Defined terms

investment contract with discretionary participation features

A financial instrument that provides a particular investor with the contractual right to receive, as a supplement to an amount not subject to the discretion of the issuer, additional amounts:

- (a) that are expected to be a significant portion of the total contractual benefits;
- (b) the timing or amount of which are contractually at the discretion of the issuer; and
- (c) that are contractually based on:
 - (i) the returns on a specified pool of contracts or a specified type of contract;
 - (ii) realised and/or unrealised investment returns on a specified pool of assets held by the issuer; or
 - (iii) the profit or loss of the entity or fund that issues the contract.

Although investment contracts with discretionary participation features do not meet the definition of insurance contracts, the advantages of treating them the same as insurance contracts rather than as financial instruments when they are issued by entities that issue insurance contracts include: [IFRS 17.BC83]

- Investment contracts with discretionary participation features and insurance contracts that specify a link to returns on underlying items are sometimes linked to the same underlying pool of assets. Sometimes investment contracts with discretionary participation features share in the performance of insurance contracts. Using the same accounting for both types of contracts will produce more useful information for users of financial statements because it enhances comparability within an entity. It also simplifies the accounting for those contracts. For example, some cash flow distributions to participating policyholders are made in aggregate both for insurance contracts that specify a link to returns on underlying items and for investment contracts with discretionary participation features. This makes it challenging to apply different accounting models to different parts of that aggregate participation.
- Both of these types of contract often have characteristics, such as long maturities, recurring premiums and high acquisition cash flows, that are more commonly found in insurance contracts than in most other financial instruments. The Board developed the model for insurance contracts specifically to generate useful information about contracts containing such features.
- If investment contracts with discretionary participation features were not accounted for by applying IFRS 17, some of the discretionary participation features might be separated into an equity component in accordance with the Board's existing requirements for financial instruments. Splitting these contracts into components with different accounting treatments would cause the same problems that would arise if insurance contracts were separated. Also, in the Board's view, the accounting model it has developed for insurance contracts, including the treatment of discretionary cash flows is more appropriate than using any other model for these types of contracts.

Investment contracts with discretionary participation features are accounted for in the same way as other insurance contracts. This means that the general model is applied (as discussed in section 9 above) and, at initial recognition, an entity should assess whether the contracts contain direct participation features and hence should apply the variable fee approach (discussed in section 12.3 above).

However, as investment contracts with discretionary participation features do not transfer insurance risk, IFRS 17 requires certain modifications: [IFRS 17.71]

- The date of initial recognition is the date the entity becomes party to the contract (see section 7 above).
- The contract boundary (see section 9.1 above) is modified so that cash flows are within the contract boundary if they result from a substantive obligation of the entity to deliver cash at a present or future date. The entity has no substantive obligation to deliver cash if it has the practical ability to set a price for the promise to deliver the cash that fully reflects the amount of cash promised and related risks.
- The allocation of the contractual service margin is modified so that the entity recognises the contractual service margin over the duration of a group of contracts in a systematic way that reflects the transfer of investment services under the contract.

Frequently asked questions

Question 12-6: Does an investment contract that contains a crediting rate meet the third criteria of the definition of an investment contract with discretionary participation features in IFRS 17?

(TRG meeting April 2019 - Agenda paper no. 2, Log S94 & S95)

The Basis for Conclusions of IFRS 4 states that: [IFRS 4.BC162]

Extract from IFRS 4

BC162 The definition of a discretionary participation feature does not capture an unconstrained contractual discretion to set a 'crediting rate' that is used to credit interest or other returns to policyholders (as found in the contracts described in some countries as 'universal life' contracts). Some view these features as similar to discretionary participation features because crediting rates are constrained by market forces and the insurer's resources. ...

The submission asked whether, in the light of IFRS4.BC162, an example contract in a specific jurisdiction with a crediting rate met the third requirement in IFRS 17 to qualify as an investment contract with discretionary participation features relating to the contractual basis for the discretionary returns. The crediting rate in the example was based on returns of assets held as well as the weighted average rates on local treasury bonds. The crediting rate could be adjusted by the entity to some extent, based on future expected revenue and returns (the discretionary feature). The submissions assumed that the contract meets the first and second criteria of the definition of an investment contract with discretionary participation features in IFRS 17.

The IASB staff observed that the definition of an investment contract with discretionary participation features in IFRS 17 is consistent with the definition in IFRS 4. Both require that the additional discretionary amounts are contractually based on specified pools of contracts, specified pools of assets, or the profit or loss of the entity or fund that issues the contract. Any discretionary features in each investment contract need to be assessed against these criteria considering all relevant facts and circumstances. It appears that the IASB staff were sceptical that the investment contract in the example met the criteria of an investment contract with discretionary participation features.

How we see it

The release of the contractual service margin for investment contracts with discretionary participation features is not based on coverage units (see section 9.7 above), rather it is based on the investment services provided over the life of the contracts. It appears that this requirement is similar to the revenue recognition guidance contained in IFRS 15. Given that IFRS 15 would apply to fees from investment contracts without discretionary participation features, this would be consistent with other investment management contracts.

12.4.1 Contracts with switching features

Some contracts may contain options for the policyholder to switch between funds over the lifetime of the contract and therefore change from holding an investment contract measured under IFRS 9 to holding an investment contract with discretionary participation features measured under IFRS 17 (or *vice versa*) provided the entity also issues insurance contracts. Where the assessment at contract inception has concluded that the contract is not an investment contract with discretionary participation features the question arises as to whether the existence of the option means that the contract is accounted for under IFRS 17 (as an investment contract with discretionary participation features). If the option contains features (for example in terms of pricing) that require it to be considered within the boundary of the contract (see section 9.1 above) the option may already scope the contract within IFRS 17 from inception as an investment contract with discretionary participation features.

IFRS 17 states that once a contract is within its scope then it is not subsequently reassessed even if, at a later date, it is no longer a contract within its scope if the contract would have been reassessed at that date. [IFRS 17.B25]. Therefore, investment contracts with discretionary participation features, issued by an entity that also issues insurance contracts, that subsequently lose their 'discretionary feature' as the result of the exercise of a policyholder option will remain within the scope of IFRS 17.

13 Contract modification and derecognition

A contract that qualifies as an insurance contract remains so until all rights and obligations are extinguished (i.e., discharged, cancelled or expired), unless the contract is derecognised because of a contract modification. [IFRS 17.B25].

IFRS 4 contained no guidance on when or whether a modification of an insurance contract might cause derecognition of that contract. Therefore, prior to IFRS 17, most insurers would have applied the requirements, if any, contained in local GAAP.

IFRS 17 does not contain guidance for modifications of non-insurance contracts that could result in those contracts becoming contracts within the scope of IFRS 17. Modifications of non-insurance contracts are accounted for under the relevant IFRS and a contract within the scope of another IFRS could only become (wholly or partly) within the scope of IFRS 17 once the contract was derecognised under the original standard. For example, IFRS 15.20-21 explains how an entity accounts for a modification of a contract to sell goods and services within its scope (i.e., whether the original contract is derecognised or not) and IFRS 9.3.3.2 explains when an exchange between an existing borrower and lender of debt instruments with substantially different terms is accounted for as a modification or an extinguishment of the original financial liability.

13.1 Modifications of insurance contracts

An insurance contract may be modified, either by agreement between the parties or as a result of a change in regulation. If the terms are modified, an entity must derecognise the original insurance contract and recognise the modified contract as a new contract if and only if, any of the conditions listed below are satisfied. [IFRS 17.72].

- If the modified terms were included at contract inception:
 - The modified contract would have been excluded from the scope of IFRS 17.
 - An entity would have separated different components from the host insurance contract (see section 5 above) resulting in a different insurance contract to which IFRS 17 would have applied.
 - The modified contract would have had a substantially different contract boundary (see section 9.1 above).
 - The modified contract would have been included in a different group of contracts at initial recognition (e.g., the contracts would have been onerous at initial recognition rather than having no significant possibility of becoming onerous subsequently) (see section 6 above).
- The original contract met the definition of an insurance contract with direct participation features, but the modified contract no longer meets that definition or *vice versa*.
- The entity applied the premium allocation approach (see section 10 above) to the original contract, but the modifications mean that the contract no longer meets the eligibility criteria for that approach.

In summary, any contract modification that changes the accounting model or the applicable standard for measuring the components of the insurance contract, is likely to result in derecognition.

If a contract modification meets none of the conditions above for derecognition, the entity must treat any changes in cash flows caused by the modification as changes in the estimates of the fulfilment cash flows. [IFRS 17.73].

In practical terms, this means that an entity will need to determine whether the change in the estimate of the fulfilment cash flows arising from the modification is a past service event (which affects profit or loss in the current period) or a future service event (which affects the contractual service margin). For contracts applying the premium allocation approach, any adjustments to premium receipts or insurance acquisition cash flows arising from a modification, adjust the liability for remaining coverage and insurance revenue is allocated to the period for services provided (which would also require judgement in determining the period to which the modification applies). See sections 9.6, 10.4 and 12.3.3 above for the accounting for changes in the fulfilment cash flows.

The exercise of a right included in the terms of a contract is not a modification. [IFRS 17.72]. This includes the exercise of a right that could change the nature of the insurance contract. In February 2020, the IASB discussed a staff paper prepared on this issue as a result of feedback from respondents who stated that an accounting mismatch could arise from a contract that changes in nature over time. Such a contract could change its nature due to the policyholder exercising an option. An example of such a contract noted in the staff paper is a contract with a savings phase with profit sharing that provides the policyholder with an option to subsequently convert the account balance into an annuity at a guaranteed rate. At inception, that contract might meet the requirements to be accounted for under the variable fee approach. Subsequently, when the policyholder exercises the annuity option, the entity will still be required to continue applying the variable fee approach. In contrast, at inception of an annuity contract without a savings phase the entity would normally apply the general model. The IASB staff observed that different respondents favoured different suggested ways of amending IFRS 17 to address this matter such as to exclude cash flows generated from exercising some options from the contract boundary, providing an accounting election to separate some components of an insurance contract or other changes. In conclusion, the IASB agreed with the IASB staff recommendation not to amend IFRS 17 as the suggested changes touched on key aspects of IFRS 17 and the IASB staff believed these were likely to result in unintended consequences and some of the options suggested would significantly reduce comparability across entities and would increase the complexity of IFRS 17. In addition, the IASB agreed with the IASB staff's decision to decline to provide further application guidance or educational material on the matter, as suggested by some respondents, on the grounds that such guidance could be disruptive to the IFRS 17 implementation stage.¹²

Accounting for derecognition of a modified contract is discussed in section 13.3 below.

How we see it

The guidance on contract modification and derecognition under IFRS 17 is likely to result in differences from practices applied previously under IFRS 4. In particular, derecognition of a contract can only happen from a modification or extinguishment and not from the exercise of an option in a contract. This can lead to different accounting practices from those adopted previously under IFRS 4, for example for contracts that change their nature over time. A contract that is accounted for under the variable fee approach may have an accumulation phase, where the policyholder receives the returns from a pool of underlying items, and a pay-out phase, where the accumulated contract value is exchanged for a life contingent payout annuity at guaranteed rates. Because the option to take out the annuity was included in the original contract, the exercise of that option by the policyholder is not a modification. Therefore, when the contract moves into the payout annuity phase, it would not result in a derecognition of the accumulation contract and recognition of a new payout annuity contract. The contract would therefore continue to be accounted for under the variable fee approach. This is the case even though a contract that only contained a life contingent payout annuity would not meet the definition of a direct participating contract and would, therefore, be accounted for under the general model if it was issued as a separate contract.

13.2 Derecognition of insurance contracts

An insurance contract is derecognised when, and only when: [IFRS 17.74]

- It is extinguished, i.e., when the obligation specified in the insurance contract expires or is discharged or cancelled
- Or
- Any of the conditions for modifications, which result in derecognition, are met (see section 13.1 above)

The treatment of contract derecognition differs depending on which of the two scenarios above applies (see section 13.3 below).

When an insurance contract is extinguished, the entity is no longer at risk and is not required to transfer economic resources to satisfy the contract. Therefore, the settlement of the last claim outstanding on a contract does not necessarily result in derecognition of the contract *per se*, although it may result in the remaining fulfilment cash flows under a contract being immaterial. For derecognition to occur, all obligations must be discharged or cancelled. When an entity purchases reinsurance, it must derecognise the underlying insurance contracts only when those underlying insurance contracts are extinguished. [IFRS 17.75].

¹² [IASB Staff paper 2F](#): Project: *Amendments to IFRS 17*, Paper topic: *Other topics raised by respondents to the Exposure Draft Amendments to IFRS 17*, IASB meeting, February 2020, paragraphs 20-25. Available on the IFRS Foundation's website.

The derecognition requirements in IFRS 17 are intended to be consistent with the requirements in other IFRS accounting standards, including the derecognition requirements for financial liabilities in IFRS 9. [IFRS 17.BC321]. However, no consequential amendments were made to IFRS 17 when the IFRS 9 financial liability derecognition criteria were changed by the Amendments to the Classification and Measurement of Financial Instruments issued in May 2024. These amendments to IFRS 9 clarified that a financial liability is derecognised on the settlement date (unless an electronic payment system exemption applies) (see Chapter 36 and Chapter 48). Considering the absence of consequential amendments to IFRS 17, more than one approach may be applied to determining the derecognition of insurance liabilities accounted for under IFRS 17 in this context by continuing existing practices. If the application of an insurer's accounting policy for derecognition of insurance contract liabilities results in a material judgement that can significantly affect the amounts recognised as insurance contract liabilities and amounts recognised as cash, insurers must disclose that judgement in accordance with IAS 1. [IAS 1.122].

13.3 Accounting for derecognition

IFRS 17 contains three different ways to treat the derecognition of a contract, depending on the circumstances. These three different ways are extinguishment, transfer and modification.

The effect of derecognition on amounts previously recognised in other comprehensive income is discussed in section 13.3.4 below.

13.3.1 Derecognition resulting from extinguishment

An entity derecognises an insurance contract from within a group of insurance contracts by applying the following requirements: [IFRS 17.76]

- The fulfilment cash flows allocated to the group for both the liability for remaining coverage and the liability for incurred claims are adjusted to eliminate the present value of the future cash flows and risk adjustment for non-financial risk relating to the rights and obligations that have been derecognised from the group
- The contractual service margin of the group is adjusted for the change in fulfilment cash flows described above, to the extent required by the general model, as discussed in section 9.6 above (for contracts without direct participation features) and section 12.3 above (for contracts with direct participation features)
- The number of coverage units for expected remaining insurance contract services is adjusted to reflect the coverage units derecognised from the group, and the amount of the contractual service margin recognised in profit or loss in the period is based on that adjusted number to reflect services provided in the period (see section 9.7 above)

An entity might not know whether a liability has been extinguished because claims are sometimes reported years after the end of the coverage period. As a result, an entity might be unable to derecognise those liabilities. Ignoring contractual obligations that remain in existence and may generate valid claims would not give a faithful representation of an entity's financial position. However, it is expected that when the entity has no information to suggest there are unasserted claims on a contract with an expired coverage period, the entity would measure the insurance contract liability at a very low amount. Accordingly, there may be little practical difference between recognising an insurance liability measured at a very low amount and derecognising the liability. [IFRS 17.BC322].

13.3.2 Derecognition resulting from transfer

When an entity derecognises an insurance contract because it transfers the contract to a third party, the entity must: [IFRS 17.77]

- Adjust the fulfilment cash flows allocated to the group for the rights and obligations that have been derecognised, as discussed in section 13.3.1 above
- Adjust the contractual service margin of the group from which the contract has been derecognised for the difference between the change in the contractual cash flows resulting from derecognition and the premium charged by the third party (unless the decrease in fulfilment cash flows is allocated to the loss component of the liability for remaining coverage)

If there is no contractual service margin to be adjusted, then the difference between the fulfilment cash flows derecognised and the premium charged by the third party is recognised in profit or loss.

13.3.3 Derecognition resulting from modification

When an entity derecognises an insurance contract and recognises a new insurance contract as a result of a modification described in section 13.1 above, the entity must: [IFRS 17.77]

- Adjust the fulfilment cash flows allocated to the group relating to the rights and obligations that have been derecognised, as discussed in section 13.3.1 above
 - Adjust the contractual service margin of the group, from which the contract has been derecognised for the difference between the change in the contractual cash flows resulting from derecognition and the hypothetical premium the entity would have charged, had it entered into a contract with terms equivalent to the new contract at the date of the contract modification, less any additional premium charged for the modification (unless the decrease in fulfilment cash flows is allocated to the loss component of the liability for remaining coverage)
- And
- Measure the new contract recognised assuming the entity received the hypothetical premium that it would have charged, had it entered into the modified contract at the date of the contract modification

Illustration 13-1: Contract derecognition resulting from modification

An entity modifies an insurance contract issued such that the modified contract would have been included in a different group of contracts and, applying the guidance in IFRS 17, determines that the contract should be derecognised and replaced by a new contract. The original contract was part of a group of insurance contracts that was not onerous. The group of contracts that the modified contract joins is also not onerous.

At the date of modification, the fulfilment cash flows of the contract were CU100 and the additional premium received at that date for the contract modification is CU20. The entity estimates that a hypothetical premium that it would have charged had it entered into the modified contract at that date was CU112. The fulfilment cash flows of the newly recognised contract were CU105.

This gives rise to the following accounting entries:

		CU	CU
Dr	Cash	20	
Dr	Derecognition of fulfilment cash flows in the group from which the contract is derecognised	100	
Cr	Adjustment to contractual service margin of the group from which the modified contract is derecognised (20 + 100 - 112)		8
Cr	Recognition of fulfilment cash flows of modified contract		105
Cr	Addition to the contractual service margin of the group that the modified contract joins (112 - 105)		7

Frequently asked questions

Question 13-1: Is a new contract recognised as a result of a modification accounted for similarly to contracts acquired in their settlement period applying IFRS 17.B5 and how are the coverage units identified?

(TRG meeting April 2019 - Agenda paper no. 2, Log S82)

The IASB staff clarified that when an entity recognises new contracts that are in their settlement period, as a result of a modification that results in a derecognition of an existing contract, and which, therefore, cover events that have already occurred but the financial effect of which is uncertain, the insured event is the determination of the ultimate cost of the claims. This means that an entity recognises a liability for remaining coverage rather than a liability for incurred claims. See section 14.2 below.

How we see it

Determining any hypothetical premium will require the exercise of judgement by the reporting entity. This judgement may require input from an entity's pricing information and may place higher demands on data and systems. The estimate of the hypothetical premium is also a key input in determining the derecognition effect that will be adjusted against the contractual service margin of the original group of contracts and the contractual service margin that the newly recognised contract will add to the group of contracts of which it becomes a part.

13.3.4 Reclassification adjustments arising from derecognition

When an entity transfers a group of insurance contracts, or derecognises an insurance contract because it either transfers that contract to a third party (see section 13.3.2 above), or derecognises the insurance contract and recognises a new insurance contract (see section 13.3.3 above): *[IFRS 17.91]*

- For insurance contracts without direct participation features or contracts with direct participation features where the entity does not hold the underlying items, it reclassifies to profit or loss as a reclassification adjustment any remaining amounts for the group (or contract) that were previously recognised in other comprehensive income as a result of its accounting policy choice, if any, to disaggregate the finance income or expenses of a group of insurance contracts (see section 15.3.2 below).
- Or
- For insurance contracts with direct participation features where the entity holds the underlying item (i.e., it applies the current book yield approach), it does not reclassify to profit or loss, as a reclassification adjustment, any remaining amounts for the group (or contract) that were previously recognised in other comprehensive income as a result of its accounting policy choice, if any, to disaggregate the finance income or expenses of a group of insurance contracts (see section 15.3.4 below).

A derecognition for insurance contracts without direct participation features, other than from a transfer to a third party or a modification, does not result in a reclassification adjustment between other comprehensive income and profit or loss. However, the entity would remeasure the amount recognised in other comprehensive income for the group of contracts following the requirements for disaggregating insurance finance income or expenses based on a systematic allocation of the expected total insurance finance income or expenses over the duration of the group (see section 15.3.2 below).

Even though no reclassification is applied to remaining amounts in other comprehensive income upon derecognition of insurance contracts with direct participation features where the entity holds the underlying items, any effects stemming from matching the insurance finance income or expenses included in profit or loss for underlying items should be taken into account (current period book yield approach, see section 15.3.4 below).

13.3.5 Contracts applying the premium allocation approach that are derecognised

IFRS 17 does not contain guidance on how contracts accounted for under the premium allocation approach (see section 10 above) must apply the requirements in sections 13.3.1 to 13.3.3 above in circumstances in which the derecognised contracts are part of a group which has a liability for remaining coverage but no separate contractual service margin (as a contractual service margin is not recognised separately under the premium allocation approach).

13.4 Derecognition of assets for insurance acquisition cash flows paid before the related group of insurance contracts is recognised as an asset

An entity must derecognise an asset recognised for insurance acquisition cash flows paid before the related group of insurance contracts is recognised as an asset when the insurance acquisition cash flows allocated to the group of insurance contracts are included in the measurement of the group. The derecognition must be allocated against the contractual margin and not taken to profit or loss unless the contract is onerous (see section 9.8 above). *[IFRS 17.28C]*.

If an entity recognises in a reporting period only some of the insurance contracts expected to be included in the group, the entity must determine the related portion of an asset for insurance acquisition cash flows for the group on a systematic and rational basis considering the expected timing of recognition of contracts in the group. The entity must derecognise that portion of the asset and include it in the measurement of a group of insurance contracts as above. *[IFRS 17.28C]*. In this situation it would also be necessary to perform an impairment test on any remaining asset for acquisition cash flows that relates to the group (see section 9.10 above).

14 Acquisition of insurance contracts

Insurance contracts may be acquired in a transfer (often referred to as a portfolio transfer) or in a business combination, as defined in IFRS 3.

IFRS 3 requires a group of insurance contracts acquired in a business combination to be measured at the acquisition date under IFRS 17 rather than at fair value. [IFRS 3.31A]. This means that insurance contracts acquired in a transfer or a business combination are classified and measured in the same way as those issued by the entity at the date of the combination or transfer, except that the fulfilment cash flows are recognised at the date of the combination or transfer.

This results in the following key differences for insurance contracts acquired in a business combination within the scope of IFRS 3 compared with the accounting used previously under IFRS 4:

- Contracts acquired in a business combination within the scope of IFRS 3 after the date of initial application of IFRS 17 (i.e., accounting periods beginning on or after 1 January 2023) are classified as insurance contracts based on the contractual terms, economic conditions, operating or accounting policies and other pertinent factors and conditions as they exist at the acquisition date. [IFRS 3.15, IFRS 3.64N]. Other assessments like the eligibility for the premium allocation approach or variable fee approach for direct participation contracts must also be based on the contractual terms and conditions at the date of acquisition. Previously, when IFRS 4 applied, IFRS 3 contained an exception from this requirement for insurance contracts and stated that insurance contracts acquired in a business combination within its scope must be classified on the basis of the contractual terms and other factors at the inception of the contract rather than at the date of acquisition.
- Contracts acquired in a transfer that is not a business combination are classified as insurance contracts based on the contractual terms, economic conditions, operating or accounting policies and other pertinent factors and conditions as they exist at the acquisition date (i.e., there is no transitional relief - see section 17.2 below).
- Contracts are measured under the IFRS 17 requirements, rather than at fair value. Consequently, no option is available to split the value of the acquired insurance contracts into two components, as was permitted under IFRS 4 (i.e., between a liability in accordance with the insurer's accounting policies and an intangible asset representing the difference between fair value and the value of that liability under the IFRS 17 measurement model).

In a business combination, an entity is required to classify contracts (i.e., assess whether a contract transfers significant insurance risk or is an investment contract with discretionary participation features) based on the contractual terms and other factors at the date of acquisition rather than the original inception date of the contract.¹³

When considering feedback from entities implementing IFRS 17, the Board considered but rejected a suggestion to reinstate the previous IFRS 4 exception in IFRS 3. In the Board's view, by removing the exception, IFRS 17 makes the accounting for the acquisition of insurance contracts consistent with the accounting for acquisitions of other contracts acquired in a business combination. The Board was not persuaded by the argument that applying the requirement will result in differences in accounting between an acquirer's consolidated financial statements and an acquiree's financial statements. In the Board's view, differences in accounting between an acquirer's financial statements and an acquiree's financial statements depict differences arising from the economics of the acquisition, they are not unique to insurance contracts and are not unusual when applying IFRS accounting standards. Those differences reflect changes in facts and circumstances at the acquisition date compared to facts and circumstances at the date the acquiree recognised the contracts. In addition, differences between an acquirer's financial statements and an acquiree's financial statements can arise for other reasons, for example, because of the elimination of intragroup transactions. [IFRS 17.BC327B, IFRS 17.BC327C, IFRS 17.BC327D].

IFRS 17 requires an entity to treat the consideration received or paid for insurance contracts acquired in a transfer of business or a business combination within the scope of IFRS 3, including contracts in their settlement period, as a proxy for the premiums received. This means that the entity determines the contractual service margin in accordance with all other requirements of IFRS 17 in a way that reflects the premium paid for the contracts. In a business combination within the scope of IFRS 3, the consideration received or paid is the fair value of the contracts at that date. However, IFRS 17 states that the entity does not apply the requirement in IFRS 13 that the fair value of a financial liability with a demand feature cannot be less than the amount payable on demand, discounted from the first date that the amount could be required to be paid. [IFRS 17.B94].

13 [IASB Staff paper 2C](#): Project: *Insurance Contracts*, Paper topic: *Responding to the external editorial review*, IASB meeting, February 2017, Issue A12. Available on the IFRS Foundation's website.

The consideration received or paid for the contracts excludes the consideration received or paid for any other assets or liabilities acquired in the same transaction. Therefore, an acquirer will have to allocate the consideration received or paid between contracts within the scope of IFRS 17, other assets and liabilities outside the scope of IFRS 17 and goodwill, if any. [IFRS 17.B94].

For insurance contracts measured using the general model, including the variable fee approach, on initial recognition (i.e., acquisition) the contractual service margin is calculated: [IFRS 17.B95]

- For acquired insurance contracts issued based on the requirements of the general model (see section 9 above)
- For acquired reinsurance contracts held based on the requirements of the general model as modified (see section 11 above) using the consideration received or paid for the contracts as a proxy for the premiums received or paid at the date of initial recognition

If the premium allocation approach applies to insurance contracts acquired in a transfer or business combination, the premium received is the initial carrying amount of the liability for remaining coverage and the liability for incurred claims. [IFRS 17.B94]. If facts and circumstances indicate that the contract is onerous, the difference between the carrying amount of the liability for remaining coverage and the fulfilment cash flows that relate to the remaining coverage must be treated the same way as a contract under the general model (i.e., recognised within goodwill or the gain on bargain purchase in a business combination or recognised as a loss in profit or loss on a transfer).

If the acquired insurance contracts issued are onerous: [IFRS 17.B95A]

- For contracts acquired in a business combination within the scope of IFRS 3, the excess of the fulfilment cash flows over the consideration paid or received must be recognised as part of goodwill or the gain on a bargain purchase.

Or

- For contracts acquired in a transfer, the excess of the fulfilment cash flows over the consideration paid or received is recognised as a loss in profit or loss. The entity must establish a loss component of the liability for remaining coverage for that excess (i.e., the onerous group) and apply the guidance discussed in section 9.8 above to allocate subsequent changes in fulfilment cash flows to that loss component.

For a group of reinsurance contracts held when the underlying insurance contracts issued are onerous and a loss-recovery component has been recognised, an entity must determine the loss-recovery component of the asset for remaining coverage at the date of transaction by multiplying: [IFRS 17.B95B]

- The loss component of the liability for remaining coverage of the group of underlying insurance contracts at the date of transaction

And

- The percentage of claims on the underlying insurance contracts the entity expects at the date of transaction to recover from the group of reinsurance contracts held

Any loss-recovery component determined above is part of goodwill or the gain on a bargain purchase for reinsurance contracts held acquired in a business combination within the scope of IFRS 3, or as income in profit or loss for contracts acquired in a transfer. [IFRS 17.B95C].

At the date of the transaction, onerous underlying insurance contracts might be included in a group of insurance contracts with other onerous contracts not covered by the group of reinsurance contracts held. In that situation, for the purposes of applying the requirements above, the entity must use a systematic and rational allocation basis to determine the portion of the loss component of the group of insurance contracts that relates to insurance contracts covered by the group of reinsurance contracts held. [IFRS 17.B95D].

Investment contracts within the scope of IFRS 9 are required to be measured at fair value when acquired in a business combination.

The two following Illustrations, based on Illustrative Examples 13 and 14 of IFRS 17, demonstrate the measurement on initial recognition for insurance contracts acquired: [IFRS 17.IE139-145, IFRS 17.IE146-151]

Illustration 14-1: Measurement on initial recognition of insurance contracts acquired in a transfer that is not a business combination

An entity acquires insurance contracts in a portfolio transfer from another entity. The seller pays CU30 to the entity to take on those insurance contracts. The entity determines that the acquired contracts form a group, as if it had entered into the contracts on the date of the transaction. The entity applies the general model to the measurement of the insurance contracts.

On initial recognition, the entity determines that the consideration received (i.e., the deemed premium) of the group of insurance contracts is CU30 and the fulfilment cash flows are, as follows:

- Example A - outflow (or liability) of CU20
- Example B - outflow (or liability) of CU45

For simplicity, this example ignores all other amounts.

On initial recognition, the entity measures the liability for the group of contracts, as follows:

	Example A	Example B
	CU	CU
Fulfilment cash flows	20	45
Contractual service margin	10	-
Insurance contract liability on initial recognition	30	45
The effect on profit or loss will be:		
Profit/(loss) on initial recognition	-	(15)
Carrying amount of the insurance contract liability:		
Deemed premium received for the group of insurance contracts	30	30
Loss on acquired onerous insurance contracts	-	15
Total	30	45

For contracts that are not onerous, the contractual service margin is the difference between the premium received by the entity (CU30) and the fulfilment cash flows (CU20) (i.e., CU30 less CU20 resulting in a contractual service margin of CU10 in Example A). Consequently, in Example A, the total insurance contract liability is equal to the premium received.

In Example B, the premium received (CU30) is less than the fulfilment cash flows (CU45). Therefore, the entity concludes that the contract is onerous. Consequently, the difference between CU30 and (CU45) of (CU15) is an expense in profit or loss and the insurance contract liability is equal to the fulfilment cash flows. The entity also establishes a loss component of CU15 for the liability for remaining coverage. The insurance contract liability of CU45 is the sum of the fulfilment cash flows of CU45, including the loss component of CU15.

Illustration 14-2: Measurement on initial recognition of insurance contracts acquired in a business combination

An entity acquires insurance contracts as part of a business combination within the scope of IFRS 3 and estimates that the transaction results in goodwill when it applies IFRS 3. The entity determines that the acquired contracts form a group, as if it had entered into the contracts on the date of the transaction. The entity applies the general model to the measurement of the insurance contracts.

On initial recognition, the entity determines that the consideration received (i.e., fair value of the acquired contracts, reflecting the deemed premium) of the group of insurance contracts is CU30 and the fulfilment cash flows are, as follows:

- Example A - outflow (or liability) of CU20
- Example B - outflow (or liability) of CU45

For simplicity, this example ignores all other amounts.

On initial recognition, the entity measures the liability for the group of contracts, as follows:

	Example A	Example B
	CU	CU
Fulfilment cash flows	20	45
Contractual service margin	10	-
Insurance contract liability on initial recognition	30	45
The effect on profit or loss will be:		
Profit/(loss) on initial recognition	-	-
Carrying amount of the insurance contract liability:		
Deemed premium received for the group of insurance contracts	30	30
Recognised as part of goodwill (or gain on a bargain purchase)	-	15
Total	30	45

In Example A, the entity measures the contractual service margin as the difference between the deemed premium (CU30) and the fulfilment cash flows (CU20). Consequently, in Example A the contractual service margin is CU10; and the total insurance contract liability of CU30 is the sum of the fulfilment cash flows of CU20 and the contractual service margin of CU10 (i.e., equal to the deemed premium).

In Example B, the fulfilment cash flows exceed the deemed premium. Consequently, the contractual service margin is zero (as the difference between the deemed premium (CU30) and the fulfilment cash flows (CU45) reflects an expected net outflow of CU15); and the excess of CU15 of the fulfilment cash flows (CU45) over the deemed premium (CU30) is part of the goodwill on the business combination. The entity also establishes a loss component of CU15 for the liability for remaining coverage. The insurance contract liability of CU45 is the sum of the fulfilment cash flows of CU45, including the loss component of CU15.

How we see it

When insurance contracts issued or reinsurance contracts held are acquired in a transfer of insurance contracts that does not form a business, or in a business combination within the scope of IFRS 3, an entity should also apply the aggregation requirements for the identification of portfolios of insurance contracts and divide those into groupings, as explained in section 5 above, as if it had entered into the contracts on the date of transaction. This implies that contract classifications and eligibility assessments relevant to such acquired contracts (i.e., significant insurance risk, direct participation features, eligibility for the premium allocation approach) are based on the terms and conditions at the acquisition date.

As IFRS 3 also refers to 'groupings' and 'operating and accounting policies', this implies that other assessments like the eligibility for the premium allocation approach or variable fee approach for direct participation contracts (see sections 10.1 and 12.3.1 above) should be based on the contractual terms and conditions at the date of acquisition rather than at the date of the original inception of the contract. This approach may result in, for example, contracts that are insurance contracts from the perspective of the acquiree but investment contracts from the perspective of the acquirer. Consequently, there will be a different accounting treatment for the same contracts between the consolidated financial statements that includes the acquiree and the separate financial statements of the acquiree in such a situation. However, this would reflect the substance that the acquirer has purchased investment contracts rather than insurance contracts.

14.1 Assets for insurance acquisition cash flows acquired in a business combination within the scope of IFRS 3 or a transfer of insurance contracts that do not form a business

Extract from IFRS 17

Asset for insurance acquisition cash flows

- B95E** When an entity acquires insurance contracts issued in a transfer of insurance contracts that do not form a business or in a business combination within the scope of IFRS 3, the entity shall recognise an asset for insurance acquisition cash flows at fair value at the date of the transaction for the rights to obtain:
- (a) future insurance contracts that are renewals of insurance contracts recognised at the date of the transaction; and
 - (b) future insurance contracts, other than those in (a), after the date of the transaction without paying again insurance acquisition cash flows the acquirer has already paid that are directly attributable to the related portfolio of insurance contracts.

[IFRS 17.B95E].

The asset for insurance acquisition cash flows must be excluded from the measurement of insurance contracts acquired in a business combination within the scope of IFRS 3 or in a transfer of insurance contracts that do not form a business. [IFRS 17.B95F].

These insurance acquisition cash flow assets recognised for the rights to obtain future insurance contracts are excluded from the scope of IAS 38. [IAS 38.3(g)]. IAS 38 excludes from its scope contracts within the scope of IFRS 17 and any assets for insurance acquisition cash flows as defined in IFRS 17. However, rights to obtain future insurance contracts such as customer relationships or customer lists which are unconnected to any previously paid insurance acquisition cash flows and relate to contracts which do not meet the recognition criteria of IFRS 17 would fall within the scope of IAS 38. [IFRS 17.BC327H].

The IASB concluded that requiring an entity to recognise assets for insurance acquisition cash flows for rights to obtain future insurance contracts and future renewals at the acquisition date ensures that the contractual service margin of groups of insurance contracts the entity recognises subsequent to the acquisition appropriately reflect the rights the entity paid for relating to those future groups as part of the consideration for the acquisition. Requiring an entity to recognise any such assets at the acquisition date is consistent with the other requirements in IFRS 17 for recognising an asset for insurance acquisition cash flows (see section 7.3 above). The Board decided that to achieve that consistency, it is necessary to determine the rights described in the first bullet point above by reference to insurance acquisition cash flows the acquirer has already paid. Otherwise, broader rights to obtain future contracts from intangible assets such as customer relationships, unconnected to any previously paid insurance acquisition cash flows, could be included in the insurance acquisition cash flow assets. In contrast, the Board decided that such reference is not needed to determine the rights described in the subsequent bullet point above. The fact that these rights relate only to renewals means they are sufficiently constrained. [IFRS 17.BC327I].

14.2 Subsequent treatment of contracts acquired in their settlement period

For retroactive insurance contracts that cover events that have already occurred, but for which, the financial effect is uncertain, IFRS 17 states that the insured event is the determination of the ultimate costs of the claim. [IFRS 17.B5]. As the claim has occurred already, the question arises as to how insurance revenue and insurance service expense must be presented for these insurance contracts when they are acquired in a business combination or similar acquisition in their settlement period. More specifically, whether insurance revenue must reflect the entire expected claims or not.

Frequently asked questions

Question 14-1: How should insurance revenue and insurance service expenses be presented for insurance contracts acquired in conjunction with a business combination or similar acquisition in their settlement period. More specifically, should revenue reflect the entire expected claims or not?

(TRG meeting February 2018 - Agenda paper no. 7, Log S04)

The IASB staff observed that IFRS 17.B5 states that for those contracts which cover events that have already occurred but the financial effect of which is uncertain the insured event is the determination of the ultimate cost of the claim. Therefore, acquiring contracts in their settlement period is essentially providing coverage for the adverse development of claims.

The subsequent treatment for the liability for remaining coverage is set out in IFRS 17.41, Accordingly, revenue would reflect the entire expected claims.

If some cash flows meet the definition of an investment component, those cash flows will not be reflected in revenue or expenses.

Frequently asked questions

Question 14-2: For issued adverse loss cover and contracts acquired in their settlement period when are claims incurred for these contracts and, what subsequent treatment should be applied if the liability for remaining coverage is determined to have nil contractual service margin at initial recognition and estimates of future cash outflows decrease subsequently?

(TRG meeting May 2018 - Agenda paper no. 7, Log S32)

The IASB staff stated that, for contracts acquired in their settlement period, claims are incurred (and, hence, the liability for remaining coverage is reduced) when the financial effect becomes certain. This is not when the entity has a reliable estimate if there is still uncertainty involved. Conversely, this is not necessarily when the claims are paid if certainty has been achieved prior to the actual payment.

The IASB staff also stated that subsequent measurement of insurance contracts acquired, including changes in estimates that adjust the contractual service margin is the same as for insurance contracts issued applying IFRS 17.40-52. Therefore, in a scenario where the liability for remaining coverage is determined to have nil contractual service margin at initial recognition for contracts acquired in their settlement period (i.e., insurance contracts are measured at zero with nil contractual service margin) and estimates of net future cash outflows decrease subsequently (i.e., favourable change in fulfilment cash flows), the IASB staff stated that a contractual service margin larger than zero may be recognised post acquisition.

The TRG members had no specific comments on the IASB staff observations, although the TRG members had previously observed that the requirements reflect a significant change from existing practice and this change results in implementation complexities and costs. However, the IASB declined to create an exception to the general classification and measurement requirements in IFRS 17 for contracts acquired in their settlement period. The Board concluded that an entity that acquires a contract should, at the acquisition date, apply the requirements for identifying whether a contract has an insured event and meets the definition of an insurance contract, just as an entity that issues a contract applies the requirement at the issue date. *[IFRS 17.BC327E]*.

This results in different accounting for similar contracts, depending on whether the contracts are issued by the entity or whether the entity acquired those contracts in their settlement period. The most notable outcomes of this distinction include:

- An entity applies the general model for contracts acquired in their settlement period, because the period over which claims could develop (i.e., the coverage period for the determination of the ultimate cost of the claims) is longer than one year, whilst the entity would expect to apply the premium allocation approach for similar contracts that it issues
- An entity recognises revenue for the contracts acquired in their settlement period over the period the claims can develop, while revenue is no longer recognised over this period for similar contracts issued

Some contracts acquired in their settlement period will not meet the definition of an insurance contract at the acquisition date. This is because, in some circumstances, all claim amounts are known at the acquisition date but remain unpaid. In such circumstances, the acquirer is not providing insurance coverage, the contract does not meet the definition of an insurance contract and the acquirer would account for the contract as a financial liability applying IFRS 3 and subsequently IFRS 9. The Board also observed that for contracts that meet the definition of an insurance contract at the acquisition date, an entity would need to consider whether any amounts payable to the policyholder meet the definition of an investment component (and are therefore excluded from insurance revenue). [IFRS 17.BC327G].

The following illustrates an accounting policy for contracts acquired in their settlement period in a business combination:

Practical example 14-1: AXA SA (2023)	France
UNIVERSAL REGISTRATION DOCUMENT - ANNUAL REPORT 2023 [extract] 6 CONSOLIDATED FINANCIAL STATEMENTS [extract] 6.6 NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract] Note 1 Accounting principles [extract] 1.3 PRINCIPLES AND METHODS OF CONSOLIDATION [extract] 1.3.2 Business combinations and subsequent changes in the Group ownership interest [extract] 1.3.2.2 VALUATION OF ASSETS ACQUIRED, AND LIABILITIES ASSUMED IN A BUSINESS COMBINATION [extract] Insurance and investment contracts [extract]	
<p style="text-align: center;">...</p> <p style="text-align: center;">Groups of insurance contracts acquired in their settlement period are, if material, valued as if they were new insurance contracts issued by the acquirer as at the acquisition date: the LRC are recognized for such insurance contracts using the General Measurement Model described in paragraph 1.14.5, with the consideration received used as a proxy for the premiums received. Subsequently, the whole amount of the LRC recognized for the acquired claim settlement liabilities is recycled in the insurance revenue over the coverage period applying the mechanism described in paragraph 1.19.1.</p> <p style="text-align: center;">...</p>	

IFRS 17 includes transition relief for the settlement of claims incurred before an insurance contract is acquired when the modified retrospective approach or the fair value approach is used (see sections 17.4 and 17.5 below). Furthermore, IFRS accounting standards includes transition relief that allows entities to continue to apply their previous IFRS 4 classification as insurance contracts of contracts acquired in a business combination before the date of initial application of IFRS 17 (see section 17.2.1.C below).

14.3 Business combinations under common control

IFRS 3 does not apply to a combination of entities or businesses under common control (i.e., a common control business combination). [IFRS 3.2(c)].

Similarly, IFRS 17 limits the accounting requirements in respect of business combinations (discussed in section 14 above) to 'a business combination within the scope of IFRS 3'. This requirement excludes business combinations outside the scope of IFRS 3, such as business combinations under common control, from the specific measurement requirements of IFRS 17 applying to those combinations with the scope of IFRS accounting standards. [IFRS 17.BC327A].

How we see it

Business combinations under common control are outside the scope of IFRS 17. Consequently, an entity will need to develop an appropriate accounting policy for business combinations under common control. Currently, there is no guidance in IFRS accounting standards for business combinations under common control, i.e., transactions in which the combining businesses are ultimately controlled by the same party both before and after the combination. Accounting for business combinations under common control and the application and use of the pooling of interests method are discussed in Chapter 11

14.4 Portfolio transfers - practical issues

14.4.1 The difference between a business combination and a transfer of insurance contracts that do not form a business

When an entity acquires a portfolio of insurance contracts, the main accounting consideration is to determine whether that acquisition meets the definition of a business. IFRS 3 defines a business as: *[IFRS 3 Appendix A]*

Extract from IFRS 3

Appendix A Defined terms

business	An integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing goods or services to customers, generating investment income (such as dividends or interest) or generating other income from ordinary activities.
-----------------	--

The application guidance to IFRS 3 notes that a business consists of inputs and processes applied to those inputs that have the ability to contribute to the creation of outputs. Although businesses usually have outputs they are not required for an integrated set of assets and activities to be a business. *[IFRS 3.B7, IFRS 3.B8]*. Where it is considered that a business is acquired, goodwill may need to be recognised, as may deferred tax liabilities, in respect of any acquired intangibles. For a transfer which does not constitute a business, neither goodwill nor deferred tax are recognised.

Rights to issue or renew contracts in the future (as opposed to existing insurance contracts) are separate intangible assets and the accounting for the acquisition of such rights is discussed in section 14.4.3 below.

An entity recognises an asset at fair value for insurance acquisition cash flows that relate to future insurance contracts and future renewals acquired in a transfer that is not a business as discussed in section 14.1 above.

How we see it

The determination of whether a portfolio of contracts or a business has been acquired will be a matter of judgement based on the facts and circumstances. Acquisitions of contracts that also include the acquisition of underwriting systems and/or the related organised workforce are more likely to meet the definition of a business than merely the acquisition of individual or multiple contracts.

14.4.2 Deferred taxation

For transactions that meet the definition of a business combination, IAS 12 requires deferred tax to be recognised in respect of temporary differences arising in business combinations, for example if the tax base of the asset or liability remains at cost when the carrying amount is fair value. IFRS 17 contains no exemption from these requirements. Therefore, deferred tax will often arise on temporary differences created by the recognition of insurance contracts at a value different from that applied previously by the acquiree (e.g., because the fulfilment cash flows at the date of acquisition for the insurance contracts acquired, calculated on the basis of the contractual terms at the date of the acquisition, is likely to be different from the carrying value of the fulfilment cash flows calculated by the acquiree on the basis of contractual terms on initial recognition of the insurance contract). The deferred tax adjusts the amount of goodwill recognised. For transactions that do not meet the definition of a business combination, the initial recognition exemption applies and no deferred tax is recognised on initial recognition (as discussed in section 14.4.1 above).

14.4.3 Customer lists and relationships not connected to insurance contracts

The requirements discussed in section 14 above apply only to insurance contracts that exist at the date of a business combination or transfer and the requirements discussed in section 14.1 above apply to insurance acquisition cash flows related to the rights to obtain future insurance contracts.

Therefore, they do not apply to customer lists and customer relationships reflecting the expectation of future insurance contracts and related insurance acquisition cash flows that do not meet the IFRS 17 recognition criteria. IAS 36 and IAS 38 apply to such transactions as they apply to other intangible assets.

The following Illustration deals with customer relationships acquired together with a portfolio of one-year motor insurance contracts.

Illustration 14-3: Purchase of portfolio of one-year motor insurance contracts

Parent A obtained control of insurer B in a business combination on 31 December 20X3. B has a portfolio of one-year motor insurance contracts that policyholders may cancel annually.

Because Insurer B establishes its relationships with policyholders through insurance contracts, the customer relationship with the policyholders meets the contractual-legal criterion for recognition as an intangible asset. IAS 36 and IAS 38 apply to the customer relationship intangible asset. [IFRS 3.IE30(d)].

15 Presentation

IFRS 17 specifies line items of amounts that need to be presented on the face of the statement of financial position and statement of financial performance. These are supplemented by disclosures in the notes to explain the amounts recognised on the face of the primary financial statements (see section 16 below).

IFRS 17 requires separate presentation of amounts relating to insurance contracts issued and reinsurance contracts held in the primary statements. There is nothing to prevent an entity from providing further sub-analysis of the required line items (which may make the relationship of the reconciliations to the face of the statement of financial position more understandable). Indeed, IAS 1 requires presentation of additional line items (including the disaggregation of line items specifically required), headings and subtotals on the face of the statements of financial position and financial performance when such presentation is relevant to an understanding of the entity's financial position or financial performance. [IAS 1.54, IAS 1.55, IAS 1.56, IAS 1.82-86].

15.1 Statement of financial position

For presentation in the statement of financial position, IFRS 17 and IAS 1 require insurance contracts to be aggregated by portfolios and presented separately, as follows: [IFRS 17.78, IAS 1.54(da), IAS 1.54(ma)]

- Insurance contracts issued that are assets
- Insurance contracts issued that are liabilities
- Reinsurance contracts held that are assets
- Reinsurance contracts held that are liabilities

A portfolio is a group of insurance contracts that are subject to similar risks and managed together (see section 6.1 above). [IFRS 17.14].

The requirement to present insurance contracts assets and liabilities at a portfolio level provides significant operational relief and does not significantly diminish the usefulness of information compared to a requirement to present assets and liabilities at a group of insurance contract level. [IFRS 17.BC330B].

Any assets or liabilities for insurance acquisition cash flows paid before the related group of insurance contracts is recognised (see section 7.3 above) must be included in the carrying amount of the related portfolios of insurance contracts issued and any assets or liabilities for cash flows related to portfolios of reinsurance contracts held are included in the carrying amount of the portfolios of reinsurance contracts held. [IFRS 17.79].

There is no requirement for disclosure of portfolio balances in respect of the general model, premium allocation approach, or variable fee approach to be shown separately on the face of the statement of financial position. There is also no requirement for the components of the portfolio balances (such as the contractual service margin or the risk adjustment for non-financial risk) to be presented separately on the face of the statement of financial position.

However, an entity must disclose reconciliations in the notes to the financial statements that show how the amounts disclosed on the face of the statement of financial position (i.e., the net carrying amount of contracts within the scope of IFRS 17) changed during the reporting period because of cash flows and income and expenses recognised in the statement of financial performance. Separate reconciliations are required for insurance contracts issued and reinsurance contracts held. [IFRS 17.98]. The detailed requirements of these reconciliations are discussed in section 16.1 below. In summary, separate reconciliations are required for contracts subject to the general model and the premium allocation approach together with reconciliations for the individual components of the contract balances. An entity is required to consider the level of aggregation of these reconciliations necessary to meet the overall disclosure objectives of IFRS 17. [IFRS 17.95].

Under IFRS 4, some entities presented separately in the statement of financial position different amounts arising from an insurance contract, as if those different amounts were separate assets or liabilities. For example, some entities presented line items labelled as premiums receivable, claims payable and deferred acquisition costs separately from the insurance contract liability. Different entities presented different line items and had different definitions of what those line items were (for example, some entities presented as premiums receivable amounts that were not yet billed while other entities presented only billed amounts that remain outstanding). Some stakeholders expressed the view that they would like to continue that practice of further disaggregation because they view such disaggregated line items as providing meaningful information to users of financial statements. However, the Board disagreed with this approach to presentation because it could result in the presentation of amounts that are not separable assets or liabilities. For example, premiums receivable for future coverage is not a gross asset separable from the related liability for the future coverage. [IFRS 17.BC330D]. IAS 1 permits the presentation of additional line items (including by disaggregation of required line items), headings and subtotals in the statement of financial position, when such presentation is relevant to an understanding of the entity's financial position. [IAS 1.55].

The Board also considered some stakeholders' suggestions that entities should be permitted to present one insurance contract asset or liability for all insurance contracts issued by the entity (that is, present insurance contracts at an entity level). The Board rejected that suggestion because that would risk an unacceptable loss of useful information for users of financial statements. [IFRS 17.BC330C].

In addition, the statement of financial position must include, among others, line items that present the following amounts, including those that back policyholder liabilities (see Chapter 3): [IAS 1.54]

- Investment property
- Intangible assets
- Financial assets, with separate presentation of trade and other receivables and cash and cash equivalents
- Financial liabilities, with separate presentation of trade and other payables
- Liabilities and assets for current tax, as defined in IAS 12
- Deferred tax liabilities and deferred tax assets, as defined in IAS 12

How we see it

The presentation requirements are significantly different from those required by IAS 32 for financial instruments. These are also likely to differ significantly from the presentation applied previously by an insurer under IFRS 4. For example, individual positive and negative contract balances with different counterparties within one portfolio are aggregated (netted) on the statement of financial position.

All rights and obligations arising from an insurance contract are included in the presentation of the portfolio on a net basis, unless the components of the contract are separated and accounted for under a different IFRS (see section 6.1.1 above). The rights and obligations presented net include all related non-distinct elements, for example, policyholder loans, insurance premiums receivable, liabilities for incurred claims and insurance acquisition cash flows that have been included in the measurement of the contractual service margin.

The fulfilment cash flows of an insurer that is a mutual entity generally include the rights of policyholders to the whole of any surplus of assets over liabilities. This means that, for an insurer that is a mutual entity, there should, in principle, be no equity and no net comprehensive income reported in any accounting period. Mutual insurers may choose to present additional line items and sub totals on the face of their statement of financial position. This would distinguish amounts due to or from policyholders, in their capacity as policyholders, from amounts due to, or from, qualifying mutual policyholders (including future policyholders) in their capacity as holders of the most residual interest in the entity.

15.2 Statement of financial performance

An entity is required to disaggregate the amounts recognised in the statement of profit or loss and the statement of other comprehensive income (collectively, referred to in the standard as the statement of financial performance) into: [IFRS 17.80, IAS 1.82(a)(ii), IAS 1.82(ab)]

- Insurance service result comprised of:
 - Insurance revenue
 - And
 - Insurance service expenses
- Insurance finance income or expenses

Income or expenses from reinsurance contracts held are presented separately from the expenses or income from insurance contracts issued. [IFRS 17.82, IAS 1.82(ac)].

An entity may present the income or expense from a group of reinsurance contracts held, other than insurance finance income or expenses, as either: [IFRS 17.86]

- A single amount (net presentation)
- Or
- Separately (gross presentation):
 - The amounts recovered from the reinsurer
 - An allocation of the premium paid

When the gross presentation for reinsurance held is used, an entity is not allowed to present the allocation of the reinsurance premiums paid as a reduction in revenue. [IFRS 17.86(c)].

Insurance finance income or expenses must be presented separately for insurance contracts issued and reinsurance contracts held on the face of the statement of profit or loss. [IAS 1.82(bb), IAS 1.82(bc)]. When insurance finance income or expenses is disaggregated it must also be shown separately for insurance contracts issued and reinsurance contracts held in other comprehensive income, within items of other comprehensive income that will be reclassified subsequently to profit or loss when specific conditions are met. [IAS 1.7(i), IAS 1.7(j)].

In addition, the profit or loss section or the statement of profit or loss must include, among others, line items that present the following amounts for the period: [IAS 1.82]

- Revenue, presenting separately
 - Interest revenue calculated using the effective interest method
 - Insurance revenue
- Gains and losses arising from the derecognition of financial assets measured at amortised cost
- Finance costs
- Impairment losses (including reversals of impairment losses or impairment gains) determined in accordance with IFRS 9.5.5.
- Share of the profit or loss of associates and joint ventures using the equity method
- Tax expense, being the aggregate amount included in the determination of profit or loss for the period in respect of current tax and deferred tax

The following table illustrates a summary statement of financial performance under IFRS 17 using the net presentation for reinsurance held.

Illustration 15-1: Illustrative statement of financial performance		
Statement of profit or loss and other comprehensive income	20X2	20X1
	CU m	CU m
<i>Insurance revenue</i>	10,304	8,894
<i>Insurance service expenses</i>	(9,069)	(8,489)
Insurance service result before reinsurance contracts held	1,235	405
<i>Income/(expenses) from reinsurance contracts held</i>	(448)	(327)
Insurance service result	787	78
Insurance finance income or expenses from contracts issued within the scope of IFRS 17	(394)	(353)
Finance income or expenses from reinsurance contracts held	200	300
Net financial result	(194)	(53)
Profit before tax	593	25
Other comprehensive income		
Items that may be reclassified subsequently to profit or loss		
Insurance finance income or expenses from contracts issued within the scope of IFRS 17	50	(25)
Finance income or expenses from reinsurance contracts held	(25)	50
Other comprehensive income for the year net of tax	25	25
Total comprehensive income for the year	618	50

The following Illustration shows the presentation of the insurance service result if the result from reinsurance contracts held is shown on a gross basis.

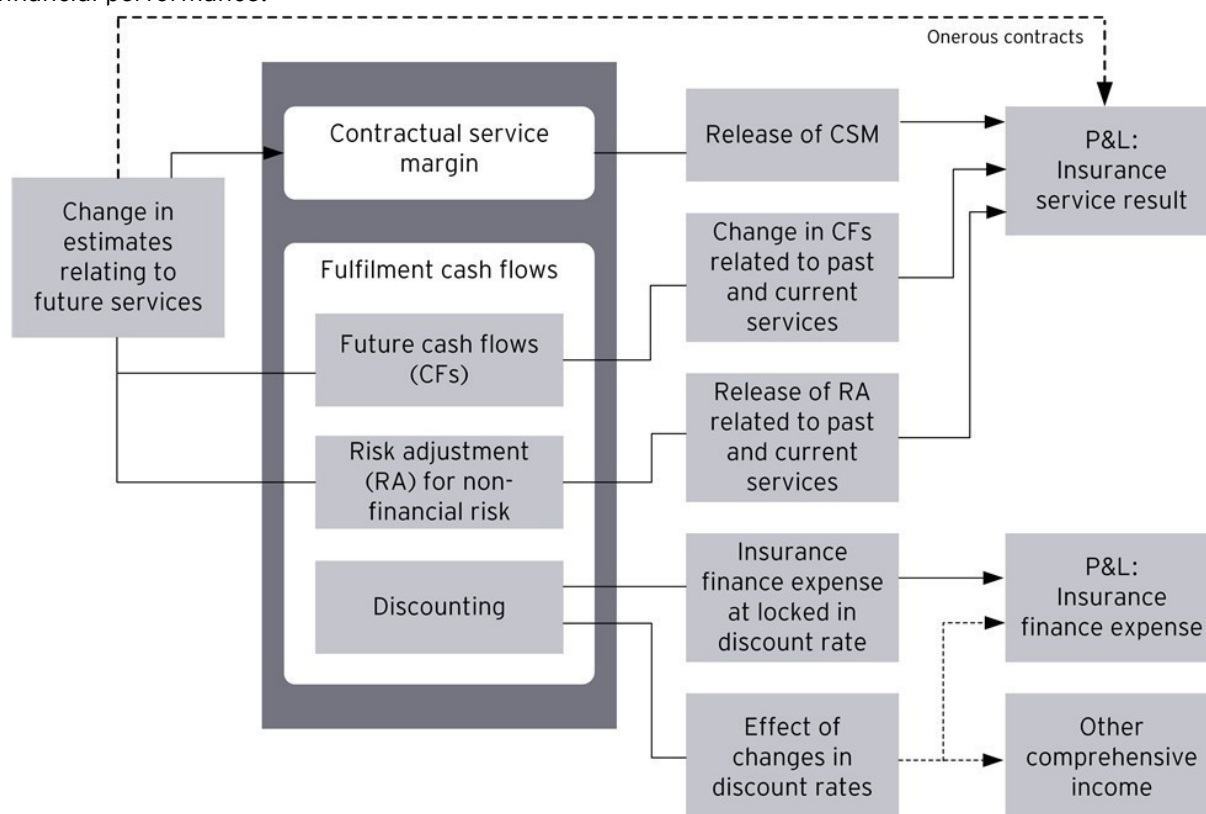

Illustration 15-2: Insurance service result if the result from reinsurance contracts held is shown on a gross basis

Statement of profit or loss and other comprehensive income	20X2	20X1
	CU m	CU m
Insurance revenue	10,304	8,894
Insurance service expenses	(9,069)	(8,489)
Insurance service result before reinsurance contracts held	1,235	405
Income/(expenses) from reinsurance contracts held		
Amounts recovered from the reinsurer	300	200
Allocation of reinsurance premiums paid	(748)	(527)
Reinsurance held subtotal	(448)	(327)
Insurance service result	787	78

There is nothing to prevent an entity from providing further sub-analysis of the components of the insurance service result (which may make the relationship of the reconciliations discussed in section 16.1 below to the face of the statement of financial performance more understandable). Indeed, IAS 1 states that an entity must present additional line items (including by disaggregating line items specified by the standard), headings and subtotals in the statement(s) presenting profit or loss and other comprehensive income when such presentation is relevant to an understanding of the entity's financial performance.

[IAS 1.85].

The following diagram illustrates the high-level relationship of the movements in the building blocks of the general model (discussed in section 8 above) and their relationship with the presentation in the statement of financial performance.

Each of the amounts required to be reported in the statement of financial performance are discussed in sections 15.2.1 to 15.3 below.

15.2.1 Insurance revenue

Insurance revenue depicts the provision of services arising from a group of insurance contracts at an amount that reflects the consideration to which the entity expects to be entitled in exchange for those services. [IFRS 17.83].

Insurance revenue from a group of insurance contracts is therefore the consideration for the contracts, i.e., the amount of premiums paid to the entity: [IFRS 17.B120]

- Adjusted for financing effect (the time value of money)
- Excluding any investment components

Investment components are accounted for separately and are not part of the insurance service result.

The amount of insurance revenue recognised in a period depicts the transfer of promised services at an amount that reflects the consideration to which the entity expects to be entitled in exchange for those services. The total consideration for a group of contracts covers the following: [IFRS 17.B121]

- Amounts related to the provision of services, comprising:
 - Insurance service expenses, excluding any amounts related to the risk adjustment for non-financial risk included per bullet point below and any amounts allocated to the loss component of the liability for remaining coverage
 - Amounts related to income tax that are specifically chargeable to the policyholder
 - The risk adjustment for non-financial risk, excluding any amounts allocated to the loss component of the liability for remaining coverage
 - The contractual service margin.
- Amounts related to insurance acquisition cash flows

Expected allocated expenses for insurance service expenses will be included in the fulfilment cash flows. For example, an entity might include building costs in the fulfilment cash flows (see section 9.2.3 above). The entity will determine depreciation costs over the period of the useful life of the building applying the requirements of IAS 16. When these allocated depreciation expenses are incurred under IFRS 17 they are treated initially as part of the liability for incurred claims. The entity will reduce the liability for remaining coverage and recognise insurance revenue. When such depreciation expenses are incurred applying IAS 16 (or another standard), the amount included in the liability for incurred claims is deemed to be settled and a corresponding credit to the asset is recorded under IAS 16 (or a corresponding liability under another standard). Another example is the treatment of expected defined benefit pension costs allocated and included in the measurement of a group of insurance contracts applying B65(l) of IFRS 17. An estimate of such expected cash flows will be included in the measurement from the initial recognition of the group of insurance contracts. When the employee service that gives rise to the pension cost occurs, a pension cost and liability will be recognised applying IAS 19. At that point, the relevant expected cash flows will be removed from the measurement of the group of insurance contracts. Continuing to include the cash flows expected to settle the pension liability in the measurement of a group of insurance contracts would result in double-counting the liability for those cash flows, and the insurance liability will continue to exist long after the insurer has fulfilled its other obligations under the insurance contract. Accordingly, an insurer removes expected cash flows from the measurement of a group of contracts under IFRS 17 when the cash flows are recovered or settled, or when the cash flows are recognised as an asset or liability under another IFRS.¹⁴

An entity accounts for income tax applying IAS 12. When income tax expenses that are specifically chargeable to the policyholder under the terms of an insurance contract are recognised applying IAS 12, an entity recognises insurance revenue for the consideration paid by the policyholder for such income tax amounts when the entity recognises the income tax amounts in profit or loss. This means that when an entity incurs income tax expenses that are specifically chargeable to the policyholder under the terms of an insurance contract, the entity will need to reduce the liability for remaining coverage and recognise insurance revenue accordingly.¹⁵ As IAS 1 requires a separate presentation of the tax expense, the related income tax amount incurred in the period is reported as part of the tax expense line item. [IAS 1.82(d)].

Illustration 15-3: Interaction between IFRS 17 and other IFRS accounting standards

At 31 December 20X4 (Q4/H2), Entity A recognised a liability for a group of insurance contracts on the face of its statement of financial position.

Note: All other amounts, apart from those mentioned below, are ignored for simplicity.

The fulfilment cash flows of the liability for remaining coverage at 31 December 20X4 includes the following:

	CU
Allocated depreciation on right-of-use asset expected to be incurred during 20X5 ¹	218
Expected income tax payment for 20X5, chargeable to the policyholder	120

¹ At 31 December Entity A has recognised a right-of-use asset (CU436) and a corresponding lease liability (CU446) related to the current lease contract as required by IFRS 16.

The actual expenses incurred during 20X5 amount to:

	CU
Income tax expense recognised and measured in terms of IAS 12 Current tax	120
Amortisation of right-of-use asset	218

The journal entries to account for the consequences of the actual expenses incurred within 20X5 may be presented (assuming no differences between actual and expected expenses), as follows:

	CU	CU
Dr Amortisation expense	218	
Cr Right-of-use asset - accumulated amortisation		218

Application of IFRS 16

Dr Liability for remaining coverage	218	
Cr Insurance revenue		218

Application of IFRS 17.41(a)

Dr Insurance service expenses	218	
Cr Liability for incurred claims		218

Application of IFRS 17.42(a)

Dr Liability for incurred claims	218	
Cr Amortisation expense		218

Deemed settlement of liability for incurred claims when expense is incurred under IFRS 16

Income tax

	CU	CU
Dr Liability for remaining coverage	120	
Cr Insurance revenue		120

Application of IFRS 17.41(a) and B121(a)(ia)

Dr Income tax expense	120	
Cr Current tax liability		120

Application of IAS 12

The above journal entries may result in the following line items in the statement of profit or loss for the period ended 31 December 20X5:

	IAS 1 ref	CU
Insurance revenue (120 + 218)	82(a)(ii)	338
Insurance service expenses	82(ab)	(218)
Insurance service result		120
Tax expense	82(d)	(120)

15.2.1.A Insurance revenue related to the provision of services in a period

When an entity provides services in a period, it reduces the liability for remaining coverage for the services provided and recognises revenue. This is consistent with revenue recognition under IFRS 15 in which an entity recognises revenue and derecognises the performance obligation for services that it provides. [IFRS 17.B123].

The reduction in the liability for remaining coverage that gives rise to insurance revenue excludes changes in the liability that do not relate to services expected to be covered by the consideration received by the entity. These are changes that: [IFRS 17.B123]

- Do not relate to services provided in the period, for example, include:
 - Changes resulting from cash inflows from premiums received
 - Changes that relate to investment components in that period
 - Changes resulting from cash flows from loans to policyholders
 - Changes that relate to transaction-based taxes collected on behalf of third parties (such as premium taxes, value added taxes and goods and services taxes)
 - Insurance finance income or expenses
 - Insurance acquisition cash flows
 - Derecognition of liabilities transferred to a third party
- Relate to services, but for which the entity does not expect consideration, i.e., increases and decreases in the loss component of the liability for remaining coverage

Additionally, any insurance revenue presented in profit or loss must exclude any investment components as well as amounts not arising from the provision of insurance services. [IFRS 17.85].

To the extent that an entity derecognises an asset for cash flows other than insurance acquisition cash flows at the date of initial recognition of a group of insurance contracts (see section 9.5.1 above), it must recognise insurance revenue and expenses for the amount derecognised at that date. [IFRS 17.B123A].

After having explained what insurance revenue is not, IFRS 17 then explains which changes in the liability for remaining coverage in the period relates to services for which the entity expects to receive compensation. Those changes are: [IFRS 17.B124]

- Insurance service expenses incurred in the period (measured at the amounts expected at the beginning of the period), excluding:
 - Amounts allocated to the loss component of the liability for remaining coverage
 - Repayments of investment components
 - Amounts related to transaction-based taxes collected on behalf of third parties (such as premium taxes, value added taxes and goods and services taxes)
 - Insurance acquisition expenses
 - The amount related to the risk adjustment for non-financial risk
- The change in risk adjustment for non-financial risk, excluding:
 - Changes included in insurance finance income or expenses
 - Changes that adjust the contractual service margin because they relate to future service
 - Amounts allocated to the loss component of the liability for remaining coverage
- The amount of the contractual service margin recognised in profit or loss in the period
- Other amounts, if any, for example, experience adjustments for premium receipts other than those that relate to future service

Insurance revenue related to insurance acquisition cash flows must be determined by allocating the portion of the premiums that relate to recovering those cash flows to each reporting period in a systematic way on the basis of passage of time. An entity must recognise the same amount as insurance service expenses. [IFRS 17.B125]. The purpose of this is to separately identify and recognise the recovery of the insurance acquisition cash flows through insurance revenue over the coverage period.

Frequently asked questions

Question 15-1: Can experience adjustments relate to insurance acquisition cash flows and how do they align with the definition of insurance acquisition cash flows?

(TRG meeting September 2018 - Agenda paper no. 6, Log S80)

The IASB staff paper noted that insurance acquisition cash flows are included in the determination of the contractual service margin or loss component for a group of insurance contracts on initial recognition. They are treated the same way as other cash flows incurred in fulfilling insurance contracts. An entity is, therefore, not required to identify whether it will recover the acquisition cash flows at each reporting date since the measurement model captures any lack of recoverability automatically. It does this by limiting the contractual service margin from becoming negative. When expected cash inflows are less than the total of expected cash outflows (including acquisition cash flows) and the risk adjustment for non-financial risk, a loss component is recognised along with a charge to profit or loss.

The TRG members observed that:

- An entity is not required separately to identify whether it will recover insurance acquisition cash flows at each reporting date.
- IFRS 17 assumes that the portion of premiums relating to the recovery of insurance acquisition cash flows is equal to the current estimate of total expected insurance acquisition cash flows at each reporting period.

The TRG members also noted that experience adjustments arising from premiums received in the period that relate to future service, and the related cash flows such as insurance acquisition cash flows, adjust the contractual service margin.

This means that, for example, if initial estimates of acquisition cash flows, payable at the end of a one-year coverage period, were CU100 and, at six months into the coverage period, the entity now expects to pay CU120 for acquisition cash flows at the end of the coverage period compared to the initial expectation of CU100; then the amount of insurance service expenses related to the amortisation of acquisition cash flows (and insurance revenue recognised) at six months is CU60 ($CU120 \times 6/12$).

Question 15-2: Does IFRS 17 require or permit an entity to accrete interest on the amount of acquisition cash flows paid for determining the insurance revenue and insurance services expenses applying IFRS 17.B125?

(TRG meeting April 2019 - Agenda paper no. 2, Log S121)

The IASB staff observed that an entity is required to determine insurance revenue related to insurance acquisition cash flows by allocating the portion of premiums that relate to recovering those cash flows to each reporting period in a systematic way on the basis of passage of time. Such a systematic way does not preclude consideration of interest accretion.

The following Illustration shows how insurance acquisition cash flows are allocated to revenue.

Illustration 15-4: Allocating a portion of premiums to recovery of insurance acquisition cash flows

An entity issues a group of insurance contracts with a coverage period of four years. The entity pays initial acquisition cash flows of CU200 and expects to pay trail commission of CU50 at the end of year 4. The group of contracts is not determined to be onerous. The entity estimates, at the time of initial recognition of the group of contracts, that the discount rate that applies to nominal cash flows that do not vary based on the returns on any underlying items is 3% per year.

The present value of expected insurance acquisition cash flows at initial recognition is CU244 [$CU200 + (CU50 \div 1.03^4)$] which is part of the initial liability for remaining coverage. This is reduced as the cash flows related to the acquired insurance contracts occur. The entity elects to accrete interest on the insurance acquisition cash flows (see section 9.3 above) and estimates the portion of premiums that relates to the recovery of insurance acquisition cash flows in each of the four years of coverage after accreting interest on the opening balance to be CU63, CU65, CU67 and CU68. The entity recognises the same amounts as insurance service expenses in each year (i.e., insurance revenue and insurance service expenses are grossed up for the same amount of CU263).

	Year 1	Year 2	Year 3	Year 4
	CU	CU	CU	CU
A. Memorandum balance at the beginning of the year of coverage	244	188	129	66
B. Accretion of interest at 3% per year	7	6	4	2
C. Amount allocated for the year (A+B)/the number of remaining years of coverage	(63)	(65)	(67)	(68)
D. Memorandum balance at the end of the year	188	129	66	0

How we see it

Revenue recognition will be different from practice under IFRS 4, particularly for life contracts where the accounting practice in many jurisdictions is to recognise premiums due in a period as equivalent to revenue. Revenue in IFRS 17 excludes investment components and recognises revenue as service is provided, instead of when premiums are due to be received. Maintaining records of the liability for remaining coverage for each group of insurance contracts, including any loss component, over the course of the coverage period, and adjusting the amount recognised in profit or loss in each period as revenue for investment components will call for new systems and processes. This new measurement of insurance revenue is also likely to change reported metrics and even impact on the perceived size of entities where this is based on the amount of revenue reported.

Insurance revenue should also incorporate a financing effect (i.e., the adjustment for the effect of time value of money, see section 15.2.1 above), with a corresponding effect reflected in insurance service expenses (see section 15.2.2 below). IFRS 17 is clear that for contracts with direct participation features, this effect is determined using a current discount rate. IFRS 17 is also clear that for contracts accounted for under the premium allocation approach, the financing effect (if any) for the liability for remaining coverage should be determined using the discount rate at initial recognition of the group of contracts. However, IFRS 17 is not clear on whether the financing effect for contracts accounted for under the general model should be based on the current rate or the rate at initial recognition. An entity would therefore have to make an accounting policy choice between a current rate and a rate at initial recognition for determining the financing effect under the general model and apply this choice consistently to contracts accounted for under the general model.

An entity must allocate the portion of the premium that relates to recovering the insurance acquisition cash flows in a systematic way on the basis of time over the coverage period. Such a pattern does not necessarily have to be purely time-proportionate but could also be another systematic basis that appropriately considers the passage of time, like coverage units. Further, as observed by the IASB staff and the TRG in Question 15-2 above, IFRS 17 does not preclude determining this basis in a way that considers the accretion of interest. This means an entity will have to determine its accounting policy on accreting interest to the memorandum balance of insurance acquisition cash flows.

15.2.1.B Revenue under the premium allocation approach

When an entity applies the premium allocation approach, insurance revenue for the period is the amount of expected premium receipts (excluding any investment component and adjusted to reflect the time value of money and the effect of financial risk, if applicable) allocated to the period. The entity must allocate the expected premium receipts to each period of insurance contract services: *[IFRS 17.B126]*

- On the basis of the passage of time
- But

- If the expected pattern of release of risk during the coverage period differs significantly from the passage of time, then on the basis of the expected timing of incurred insurance service expenses

An entity must change the basis of allocation between the two methods above, as necessary, if facts and circumstances change. *[IFRS 17.B127]*. Any change must be reflected in the basis of allocation as a change in accounting estimate and applied prospectively (see section 10.3 above).

If an entity using the premium allocation approach does not expense insurance acquisition cash flows as incurred (see section 10.2 above), the same guidance applies for allocating these to revenue as discussed in section 15.2.1 above for the general approach.

How we see it

The premium allocation approach has many similarities with current practice for non-life insurance based on the unearned premium reserve (UPR) method. However, entities should determine whether the allocation guidance in IFRS 17 requires a change in the revenue recognition pattern. This would be the case if, for example, the expected pattern of release of risk during the coverage period differs significantly from the passage of time, but the entity currently recognises revenue based on the passage of time.

IFRS 17 is silent on how to apply the systematic way on the basis of passage of time for allocating the insurance acquisition cash flows over the coverage period. The standard, therefore, does not appear to preclude applying this allocation pattern in a way that is consistent with the pattern for recognising insurance revenue under the premium allocation approach. This could be administratively easier for entities as they can then determine revenue on a 'net' basis (i.e., the premium amount less insurance acquisition cash flows) and then 'gross up' insurance revenue and insurance service expenses for the amount of insurance acquisition cash flows allocated to the period for presentation in the statement of financial performance.

As discussed in section 15.2.1.A above, IFRS 17 is clear that for contracts accounted for under the premium allocation approach, the financing effect (if any) should be determined using the discount rate at initial recognition of the group of contracts.

15.2.1.C Income or expense from reinsurance contracts held

IFRS 17 permits an entity to present income or expenses from a group of reinsurance contracts held, other than insurance finance income or expenses, either: *[IFRS 17.86]*

- As a single amount
- Or
- Separately, the amounts recovered from the reinsurer and an allocation of the premiums paid that, together, give a net amount equal to that single amount

If an entity presents separately the amounts recovered from the reinsurer and an allocation of the premiums paid, it must: *[IFRS 17.86]*

- Treat reinsurance cash flows that are contingent on claims on the underlying contracts (which would include profit commission payable or receivable) as part of the claims that are expected to be reimbursed under the reinsurance contract held
- Treat amounts from the reinsurer that it expects to receive that are not contingent on the claims of the underlying contracts (for example, some types of commissions, see Illustration 9-19 in section 9.9.3 above) as a reduction in the premiums to be paid to the reinsurer
- Treat amounts recognised relating to recovery of losses when an entity has a group of reinsurance contracts held providing coverage for an onerous group of underlying insurance contracts as amounts recovered from the reinsurer (see section 11.4.2 above)
- Not present the allocation of premiums paid as a reduction in revenue

15.2.2 Insurance service expense

Insurance service expense comprises the following: [IFRS 17.84, IFRS 17.103(b)]

- Incurred claims (excluding repayments of investment components) and other incurred service expenses
- Amortisation of insurance acquisition cash flows
- Changes in fulfilment cash flows that relate to past services, i.e., relating to the liability for incurred claims
- Changes in fulfilment cash flows that relate to future service, but which do not adjust the contractual service margin, i.e., losses on onerous groups of contracts and reversals of such losses

An entity needs to disaggregate this information (for example, to show insurance acquisition cash flows separately from other insurance service expenses) when it is relevant to understanding the entity's financial performance (see section 15.2 above).

With respect to the change in risk adjustment for non-financial risk, the entire change is included as part of insurance service result, unless the entity has decided to disaggregate this change between the insurance service result and the insurance finance income or expense. [IFRS 17.81].

How we see it

As with insurance revenue, insurance service expense also incorporates a financing effect (i.e., the adjustment for the effect of time value of money, see section 15.2.1 above). IFRS 17 is clear that for contracts with direct participation features, this effect is determined using a current discount rate. However, IFRS 17 is not clear on whether the financing effect for contracts accounted for under the general model should be based on the current rate or the rate at initial recognition. For contracts accounted for under the premium allocation approach, IFRS 17 is also silent on whether the financing effect of the liability for incurred claims should be based on the current rate or the rate at the date the claim is incurred.

An entity would therefore have to make an accounting policy choice as to which rates to use and apply its policy consistently for similar transactions, other events and conditions as required by IAS 8.

15.3 Insurance finance income or expenses

Insurance finance income or expenses comprise the change in the carrying amount of the group of insurance contracts arising from: [IFRS 17.87]

- The effect of the time value of money and changes in the time value of money
And
- The effect of financial risk and changes in financial risk
But
- Exclude any such changes for groups of insurance contracts with direct participation features that would adjust the contractual service margin, but do not do so in certain circumstances and are included in insurance service expenses instead. These circumstances occur when:
 - The entity's share of a decrease in the fair value of the underlying items exceeds the carrying amount of the contractual margin and gives rise to a loss, or an increase in the amount of the entity's share of the fair value that causes a reversal of that loss
 - Increases in the fulfilment cash flows exceed the carrying amount of the contractual service margin and give rise to a loss, or decreases in fulfilment cash flows are allocated to the loss component of the liability for remaining coverage

Insurance finance income or expenses do not include income or expenses related to financial assets or liabilities within the scope of IFRS 9, such as investment finance income on underlying items. This is disclosed separately under IAS 1 (see section 15.2 above).

An entity is required to include in insurance finance income or expenses the effect of the time value of money and financial risk and changes therein. For this purpose: [IFRS 17.B128]

- Assumptions about inflation based on an index of prices or rates or on prices of assets with inflation-linked returns are assumptions that relate to financial risk
- Assumptions about inflation based on an entity's expectation of specific price changes are not assumptions that relate to financial risk

- Changes in the measurement of a group of insurance contracts caused by changes in the value of underlying items (excluding additions and withdrawals) are changes arising from the effect of the time value of money and financial risk and changes therein

The words in the last bullet point above mean that changes in the measurement of insurance contracts arising from changes in underlying items, including changes in the value of underlying items not caused by the time value of money or the effect of financial risks, for example, where the underlying items include non-financial assets, should be treated as insurance finance income or expenses. This is because the underlying items are regarded as investments that determine the amount of some payments to policyholders. The underlying items referred to are those that affect measurement of all insurance contracts and not only underlying items in respect of contracts with direct participation features. The Basis for Conclusions observes that, without this requirement, changes in underlying items could adjust the contractual service margin of insurance contracts without direct participation features. The Board considered a view that, although it would be complex, the effects of changes in cash flows from participating in underlying items that are not financial in nature (for example, insurance contracts) should be presented within the insurance service result, rather than within insurance finance income or expenses. The Board disagreed with this view because the requirement to reflect changes from participation in underlying items in insurance finance income or expenses appropriately depicts the nature of the participation, as an investment. In the Board's view, policyholder participation in underlying items that are not solely financial in nature, such as insurance contracts, should not change the underlying insurance service result. Further, splitting the effect of changes in cash flows resulting from the participation in underlying items that are not solely financial in nature into an amount that should be included in the insurance service result and an amount that should be included in insurance finance income or expense would be complex and could disrupt implementation for some entities. [IFRS 17.BC342A].

An entity's accounting policy on currency denomination determines which effects of changes in exchange rates are changes in financial risk accounted for applying IFRS 17 and which of these effects are exchange differences accounted for applying IAS 21. Neither IAS 21 nor IFRS 17 specify where, in profit or loss, exchange differences under IAS 21 are presented. See section 8.3 above.

Frequently asked questions

Question 15-3: Are changes in fulfilment cash flows as a result of changes in inflation assumptions treated as changes in non-financial risk (which may adjust the contractual service margin) or changes in financial risk for contracts measured under the general model?

(TRG meeting April 2019 - Agenda paper no. 2, Log S122)

The submission provided examples of cash flows, such as claims contractually linked to a specified consumer price inflation index and cash flows that are not contractually linked to an index, but which are expected to increase with inflation. The IASB staff observed that cash flows that an entity expects to increase with an index are an assumption that relates to financial risks, even if the cash flows are not contractually linked to a specific index. The TRG members did not disagree with the IASB staff's observation.

15.3.1 Presentation of insurance finance income or expenses in the statement of comprehensive income

Except for insurance finance income or expenses arising from insurance contracts under the variable fee approach when risk mitigation is applied, entities have an accounting policy choice between presenting insurance finance income or expenses in profit or loss, or disaggregated between profit or loss and other comprehensive income. [IFRS 17.88, IFRS 17.89].

If an entity mitigates the effect of financial risk under the variable fee approach (see section 12.3.5 above) using derivatives and non-derivative financial assets measured at fair value through profit or loss, it must include insurance finance income or expenses for the period in profit or loss. If an entity mitigates the effect of financial risk using reinsurance contracts held, insurance finance income or expenses must be allocated between profit or loss and other comprehensive income on the basis of the allocation used by the reinsurance contract. [IFRS 17.B117A].

An entity must apply its choice of accounting policy to portfolios of insurance contracts. The choice is then applied to all groups of contracts within that portfolio. In assessing the appropriate accounting policy for a portfolio of insurance contracts, applying the requirements of IAS 8, the entity must consider for each portfolio the assets that the entity holds and how it accounts for those assets. [IFRS 17.B129].

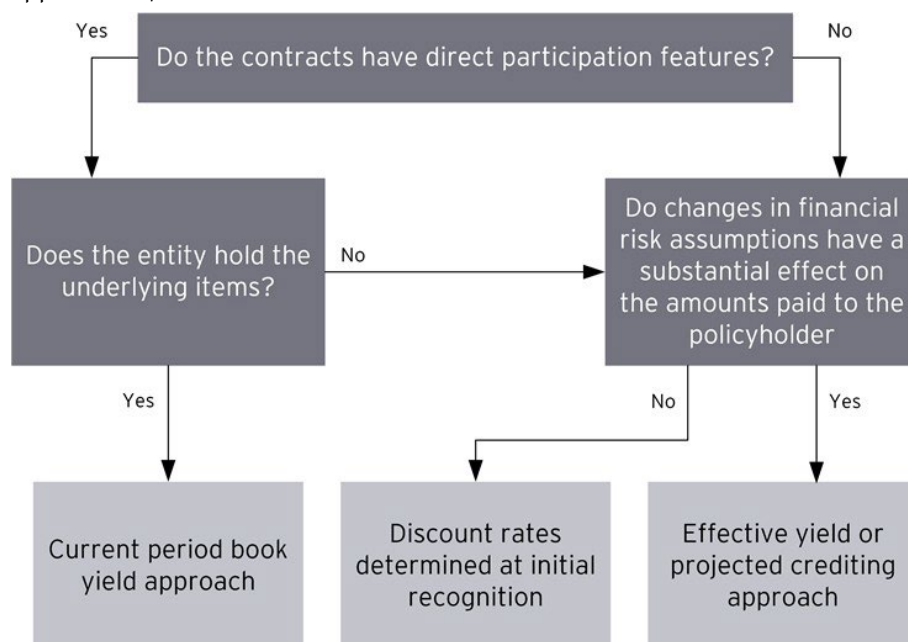

A summary of the policy choices that apply when allocating insurance finance income or expenses in the statement of comprehensive income between profit or loss and other comprehensive income are, as follows:

Type of contract	Accounting	Unit of account
General model		
Present value of future cash flows	All in profit or loss unless disaggregated between profit or loss and other comprehensive income	Disaggregation choice per portfolio
Risk adjustment for non-financial risk	If the entity has elected to disaggregate the risk adjustment between insurance service result and insurance finance income or expenses (see section 9.4.2 above): insurance finance income and expenses allocation follows the present value of future cash flows per above (i.e., all in profit or loss or disaggregated)	Disaggregation choice per portfolio
Contractual service margin	All in profit or loss at the rate at initial recognition as not revalued at current interest rates	N/A
Premium allocation approach		
Liability for remaining coverage	All in profit or loss as not revalued at current interest rates	N/A
Liability for incurred claims	All in profit or loss unless disaggregated between profit or loss and other comprehensive income	Disaggregation choice per portfolio
Variable fee approach		
Present value of future cash flows	All in profit or loss unless disaggregated between profit or loss and other comprehensive income	Disaggregation choice per portfolio
Risk adjustment for non-financial risk	If the entity has elected to disaggregate the risk adjustment between insurance service result and insurance finance income or expenses (see section 9.4.2 above): insurance finance income and expenses allocation follows the present value of future cash flows per above (i.e., all in profit or loss or disaggregated)	Disaggregation choice per portfolio
Contractual service margin	The contractual service margin is measured at current interest rates which this leads to an offset between fulfilment cash flows and contractual service margin rather than being presented in insurance finance income or expenses	N/A

When disaggregation is selected, the methodology required for allocating insurance finance income or expenses between profit or loss and other comprehensive income is different depending on the entity's accounting policy choices based on the nature of the insurance contract liabilities in the portfolio.

The disaggregation approaches for each type of insurance contract are discussed in sections 15.3.2 to 15.3.4 below.

In summary, the approach to determining what portion of insurance finance income or expenses is attributed to profit or loss for portfolios of contracts, except those to which risk mitigation is applied, under the variable fee approach is, as follows:

This can be further illustrated, as follows:

Contract type	Amount recognised in profit or loss	Remaining OCI element reclassified to profit or loss upon derecognition or transfer
Groups of insurance contracts without direct participating features where the effect of financial risk assumptions does not have a substantial effect on the policyholder	Using discount rates determined on initial recognition	Yes
Groups of insurance contracts without direct participating features where the effect of financial risk assumptions has a substantial effect on the policyholder	Choice of (a) effective yield or (b) projected crediting approach	Yes
Contracts accounted for under the premium allocation approach (incurred claims)	Using discount rates determined at date of incurred claim	Yes
Groups of insurance contracts with direct participating features where the underlying items are not held but the effect of financial risk assumptions has a substantial effect on the policyholder	Choice of (a) effective yield or (b) projected crediting approach	Yes
Groups of insurance contracts with direct participating features where the underlying items are held	Current period book yield approach (i.e., net profit or loss impact in the period should be nil)	No

Frequently asked questions

Question 15-4: In a situation in which portfolios of insurance contracts change due to the manner in which the entity manages its contracts, what is the impact of such a change on the group unit of account or the application of the option to disaggregate insurance finance income or expenses between profit or loss and other comprehensive income?

(TRG meeting April 2019 - Agenda paper no. 2, Log S106)

The IASB staff observed that IFRS 17.24 requires that an entity establishes groups of contracts at initial recognition and does not reassess the composition of the groups subsequently. IFRS 17.B129 states that the option to disaggregate insurance finance income or expense between profit or loss and other comprehensive income is a policy choice applied to portfolios of insurance contracts. The requirements of IAS 8 are applicable for changes in accounting policies. Applying IAS 8.13 means that an entity selects and applies its accounting policy consistently for similar portfolios of insurance contracts.

This implies that when an entity decides to choose a policy of disaggregation (or decides to cease a policy of disaggregation) that policy change or choice should be applied to all similar portfolios.

How we see it

Allowing entities a choice between recognising insurance finance income or expenses wholly in profit or loss, or disaggregating it between profit or loss and other comprehensive income, significantly reduces the comparability of profits between entities that apply IFRS 17. There is a trade-off between ensuring comparability between entities and allowing entities to choose how to present insurance finance income or expenses in the accounting in a way that, together with the accounting for their assets backing the insurance liabilities, best fits with how they manage financial risk.

Entities would typically try to minimise accounting mismatches between assets and liabilities. For example, entities that have financial assets held within a business model whose objective is achieved by both collecting contractual cash flows and selling financial assets and, therefore, record the effect of fair value fluctuations on those debt securities in other comprehensive income under IFRS 9, would be expected to disaggregate insurance finance income or expenses between profit or loss and other comprehensive income on related insurance contract liabilities to minimise accounting mismatches. Conversely, an entity would be less inclined to disaggregate insurance finance income or expenses for portfolios of insurance contracts where the assets backing those liabilities include a substantial proportion of financial instruments which are held at fair value with changes in fair value through profit or loss under IFRS 9.

In presenting insurance finance income or expense, an entity is permitted, but not required, to disaggregate the change in risk adjustment for non-financial risk between the insurance service result and insurance finance income or expenses. The risk adjustment reflects the uncertainty of the present value of cash flows. Consequently, its measurement reflects the time value of money. Permitting entities, as an accounting policy choice, to disaggregate a financing element of changes in the risk adjustment for non-financial risks allows an entity to select its preferred way of reporting the effects of changes in the risk adjustment as part of how the entity manages, and presents, the effects of changes in financial risks. If an entity chooses not to disaggregate the time value of money effect of changes in the carrying amount of the risk adjustment for non-financial risk, the entity should include the entire change in the risk adjustment for non-financial risk as part of the insurance service result (see section 9.4.2 above).

15.3.2 Allocating insurance finance income or expenses for contracts except those with direct participation features for which the entity holds the underlying items

For insurance contracts without direct participation features and contracts with direct participation features where the entity does not hold the underlying items (i.e., all insurance contracts except those with direct participation features for which the entity holds the underlying items), an entity must make an accounting policy choice between: [IFRS 17.88]

- Including insurance finance income or expenses for the period in profit or loss
- Or
- Disaggregating insurance finance income or expenses for the period to include in profit in loss, an amount determined by a systematic allocation of the expected total insurance finance income or expenses over the duration of the group of contracts

When an entity chooses a disaggregation policy for a portfolio, the amount included in other comprehensive income is the difference between the insurance finance income or expenses included in profit or loss measured on a systematic allocation basis (see section 15.3.1 above) and the total insurance finance income or expenses in the period, i.e., the amount included in other comprehensive income is the balancing figure. [IFRS 17.90].

This approach applies to both the liability for remaining coverage and the liability for incurred claims under the general model. Under the premium allocation approach, it applies only to the liability for incurred claims. It does not apply to the liability for remaining coverage under the premium allocation approach unless the group of contracts becomes onerous as the liability for remaining coverage is discounted using the rates at initial recognition of the group and not at current rates. Disaggregating discount rates for the liability for incurred claims under the premium allocation approach is discussed in section 15.3.3 below.

A systematic allocation means an allocation of the total expected insurance finance income or expenses of a group of insurance contracts over the duration of the group that: [IFRS 17.B130]

- Is based on characteristics of the contracts, without reference to factors that do not affect the cash flows expected to arise under the contracts. For example, the allocation of the insurance finance income or expenses must not be based on expected recognised returns on assets if those expected recognised returns do not affect the cash flows of the contracts in the group.
- Results in the amounts recognised in other comprehensive income over the duration of the group of contracts totalling zero. The cumulative amount recognised in other comprehensive income at any date is the difference between the carrying amount of the group of contracts and the amount that the group would be measured at when applying the systematic allocation.

When an entity that has disaggregated insurance finance income or expenses of a group of insurance contracts transfers that group of insurance contracts or derecognises an insurance contract as a result of a modification or transfer (see section 13.3.4 above), it must reclassify to profit or loss as a reclassification adjustment any remaining amounts for the group (or contract) that were previously recognised in other comprehensive income as a result of its accounting policy choice. [IFRS 17.91(a)].

15.3.2.A Allocating insurance finance income or expenses for contracts for which changes that relate to financial risk do not have a substantial effect on the amounts paid to the policyholder

For groups of insurance contracts for which changes in assumptions that relate to financial risk do not have a substantial effect on the amounts paid to the policyholder, the systematic allocation (i.e., the amount presented in profit or loss) is determined using the discount rates at the date of initial recognition of the group of contracts. [IFRS 17.B131].

For contracts applying the general model, as the contractual service margin is not remeasured using current rates, all insurance finance income or expenses arising from the accretion of interest of the contractual service margin is recorded in profit or loss.

Frequently asked questions

Question 15-5: For contracts measured applying the general model, when an entity makes an accounting policy choice to disaggregate insurance finance income or expenses between profit or loss and other comprehensive income (OCI), should accumulated OCI on insurance contracts be reclassified to profit or loss when experience does not unfold as expected, and if so, how?

(TRG meeting April 2019 - Agenda paper no. 2, Log S102)

Under IFRS 17, the amount of insurance finance income or expenses allocated to profit or loss is determined by a systematic allocation of the expected total finance income or expenses over the duration of the group. This results in the amounts recognised in other comprehensive income over the duration of the group of contracts totalling zero. The IASB staff observed that the cumulative amount recognised in other comprehensive income at any date is the difference between the carrying amount of the group of contracts and the amount that the group would be measured at when applying the systematic allocation of the expected total insurance finance or expenses over the duration of the group. That is, when the insurance liability is increased or decreased as a result of experience adjustments, the discount rate used for the systematic allocation of the expected total insurance finance income or expenses continues to be calculated as before (e.g., based on the discount rates determined at initial recognition for a group of insurance contracts for which changes in assumptions that relate to financial risk do not have a substantial effect on the amounts paid to the policyholder) and a reclassification adjustment occurs only on derecognition.

Illustration 15-5: Allocating insurance finance income or expenses for contracts where the impact of financial risk on the amounts paid to policyholders is not substantial

On initial recognition of a group of insurance contracts an entity expects to pay policyholders CU1,890 at the end of Year 3. The impact of financial risk on the amounts paid to the policyholders is not substantial and is not affected by changes in discount rates. The interest rate at initial recognition of the group of contracts is 10% and there are no changes to this applying a weighted average discount rate. For simplicity it is assumed that all premiums (cash inflows) are received at the date of initial recognition and all other amounts, including the risk adjustment for non-financial risk, are ignored. Applying IFRS 17.B131, the entity disaggregates insurance finance income or expense using the discount rates determined on initial recognition of the group.

At initial recognition, the present value of expected future cash flows is CU1,420 (i.e., CU1,890 discounted for 3 years at 10% being CU1,562 after one year, CU1,718 after 2 years and CU1,890 after 3 years).

At the end of year 1, the present value of expected future cash flows is CU1,562 (i.e., CU1,890 discounted for 2 years at 10%). The insurance finance income or expenses of CU142 (i.e., CU1,562 less CU1,420) is debited to profit or loss as there is no difference between current discount rates and the discount rate at initial recognition.

At the end of year 2, market interest rates have reduced to 5%. As a result, the present value of expected future cash flows at the end of year 2 is CU1,800. The insurance finance income or expenses of CU238 (i.e., CU1,800 less CU1,562) is allocated, as follows:

- CU156 is debited to profit or loss being the difference between CU1,800 and CU1,562 at the discount rate at initial recognition of 10%.
- CU82 is debited to other comprehensive income being the difference being total insurance finance income or expenses of CU238 and the amount allocated to profit or loss of CU156.

At the end of year 3, market interest rates are still 5%. As a result, the insurance finance income or expenses of CU90 (i.e., CU1,890 less CU1,800) is allocated, as follows:

- CU172 is debited to profit or loss being the difference between CU1,718 and CU1,890 using the discount rate and cash flows at initial recognition of 10%.
- CU82 is credited to other comprehensive income being the difference being total insurance finance income or expenses of CU90 and the amount allocated to profit or loss of CU172.

The net cumulative amount in other comprehensive income at the end of year 3 is CU nil.

15.3.2.B Allocating insurance finance income or expense for contracts for which changes in assumptions that relate to financial risk have a substantial effect on amounts paid to policyholders

For groups of insurance contracts for which changes in assumptions that relate to financial risk have a substantial effect on the amounts paid to the policyholders, which will include contracts with direct participation features for which the underlying items are not held, a systematic allocation for the finance income or expenses arising from the estimates of future cash flows can be determined in one of the following ways: [IFRS 17.B132(a)]

- Using a rate that allocates the remaining revised expected finance income or expenses over the remaining duration of the group of contracts at a constant rate ('effective yield approach')
- Or
- For contracts that use a crediting rate to determine amounts due to the policyholders, using an allocation that is based on the amounts credited in the period and expected to be credited in future periods to the policyholder ('projected crediting approach')

IFRS 17 does not provide guidance on how to determine 'substantial effect' although it is presumably intended to be interpreted similarly to the words 'substantial share' and 'substantial proportion' discussed in the context of insurance contracts with direct participation features in section 12.3.1 above. A group of insurance contracts with direct participation features will usually be a group for which changes in assumptions that relate to financial risk have a substantial effect on the amounts paid to the policyholders. In addition, a group of insurance contracts that have failed to meet the criteria for applying the variable fee approach because of, for example, a lack of a clearly identified pool of underlying items (see section 12.3.1 above) might also be groups of contracts for which changes in assumptions that relate to financial risk (e.g., a change in the crediting rate or dividend amount) have a substantial effect on the amounts paid to policyholders.

The decision to elect either an effective yield approach or a projected crediting approach is an accounting policy choice and is applied to eligible groups according to the criteria in IAS 8.

A systematic allocation for the finance income or expenses arising from the risk adjustment for non-financial risk, if separately disaggregated from other changes in the risk adjustment for non-financial risk, is determined using an allocation consistent with that used for the allocation for the finance income or expenses arising from the future cash flows. [IFRS 17.B132(b)].

A systematic allocation for the finance income or expenses arising from the contractual service margin is determined: [IFRS 17.B132(c)]

- For insurance contracts without direct participation features, using the discount rates determined at the date of initial recognition of the group of contracts (which results in the entire insurance finance income or expenses allocated to profit or loss since the contractual service margin is not remeasured at current rates)
- For insurance contracts with direct participation features, using an allocation consistent with that used for the allocation for the interest income or expenses arising from future cash flows

The following Illustrations are based on Example 15A and 15B in the Illustrative Examples to IFRS 17: [IFRS 17.IE155-164, IFRS 17.IE165-172]

Illustration 15-6: Allocating insurance finance income or expenses for contracts where the impact of financial risk on the amounts paid to policyholders is substantial - effective yield approach

On initial recognition of a group of insurance contracts an entity expects to pay policyholders CU1,890 at the end of Year 3. The interest rate at initial recognition of the group of contracts is 10% and there are no changes to this applying a weighted average discount rate. For simplicity it is assumed that all premiums (cash inflows) are received at the date of initial recognition and all other amounts, including the risk adjustment for non-financial risk, are ignored. The entity chooses to disaggregate insurance finance income or expenses using a systematic allocation of the total expected insurance finance income or expenses over the remaining duration of the group.

At initial recognition, the present value of expected future cash flows is CU1,420 (i.e., €1,890 discounted for 3 years at 10%, being CU1,562 after one year, CU1,718 after 2 years and CU1,890 after 3 years).

At the end of year 1, market interest rates have reduced to 5%. Consequently, the entity revises its expectations as to the future cash flows it will pay its policyholders and now expects to pay only CU1,802 at the end of year 3. The revised constant interest rate is calculated at 7.42% a year (i.e., the rate required to accrete CU1,562 up to CU1,802). As a result, the revised present value of future cash flows at the end of year 1 is CU1,635.

Applying IFRS 17.B132(a)(i), the entity recognises in profit or loss the insurance finance income or expenses calculated as the change in estimates of the present value of the future cash flows at the constant rate of return. In year 1, the finance expenses of CU142 in profit or loss is the difference between the estimates of the present value of future cash flows at the original constant rate of 10% at the end of the year 1 of CU1,562 and the corresponding amount at the beginning of the period of CU1,420. Applying IFRS 17.B130(b), the entity recognises in other comprehensive income the difference between the total insurance finance expense of CU215 (i.e., the difference between opening fulfilment cash flows of CU1,420 and the current fulfilment cash flows of CU1,635) and the amount included in profit or loss of CU142, i.e., CU73.

At the end of year 2, market interest rates are still 5%. The present value of expected future cash flows discounted at current rates is CU1,716. The insurance finance income or expenses of CU81 (i.e., the difference between CU1,716 and the opening revised cash flows of CU1,635) is allocated, as follows:

- CU116 is debited to profit or loss being the difference between the estimates of future cash flows of CU1,562 and CU1,678 using the constant rate of return of 7.42%
- CU35 is credited to other comprehensive income being the difference being total insurance finance income or expenses of CU81 and the amount allocated to profit or loss of CU116

At the end of year 3, market interest rates are still 5%. As a result, the insurance finance income or expenses of CU86 (i.e., CU1,802 less CU1,716) is allocated, as follows:

- CU124 is debited to profit or loss being the difference between the final cash flows of CU1,802 and the previous discounted figure of CU1,678 using the constant rate of return of 7.42%
- CU38 is credited to other comprehensive income being the difference being total insurance finance income or expenses of CU86 and the amount allocated to profit or loss of CU124

The net cumulative amount in other comprehensive income at the end of year 3 is nil.

Illustration 15-7: Allocating insurance finance income or expenses for contracts where the impact of financial risk on the amounts paid to policyholders is substantial - projected crediting rate approach

On initial recognition of a group of insurance contracts, an entity receives a single premium of CU15 for 100 insurance contracts with a coverage period of three years. The total premium for the group of contracts is CU1,500. On initial recognition, the entity expects to achieve rate of return on underlying items of 10% each year and to credit the policyholder account balances by 8% each year (the expected crediting rate). Consequently, the entity expects to pay policyholders CU1,890 at the end of Year 3 ($CU1,500 \times 1.08 \times 1.08 \times 1.08$). At initial recognition, the present value of the expected cash flow at the end of Year 3 amounts to CU1,420 ($CU1,890 \div ((1 + 0.10)^3)$).

In Year 1, the entity credits the policyholder account balances with a return of 8% a year, as expected at the date of initial recognition.

At the end of Year 1, the market interest rate falls from 10% per year to 5% per year. Consequently, the entity revises its expectations about cash flows as follows:

- It will achieve a return of 5% in Year 3 after reinvesting the maturity proceeds of the bonds that mature at the end of Year 2
- It will credit the policyholder account balances 8% in Year 2 and 3% in Year 3
- It will pay policyholders CU1,802 at the end of Year 3 ($CU1,500 \times 1.08 \times 1.08 \times 1.03$)

The entity elects to disaggregate insurance finance income or expenses using an allocation to profit or loss based on amounts credited in the period and expected to be credited in future periods (a 'projected crediting rate approach').

Therefore, the entity allocates the remaining expected insurance finance income or expenses over the remaining life of the contracts using the series of discount rates calculated as the projected crediting rates multiplied by the constant factor. The constant factor and the series of discount rates based on crediting rates at the end of Year 1 are, as follows:

- The product of the actual crediting rate in Year 1 and the expected crediting rates in Years 2 and 3 equals 1.20 ($1.08 \times 1.08 \times 1.03$)
- The carrying amount of the liability increases by a factor of 1.269 over three years because of the interest accretion ($CU1,802 \div CU1,420$)
- Consequently, each crediting rate needs to be adjusted by a constant factor (K), as follows $1.08K \times 1.08K \times 1.03K = 1.269$
- The constant K equals 1.0184 calculated as $(1.269 \div 1.20)^{1/3}$
- The resulting interest accretion rate for Year 1 is 10% (calculated as 1.08×1.0184)

The carrying amount of the liability at the end of Year 1 for the purposes of allocating insurance finance income or expenses to profit or loss is CU1,562 ($CU1,420 \times 1.08 \times 1.0184$).

The actual crediting rate for Years 2 and 3 are as expected at the end of Year 1. The resulting accretion rate for Year 2 is 10% (calculated as $(1.08 \times 1.0184) - 1$) and for Year 3 is 4.9% (calculated as $(1.03 \times 1.0184) - 1$).

	Initial recognition	Year 1	Year 2	Year 3
	CU	CU	CU	CU
Estimates of future cash flows at the end of Year 3	1,890	1,802	1,802	1,802
Estimates of the present value of future cash flows at current discount rates (A)	1,420	1,635	1,716	1,802
Estimates of future cash flows at discount rates based on projected crediting (B)	1,420	1,562	1,718	1,802
Amount accumulated in other comprehensive income (A-B)	-	73	(2)	-

In the table above, CU1,716 equals the estimate of the future cash flows at the end of Year 3 of CU1,802 discounted at the current market rate of 5% per year, i.e., $CU1,802 \div 1.05 = CU1,716$.

CU1,718 equals the estimates of future cash flows at the end of Year 3 of CU1,802 discounted at the projected crediting rate of 4.9% per year, i.e., $CU1,802 \div 1.049 = CU1,718$.

There is an amount of CU2 accumulated in other comprehensive income at the end of Year 2 because the discount rate based on projected crediting rate of 4.9% per year ($1.03 \times K$) is different from the current discount rate of 5% per year.

The insurance finance income or expenses included in profit or loss and other comprehensive income are, as follows:

	Year 1	Year 2	Year 3
Insurance income and expensed arising from fulfilment cash flows			
	CU	CU	CU
Profit or loss	(142)	(156)	(84)
Other comprehensive income	(73)	75	(2)
Total comprehensive income	(215)	(81)	(86)

The entity recognises in profit or loss the insurance finance expenses calculated as the change in the estimates of the present value of the future cash flows at the projected crediting rate. In Year 1, insurance finance expenses of CU142 is the difference between the estimates of the present value of the future cash flows at the original crediting rate of 10% at the end of Year 1 of CU1,562 and the corresponding amount at the beginning of the period of CU1,420.

The entity includes in other comprehensive income, the difference between the amount recognised in total comprehensive income and the amount recognised in profit or loss. In Year 1, for example, the amount included in other comprehensive income of CU(73) is CU(215) minus CU(142). In Years 1-3, the total other comprehensive income equals zero ($CU0 = CU(73) + CU75 + CU(2)$).

The entity recognises, in total comprehensive income, the change in estimates of the present value of the future cash flows at the current discount rate. In Year 1, the total insurance finance expenses of CU(215) is the difference between the estimates of the present value of the future cash flows at the current discount rate at the beginning of Year 1 of CU1,420 and the corresponding amount at the end of Year 1 of CU1,635.

15.3.3 Allocating insurance finance income or expenses for incurred claims when applying the premium allocation approach

When the premium allocation approach is applied (see section 10 above), an entity may be required, or may choose to discount the liability for incurred claims (see section 10.5 above). In such cases, it may also choose to disaggregate the insurance finance income or expenses as discussed in section 15.3.1 above. If the entity makes this choice, it must determine the insurance finance income or expenses in profit or loss using the discount rate determined at the date of the incurred claim. [IFRS 17.B133].

15.3.4 Allocating finance income or expenses for insurance contracts with direct participation features for which the entity holds the underlying items

For insurance contracts with direct participation features, for which the entity holds the underlying items, an entity must make an accounting policy choice between: [IFRS 17.89]

- Including insurance finance income or expenses for the period in profit or loss
- Or
- Disaggregating insurance finance income or expenses for the period to include in profit or loss an amount that eliminates accounting mismatches, with income or expenses included in profit or loss on the underlying items held

This means that, when disaggregation is applied, the amount included in profit or loss for insurance finance income or expenses for insurance contracts with direct participation features exactly matches the insurance finance income or expenses included in profit or loss for the underlying items, resulting in the net of the separately presented items being nil. [IFRS 17.B134]. This is sometimes referred to as the current period book yield approach.

An entity may qualify for the current period book-yield approach in some periods but not in others, because of a change in whether it holds the underlying items. If such a change occurs, the accounting policy choice available to the entity changes from that set out above to that set out in section 15.3.1 above or *vice versa*. Hence, an entity might change its accounting policy between that set out above and that set out in section 15.3.1 above. In making such a change, an entity must: [IFRS 17.B135]

- Include the accumulated amount previously included in other comprehensive income at the date of the change as a reclassification adjustment in profit or loss in the period of change and in future periods, as follows:
 - If the entity had previously applied the requirements described in section 15.3.1 above, it must include in profit or loss the accumulated amount included in other comprehensive income before the change as if it were continuing the approach described in section 15.3.1 above based on the assumptions that applied immediately before the change.
 - And
 - If the entity had previously applied the requirements above, it must include in profit or loss the accumulated amount included in other comprehensive income before the change as if it were continuing the approach above based on the assumptions that applied immediately before the change.
- Not restate prior period comparative information

An entity must not recalculate the accumulated amount previously included in other comprehensive income as if the new disaggregation had always applied; nor update the assumptions used for the reclassification in future periods after the date of the change. [IFRS 17.B136].

When an entity that has disaggregated the insurance finance income or expenses of a group of insurance contracts with direct participation features using the current book yield approach and transfers that group of insurance contracts or derecognises an insurance contract due to a modification (see section 13.3.4 above), it must not reclassify to profit or loss as a reclassification adjustment any remaining amounts for the group (or contract) that were previously recognised in other comprehensive income as a result of its accounting policy choice. [IFRS 17.91(b)]. This is a different accounting treatment than for contracts which do not apply the current book yield approach (see section 15.3.2 above).

The following Illustration is based on Example 16 in the Illustrative Examples to IFRS 17: [IFRS 17.IE173-185]

Illustration 15-8: Allocating insurance finance income or expense for contracts using the current book yield approach

An entity issues 100 insurance contracts with a coverage period of three years. The coverage period starts when the insurance contracts are issued. The contracts meet the criteria for insurance contracts with direct participation features.

The entity receives a single premium of CU15 for each contract at the beginning of the coverage period (total future cash inflows of CU1,500). The entity promises to pay policyholders on maturity of the contract, an accumulated amount of returns on a specified pool of bonds minus a charge equal to 5% of the premium and accumulated returns calculated at that date. Thus, policyholders that survive to maturity of the contract receive 95% of the premium and accumulated returns. In this example, all other amounts, including the risk adjustment for non-financial risk are ignored for simplicity.

The entity invests premiums received of CU1,500 in zero coupon fixed income bonds with a duration of three years (the same as the returns promised to policyholders). The bonds return a market interest rate of 10% per year. At the end of Year 1, market interest rates fall from 10% a year to 5% per year. The entity measures the bonds at fair value through other comprehensive income applying IFRS 9. The effective interest rate of the bonds acquired is 10% per year, and that rate is used to calculate investment income in profit or loss. For simplicity, this example excludes the effect of accounting for expected credit losses on financial assets. The value of the bonds held by the entity is illustrated in the table below:

	Initial recognition	Year 1	Year 2	Year 3
	CU	CU	CU	CU
Fair value	1,500	1,811	1,902	1,997
Amortised cost	1,500	1,650	1,815	1,997
Cumulative amounts recognised in other comprehensive income	-	161	87	-
Change in other comprehensive income		161	(74)	(87)
Investment income recognised in profit or loss (effective interest rate)		150	165	182

The entity elects to disaggregate insurance finance income or expenses for each period to include in profit or loss an amount that eliminates accounting mismatches with income or expense included in profit or loss on underlying items held. Therefore, the entity needs to analyse the changes in fulfilment cash flows to decide whether each change adjusts the contractual service margin. The source of the fulfilment cash flows is, as follows:

	Year 1	Year 2	Year 3
Fulfilment cash flows	CU	CU	CU
Opening balance	-	1,720	1,806
Change related to future service: new contracts	(75)	-	-
Change in the policyholders' share in the fair value of the underlying items	295	86	90
Cash flows	1,500	-	(1,896)
Closing balance	1,720	1,806	-

Fulfilment cash flows are the estimate of the present value of the future cash inflows and the estimate of the present value of the future cash outflows (in this example, all cash outflows vary based on the returns on underlying items). For example, at initial recognition the fulfilment cash flows of CU(75) are the sum of the estimates of the present value of the future cash inflows of CU(1,500) and the estimates of the present value of the future cash outflows of CU1,425 (the policyholders' share of 95% of the fair value of the underlying items at initial recognition of CU1,500).

The change in the policyholders' share in the fair value of the underlying items is 95% of the change in fair value of the underlying items. For example, in Year 1, the change in the policyholders' share in the underlying items of CU295 is 95% of the change in fair value in Year 1 of CU311 (CU1,811 - CU1,500). The entity does not adjust the contractual service margin for the change in the obligation to pay policyholders an amount equal to the fair value of the underlying items because it does not relate to future service.

The entity determines the carrying amount of the contractual service margin at the end of each reporting period, as follows:

	Year 1	Year 2	Year 3
Contractual service margin	CU	CU	CU
Opening balance	-	61	33
Change related to future service: new contracts	75	-	-
Change in the entity's share in the fair value of the underlying items	16	5	5
Change relating to current service: recognition in profit or loss for the service provided	(30)	(33)	(38)
Closing balance	61	33	-

The entity adjusts the contractual service margin for the change in the amount of the entity's share of the fair value of the underlying items because those changes relate to future service. For example, in Year 1 the change in the amount of the entity's share of the fair value of the underlying items of CU16 is 5% of the change in fair value of the underlying items of CU311 (CU1,811 - CU1,500). This example does not include cash flows that do not vary based on the returns on underlying items.

The entity determines the amount of contractual service margin recognised in profit or loss by allocating the contractual service margin at the end of the period (before recognising any amounts in profit or loss) equally to each coverage unit provided in the current period and expected to be provided in the future. In this example, the coverage provided in each period is assumed to be the same. Hence, the contractual service margin recognised in profit or loss for Year 1 of CU30 is the contractual service margin before allocation of CU91 (CU75 + CU16), divided by three years of coverage.

The amounts recognised in the statement(s) of financial performance for the periods are, as follows:

	Year 1	Year 2	Year 3
Statement(s) of financial performance	CU	CU	CU
<i>Profit or loss</i>			
Contractual service margin recognised in profit or loss for the service provided	30	33	38
Insurance service result	30	33	38

Investment income	150	165	182
Insurance finance expense	(150)	(165)	(182)
Profit	30	33	38
<i>Other comprehensive income</i>			
Gain/(loss) on financial assets measured at fair value through other comprehensive income	161	(74)	(87)
Gain/(loss) on insurance contracts	(161)	74	87
Total other comprehensive income	-	-	-

The entity does not adjust the contractual service margin for the changes in the obligation to pay the policyholders an amount equal to the fair value of the underlying items because those changes do not relate to future service. Consequently, the entity recognises those changes as insurance finance income or expenses in the statement(s) of financial performance. For example, in Year 1, the change in fair value of the underlying items is CU311 (CU1,811 - CU1,500).

Furthermore, the entity disaggregates the insurance finance income or expenses for the period between profit or loss and other comprehensive income to include in profit or loss an amount that eliminates accounting mismatches with the income or expenses included in profit or loss on the underlying items held. This amount exactly matches the income or expenses included in profit or loss for the underlying items, resulting in the net of the two separately presented items being zero. For example, in Year 1, the total amount of the insurance finance income or expenses of CU311 is disaggregated and the entity presents in profit or loss the amount of CU150 that equals the amount of finance income for the underlying items. The remaining amount of insurance finance income or expenses of CU161 is recognised in other comprehensive income.

15.4 Reporting the contractual service margin in interim financial statements

Extract from IFRS 17

The effect of accounting estimates made in interim financial statements

B137 If an entity prepares interim financial statements applying IAS 34 *Interim Financial Reporting*, the entity shall make an accounting policy choice as to whether to change the treatment of accounting estimates made in previous interim financial statements when applying IFRS 17 in subsequent interim financial statements and in the annual reporting period. The entity shall apply its choice of accounting policy to all groups of insurance contracts it issues and groups of reinsurance contracts it holds.

[IFRS 17.B137].

An entity which elects not to change the treatment of estimates made in previous interim financial statements is likely to have a different accounting result than an entity which elects to change estimates made in previous interim reporting periods. This is because adjusting the contractual service margin for changes in estimates of the fulfilment cash flows but not for experience adjustments has the consequence that the accounting depends on the timing of a reporting date. [IFRS 17.BC236].

When an entity elects not to change estimates made in previous interim financial statements, the amounts presented in any annual report should equal the values as of the end of the last interim period and the cumulative profit or loss for the year should be the sum of the profit or loss amounts for each interim period. Each interim period is determined separately as if it were a discrete period and the annual period is simply the total of the profit or loss of the discrete interim periods.

When an entity does restate estimates made in previous interim periods, each interim report includes information which, in aggregate, results in the year-to-date figures in that interim report being equal to the value which would have resulted if IFRS 17 had been applied to the full year to date period without any interim periods. The cumulative profit or loss to date of the interim period would equal the cumulative amount on an annual basis to date.

The Board concluded that permitting an accounting policy choice would ease IFRS 17 implementation by enabling an entity to assess which accounting policy is less burdensome. To avoid a significant loss of useful information for users of financial statements, the Board concluded that the entity is required to apply consistently its choice of accounting policy to all groups of insurance contracts it issues and groups of reinsurance contracts it holds (i.e., accounting policy choice at reporting entity level). [IFRS 17.BC236B, IFRS 17.BC236C].

There is also related transitional relief available upon applying IFRS 17 for entities applying the modified retrospective approach that elect an accounting policy not to change the treatment of estimates made in previous interim reporting periods. See section 17.4 below.

Frequently asked questions

Question 15-6: Can the requirements in IFRS 17.B137 be extended to apply to monthly reporting that is prepared for internal management reporting and external regulatory reporting?

(TRG meeting September 2018 - Agenda paper no. 11, Log S56)

The IASB staff confirmed that the requirements of IFRS 17.B137 described above apply only to interim reports prepared applying IAS 34. This can cause a particular issue for groups where the parent does, but the subsidiary does not, prepare IAS 34 interim financial statements. If the parent prepares IAS 34 interim financial statements, but the subsidiary does not, (e.g., the subsidiary prepares interim internal management reports that do not comply with IAS 34) then the choice of changing the treatment of previous estimates in subsequent interim financial statements is available only to the parent and not applicable to the subsidiary. The TRG members agreed with the IASB staff's interpretation but highlighted the significant operational challenges of applying it in practice.

Illustration 15-9: The contractual service margin and interim reporting

This example focuses on the impact of the release of the contractual service margin on insurance revenue and not on the impact on profit or loss of other components of an insurance contract liability. The example also assumes there are no other changes in expectations and ignores accretion of interest for simplicity.

An entity with an annual reporting period ending on 31 December publishes half-yearly interim financial statements.

At 31 December 20X3, the entity has issued a group of insurance contracts with a contractual service margin of CU1,200 and an expected coverage period of two years. The entity expects to provide coverage evenly over the coverage period and expects to incur claims in H2 20X3 of CU300.

At the end of H1 20X4, the entity increases its estimate of claims to be incurred in H2 of 20X4 by CU200 to CU500. The entity adjusts (reduces) the related contractual service margin by CU200 and reduces the contractual service margin by CU250 for services provided in H1 ($(CU1,200 - CU200) \div 4$). At the end of H1 20X4, the entity carries forward a contractual service margin of CU750.

The entity incurs claims in H2 20X4 of CU300 (as originally expected).

Option A - the entity elects not to change the treatment of its previous estimates in subsequent interim financial statements and in the annual financial report

As a result of incurring claims in H2 20X4 of CU300, the entity recognises a favourable experience adjustment in profit or loss (i.e., a credit to insurance service expenses) of CU200 in H2.

The entity releases CU250 from the contractual service margin to profit or loss (insurance revenue) in H2 and carries forward a contractual service margin of CU500 ($CU750 - CU250$) at 31 December 20X4 in the H2 20X4 interim as well as annual 2024 financial statements.

In summary, in 20X4, the entity recognises CU500 as part of insurance revenue, a positive experience adjustment in insurance service expenses of CU200 and carries forward a contractual service margin of CU500 in both its interim financial statements for H2 20X4, as well as its annual financial statements for that year.

Option B - the entity elects to change the treatment of its previous estimates in subsequent interim financial statements and in the annual financial report

If the entity does change its previous estimates, then the position at the end of the H2 20X4 interims and the 20X4 financial report is the cumulative result for the calendar year. Therefore, the impact on the annual financial statements is as follows:

- There is no experience adjustment in the year - claims in 20X4 are as expected at 31 December 20X3.
- The entity would release CU600 from the contractual service margin to profit or loss in the calendar year 20X4 and would carry forward a contractual service margin of CU600 ($CU1,200$ brought forward - CU600 release to P&L = CU600).

In summary, in 20X4, the entity recognises CU600 as part of insurance revenue in 20X4 and carries forward a contractual service margin of CU600 at 31 December 20X4 instead of recognising insurance revenue of CU500 and a positive experience adjustment in insurance service expenses of CU200 and carrying forward a contractual service margin of CU500 under option A above.

How we see it

The policy choice in IFRS 17.B137 applies only to interim financial statements that are prepared applying IAS 34 and have gone through the full internal governance procedures with management able to provide a statement of compliance with IAS 34. IFRS 17.B137 cannot be applied to interim reports that do not meet these conditions. However, an entity does not need to publish a set of interim financial statements in order to qualify as IAS 34 interim financial statements within the context of IFRS 17.B137. For example, an entity could prepare IAS 34 interim reports on a quarterly basis, but only publish its interim reports for the second quarter and fourth quarter. In this case, the entity could still choose to apply a period-to-period accounting policy under IFRS 17.B137 on a quarterly basis. In this example, the entity should disclose relevant information in the notes of second quarter and fourth quarter financial statements to explain how it prepares its published financial statements under the period-to-period approach. More specifically, the entity would need to explain that the year-to-date result is the sum of the discrete first and second quarters and would also have to consider whether additional disclosure on the effects of changes in estimates would be necessary based on the requirements of IAS 34.16A(d). The same approach would apply to the fourth quarter interim report.

CONSOLIDATED FINANCIAL STATEMENTS AND NOTES [extract]

Notes to the Consolidated Financial Statements [extract]

1. Material Accounting Policies [extract]

Insurance Contracts [extract]

Level of Aggregation [extract]

Subsequent Measurement [extract]

...

We have not changed the accounting estimates made in previous interim financial statements in the preparation of these Consolidated Financial Statements. In particular, the CSM at the end of each reporting period is the CSM at the beginning of the reporting period adjusted as described above, rather than the CSM at the beginning of the calendar year adjusted as described above.

16 Disclosure

One of the main objectives of IFRS 17 is to establish principles for the disclosure of insurance contracts which gives a basis for users of the financial statements to assess the effect that insurance contracts have on an entity's financial position, financial performance and cash flows. [IFRS 17.1].

Hence, the objective of the disclosure requirements is for an entity to disclose information in the notes that, together with the information provided in the statement of financial position, statement(s) of financial performance and statement of cash flows, gives a basis for users of financial statements to assess the effect of contracts within the scope of IFRS 17. To achieve that objective, an entity must disclose qualitative and quantitative information about: [IFRS 17.93]

- The amounts recognised in its financial statements for contracts within the scope of IFRS 17 (see section 16.1 below)
- Disclosures showing the effect of transition (see section 16.2 below)
- The significant judgements, and changes in those judgements, when applying IFRS 17 (see section 16.3 below)
- The nature and extent of risks arising from contracts within the scope of IFRS 17 (see section 16.5 below)

The disclosure objective is supplemented with some specific disclosure requirements designed to help the entity satisfy this objective. By specifying the objective of the disclosures, the Board aims to ensure that entities provide the information that is most relevant for their circumstances and to emphasise the importance of communication to users of financial statements rather than compliance with detailed and prescriptive disclosure requirements. In situations in which the information provided to meet the specific disclosure requirements is not sufficient to meet the disclosure objective, the entity is required to disclose additional information necessary to achieve that objective. [IFRS 17.BC347].

The Board used the disclosure requirements in IFRS 4, including the disclosure requirements in IFRS 7 that are incorporated in IFRS 4 by cross-reference, as a basis for the requirements in IFRS 17. This is because stakeholders have indicated that such disclosures provide useful information to users of financial statements for understanding the amount, timing and uncertainty of future cash flows from insurance contracts. The disclosure requirements brought forward from IFRS 4 include information about significant judgements in applying the standard as well as most of the disclosures about the nature and extent of risks that arise from insurance contracts. [IFRS 17.BC348]. In addition, when developing IFRS 17, the Board identified key items it views as critical to understanding the financial statements of entities issuing insurance contracts, in the light of the requirement to update the measurement of insurance contracts at each reporting date. Consequently, additional disclosures have been added requiring: [IFRS 17.BC349]

- Reconciliations of opening to closing balances of the various components of the liability for remaining coverage and the liability for incurred claims
- An analysis of insurance revenue
- Information about initial recognition of insurance contracts in the statement of financial position
- An explanation of when an entity expects to recognise the contractual service margin remaining at the end of the reporting period in profit or loss
- An explanation of the total amount of insurance finance income or expenses in profit or loss and the composition and fair value of underlying items for contracts with direct participation features
- Information about the entity's approach to determining various inputs into the fulfilment cash flows
- The confidence level used to determine the risk adjustment for non-financial risk
- Information about yield curves used to discount cash flows that do not vary based on returns from underlying items
- Information about the effect of the regulatory framework in which the entity operates.

IFRS 17 requires a reporting entity to consider the level of detail necessary to satisfy the disclosure objective and how much emphasis to place on each of the various requirements. Preparers are informed that if the mandatory disclosures required are not enough to meet the disclosure objective, additional information must be disclosed as necessary to meet that objective. [IFRS 17.94].

An entity must aggregate or disaggregate information so that useful information is not obscured either by the inclusion of a large amount of insignificant detail or by the aggregation of items that have different characteristics. [IFRS 17.95].

Preparers are also reminded of the requirements in IAS 1 relating to materiality and aggregation of information. IFRS 17 states that examples of aggregation bases that might be appropriate for information disclosed about insurance contracts include: [IFRS 17.96]

- Type of contract (e.g., major product lines)
- Geographical area (e.g., country or region)
- Reportable segment, as defined in IFRS 8 *Operating Segments*

IAS 1 requires comparative information to be presented in respect of the preceding period for all amounts reported in the current period's financial statements unless IFRS accounting standards permit or require otherwise. An entity must also include comparative information for narrative and descriptive information if it is relevant to understanding the current period's financial statements. [IAS 1.38]

How we see it

The disclosure requirements of IFRS 17 are more extensive compared with those in IFRS 4. They comprise 40 paragraphs of the standard. Insurance entities have not had to provide many of these disclosures in the past, so complying with the disclosure requirements will be a challenge for data, systems and processes. Entities will need to apply judgement in how they break down the required disclosures into separate lines of business, reportable segments, or geographical areas. Entities will need to determine this based on the objective of providing decision useful information to the users of the financial statements in accordance with the disclosure principles of IFRS 17.

The provision of additional disclosures should be considered when compliance with the specific requirements in IFRS is insufficient to enable users of financial statements to understand the impact of particular transactions, other events and conditions on the entity's financial position and financial performance. This point is made explicitly in IFRS 17.94.

Applying the concept of materiality, a specific disclosure otherwise required by an IFRS accounting standard in the financial statements, need not be provided if the information resulting from that requirement is not material. This is the case even if the IFRS accounting standard contains a list of specific requirements or describes them as minimum requirements. The IASB has issued *IFRS Practice Statement 2: Making Materiality Judgements*. This is a non-mandatory statement that entities may apply to assist in making materiality judgements (see Chapter 3).

16.1 Explanation of recognised amounts

The first part of the disclosure objective established by the standard is that an entity must disclose qualitative and quantitative information about the amounts recognised in its financial statements for contracts within its scope. [IFRS 17.93].

The principal method by which the disclosure objective is achieved is by the disclosure of reconciliations that show how the net carrying amounts of contracts within the scope of IFRS 17 changed during the period because of cash flows and income and expenses recognised in the statement(s) of financial performance. Separate reconciliations must be disclosed for insurance contracts issued and reinsurance contracts held. An entity must adapt the requirements of the reconciliations described below to reflect the features of reinsurance contracts held that differ from insurance contracts issued; for example, the generation of expenses or reduction in expenses rather than revenue. [IFRS 17.98].

Enough information must be provided in the reconciliations to enable users of financial statements to identify changes from cash flows and amounts that are recognised in the statement(s) of financial performance. To comply with this requirement, an entity must: [IFRS 17.99]

- Disclose, in a table, the reconciliations set out in sections 16.1.1 to 16.1.2 below
- For each reconciliation, present the net carrying amounts at the beginning and at the end of the period, disaggregated into a total for portfolios of contracts that are assets and a total for portfolios of contracts that are liabilities, that equal the amounts presented in the statement of financial position as set out in section 15.1 above

The objective of the reconciliations detailed in sections 16.1.1 to 16.1.2 below is to provide different types of information about the insurance service result. [IFRS 17.102].

16.1.1 Reconciliations required for contracts applying the general model

These reconciliations are required for all contracts other than those to which the premium allocation approach is applied including contracts with direct participation features. Firstly, an entity must provide overall reconciliations from the opening to the closing balances separately for each of the following: *[IFRS 17.100]*

- The net liabilities (or assets) for the remaining coverage component, excluding any loss component
- Any loss component (see section 9.8 above)
- The liabilities for incurred claims

Within the overall reconciliations above, an entity must separately disclose each of the following amounts related to insurance contract services, if applicable: *[IFRS 17.103]*

- Insurance revenue
- Insurance service expenses, showing separately:
 - Incurred claims (excluding investment components) and other incurred insurance service expenses
 - Amortisation of insurance acquisition cash flows
 - Changes that relate to past service, i.e., changes in fulfilment cash flows relating to the liability for incurred claims
 - Changes that relate to future service, i.e., losses on onerous groups of contracts and reversals of such losses
- Investment components excluded from insurance revenue and insurance service expenses (combined with refunds of premiums unless refunds of premiums are presented as part of the cash flows in the period)

Below is an example of this overall reconciliation, based on an illustrative disclosure in the IASB's *IFRS 17 Effects Analysis*.

Liability for remaining coverage				
	Excluding onerous contracts component	Onerous contracts component	Liabilities for incurred claims	Total
	CU	CU	CU	CU
Insurance contract liabilities 20X4	161,938	15,859	1,021	178,818
Insurance revenue	(9,856)			(9,856)
Insurance services expenses	1,259	(623)	7,985	8,621
Incurred claims and other expenses		(840)	7,945	7,105
Acquisition expenses	1,259			1,259
Changes that relate to future service: loss on onerous contracts and reversals of those losses		217		217
Changes that relate to past service: changes to liability for incurred claims			40	40
Investment components	(6,465)		6,465	0
Insurance service result	(15,062)	(623)	14,450	(1,235)
Insurance finance expenses	8,393	860	55	9,308
Total changes in the statement of comprehensive income	(6,669)	237	14,505	8,073
Cash flows				
Premiums received	33,570			33,570
Claims, benefits and other expenses paid			(14,336)	(14,336)
Acquisition cash flows paid	(401)			(401)
Total cash flows	33,169	-	(14,336)	18,833
Insurance contract liabilities 20X5	188,438	16,096	1,190	205,724

Secondly, an entity must also disclose reconciliations from the opening to the closing balances separately for each of the following: *[IFRS 17.101]*

- The estimates of the present value of the future cash flows
- The risk adjustment for non-financial risk
- The contractual service margin

Within these reconciliations, an entity must disclose the following amounts related to services, if applicable:
[IFRS 17.104]

- Changes that relate to future service, showing separately:
 - Changes in estimates that adjust the contractual service margin
 - Changes in estimates that do not adjust the contractual service margin, i.e., losses on groups of onerous contracts and reversals of such losses
 - The effects of contracts initially recognised in the period
- Changes that relate to current service, which include:
 - The amount of the contractual service margin recognised in profit or loss to reflect the transfer of services
 - The change in the risk adjustment for non-financial risk that does not relate to future service or past service
 - Experience adjustments, excluding amounts relating to the risk adjustment for non-financial risk included above
- Changes that relate to past service, i.e., changes in fulfilment cash flows relating to incurred claims

Below is an example of these reconciliations, based on an illustrative disclosure in the IASB's *IFRS 17 Effects Analysis*:

	Estimates of the present value of future cash flows	Risk adjustment	Contractual service margin	Total
	CU	CU	CU	CU
Insurance contract liabilities 20X4	163,962	5,998	8,858	178,818
Changes that relate to current service	35	(604)	(923)	(1,492)
Contractual service margin recognised for service period			(923)	(923)
Risk adjustment recognised for the risk expired		(604)		(604)
Experience adjustments	35			35
Changes that relate to future service	(784)	1,117	(116)	217
Contracts initially recognised in the period	(2,329)	1,077	1,375	123
Changes in estimates reflected in the contractual service margin	1,452	39	(1,491)	-
Changes in estimates that result in onerous contract losses	93	1		94
Changes that relate to past service	47	(7)		40
Adjustments to liabilities for incurred claims	47	(7)		40
Insurance service result	(702)	506	(1,039)	(1,235)
Insurance finance expenses	9,087	-	221	9,308
Total changes in the statement of comprehensive income	8,385	506	(818)	8,073
Cash flows	18,833			18,833
Insurance contract liabilities 20X5	191,180	6,504	8,040	205,724

In addition, to complete the reconciliations above, an entity must also disclose separately each of the following amounts not related to services provided in the period, if applicable: *[IFRS 17.105]*

- Cash flows in the period, including:
 - Premiums received for insurance contracts issued (or paid for reinsurance contracts held)
 - Insurance acquisition cash flows
 - Incurred claims paid and other insurance service expenses paid for insurance contracts issued (or recovered under reinsurance contracts held), excluding insurance acquisition cash flows
- The effect of changes in the risk of non-performance by the issuer of reinsurance contracts held
- Insurance finance income or expenses
- Any additional line items that may be necessary to understand the change in the net carrying amount of the insurance contracts

How we see it

As discussed in section 11.4.4. above, the risk of non-performance includes both credit and dispute risk. IFRS 17.105 requires insurers to disclose the effect of changes in the risk of non-performance by issuers of reinsurance contracts held. IFRS 17 also states that changes in the fulfilment cash flows that result from changes in the risk of non-performance by the issuer of a reinsurance contract held do not relate to future service and shall not adjust the contractual service margin. Hence, these changes should be recognised in the statement of comprehensive income in the period in which these effects occur. However, IFRS 17 does not state whether the effect of change in the risk of non-performance is part of insurance service expenses or part of insurance finance income or expenses. Where an entity makes the judgement that the risk of non-performance is a non-financial risk, it will present the effects of non-performance risk for reinsurance held as insurance service expenses. Where an entity makes the judgement that the risk of non-performance is a financial risk, per Appendix A of IFRS 17, it will present the effects of non-performance risk for reinsurance held as insurance finance income or expenses in the statement of comprehensive income. If an entity treats non-performance risk as a financial risk also applies the option to disaggregate insurance finance income or expenses between profit or loss and other comprehensive income, then it follows from the disaggregation requirements in IFRS 17 that subsequent changes arising in non-performance risk should also be disaggregated between profit and loss and other comprehensive income according to IFRS 17.88 and IFRS 17.89 (see section 15.3.1 above).

When an entity recognises an asset for insurance acquisition cash flows paid for existing or future groups of insurance contracts before those insurance contracts are recognised (see section 7.3 above), it must disclose a reconciliation from the opening to the closing balance of assets recognised for those insurance acquisition cash flows. The information must be aggregated at a level which is consistent with that for the other reconciliations of insurance contracts discussed above. *[IFRS 17.105A]*.

The reconciliation of the insurance acquisition cash flows above must disclose separately any recognition of impairment losses and reversals of impairment losses of the insurance acquisition cash flow assets. *[IFRS 17.105B]*.

In respect of insurance revenue recognised in the period, entities must provide the following analysis: *[IFRS 17.106]*

- The amounts relating to the changes in the liability for remaining coverage as discussed in section 15.2.1 above, separately disclosing:
 - The insurance service expenses incurred during the period
 - The change in the risk adjustment for non-financial risk
 - The amount of the contractual service margin recognised in profit or loss because of the transfer of insurance contract services in the period
 - Other amounts, if any, for example, experience adjustments for premium receipts other than those that relate to future service
- The allocation of the portion of the premiums that relate to the recovery of insurance acquisition cash flow

Below is an example of this insurance revenue analysis, based on an illustrative disclosure in the IASB's *IFRS 17 Effects Analysis*.

	20X5
	CU
Amounts related to liabilities for remaining coverage	8,597
Expected incurred claims and other expenses	7,070
Contractual service margin for the service provided	923
Risk adjustment for the risk expired	604
Recovery of acquisition cash flows	1,259
Insurance revenue	9,856

The effect on the statement of financial position for insurance contracts issued and reinsurance contracts held that are initially recognised in the period, must be shown separately, disclosing the effect at initial recognition on: *[IFRS 17.107]*

- The estimates of the present value of future cash outflows, showing separately the amount of the insurance acquisition cash flows
- The estimates of the present value of future cash inflows
- The risk adjustment for non-financial risk
- And
- The contractual service margin

In the reconciliation showing the effect of insurance contracts issued and reinsurance contracts held, there must be separate disclosure of the following: *[IFRS 17.108]*

- Contracts acquired from other entities in transfers of insurance contracts or business combinations
- Groups of contracts that are onerous

Below is an example of this analysis, based on an illustrative disclosure in the IASB's *IFRS 17 Effects Analysis*. The example shows insurance contracts issued only for an entity which has not acquired contracts in the period via transfers or business combinations.

	Total	Of which contracts acquired	Of which onerous contracts
	CU	CU	CU
Contracts initially recognised in 20X5			
Estimates of the present value of futures cash inflows	(33,570)	(19,155)	(1,716)
Estimates of the present value of future cash outflows			
Insurance acquisition cash flows	401	122	27
Claims payable and other expenses	30,840	17,501	1,704
Risk adjustment	1,077	658	108
Contractual service margin	1,375	896	-
Total	123	22	123

Additionally, an entity must disclose *quantitatively* (emphasis added) when it expects to recognise the contractual service margin remaining at the end of the reporting period in profit or loss, in appropriate time bands. Such information should be provided separately for insurance contracts issued and reinsurance contracts held. *[IFRS 17.109]*. The total contractual service margin amount should be reconciled to the contractual service margin shown in the reconciliations above.

An entity is also required to disclose quantitatively, in appropriate time bands, when it expects to derecognise an asset for insurance acquisition cash flows. *[IFRS 17.109A]*.

Frequently asked questions

Question 16-1: What is the sequence to be applied to adjusting a loss component in a financial period when one experience adjustment that relates to future service would increase a loss component, while another would decrease it; and should a gross disclosure be provided applying paragraphs 103(b) and 104(a) of IFRS 17?

(TRG meeting April 2019 - Agenda paper no. 02, Log S125)

In the example submitted, there was a premium experience adjustment related to future service that would increase a loss component and a change in fulfilment cash flows related to future service that would decrease a loss component. The IASB staff observed that IFRS 17 requires an entity to provide disclosure of changes that relate to future service separately from those related to current or past service and in the example submitted, all changes relate to future service. That is, no sub-analysis of the changes that relate to future service was required for the example included in the submission.

Question 16-2: How should the reconciliation of estimates of the present value of future cash flows applying paragraphs 101 and 104 of IFRS 17 for the annual reporting period be disclosed, considering the requirements in IFRS 17.B137 relating to interim financial statements?

(TRG meeting April 2019 - Agenda paper no. 02, Log S83)

The submission asks, for example, whether changes disclosed as relating to past service in an interim reporting period should be disclosed as changes relating to current service in the annual reporting. The IASB staff stated the amounts disclosed in the reconciliations in IFRS 17.101 and 104 reflected the amounts included in the measurement of insurance contracts and that the description of the amount as relating to past or current service does not affect the measurement as both are treated in the same way when determining the fulfilment cash flows and any effect of changes in fulfilment cash flows on the contractual service margin.

How we see it

The roll forward reconciliations are detailed analyses of movements in the carrying amounts of insurance contracts issued and reinsurance contracts held. They will provide more information and transparency to users than they currently receive from IFRS financial statements. An entity is required to provide analyses of the change in the carrying amount that view insurance contracts in two ways:

- The building blocks view (present value of expected future cash flows, risk adjustment for non-financial risk, and the contractual service margin)
- By type of insurance obligation (the liability for incurred claims and the liability for remaining coverage split between the loss component and the non-loss component)

The reconciliations are two views of the same events in a reporting period. Entities need to decide to what extent they build the reconciliations from low-level detailed data on changes in the carrying amounts of insurance contracts maintained in a general ledger (and/or data warehouse) versus maintaining high-level data in the general ledger and taking a top-down approach to analysing movements and obtaining the required movements data from other sources. On one hand, a bottom-up approach to maintaining movement data in the general ledger/data warehouse represents a significant data and process challenge. On the other hand, a top-down approach risks an entity being unable to provide the analyses in a robust and timely way.

16.1.2 Information about contracts to which the entity applies the premium allocation approach

16.1.2.A Accounting policies adopted for contracts applying the premium allocation approach

When an entity uses the premium allocation approach, it must disclose the following: [IFRS 17.97]

- Which of the criteria for the use of the premium allocation approach for insurance contracts issued and reinsurance contracts held it has satisfied
- Whether it makes an adjustment for the time value of money and the effect of financial risk for the liability for remaining coverage and the liability for incurred claims
- Whether it recognises insurance acquisition cash flows as expenses when it incurs those costs or amortises insurance acquisition cash flows over the coverage period

These choices are discussed in sections 10.1, 10.4 and 10.5 above.

16.1.2.B Reconciliations required for contracts applying the premium allocation approach

The reconciliations described below apply to contracts using the premium allocation approach. Most also apply for contracts using the general model (see section 16.1.1 above). As with the general model, for each reconciliation, an entity should present the net carrying amounts at the beginning and at the end of the period, disaggregated into a total for portfolios of contracts that are assets and a total for portfolios of contracts that are liabilities, that equal the amounts presented in the statement of financial position as set out in section 15.1 above. *[IFRS 17.99]*.

Overall reconciliations from the opening to the closing balances are required separately for each of: *[IFRS 17.100]*

- The net liabilities (or assets) for the remaining coverage component, excluding any loss component
- Any loss component (see section 9.8 above)
- The liabilities for incurred claims with separate reconciliations for:
 - The estimates of the present value of the future cash flows
 - The risk adjustment for non-financial risk

Within the overall reconciliations above, separate disclosure of each of the following amounts related to services, if applicable: *[IFRS 17.103]*

- Insurance revenue
- Insurance service expenses, showing separately:
 - Incurred claims (excluding investment components) and other incurred insurance service expenses
 - Amortisation of insurance acquisition cash flows
 - Changes that relate to past service, i.e., changes in fulfilment cash flows relating to the liability for incurred claims
 - Changes that relate to future service, i.e., losses on onerous groups of contracts and reversals of such losses
- Investment components excluded from insurance revenue and insurance service expenses (combined with refunds of premiums unless refunds of premiums are presented as part of the cash flows in the period)

Disclosure is also required of each of the following amounts that are not related to services provided in the period, if applicable: *[IFRS 17.105]*

- Cash flows in the period, including:
 - Premiums received for insurance contracts issued (or paid for reinsurance contracts held)
 - Insurance acquisition cash flows
 - Incurred claims paid and other insurance service expenses paid for insurance contracts issued (or recovered under reinsurance contracts held), excluding insurance acquisition cash flows
- The effect of changes in the risk of non-performance by the issuer of reinsurance contracts held
- Insurance finance income or expenses
- Any additional line items that may be necessary to understand the change in the net carrying amount of the insurance contracts

The disclosures required when an entity recognises an asset for acquisition cash flows paid for existing or future groups of insurance contracts before those insurance contracts are recognised insurance acquisition cash flow assets also apply to contracts accounted for under the premium allocation approach (see section 16.1.1 above).

16.1.3 Explanation of the total amount of insurance finance income or expenses in each reporting period

The total amount of insurance finance income or expenses in the reporting period must be disclosed and explained. In particular, an entity must explain the relationship between insurance finance income or expenses and the investment return on its assets, to enable users of its financial statements to evaluate the sources of finance income or expenses recognised in profit or loss and other comprehensive income.

[IFRS 17.110].

Specifically, for contracts with direct participation features, an entity must: [IFRS 17.111, IFRS 17.112, IFRS 17.113]

- Describe the composition of the underlying items and disclose their fair value.
- Disclose the effect of any adjustment to the contractual service margin in the current period as a result of the application of risk mitigation whereby a choice not to adjust the contractual service margin to reflect some or all of the changes in the effect of financial risk on the entity's share of underlying items for the effect of the time value of money and financial risks not arising from the underlying items (see section 12.3.6 above).
- Disclose, in the period when the entity changes the basis of disaggregation of insurance finance income or expense between profit or loss and other comprehensive income because of a change in whether it holds the underlying items (see section 15.3.4 above):
 - The reason why the entity was required to change the basis of disaggregation
 - The amount of any adjustment for each financial statement line item affected
 - The carrying amount of the group of insurance contracts to which the change applied at the date of the change

16.2 Transition amounts

An entity must provide disclosures that enable users of financial statements to identify the effect of groups of insurance contracts measured at the transition date when applying the modified retrospective approach (see section 17.4 below) or the fair value approach (see section 17.5 below) on the contractual service margin and insurance revenue in subsequent periods. To achieve this, IFRS 17 requires various disclosures to be made in each reporting period until the contracts which exist at transition have expired or been extinguished. These disclosures are necessary because the Board expects that there will be some differences in the measurement of insurance contracts when applying the different transition approaches permitted in IFRS 17. [IFRS 17.BC399]

Hence, an entity must disclose the reconciliation of the contractual service margin and the amount of insurance revenue in section 16.1.1 above, separately for: [IFRS 17.114]

- Insurance contracts that existed at the transition date to which the entity has applied the modified retrospective approach
- Insurance contracts that existed at the transition date to which the entity has applied the fair value approach

All other insurance contracts (i.e., including those which the entity has accounted for fully retrospectively)

Practical example 16-1: Zurich Insurance Group Ltd (2023)

Switzerland

Annual Report 2023 [extract]

Financial Review [extract]

Consolidated financial statements [extract]

9 Insurance revenue [extract]

...

Table 9.2

Insurance revenue by transition approach measured under BBA and VFA

In USD millions for the years ended December 31

	2023		2022	
	Contracts measured under BBA	Contracts measured under VFA	Contracts measured under BBA	Contracts measured under VFA
Contracts measured under the modified retrospective approach	482	2,620	511	2,777
Contracts measured under the fair value approach	1,406	440	1,339	161
All other contracts	4,472	729	4,133	529
Insurance revenue measured under BBA and VFA	6,360	3,788	5,983	3,466

In addition, for all periods in which disclosures are made for contracts that, on transition, were accounted for using either the modified retrospective approach or the fair value approach, an entity must explain how it determined the measurement of insurance contracts at the transition date. The purpose of this is to enable users of financial statements to understand the nature and significance of the methods used and judgements applied in determining the transition amounts. [IFRS 17.115].

An entity that chooses to disaggregate insurance finance income or expenses between profit or loss and other comprehensive income applies the requirements discussed in section 17.4.4 below (for the modified retrospective approach) or in section 17.5.1 below (for the fair value approach). This is to determine the cumulative difference between the insurance finance income or expenses that would have been recognised in profit or loss and the total insurance finance income or expenses at the transition date for the groups of insurance contracts to which the disaggregation applies. For all periods in which amounts determined applying these alternative transitional approaches exist, the entity must disclose a reconciliation of the opening to the closing balance of the cumulative amounts included in other comprehensive income for financial assets measured at fair value through other comprehensive income related to the groups of insurance contracts. The reconciliation must include, for example, gains or losses recognised in other comprehensive income in the period and gains or losses previously recognised in other comprehensive income in previous periods reclassified in the period to profit or loss. [IFRS 17.116].

How we see it

Transition disclosures will require considerable effort. Entities need to think about their solutions for identifying and tracking these amounts carefully. They will need to continue separately disclosing the contractual service margin for contracts in-force at transition in the years after transition and must consider this requirement when building their financial reporting processes and systems. The effort of tracking the contractual service margins for groups of contracts present at transition that are not determined on a full retrospective basis must be considered together with the effort of applying a full retrospective approach at transition.

16.3 Significant judgements made in applying IFRS 17

IAS 1 requires that an entity should disclose, along with material accounting policy information, the judgements, apart from those involving estimations which are required separately, that management has made in the process of applying the entity's accounting policies and that have the most significant effect on the amounts recognised in the financial statements. [IAS 1.122].

Consistent with IAS 1, the second part of the disclosure objective established by IFRS 17 is that an entity should disclose the significant judgements and changes in judgements made by an entity in applying the standard. [IFRS 17.93(b)].

Specifically, an entity must disclose the inputs, assumptions and estimation techniques it has used, including: [IFRS 17.117]

- The methods used to measure insurance contracts within the scope of IFRS 17 and processes to estimate the inputs to those methods. Unless impracticable, an entity must also provide quantitative information about those inputs.
- Any changes in methods and processes for estimating inputs used to measure contracts, the reason for each change, and the type of contracts affected.
- To the extent not covered above, the approach used:
 - To distinguish changes in estimates of future cash flows arising from exercising discretion from other changes in estimates of future cash flows for contracts without direct participation features
 - To determine the risk adjustment for non-financial risk, including whether changes in the risk adjustment for non-financial risk are disaggregated into an insurance service component and an insurance finance component, or are presented in full in the insurance service result
 - To determine discount rates
 - To determine investment components
 - To determine the relative weighting of the benefits provided by insurance coverage and investment-return service (for insurance contracts without direct participation features) or insurance coverage and investment-related service (for insurance contracts with direct participation features)

If an entity chooses to disaggregate insurance finance income or expenses into amounts presented in profit or loss and in other comprehensive income (see sections 15.3.1 to 15.3.4 above), it must disclose an explanation of the methods used to determine the insurance finance income or expenses recognised in profit or loss. [IFRS 17.118].

An entity must also disclose the confidence level used to determine the risk adjustment for non-financial risk. If the entity uses a technique other than the confidence level technique, it must disclose: [IFRS 17.119]

- The technique used
- The confidence level corresponding to the results of that technique

The following example illustrates disclosure of critical accounting judgements relating to separation of insurance contract components (see section 5.3 and section 6.1.1).

Practical example 16-3: Admiral Group plc (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]

Financial Statements [extract]

Notes to the Consolidated Financial Statements [extract]

2. Critical accounting judgements and estimates [extract]

2.1 Critical accounting judgements [extract]

Unit of account: combination of insurance contracts and separation of distinct components [extract]

...

In addition, any cashflows related to promises to transfer distinct goods or services, other than insurance contract services, that are within the host insurance contract are separated and recognised by applying IFRS 15. In determining whether there are such distinct components, the following is considered:

- whether the policyholder can benefit from the good or service on its own or together with other resources available to the policyholder
- whether the cashflows and risks associated with the good or service are highly interrelated with the cashflows and risks associated with the insurance components in the contract
- whether the Group provides a significant service in integrating the good or service with the insurance components.

After separating any such distinct components, IFRS 17 is applied to all remaining components of the (host) insurance contract.

The Group has determined that, in applying these requirements to its insurance contracts:

- The individual insurance policies contained in a 'multi-cover policy' are treated as separate contracts, given that the components can be priced and sold separately, there is little interdependency between the risks covered, and the components can lapse separately
 - The cashflows associated with administration fees (for changes to the underlying insurance policy), and instalment income (being the additional fees payable by a policyholder associated with paying for an insurance contract over 12 months, rather than in one up-front payment), are non-distinct given that the policyholder cannot benefit from these services separately and the services are highly interrelated with the core insurance policy. These cashflows are therefore treated as insurance revenue under IFRS 17. However, for the component of the insurance policy that is underwritten outside the Group by a third party insurer, the Group is performing an agency service on behalf of the third party insurer, and therefore this component is treated as a separate component of revenue and accounted for under IFRS 15
 - The cashflows associated with ancillary or 'add on' products (which are sold within the same set of contracts as the core product), are separated from the core product in cases where the policyholder can benefit from the product on its own, and where the cashflows are not highly interrelated with the insurance components in the contract or the Group does not provide a significant service in integrating the products.
- ...

The following example illustrates disclosure of the confidence level used to determine the risk adjustment for non-financial risk and also includes risk adjustment sensitivity analysis.

Practical example 16-4: Aviva plc (2023)
United Kingdom
Annual Report and Accounts 2023 [extract]
IFRS Financial Statements [extract]
Notes to the consolidated financial statements [extract]
40 - Insurance and reinsurance contracts [extract]
(g) Significant judgements, estimates and assumptions [extract]
(i) Fulfilment cash flows [extract]
Risk adjustments for non-financial risk [extract]

...

The Group estimates the Risk Adjustment's corresponding confidence level by comparing the combined value of best estimate cash flows and Risk Adjustment with a distribution of possible outcomes on an ultimate horizon. For life and participating contracts the confidence interval, net of reinsurance corresponds to the 68th percentile (2022: 70th percentile), for non-life contracts it corresponds to the 77th percentile (2022: 74th percentile). The percentiles disclosed benefit from the diverse profile of entities within the Group, but not from diversification between the Group's Life and non-Life segments and are uncertain estimates made as of 31 December, which could reasonably change within 12 months. Factors which could cause them to change include variations in the Company's risk profile or quantification thereof, for example as might arise from economic factors such as changes in risk-free discount rates or changes in the composition of insurance liabilities. The movements in the value of the net risk adjustment required to move the confidence level by 2.5 percentage points can be seen in the table below. The figures assume that there are no changes in estimate of future cashflows when in reality a lot of factors which influence the risk adjustment calibration will also impact the estimate of future cashflows.

	2023 £m	2022 £m
Life and participating business		
Movement in net risk adjustment required for 2.5pp confidence level increase	65	75
Movement in net risk adjustment required for 2.5pp confidence level reduction	(65)	(75)
Non-Life business		
Movement in net risk adjustment required for 2.5pp confidence level increase	45	48
Movement in net risk adjustment required for 2.5pp confidence level reduction	(41)	(46)

For Life risk and Participating contracts, this is the confidence level that the liabilities recognised and associated reinsurance balances, excluding CSM, are sufficient to cover the ultimate cost of in-force insurance liabilities applying period end assumptions. For non-Life contracts, this represents the confidence level that net claims liabilities recognised are sufficient to cover the ultimate cost of claims. Net non-Life claims liabilities include the liability for incurred claims, asset for incurred claims and the asset for remaining coverage on reinsurance contracts held that reinsure against adverse development on incurred claims.

An entity must disclose the yield curve (or range of yield curves) used to discount cash flows that do not vary based on the returns on underlying items. When an entity provides this disclosure in aggregate for a number of groups of insurance contracts, it must provide such disclosures in the form of weighted averages, or relatively narrow ranges. [IFRS 17.120].

The following example illustrates disclosure of ranges of yield curves.

Practical example 16-5: Manulife Financial Corporation (2023)

Canada

2023 Annual Report [extract]**Consolidated Financial Statements [extract]****Notes to Consolidated Financial Statements [extract]****Note 7 Insurance and Reinsurance Contract Assets and Liabilities [extract]****(g) Significant judgements and estimates [extract]****(iii) Discount Rates [extract]**

Insurance contract cash flows for non-participating business are discounted using risk-free yield curves adjusted by an illiquidity premium to reflect the liquidity characteristics of the liabilities. Cash flows that vary based on returns of underlying items are adjusted to reflect their variability under these adjusted yield curves. Each yield curve is interpolated between the spot rate at the last observable market data point and an ultimate spot rate which reflects the long-term real interest rate plus inflation expectations.

For participating business, insurance contract cash flows that vary based on the return of underlying items are discounted at rates reflecting that variability.

For insurance contracts with cash flows that vary with the return of underlying items and where the present value is measured by stochastic modelling, cash flows are both projected and discounted at scenario specific rates, calibrated on average to be the risk-free yield curves adjusted for liquidity.

The spot rates used for discounting liability cash flows are presented in the following table and include illiquidity premiums determined with reference to net asset spreads indicative of the liquidity characteristics of the liabilities by geography.

December 31, 2023										
	Currency	Liquidity category	Observable years	Ultimate year	1 year	5 years	10 years	20 years	30 years	Ultimate
Canada	CAD	Illiquid	30	70	5.17%	4.33%	4.92%	4.86%	4.80%	4.40%
		More liquid	30	70	5.14%	4.22%	4.69%	4.72%	4.69%	4.40%
U.S.	USD	Illiquid	30	70	5.38%	4.54%	5.37%	5.65%	5.27%	5.00%
		More liquid	30	70	5.32%	4.57%	5.25%	5.56%	5.18%	4.88%
Japan	JPY	Mixed	30	70	0.53%	0.77%	1.08%	1.75%	2.24%	1.60%
Hong Kong	HKD	Illiquid	15	55	4.20%	4.01%	4.98%	4.61%	4.19%	3.80%

...

16.4 Disclosure of accounting policy information

Unlike IFRS 4, IFRS 17 does not contain an explicit requirement to disclose material accounting policy information for insurance contracts and related liabilities, income and expense. However, IAS 1 requires an entity to disclose material accounting policy information. [IAS 1.117]

Accounting policy information is likely to be material to an entity's financial statements if that information relates to material transactions, other events or conditions and: [IAS 1.117B]

- The entity changed its accounting policy during the reporting period and this change resulted in a material change to the information in the financial statements
- The entity chose the accounting policy from one or more options permitted by IFRSs, for example a choice between historical cost and fair value
- The accounting policy was developed in accordance with IAS 8 in the absence of an IFRS that specifically applies
- The accounting policy relates to an area for which the entity is required to make significant judgements or assumptions in applying an accounting policy and the entity discloses those judgements or assumptions in accordance with IAS 1
- The accounting required is complex and users of the entity's financial statements would otherwise not understand those material transactions, other events or conditions.

In addition, certain specific disclosures concerning accounting policy choices in respect of discounting and insurance acquisition cash flows are required by IFRS 17 when the premium allocation approach is used (see section 16.1.2.A above).

IFRS 17 contains a number of specific accounting policy elections, the exercise of which (or not) may be material to the financial statements. Some of these are summarised in the table below. Accounting policy elections applicable only on transition are discussed in section 17 below.

Accounting policy choice	Unit of Account	Revocable choice?
Election to apply IFRS 17 or IAS 32/IFRS 9 to financial guarantee contracts if previously asserted to be insurance contracts (see section 2.3.1.B above)	Individual contract	No
Election to apply either IFRS 15 or IFRS 17 to certain fixed-fee service contracts (see section 2.3.2 above)	Individual contract	No
Election to apply either IFRS 17 or IFRS 9 to certain loan contracts that transfer insurance risk only on settlement (see section 2.3.3 above)	Accounting policy at level of portfolio of contracts	No
Multi-currency groups of insurance contracts - election to apply a 'single-currency denomination' approach or a 'multi-currency denomination' approach (see section 8.3 above)	IAS 8 applies	IAS 8 applies
Accretion of interest on insurance acquisition cash flows - voluntary election (see section 9.3 above)	IAS 8 applies	IAS 8 applies
Discount rate used for loss component, insurance revenue and insurance service expenses - election between current rate and rate at date of initial recognition of the group, applies to all contracts under the general model (see sections 15.2.1 and 15.2.2 above)	IAS 8 applies	IAS 8 applies
Election to apply either IFRS 17 or IFRS 9 to amounts receivable from an intermediary when a policyholder has discharged its obligation to an insurer (see section 9.12 above)	IAS 8 applies	IAS 8 applies
Use of the premium allocation approach (see section 10 above)	Group of contracts	No - unless contract modified (see section 13.1 above).
Premium allocation approach - election to expense insurance acquisition cash flows as incurred for contracts where coverage period of each contract in group is no more than one year as opposed to including within the liability for remaining coverage (see section 10.2 above)	Group of contracts	No
Premium allocation approach - election to not adjust the liability for remaining coverage to reflect the time value of money and effect of financial risk if, on initial recognition, the time between providing services and premium due date is no more than one year (see section 10.2 above).	Group of contracts	No
Premium allocation approach - election not to adjust the liability for incurred claims to reflect the time value of money and effect of financial risk if the cash flows are expected to be paid or received in one year or less from the date the claims are incurred (see section 10.5 above).	Group of contracts	Yes - if eligibility criteria failed in subsequent periods
Use of risk mitigation for eligible contracts applying the variable fee approach (see section 12.3.5 above)	Group of contracts	If, and only if, conditions cease to apply (see section 12.3.5 above).

Accounting policy choice	Unit of Account	Revocable choice?
Present changes in the risk adjustment for non-financial risk in insurance service expenses or disaggregate between insurance service expenses and insurance finance income or expenses (see section 15.2.2 above)	IAS 8 applies	IAS 8 applies
Present insurance finance income or expenses in profit or loss or disaggregate between profit or loss and other comprehensive income (see section 15.3.1 above)	Portfolio of contracts	Yes - provided change satisfies IAS 8 criteria. For variable fee contracts, if underlying items now held or no longer held change is mandatory (see section 12.3.6 above)
Election as to whether to change the treatment of accounting estimates made in previous interim financial statements when applying IFRS 17 in subsequent interim financial statements and in the annual reporting period (see section 15.4 above)	Reporting entity	IAS 8 applies
Net or gross presentation of reinsurance held in profit or loss (see section 15.2 above)	Reporting entity	IAS 8 applies

16.5 Disclosure about the nature and extent of risks

The third part of the disclosure objective established by IFRS 17 is that an entity is required to disclose the nature and extent of the risks from contracts within the scope of the standard. [IFRS 17.93].

To comply with this objective, an entity must disclose information that enables users of its financial statements to evaluate the nature, amount, timing and uncertainty of future cash flows that arise from contracts within the scope of IFRS 17. [IFRS 17.121].

The disclosures detailed below are considered to be those that would normally be necessary to meet this requirement. These disclosures focus on the insurance and financial risks that arise from insurance contracts and how they have been managed. Financial risks typically include, but are not limited to, credit risk, liquidity risk and market risk. [IFRS 17.122]. Many similar disclosures were contained in IFRS 4, often phrased to the effect that an insurer should make disclosures about insurance contracts assuming that insurance contracts were within the scope of IFRS 7. The disclosures required by IFRS 17 are tailored to the recognition and measurement of the standard and do not cross-refer to IFRS 7.

For each type of risk arising from contracts within the scope of IFRS 17, an entity must disclose: [IFRS 17.124]

- The exposures to risks and how they arise
- The entity's objectives, policies and processes for managing the risks and methods used to measure them
- Any changes in the above from the previous period

An entity must also disclose, for each type of risk: [IFRS 17.125]

- Summary quantitative information about its exposure to that risk at the end of the reporting period, with disclosure based on information provided internally to the entity's key management personnel
- The disclosures detailed in sections 16.5.1 to 16.5.5 below, to the extent not provided by the summary quantitative information required above

If the information disclosed about an entity's exposure to risk at the end of the reporting period is not representative of its exposure to risk during the period, the entity must disclose that fact, the reason why the period-end exposure is not representative, and further information that is representative of its risk exposure during the period. [IFRS 17.123].

Disclosure of an entity's objectives, policies and processes for managing risks and the methods used to manage the risk provides an additional perspective that complements information about contracts outstanding at a particular time and might include information about:

- The structure and organisation of the entity's risk management function(s), including a discussion of independence and accountability
- The scope and nature of its risk reporting or measurement systems, such as internal risk measurement models, sensitivity analyses, scenario analysis, and stress testing, and how these are integrated into the entity's operating activities. Useful disclosures might include a summary description of the approach used, associated assumptions and parameters (including confidence intervals, computation frequencies and historical observation periods) and strengths and limitations of the approach.
- The processes for accepting, measuring, monitoring and controlling insurance risks and the entity's underwriting strategy to ensure that there are appropriate risk classification and premium levels
- The extent to which insurance risks are assessed and managed on an entity-wide basis
- The methods employed to limit or transfer insurance risk exposures and avoid undue concentrations of risk, such as retention limits, inclusion of options in contracts, and reinsurance
- Asset and liability management techniques
- The processes for managing, monitoring and controlling commitments received (or given) to accept (or contribute) additional debt or equity capital when specified events occur

Additionally, it might be useful to provide disclosures both for individual types of risks insured and overall. These disclosures might include a combination of narrative descriptions and specific quantified data, as appropriate to the nature of the contracts and their relative significance to the insurer.

Quantitative information about exposure to insurance risk might include:

- Information about the nature of the risk covered, with a brief summary description of the class (such as annuities, pensions, other life insurance, motor, property and liability).
- Information about the general nature of participation features whereby policyholders share in the performance (and related risks) of individual contracts or pools of contracts or entities. This might include the general nature of any formula for the participation and the extent of any discretion held by the insurer.
- Information about the terms of any obligation or contingent obligation for the insurer to contribute to government or other guarantee funds established by law which are within the scope of IAS 37.

16.5.1 Concentrations of risk

An entity must disclose information about concentrations of risk arising from contracts within the scope of IFRS 17, including a description of how the entity determines the concentrations, and a description of the shared characteristic that identifies each concentration (for example, the type of insured event, industry, geographical area, or currency). [IFRS 17.127].

IFRS 17 explains that concentrations of financial risk might arise, for example, from interest-rate guarantees that come into effect at the same level for a large number of contracts. Concentrations of financial risk might also arise from concentrations of non-financial risk, e.g., if an entity provides product liability protection to pharmaceutical companies and also holds investments in those companies (i.e., a sectoral concentration). [IFRS 17.127].

Other concentrations could arise from, for example:

- A single insurance contract, or a small number of related contracts. For example, when an insurance contract covers low-frequency, high-severity risks such as earthquakes
- Single incidents that expose an insurer to risk under several different types of insurance contract. For example, a major terrorist incident could create exposure under life insurance contracts, property insurance contracts, business interruption and civil liability.
- Exposure to unexpected changes in trends. For example, unexpected changes in human mortality or in policyholder behaviour
- Exposure to possible major changes in financial market conditions that could cause options held by policyholders to come into the money. For example, when interest rates decline significantly, interest rate and annuity guarantees may result in significant losses
- Significant litigation or legislative risks that could cause a large single loss, or have a pervasive effect on many contracts
- Correlations and interdependencies between different risks
- Significant non-linearities, such as stop-loss or excess of loss features, especially if a key variable is close to a level that triggers a material change in future cash flows
- Geographical concentrations

Disclosure of concentrations of insurance risk might include a description of the shared characteristic that identifies each concentration and an indication of the possible exposure, both before and after reinsurance held, associated with all insurance liabilities sharing that characteristic.

Disclosure of the historical performance of low-frequency, high-severity risks might be one way to help users assess cash flow uncertainty associated with those risks. For example, an insurance contract may cover an earthquake that is expected to happen, on average, once every 50 years. If the earthquake occurs during the current reporting period, the insurer will report a large loss. If the earthquake does not occur during the current reporting period, the insurer will report a profit. Without adequate disclosure of long-term historical performance, it could be misleading to report 49 years of large profits, followed by one large loss, because users may misinterpret the insurer's long-term ability to generate cash flows over the complete cycle of 50 years. Therefore, describing the extent of the exposure to risks of this kind and the estimated frequency of losses might be useful. If circumstances have not changed significantly, disclosure of the insurer's experience with this exposure may be one way to convey information about estimated frequencies. However, there is no specific requirement to disclose a probable maximum loss (PML) in the event of a catastrophe.

16.5.2 Insurance and market risks - sensitivity analysis

Extract from IFRS 17

Insurance and market risks-sensitivity analysis

- 128 An entity shall disclose information about sensitivities to changes in risk variables arising from contracts within the scope of IFRS 17. To comply with this requirement, an entity shall disclose:
- (a) a sensitivity analysis that shows how profit or loss and equity would have been affected by changes in risk variables that were reasonably possible at the end of the reporting period:
 - (i) for insurance risk-showing the effect for insurance contracts issued, before and after risk mitigation by reinsurance contracts held; and
 - (ii) for each type of market risk-in a way that explains the relationship between the sensitivities to changes in risk variables arising from insurance contracts and those arising from financial assets held by the entity.
 - (b) the methods and assumptions used in preparing the sensitivity analysis; and
 - (c) changes from the previous period in the methods and assumptions used in preparing the sensitivity analysis, and the reasons for such changes.

[IFRS 17.128].

Market risk comprises three types of risk: currency risk, interest rate risk and other price risk. [IFRS 7 Appendix A].

If an entity prepares a sensitivity analysis (e.g., an embedded value analysis) that shows how amounts different from those above are affected by changes in risk variables and uses that sensitivity analysis to manage risks arising from contracts within the scope of IFRS 17, it may use that sensitivity analysis in place of the analysis specified above. In this case, the entity must also disclose: [IFRS 17.129]

- An explanation of the method used in preparing such a sensitivity analysis and of the main parameters and assumptions underlying the information provided
- An explanation of the objective of the method used and of any limitations that may result in the information provided

16.5.3 Insurance risk - claims development

An entity must disclose actual claims compared with previous estimates of the undiscounted amount of the claims (i.e., claims development). The disclosure regarding claims development must start with the period when the earliest material claim(s) arose and for which there is still uncertainty about the amount and timing of the claims payments at the end of the reporting period. However, the disclosure is not required to start more than 10 years before the end of the reporting period (although there is transitional relief for first-time adopters - see section 17.2.1.A below). An entity is not required to disclose information about the development of claims for which uncertainty about the amount and timing of the claims payments is typically resolved within one year. [IFRS 17.130].

An entity must reconcile the disclosure about claims development with the aggregate carrying amount of the liabilities for incurred claims disclosed in the reconciliation required by IFRS 17.100(c) and discussed in sections 16.1.1 and 16.1.2.B above. [IFRS 17.130]. Hence, only incurred claims are required to be compared with previous estimates and not amounts within the liability for remaining coverage. In this context, incurred claims also means incurred claim recoveries included in the equivalent IFRS 17.100(c) reconciliation for reinsurance contracts held as well as those arising from insurance and reinsurance contracts issued. [IFRS 17.100].

These requirements apply to the liability for incurred claims arising from all models (i.e., general model, premium allocation approach and variable fee approach). However, because insurers need not disclose the information about claims for which uncertainty about the amount and timing of payments is typically resolved within a year, it is unlikely that many life insurers will need to give the disclosure.

The claims development information is required to be shown on an undiscounted basis. Hence, any discounting adjustment will be a reconciling item between the claims development table and the carrying amount of the liability for incurred claims. In addition, given the long tail nature of many non-life insurance claims liabilities, it is likely that many non-life insurers will have claims outstanding at the reporting date that are more than ten years old and which will also need to be included in a reconciliation of the claims development table to the carrying amount of the liability for incurred claims.

IFRS 17 does not contain an illustrative example of disclosure of claims development information (or, indeed, specifically require disclosure in a tabular format). The example below is based on an Illustrative Example contained in the Implementation Guidance to IFRS 4. This example, as a simplification for illustration purposes, presents five years of claims development information by underwriting year, although the standard itself requires ten (subject to the transitional relief upon first-time adoption) and assumes no reinsurance held. The figures in the table comprise all liabilities for incurred claims including the risk adjustment for non-financial risk, claims handling expenses and other incurred insurance expenses outstanding at the reporting date. Other formats are permitted, including, for example, presenting information by accident year or reporting period rather than underwriting year.

Illustration 16-1: Disclosure of claims development

The top half of the claims development information shows how the insurer's estimates of incurred claims for each underwriting year develop over time. For example, at the end of 20X1, the insurer's estimate of the undiscounted liability for incurred claims that it would pay for insured events relating to insurance contracts underwritten in 20X1 was CU680. By the end of 20X2, the insurer had revised the estimate of incurred claims (both those paid and those still to be paid) to CU673.

The lower half of the table reconciles the cumulative incurred claims to the amount appearing in the statement of financial position. First, the cumulative payments are deducted to give the cumulative unpaid claims for each year on an undiscounted basis. Second, the effect of discounting is deducted to give the carrying amount in the statement of financial position.

Incurred claim year	20X1	20X2	20X3	20X4	20X5	Total
	CU	CU	CU	CU	CU	CU
Estimate of incurred claims:						
At end of underwriting year	680	790	823	920	968	
One year later	673	785	840	903		
Two years later	692	776	845			
Three years later	697	771				
Four years later	702					
Estimate of incurred claims	702	771	845	903	968	
Cumulative payments	(702)	(689)	(570)	(350)	(217)	
	-	82	275	553	751	1,661
Effect of discounting	-	(14)	(68)	(175)	(265)	(562)
Liabilities net of discounting for which uncertainty is expected to be settled within one year						20
Liabilities for incurred claims	-	68	207	378	486	1,119

How we see it

IFRS 17 does not address the claims development presentation of:

- Exchange differences associated with insurance liabilities arising on retranslation (e.g., whether previous years' incurred claims should be retranslated using exchange rates as at the current reporting period date)
- Claims liabilities acquired in a business combination or transfer (as discussed in section 14.2 above, for contracts acquired in their settlement period, claims are incurred only when the financial effect becomes certain)
- Claims liabilities disposed of in a business disposal or transfer
- Whether claims should include claims handling or other allocated expenses or could be defined as comprising claims payment amounts only (with - attributable expenses included as a reconciling item)
- Whether claims development should be provided on both a gross and net of reinsurance basis (although it must be reconciled to the IFRS 17.100(c) reconciliations)
- Whether claims development information includes or exclude the risk adjustment for non-financial risk. If excluded, the risk adjustment for non-financial risk is reflected as a reconciling item.

As IFRS 17 is silent on these matters, a variety of treatments would appear to be permissible, provided these are adequately explained to the users of the financial statements, consistently applied in each reporting period and the information reconciles with the carrying amount of the liability for incurred claims included in the statement of financial position.

16.5.4 Credit risk - other information

Extract from IFRS 7

Appendix A Defined terms

credit risk	The risk that one party to a financial instrument will cause a financial loss for the other party by failing to discharge an obligation.
--------------------	--

[IFRS 7 Appendix A].

For credit risk that arises from contracts within the scope of IFRS 17, an entity must disclose: [IFRS 17.131]

- The amount that best represents its maximum exposure to credit risk at the end of the reporting period, separately for insurance contracts issued and reinsurance contracts held
- Information about the credit quality of reinsurance contracts held that are assets

IFRS 17 provides no further detail about what is considered to be the maximum exposure to credit risk for an insurance contract or reinsurance contract held at the end of the reporting period (such as whether it is the maximum possible loss, the maximum probable loss or the fulfilment cash flows). The equivalent IFRS 7 requirement for financial instruments requires disclosure of credit risk gross of collateral or other credit enhancements. [IFRS 7.35K(a)]. However, IFRS 17 does not specify that the maximum credit risk should be disclosed gross of collateral or other credit enhancements.

Information about the credit quality of reinsurance could be provided by an analysis based on credit risk rating grades.

16.5.5 Liquidity risk - other information

Extract from IFRS 7

Appendix A Defined terms

liquidity risk	The risk that an entity will encounter financial difficulty in meeting obligations associated with financial liabilities that are settled by delivering cash or another financial asset.
-----------------------	--

[IFRS 7 Appendix A].

For liquidity risk arising from contracts within the scope of IFRS 17, an entity must disclose: [IFRS 17.132]

- A description of how it manages the liquidity risk
- Separate maturity analyses for portfolios of insurance contracts issued that are liabilities and portfolios of reinsurance contracts held that are liabilities that show, as a minimum, net cash flows of the portfolios for each of the first five years after the reporting date and in aggregate beyond the first five years. An entity is not required to include in these analyses liabilities for remaining coverage measured applying the premium allocation approach. The analyses may take the form of:
 - An analysis by the estimated timing of the remaining contractual undiscounted net cash flows
 - Or
 - An analysis by the estimated timing of the estimates of the present value of the future cash flows
- The amounts that are payable on demand, explaining the relationship between such amounts and the carrying amount of the related portfolios of contracts, if not disclosed in the maturity analysis above.

As the requirement is to disclose 'net cash flows' rather than 'fulfilment cash flows', the liabilities analysis excludes the risk adjustment for non-financial risk. The analysis also excludes the contractual service margin. An analysis of the expected recognition of the contractual service margin is required separately (see section 16.1.1 above).

Practical example 16-6: AXA SA (2024)

France

Universal Registration Document 2024 [extract]**6 Consolidated financial statements [extract]****6.6 Notes to the Consolidated financial statements [extract]****Note 12 Insurance contracts, investment contracts and reinsurance contracts [extract]****12.1 Insurance and reinsurance contracts [extract]****12.1.5 Insurance revenue and CSM [extract]****12.1.5.2 CSM [extract]**

...

The two following tables provide a detail of the expected timing of recognition in profit or loss of the CSM, such as reported in the consolidated statement of financial position at December 31, 2024 and December 31, 2023, restated. This pattern of recognition therefore only reflects the expected coverage units which do not consider the future expected accretion of the CSM arising from risk neutral unwind for contracts measured using the BBA and expected return of assets for contracts measured using the VFA.

Furthermore, it should be noted that the future releases of CSM will also include amounts related to new contracts that are not yet recognized at December 31, 2024 (and December 31, 2023, restated). For these reasons, the two tables below do not reflect the expected release of CSM that will be reported in the statement of profit or loss in the coming years for these contracts.

Expected timing of recognition in profit or loss of the CSM as of December 31, 2024:

<i>(in Euro millions)</i>	1 year or less	1 - 2 years	2 - 3 years	3 - 4 years	4 - 5 years	5 - 10 years	More than 10 years	Total
Life & Health	2,740	2,542	2,367	2,197	2,036	8,155	15,050	35,086
Property & Casualty	25	20	18	16	13	43	179	314
CSM arising from insurance contracts and investment contracts with DPF	2,765	2,562	2,384	2,213	2,050	8,198	15,229	35,400
Life & Health	126	115	106	97	89	349	634	1,516
Property & Casualty	10	5	4	3	2	4	4	32
CSM arising from reinsurance contracts held	136	120	110	99	91	354	638	1,547

United Kingdom

Annual Report and Accounts 2023 [extract]

IFRS Financial Statements [extract]

Notes to the consolidated financial statements [extract]

54 - Risk management [extract]

(d) Liquidity risk [extract]

Maturity analysis [extract]

(i) Analysis of maturity of insurance and investment contract liabilities [extract]

For insurance and participating investment contract liabilities, including reinsurance contract liabilities, the following table shows the estimates of the present value of future cash flows at 31 December 2023 and 2022 analysed by estimated timing.

For non-participating investment contracts, almost all may be surrendered or transferred on demand. The earliest contractual maturity date is therefore 2023 statement of financial position date, for a surrender amount approximately equal to the current statement of financial position liability.

However, we expect surrenders, transfers and maturities to occur over many years, and therefore the table below reflects the expected cash flows for these contracts, rather than their contractual maturity date.

2023	Within 1 year £m	One to Two years £m	Two to Three years £m	Three to Four years £m	Four to Five Years £m	Five to 15 years £m	Over 15 years £m	Total £m
Life risk	3,751	2,302	2,230	2,226	2,252	20,623	26,009	59,393
Participating	3,650	2,087	1,998	1,923	2,006	15,612	11,163	38,439
Non-life	4,803	2,748	1,747	1,206	828	2,048	469	13,849
Insurance contract and participating investment contract liabilities	12,204	7,137	5,975	5,355	5,086	38,283	37,641	111,681
Non-participating investment contract liabilities	1,543	1,259	2,908	4,109	4,833	52,385	91,551	158,588
Total contract liabilities	13,747	8,396	8,883	9,464	9,919	90,668	129,192	270,269

Restated' 2022	Within 1 year £m	One to Two years £m	Two to Three years £m	Three to Four years £m	Four to Five Years £m	Five to 15 years £m	Over 15 years £m	Total £m
Life risk	3,677	2,458	2,383	2,328	2,324	21,247	21,849	56,266
Participating	3,539	2,151	2,136	2,036	1,945	16,953	11,200	39,960
Non-life	5,137	2,329	1,489	1,034	687	1,607	410	12,693
Insurance contract and participating investment contract liabilities	12,353	6,938	6,008	5,398	4,956	39,807	33,459	108,919
Non-participating investment contract liabilities	1,401	1,053	2,559	3,622	4,275	46,859	81,419	141,188
Total contract liabilities	13,754	7,991	8,567	9,020	9,231	86,666	114,878	250,107

1. The 2022 comparative amounts have been restated following the adoption of IFRS 17 and for a correction in respect of historic accounting for with-profits funds (see note 1).

The amounts from insurance and investment contract liabilities that are payable on demand are set out below.

	Amount payable on demand £m	2023 Carrying value £m	2022 Amount payable on demand £m	2022 Carrying value £m
Insurance contracts - Life risk	11,378	11,324	9,559	9,549
Insurance contracts - Participating	38,246	38,131	39,213	39,626
Non-participating investment contract liabilities	158,514	158,588	140,952	141,188
	208,138	208,043	189,724	190,363

IFRS 7 does not contain an equivalent requirement to disclose 'amounts that are payable on demand'. As such, the nature of this requirement in IFRS 17 is not entirely clear since many insurance liabilities are theoretically payable on demand even though they may not settle for many years or may not have been notified at the reporting date. It is also not clear whether the disclosure is intended to be net of cash inflows in respect of portfolios of insurance contracts and reinsurance assets held that are liabilities.

16.5.6 Regulatory disclosures

Most insurance entities are exposed to externally imposed capital requirements. Therefore, IAS 1 disclosures in respect of these requirements are likely to be applicable.

Where an entity is subject to externally imposed capital requirements, disclosure must be made of the nature of these requirements and how these requirements are incorporated into the management of capital. Whether or not these requirements have been complied with in the reporting period and, where they have not been complied with, the consequences of such non-compliance must also be disclosed.

[IAS 1.135].

Many insurance entities operate in several jurisdictions. Where an aggregate disclosure of capital requirements and how capital is managed would not provide useful information or distorts a financial statement user's understanding of an entity's capital resources, separate information must be disclosed for each capital requirement to which an entity is subject. [IAS 1.136].

In addition to the requirements of IAS 1, an entity must disclose information about the effect of the regulatory frameworks in which it operates, for example, minimum capital requirements or required interest-rate guarantees. [IFRS 17.126]. These extra disclosures do not contain an explicit requirement for an insurer to quantify its regulatory capital requirements. The IASB considered whether to add a requirement for insurers to quantify regulatory capital on the grounds that such disclosures might be useful for all entities operating in a regulated environment. However, the Board was concerned about developing such disclosures in isolation in a project on accounting for insurance contracts that would go beyond the existing requirements in IAS 1. Accordingly, the Board decided to limit the disclosures about regulation to those set out above. [IFRS 17.BC369, IFRS 17.BC370, IFRS 17.BC371].

Additionally, if an entity includes contracts within the same group which would have been in different groups only because law or regulation specifically constrains the entity's practical ability to set a different price or level of benefits for policyholders with different characteristics (see section 6.2.1 above), it discloses that fact. [IFRS 17.126].

16.5.7 Disclosures required by IFRS 7 and IFRS 13

Contracts within the scope of IFRS 17 are not excluded from the scope of IFRS 13. Therefore, any insurance contracts measured at fair value are also subject to the disclosures required by IFRS 13. IFRS 17's measurement approach is not a fair value measurement. In addition, all contracts within the scope of IFRS 17 are excluded from the scope of IFRS 7. [IFRS 7.3(d)]. Under IFRS 4, investment contracts with discretionary participation features were within the scope of IFRS 7.

However, IFRS 7 applies to: [IFRS 7.3(d)]

- Derivatives that are embedded in contracts within the scope of IFRS 17, if IFRS 9 requires the entity to account for them separately

Investment components that are separated from contracts within the scope of IFRS 17, following the separation requirements of IFRS 17 set out in section 5.2 above.

- if IFRS 17 requires such separation
- An issuer's rights and obligations arising under insurance contracts that meet the definition of financial guarantee contracts, if the issuer applies IFRS 9 in recognising and measuring these contracts (see section 2.3.1.B above)
- An entity's rights and obligations that are financial instruments arising under credit card contracts, or similar contracts that provide credit or payment arrangements that an entity issues that meet the definition of an insurance contract, if the entity applies IFRS 9 to those rights and obligations (see section 2.3.1.D above)
- An entity's rights and obligations that are financial instruments arising under insurance contracts that an entity issues that limit the compensation for insured events to the amount otherwise required to settle the policyholder's obligation created by the contract, if the entity elects to apply IFRS 9 to such contracts (see section 2.3.3 above)

16.5.8 Key performance indicators and management performance measures

IFRS 17 does not require disclosure of key performance indicators or management performance measures (management performance measures apply when IFRS 18 *Presentation and Disclosure in Financial Statements* - see Chapter 4 - is adopted). However, such disclosures might be a useful way for an insurer to explain its financial performance during the period and to give an insight into the risks arising from insurance contracts.

17 Effective date and transition

17.1 Effective date

An entity must apply IFRS 17 for annual reporting periods beginning on or after 1 January 2023. *[IFRS 17.C1]*. When IFRS 17 is applied, IFRS 4 is withdrawn. *[IFRS 17.C34]*. Local regulators may impose a later effective date with a consequential impact on the transition date.

If an entity applies IFRS 17 earlier than reporting periods beginning on or after 1 January 2023 it must disclose that fact. However, early application is permitted only for entities that also apply IFRS 9 on or before the date of initial application of IFRS 17. *[IFRS 17.C1]*.

For the purposes of the transition requirements discussed in section 17.2 below: *[IFRS 17.C2]*

- The date of initial application is the beginning of the annual reporting period in which an entity first applies IFRS 17 (i.e., 1 January 2023 for an entity first applying the standard with an annual reporting period ending 31 December 2023)
- The transition date is the beginning of the annual reporting period immediately preceding the date of initial application (i.e., 1 January 2022 for an entity first applying the standard with an annual reporting period ending 31 December 2023 which reports only one comparative period)

17.2 Transition - general requirements

An entity must apply IFRS 17 retrospectively from the transition date unless: *[IFRS 17.C3]*

- It is impracticable
- Or
- The entity chooses to apply the fair value approach for a group of insurance contracts with direct participation features (to which it could apply IFRS 17 retrospectively) when risk mitigation has been applied prospectively to the group from the transition date and the entity has used derivatives, non-derivative financial instruments measured at fair value through profit or loss, or reinsurance contracts held or to mitigate financial risk arising from that group of contracts before transition date *[IFRS 17.C5A]*

Notwithstanding the requirement for retrospective application, if it is impracticable (as defined in IAS 8), to apply IFRS 17 retrospectively for a group of insurance contracts, an entity must apply one of the following two approaches instead: *[IFRS 17.C5]*

- A modified retrospective approach (see section 17.4 below)
- Or
- A fair value approach (see section 17.5 below)

An entity must also apply either the modified retrospective approach or the fair value approach to measure an asset for insurance acquisition cash flows if, and only if, it is impracticable to identify, recognise and measure any assets for insurance acquisition cash flows retrospectively. *[IFRS 17.C5B]*.

IAS 8 states that applying a requirement is 'impracticable' when an entity cannot apply it after making every reasonable effort to do so. *[IAS 8.5]*. Guidance on what impracticable means in the context of restatement of prior periods following a change in accounting policy is discussed at Illustration 17-1 below.

The Board permitted these alternative options to the full retrospective approach on the grounds that measuring the remaining amount of the contractual service margin for contracts acquired in prior periods, as well as the information needed in the statement of financial performance in subsequent periods, was likely to be challenging for preparers. This is because these amounts reflect a revision of estimates for all periods after the initial recognition of a group of contracts. *[IFRS 17.BC377]*. In the Board's opinion, measuring the following amounts needed for retrospective application would often be impracticable: *[IFRS 17.BC378]*

- The estimates of cash flows at the date of initial recognition
- The risk adjustment for non-financial risk at the date of initial recognition
- The changes in estimates that would have been recognised in profit or loss for each accounting period because they did not relate to future service, and the extent to which changes in the fulfilment cash flows would have been allocated to the loss component
- The discount rates at the date of initial recognition
- The effect of changes in discount rates on estimates of future cash flows for contracts for which changes in financial assumptions have a substantial effect on the amounts paid to policyholders

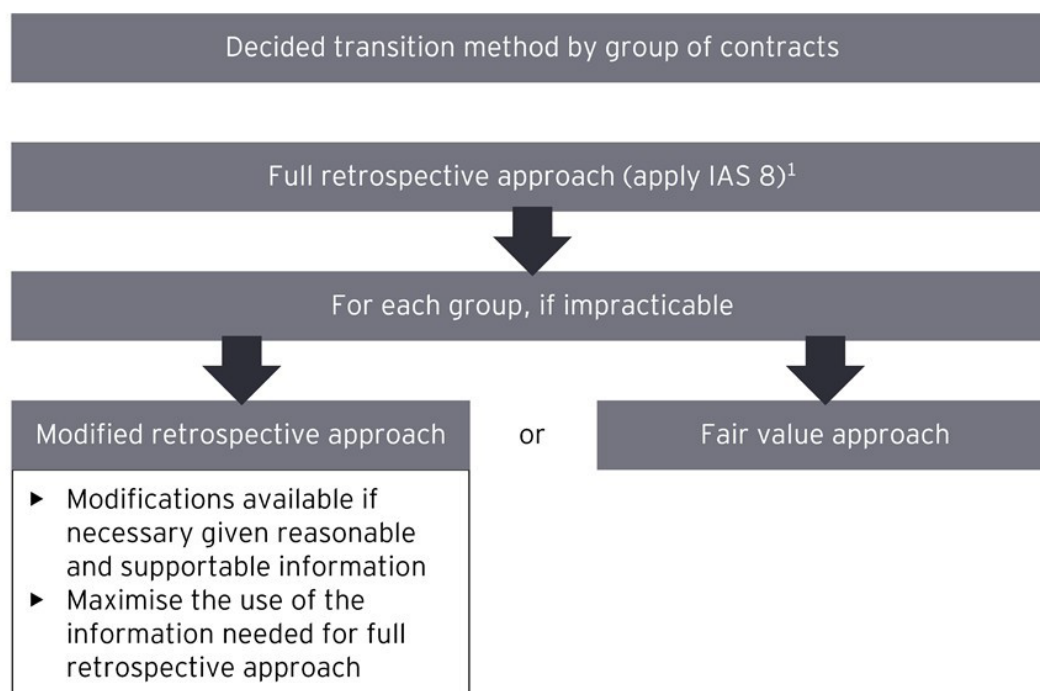

The choice of applying either a modified retrospective approach or a fair value approach exists separately for each group of insurance contracts when it is impracticable to apply IFRS 17 retrospectively to that group. An entity is permitted to use either of these two methods, although use of the modified retrospective approach is conditional on the availability of reasonable and supportable information.

[IFRS 17.C6(a)].

Within the two permitted methods there are also measurement choices available depending on the level of prior year information. Consequently, there is likely to be considerable diversity in practice across entities in calculating the contractual service margin at transition date. In turn, this will result in potentially different releases of the contractual service margin (i.e., different profit) for similar types of contracts in subsequent accounting periods. The Board acknowledged that the choice of transition methods results in a lack of comparability of transition amounts. [IFRS 17.BC373]. This explains why the Board included a requirement for disclosures that track the effects of the modified retrospective approach and the fair value approach on the contractual service margin and insurance revenue in future periods (see section 16.2 above).

It is observed in the Basis for Conclusions that no simplification is provided for contracts that have been derecognised before transition. This is because the Board considers that reflecting the effect of contracts derecognised before the transition date on the remaining contractual service margin was necessary to provide a faithful representation of the remaining profit of the group of insurance contracts. [IFRS 17.BC390].

An overview of the transition methods is illustrated below:

1 An entity eligible to apply the full retrospective approach can also elect to use the fair value approach for a group of insurance contracts with direct participation features when risk mitigation is applied prospectively to the group from the transition date.

Illustration 17-1: Guidance on meaning of 'impracticable'

IAS 8 does not require the restatement of prior periods following a change in accounting policy or the correction of material errors if such a restatement is impracticable.

The standard devotes a considerable amount of guidance to discussing what 'impracticable' means for these purposes.

IAS 8 states that applying a requirement is impracticable when an entity cannot apply it after making every reasonable effort to do so. It goes on to note that, for a particular prior period, it is impracticable to apply a change in an accounting policy retrospectively or to make a retrospective restatement to correct an error if:

- The effects of the retrospective application or retrospective restatement are not determinable
 - The retrospective application or retrospective restatement requires assumptions about what management's intent would have been in that period
- Or
- The retrospective application or retrospective restatement requires significant estimates of amounts and it is impossible to distinguish objectively information about those estimates that:
 - Provides evidence of circumstances that existed on the date(s) as at which those amounts are to be recognised, measured or disclosed
 - Would have been available when the financial statements for that prior period were authorised for issue from other information

An example of a scenario covered by the first bullet above is that, in some circumstances, it may be impracticable to adjust comparative information for one or more prior periods to achieve comparability with the current period because data may not have been collected in the prior period(s) in a way that allows either retrospective application of a new accounting policy (or its prospective application to prior periods) or retrospective restatement to correct a prior period error, and it may be impracticable to recreate the information.

IAS 8 observes that it is frequently necessary to make estimates in applying an accounting policy and that estimation is inherently subjective, and that estimates may be developed after the reporting period. Developing estimates is potentially more difficult when retrospectively applying an accounting policy or making a retrospective restatement to correct a prior period error, because of the longer period of time that might have passed since the affected transaction, other event or condition occurred.

However, the objective of estimates related to prior periods remains the same as for estimates made in the current period, namely, for the estimate to reflect the circumstances that existed when the transaction, other event or condition occurred. Hindsight should not be used when applying a new accounting policy to, or correcting amounts for, a prior period, either in making assumptions about what management's intentions would have been in a prior period or estimating the amounts recognised, measured or disclosed in a prior period. However, the fact that significant estimates are frequently required when amending comparative information presented for prior periods does not prevent reliable adjustment or correction of the comparative information.

Therefore, retrospectively applying a new accounting policy or correcting a prior period error requires distinguishing information that:

- Provides evidence of circumstances that existed on the date(s) as at which the transaction, other event or condition occurred
- And
- Would have been available when the financial statements for that prior period were authorised for issue, from other information. The standard states that for some types of estimates, it is impracticable to distinguish these types of information. When retrospective application or retrospective restatement would require making a significant estimate for which it is impossible to distinguish these two types of information, it is impracticable to apply the new accounting policy or correct the prior period error retrospectively.

17.2.1 Transitional relief and prohibition - all entities

IFRS 17 provides disclosure exemptions for all entities, a prohibition from applying risk mitigation retrospectively prior to the transition date and measurement exemptions or modifications on transition. Consequential amendments to IFRS 3 provide transitional relief for business combinations within the scope of IFRS 3 prior to the date of initial application of IFRS 17.

17.2.1.A Disclosure relief

IFRS 17 contains the following disclosure relief on transition:

- An entity is exempt from the IAS 8 requirement to present the amount of the adjustment resulting from applying IFRS 17 affecting each financial line item to either the current period or each prior period presented and the impact of applying IFRS 17 in those periods on earnings per share. [IFRS 17.C3(a)]. In the Board's view, the cost of providing this disclosure, which would include the running of parallel systems, would exceed the benefits. [IFRS 17.BC400].
- An entity need not disclose previously unpublished information about claims development that occurred earlier than five years before the end of the annual reporting period in which it first applies IFRS 17 (i.e., information about claims that occurred prior to 1 January 2019 for an entity first applying the standard with an annual reporting period ending 31 December 2023). An entity that elects to take advantage of this disclosure relief should disclose that fact. [IFRS 17.C28].

17.2.1.B Prohibition from applying the risk mitigation prior to the transition date

An entity must not apply the risk mitigation option available for insurance contracts with direct participation features (see section 12.3.5 above) before the transition date of IFRS 17. An entity may apply the risk mitigation option prospectively on or after the transition date if, and only if, the entity designates risk mitigation relationships at or before the date it applies the option. [IFRS 17.C3(b)].

The Board was aware that some stakeholders would have preferred that the Board amend IFRS 17 to permit retrospective application of the risk mitigation option. In the view of those stakeholders, permitting retrospective application of the option would be the optimal approach to achieve comparability between the information provided about risk mitigation activities that took place before and after the transition date. Acknowledging that view, the Board considered whether it should amend IFRS 17 to permit retrospective application of the risk mitigation option. However, the Board noted that if an entity was permitted to apply the option retrospectively, it could freely decide the extent to which to reflect risk mitigation activities in the contractual service margin based on a known accounting outcome. The entity could do this in a way that would not reflect how the entity would have applied the option in previous periods, without hindsight, had it always applied IFRS 17. Such a risk would affect the credibility of information presented on transition to IFRS 17 and in subsequent periods in which those groups of insurance contracts continue to exist. In the Board's view, these costs would outweigh the benefits of permitting retrospective application of the option. Therefore, the Board reaffirmed its decision to prohibit retrospective application of the option because of the risk of the use of hindsight. [IFRS 17.BC393C]. Some stakeholders suggested alternative approaches that would avoid the risk of the use of hindsight. However, the Board also rejected these approaches as unworkable. [IFRS 17.BC393D, IFRS 17.BC393E].

17.2.1.C Business combinations within the scope of IFRS 3 before initial application of IFRS 17

For contracts acquired in business combinations within the scope of IFRS 3 before the date of initial application of IFRS 17, an entity classifies those contracts as insurance contracts based on the contractual terms, economic conditions, operating or accounting policies or other factors as they existed at the date of initial recognition of those contracts rather than at the acquisition date of the business combination. [IFRS 3.64N]. This relief allows entities to continue to apply their previous IFRS 4 classification as insurance contracts of contracts acquired in a business combination before the date of initial application of IFRS 17 but does not apply to other assessments made under IFRS 17.

This relief also does not apply to transfers of contracts (e.g., portfolio transfers) that are not business combinations.

17.2.2 Disclosures about the effect of transition

At transition to IFRS 17, entities should provide the disclosures required by IAS 8 applicable to changes in accounting policies apart from the exemption discussed above (i.e., there is no requirement to present the amount of the adjustment resulting from applying IFRS 17 affecting each financial line item to either the current period or each prior period presented and the impact of applying IFRS 17 in those periods on earnings per share).

IAS 8 requires the following disclosures upon initial application of an IFRS: *[IAS 8.28]*

- The title of the IFRS accounting standard (i.e., IFRS 17)
- A statement that the change in accounting policy is made in accordance with the transitional provisions
- The nature of the change in accounting policy
- Where applicable, a description of the transitional provisions (which means that an entity would need to explain whether and how it had applied the retrospective, modified retrospective and fair value approaches)
- When applicable, the transitional provisions that might have an effect on future periods
- The amount of any adjustment relating to periods prior to the accounting periods presented in the financial statements, to the extent practicable
- If retrospective application is impracticable, the circumstances that led to the existence of that condition and a description of how and from when the change in accounting policy is consistently applied

In addition, as discussed in section 16.2 above, entities are required to provide disclosures to enable users of the financial statements to identify the effects of groups of insurance contracts measured at transition date applying the modified retrospective approach or the fair value approach on the contractual service margin in subsequent periods. This information is provided in the form of reconciliations. In all periods for which disclosures are made for those contracts which used the modified retrospective or fair value approach on transition, an entity should continue to explain how it determined the measurement requirements at transition date.

17.3 Retrospective application of transition

When applying IFRS 17 retrospectively, an entity must: *[IFRS 17.C4]*

- Identify, recognise and measure each group of insurance contracts as if IFRS 17 had always applied
- Identify, recognise and measure any assets for insurance acquisition cash flows as if IFRS 17 had always applied (except that an entity is not required to apply the recoverability assessment test discussed in section 9.10 above before the transition date)
- Derecognise any existing balances that would not exist had IFRS 17 always applied
- Recognise any resulting net difference in equity

The balances derecognised upon application of IFRS 17 would include balances recognised previously under IFRS 4, as well as items such as deferred acquisition costs, deferred origination costs (for investment contracts with discretionary participation features) and some intangible assets that relate solely to existing contracts. The requirement to recognise any net difference in equity means that no adjustment is made to the carrying amounts of goodwill from any previous business combination. *[IFRS 17.BC374]*. However, the value of contracts within the scope of IFRS 17 that were acquired in prior period business combinations or transfers would have to be adjusted by the acquiring entity from the date of acquisition (i.e., initial recognition of the contracts) together with any intangible related to those in-force contracts (see section 14 above).

Any intangible asset derecognised would include an intangible asset that represented the difference between the fair value of insurance contracts acquired in a business combination or transfer. It would also include a liability measured in accordance with an insurer's previous accounting practices for insurance contracts where an insurer previously chose the option in IFRS 4 to use an expanded presentation that split the fair value of acquired insurance contracts into two components. *[IFRS 4.31]*.

Applying the standard retrospectively means that the comparative period (i.e., the annual reporting period immediately preceding the date of initial application) must be restated and comparative disclosures made in full in the first year of application subject to the exemptions noted below. An entity may also present adjusted comparative information applying IFRS 17 for any earlier periods (i.e., earlier than the annual reporting period immediately preceding the date of initial application) but is not required to do so. If an entity does present adjusted comparative information for any prior periods, the reference to 'the beginning of the annual reporting period immediately preceding the date of initial application' (see section 17.1 above) must be read as 'the beginning of the earliest adjusted comparative period presented'. *[IFRS 17.C25]*. However, an entity is not required to provide the disclosures specified in section 16 above for any period presented before the beginning of the annual accounting period immediately preceding the date of initial application. *[IFRS 17.C26]*. This relief is intended for entities that are required to present more than one comparative period in their annual financial statements.

If an entity presents unadjusted comparative information and disclosures for any earlier periods, it must clearly identify the information that has not been adjusted, disclose that it has been prepared on a different basis, and explain that basis. [IFRS 17.C27].

The requirement to apply IFRS 17 retrospectively as if it had always applied, means that an entity that elects not to change estimates made in previous interim financial statements (see section 15.4 above) must estimate the contractual service margin for all individual interim periods previously presented, in order to get to a number for the contractual service margin that reflects that as if IFRS 17 had always been applied. [IFRS 17.B137]. This is based on the fact that only a fully retrospective interim contractual service margin roll-forward would provide the outcome that corresponds to a situation as if IFRS 17 had always been applied. Retrospective application of the standard by an entity that issues interim financial statements may present significant additional operational challenges for insurers upon transition. This is because the contractual service margin for each interim reporting period subsequent to initial recognition of a group of contracts would need to be tracked and estimated in accordance with the requirements in IFRS 17 to determine the contractual service margin on transition date. Therefore, for entities applying the modified retrospective approach, transitional relief is available from this requirement (see section 17.4 below).

The IASB considered that some stakeholders implementing IFRS 17 thought that the inclusion of specified modifications in IFRS 17 implies that an entity cannot make estimates in applying IFRS 17 retrospectively. The Board noted that IAS 8.51, which states that “...the objective of estimates related to prior periods remains the same as estimates related to the current period, namely, for the estimates to reflect the circumstances that existed when the transaction, other event or condition occurred” specifically acknowledges the need for estimates in retrospective application and that this paragraph applies to entities that apply IFRS 17 for the first time, just as it does to entities that apply other IFRS accounting standards for the first time. [IFRS 17.BC380C].

In addition, some stakeholders suggested that the Board could reduce the burden of applying the transition requirements by specifying methods that can be used, for example, methods using information from embedded value reporting or information prepared for regulatory reporting purposes. However, the Board rejected this suggestion and concluded that specifying methods would conflict with the approach in IFRS 17 of establishing measurement objectives that can be satisfied using different approaches. In particular situations, some methods may be more applicable, or may be easier to implement, and it would not be practicable for an IFRS accounting standard to specify in detail every situation in which particular methods would be appropriate. The appropriateness of any method depends on the particular facts and circumstances. Furthermore, specifying methods could risk incorrectly implying other methods that would satisfy the requirements of IFRS 17, cannot be used. [IFRS 17.BC380D].

How we see it

IFRS 17 does not include, unlike some other IFRS accounting standards, a simplification for contracts that have been derecognised before transition date. This is due to the inherent reliance of the model on the contractual service margin at initial recognition of a group of contracts, combined with the long-term nature of many insurance contracts. The consequence is that full retrospective application will be impracticable in more situations because entities will not have sufficient historic information for contracts that were derecognised in the past.

There is likely to be considerable diversity of practice across entities in calculating the contractual service margin at transition date. This will result in potentially different releases of the contractual service margin (i.e., different profit) for similar types of contracts in subsequent accounting periods. This explains why the Board included a requirement for disclosures that track the effects of the modified retrospective approach and the fair value approach on the contractual service margin and insurance revenue in future periods (see section 16.2 above).

Full retrospective application is based on a revision of estimates for all periods after the initial recognition of a group of contracts, requiring the use of historical data. Particularly for long-duration contracts, full retrospective application is likely to be impracticable in many cases, because an entity would have to use hindsight if some of the historical data is lacking.

17.4 Modified retrospective approach

This approach contains a series of permitted modifications to (full) retrospective application, as follows: [IFRS 17.C7]

- Assessment of insurance contracts or groups of insurance contracts that would have been made at the date of inception or initial recognition (see section 17.4.1 below)
- Amounts related to the contractual service margin or loss component for insurance contracts without direct participation features (see section 17.4.2 below)
- Amounts related to the contractual service margin or loss component for insurance contracts with direct participation features (see section 17.4.3 below)
- Insurance finance income or expenses (see section 17.4.4 below)

An entity is permitted to use each modification listed above only to the extent that it does not have reasonable and supportable information to apply a full retrospective approach. [IFRS 17.C8].

The objective of the modified retrospective approach is to achieve the closest outcome to retrospective application possible using reasonable and supportable information available without undue cost or effort. Accordingly, in applying this approach, an entity must: [IFRS 17.C6]

- Use reasonable and supportable information. If the entity cannot obtain reasonable and supportable information necessary to apply the modified retrospective approach, it should apply the fair value approach.
- Maximise the use of information that would have been used to apply a fully retrospective approach, but only use information available without undue cost or effort.

'Undue cost and effort' is not defined in IFRS accounting standards. However, *IFRS for Small and Medium-sized Entities* (IFRS for SMEs) states that considering whether obtaining or determining the information necessary to comply with a requirement would involve undue cost or effort depends on the entity's specific circumstances and on management's judgement of the costs and benefits from applying that requirement. This judgement requires consideration of how the economic decisions of those that are expected to use the financial statements could be affected by not having that information. Applying a requirement would involve undue cost or effort by a small and medium sized entity (SME) if the incremental cost (for example, valuers' fees) or additional effort (for example, endeavours by employees) substantially exceed the benefits those that are expected to use the SME's financial statements would receive from having the information. The Basis for Conclusions to the IFRS for SMEs further observes that:

- The undue cost or effort exemption is not intended to be a low hurdle. This is because an entity is required to carefully weigh the expected effects of applying the exemption on the users of the financial statements against the cost or effort of complying with the related requirement. In particular, the IASB observed that it would expect that if an entity already had, or could easily and inexpensively acquire, the information necessary to comply with a requirement, any related undue cost or effort exemption would not be applicable. This is because, in that case, the benefits to the users of the financial statements of having the information would be expected to exceed any further cost or effort by the entity.

And

- An entity must make a new assessment of whether a requirement will involve undue cost or effort at each reporting date.

The IASB's Conceptual Framework also notes that although cost is a pervasive constraint on the information provided by financial reporting and that the cost of producing information must be justified by the benefits that it provides, the cost is ultimately borne by the users (not the preparers) and implies that any cost constraint should be seen from a user's viewpoint. If needed information is not provided, users incur additional costs to obtain that information elsewhere or to estimate it. [CF 2.39, CF 2.40].

To use each modification, an entity must have the reasonable and supportable information necessary to apply that modification. If not, the entity is required to apply the fair value approach to the group of insurance contracts. The Basis for Conclusions observes that the Board expects that estimates will often be needed when applying a specified modification in the modified retrospective approach. [IFRS 17.BC380A, IFRS 17.BC380C].

The Board considered feedback from entities implementing IFRS 17 that said the requirement to use reasonable and supportable information significantly increases the costs of applying the modified retrospective approach. The Board acknowledged that removing the requirements relating to the use of reasonable and supportable information might provide significant cost relief for those entities. However, the Board disagreed with suggestions to amend IFRS 17 in that regard because, in its view, entities should use information that is reasonable and supportable. Permitting an entity to use information that is not reasonable and supportable would undermine the credibility of the information that results from applying IFRS 17. In addition, permitting an entity to ignore reasonable and supportable information available without undue cost or effort that the entity would have used to apply a retrospective approach would be contrary to the objective of the modified retrospective approach and would reduce comparability between contracts issued before and after the transition date. [IFRS 17.BC380B].

How we see it

Basis for Conclusions articulates the IASB's intent that an entity is allowed to make estimates when applying a specified modification in the modified retrospective approach. This clarification of what the IASB intended will assist entities in applying the modified retrospective approach.

17.4.1 Assessments at inception or initial recognition

When it is impracticable for an entity to apply the retrospective approach to a group of contracts at initial recognition, it must determine the following by using information available at the transition date: [IFRS 17.C9]

- How to identify groups of contracts (see section 6 above)
- Whether an insurance contract meets the definition of an insurance contract with direct participation features (see section 12.3.1 above)
- How to identify discretionary cash flows for insurance contracts without direct participation features (see section 12.2 above)
- Whether an investment contract meets the definition of an investment contract with discretionary participation features (see section 12.4 above)

To apply IFRS 17 retrospectively, an entity needs to determine the group of insurance contracts to which individual contracts would have belonged on initial recognition. IFRS 17 requires entities to group only contracts written within one year. [IFRS 17.BC391]. The IASB considered that it may not always be practicable for entities to group contracts written in the same one year period retrospectively. [IFRS 17.BC392].

Consequently, in aggregating contracts when it is impracticable to apply a retrospective approach, an entity is permitted (to the extent that reasonable and supportable information does not exist) to aggregate contracts in a portfolio issued more than one year apart into a single group. [IFRS 17.C10]. This may mean that a single group of, say, term life contracts, could span many years to the extent that reasonable and supportable information would not be available to aggregate the contracts into groups that only contain contracts issued within one year.

To the extent there is no reasonable and supportable information, as discussed above, an entity must classify as a liability for incurred claims, a liability for settlement of claims incurred before an insurance contract was acquired in a transfer of business contracts that do not form a business or in a business combination within the scope of IFRS 3 (see section 14.2 above). [IFRS 17.C9A]. This relief was added in response to feedback that suggested that it would often be impracticable for an entity to apply IFRS 17 retrospectively to contracts acquired before the transition date (that is, to classify and measure those contracts as a liability for remaining coverage). [IFRS 17.BC382A].

17.4.2 Determining the contractual service margin or loss component for groups of insurance contracts without direct participation features

When it is impracticable for an entity to apply the full retrospective approach at initial recognition to determine the contractual service margin or the loss component of the liability for remaining coverage, it is permitted to determine these at transition date using a modified approach to determine the components of the liability for remaining coverage. [IFRS 17.C11].

The modified retrospective approach requires that reasonable and supportable information exists for the cash flows prior to transition up until the date of initial recognition (i.e., the date past which reasonable and supportable information is no longer available). This means all of the cash flows within the boundary of the insurance contract, as discussed in section 9.1 above, including, for example, internally allocated directly attributable insurance acquisition cash flows, claims handling costs, policy maintenance and administration costs and an allocation of fixed and variable overheads.

The modified retrospective approach allows considerable judgement as it permits an entity to go back as far as it is able in order to determine reliable accounting estimates for the fulfilment cash flows. Inevitably, this will result in diversity in practice by first time adopters and some lack of comparability in the release of the contractual margin in future periods between entities with longer-term contracts.

The process applied is as follows:

- The future cash flows at the date of initial recognition of a group of insurance contracts must be estimated as the amount of the future cash flows at the transition date (or earlier, if the future cash flows at the earlier date can be determined retrospectively), adjusted by the cash flows that have occurred between the date of initial recognition of a group of insurance contracts and the transition date (or earlier date). The cash flows known to have occurred include those resulting from contracts that were derecognised before the transition date. *[IFRS 17.C12]*.
- The discount rates that applied at the date of initial recognition of a group of insurance contracts (or subsequently) must be determined: *[IFRS 17.C13]*
 - Using an observable yield curve that, for at least three years immediately before the transition date, approximates the yield curve estimated applying a basis comparable with the general approach to calculating discount rates (see section 9.3 above), if such an observable yield curve exists.
 - Or
 - If the observable yield curve described above does not exist, the discount rates that applied at the date of initial recognition, or subsequently, should be estimated by determining an average spread between an observable yield curve and the yield curve estimated applying the general approach, and applying that spread to that observable yield curve. That spread should be an average over at least three years immediately before the transition date.
- The risk adjustment for non-financial risk at the date of initial recognition of a group of insurance contracts, or subsequently, must be determined by adjusting the risk adjustment for non-financial risk at the transition date by the expected release of risk before the transition date. The expected release of risk must be determined by reference to the release of risk for similar insurance contracts that the entity issues at the transition date. *[IFRS 17.C14]*.

An entity must use the same systematic and rational method that it expects to use after the transition date to allocate any insurance acquisition cash flows paid (or for which a liability has been recognised applying another IFRS accounting standard) before the transition date (excluding any amount relating to insurance contracts that ceased to exist before the transition date) to: *[IFRS 17.C14B]*

- Groups of insurance contracts recognised at the transition date
- Groups of insurance contracts that are expected to be recognised after the transition date

Insurance acquisition cash flows paid before the transition date that are allocated to a group of insurance contracts that is recognised at the transition date adjust the contractual service margin of that group, to the extent insurance contracts expected to be in the group have been recognised at that date. Other insurance acquisition cash flows paid before the transition date, including those that are allocated to a group of insurance contracts that is expected to be recognised after the transition date, are also recognised as an asset (see section 7.3 above). *[IFRS 17.C14C]*.

This systematic and rational method mentioned above must be the same systematic and rational method as the entity expects to apply after the transition date (see section 7.3 above). To the extent that the entity does not have reasonable and supportable information to use a systematic and rational method, the following amounts must be determined to be nil at the transition date: *[IFRS 17.C14D]*

- The adjustment to the contractual service margin of groups of insurance contracts that are recognised at the transition date and any asset for insurance acquisition costs relating to that group
- The asset for insurance acquisition cash flows for groups of insurance contracts that are expected to be recognised after the transition date

The purpose of this modification is to avoid an entity not being allowed to use the modified retrospective approach and having to use the fair value approach solely because of a lack of information about insurance acquisition cash flows before transition date.

An entity that makes an accounting policy choice not to change the treatment of accounting estimates made in previous interim financial statements (see section 15.4 above) must determine the contractual service margin or loss component at the transition date as if it had not prepared interim financial statements before the transition date, if there is no reasonable and supportable information to apply a retrospective approach. [IFRS 17.C14A]. This means that entities without reasonable and supportable retrospective information do not have to recalculate insurance contract liabilities prior to transition date on a more frequent basis than annual.

If applying the modified requirements above results in a contractual service margin at initial recognition, the entity must determine the contractual service margin at transition date, as follows: [IFRS 17.C15]

- Use the modified discount rates calculated above to accrete interest on the contractual service margin
- Determine the amount of the contractual service margin recognised in profit or loss because of the transfer of services before the transition date, by comparing the remaining coverage units at that date with the coverage units provided under the group of contracts before the transition date (see section 9.7 above)

If applying the modified requirements above results in a loss component of that liability for remaining coverage at the date of initial recognition, an entity must determine any amounts allocated to that loss component before the transition date applying the modified requirements above and using a systematic basis of allocation. [IFRS 17.C16].

For a group of reinsurance contracts held that provides coverage for an onerous group of insurance contracts and was acquired before or at the same time that the insurance contracts were issued, an entity should establish a loss-recovery component of the asset for remaining coverage at the transition date (see section 11.4.3 above). To the extent that there is no reasonable and supportable information to apply a retrospective approach, the entity must determine the loss-recovery component by multiplying: [IFRS 17.C16A]

- The loss component of the liability for remaining coverage for the underlying insurance contracts at the transition date
- And
- The percentage of claims for the group of underlying insurance contracts the entity expects to recover from the group of reinsurance contracts held

However, if an entity does not have reasonable and supportable information to determine the loss recovery, it is not permitted to identify a loss-recovery component for the group of reinsurance contracts held. [IFRS 17.C16C].

At the transition date, onerous underlying insurance contracts might include in an onerous group of insurance contracts both onerous insurance contracts covered by the group of reinsurance contracts held and onerous insurance contracts not covered by a group of reinsurance contracts held. In that case, for the purpose of determining the loss-recovery component, the entity must use a systematic and rational basis of allocation to determine the portion of the loss component of the group of insurance contracts that relates to insurance contracts covered by the group of reinsurance contracts held. [IFRS 17.C16B].

The following Illustration, based on Example 17 in the Illustrative Examples to IFRS 17, shows the measurement of contracts without direct participation features at the transition date using the modified retrospective approach: [IFRS 17.IE186-191]

Illustration 17-2: Measurement of groups of insurance contracts without direct participation features applying the modified retrospective approach

An entity issues insurance contracts without direct participation features and aggregates those contracts into groups. The entity estimates the fulfilment cash flows at the transition date applying the general model as the sum of:

- An estimate of the present value of future cash flows of CU620 (including the effect of discounting of CU(150))
- And
- A risk adjustment for non-financial risk of CU100

The entity concludes that it is impracticable to apply IFRS 17 retrospectively. As a result, the entity chooses to apply the modified retrospective approach to measure the contractual service margin at the transition date. The entity uses reasonable and supportable information to achieve the closest outcome to retrospective application.

Analysis

The entity determines the contractual service margin at the transition date by estimating the fulfilment cash flows on initial recognition, as follows:

Future cash flows at the date of initial recognition of the group of insurance contracts are estimated to be the sum of future cash flows of CU770 at the transition date and cash flows of CU800 that are known to have occurred between the date of initial recognition of the group of insurance contracts and transition date. This includes premiums paid on initial recognition of CU1,000 and cash outflows of CU200 paid during the period. This amount includes cash flows resulting from contracts that ceased to exist before the transition date.

- The entity determines the effect of discounting at the date of initial recognition of the group of insurance contracts to equal CU(200), calculated as the discounting effect on estimates of future cash flows at the date of initial recognition determined above. The entity determines the effect of discounting by using a yield curve that, for at least three years immediately before the transition date, approximates the yield curve estimated applying the methodology described (see section 9.3 above). The entity estimates this amount to equal CU50, reflecting that the premium received on initial recognition; thus, the discounting effect relates only to future cash outflows.
- The entity determines the risk adjustment for non-financial risk on initial recognition of CU120, as the risk adjustment for the non-financial risk at the transition date of CU100 adjusted by CU20 to reflect the expected release of risk before the transition date. The entity determines the expected release of risk by reference to the release of risk for similar insurance contracts that the entity issues at the transition date.
- The contractual service margin on initial recognition is CU110, the amount that would result in no profit or loss on initial recognition of the fulfilment cash flows of CU110. The subsequent movement in the contractual service margin uses the discount rates derived above to accrete interest and recognises the amount in profit or loss because of the transfer of services. Comparing the remaining coverage units at the transition date with the coverage units provided by the group before the transition date results in CU90. Consequently, the contractual service margin on the transition date is CU20.

This is illustrated, as follows:

	Transition date	Adjustment to initial recognition	Initial recognition
	CU	CU	CU
Estimates of future cash flows	770	(800)	(30)
Effect of discounting	(150)	(50)	(200)
Risk adjustment for non-financial risk	100	20	120
Fulfilment cash flows	720	(830)	(110)
Contractual service margin	20	90	110
Liability for remaining coverage	740		

How we see it

The modified retrospective approach allows considerable judgement, as it permits an entity to use historical data to determine reliable accounting estimates for the fulfilment cash flows. Inevitably, this will likely result in diversity in practice that reduces the comparability in the release of the contractual service margin in future periods between entities with longer-term contracts.

17.4.3 Determining the contractual service margin or loss component for groups of insurance contracts with direct participation features

When it is impracticable for an entity to apply the full retrospective approach, at initial recognition, to determine the contractual service margin or the loss component of the liability for remaining coverage for groups of contracts with direct participation features, these should be determined, as: [IFRS 17.C17]

- The total fair value of the underlying items at the transition date (A in the table in Illustration 17-3 below)
Minus
- The fulfilment cash flows at the transition date (B)
Plus or minus
- An adjustment for (C):

- Amounts charged by the entity to policyholders (including amounts deducted from the underlying items) before that date.
 - Amounts paid before that date that would not have varied based on the underlying items.
 - The change in the risk adjustment for non-financial risk caused by the release from risk before that date. An entity should estimate this amount by reference to the release of risk for similar insurance contracts that the entity issues at the transition date.
 - Insurance acquisition cash flows paid (for which a liability has been recognised under another IFRS accounting standard) before the transition date that are allocated to the group.
- If the sum of (A) - (C) above results in a contractual service margin - minus the amount of the contractual service margin that relates to services provided before that date. The sum of (A)-(C) is a proxy for the total contractual service margin for all services to be provided under the group of contracts, i.e., before any amounts that would have been recognised in profit or loss for services provided. An entity should estimate the amounts that would have been recognised in profit or loss for services provided by comparing the remaining coverage units at the transition date with the coverage units provided under the group of contracts before the transition date.
- Or
- If the sum of (A) - (C) results in a loss component, adjust the loss component to nil and increase the liability for remaining coverage excluding the loss component by the same amount.

The following Illustration, based on Example 18 in the Illustrative Examples to IFRS 17, shows how to apply the modified retrospective approach to contracts with direct participation features at the transition:
[IFRS 17.IE192-199]

Illustration 17-3: Measurement of groups of insurance contracts with direct participation features applying the modified retrospective approach

An entity issues 100 insurance contracts with direct participation features five years before the transition date and aggregates these contracts into a group. Under the terms of the contracts:

- A single premium is paid at the beginning of the coverage period of 10 years.
- The entity maintains account balances for policyholders and deducts charges from those account balances at the end of each year.
- A policyholder will receive an amount equal to the higher of the account balance and the minimum death benefit, if an insured person dies during the coverage period.
- If an insured person survives the coverage period, the policyholder receives the value of the account balance.

The following events occurred in the five-year period prior to the transition date:

- The entity paid death benefits and other expenses of CU239 comprising:
- CU216 of cash flows that vary based on returns from underlying items
- CU23 of cash flows that do not vary based on the returns from underlying items

And

- The entity deducted charges from the underlying items of CU55

The entity estimates the fulfilment cash flows at the transition date to be CU922, comprising the estimates of the present value of the future cash flows of CU910 and a risk adjustment for non-financial risk of CU12. The fair value of the underlying items at that date is CU948.

The entity makes the following estimates:

- Based on an analysis of similar contracts that the entity issues at transition date, the estimated change in the risk adjustment for non-financial risk caused by the release from risk in the five-year period before transition date is CU14.

And

- The units of coverage provided before the transition date is approximately 60% of the total coverage units of the group of contracts.

Analysis

The entity applies a modified retrospective approach to determine the contractual service margin at transition date. It determines that the contractual service margin for services provided before the transition date of CU26 is the percentage of the coverage units provided before the transition date, and the total coverage units of 60% multiplied by the contractual service margin before recognition in profit or loss is CU44. This is illustrated, as follows:

	CU
Fair value of the underlying items at transition date (A)	948
Fulfilment cash flows at the transition date (B)	(922)
Adjustments (C):	
Charges deducted from underlying items before the transition date	55
Amounts paid before transition date that would not have varied based on the returns on underlying items	(23)
Estimated change in the risk adjustment for non-financial risk caused by the release from risk before transition date	(14)
Contractual service margin of the group of contracts before recognition in profit or loss	44
Estimated amount of the contractual service margin that relates to services provided before the transition date	(26)
Estimated contractual service margin at the transition date	18

The total insurance contract liability at the transition date is CU940, which is the sum of the fulfilment cash flows of CU922 and the contractual service margin of CU18.

In addition, an entity must apply the same methodology described in section 17.4.2 above to recognise an asset for insurance acquisition cash flows, and any adjustment to the contractual service margin of a group of insurance contracts with direct participation features for insurance acquisition cash flows. [IFRS 17.C17A].

How we see it

For the variable fee approach, the modified retrospective approach focuses on the contractual service margin for the open contracts at transition. However, historical information and estimates of certain effects, for example fees charged to policyholders or death benefits paid before the transition date, are still required for all contracts, including contracts derecognised before the transition date, in order to estimate the contractual service margin at transition.

Another important feature of the variable fee approach is that no loss component will exist at transition when the modified retrospective approach is applied. As a result, the possibility of an entity being able to establish a contractual service margin in case of favourable changes in circumstances after transition increases.

17.4.4 Insurance finance income or expenses

The modified requirements for insurance finance income or expenses differ depending on whether, as a result of applying the modified retrospective approach, groups of insurance contracts include those issued more than one year apart (see section 17.4.1 above).

17.4.4.A Groups of insurance contracts that include contracts issued more than one year apart

When an entity has aggregated a group of insurance contracts on a basis that includes contracts issued more than one year apart in the same group: *[IFRS 17.C18]*

- The entity is permitted to determine the discount rates at the date of initial recognition for the contractual service margin, the liability for remaining coverage and for incurred claims for contracts applying the premium allocation approach, as at the transition date instead of at the date of initial recognition or incurred claim date.
- If an entity chooses to disaggregate insurance finance income or expenses between amounts included in profit or loss and amounts included in other comprehensive income (see sections 15.3.1 to 15.3.4 above), the entity needs to determine the cumulative amount of insurance finance income or expenses recognised in other comprehensive income at the transition date in order to be able to reclassify any remaining amounts from other comprehensive income to profit or loss upon subsequent transfer or derecognition. The entity is permitted to determine the cumulative difference on transition either by:
 - Applying the requirements for groups of contracts that do not include contracts issued more than one year apart - see section 17.4.4.B below
 - Or
 - As nil, except for:
Insurance contracts with direct participation features where the entity holds the underlying items when the cumulative difference is equal to the cumulative amount recognised in other comprehensive income on the underlying items

The table below provides a summary of the requirements:

	Groups at transition date	
	Include contracts issued more than one year apart (see section 17.4.4.A)	Do not include contracts issued more than one year apart (see section 17.4.4.B)
1. Discount rates to determine insurance finance income or expenses subsequent to transition	Permitted to determine the discount rate at initial recognition and at the date of incurred claims, at the transition date instead of at the date of initial recognition or incurred claims	If an entity is applying the permitted modification in determining the discount rate at initial recognition (or subsequently), it must determine other discount rates in the same way
2. Cumulative other comprehensive income at transition date for: A) Groups of direct participating contracts for which entity holds underlying items	Equal to the cumulative amount recognised in other comprehensive income on the underlying items	
B) Groups of other contracts for which changes in financial assumptions have a substantial effect on the amounts paid to policyholders	Set to nil	Set to nil
C) Other groups of contracts subject to general model	Set to nil; or apply fully retrospective or modified retrospective approach to estimating discount rates at initial recognition	Determine cumulative difference by applying fully retrospective or modified retrospective approach to estimating discount rates at initial recognition
D) Groups of contracts subject to premium allocation approach- entity disaggregates interest expense on incurred claims	Set to nil; or apply fully retrospective approach or modified retrospective approach to estimating discount rates at initial recognition	Determine cumulative difference by applying fully retrospective or modified retrospective approach to estimating discount rates when claims incurred

How we see it

For groups of insurance contracts with direct participation features where disaggregation is applied and for which the entity holds the underlying items (i.e., application of the current period book yield approach), the modification for disaggregating insurance finance income or expenses at transition allows an entity to determine the cumulative amount of insurance finance income or expenses recognised in OCI at the transition date equal to the cumulative amount recognised in OCI on the underlying items at that date. In certain circumstances, the interaction of this provision with the initial application of IFRS 9 could result in mismatches between amounts accumulated in OCI for the underlying items and the amounts accumulated in OCI for insurance contracts on the date of initial application. This is because the modification is applied at the date of transition to IFRS 17 (1 January 2022) whereas the date of initial application of IFRS 9 is 1 January 2023. To the extent the amount recognised in OCI under the modification exceeds the amount recognised in OCI for the underlying items at the date of initial application, an entity could elect to transfer amounts recognised in OCI for the insurance liabilities to another part of equity. This is because this mismatch would reflect amounts that would not be reclassified to profit or loss in a future period and IFRS 17 or another IFRS accounting standard would not prohibit transferring such an amount from OCI to other parts of equity. Entities would have to consider any specific capital requirements that apply under local law and regulations.

17.4.4.B Groups of insurance contracts that do not include contracts issued more than one year apart

When an entity has aggregated a group of insurance contracts on a basis that does not include contracts issued more than one year apart in the same group: [IFRS 17.C19]

- If an entity applies the requirements in section 17.4.2 above for groups of insurance contracts without direct participation features to estimate the discount rates that applied at initial recognition (or subsequently), it must also determine the discount rates specified for accreting the interest on the contractual service margin, measuring the changes in the contractual service margin, discounting the liability for remaining coverage under the premium allocation approach and for disaggregated insurance finance income or expenses in the same way.
- If an entity chooses to disaggregate insurance finance income or expenses between amounts included in profit or loss and amounts included in other comprehensive income (see sections 15.3.1 to 15.3.4 above), the entity needs to determine the cumulative amount of insurance finance income or expenses recognised in other comprehensive income at the transition date in order to be able to reclassify any remaining amounts from other comprehensive income to profit or loss upon subsequent transfer or derecognition in future periods. The entity must determine the cumulative difference:
 - For insurance contracts for which changes in assumptions that relate to financial risk do not have a substantial effect on the amounts paid to policyholders - if it applies the requirements in section 17.4.2 above to estimate the discount rates at initial recognition - using the discount rates that applied at the date of initial recognition, also applying the requirements in section 17.4.2 above
 - For groups of insurance contracts for which changes in assumptions that relate to financial risk have a substantial effect on the amounts paid to policyholders, on the basis that the assumptions that relate to financial risk that applied at the date of initial recognition are those that apply on the transition date, i.e., as nil
 - For insurance contracts for which an entity will apply the premium allocation approach to discount the liability for incurred claims - if the entity applies the requirements in section 17.4.2 above to estimate the discount rates at initial recognition (or subsequently) - using the discount rates that applied at the date of the incurred claim, also applying the requirements in section 17.4.2 above
 - For insurance contracts with direct participation features where the entity holds the underlying items - as equal to the cumulative amount recognised in other comprehensive income on the underlying items

Although entities are permitted to set the cumulative balance in other comprehensive income for disaggregated insurance finance income or expenses at nil on transition in certain circumstances, the same option is not permitted under IFRS 9 for any related financial assets. Therefore, an accounting mismatch will arise. It is observed in the Basis for Conclusions that the Board considered feedback from some stakeholders that preferred alternative modifications to those modifications set out above for determining the amount of insurance finance income or expenses accumulated in other comprehensive income at the transition date in order to resolve the accounting mismatch. The Board disagreed with these suggestions on various grounds and declined to amend either IFRS 9 or IFRS 17. [IFRS 17.BC384A, IFRS 17.BC384B].

In addition, to the extent that an entity has made an accounting policy choice not to change the treatment of accounting estimates made in previous interim financial statements and is unable to apply this treatment retrospectively (see section 17.4.1 above) it should determine amounts related to insurance finance income or expenses at the transition date as if it had not prepared interim financial statements before the transition date.

How we see it

The possibility and, in some cases, the requirement, to set OCI related to insurance liabilities on transition to nil, sometimes referred to as the 'fresh start' approach may be viewed as an important aspect to managing the transition effects of IFRS 17. In particular, this will be the case in jurisdictions where interest rates guaranteed in the past are relatively high compared with the existing low interest rate environment that may still apply at transition. This approach would immediately affect shareholder's equity at transition, but more favourably impact profit or loss in the years after transition due to a lower interest accretion on the insurance liabilities. If setting OCI balances to nil, entities should carefully consider what rate at initial recognition will be used for disaggregating insurance finance income or expenses after transition. Under the modified retrospective approach, the standard allows entities to set the rate at the transition date rather than at the inception date. Using the rate at transition would, in our view, best align with an OCI balance of nil as the rate at the transition date would be consistent with a transition OCI balance of nil under the IFRS 17 model.

For contracts with direct participation features applying the current period book-yield approach, the simplification to set the OCI balance for the insurance liabilities at the amount of the underlying items at transition seems logical. Where the interaction of this provision with the initial application of IFRS 9 results in mismatches between amounts accumulated in OCI for the underlying items and the amounts accumulated in OCI for insurance contracts on the date of initial application, an entity could elect to transfer amounts recognised in OCI for the insurance liabilities to another part of equity (see our comment at section 17.4.4.A above).

17.5 Fair value approach

The fair value approach is:

- Permitted as an alternative to the modified retrospective approach for a group of contracts when full retrospective application of that group of contracts is impracticable (see section 17.2 above)
- Or
- Required when full retrospective application of a group of contracts is impracticable and an entity cannot obtain reasonable and supportable information for that group of contracts to use the modified retrospective approach (see section 17.3 above)
- Or
- Permitted for a group of insurance contracts with direct participation features when risk mitigation has been applied prospectively to the group from the transition date and the entity has used derivatives, reinsurance contracts held or non-derivative financial instruments at fair value through profit or loss to mitigate financial risk arising from that group of contracts before transition date (see section 12.3.5 above)

To apply the fair value approach, an entity must determine the contractual service margin or loss component of the liability for remaining coverage at the transition date as the difference between the fair value of a group of insurance contracts and the fulfilment cash flows measured at that date. In determining fair value, an entity must apply the requirements of IFRS 13. This excludes the requirement that the fair value of a financial liability with a demand feature (e.g., a demand deposit floor) cannot be less than the amount payable on demand, discounted from the first date that the amount could be required to be paid. [IFRS 17.C20]. This means that insurance contract liabilities can be measured at an amount lower than the discounted amount repayable on demand.

For a group of reinsurance contracts held to which the underlying insurance contracts are onerous at the transition date, an entity determines the loss-recovery component of the asset for remaining coverage by multiplying: [IFRS 17.C20A]

- The loss component for the liability for remaining coverage for the underlying insurance contracts at the transition date
- And
- The percentage of claims for the group of underlying insurance contracts the entity expects to recover from the group of reinsurance contracts held

At the transition date, onerous underlying insurance contracts might be included in a group of insurance contracts with other onerous insurance contracts that are not covered by the group of reinsurance contracts held. In that case, for the purpose of applying the calculation above, an entity must use a systematic and rational basis of allocation to determine the portion of the loss component of the group of insurance contracts that relates to insurance contracts covered by the group of reinsurance contracts held. [IFRS 17.C20B].

How we see it

When applying the fair value approach at transition to a group of insurance contracts that contains both liabilities for remaining coverage and incurred claims, the question arises whether the difference between the fulfilment cash flows and the fair value of that group should include liabilities for remaining coverage as well as the liabilities for incurred claims (as the liability for incurred claims does not contain a contractual service margin). In our view, because IFRS 17.C20 requires the fair value approach to be applied at the level of a group of insurance contracts, the fulfilment cash flows of the group and its fair value should consider both liabilities for remaining coverage and liabilities for incurred claims in that situation.

In applying the fair value approach, an entity may use reasonable and supportable information for what the entity would have determined, given the terms of the contract and market conditions at the date of inception or initial recognition, as appropriate or, alternatively, reasonable and supportable information at the transition date in determining the following: [IFRS 17.C21, IFRS 17.C22]

- How to identify groups of insurance contracts
- Whether an insurance contract meets the definition of an insurance contract with direct participation features
- How to identify discretionary cash flows for insurance contracts without direct participation features
- Whether an investment contract meets the definition of an investment contract with discretionary participation features (see section 12.4 above)

In addition, the general requirements of IFRS 17 are modified when the fair value approach is used as follows: [IFRS 17.C23]

- An entity may choose to classify as a liability for incurred claims, a liability for settlement of claims incurred before an insurance contract was acquired in a transfer of insurance contracts that do not form a business or in a business combination within the scope of IFRS 3. [IFRS 17.C22A].
- When determining groups of insurance contracts, an entity may include those issued more than one year apart. An entity is only allowed to divide groups into those that include contracts issued within a year or less if it has reasonable and supportable information to make the decision. This reflects the Board's expectation that grouping of contracts issued within a year (or less) will be challenging in situations where the fair value approach is applied. [IFRS 17.C23].
- An entity determines the discount rate at the date of initial recognition of a group of contracts and discount rates of incurred claims under the premium allocation approach (when discounting has been elected - see section 10.5 above) at the transition date instead of the date of the initial recognition or incurred claim. [IFRS 17.C23].

Frequently asked questions

Question 17-1: In applying the fair value approach on transition, should the fair value reflect the non-performance risk of the entity?

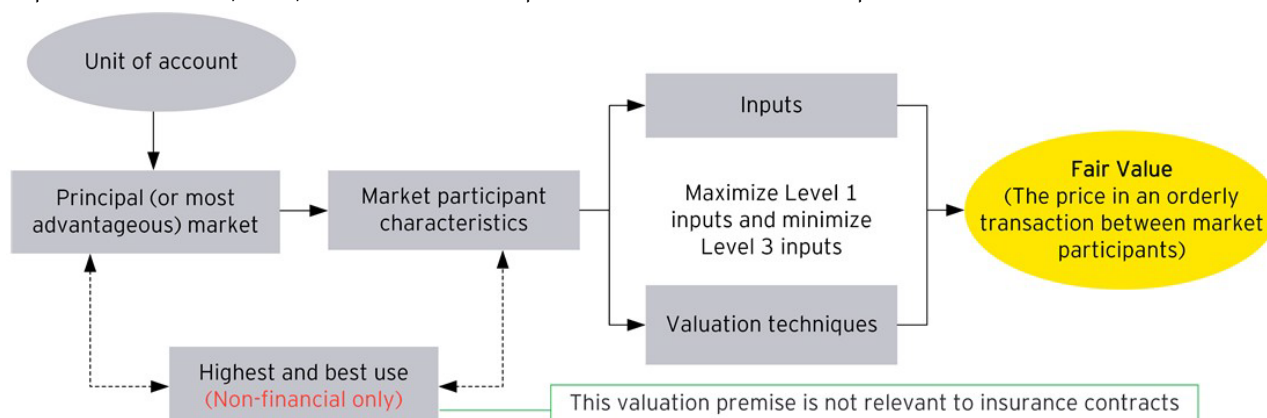

(TRG meeting April 2019 - Agenda paper no. 02, Log S127)

The IASB staff confirmed that when, applying the fair value approach, an entity determines the contractual service margin by comparing the fulfilment cash flows and the fair value of a group of insurance contracts. The fair value measurement in this situation reflects the effect of non-performance risk as required by IFRS 13 (but not the requirements relating to demand features). However, the fulfilment cash flows of an entity do not reflect the non-performance risk of the entity and this applies also to the fulfilment cash flows of an entity using the fair value approach on transition. Therefore, the fulfilment cash flows of an entity that applies the fair value approach on transition exclude non-performance risk, but non-performance risk is considered when determining the fair value of a group of contracts at transition date for the purpose of the calculation of the contractual service margin as the difference between the fulfilment cash flows and fair value.

Illustration 17-4: The fair value framework

The objective of a fair value measurement is to estimate the price at which an orderly transaction to sell the asset or to transfer the liability would take place between market participants at the measurement date under current market conditions. [IFRS 13.BC55-BC59].

This diagram below illustrates the interdependence of the various components of the fair value measurement principles in IFRS 13. All of these interdependent components need to be considered. A decision on one will impact another and, thus, conclusions will require refinement as each component is considered.

The unit of account determines the level at which an asset or liability is aggregated or disaggregated for financial reporting purposes. IFRS 17 determines the unit of account to determine the fair value of a group of insurance contracts for both business combinations (see section 14 above) and transition purposes.

The reference market determines the possible source of market data (whether observable or estimated using a valuation technique) that can be used within the fair value calculation as well as the characteristics of a hypothetical market participant. If there is a principal market for the asset or liability being measured, fair value should be determined using the price in that market, even if a price in a different market is more advantageous at the measurement date. Only in situations where there is no principal market for the asset or liability being measured, can an entity consider the most advantageous market. The most advantageous market is the one that maximises the amount that would be received to sell the asset or minimises the amount that would be paid to transfer the liability. The entity must have access to the market at the measurement date.

Market participants are other entities with whom the entity would enter into a transaction in the reference market. Buyers and sellers in the principal (or most advantageous) market for the asset or liability that have all of the following characteristics: [IFRS 13.BC55-BC59]

- Independent of each other
- Knowledgeable, having a reasonable understanding about the asset or liability
- Willing to enter into a transaction for the asset or liability
- Able to enter into a transaction

Three widely used valuation techniques are the market approach, the cost approach and the income approach. An entity must use valuation techniques consistent with one or more of those approaches to measure fair value. [IFRS 13.62].

Some of the key differences between the measurement model under IFRS 17 fulfilment cash flows and the fair value measurement approach under IFRS 13 are:

	IFRS 17 fulfilment cash flows	IFRS 13 fair value
Overall objective	Fulfilment of insurance contract, but considering consistency with market information where necessary	View of a (hypothetical) market participant
Entity's own risk of non-performance	Excludes own risk of non-performance	Includes own risk of non-performance
Adjustment for risk	Reflecting the entity's perception of non-financial risk	Reflecting a market participant's perception of risk
Service margin	N/A	Service margin required by a market participant

How we see it

Determining fair value will pose many challenges and require significant judgement. An important area is the level of aggregation and its impact on diversification. The fair value of a single group of insurance contracts may not take into account any benefits of diversification which would likely be considered by entities when determining the fulfilment cash flows.

IFRS 13 includes a requirement on demand deposits, which means that the fair value of a financial liability with a demand feature can never be less than present value of the amount payable on demand. This requirement does not have to be applied when calculating the fair value of insurance contracts at transition. However, all other IFRS 13 requirements must be applied in determining fair value, including the requirement to consider the entity's own non-performance risk.

17.5.1 Disaggregated insurance finance income or expenses using the fair value approach

If an entity chooses to disaggregate insurance finance income or expenses between profit or loss and other comprehensive income, it is permitted to determine the cumulative amount of insurance finance income or expenses recognised in other comprehensive income at the transition date: [IFRS 17.C24]

- Retrospectively, but only if it has reasonable and supportable information to do so
- Or
- As nil, unless the below applies
- For insurance contracts with direct participation features where the entity holds the underlying items, as equal to the cumulative amount recognised in other comprehensive income from the underlying items

How we see it

Although the above-mentioned option allows for other comprehensive income to be set at nil on transition, no equivalent option exists under transition to IFRS 9 for financial assets held at fair value through other comprehensive income. Entities should, therefore, carefully evaluate the combined transition impact of IFRS 17 and IFRS 9 and determine a transition approach that results in a useful depiction of this relationship in the years after transition.

17.5.2 Asset for insurance acquisition cash flows using the fair value approach

In applying the fair value approach for an asset for insurance acquisition cash flows, an entity determines an asset for insurance acquisition cash flows at the transition date at an amount equal to the amount of insurance acquisition cash flows the entity would incur at the transition date for the rights to obtain:

[IFRS 17.C24A]

- Recoveries of insurance acquisition cash flows from premiums of insurance contracts issued before the transition date but not yet recognised at the transition date (a)
- Future insurance contracts that are renewals of insurance contracts recognised at the date of transition and insurance contracts described in (a) above, (b)
- Future insurance contracts, other than those in (b) above, after the date of transition without paying again insurance acquisition cash flows the entity has already paid that are directly attributable to the related portfolio of insurance contracts

The amount of any asset for insurance acquisition cash flows is excluded from the measurement of any groups of insurance contracts recognised at the transition date. [IFRS 17.C24B].

Frequently asked questions

Question 17-2: When the fair value approach to transition is applied, are insurance acquisition cash flows that occurred prior to the transition date recognised as revenue and expenses in the statement of financial performance applying paragraphs B121(b) and B125 of IFRS 17 for reporting periods subsequent to the transition date?

(TRG meeting February 2018 - Agenda paper no. 06, Log S05)

The TRG members noted that:

- Applying the fair value transition approach means that the amount of insurance acquisition cash flows included in the measurement of the contractual service margin will be only amounts occurring after the transition date that are also included in the fulfilment cash flows. When this approach to transition is applied, an entity is not permitted to include in the measurement of the contractual service margin any insurance acquisition cash flows occurring prior to the date of transition.
- The fair value approach is intended to provide an entity with a 'fresh start' approach to transition.
- Since insurance acquisition cash flows that occurred prior to the transition date are not included in the measurement of the contractual service margin at the transition date, they are not included in the presentation of insurance revenue and expenses for reporting periods subsequent to the transition date.

The IASB staff noted that this analysis applies in all situations that the fair value transition approach is taken, irrespective of whether the entity can identify and measure the insurance acquisition cash flows that applied prior to the transition date.

How we see it

Even though the fair value transition approach of IFRS 17 allows for the recognition of an asset for insurance acquisition cash flows for contracts to be recognised *after the transition date* (see section 7.3 above), no insurance acquisition cash flows should be included in the measurement of any contracts included in the measurement of the groups of contracts recognised at the transition date.

17.6 Redesignation of financial assets and financial liabilities - when IFRS 9 has been applied previously

IFRS 17 allows a generous degree of dispensation for entities to redesignate their financial assets within the scope of IFRS 9 when IFRS 17 is applied. In addition, a consequential change to IFRS 9 allows redesignation of financial liabilities in certain circumstances.

17.6.1 Redesignation of financial assets

At the date of initial application of IFRS 17, an entity that had applied IFRS 9 to annual reporting periods before the initial application of IFRS 17: *[IFRS 17.C29]*

- May reassess whether an eligible financial asset meets the condition to be held within a business model whose objective is to hold financial assets in order to collect contractual cash flows, or is held within a business model whose objective is achieved by both collecting contractual cash flows and selling financial assets. A financial asset is eligible only if the financial asset is held for an activity that is connected with contracts within the scope of IFRS 17. Examples of financial assets that would not be eligible for reassessment are financial assets held for banking activities or financial assets held for investment contracts that are outside the scope of IFRS 17
- Must revoke its designation of a financial asset measured at fair value through profit or loss if the original designation was made to avoid or reduce an accounting mismatch and that accounting mismatch no longer exists because of the application of IFRS 17
- May designate a financial asset as measured at fair value through profit or loss if, in doing so, it eliminates or significantly reduces an accounting mismatch that would otherwise arise from measuring assets or liabilities or recognising the gains and losses on different bases
- May irrevocably elect to designate an investment in an equity instrument at fair value through other comprehensive income, provided that equity instrument is neither held for trading nor contingent consideration recognised by an acquirer in a business combination to which IFRS 3 applies
- May revoke its previous designation of an investment in an equity instrument at fair value through other comprehensive income

An entity must apply the above based on the facts and circumstances that exist at the date of initial application of IFRS 17. An entity must apply these designations and classifications retrospectively. In doing so, it must apply the relevant requirements in IFRS 9. The date of initial application for that purpose is deemed to be the date of initial application of IFRS 17 (i.e., accounting periods beginning on or after 1 January 2023). *[IFRS 17.C30]*.

However, for a financial asset derecognised between the transition date and date of initial application of IFRS 17 an entity may apply the classification overlay (see section 17.7 below) for the purpose of presenting comparative information as if IFRS 17.C29 (i.e., the requirements set out immediately above) had been applied to that asset. Such an entity adapts the requirements of the classification overlay so that it is based on how the entity expects the financial asset would be designated applying the bullet points above at the date of initial application of IFRS 17. *[IFRS 17.C33A]*. The classification overlay, therefore, permits an entity to redesignate financial instruments derecognised in the comparative periods to avoid accounting mismatches in those comparative periods.

Any changes resulting from applying the above do not require the restatement of prior periods. However, the entity may restate prior periods only if it is possible without the use of hindsight. This may result in a situation whereby the comparative period is restated for IFRS 17 (which may include changes that affect financial instruments within the scope of IFRS 9). For example, accounting for investment components that are separated, but not for consequential changes resulting in the classification of financial assets (this situation will also potentially arise when an entity has not previously applied IFRS 9 (see section 17.7 below). If an entity restates prior periods, the restated financial statements must reflect all IFRS 9 requirements for those affected financial assets. If an entity does not restate prior periods, the entity must recognise, in the opening restated earnings (or other component of equity, as appropriate) at the date of initial application, any difference between:

- The previous carrying amount of those financial assets
- And
- The carrying amount of those financial assets at the date of initial application *[IFRS 17.C31]*

Other disclosure requirements when redesignation of financial assets is applied are, as follows:

- The basis for determining financial assets eligible for redesignation
- The measurement category and carrying amount of the affected financial assets determined immediately before the date of initial application of IFRS 17
- The new measurement category and carrying amount of the affected financial assets determined after redesignation
- The carrying amount of financial assets in the statement of financial position that were previously designated as measured at fair value through profit or loss in order to significantly reduce or avoid an accounting mismatch that no longer exists [IFRS 17.C32]
- Qualitative information that would enable financial statement users to understand: [IFRS 17.C33]
 - How the entity applied the various options available for reassessment, revocation and designation described above
 - Reasons for any designation or de-designation of financial assets measured at fair value through profit or loss in order to significantly reduce or avoid an accounting mismatch
 - Why the entity reached a different conclusion in the new assessments, applying the requirements of the business model test

A simplified summary of the IFRS 9 redesignations above when initially applying IFRS 17 is, as follows:

IFRS 9 asset class	Re-designate?	New category
Amortised cost	Yes - may reassess classification and change if business model has changed and assets are held in respect of an activity that is connected with contracts within the scope of IFRS 17	Fair value through other comprehensive income or fair value through profit or loss depending on the business model
	Yes - may designate on an instrument-by-instrument basis if this eliminates or significantly reduces an accounting mismatch	Fair value through profit or loss
Fair value through other comprehensive income (debt securities)	Yes - may reassess classification and change if business model has changed and assets are held in respect of an activity that is connected with contracts are within the scope of IFRS 17	Amortised cost or fair value through profit or loss depending on the business model
	Yes - may designate on an instrument-by-instrument basis if this eliminates or significantly reduces an accounting mismatch	Fair value through profit or loss
Fair value through profit or loss (debt securities)	Yes - fair value through profit or loss designation must be revoked if designation on grounds of accounting mismatch and accounting mismatch no longer applies due to IFRS 17	Amortised cost or fair value through other comprehensive income depending on business model
Fair value through profit or loss (equity securities not held for trading)	Yes - free election instrument by instrument	Fair value through other comprehensive income
Fair value through other comprehensive income (equity securities)	Yes - free election instrument by instrument	Fair value through profit or loss

17.6.2 Redesignation of financial liabilities

When IFRS 17 is applied, IFRS 9 states that:

- A previous designation of a financial liability measured at fair value through profit or loss should be revoked if that designation was previously made in order to eliminate or reduce an accounting mismatch, but the condition which caused the mismatch is no longer satisfied as a result of the application of IFRS 17.
- A financial liability may be designated as measured at fair value through profit or loss if that designation would not have previously been permitted because it did not satisfy the condition (i.e., because there was no accounting mismatch) and that condition is now satisfied as a result of the application of these amendments.

Such a designation and revocation must be made on the basis of the facts and circumstances that exist at the date of initial application of the amendments to IFRS 9, and the classification must be applied retrospectively. [IFRS 9.7.2.39]. However, prior periods may only be restated if it is possible to do so without the use of hindsight. [IFRS 9.7.2.40].

17.7 Entities that have not previously applied IFRS 9

An entity that adopts IFRS 9 at the same time that it adopts IFRS 17 may assess financial asset classifications, elections and designations while, at the same time, assessing the implications of the requirements of IFRS 17. An entity adopting IFRS 9 at the same time that it adopts IFRS 17 applies the transitional provisions of IFRS 9, which include a number of elections and (de)designations.

IFRS 17 requires any net differences resulting from its application to be recorded in net equity at the date of transition (i.e., 1 January 2022 for an entity applying IFRS 17 for the first time in its annual reporting period ending 31 December 2023). In contrast, IFRS 9's starting point records net differences resulting from its application in net equity at the date of initial application (i.e., 1 January 2023 for an entity applying IFRS 17 for the first time in its annual reporting period ending 31 December 2023). Comparative periods may be restated if it is possible to do so without the use of hindsight. [IFRS 9.7.2.15].

How we see it

The IFRS 17 and IFRS 9 transition requirements do not address how to treat an IAS 39 cash flow hedge reserve in accumulated OCI for cash flow hedge relationships that are discontinued upon initial application of IFRS 9 and IFRS 17 (even though the future hedged transactions are still expected to occur). For example, an entity may have designated a cash flow hedge to fix the interest rate variability of forecasted reinvestments of debt instruments backing long-term insurance liabilities. An entity may decide to discontinue such a relationship because it now applies an accounting model for both insurance liabilities and related financial assets where the effects of interest rate changes (and any other relevant financial risks) are recognised in profit or loss. Such a change in accounting model would result in recognising the interest rate effect of financial assets and insurance liabilities on transition in opening retained earnings. In this case, we believe an entity has an accounting policy choice following IAS 8. It could transfer the cash flow hedge reserve to retained earnings on transition. This is because an entity may assess that there is no longer an appropriate recycling mechanism from OCI to profit or loss for prior hedging gains or losses (see Chapter 49). Alternatively, it could recycle the hedge reserve from other comprehensive income to profit and loss over time as the hedged forecasted transactions impact profit or loss (based on the accrual of interest on the hedged forecast financial assets).

However, even if comparative periods are restated, IFRS 9 cannot be applied to items already derecognised at the date of initial application (i.e., 1 January 2023 if IFRS 9 is first applied in a calendar year ending 31 December 2023). [IFRS 9.7.2.1]. Therefore, IAS 39 accounting, for example, available-for-sale accounting, would remain in the comparative statement of comprehensive income for financial assets derecognised in that comparative period.

The Board received information that, for some entities, these differing transition requirements of IFRS 17 and IFRS 9 could lead to significant accounting mismatches between financial assets and insurance contract liabilities in the comparative information presented on initial application of the two Standards.

Consequently, the Board concluded that IFRS 17 should be amended to enable entities to reduce those accounting mismatches. As a result, the IASB issued the December 2021 amendments. [IFRS 17.BC398G].

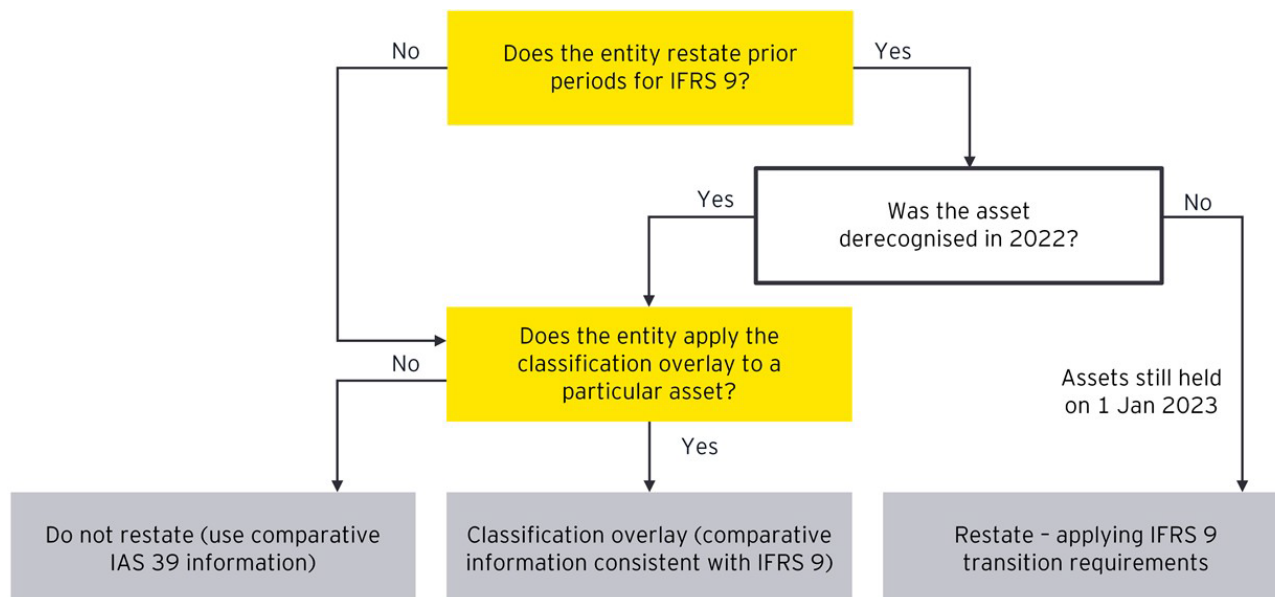

The December 2021 amendments introduce an optional classification overlay for financial assets in the comparative period. The classification overlay may be applied by: [IFRS 17.C28A, IFRS 17.BC398H]

- Entities that adopt IFRS 17 and IFRS 9 at the same time and choose to restate comparative information applying IFRS 9. These entities can apply the classification overlay to financial assets derecognised in the comparative period (to which IFRS 9 cannot be applied).
- Entities that adopt IFRS 17 and IFRS 9 at the same time and do not restate comparative information applying IFRS 9. For these entities, the classification overlay can be applied to any financial asset in the comparative period.
- Entities that applied IFRS 9 before they apply IFRS 17 for the first time. These entities can apply the classification overlay to assets that would have been redesignated in accordance with paragraph C29 of IFRS 17 if they had not been derecognised in the comparative period. See section 17.6 above.

The application of the classification overlay is optional on an instrument-by-instrument basis. This is to allow an entity to assess whether, for a particular financial asset, the benefits of applying the classification overlay outweigh the costs. However, this option does not prevent an entity from applying it at a high level of aggregation, for example, by considering the level at which an entity would assess its business model when applying IFRS 9. [IFRS 17.BC398R].

If an entity elects to apply the classification overlay, it can only do so for comparative periods to which it applies IFRS 17 (i.e., between the transition date to IFRS 17 and the date of initial application of IFRS 17). [IFRS 17.C28E(c)].

A decision tree on the classification overlay and presentation of comparative information about financial assets on initial application of IFRS 9 and IFRS 17 is shown below:

Based on October 2021 IASB staff paper Agenda Ref 2

17.7.1 Classification and measurement under the classification overlay

An entity that applies the classification overlay to a financial asset must: *[IFRS 17.C28B]*.

- Use reasonable and supportable information available at the transition date to determine how the entity expects that financial asset would be classified and measured on initial application of IFRS 9 (for example, using preliminary assessments performed to prepare for initial application of IFRS 9)
- Present comparative information as if the classification and measurement requirements of IFRS 9 had been applied to that financial asset

The IASB noted that an entity could, for example, use preliminary assessments of the business model and cash flow characteristics performed to prepare for the initial application of IFRS 9 as reasonable and supportable information for the classification overlay. Applying the classification overlay, the carrying amount of a financial asset would be determined consistently with how the entity expects it to be measured on initial application of IFRS 9. For example, for a financial asset previously measured at amortised cost, that is presented at fair value through profit or loss when applying the classification overlay, the carrying amount at the transition date to IFRS 17 would be its fair value at that date. *[IFRS 17.BC398J]*.

Any difference between the previous carrying amount of a financial asset and the carrying amount at the transition date that results from applying the classification overlay is recognised in opening retained earnings (or other component of equity, as appropriate) at the transition date (i.e., 1 January 2022 for most entities). *[IFRS 17.C28D]*.

The amendment does not change any of the transition requirements of IFRS 9. Entities that choose to apply the classification overlay to some or all of their financial assets will therefore still need to apply the requirements of IFRS 9 to any financial assets that continue to be recognised at the date of initial application of IFRS 9. This means that at the date of initial application of IFRS 9, entities that apply the classification overlay will be required to assess whether the classification of financial assets that continue to be recognised at that date is in accordance with IFRS 9. If the classification determined applying the classification overlay does not meet the requirements of IFRS 9 on the date of initial application of IFRS 9, the entity would be required to update the classification of a financial asset on that date and apply the updated classification retrospectively as per the transition requirements of IFRS 9. *[IFRS 17.BC398K]*.

17.7.2 Impairment of financial assets under the classification overlay

In applying the classification overlay, an entity is permitted but not required to apply the impairment requirements of IFRS 9 (i.e., the expected credit loss model). If a financial asset would be subject to the impairment requirements of IFRS 9 following the classification under the classification overlay but the entity does not apply those impairment requirements, it must continue to present any impairment amount recognised in the prior reporting period in accordance with IAS 39. Otherwise, any impairment amount previously recognised for that financial asset should be reversed. *[IFRS 17.C28C]*.

The Board allowed this choice of impairment model observing that some entities may not yet be prepared to apply the impairment requirements of IFRS 9, and that comparative information would still be improved by applying the classification overlay, even without applying the impairment requirements of IFRS 9.

[IFRS 17.BC398M].

How we see it

The classification overlay requires an entity to present impairments recognised in the prior period under IAS 39 if it chooses not to apply the expected credit loss model of IFRS 9 when applying the classification overlay to the 2022 comparatives. However, it does not specify what an entity should do if the financial asset did not recognise any prior period impairments previously under IAS 39, for example if the classification of a debt security is fair value through other comprehensive income under IFRS 9 but was fair value through profit or loss under IAS 39. In our view, as IFRS 17 is silent on this matter, an entity has an accounting policy choice as to whether it records incurred losses in accordance with the IAS 39 impairment model, or not, in the 2022 comparatives for those financial assets.

17.7.3 Disclosure of the use of the classification overlay

An entity that applies the classification overlay must disclose qualitative information that enables users of financial statements to understand: [IFRS 17.C28E(a)].

- The extent to which the classification overlay has been applied (such as whether it has been applied to all financial assets derecognised in the comparative period).
- Whether and to what extent the impairment requirements in IFRS 9 have been applied under the classification overlay.

The Board rejected respondents' suggestions to disclose the quantitative effects of the classification overlay at the transition date to IFRS 17. As applying the classification overlay would improve consistency of comparative information, the Board considered that the costs of such quantitative disclosure requirements would likely outweigh the benefits. [IFRS 17.BC398N]. Also, the Board observed that other IFRS accounting standards, such as IAS 1, might require further disclosure about the impact of the classification overlay. [IFRS 17.BC398O].

18 Future developments

18.1 IFRS 18

IFRS 18, is applicable for reporting periods beginning on or after 1 January 2027 (with early application permitted) and once effective, supersedes IAS 1. IFRS 18 introduces new requirements for the presentation and disclosure in financial statements to enhance the comparability and consistency. The new requirements impacting entities issuing insurance contracts, include:

- Requirements to classify all income and expenses included in the statement of profit or loss into one of five categories, and to present two new mandatory subtotals
- Required disclosures about management-defined performance measures (MPMs) - a subset of alternative performance measures - in a single note to the financial statements, which will be subject to audit
- More granular analysis of income and expenses to comply with the enhanced aggregation and disaggregation requirements

See Chapter 4 for more detailed guidance on the requirements of IFRS 18 including specific implications for entities issuing insurance contracts.

18.2 IFRS 19

IFRS 19 *Subsidiaries without Public Accountability*, was issued by the IASB in May 2024 to simplify the preparation of financial statements by eligible subsidiaries. Eligible subsidiaries that elect to apply IFRS 19 are allowed to provide reduced disclosures while still applying the recognition, measurement and presentation requirements in other IFRS accounting standards. IFRS 19 is effective for reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). However, IFRS 19 does not contain any reduced disclosures in respect of IFRS 17. See Chapter 4 for further details on the requirements of IFRS 19.

Appendix B - Index of Frequently asked questions

Question 3-1:	Would IFRS 17 apply to, among others, service contracts including a form of EBITDA guarantee?	4446
Question 3-2:	Is the risk related to a premium waiver provision a pre-existing risk of the policyholder transferred to the entity by the contract and therefore an insurance risk, or a new risk created by the contract?	4453
Question 3-3:	Should an entity exclude from insurance revenue, premiums waived as a result of an insured event or should it account for them as part of insurance service expense (i.e., an incurred claim)?	4453
Question 3-4:	How should the exercise of an option to convert a contract to a different type of contract be treated?	4454
Question 4-1:	When may it be necessary to treat a set or series of insurance contracts as a whole, applying IFRS 17.9?	4458
Question 5-1:	How to determine whether an insurance contract includes an investment component.	4464
Question 5-2:	How to assess whether an investment component is distinct.	4467
Question 5-3:	How to determine the amount of an investment component.	4470
Question 6-1:	Is it permitted to separate different insurance components from the host insurance contract and measure the components separately?	4475
Question 6-2:	How should 'no significant possibility' be interpreted, as set out in IFRS 17.16(b)?	4479
Question 8-1:	Should an entity consider currency exchange risks when applying IFRS 17 to identify portfolios of insurance contracts?	4490
Question 8-2:	How should an entity apply IAS 21 in conjunction with IFRS 17 in measuring a group of insurance contracts that generate cash flows in more than one currency?	4490
Question 9-1:	How to interpret the term 'contract boundary' described in IFRS 17.34 in the context of contracts with annual repricing mechanisms.	4496
Question 9-2:	Whether the reference to a 'portfolio of insurance contracts' in IFRS 17.34(b) is a 'portfolio of insurance contracts' as defined in Appendix A of IFRS 17?	4497
Question 9-3:	What is the interrelation between the requirements in IFRS 17.35 (cash flows that are outside the boundary of an insurance contract) and the requirements in IFRS 17.B64 (reassessment of the boundary of an insurance contract at each reporting date)?	4497
Question 9-4:	Are cash flows related to free additional coverage within the boundary of the insurance contracts purchased by policyholders?	4498
Question 9-5:	Are cash flows within the boundary of a group insurance contract, if those cash flows relate to periods after the entity can cancel the group insurance policy?	4498
Question 9-6:	How should an option to add coverage to an existing coverage on terms that are not guaranteed be accounted for?	4501
Question 9-7:	Which are the cash flows within the boundary of each of two specific fact patterns of health insurance contracts for which the policyholder has a right to terminate a contract, which results in its lapse, and a right to reinstate the contract?	4501
Question 9-8:	What constraints or limitations, other than those arising from the terms of an insurance contract, would be relevant in assessing the practical ability of an entity to reassess the risks of the particular policyholder (or of the portfolio of insurance contracts that contains the contract) and set a price or level of benefits that fully reflects those risks?	4502
Question 9-9:	Should 'risk neutral' or 'real world' scenarios be used for stochastic modelling techniques to project future returns on assets, applying IFRS 17.B48?	4505

Question 9-10:	Are cash flows still within the boundary of the contract if those cash flows relate to periods when insurance coverage is no longer provided and where the policyholder bears all the risks related to the investment services?	4509
Question 9-11:	How to account for the difference that may arise between the current discount rate of each contract when it joins the group and the weighted average discount rates used at initial recognition?	4516
Question 9-12:	Should an entity use an effective yield rate or a yield curve, specifically, in terms of IFRS 17.B72(e)(i) for a group of insurance contracts for which changes in assumptions that relate to financial risk do not have a substantial effect on the amounts paid to policyholders?	4516
Question 9-13:	Should the liability for any minimum interest rate guarantees made to policyholders be measured through adjusting the discount rate (rather than through adjustments to the cash flows)?	4518
Question 9-14:	When using a top-down approach to determine discount rates, should the reference portfolio of assets reflect the liquidity characteristics of the insurance contracts? If using an own portfolio of assets as the reference portfolio, should the effect of purchasing and selling assets during the reporting period be reflected in the discount rates used for insurance contracts?	4521
Question 9-15:	Would it be appropriate, if applying the top-down discount rate approach, to determine discount rates at initial recognition of each group using a target asset mix that the entity plans to invest in for that group as the reference portfolio of assets, and subsequently, using the actual asset mix covering all underwriting years as the reference portfolio of assets?	4522
Question 9-16:	Does the risk adjustment for non-financial risk take into account uncertainty related to how management will apply discretion?	4523
Question 9-17:	Which level is the risk adjustment for non-financial risk required to be determined: in (a) the individual financial statements of entities that are part of a consolidated group (i.e., parent and subsidiary entities that issue insurance contracts), and (b) the consolidated financial statements of the group of entities?	4525
Question 9-18:	For insurance contracts issued by an industry pool, should the risk adjustment for non-financial risk be determined at the association (pool) level or at the individual member entity level and could the risk adjustment for non-financial risk be measured differently in the financial statements of the members when compared to the financial statements of the pool?	4526
Question 9-19:	Should the effect of reinsurance held be considered in calculating the risk adjustment for non-financial risk for contracts that have been reinsured?	4526
Question 9-20:	Should an entity's obligation to pay amounts subject to insurance risk after an incurred claim be treated as a liability for remaining coverage or a liability for incurred claims?	4529
Question 9-21:	For insurance contracts without direct participation features, is a difference between the expected and the actual crediting rate applied to a policyholder's account balance included in insurance finance income or expenses, or does it adjust the contractual service margin applying IFRS 17.B96(c)?	4535
Question 9-22:	Do all premium experience adjustments relate to future service and therefore adjust the contractual service margin, or is an entity required to identify whether the experience adjustment relates to current, past, or future service?	4535
Question 9-23:	How should the contractual service margin be allocated to coverage units provided in the current period and expected to be provided in the future applying IFRS 17.B119(b).	4538
Question 9-24:	What is the definition of 'quantity of benefits' in IFRS 17.B119(a) for use in determining the amortisation pattern of the contractual service margin?	4538

Question 9-25:	How does an entity determine the amount of the contractual service margin (i.e., the quantity of benefits) to recognise in profit or loss in a period because of the transfer of insurance coverage for survival in that period?	4539
Question 9-26:	What is the contract boundary of a reinsurance contract that contains a break clause?	4549
Question 9-27:	From the perspective of the cedant, is there is an expectation of a symmetrical treatment of the contract boundary between the reinsurer and the cedant for the examples discussed at the May 2018 meeting for reinsurance held?	4549
Question 9-28:	How should insurance revenue and insurance service expenses be presented for insurance contracts acquired in conjunction with a business combination or similar acquisition in their settlement period. More specifically, should revenue reflect the entire expected claims or not?	4550
Question 9-29:	How should ceding commissions paid by the reinsurer to the cedant be treated in the reinsurer's statement of financial performance?	4551
Question 9-30:	Are premiums receivable from an intermediary when a policyholder has discharged its obligation to an insurer within the scope of IFRS 9 or IFRS 17?	4557
Question 10-1:	Is an entity required or permitted to reassess a contract's eligibility for the premium allocation approach and as a result to revoke its election to apply the approach?	4561
Question 10-2:	Do paragraphs 55(a)(i) and 55(b)(i) of IFRS 17 preclude the recognition of future premiums already invoiced but not yet paid and future premiums not yet invoiced in the measurement of the liability for remaining coverage applying the premium allocation approach?	4567
Question 10-3:	How should differences between expected premiums and actual premiums which relate to current or past service be accounted for applying the premium allocation approach?	4569
Question 10-4:	Why is the option in IFRS 17.59(b) where an entity is not required to adjust future cash flows in the liability for incurred claims for the time value of money and the effect of financial risk if those cash flows are expected to be paid or received in one year or less from the date the claims are incurred, limited to groups of contracts applying the premium allocation approach?	4570
Question 11-1:	Should a reinsurance contract held be separated into components for measurement purposes to reflect the underlying contracts covered? For example, should a reinsurance contract held that provides coverage to underlying contracts that are included in different groups of insurance contracts be separated?	4573
Question 11-2:	Should the boundary of a reinsurance contract held include anticipated cash flows from unissued underlying contracts?	4574
Question 11-3:	What is the boundary of a reinsurance contract held with a break clause that allows either party to cancel the contract at any time following a specified notice period?	4574
Question 11-4:	How should the boundary of a reinsurance contract held be determined when the reinsurer has the right to reprice remaining coverage prospectively?	4575
Question 11-5:	Paragraph 63 of IFRS 17 requires the use of assumptions for the measurement of the estimates of the present value of the future cash flows for a group of reinsurance contracts held that are consistent with those used to measure the underlying insurance contracts. Does this mean that the use of an identical discount rate is required?	4578
Question 11-6:	What discount rate should be used to measure the present value of future cash flows of a reinsurance contract held if the liquidity characteristics of the underlying contracts are different from those of the reinsurance contract held?	4578

Question 11-7:	For reinsurance contracts held, is the risk of non-performance of the reinsurer considered within the estimates of the present value of future cash flows or the risk adjustment for non-financial risk?	4583
Question 11-8:	Should non-performance risks of a reinsurer such as insolvency and dispute risk be identified as financial or non-financial risks and what impact does this determination have on the measurement of the risk adjustment for reinsurance contracts held?	4583
Question 11-9:	For reinsurance contracts held, are coverage units determined based on the services provided by the reinsurer, or the coverage units of the underlying insurance contracts?	4590
Question 12-1:	For annual groups of contracts that all share in the return of a specified pool of underlying items, with some of the return contractually passing from one group of policyholders to another, in what circumstances would measuring the contractual service margin at a higher level than an annual cohort level, such as a portfolio level, achieve the same accounting outcome as measuring the contractual service margin at an annual cohort level applying IFRS 17.22?	4597
Question 12-2:	How should the exercise of an option to convert a contract to a different type of contract be treated? For example, an insurance contract that can be converted to an annuity contract, or a term life contract (similar in nature to contracts that are accounted applying the general model) that can be converted to a permanent life contract (similar in nature to contracts that are accounted for applying the variable fee approach).	4597
Question 12-3:	Would contracts where the return is based on an amortised cost measurement of the underlying items fail the definition of insurance contract with direct participation features?	4603
Question 12-4:	For a unit-linked insurance contract for which the entity charges an asset management fee, determined as a percentage of the fair value of the underlying items at the end of each period, and a premium for mortality cover, by reducing the underlying items at the beginning of each period, how does the entity determine what is a substantial share of the fair value returns?	4603
Question 12-5:	For a direct participating contract that shares returns with policyholders by paying dividends, on what basis should the adjustment to the CSM reflect changes related to non-economic experience on underlying items be measured and in applying the current period book yield approach to disaggregate insurance finance income or expense, is the adjustment limited to financial income or expenses on the underlying items held?	4609
Question 12-6:	Does an investment contract that contains a crediting rate meet the third criteria of the definition of an investment contract with discretionary participation features in IFRS 17?	4611
Question 13-1:	Is a new contract recognised as a result of a modification accounted for similarly to contracts acquired in their settlement period applying IFRS 17.B5 and how are the coverage units identified?	4616
Question 14-1:	How should insurance revenue and insurance service expenses be presented for insurance contracts acquired in conjunction with a business combination or similar acquisition in their settlement period. More specifically, should revenue reflect the entire expected claims or not?	4623
Question 14-2:	For issued adverse loss cover and contracts acquired in their settlement period when are claims incurred for these contracts and, what subsequent treatment should be applied if the liability for remaining coverage is determined to have nil contractual service margin at initial recognition and estimates of future cash outflows decrease subsequently?	4623
Question 15-1:	Can experience adjustments relate to insurance acquisition cash flows and how do they align with the definition of insurance acquisition cash flows?	4634

Question 15-2: Does IFRS 17 require or permit an entity to accrete interest on the amount of acquisition cash flows paid for determining the insurance revenue and insurance services expenses applying IFRS 17.B125?	4634
Question 15-3: Are changes in fulfilment cash flows as a result of changes in inflation assumptions treated as changes in non-financial risk (which may adjust the contractual service margin) or changes in financial risk for contracts measured under the general model?	4638
Question 15-4: In a situation in which portfolios of insurance contracts change due to the manner in which the entity manages its contracts, what is the impact of such a change on the group unit of account or the application of the option to disaggregate insurance finance income or expenses between profit or loss and other comprehensive income?	4641
Question 15-5: For contracts measured applying the general model, when an entity makes an accounting policy choice to disaggregate insurance finance income or expenses between profit or loss and other comprehensive income (OCI), should accumulated OCI on insurance contracts be reclassified to profit or loss when experience does not unfold as expected, and if so, how?	4642
Question 15-6: Can the requirements in IFRS 17.B137 be extended to apply to monthly reporting that is prepared for internal management reporting and external regulatory reporting?	4650
Question 16-1: What is the sequence to be applied to adjusting a loss component in a financial period when one experience adjustment that relates to future service would increase a loss component, while another would decrease it; and should a gross disclosure be provided applying paragraphs 103(b) and 104(a) of IFRS 17?	4659
Question 16-2: How should the reconciliation of estimates of the present value of future cash flows applying paragraphs 101 and 104 of IFRS 17 for the annual reporting period be disclosed, considering the requirements in IFRS 17.B137 relating to interim financial statements?	4659
Question 17-1: In applying the fair value approach on transition, should the fair value reflect the non-performance risk of the entity?	4693
Question 17-2: When the fair value approach to transition is applied, are insurance acquisition cash flows that occurred prior to the transition date recognised as revenue and expenses in the statement of financial performance applying paragraphs B121(b) and B125 of IFRS 17 for reporting periods subsequent to the transition date?	4695

Appendix C - Defined terms

Extract from IFRS 17

Appendix A Defined terms

This appendix is an integral part of IFRS 17 Insurance Contracts.

contractual service margin	A component of the carrying amount of the asset or liability for a group of insurance contracts representing the unearned profit the entity will recognise as it provides insurance contract services under the insurance contracts in the group.
coverage period	The period during which the entity provides insurance contract services . This period includes the insurance contract services that relate to all premiums within the boundary of the insurance contract .
experience adjustment	A difference between: <ul style="list-style-type: none"> (a) for premium receipts (and any related cash flows such as insurance acquisition cash flows and insurance premium taxes) - the estimate at the beginning of the period of the amounts expected in the period and the actual cash flows in the period; or (b) for insurance service expenses (excluding insurance acquisition expenses) - the estimate at the beginning of the period of the amounts expected to be incurred in the period and the actual amounts incurred in the period.
financial risk	The risk of a possible future change in one or more of a specified interest rate, financial instrument price, commodity price, currency exchange rate, index of prices or rates, credit rating or credit index or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract.
fulfilment cash flows	An explicit, unbiased and probability-weighted estimate (ie expected value) of the present value of the future cash outflows minus the present value of the future cash inflows that will arise as the entity fulfils insurance contracts , including a risk adjustment for non-financial risk .
group of insurance contracts	A set of insurance contracts resulting from the division of a portfolio of insurance contracts into, at a minimum, contracts issued within a period of no longer than one year and that, at initial recognition: <ul style="list-style-type: none"> (a) are onerous, if any; (b) have no significant possibility of becoming onerous subsequently, if any; or (c) do not fall into either (a) or (b), if any.
insurance acquisition cash flows	Cash flows arising from the costs of selling, underwriting and starting a group of insurance contracts (issued or expected to be issued) that are directly attributable to the portfolio of insurance contracts to which the group belongs. Such cash flows include cash flows that are not directly attributable to individual contracts or groups of insurance contracts within the portfolio.
insurance contract	A contract under which one party (the issuer) accepts significant insurance risk from another party (the policyholder) by agreeing to compensate the policyholder if a specified uncertain future event (the insured event) adversely affects the policyholder .

insurance contract services	<p>The following services that an entity provides to a policyholder of an insurance contract:</p> <ul style="list-style-type: none"> (a) coverage for an insured event (insurance coverage); (b) for insurance contracts without direct participation features, the generation of an investment return for the policyholder, if applicable (investment-return service); and (c) for insurance contracts with direct participation features, the management of underlying items on behalf of the policyholder (investment-related service).
insurance contract with direct participation features	<p>An insurance contract for which, at inception:</p> <ul style="list-style-type: none"> (a) the contractual terms specify that the policyholder participates in a share of a clearly identified pool of underlying items; (b) the entity expects to pay to the policyholder an amount equal to a substantial share of the fair value returns on the underlying items; and (c) the entity expects a substantial proportion of any change in the amounts to be paid to the policyholder to vary with the change in fair value of the underlying items.
insurance contract without direct participation features	An insurance contract that is not an insurance contract with direct participation features .
insurance risk	Risk, other than financial risk , transferred from the holder of a contract to the issuer.
insured event	An uncertain future event covered by an insurance contract that creates insurance risk .
investment component	The amounts that an insurance contract requires the entity to repay to a policyholder in all circumstances, regardless of whether an insured event occurs.
investment contract with discretionary participation features	<p>A financial instrument that provides a particular investor with the contractual right to receive, as a supplement to an amount not subject to the discretion of the issuer, additional amounts:</p> <ul style="list-style-type: none"> (a) that are expected to be a significant portion of the total contractual benefits; (b) the timing or amount of which are contractually at the discretion of the issuer; and (c) that are contractually based on: <ul style="list-style-type: none"> (i) the returns on a specified pool of contracts or a specified type of contract; (ii) realised and/or unrealised investment returns on a specified pool of assets held by the issuer; or (iii) the profit or loss of the entity or fund that issues the contract.
liability for incurred claims	<p>An entity's obligation to:</p> <ul style="list-style-type: none"> (a) investigate and pay valid claims for insured events that have already occurred, including events that have occurred but for which claims have not been reported, and other incurred insurance expenses; and (b) pay amounts that are not included in (a) and that relate to: <ul style="list-style-type: none"> (i) insurance contract services that have already been provided; or (ii) any investment components or other amounts that are not related to the provision of insurance contract services and that are not in the liability for remaining coverage.

liability for remaining coverage	<p>An entity's obligation to:</p> <ul style="list-style-type: none"> (a) investigate and pay valid claims under existing insurance contracts for insured events that have not yet occurred (ie the obligation that relates to the unexpired portion of the insurance coverage); and (b) pay amounts under existing insurance contracts that are not included in (a) and that relate to: <ul style="list-style-type: none"> (i) insurance contract services not yet provided (ie the obligations that relate to future provision of insurance contract services); or (ii) any investment components or other amounts that are not related to the provision of insurance contract services and that have not been transferred to the liability for incurred claims.
policyholder	A party that has a right to compensation under an insurance contract if an insured event occurs.
portfolio of insurance contracts	Insurance contracts subject to similar risks and managed together.
reinsurance contract	An insurance contract issued by one entity (the reinsurer) to compensate another entity for claims arising from one or more insurance contracts issued by that other entity (underlying contracts).
risk adjustment for non-financial risk	The compensation an entity requires for bearing the uncertainty about the amount and timing of the cash flows that arises from non-financial risk as the entity fulfils insurance contracts .
underlying items	Items that determine some of the amounts payable to a policyholder . Underlying items can comprise any items; for example, a reference portfolio of assets, the net assets of the entity, or a specified subset of the net assets of the entity.

Supplement

IBOR reform

Contents

Overview	4716
1 Introduction	4717
1.1 Background	4717
1.2 IFRS Amendments	4719
2 Changes in the basis for determining the contractual cash flows	4721
2.1 Changes in the rate of interest	4722
2.1.1 Direct consequences of the Reform	4723
2.1.2 Economically equivalent	4723
2.1.3 ISDA fallback spread	4725
2.1.4 Addition of and adjustment to floors and caps	4726
2.1.5 Cash settlement	4726
2.2 Derecognition	4727
2.2.1 Modification of financial instruments	4727
2.3 Modification or replacement of derivative contracts	4728
2.3.1 Two new derivatives, one equal and offsetting the original derivative	4728
2.3.2 Derivative replaced with a new derivative	4728
2.3.3 New basis swap linked to the derivative	4728
2.3.4 Novation to a new counterparty and amendment of the derivative	4729
2.3.5 Transition by central clearing houses	4730
3 Classification	4731
3.1 Classification of financial assets	4731
3.2 Separation of embedded derivatives	4732
4 Hedge accounting	4733
4.1 Phase 1 reliefs	4733
4.1.1 The Phase 1 reliefs for IFRS 9	4733
4.1.2 End of Phase 1 reliefs for IFRS 9	4734
4.1.3 Phase 1 reliefs for IAS 39	4736
4.2 Phase 2 hedge accounting amendments	4736
4.2.1 Phase 2 reliefs for IFRS 9	4736
4.2.2 Phase 2 reliefs from discontinuing hedge relationships	4737
4.2.3 Phase 2 relief for groups of items	4740
4.2.4 Phase 2 temporary relief for designation of risk components	4740
4.2.5 Determination of whether an RFR is a separately identifiable risk component	4741
4.2.6 Determination of whether an RFR is a reliably measurable risk component	4743

4.2.7	Phase 2 amendments for IAS 39	4743
4.2.8	Determination of whether an RFR is a separately identifiable risk component under IAS 39	4744
4.3	Application of Phase 2 reliefs	4744
4.3.1	Fair value hedges	4744
4.3.2	Cash flow hedges	4746
5	Transition	4750
5.1	Phase 1	4750
5.2	Phase 2	4750
6	Disclosures	4752
6.1	Phase 1	4752
6.2	Phase 2	4754
6.2.1	Disclosure for instruments which have not transitioned	4755
6.2.2	Application to loan commitments	4756
6.2.3	Level of detail for different categories	4756
6.2.4	Exposures that reference a new rate but for which further transition could occur	4757
6.2.5	Phase 2 disclosure: Illustrations and examples	4758
6.3	Sources of hedge ineffectiveness	4760
6.4	Significant judgements	4761
6.5	Transition disclosures	4761
7	Amendments to IFRS 16 Leases	4762
8	Amendments to IFRS 4 Insurance Contracts	4763
	Appendix A - Index of Illustrations	4764
	Appendix B - Defined terms	4765

Overview

One of the reforms mandated by the Financial Stability Board following the financial crisis was to push for benchmark Interbank Offered Rates (IBORs), such as LIBOR, to be replaced by new 'official' benchmark rates, known as alternative Risk Free Rates (RFRs), a process hereinafter referred to as 'IBOR Reform' or 'the Reform'.

The IASB responded with two separate amendments to IFRS: the Phase 1 Amendments were published in September 2019 (effective for years beginning on or after 1 January 2020, but with early application permitted); and the Phase 2 Amendments were published in August 2020 (effective for years beginning on or after 1 January 2021, but again with early application permitted). Once IBOR Reform is complete and the RFRs have become established in the market, the Phase 1 and Phase 2 amendments will cease to be required.

The Phase 1 Amendments address the accounting consequences that arise during the period before financial instruments transition from referencing IBORs to referencing replacement benchmark interest rates. They primarily permit the continuation of hedge accounting for hedge relationships that reference IBORs that are expected to be replaced by IBOR Reform. This supplement describes how the reliefs to allow hedging relationships to continue are applied and the additional disclosures that are required.

The Phase 2 Amendments address the accounting consequences that arise once financial instruments and leases transition from referencing IBORs to referencing replacement benchmark interest rates. This supplement describes how the reliefs are applied to financial instruments when they transition to replacement benchmark interest rates, including the effect on hedging relationships and, again, the disclosures entities are required to provide.

Differences between the IFRS accounting standards and US GAAP guidance on this topic are not addressed in this supplement as the standards are not converged. Therefore, differences between IFRS accounting standards and US GAAP could exist that are not discussed in this supplement.

At the time of writing, IBOR Reform is substantially complete as the most significant IBORs, including all the LIBORs, have now ceased and been replaced. However, there remain some local IBORs for which the work to replace them is still in progress or has only very recently been completed, hence the guidance in this chapter remains relevant.

What you need to know

- The end of IBORs present various accounting challenges, for which the amendments to IFRS accounting standards provide relief. The IASB achieved this with the Phase 1 and Phase 2 Amendments to IFRS accounting standards.
- The Phase 1 Amendments primarily permit the continuation of hedge accounting for hedge relationships that reference IBORs that are expected to be replaced by IBOR Reform. They provide relief from the uncertainty caused by IBOR Reform which could otherwise affect hedging relationships.
- The main elements of the Phase 2 Amendments provide that for modifications to financial instruments that are necessary to implement IBOR Reform, and for which the new basis for calculating cash flows is 'economically equivalent' to the previous basis:
 - (i) The effective interest rate (EIR) on floating-rate financial instruments is adjusted.
 - (ii) The formal designation of hedge relationships is amended and hedge accounting will continue.
- To the extent that any additional modifications are made to financial instruments, it will be necessary to assess whether they would lead to the instruments' derecognition.
If not:
 - (i) For floating rate instruments not recorded at fair value through profit or loss, the net present value of the additional modification (discounted at the adjusted EIR noted in (i) above) is recorded in profit or loss.
 - (ii) Hedge accounting will only continue as long as the hedge is not required to be discontinued, applying the normal hedge accounting rules. If the hedge continues, the formal designation is amended, but there could, in future, be additional hedge ineffectiveness.
- Both the Phase 1 and Phase 2 Amendments contain some significant additional disclosure requirements.
- IFRS 16 *Leases* was amended to provide relief for the accounting by lessees for leases which refer to IBORs.

1 Introduction

1.1 Background

IBOR Reform is ongoing since, whilst the most significant IBORs have now completed the transition to RFRs, some local IBORs are still to transition. Examples of RFRs that have replaced or are in the process of replacing IBORs include the following:

- Hong Kong dollar Overnight Index Average (HONIA) that has replaced Hong Kong Dollar LIBOR.
- Swiss Average Rate Overnight (SARON) that has replaced Swiss LIBOR.
- Secured Overnight Financing Rate (SOFR) that has replaced US dollar LIBOR.
- Sterling Overnight Indexed Average (SONIA) that has replaced sterling LIBOR.
- Tokyo Overnight Average (TONA) that has replaced Japanese Yen LIBOR.
- Canadian Overnight Repo Rate Average (CORRA) that has replaced Canadian Dollar Offered Rate (CDOR), which ceased on 28 June 2024.¹
- The Singapore Overnight Rate Average (SORA) that has replaced Singapore Dollar Swap Offer Rate (SOR), which ceased in 2023 and is in the process of replacing Singapore Interbank Offered Rate (SIBOR, which will cease after December 2024).²

In March 2021, the Intercontinental Exchange (ICE) Benchmark Administration (the administrator of LIBOR), in conjunction with the UK's Financial Conduct Authority (FCA) announced that it would stop publishing the following LIBOR settings based on submissions from panel banks, after 31 December 2021: all GBP, EUR, CHF and JPY LIBOR settings and the one-week and two-month US dollar LIBOR settings. All remaining US dollar LIBOR settings (i.e., the overnight and the one-, three-, six- and twelve-month settings) ceased to be published based on panel bank submissions after 30 June 2023.

The FCA, which regulates LIBOR, confirmed on 29 September 2021 that 'synthetic' LIBOR would continue to be published for one-month, three-month and six-month sterling and yen LIBOR until 31 December 2022. The FCA indicated that it would not compel publication of yen LIBOR thereafter. The synthetic LIBOR is based on forward looking term versions of the relevant RFR plus the ISDA fallback spread adjustment (see below). However, the FCA stressed that these synthetic LIBORs do not meet the conditions of the Benchmark Regulation, are not for use in new contracts and are intended to help reduce disruption for certain contracts that are particularly difficult to amend (often referred to as 'tough legacy') to help ensure an orderly wind-down.³

In September 2022, the FCA confirmed that publication of one and six-month synthetic sterling LIBOR would be required until the end of March 2023, after which these settings would permanently cease.⁴ In April 2023, the FCA confirmed that three-month synthetic sterling LIBOR would continue until the end of March 2024 and then permanently cease, and that one-month, three-month and six-month US dollar LIBOR settings would continue in synthetic form until 30 September 2024 and then permanently cease.⁵ See below in section 6.2.1 for further detail on the availability of synthetic LIBORs.

Meanwhile, the Euro Overnight interest Average (EONIA) was, in effect, replaced by the Euro Short Term-Rate (€STR) and publication of EONIA ceased on 3 January 2022.⁶ Reforms to the Euro Interbank Offered Rate (EURIBOR) methodology were completed in 2019 with the process by which it was set changing from a quotes-based to a transactions-based methodology. Since then, the organisation which oversees EURIBOR, the European Money Markets Institute (EMMI), has continued to improve the methodology by which it is set and the most recent changes were proposed in October 2023⁷ and started to be implemented in May 2024 (with a phased implementation due to complete in October 2024).⁸ These changes ensure that EURIBOR continues to satisfy the requirements of the Benchmark Regulation and does not need to be replaced with a RFR.

The RFRs that were originally introduced are overnight rates based on actual transactions and reflect the average of the interest rates that certain financial institutions pay to borrow overnight either on an unsecured basis (such as SONIA) or on secured overnight repurchase transactions (such as SOFR). The interest paid on an overnight RFR-based loan is calculated in arrears over a period, usually by compounding the daily rate. Term RFRs, based on the forward market for overnight RFRs are available for use in certain circumstances and allow borrowers to know in advance the interest they will pay for a period, in a similar manner to IBOR-based loans. On 29 July 2021, the U.S. Alternative Reference Rates Committee (ARRC) formally endorsed the use of the 1-month, 3-month and 6-month SOFR Term Rates administered by the Chicago Mercantile Exchange (CME) Group.⁹ In addition, the 12-month SOFR Term Rate was endorsed in May 2022.¹⁰ However, given concerns about the potential financial stability risks that could result from the widespread use of Term SOFR, the ARRC recommended that the use of Term SOFR be limited to the following specific purposes:¹¹

- As a fallback rate for legacy LIBOR cash products
- For new use in business loans, and also certain securitisations that hold Term SOFR assets
- For use in derivatives only if issued to end-users to hedge cash products that reference the Term SOFR rate

Whilst the ARRC recognised the use of Term SOFR in the above cases, it continued to recommend the use of overnight SOFR and SOFR averages for all products.

One-month, three-month, six-month and twelve-month forward looking term SONIA Reference Rates also became available from the beginning of 2021. References in this supplement to SOFR and SONIA are to overnight rates unless indicated otherwise.

On 23 October 2020, the International Swaps and Derivatives Association (ISDA) published its IBOR fallback protocol and supplements, which were designed to address transition for those derivative contracts still outstanding on the permanent cessation of an IBOR. However, derivative market participants were encouraged to amend or close out existing IBOR contracts before then, without waiting to use the fallback mechanism.¹²

IBORs, fixed in advance for a period (such as 3-months or 6-months), include a bank's credit risk premium for that period. However, the RFRs are designed to exclude all but overnight credit risk and SOFR is based on secured lending rates. Hence, applying the ISDA Fallbacks, the transition includes a spread adjustment to the previous derivative floating rate, which takes effect from when the period for the current LIBOR (or synthetic LIBOR) fixing comes to an end. The same approach is used for derivatives that transition with the central clearing houses. The ISDA fallback spread adjustments, sometimes referred to as Credit Adjustment Spreads ('CAS') are based on the average historical spread between the relevant IBOR and the compounded RFR over the previous five years (see section 2.1.3 below). The ISDA spread adjustments for LIBOR became fixed on 5 March 2021.¹³ These included:

- US dollar 3-months 26.161bp
- Sterling 3-months 11.93bp
- Sterling 6-months 27.66bp
- Japanese Yen 3-months 0.835bp

ISDA also published spread adjustments for other IBORs including CDOR and HIBOR.¹⁴ Also, during 2020, derivative clearing houses such as the CME and the London Clearing House (LCH) adopted RFRs as discount rates to value LIBOR derivatives. Amending the reference rate for derivatives does not affect their credit risk. Consequently, a spread may be required to be added to the RFR discount rate to reflect the appropriate credit risk. For example, for uncollateralised derivatives, unless compensating changes are also made to the calculation of the Credit Valuation Adjustment (CVA), it does not follow that an overall reduction in the discount rates used to value them would be appropriate.

The Reform also affects future cash flows on non-derivative floating rate financial instruments such as bonds and loans, referenced to IBORs. These need to be bilaterally renegotiated, as with other transactions that reference IBORs, such as some leases. In each country, working groups have been formed to issue recommendations and assist market participants in the transition from IBORs, including fallback language, possible replacement rates and the related spread adjustment methodologies for different types of loans.

How we see it

Entities need to update their assessment of the accounting implications of the scenarios they expect to encounter as they continue to transition from IBORs to RFRs and complete their programmes to implement the new requirements before the remaining IBORs cease and local IBORs that are still to transition. The work required to negotiate the new terms for loans (especially where there are multiple parties to the contract such as syndicated loans) and to amend derivative valuation models could be substantial.

1.2 IFRS Amendments

In 2018, the IASB added a project to its agenda to consider the financial reporting implications of the Reform. It identified two groups of accounting issues that could have financial reporting implications. These were:

- *Phase 1:*
Pre-replacement issues - issues affecting financial reporting in the period before the replacement of an existing interest rate benchmark with an alternative RFR.
- *Phase 2:*
Replacement issues - issues that might affect financial reporting when an existing interest rate benchmark is replaced with an alternative RFR.

The IASB gave priority to the Phase 1 issues because they were more urgent at that time and in September 2019, the Board issued *Interest Rate Benchmark Reform, Amendments to IFRS 9, IAS 39 and IFRS 7* (the Phase 1 Amendments) to address them. The Phase 1 Amendments provided a number of temporary exceptions from applying specific hedge accounting requirements of both IFRS 9 *Financial Instruments* and IAS 39 *Financial Instruments: Recognition and Measurement* (see section 4.1 below). They primarily permit the continuation of hedge accounting for hedge relationships that reference IBORs that are expected to be replaced by IBOR Reform. The Phase 1 Amendments also added some additional disclosure requirements to IFRS 7 *Financial Instruments: Disclosures* (see section 6.1 below).

The Phase 1 Amendments were effective for accounting periods beginning on or after 1 January 2020 and early application was permitted.

In August 2020, the IASB issued *Interest Rate Benchmark Reform Phase 2, Amendments to IFRS 9, IAS 39, IFRS 7, IFRS 4 and IFRS 16* (the Phase 2 Amendments). The Phase 2 Amendments provided the following changes in respect of financial instruments that are directly affected by the Reform:

- A practical expedient when accounting for changes in the basis for determining the contractual cash flows of financial assets and liabilities, to require the effective interest rate to be adjusted (see section 2 below).
- Reliefs from discontinuing hedge relationships (see sections 4.2 and 4.3 below).
- Temporary relief from having to meet the separately identifiable requirement when an RFR instrument is designated as a hedge of a risk component (see sections 4.2.4 and 5 below).
- Additional IFRS 7 disclosures (see section 6.2 below).

How we see it

The Phase 2 Amendments introduced additional areas of judgement, for which entities need to ensure they have appropriate accounting policies and governance in place. For the additional disclosures, entities must ensure they can gather and present compliant information.

The Phase 2 Amendments also affected IFRS 16 *Leases* (see section 7 below) and IFRS 4 *Insurance Liabilities* (see section 8 below). The amendments to IFRS 4 were designed to allow insurers who are still applying IAS 39 to obtain the same reliefs as those provided by the amendments made to IFRS 9. Given the limited scope of the IFRS 4 amendments, this supplement only provides references to IAS 39 in respect of hedge accounting, which is still applied by many entities.

The Phase 2 Amendments were effective for annual periods beginning on or after 1 January 2021 and early application was permitted (see section 5 below).

While all LIBORs had fully transitioned by the end of 2024, other IBORs (such as the Johannesburg InterBank Average Rate (JIBAR)) were still progressing their transition and other IBORs may transition at some further date in the future which has not yet been set.¹⁵ The Phase 1 and Phase 2 Amendments to IFRS accounting standards apply on an instrument-by-instrument basis, and it is possible that, for some IBORs, application of Phase 2 will not happen until an as yet unknown number of years in the future.

In this EY Global IFRS video from September 2020 Tony Clifford and David Bradbery provide a summary of the IASB's IBOR Reform Phase 2 Amendments.

2 Changes in the basis for determining the contractual cash flows

In its Phase 2 Amendments the IASB identified four ways that changes in the basis for determining the contractual cash flows of a financial instrument might be made in order to achieve IBOR Reform:

[IFRS 9.5.4.6, IFRS 9.6.9.2, IFRS 9.BC6.620(a)]

- By amending the contractual terms (for instance, to replace a reference to an IBOR with a reference to an RFR)
- Through activation of an existing fallback clause in the contract
- Without amending the contractual terms, but by changing the way that an interest rate benchmark is calculated
- A hedging instrument could alternatively be changed as required by the Reform by closing out an existing IBOR-related derivative and replacing it with a new derivative with the same counterparty, on similar terms except referencing an RFR, or by combining the existing IBOR-related derivative with a new basis swap that swaps the existing referenced IBOR for the RFR

The first two approaches are relatively self-explanatory. The third corresponds, for example, to the decision made in Europe in 2019 to redefine EONIA as ESTR plus 8.5bp and also to the changes made in 2019 to how EURIBOR is calculated. The IASB believes that changes in methods for calculating the interest rate could, in effect, represent a modification of the contractual cash flows. [IFRS 9.BC5.297, IFRS 9.BC5.298, IFRS 9.BC5.299]. However, the Phase 2 Amendments use the phrase, 'changes in the basis for determining contractual cash flows' instead of 'modification of the contractual cash flows', so as not to imply that the Phase 2 Amendments provide guidance on the treatment of those modifications that occur outside the scope of the Reform. The IASB identified the general model of modifications to contractual cash flows as a topic to be addressed as part of the Post Implementation Review of IFRS 9. In September 2024, they commenced the Amortised Cost Measurement Project and included modification of contractual cash flows in the project plan.¹⁶ This is also discussed in Chapter 46.¹⁷

The fourth method of making changes to the basis for determining contractual cash flows of an instrument, by replacing a hedging instrument, as described above, was added following responses to the Phase 2 ED. Many derivatives, especially those cleared through central clearing counterparties, will potentially never be adjusted to achieve the Reform but, instead, be replaced by a new derivative on similar terms. (This is discussed in more detail in section 2.3 below).

For all four changes, an entity needs to assess whether they are a 'direct consequence of the Reform' (as discussed in section 2.1.1 below) and result in new contractual cash flows that are 'economically equivalent' (as discussed in section 2.1.2 below).

If yes, then the reliefs applicable for the adjustment of the EIR (as described in section 2.1 below) and for the continuation of hedging relationships (as described in section 4.2.2 below) must be applied.

If the changes are not a direct consequence of the reform or do not result in economically equivalent contractual cash flows, it is first necessary to assess if the changes require the derecognition of the original instrument, as described in section 2.2 below.

If derecognition is required, then the reliefs applicable to the EIR and the continuation of hedging relationships are not available.

If derecognition is not required by the changes, then the reliefs could be partially applicable:

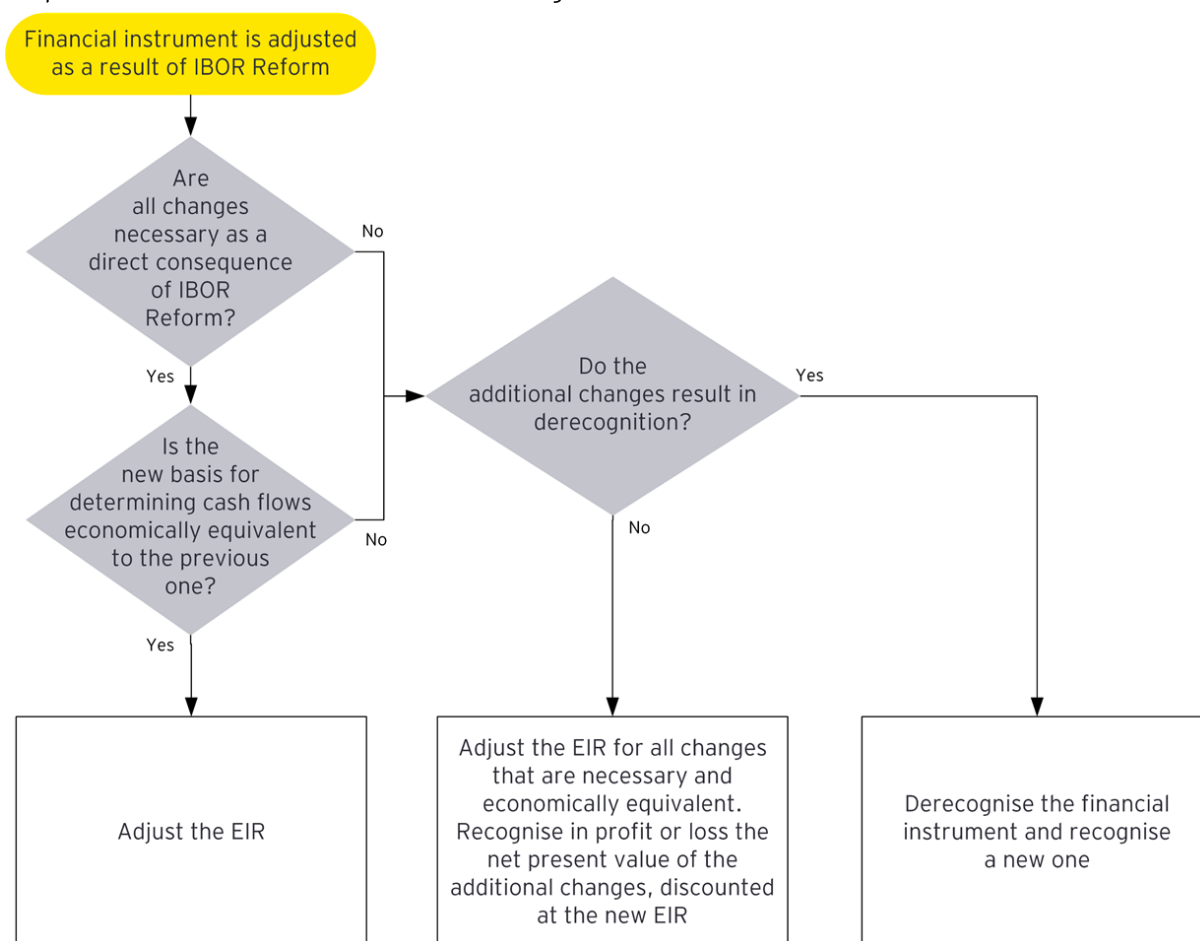

- A modification gain or loss will potentially need to be recognised after revising the EIR for instruments involving an EIR, as described in section 2.1 below.
- A hedging relationship can potentially still continue, as described in section 4.2.2 below.

16 [IASB Staff Paper AP11, Amortised Cost Measurement, Project commencement, September 2024](#). See Appendix A - Initial list of project, page 13, topics 2 and 3. Available on the IFRS Foundation's website.

17 [IASB Staff Paper 3A, Project: Post-implementation review of IFRS 9 - Classification and Measurement, Paper topic: Modifications of financial assets and financial liabilities](#), IASB meeting, July 2022. Available on the IFRS Foundation's website.

2.1 Changes in the rate of interest

The requirements are summarised in the following flow chart:

This section covers the application of the relief applicable to instruments with an EIR. However, because the two conditions required to apply this relief (i.e., the changes are a direct consequence of the Reform and the changes result in economically equivalent contractual cash flows) are the same as for the relief allowing the continuation of hedging relationships, the clarifications provided in this section on these two conditions are also applicable for the purpose of assessing the continuation of hedging relationships (as further discussed in section 4.2.2 below).

If an IBOR is amended to refer to an RFR, without the benefit of the Phase 2 Amendments:

- First, the entity would have to assess whether the changes made to a financial instrument to achieve the Reform would lead to its derecognition.
- Second, if the instrument is not derecognised and is recorded at amortised cost or at fair value through other comprehensive income, the entity would apply the requirements in IFRS 9.5.4.3 and recalculate the carrying amount of the financial instrument using the original effective interest rate (EIR), i.e., based on the IBOR before transition to the RFR.

The second of these would mean that interest revenue or expense would continue to be recognised using an IBOR-based EIR over the remaining life of the instrument, even if the IBOR is no longer available. The Board considered that, in this context, this outcome would not necessarily provide useful information to users of the financial statements, as the interest recognised would not reflect the economic effects of changes made to a financial instrument as a result of the Reform. [IFRS 9.BC5.306].

Therefore, the Phase 2 Amendments require, as a practical expedient, for changes to cash flows that relate directly to the Reform to be treated as changes to a floating interest rate, i.e., the EIR is updated to reflect the change in an interest rate benchmark from IBOR to an RFR without adjusting the carrying amount. In effect, the change is treated as akin to a movement in the market rate of interest. [IFRS 9.5.4.7].

The use of the practical expedient is subject to two conditions: [IFRS 9.5.4.7]

- First, the change in the basis for determining contractual cash flows must be ‘necessary as a direct consequence of interest rate benchmark reform’.
- Second, the new basis for determining the contractual cash flows must be ‘economically equivalent to the previous basis’, immediately preceding the change.

Each of these conditions is discussed, in turn, below.

It must be noted that the addition of a fallback provision and the activation of a fallback provision are both treated in the Phase 2 Amendments as changes to the basis for determining contractual cash flows. This implies that if a financial instrument is, first, amended to add a fallback provision and, second, this provision is activated, then the Phase 2 practical expedient will be applied twice. However, applying the expedient, the accounting effects arise only on activation. Some ‘hardwired’ fallbacks specify two transitions, first to an overnight RFR and second, to a term RFR when it becomes available. Presumably, Phase 2 reliefs will be available for each transition.

How we see it

Because of the practical expedient, transition to RFRs will generally result in a change in the EIR for floating-rate financial instruments recorded at amortised cost or at fair value through OCI. However, many financial instruments such as loans will need to be renegotiated bilaterally and entities will need to establish policies and procedures to avoid, or else identify, any modifications over and above those required by the Reform and to ensure that they are accounted for appropriately (see section 2.2.1 below).

2.1.1 Direct consequences of the Reform

There is limited guidance in the Phase 2 Amendments as to what changes for determining contractual cash flows would be a direct consequence of the Reform. In Phase 1, the IASB defined IBOR Reform as “the market-wide reform of an interest rate benchmark, including the replacement of an interest rate benchmark with an alternative benchmark rate such as that resulting from the recommendations of the Financial Stability Board’s July 2014 report, *‘Reforming Major interest Rate Benchmark’*.” [IFRS 9.6.8.2, IAS 39.102B]. IBOR Reform can, therefore, be read to encompass any replacement of references to an IBOR with a rate considered acceptable by local regulators, such as an RFR, and any related amendments necessary to implement the Reform, including those needed to achieve economic equivalence (see section 2.1.2 below).

Some respondents to the Phase 2 ED asked the question as to whether the reliefs are only available if, in the particular jurisdiction, IBOR Reform is mandated by laws or regulations. Consequently, they would not be available if, for example, financial instruments were modified only because of a concern that the IBOR could, in future, be discontinued due to reduced liquidity or to align with global market developments. In the Phase 2 Amendments’ Basis for Conclusions, the IASB has clarified that, while the changes must be a direct consequence of the Reform, they do not, in themselves, have to be mandatory. [IFRS 9.BC5.313].

2.1.2 Economically equivalent

The Phase 2 Amendments provide examples of where changes would be ‘economically equivalent’: [IFRS 9.5.4.8]

Extract from IFRS 9

- 5.4.8 Examples of changes that give rise to a new basis for determining the contractual cash flows that is economically equivalent to the previous basis (ie the basis immediately preceding the change) are:
- (a) the replacement of an existing interest rate benchmark used to determine the contractual cash flows of a financial asset or financial liability with an alternative benchmark rate - or the implementation of such a reform of an interest rate benchmark by altering the method used to calculate the interest rate benchmark - with the addition of a fixed spread necessary to compensate for the basis difference between the existing interest rate benchmark and the alternative benchmark rate;
 - (b) changes to the reset period, reset dates, or the number of days between coupon payment dates in order to implement the reform of an interest rate benchmark; and
 - (c) the addition of a fallback provision to the contractual terms of a financial asset or financial liability to enable any change described in (a) and (b) above to be implemented.

It will be clear from the list above that 'economically equivalent' does not mean 'economically identical'. The IASB also makes it clear that it regards 'economic equivalence' to be principle-based and the above list is not intended to be exhaustive. [IFRS 9.BC5.315, IFRS 9.BC5.317]. For instance, it would be consistent with these examples to include amendments to caps and floors so as to maintain their economic effect (see Illustration 2-1 in section 2.1.4 below). It would also be consistent with the examples for transition to a synthetic LIBOR such as those defined by the FCA (see section 1.1 above), to be considered as economically equivalent.

The Basis for Conclusions also clarifies that, while the notion of economic equivalence means that the interest rate will be substantially the same before and after the replacement, as long as the changes are consistent with the above examples, there is no requirement to demonstrate this is the case through a quantitative analysis ("the entity would not be required to analyse whether the discounted present value of the cash flows of that financial instrument are substantially similar before and after the replacement"). [IFRS 9.BC5.315, IFRS 9.BC5.316]. Accordingly, the IASB set no 'bright lines' and an entity is required to apply judgement to assess whether circumstances meet the economic equivalence condition.

How we see it

The term 'economically equivalent' is not defined in the Phase 2 Amendments. Whilst the IASB's intention is that the assessment is predominantly qualitative in nature, entities need to develop an accounting policy and processes to ensure that the assessment can be carried out consistently in a suitably controlled manner. Associated with this, entities are advised to review how their existing accounting policy for modifications of financial instruments is determined and applied in practice.

For many financial instruments, the changes needed to transition to an RFR will require negotiation between the two parties to the contract and it is possible that the agreed modifications could go further than those needed just to implement the Reform. After an entity applies the practical expedient to modifications to the financial instrument required by the Reform, it then separately assesses any further modifications that are not required by the Reform to determine whether they result in derecognition of the financial instrument (see section 2.2 below). If they do not result in derecognition, an entity uses the updated EIR to adjust the carrying amount of an instrument not recorded at fair value through profit or loss, and immediately recognises a modification gain or loss in profit or loss within interest income or expense. [IFRS 9.5.4.9].

Extract from IFRS 9

5.4.9 If changes are made to a financial asset or financial liability in addition to changes to the basis for determining the contractual cash flows required by interest rate benchmark reform, an entity shall first apply the practical expedient in paragraph 5.4.7 to the changes required by interest rate benchmark reform. The entity shall then apply the applicable requirements in this Standard to any additional changes to which the practical expedient does not apply. If the additional change does not result in the derecognition of the financial asset or financial liability, the entity shall apply paragraph 5.4.3 or paragraph B5.4.6, as applicable, to account for that additional change. If the additional change results in the derecognition of the financial asset or financial liability, the entity shall apply the derecognition requirements.

Application of these requirements means an entity first applies the practical expedient to a change that is required by IBOR Reform (i.e., a change that meets both the conditions in IFRS 9.5.4.7, as discussed in this section and then applies the normal requirements in IFRS 9 to those changes to which the practical expedient does not apply.

Examples of possible changes that would most likely not be viewed as economically equivalent, include:

- Changes to the principal or notional value
- Changes in maturity and methods of repayment (such as a move from a bullet repayment to by instalment)
- Changes in credit spread to reflect changes in the credit quality of the obligor
- The addition or removal of caps and floors, prepayment and extension options

In many cases, an instrument will transition on a date that is different to the fixing date when the contractual cash flows are scheduled to periodically reset to the current floating rate. At the time of transition an instrument will often therefore, in effect, be a combination of a fixed rate instrument until the end of the previous fixing period and a floating rate instrument for all future fixings. IBOR Reform affects only the future fixings, which following transition will reference the new RFR. For the instrument to transition on an economically equivalent basis, any cash flows remaining from the final IBOR fixing before transition, will normally continue until the next scheduled fixing takes place, which will reference the RFR.

How we see it

In general, any transition that is economically equivalent is likely to share three main characteristics:

- The new basis for determining contractual cash flows is qualitatively similar to the previous one.
- The amendment is designed to help ensure an equitable transition to an RFR for both parties to the contract. This will, in theory, most easily be demonstrated if the amendment is in accordance with an industry-accepted protocol designed with this objective.
- An economically equivalent transition involves no significant change in a financial instrument's fair value. Therefore, any adjustment to the spread other than to reflect the difference between RFRs and IBORs on transition, or a payment by one party to the other, to compensate for a change in terms, which is not small when compared to the original contractual cash flows, could indicate that the terms are not economically equivalent and will require careful analysis.

2.1.3 ISDA fallback spread

The challenges associated with determining an appropriate method for calculating the basis spread between RFRs and IBORs on transition are illustrated well by the process through which ISDA arrived at its derivative fallback protocol for the cessation of LIBOR. ISDA set out the following criteria:

- (i) Minimising value transfer at the time the fallback is applied
- (ii) Minimising any potential for manipulation
- (iii) Eliminating or mitigating against the impact of market disruption at the time the fallback is applied

ISDA consulted on three possible approaches to set the spread, noting that they each satisfied these criteria to varying degrees:¹⁸

- (1) Arguably the most 'economically equivalent' approach, in that it would be present value neutral, would be to base the spread on the forward market view of the spread between the IBORs (for each tenor, such as 3-months or 6-months) and the RFR at the date of calibration. However, this approach would be complicated, and the necessary data is unlikely to be readily available. The forward approach would require a forward IBOR curve and a forward RFR curve for the term of all financial instruments and so potentially out to 40 or 50 years. This would require both an established RFR market as well as extensive market data, which does not currently exist.
- (2) The simplest approach would be what is termed the 'spot' method. This bases the spread adjustment on the spot spread between the relevant IBOR and the adjusted RFR on the day before the fallback provisions are triggered. This approach is likely to ensure that the current rate of interest is 'substantially the same'. Its disadvantages are not only that it does not reflect the market expectations on forward rates (and so will not be present value neutral on the date of calibration), but it is likely to be more volatile than a forward spread.
- (3) The majority of respondents to ISDA's consultation preferred what became the adopted approach, using the median historical spread between the relevant IBOR and the compounded RFR over the previous five years. It was recognised that this "is unlikely to be present value neutral on the calibration date because spot rates are unlikely to be consistent with forward rates and because the average historical market conditions may not match market expectations for future market conditions". However, it has two major advantages: first, it is less volatile than spot rates and captures the tendency of interest rates to fluctuate around a long-term mean and, hence, is likely to be a better approximation to the forward spread; and, second, it is based on readily available information.

The ISDA methodology for determining the spread can be applied by entities more broadly to the transition of many non-derivatives to RFRs, e.g., it can provide a starting point in bilateral negotiations to amend a contract. As has already been mentioned in section 1 above, the ISDA fallback spreads were 'fixed' on 5 March 2021.

¹⁸ *Interbank Offered Rate (IBOR) Fallbacks for 2006 ISDA definitions, Consultation on Certain Aspects of Fallbacks for Derivatives Referencing GBP LIBOR, CHF LIBOR, JPY LIBOR, TIBOR, Euroyen TIBOR and BBSW*, ISDA, July 2018.

How we see it

Any approach to adjust the spread on transition to an RFR must be practical to apply and make use of data that is reliable and readily available. Because of limitations on the availability of data, there will be more than one acceptable method for determining the spread between IBOR and an RFR. The types of approaches explored by ISDA can, in theory, all result in transitions which are economically equivalent.

When using approaches such as that developed by ISDA that are based on rigorous quantitative analysis, it will likely not be necessary to make a quantitative evaluation of the economic equivalence on an instrument-by-instrument basis.

2.1.4 Addition of and adjustment to floors and caps

One particular area that could cause challenges is the introduction of, or adjustment of interest rate floors and caps to financial instruments on transition to RFRs. For floors, this was particularly relevant whilst risk free interest rates were close to zero or even negative, as was the case in many jurisdictions in 2020 and 2021. In a rising interest rate environment, such as that experienced since 2022, interest rate caps become increasingly relevant. A simple example, where an interest rate floor is modified so as to give the same economic effect as before transition, is shown in Illustration 2-1 below.

For more complex fact patterns, which might involve introducing a floor or cap where none was present before, or resetting the floor so that, for example, for a floor the RFR cannot go below zero or for a cap the RFR cannot go above 5%, and which could also involve an amendment to the spread or a cash compensation paid to the lender, the assessment will be more difficult. The analysis will depend on whether the modification is considered to be required by the Reform and whether the effect is economically equivalent (see further discussion in section 2.1.1 and section 2.1.2 above). The addition of a floor or cap is unlikely to be viewed as economically equivalent unless the likelihood of the floor or cap being activated is insignificant. The Amendments provide only limited guidance, and this is an area where judgement is required.

These requirements as applied to an interest rate floor are shown in Illustration 2-1 below and also in Illustrations 4-2 to 4-4 in section 4.3 below.

Illustration 2-1: Application of the Phase 2 relief for amendment of a floor

An existing short-term loan pays 3-month US dollar LIBOR + 100 bp, with a floor of LIBOR = zero. It is restructured to pay SOFR + 126bp, when 26bp is determined to be the market basis difference between 3-month LIBOR and SOFR. (26bp is based on the ISDA fallback spread although rounded to simplify the example). The floor is amended to SOFR + 26bp = zero. Both before and after transition, including the credit spread, the loan has an effective floor of 100bp.¹⁹

The amendment of the instrument, including the floor, is a direct consequence of IBOR Reform and the new terms are assessed to be economically equivalent to the old ones, as the only adjustment is to replace 3-month LIBOR with SOFR plus the market basis difference, with an equivalent adjustment to the floor and the difference in volatility between the two floors is considered negligible. Therefore, Phase 2 IFRS 9.5.4.7 relief is applied, the EIR is amended to SOFR + 126bp and there is no need to consider any other accounting consequences.

2.1.5 Cash settlement

Another challenging issue is whether any cash settlement between the parties to a contract on transition, to compensate for the difference in fair value of a financial instrument, would automatically imply that the change is not economically equivalent. As already noted, 'economic equivalence' does not mean 'economically identical', and the guidance states that interest rates must be 'substantially similar', implying that there is a level of tolerance as to what changes would meet the criterion (see section 2.1.2 above). As described in more detail in section 2.3 below, in the context of modification or replacement of derivatives, an example is included in the Basis for Conclusions, where replacing a derivative with a new one on current market terms, with cash settlement for the difference in fair value, would not be regarded as economically equivalent. However, in this example, the contractual terms of the new at-market derivative are described as 'substantially different'.

¹⁹ In practice, there might also be a further minor adjustment to the spread to reflect the difference in volatility of an RFR based floor compared to an IBOR based floor, but this is ignored for the purpose of this example.

In contrast, another example regarded as economically equivalent involves no cash settlement and the replacement of the original derivative with an off-market derivative with identical terms other than the replacement RFR. A situation involving some cash settlement could fall between these two extremes. Therefore, a transition involving some cash settlement could still be viewed as economically equivalent provided it is relatively small when considered against the contractual cash flows of the original instrument. This is an area where judgement is required.

2.2 Derecognition

It is possible that amendments made to financial instruments on transition to RFRs could lead to their derecognition and the recognition of new instruments. Assessing whether derecognition is required could have a significant consequence for their accounting treatment. For a financial instrument that is not measured at fair value through profit or loss, the possible outcomes of this assessment include a profit or loss on derecognition, the classification of the new instrument, the measurement of the EIR, and its staging if subject to the expected credit loss impairment requirements. Meanwhile, for all financial instruments, including derivatives, the derecognition assessment could be critical for the continuation or discontinuance of hedge accounting (see section 2.2.1 below).

2.2.1 Modification of financial instruments

The issue as to when a modification of a financial instrument might lead to its derecognition is specifically addressed in IFRS 9 only for financial liabilities and not for financial assets. The key requirement for financial liabilities is that a modification that results in a 'substantial change' in the expected cash flows will lead to the derecognition of the original liability and the recognition of a new one. [IFRS 9.3.3.2]. There is no equivalent guidance in IFRS 9 for modifications of financial assets, although, in 2012, the IFRS Interpretations Committee, in discussing the restructuring of Greek Government Bonds, considered that it would be appropriate to analogise, at least to some extent, to those requirements in IFRS 9 applying to modifications and exchanges of financial liabilities (see Chapter 48 for further details).²⁰ This is an area which requires judgement, and many entities will have already developed an appropriate accounting policy. In September 2024, the IASB commenced the Amortised Cost Measurement Project, which once complete should result in additional guidance for modifications.²¹

The Phase 2 Amendments only require an assessment of whether the derecognition criteria apply if changes are made to the financial instrument beyond those that qualify for the practical expedient (see section 2.1 above). Changes qualify for the practical expedient if:

- The change in the basis for determining contractual cash flows is a direct consequence of the Reform.
- The new basis for determining the contractual cash flows is economically equivalent to the previous basis immediately preceding the change.

It follows that changes that qualify for the practical expedient are not required to be assessed for whether they are sufficiently substantial that the instrument would be derecognised. [IFRS 9.5.4.9].

For any changes that are made to a financial instrument that go beyond what is necessary to implement IBOR Reform, entities will need to assess whether the instrument must be derecognised and a new one recognised instead.

How we see it

The Amendments provide no further guidance on what level of modification would be viewed as sufficiently substantial as to lead to derecognition and this assessment will require judgement and possibly the refinement of existing policies and processes to implement the assessment. While IFRS 9 states that a 10% change in the net present value of contractual cash flows of a liability would be considered substantial, it is recognised that the assessment ought also to have regard to qualitative factors, such as the introduction of new contractual features.

²¹ [IASB Staff Paper AP11, Amortised Cost Measurement, Project commencement, September 2024](#), See Appendix A - Initial list of project, page 13, topics 2 and 3 relate to the modifications of contractual cash flows. Available on the IFRS Foundation's website.

2.3 Modification or replacement of derivative contracts

The fourth method of changing the basis for determining contractual cash flows has already been introduced in section 2 above: the close-out and replacement of a derivative with the same counterparty and on the same terms, or the addition of a basis swap. As set out in the Basis for Conclusions, the IASB was concerned that it is the substance of an arrangement that determines the accounting treatment, rather than its form and examined four scenarios. [IFRS 9.BC6.619].

2.3.1 Two new derivatives, one equal and offsetting the original derivative

The first scenario involves the counterparties to an IBOR derivative entering into two new derivatives, one derivative equal and offsetting the original IBOR-based derivative so as to close it out with no gain or loss and a second derivative that references the RFR, but otherwise with the same terms as the original derivative so that it has an equivalent fair value. [IFRS 9.BC6.620(a)]. According to the IASB's analysis, the counterparty to the new derivatives is the same as to the original derivative, the original derivative has not been derecognised and the terms of the alternative benchmark rate derivative are not substantially different from that of the original derivative. The Board, therefore, concluded that such an approach could be regarded as consistent with the changes required by the Reform and since the new derivative is economically equivalent to the original derivative, the Phase 2 hedge accounting reliefs will apply (see section 4.2 below).

If the original derivative is not legally extinguished, this implies that all three derivatives - the original IBOR derivative and the two new ones - would need to be designated together as the hedging instrument. However, in practice, it is likely that the counterparties to the original derivative and the second one which closes it out, will choose to legally extinguish the two derivatives. The process for extinguishing derivatives cleared by a central clearing counterparty is known as 'compression'. In that case, applying the derecognition guidance for financial liabilities, [IFRS 9.3.3.2], the original derivative could be treated as modified rather than as derecognised, since it is an exchange with the same counterparty and does not constitute a 'substantial modification' of the original terms. The relief criterion in IFRS 9.6.9.2(b), that the original hedging instrument is not derecognised, would, therefore, be considered to be met. This approach would also be consistent with the IASB's focus on the substance rather than the legal form, given that it will make no difference to the subsequent net cash flows, whether or not the derivative is legally extinguished.

2.3.2 Derivative replaced with a new derivative

It would give the same result as that described above, if on transition an existing swap is legally terminated and at the same time, a new interest rate swap is entered into, in which all terms and conditions remain unchanged, apart from the new RFR which replaces the IBOR. Notably, we would expect the terms of the new instrument to contain a fixed spread adjustment (similar to the CAS referred to in section 1.1 above) to reflect the absence of credit risk in the RFR which is inherent in the IBOR. If this fixed spread adjustment is not included, it would therefore contribute to the new derivative not being economically equivalent. Derecognition of the original derivative would not be required if, similar to the scenario described in section 2.3.1 above, the conditions to derecognise a financial liability have not been met as the terms are not substantially different.

By contrast, in the second scenario examined by the IASB, the original IBOR derivative is terminated and the unrealised gain or loss settled in cash, and a new RFR derivative is entered into on substantially different terms reflecting the current market rate. Because the IBOR derivative has been extinguished and replaced with a new one on substantially different terms, the IASB considered that this is not consistent with the changes required by the Reform and so the Phase 2 hedge accounting reliefs from discontinuing hedge relationships, discussed in section 4.2.2 above, will not apply. This analysis implies that the first derivative would be derecognised and the second one recognised in its place. [IFRS 9.BC6.620(b)].

2.3.3 New basis swap linked to the derivative

In the third scenario, the entity enters into a new basis swap, specific to a particular derivative instrument, which swaps the existing interest rate benchmark for that instrument to the RFR. This is viewed by the IASB as economically equivalent to modifying the contractual terms of the original instrument, as long as the basis swap is linked or coupled with the original derivative rather than being entered into at a portfolio level. [IFRS 9.BC6.620(c)]. The scenario does not specify whether the basis swap needs to be with the same counterparty as the original derivative and it is unclear whether this is expected to be assumed or whether the omission is deliberate.

2.3.4 Novation to a new counterparty and amendment of the derivative

In a fourth scenario considered by the IASB, it clarified that novating an IBOR-based derivative to a new counterparty and subsequently amending the derivative with that counterparty to refer to an RFR, would result in extinguishment of the original derivative. [IFRS 9.BC6.620(d)]. This is because novation of a derivative would result in the derecognition of the original derivative. The Phase 2 hedge accounting reliefs will, therefore, not apply.

The process of modifying a derivative is shown in Illustration 2-2. Whilst sterling LIBOR, as used in the example, ceased on 31 December 2021, the principles of the example apply equally to IBOR linked derivatives that are still to transition.

Illustration 2-2: Modification of a derivative

Entity A is a party to a swap (swap 1) with a notional value of £10 million and a remaining five-year maturity on which, quarterly, it pays sterling 3-month LIBOR (fixed in advance at the beginning of the quarter) and receives 3% fixed. When first traded with Entity B, the swap was novated to the London Clearing House (LCH), which thereby serves as the swap counterparty to both A and B. A designates the swap as the hedging instrument in a fair value hedge of a fixed rate sterling liability.

In October 2021, Entities A and B choose to amend swap 1 in order to transition it to SONIA, at a time when the basis difference between 3-month LIBOR and overnight SONIA for this instrument is determined to be 12 basis points (based on the ISDA fallback protocol, although rounded to simplify the example) (see section 2.1.3 above). A and B enter into two new swaps, swap 2 with terms equal and opposite to those of swap 1, plus a new SONIA swap, swap 3. Swap 3 has the same notional value and remaining term to maturity as swap 1 and continues to pay 3% fixed, but starting from the next quarterly fixing date, A makes a quarterly payment of SONIA + 12bp (compounded daily).

Swaps 2 and 3 are novated to the LCH and A and B elect to compress the two offsetting LIBOR swaps (i.e., swaps 1 and 2). This gives rise to no profit or loss or net cash flow but legally extinguishes the two swaps. Because the net effect of the transaction is to exchange swap 1 with swap 3, with the LCH being the counterparty to both swaps, swap 1 is treated as modified by the exchange rather than derecognised. Consequently, the replacement qualifies to be assessed as to whether hedge accounting can continue, as described in section 4.2.2 below. See Chapter 49 for a discussion of when novating derivatives to a central clearing party does not require the hedging relationship to be discontinued.

How we see it

The first two scenarios for the replacement of swaps discussed in the Basis for Conclusions are intended to represent two ends of a spectrum. The first illustrates where the terms of the new RFR derivative are the same as the old IBOR one, except that it now references the RFR with the addition of an appropriate spread. In the second scenario, the terms are substantially different. It follows that there could be intermediate fact patterns, where the derivative is amended more than is strictly necessary to transition to the RFR, without the terms being substantially different. Hence, the derivative will still not be derecognised. Assessing whether the terms are substantially different will require the development of policies and processes to make the assessment and the application of judgement.

2.3.5 Transition by central clearing houses

A further complexity can arise when entities agree that instruments will reference IBOR until the cessation date, but for operational reasons, convert the instruments prior to cessation date. The LCH operationally converted all bookings for LIBOR swaps to RFRs prior to cessation date.

For example, the LCH changed all CHF LIBOR swap bookings to SARON on 4 December 2021 but the swaps continued to reference CHF LIBOR until 31 December 2021. This meant that, for CHF LIBOR swaps with a fixing date from 4 December to 31 December, the final LIBOR fixing between the date of conversion and the date of transition was retained. Retaining this final LIBOR fixing helped ensure that the transition was economically equivalent. To help make this operational, the LCH replaced each LIBOR swap with three separate 'bookings', which, in combination, achieved this result as shown in the Illustration below. Following the transitions that took place in December 2021, LCH applied a similar approach to transition derivatives that reference US dollar LIBOR, which ceased on 30 June 2023.²²

Illustration 2-3: LCH transition of LIBOR swaps

Consider a swap with a two-year term pay 6-month CHF LIBOR, receive fixed

- First transacted on 10 June 2021 and maturing on 10 June 2023
- Fixing dates on 10 December and 10 June annually

Upon conversion on 4 December 2021, three bookings are made:

The overall effect from the combination of the three bookings is as reflected in the diagram below:

How we see it

Consistent with the guidance set out in the Phase 2 Amendments, the three new bookings would be viewed together as a continuation of the original LIBOR swap, which is treated as modified rather than derecognised. The LCH received legal advice that the three new bookings have no contractual effect and do not alter or amend the legal rights and obligations under the original derivative, which helps support them being considered together as a continuation of the original swap.

²² [Article: US dollar Libor transition: A new countdown in motion, Philip Whitehurst, LCH, Risk.net February 2022](#), available on LCH group's website.

3 Classification

3.1 Classification of financial assets

Any new financial assets, or any that have been derecognised and a new one recognised because they have been subject to substantial modification (see section 2.2 above), will need to be classified to determine their accounting treatment. A financial asset can only be accounted for at amortised cost or at fair value through other comprehensive income (FVOCI) if, at initial recognition, the cash flows represent Solely Payment of Principal and Interest (SPPI). [IFRS 9.B4.1.7-26]. See Chapter 44 for further guidance on the SPPI assessment.

As part of the IBOR Reform project, in October 2019,²³ the IASB considered whether, if IBORs are replaced with backward-looking term rates (such as a rate for the next six months based on the average overnight rate for the previous six months), this would cause instruments to fail the SPPI assessment. The IASB noted that there are no specific conditions or exceptions that would automatically disqualify contractual cash flows to be SPPI. Any assessment of interest must focus on what the entity is being compensated for (i.e., whether the entity is receiving consideration for basic lending risks, costs and a profit margin). The IASB concluded that the current guidance in IFRS 9 provides an adequate basis to determine whether alternative benchmark rates are SPPI and that, provided the interest rate continues to reflect the time value of money and does not reflect other risks and features, the new instrument will pass the SPPI assessment.

Entities will, therefore, need to apply judgement in assessing whether there are any modifications to the time value of money element in replacement RFRs and, if there are, whether these modifications will cause a financial asset to fail the SPPI test.

This principle is illustrated by two examples, for SONIA (Illustration 3-1) and Adjustable Rate Mortgages (Illustration 3-2).

Illustration 3-1: SPPI evaluation for SONIA

SONIA is replacing sterling LIBOR as the risk-free rate for sterling loans. Whilst LIBOR is forward-looking, SONIA is backward-looking. SONIA is a daily rate which is compounded to determine the rate for an interest payment period such as three months. The interest to be paid is, therefore, only known at the end of the interest period. To facilitate timely payment of interest, it is useful for borrowers to know in advance what amount of interest is required to be paid. As such, the interest is determined five working days prior to the interest payment date, based on the compounded rate over a period starting and finishing five business days before the interest period begins and ends. In this instance, an entity will be able to assess from a qualitative perspective that there is no significant modification to the time value of money and, hence, the financial asset meets the SPPI criterion.

Illustration 3-2: SPPI Evaluation for Adjustable Rate Mortgages (ARMs)

ARMs are US dollar floating rate mortgages, that have historically been reset once a year, 45 days in advance of the period, and often based on LIBOR. After transition, it was recommended by the Alternative Reference Rates Committee (ARRC) that rates would be reset 45 days in advance, every six months, based on a 30-day compounded SOFR average plus a spread adjustment. The recommended spread adjustment was similar to that introduced by ISDA in its fallback for derivatives (see section 2.1.3 above).

It was not the intent of the ARRC to introduce features that deviate from the time value of money. Rather, it has sought to achieve the optimal lending terms, considering the needs of both issuers and investors. The market is familiar with a rate that is fixed in advance once a year and the frequency of reset has been amended to once every six months in order to continue to provide certainty as to the next interest payment, and also to make the rate more responsive to changes in market rates. The rate is calculated 45 days in advance, consistent with previous practice, and given that term SOFR rates were not available when the ARRC issued their recommendations, the rate was based on overnight SOFR plus a spread adjustment. The 30-day average was chosen to smooth out day-to-day SOFR volatility. Meanwhile, the spread adjustment was designed to reconcile SOFR (collateralised) to LIBOR (uncollateralised) and to capture the theoretical forward interest rate curve out to 6 months.

²³ [IASB Update](#), October 2019; and [IASB Staff Paper 14B](#), Project: *IBOR Reform and its Effects on Financial Reporting - Phase 2*, Paper topic: *Accounting implications from derecognition of a modified financial instrument*, IASB meeting, October 2019, paragraphs 30 to 50. Available on the IFRS Foundation's website.

Although term SOFR rates are now available, we understand that 30-day average SOFR is still used as the index for many ARMs. On the basis that the lender is being compensated only for credit risk and the time value of money with a profit margin, and based on the quantitative analysis performed by the ARRC and published together with their recommendations to document their thought process,²⁴ it can be assessed qualitatively that an ARM would still satisfy the SPPI criterion and can be recorded by the lender at amortised cost or at fair value through OCI, depending on the IFRS 9 business model.

3.2 Separation of embedded derivatives

In October 2019, the IASB also considered in the context of its IBOR project, whether any amendment to IFRS 9 was required to clarify if fallback provisions added as a result of the Reform must be separated from a host financial liability as an embedded derivative.

In the context of the Reform, fallbacks arise where the contractual terms of financial instruments contemplate the replacement of an established interest rate benchmark with an alternative interest rate benchmark. Such a contractual term could involve basing the new rate of interest on the overnight RFR plus a spread or, as with US Adjustable Rate Mortgages, could be based on an average of the RFR determined over a period, and set in advance (see Illustration 3-2 in section 3.1 above).

Given that the separation of embedded derivatives is only assessed when a financial liability is first recognised, the issue is only relevant for new financial liabilities and those that have been significantly modified. If the economic terms of the financial instrument are affected by the fallback, there is a risk that it will not be closely related to the economic characteristics and risks of the host contract. Where this is the case, the fallback will need to be separated and accounted for as an embedded derivative.

In finalising the Phase 2 amendments, the IASB concluded that existing IFRS accounting standards provides an adequate basis to determine the accounting for fallbacks that could arise in the context of interest rate benchmark reform. Applying the guidance in IFRS 9.B4.3.8(a), when a new financial liability is recognised, entities must assess whether the fallback could at least double the initial return and result in a rate of return that is at least twice what would be expected for a similar contract at the time the fallback takes effect. This assessment is often referred to as the 'double-double test'.

How we see it

The vast majority of fallbacks added to financial liabilities in the context of the Reform do not require separation as an embedded derivative. This is because such fallbacks are normally consistent with the financial instrument transitioning to an alternative RFR on an economically equivalent basis. When the fallback is triggered, application of the practical expedient results in the transition being reflected as a change to a market rate of interest. The fallback is, therefore, clearly and closely related to the debt host contract and does not require separation as an embedded derivative.

²⁴ *Options for using SOFR in Adjustable Rate Mortgages*, The Alternative Reference Rates Committee, July 2019.

4 Hedge accounting

4.1 Phase 1 reliefs

Extract from IFRS 9

- 6.8.1 An entity shall apply paragraphs 6.8.4-6.8.12 and paragraphs 7.1.8 and 7.2.26(d) to all hedging relationships directly affected by interest rate benchmark reform. These paragraphs apply only to such hedging relationships. A hedging relationship is directly affected by interest rate benchmark reform only if the reform gives rise to uncertainties about:
- (a) the interest rate benchmark (contractually or non-contractually specified) designated as a hedged risk; and/or
 - (b) the timing or the amount of interest rate benchmark-based cash flows of the hedged item or of the hedging instrument.

The Phase 1 reliefs apply to all hedging relationships that are directly affected by uncertainties due to the Reform, regarding the timing or amount of interest rate benchmark-based cash flows of the hedged item or hedging instrument (i.e., uncertainty about what the new benchmark will be and when it will take effect). [IFRS 9.6.8.1]. However, if the hedged item or hedging instrument is designated for risks other than just interest rate risk, the exceptions only apply to the interest rate benchmark-based cash flows. The relief does not, therefore, apply to net investment hedges, as the hedged item must have interest-based cash flows to be eligible.

In this section, we first describe the reliefs for hedge accounting in accordance with IFRS 9. In section 4.1.3 below, we set out the differences for entities still applying IAS 39 for hedge accounting.

4.1.1 The Phase 1 reliefs for IFRS 9

Application of the reliefs is mandatory. [IFRS 9.7.1.8]. The first three reliefs for IFRS 9 provide for:

- (1) The assessment of whether a forecast transaction (or component thereof) is highly probable [IFRS 9.6.8.4].
- (2) Assessing when to reclassify the amount in the cash flow hedge reserve to profit and loss [IFRS 9.6.8.5].
- (3) The assessment of the economic relationship between the hedged item and the hedging instrument [IFRS 9.6.8.6].

On application of each of these reliefs, it must be assumed that the benchmark on which the hedged cash flows are based (whether or not contractually specified) and/or, for relief three, the benchmark on which the cash flows of the hedging instrument are based, are not altered as a result of the Reform.

It is possible that the designated hedged item is an IBOR risk component of a financial instrument. To be an eligible risk component, it would have to be 'separately identifiable' and 'reliably measurable', as discussed in Chapter 49. [IFRS 9.6.3.7(a)]. The fourth relief provides that, where a benchmark component of interest rate risk has been designated as the hedged item and it is affected by the Reform, the requirement that the risk component is separately identifiable need be met only at the inception of the hedging relationship. [IFRS 9.6.8.7]. Hence, as long as the IBOR was considered to be separately identifiable when the hedge relationship was first established, the IBOR will continue to qualify as a risk component even if the IBOR ceases to be separately identifiable. (The issue of whether a benchmark rate is separately identifiable is considered further in sections 4.2.4 and 5 below).

The Basis for Conclusions also clarifies that if IBOR cash flows have been designated as the hedged item in a cash flow hedge, the entity should continue to measure ineffectiveness based on the IBOR-based cash flows. However, the Basis for Conclusions also states that if the entity has chosen to measure changes in fair value of the IBOR cash flows using a 'hypothetical derivative', the hypothetical derivative should be measured using a market-based discount rate that reflects market participants' assumptions about the uncertainty arising from the Reform. [IFRS 9.BC6.570]. This would be consistent with the rate which market participants would apply to actual IBOR derivatives used as hedging instruments. Therefore, the use of the market-based discount rate will not, in itself, increase hedge ineffectiveness.

Illustration 4-1: Application of Phase 1 relief

Entity A is hedging an eight-year floating rate borrowing referenced to a 3-month local IBOR that is due to cease in the foreseeable future. It is known that any interest coupons payable after the loan has been amended to implement the Reform, will not be determined with reference to the local IBOR, but according to the new RFR. The borrowing was previously designated in a cash flow hedge of the 3-month local IBOR interest rate risk. It is not yet known how the amendment will be achieved or when it will occur. Therefore, there is still uncertainty due to the Reform about the timing or amount of interest rate benchmark-based cash flows of the loan and the associated hedging instrument. While the uncertainty exists, the Phase 1 Amendment requires Entity A to ignore that fact and assume the hedged interest coupons on the borrowing and associated hedging instrument will remain local IBOR-based cash flows for the purposes of assessing and measuring effectiveness.

For 'dynamic' or 'macro' hedging strategies (i.e., where hedging instruments and hedged items are added to or removed from an open portfolio in a continuous hedging strategy, resulting in frequent de-designations and re-designations) the entity need only satisfy the separately identifiable requirement when hedged items are initially designated within the hedging relationship. The entity does not subsequently need to reassess this requirement for any hedged items that have been re-designated. [IFRS 9.6.8.8].

However, the Phase 1 Amendments do not provide any relief from the requirement that changes in the fair value or cash flows of the risk component must be reliably measurable. [IFRS 9.BC6.575].

The reliefs are intended to be narrow in their effect, such that other than the specific reliefs provided, the usual requirements within the IFRS 9 hedge accounting guidance must be applied. The Basis for Conclusions contains an example of where relief will not be available: benchmark-based cash flows cannot be assumed to still be highly probable if an entity decides not to issue forecast debt due to the uncertainties arising from the Reform. [IFRS 9.BC6.560]. Also, to the extent that a hedging instrument is altered so that its cash flows are based on an RFR, but the hedged item is still based on IBOR (or vice versa), there is no relief from measuring and recording any ineffectiveness that arises due to differences in their changes in fair value. [IFRS 9.BC6.567, IFRS 9.BC6.568].

4.1.2 End of Phase 1 reliefs for IFRS 9

Reliefs one and two above cease to apply prospectively at the earlier of when the uncertainty arising from the Reform is no longer present with respect to the timing and amount of the IBOR-based cash flows of the hedged item, and:

- For relief one, when the hedging relationship that the hedged item is part of is discontinued
- For relief two, when the entire amount accumulated in the cash flow hedge reserve has been reclassified to profit and loss [IFRS 9.6.8.9, IFRS 9.6.8.10]

Relief three ceases prospectively, as follows:

- For a hedged item, when the uncertainty arising from the Reform is no longer present with respect to the timing and amount of IBOR-based cash flows of the hedged item
- For a hedging instrument, when the uncertainty arising from the Reform is no longer present with respect to the timing and amount of IBOR-based cash flows of the hedging instrument
- If the hedging relationship is discontinued before either of the two above events occur, at the date of discontinuation [IFRS 9.6.8.11]

When an entity designates a group of items as the hedged item, the end of relief requirements would be applied prospectively to each individual item within the designated group of items. [IFRS 9.6.8.12].

Relief four ceases either when the formal designation of the hedge relationship is amended, applying the Phase 2 relief (see section 4.2 below) or when the hedging relationship is discontinued, applying the normal IFRS 9 discontinuation guidance. This means that until either of these occur, the risk component will continue to be designated, even if it is no longer separately identifiable. This is particularly relevant for fair value hedges as the hedged items will generally not need to be amended for the Reform. [IFRS 9.6.8.13].

The reliefs will continue indefinitely in the absence of any of the events described above. The Basis for Conclusions sets out a number of different fact patterns, which could arise as contracts are amended in anticipation of the replacement of an interest rate benchmark, to illustrate when uncertainties due to the Reform will end. [IFRS 9.BC6.587-593]. The key message is that, in most cases, relief will only end when a contract is amended to specify both what the new benchmark will be and when it will take effect, and the spread adjustment that will be applied. As the relief is applied on a contract-by-contract basis, for some IBORs, the uncertainty could continue for a number of years as discussed in section 1.2 above.

Because the Phase 1 reliefs only cease to apply once there is no longer uncertainty over the benchmark that will apply, when it will be applied, and the change to the spread, it follows that agreement of a fallback arrangement will not in itself end the uncertainty and so does not bring an end to the Phase 1 relief, unless it specifies both the method and date of transition.

The FCA announced in March 2021, that most LIBOR settings would cease at the end of 2021 and ISDA fixed the basis spreads that applied to the RFR on transition under the fallback protocol (see section 1 above). This raised the question whether there remained any uncertainty with respect to the amount or timing of IBOR Reform, and, hence, whether Phase 1 had ended. As decisions are taken for other IBORs on how and when they will transition to RFRs, a similar question will arise. As noted in IFRS 7.24H(d), deciding whether there remains uncertainty is a judgement that entities need to make and disclose if the effect is material. In making this judgement the following factors are relevant:

- If the hedged item is floating rate but is not subject to the ISDA transition protocol and will require bilateral negotiation, there is still uncertainty as to amount and timing. Similarly, entities could decide to bilaterally negotiate the terms of transition so as to override the terms of the fallback.
- As mentioned in section 1.1 above, the FCA still required the ICE Benchmark Administration to continue publishing certain LIBOR settings (i.e., one-, three- and six- months settings for GBP and JPY) on a non-representative, 'synthetic' basis for 12-months beyond December 2021 to help deal with 'tough legacy' contracts.
- In September 2022, the FCA confirmed that they would require publication of one and six-month synthetic sterling LIBOR until the end of March 2023, after which these settings permanently ceased. In April 2023, the FCA confirmed that publication of three-month synthetic sterling LIBOR would continue until the end of March 2024, after which it permanently ceased. Following the end of US dollar LIBOR on 30 June 2023, one-month, three-month and six-month US dollar LIBOR settings continued in synthetic form until they permanently ceased on 30 September 2024.²⁵
- Entities could also have chosen to transition earlier than the date of cessation and the London Clearing House (LCH), in its circular of 18 March 2021, reiterated its recommendation that its members' transition cleared derivatives ahead of the fallback date, in which case, they are not obliged to use the ISDA fallback spread.

And

- Although it could be known when derivatives will transition and the RFR and spread adjustment that will be applied, there could be an additional adjustment at the transition date, to reflect any further differences in market fair value.

Whether or not it is judged that Phase 1 has ended, it is possible that estimates of the fixed spread that will be applied on transition to RFRs will already be reflected in the market's valuation of IBOR-based instruments. Prior to the LIBORs' cessation, market valuations converged, to a significant extent, on the ISDA fallback spreads.

There could be situations in which the uncertainty for particular elements of a single hedging relationship could end at different times. For example, assume an entity is required to apply the relevant exceptions to both the hedged item and the hedging instrument, as will typically be the case for a cash flow hedge. If the hedging instrument in that hedging relationship is amended to be based on an RFR earlier than the hedged item, such that the uncertainty about the timing and the amount of RFR-based cash flows of the hedging instrument is eliminated, the relevant exceptions would no longer apply to the hedging instrument even though they would continue to apply to the hedged item. [IFRS 9.BC6.594]. The hedged item will, therefore, by default, continue to be measured by reference to changes in IBOR, even though it is expected that it will be amended in the near term. The consequence of this is that any delay between the modification of the hedging instrument and the hedged item in a cash flow hedge will potentially introduce a new source of hedge ineffectiveness, specifically, any changes in the basis risk between the RFR interest on the hedging instrument and the IBOR interest on the hedged item. However, as the ISDA fallback spreads have now been fixed, the effect of this could be small. ISDA fallback spreads have also been fixed for other IBORs such as the Kuala Lumpur Interbank Offered Rate (KLIBOR) and Tel Aviv Inter-Bank Offered Rate (TELBOR), which are still to transition.²⁶

This problem does not arise for fair value hedges, since the hedged instrument will not be amended as a result of the Reform and Phase 2 allows the designated hedged risk to be revised when the hedging instrument is amended (see section 4.2 below).

26 IBOR Fallbacks Technical Note ([IBOR Fallbacks Technical Note \(Republication of HIBOR fallbacks\)](#), Bloomberg, 8 September 2023. [IBOR Fallbacks Technical Note \(New Fallbacks\)](#), 31 January 2023)

4.1.3 Phase 1 reliefs for IAS 39

As many entities remain under the hedge accounting requirements of IAS 39, Phase 1 Amendments were also made to IAS 39. [IAS 39.102A-102O, IAS 39.108G]. These are consistent with those for IFRS 9, as described in sections 4.1.1 and 4.1.2 above, but with the following differences:

- For the prospective assessment that a hedge is expected to be highly effective, it is assumed that the benchmark on which the hedged cash flows are based (whether or not it is contractually specified) and/or the benchmark on which the cash flows of the hedging instrument are based, are not altered as a result of the Reform. [IAS 39.102F]. This relief ends under the same conditions as the IFRS 9 relief for the assessment of the economic relationship between the hedged item and the hedging instrument (see section 4.1.2 above).
- For the retrospective assessment of effectiveness, an entity could continue to apply hedge accounting to a hedging relationship for which effectiveness is outside of the 80-125% range during the period of uncertainty arising from the Reform. This applies to any hedge relationship affected by the uncertainties due to the Reform and is not restricted to the amount of ineffectiveness that can be directly attributed to the Reform. [IAS 39.BC250].

The relief is, however, subject to satisfying the other conditions in IAS 39.88, including the prospective assessment that the hedge is expected to be highly effective (as amended above). The relief ceases at the earlier of when there is no longer uncertainty with respect to the cash flows of both the hedged item and the hedging instrument, and when the hedging relationship is discontinued [IAS 39.102M].

This relief could be particularly important if there is a delay between when a hedging instrument is amended for the Reform and the amendment of the hedged item (or vice versa). Any actual ineffectiveness would still need to be measured and recognised in the financial statements. This should be calculated based on how market participants would value the hedged items and hedging instruments and would include the effect of any increase in discount rates that the market requires due to the uncertainties arising from the Reform. [IAS 39.102G]. However, as the ISDA fallback spreads have now been fixed, the effect of this could be small.

- For a hedge of 'a benchmark portion' (similar to 'a risk component' under IFRS 9) of interest rate risk that is affected by the Reform, the requirement that the portion is separately identifiable need be met only at the inception of the hedge. [IAS 39.102H].

4.2 Phase 2 hedge accounting amendments

As noted above, the Phase 1 Amendments only cover pre-replacement issues. The issues that affect financial reporting when an existing interest rate benchmark is replaced with an RFR, are addressed by Phase 2. Hedge relationships within the scope of Phase 2 are the same as those within the scope of Phase 1 (see section 4.1 above). As with section 4.1 above, we first describe the reliefs for hedge accounting under IFRS 9 and then, in sections 4.2.7 and 4.2.8, below set out any differences for entities still applying IAS 39 for hedge accounting.

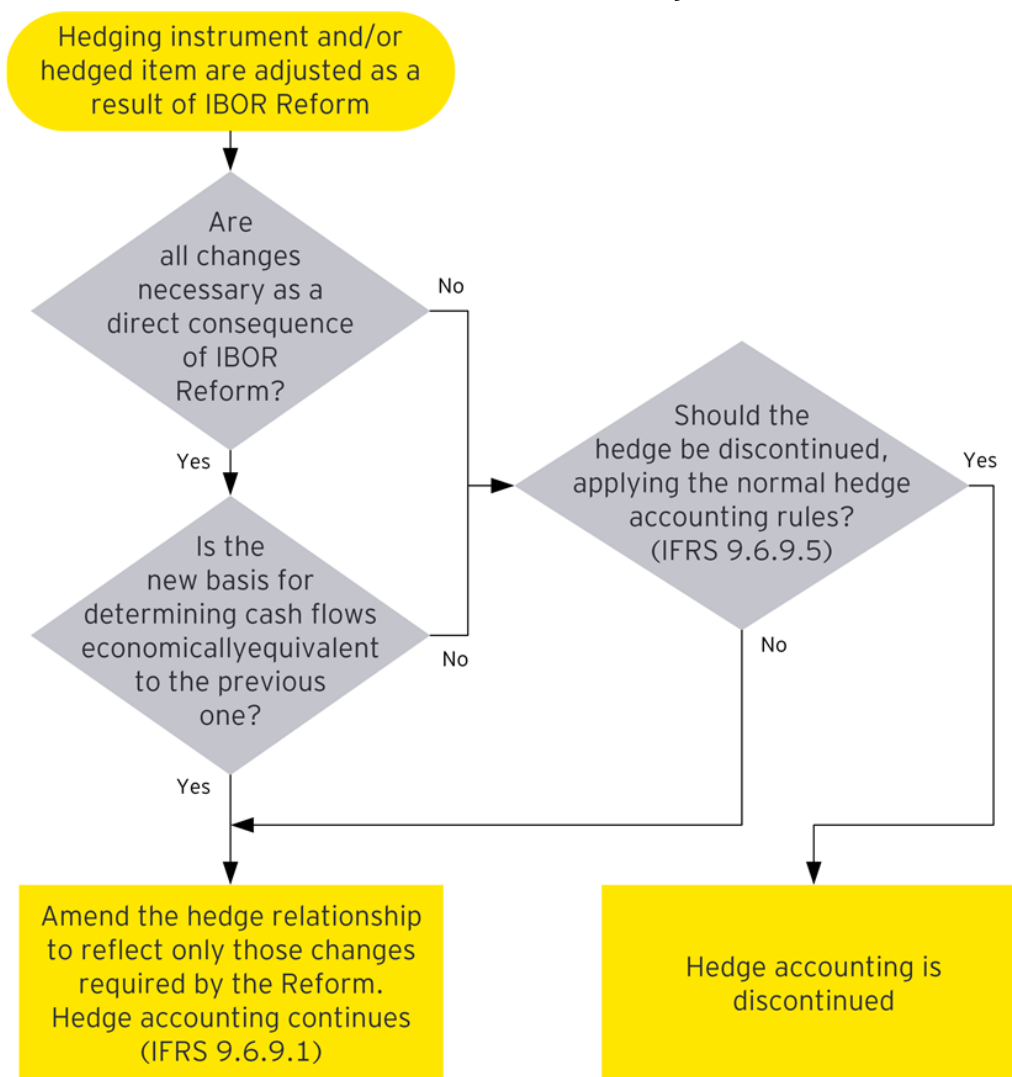

4.2.1 Phase 2 reliefs for IFRS 9

The Phase 2 Amendments for IFRS 9 provide the following reliefs (the 'Phase 2 reliefs'):

- (1) Relief from discontinuing hedge relationships because of changes to hedge documentation required by the Reform (see section 4.2.2 below)
- (2) Temporary relief from having to meet the 'separately identifiable' requirement (see sections 4.2.4 and 4.2.5 below)

4.2.2 Phase 2 reliefs from discontinuing hedge relationships

The application of the Phase 2 reliefs is summarised in the following flow chart:

The Phase 2 Amendments require that as and when an entity ceases to apply the Phase 1 reliefs to a hedging relationship (see section 4.1.2 above), the entity must amend the formal designation of that hedging relationship to reflect the changes that are required by the Reform. However, the hedge designation need not be amended immediately. It must be amended by the end of the reporting period during which a change required by the Reform is made to the hedged risk, hedged item or hedging instrument. Such an amendment does not constitute a discontinuation of the hedge relationship.

[IFRS 9.6.9.1, IFRS 9.6.9.4].

For this purpose, 'the end of the reporting period' should be given its normal interpretation as the end of an interim reporting period if an entity or group of which the entity is a member, publishes interim financial statements in accordance with IAS 34 *Interim Financial Reporting*.

These amendments to the hedge designation covered by the Phase 2 relief are restricted to one or more of the following:

- Designating an RFR as the hedged risk
- Amending the description of the hedged item, including any designated portion of the cash flows or fair value of the hedged item
- Amending the description of the hedging instrument [IFRS 9.6.9.1]

The changes must be directly required by the Reform, which means that both of the following conditions must be met:

- The changes must be necessary as a direct consequence of interest rate benchmark reform.
- The new basis for determining the contractual cash flows is 'economically equivalent' to the previous basis (i.e., the basis immediately preceding the change) [IFRS 9.6.9.1, IFRS 9.5.4.5, IFRS 9.5.4.6, IFRS 9.5.4.7].

As already discussed in section 2.1.2 above, the Amendments include examples of the type of changes required by interest rate reform that are considered to be economically equivalent to the previous basis, as follows:

- The replacement of an existing interest rate with an RFR or effecting such a reform of an interest rate benchmark by changing the method used to calculate the interest rate benchmark, with the addition of a fixed spread to compensate for a basis difference between the existing interest rate benchmark and the RFR
- Changes to the reset period, reset dates, or the number of days between coupon payment dates that are necessary to effect the reform of an interest rate benchmark
- The addition of a fallback provision to the contractual terms of a financial asset or liability to enable any of the changes described above to be made [IFRS 9.5.4.8]

The above guidance is reasonably straight forward to apply if the changes made to hedged items or hedging instruments are only those necessary to achieve IBOR Reform and so are made on an economically equivalent basis. If changes are made to a financial asset or liability (including a derivative) designated in a hedging relationship, or to the designation of the hedging relationship, beyond those required by the Reform, the Amendments require that an entity must first apply the normal requirements in IFRS 9 to determine if those additional changes would result in the discontinuation of the hedge relationship. If the additional changes do not result in the discontinuation of hedge accounting, an entity must amend the formal designation of the hedging relationship, as described above, without discontinuing the hedge relationship. [IFRS 9.6.9.5].

As already set out in section 2.1.2 above, examples of possible changes that would most likely not be viewed as economically equivalent, and hence not required by the Reform, would include:

- Changes to the principal or notional value
- Changes in maturity and methods of repayment (such as a move from a bullet repayment to instalments)
- Changes in credit spread to reflect changes in the credit quality of the obligor
- The addition or removal of caps and floors, prepayment and extension options.

Such additional changes must, therefore, be assessed to determine if, applying the normal IFRS 9 requirements, they would lead to the discontinuation of the hedge, as discussed in Chapter 49. According to IFRS 9, apart from when there is a change in the risk management objective, hedges are discontinued only when the qualifying criteria are no longer met, i.e., if:

- The hedging instrument or hedged item are no longer eligible for hedge accounting.
- There is no longer an economic relationship between the hedged item and the hedging instrument.
- The effect of credit risk dominates the value changes that result from the economic relationship.

Or

- The hedged item or hedging instrument is derecognised [IFRS 9.6.5.6, IFRS 9.6.4.1].

It is likely that the most challenging of these criteria in the context of IBOR Reform is the last: determining whether the hedged item or hedging instrument is derecognised (see section 2 above).

If the hedge relationship is not discontinued, the hedge relationship is amended to: i) designate an RFR as the hedged risk; ii) amend the description of the hedged item, including any designated portion of the cash flows or fair value of the hedged item; and/or iii) amend the description of the hedging instrument [IFRS 9.6.9.5, IFRS 9.6.9.1], in each case, to the extent required by the Reform. This means that any changes that are made to the hedging instrument or hedged item beyond those required by IBOR Reform will need to be included in the ongoing measurement of hedge ineffectiveness. This is shown in Illustration 4-4 in section 4.3.2 below.

As discussed in section 2.2 above, in the context of derecognition, it is possible that a hedging instrument will be changed by entering into two new derivatives with the same counterparty, one that is equal and offsetting to the original derivative and another one on similar terms except referencing an RFR. This is most likely to arise for derivatives cleared by a central clearing counterparty.

Phase 2 hedge accounting relief is obtained in this situation as long as two criteria are met:

- (i) The original derivative is not derecognised, as outlined earlier in section 2.3 above.
- (ii) The change is made on an economically equivalent basis.

The examples contained in the Basis for Conclusions have already been introduced in section 2.3 above in the context of derecognition. Although they provide guidance on whether or not an approach would be regarded as consistent with the changes required by the Reform, they do not specify whether the conclusion is driven primarily by the assessment of derecognition, or of economic equivalence, or both. In scenario (a), replacement of an original IBOR-based derivative by an RFR-based derivative on 'similar terms' is considered to meet both these criteria, whereas it is implied that in scenario (b) the replacement on 'substantially different terms' causes neither criterion to be met. It is, therefore, unclear whether there could be fact patterns that avoid derecognition, but still fail economic equivalence.

Also, as already discussed in the context of derecognition, the examples are intended to represent two ends of a spectrum. It would, therefore, be possible to apply the Phase 2 reliefs to fact patterns that involve a less substantial difference in terms. However, no guidance is provided as to how much change would be permitted before the derivative would be derecognised or the terms would no longer be regarded as economically equivalent. As a result, this is an area where judgement needs to be applied.

In another scenario examined by the IASB, the entity enters into a new basis swap, specific to a particular derivative instrument, which swaps the existing interest rate benchmark for that instrument to the RFR. This is viewed by the IASB as economically equivalent to modifying the contractual terms of the original instrument, as long as the basis swap is linked or coupled with the original derivative rather than being entered into at a portfolio level. [IFRS 9.BC6.620(c)]. The scenario does not specify whether the basis swap needs to be with the same counterparty as the original derivative, but this is probably assumed.

In contrast, in a further example discussed in the Basis for Conclusions, an entity enters into a basis swap in order to mitigate ineffectiveness arising between different methods of compounding of RFRs for cash products and derivatives. (A possible scenario is if the cash products and derivatives transition to RFRs on a slightly different basis, thus introducing a new source of potential hedge ineffectiveness). The implication is that an amendment of the hedge relationship to encompass the addition of this basis swap would result in the discontinuation of the hedge relationship. [IFRS 9.BC6.617]. The reason is not clearly articulated, but it is possibly because the addition of the basis swap is not strictly necessary to achieve IBOR Reform, rather it is a subsequent addition to improve hedge effectiveness.

Changes to hedge designations and hedge documentation required by the Reform may need to be made at different times for different hedge relationships, and more than once for individual hedge relationships. For instance, for a cash flow hedge, it is possible that the hedge designation and documentation will need to be amended twice: once when the derivative is modified to refer to an RFR; and again when the hedged item is renegotiated to refer to an RFR. An entity must apply the relief from discontinuing hedge relationships on each occasion the criteria are met. [IFRS 9.6.9.3].

The usual IFRS 9 requirements are applied for accounting for changes in the fair value of the hedging instrument and the hedged item. Therefore, they are measured at fair value as RFR-based or IBOR-based, depending on whether they have each been amended or not, except that, for cash flow hedges, the cash flow hedge reserve is remeasured to the lower of the cumulative gain or loss on the hedging instrument and the cumulative change in fair value of the hedged item, as discussed in Chapter 49. [IFRS 9.6.9.3]. When redesignating the hedge of a fixed-rate debt instrument, in order to be consistent with the continuation of the hedge, the component of the fixed cash flows designated as the hedged component should be adjusted to reflect the spread between RFR and IBOR. This is shown in Illustration 4-2 in section 4.3.1 below.

Meanwhile, if the change in fair value of the designated cash flows in a cash flow hedge is measured using a hypothetical derivative, after transition of the hedged financial instrument the hypothetical derivative will be adjusted to reflect the RFR (see Illustration 4-4 in section 4.3.2 below).

Any hedge ineffectiveness is recognised in profit and loss, as normal. The IASB does not expect that there would be a significant change in fair value on transition since that would imply that the amendments had not been made on an economically equivalent basis. [IFRS 9.BC6.626]. However, if there is a mismatch in timing in the amendment of the hedging instrument or hedged item, this could give rise to some ineffectiveness for cash flow hedges (see Illustration 4-4 in section 4.3.2 below).

When the hedged item is amended, amounts accumulated in the cash flow hedge reserve are deemed to be based on the RFR. The same applies for a hedge that has previously been discontinued, when the contractual cash flows of the previously designated item are modified. This results in the release of the cash flow hedge reserve to profit or loss in the same period or periods in which the hedged cash flows that are now based on the RFR affect profit or loss. [IFRS 9.6.9.7, IFRS 9.6.9.8].

Extract from IFRS 9**Cash flow hedges**

- 6.9.7 For the purpose of applying paragraph 6.5.11, at the point when an entity amends the description of a hedged item as required in paragraph 6.9.1(b), the amount accumulated in the cash flow hedge reserve shall be deemed to be based on the alternative benchmark rate on which the hedged future cash flows are determined.
- 6.9.8 For a discontinued hedging relationship, when the interest rate benchmark on which the hedged future cash flows had been based is changed as required by interest rate benchmark reform, for the purpose of applying paragraph 6.5.12 in order to determine whether the hedged future cash flows are expected to occur, the amount accumulated in the cash flow hedge reserve for that hedging relationship shall be deemed to be based on the alternative benchmark rate on which the hedged future cash flows will be based.

4.2.3 Phase 2 relief for groups of items

The Phase 2 Amendments also provide reliefs for items within a designated group of items (such as those forming part of a macro cash flow hedging strategy, see Chapter 49) that are amended for modifications directly required by the Reform. The reliefs allow the hedging strategy to remain and not be discontinued. As items within the hedged group transition at different times from IBORs to RFRs, they will be transferred to sub-groups of instruments that reference RFRs as the hedged risk. The existing IBOR would remain designated as the hedged risk for the other sub-group of hedged items, until they too are updated to reference the new RFR. [IFRS 9.6.9.9].

Although the Amendments do not provide detailed guidance on how the relief for groups of items will work, we currently assume that:

- (i) If the hedged item was originally established as an 'open' portfolio, new hedging instruments and hedged items, whether they reference IBOR or RFRs, may be added to the groups as they are entered into.

And

- (ii) At each transition, the hypothetical derivative for the sub-group will require updating.

The entity must ensure that each sub-group continues to meet the normal requirements of IFRS 9 to be an eligible hedged item. If any sub-group fails to meet the requirement to be designated as a hedged item, the entity must discontinue hedge accounting for the hedge relationship in its entirety. Meanwhile, hedge ineffectiveness must be measured and recorded as normal for the hedge relationship in its entirety. [IFRS 9.6.9.10].

4.2.4 Phase 2 temporary relief for designation of risk components

IFRS 9 requires that a risk component designated in a hedge relationship is both 'reliably measurable' and 'separately identifiable' to be eligible for hedge accounting, as discussed in Chapter 49. [IFRS 9.6.3.7(a)]. The Phase 2 Amendments provide temporary relief to entities from having to meet the separately identifiable requirement when an RFR instrument is designated as a hedge of a risk component, both upon designation of a new hedge relationship and for existing hedge relationships when changes required by the Reform are made to hedge designations and hedge documentation (see section 4.2.1 above and section 4.2.7 below). The relief allows entities to assume that the separately identifiable requirement is met, provided the entity reasonably expects the RFR risk component to become separately identifiable within the next 24 months. The 24-month period applies to each RFR separately (i.e., it applies on a rate-by-rate basis) and starts from the date an entity designates the RFR as a risk component for the first time.

If an entity reasonably expects that an RFR will not be separately identifiable within 24 months after initial designation, the relief will end for that RFR. Hedge accounting should be discontinued prospectively from the date of that reassessment for all hedging relationships in which the RFR was designated as a risk component. [IFRS 9.6.9.11, IFRS 9.6.9.12].

The assessment of whether a risk component is separately identifiable is discussed further in section 4.2.5 below. Meanwhile, it must be stressed that no relief is provided from the requirement for the risk component to be 'reliably measurable' throughout the life of the hedging relationship (see section 4.2.6 below).

The relief from the need to assess whether an RFR risk component is separately identifiable only applies for uncertainties arising directly from the Reform. The relief is not available for hedging relationships where there is uncertainty over whether the risk component is separately identifiable, but the uncertainty is not as a direct result of the Reform.

How we see it

The relief from having to satisfy the separately identifiable requirement should significantly ease the transition to RFRs by allowing hedging relationships to be designated and to continue, even before the new RFRs are fully established as market benchmarks. However, entities must ensure they are comfortable to make the appropriate judgements at the time of transition and over the subsequent 24 months, while introducing suitable processes and governance to update their assessment.

This judgement is discussed in more detail in the next section.

4.2.5 Determination of whether an RFR is a separately identifiable risk component

Although the Phase 1 and 2 Amendments provide reliefs for the assessment of whether a non-contractually specified risk component is separately identifiable, and so can be designated as a hedged risk, they do not provide guidance on what is meant by ‘separately identifiable’. Therefore, there should generally be no difference to how this criterion is interpreted in situations unrelated to IBOR reform. There are, however, a couple of points made in the Phase 2 Amendments that could be relevant, first, for fair value hedges and, second, for cash flow hedges.

(i) Fair value hedges

The first point is that the relief is provided only for ‘separately identifiable’ and not for ‘reliably measurable’, and so, the two criteria are clearly different. It is to be expected that an RFR might become sufficiently liquid that it is reliably measurable, but without yet being separately identifiable within the hedged item such as a fixed-rate debt instrument. [IFRS 9.B6.3.9].

Whilst much of the pre-existing guidance in IFRS 9 on how to determine whether or not a risk component is separately identifiable, was written primarily to permit hedging of components of non-financial items, one example appears particularly relevant for interest rate hedges, as in the extract below: [IFRS 9.B6.3.10(d)]

Extract from IFRS 9

B6.3.10 ...

- (d) Entity D holds a fixed-rate debt instrument. This instrument is issued in an environment with a market in which a large variety of similar debt instruments are compared by their spreads to a benchmark rate (for example, LIBOR) and variable rate instruments in that environment are typically indexed to that benchmark rate. Interest rate swaps are frequently used to manage interest rate risk on the basis of that benchmark rate, irrespective of the spread of debt instruments to that benchmark rate. The price of fixed-rate debt instruments varies directly in response to changes in the benchmark rate as they happen. Entity D concludes that the benchmark rate is a component that can be separately identified and reliably measured. Consequently, Entity D may designate hedging relationships for the fixed rate debt instrument on a risk component basis for the benchmark interest rate risk.

This paragraph is cited only as an example, so this should not be read as a list of criteria for a rate to qualify as separately identifiable. Nevertheless, this example could be read to imply that, for a benchmark interest rate to qualify as a risk component, it has to be the basis on which fixed rate debt instruments are frequently priced and floating rate debt instruments frequently vary in rate, and that it would be insufficient for the rate to be used only in the swap market. Not only did SONIA swaps already make up more than half the sterling swaps market by volume in 2021, but in November 2019, it was claimed that “SONIA is now the norm in issuance of floating rate sterling bonds and securitisations”.²⁷ An entity might therefore have concluded in 2021 that SONIA was already separately identifiable and, if not yet, it would be within 24 months.

²⁷ Speech delivered at the Risk.net LIBOR Summit 2019 by Edwin Shooling Latter, Director of Markets and Wholesale Policy at the UK's Financial Conduct Authority.

Prior to 2022, the percentage of the total US dollar swaps traded that referenced SOFR continued to be significantly lower than LIBOR-based swaps. In addition, there was slower progress in the growth of the issuance of SOFR-based cash instruments. However, based on the recommendations of the US Alternative Reference Rates Committee, there was an expectation that by 2022, SOFR (the chosen US dollar RFR) would eventually become the primary US dollar benchmark interest rate. On this basis, prior to 2022, we would have expected that most entities applying IFRS 9 for hedge accounting purposes would have concluded that SOFR would be separately identifiable within 24 months. By the end of Q1 2022, the volume and liquidity of SOFR swaps had surpassed that of US dollar LIBOR swaps, providing strong evidence that SOFR had superseded LIBOR as the primary US dollar derivative benchmark rate. Therefore, from 2022, we would expect entities for the purpose of applying hedge accounting under IFRS 9 (and IAS 39), to have considered SOFR to be a separately identifiable risk component of US dollar cash instruments.²⁸

Although the guidance in IFRS 9 as to the criterion for a risk component to be separately identifiable is very similar to that in IAS 39 for a risk portion, the wording is not exactly the same. IAS 39 mentions that, “for a fixed rate financial instrument hedged for changes in fair value attributable to changes in a risk-free or benchmark rate, the risk-free or benchmark rate is normally regarded as both a separately identifiable component of the financial instrument and reliably measurable” (see section 4.2.8 below). The IASB has never said that it had intended the application of ‘separately identifiable’ to interest rates to change on the application of IFRS 9, which could imply that if a benchmark risk portion is considered identifiable under IAS 39, then it would also be a separately identifiable risk component under IFRS 9. However, the example in IFRS 9.B6.3.10(d) arguably provides a more detailed interpretation of what constitutes a ‘benchmark’.

Meanwhile, the question also arises as to whether it is still possible to designate an IBOR as a separately identifiable risk component. The answer is clearly ‘yes’ until the RFR becomes established and it is likely that after that, for a short while, the IBOR and the RFR will both be separately identifiable, as the market transitions from one benchmark rate to another.

(ii) Cash flow hedges

The second point made in the Phase 2 Amendments is that it is clear that the exception for identifying risk components applies to cash flow hedges as well as fair value hedges. [IFRS 9.BC6.649]. This leads to the question of whether it is possible to designate an RFR as a risk component of an IBOR floating rate debt instrument. The relevance of this question arises mainly where there is a mismatch in the timing of the amendment of a hedging derivative and the floating rate instrument that is the hedged item, so that the derivative is amended to refer to an RFR before the hedged item. The issue here is not whether, for instance, the RFR will form the basis of floating rate instruments within 24 months, but whether it will ever be regarded as a separately identifiable component of an *IBOR-based* floating rate.

In the deliberations regarding timing mismatches in the Phase 2 Amendments, it was suggested in a Staff Paper that hedge ineffectiveness could be minimised in the period before the hedged item is amended, by adjusting the hedged risk to the RFR rather than the contractual interest rate.²⁹ This might be read to endorse the possibility of designating an RFR component of IBOR. However, there is no specific guidance on this issue within the Phase 2 Amendments. Unlike fair value hedges, in the past there has been much less practice of designation of risk components in floating rate instruments, unless the risk was already contractually specified (e.g., LIBOR risk in a loan that was indexed to LIBOR). Also, the examples in both IFRS 9 and IAS 39 only address fair value hedges. Therefore, it is more difficult to draw on past precedent or practice to support designating an RFR as a component of LIBOR.

The case for SONIA as a component of sterling LIBOR is perhaps easier to make, since it was first introduced in 1997 and SONIA can be thought of as ‘overnight sterling LIBOR’ and so a ‘building block’ of term LIBOR.³⁰ SOFR, however, which is based on overnight borrowing in the US Treasury repo market, is somewhat different in nature from US dollar LIBOR. Overnight SOFR is also quite volatile and can, on occasion, exceed 3-month US dollar LIBOR.

However, since, ‘tough legacy’ financial instruments were dealt with by creating for a limited time ‘synthetic’ IBORs, by redefining some GBP, JPY and US dollar LIBORs to be based on the term version of the RFRs plus the ISDA fallback spreads, then it follows that the RFR will have become a benchmark component of the corresponding synthetic LIBOR.

For the purpose of Illustration 4-4 in section 4.3.2 below, it has been assumed that SOFR cannot be designated as a component of US dollar LIBOR.

28 [Bloomberg Article: SOFR liquidity eclipses LIBOR](#), Bloomberg, 9 February 2022, available on Bloomberg’s website.

29 [IASB Staff Paper 14A](#), Project: *IBOR Reform and its Effects on Financial Reporting - Phase 2*, Paper topic: *End of application - Phase 1 exceptions*, IASB meeting, January 2020, paragraph 28. Available on the IFRS Foundation’s website.

30 When SONIA was reformed in 2018, so it could qualify as an RFR, the main changes were only to base it on a wider range of participants’ transactions and to amend the volume weighting methodology.

(iii) Term structure of separately identifiable risk components

The question also arises as to whether the separately identifiable criterion needs to be assessed separately depending on the maturity of the hedging instrument and the hedged item. For instance, would a hedge of a 30-year fixed rate bond be assessed separately from a hedge of a one-year bond, bearing in mind that there is likely to be far more activity in the market for shorter term instruments?

To use the IFRS 9 terminology, the separately identifiable assessment must be performed in the context of the market structure, and the structure of the interest rate market will always include a term structure. The topic of market structure is discussed in Chapter 49. If it is determined that (for instance) SOFR is, or will be, separately identifiable, it follows that this is likely to be the case equally, whether SOFR is being used to hedge loans with (for example) six months, five years or ten years maturity. If bond prices are not aligned with SOFR swap rates, then there will always be an opportunity for arbitrage, to help bring the market in line.

Synthetic LIBORs are set by reference to the term version of the corresponding RFR plus a CAS. It should, therefore, follow that the RFR has become a separately identifiable risk component of the synthetic LIBOR. This is relevant where an RFR derivative is designated as a hedge of a synthetic LIBOR exposure.

How we see it

Once an RFR is separately identifiable, it is likely to be so for any maturity. If another benchmark becomes established for certain maturities, the assessment of whether the RFR is separately identifiable is made for any maturity for which it is the benchmark. Should the market fragment in future, such that more than one benchmark emerges, serving different segments of the market, the continuing assessment required by IFRS 9.6.9.12 of the Amendments would be made separately for each segment of the market.

4.2.6 Determination of whether an RFR is a reliably measurable risk component

'Reliably measurable' is not defined further in IFRS 9 or in the IAS 39 hedge accounting guidance, but IAS 39 required that unquoted equity instruments that were not quoted in active markets to be recorded at cost if not 'reliably measurable'. [IAS 39.46(c)]. The guidance stated that the fair value would be reliably measurable if the range of variability of fair value measurements is not significant or the probabilities of the various estimates can be reasonably assessed and used when measuring fair value. [IAS 39.AG80]. The standard went on to say that there are many situations where the range of variability for unquoted equity investments is likely not to be significant and that it is normally possible to measure reliably a financial asset acquired from a third party. [IAS 39.AG81]. Given this guidance, 'reliably measurable' does not appear to be an especially high hurdle and it is likely that most derivatives referencing the RFRs will be considered reliably measurable once a market begins to develop.

4.2.7 Phase 2 amendments for IAS 39

As is the case for the Phase 1 amendments (see section 4.1.3 above), the Phase 2 Amendments also include changes to IAS 39. The corresponding amendments to IAS 39 are consistent with those for IFRS 9, but with the following differences:

- IAS 39 is amended so that for the assessment of retrospective hedge effectiveness for fair value hedges, the cumulative fair value changes can be reset to zero when the exception to the retrospective assessment ends. This election is made separately for each hedging relationship (i.e., on a hedge-by-hedge basis). However, actual hedge ineffectiveness will continue to be measured and recognised in full in profit or loss. [IAS 39.102V].
- The Phase 2 amendments also clarify that changes to the method for assessing hedge effectiveness due to modifications required by IBOR Reform, will not result in the discontinuation of hedge accounting. [IAS 39.102P(d)].

One of the changes to the method for assessing hedge effectiveness that could be required is where the approach has previously been based on regression analysis and there are insufficient data points to enable this approach to be applied for the RFR. While the Amendment is not explicit on this issue, presumably regression could be replaced by another approach until sufficient data becomes available, at which point, the use of regression would resume, as long as this is documented as the strategy at the time the hedge relationship is adjusted.

As discussed in section 4.2.2 above in the context of IFRS 9, if a hedged item, or hedging instrument is amended to transition from IBOR to an RFR, but changes are made in addition to those required by IBOR Reform to obtain the Phase 2 hedge accounting reliefs, it is necessary to assess, first, whether the additional changes result in the discontinuation of hedge accounting, applying the normal hedge accounting requirements. Under IAS 39, one of the criteria for continuing hedge accounting is that the hedge is expected to be highly effective. As a consequence, it will be necessary to assess whether any additional changes made on transition to an RFR mean that the hedge is no longer expected to be highly effective. If this is the case, hedge accounting must be discontinued and Phase 2 hedge accounting relief is not available.

4.2.8 Determination of whether an RFR is a separately identifiable risk component under IAS 39

Similar to the Phase 1 and 2 Amendments for IFRS 9 (see sections 4.1.1, 4.2.4 and 4.2.5 above), the amendments to IAS 39 provide reliefs for the assessment of whether a non-contractually specified risk component is separately identifiable, and so can be designated as a hedged risk. However, again, the Amendments provide no new guidance on what is meant by 'separately identifiable'. As mentioned in section 4.2.5 above, whilst the guidance in IFRS 9 for a risk component to be separately identifiable is very similar to that in IAS 39 for a risk portion, the wording is not exactly the same. In particular, IAS 39 contains a simpler statement compared to the considerations included in IFRS 9, as follows: "... for a fixed rate financial instrument hedged for changes in fair value attributable to changes in a risk-free or benchmark rate, the risk-free or benchmark rate is normally regarded as both a separately identifiable component of the financial instrument and reliably measurable." [IAS 39.AG99F(a)].

How we see it

Given the IAS 39 reference to 'risk-free or benchmark' as a separately identifiable component, it has been established practice to designate other benchmarks, such as the overnight interest rate swap rate (OIS). It is possible that those entities still applying IAS 39 will have considered RFRs such as SONIA and SOFR as separately identifiable components of the change in fair value of fixed rate debt, by the time they respectively replaced sterling LIBOR and US dollar LIBOR, on the basis that they were already viewed by regulators as benchmarks and SOFR is also (nearly) risk-free. Similarly, entities may identify other RFRs as separately identifiable components of a change in the fair value of fixed rate debt that has historically been valued by reference to other IBORs, as the date approaches for when they are due to be replaced.

4.3 Application of Phase 2 reliefs

4.3.1 Fair value hedges

Since the hedged item will have a fixed rate, it will not need to be amended as part of IBOR Reform. Hence, Phase 1 ends when there is no longer uncertainty as to the timing and amount of the hedging instrument. This is expected to occur when the hedging instrument is amended as required by the Reform. This would include when the hedging derivative transitions to referencing an RFR, either through a centrally managed conversion process such as that run by the LCH, or the completion of bilateral negotiations to amend the derivative. At that time, Phase 2 will apply and it will also be necessary to amend the designated hedged risk.

A hedging derivative could be amended in one of two main ways: the transition basis spread could be added either to the floating leg of the derivative or subtracted from the fixed leg. For instance, if a hedging swap had been pay 3% fixed, receive 3-month US dollar LIBOR, when the transition basis difference is considered to be 26bp, it would be acceptable for the amended derivative to be pay 3%, receive SOFR + 26bp or, alternatively, pay 2.74%, receive SOFR (where 2.74% is 3.0% - 26bp). In the examples below, for the hedging derivative the transition basis adjustment has been made to the floating leg, as the LCH have applied this approach for interest rate swaps they transition.³¹

Whether or not the transition basis spread is added to the floating leg or deducted from the fixed leg, the amendment would take effect from the date of the first reset of the floating leg to SOFR (or other RFR as appropriate). For the purposes of hedge accounting, the hedge is likely to need to be redesignated earlier, since once the contractual terms of the hedging instrument are amended, there will no longer be any uncertainty as to the timing and amount of IBOR-based cash flows.

³¹ *Managing the Transition to RFRs, SwapClear's Approach to the Conversion Process*. London Clearing House, 4 November 2021.

As already mentioned in section 1 above, changing the derivative's reference should not require a change in the discount rate used to measure it. The discount rate should reflect the credit risk of the counterparty and this will not have changed just because of IBOR Reform. IBOR-based derivatives that are fully collateralised are already discounted at overnight rates, such as the RFRs. In contrast, it would be inappropriate to move to a risk-free discount rate for uncollateralised trades (i.e., if they have previously been discounted at IBOR, then it would follow that they should now be discounted at the RFR plus the transition spread) unless compensating changes are also made to the way that Credit Valuation Adjustments (CVAs) are calculated, such that there is no net impact on their valuation.

Whether the derivative is amended to pay 3%, receive SOFR + 26bp, or to pay 2.74%, receive SOFR, the designated hedged risk would most likely be revised to be a fair value hedge of a 2.74% component of the hedged item for changes in SOFR. (The advantage of designating the 2.74% component for changes in SOFR rather than a 3% component for changes in SOFR + 26bp, is that the former is much easier to calculate and apply, especially subsequent to transition when all new hedges will be designated for changes in SOFR-flat, i.e., with no spread adjustment).

Meanwhile, the discount rate used to measure the hedged risk would change from LIBOR to SOFR. See Chapter 49, for further discussion on discount rates in this context. On transition, the cumulative change in fair value of a 2.74% component of a fixed rate debt for changes in SOFR (discounted using SOFR) should be more or less the same value as the previously recorded change in fair value of a 3% component for changes in 3-month US dollar LIBOR (discounted using LIBOR), so there should be only a small change in value, if any, to be recorded in profit or loss.

The following two examples illustrate the key features of the Phase 2 Amendments for fair value hedges, the first where the derivative is amended on an economically equivalent basis and the second where it is determined that it is not.

Illustration 4-2: Application of Phase 2 relief to a fair value hedge

Company A has previously entered into an interest rate swap paying fixed 3% and receiving 3-month US dollar LIBOR (fixed in advance at the beginning of the quarter). It had been designated in a hedge of the exposure to changes in fair value attributable to US dollar LIBOR, of cash flows equivalent to a 3% coupon plus principal of a 4% fixed US dollar asset.

On 1 November 2022, the basis difference between SOFR and LIBOR is determined to be 26 basis points (based on the ISDA fallback, rounded to simplify the example). The swap is accordingly amended to pay fixed 3%, receive SOFR+26bps, effective from the first time the floating leg resets to SOFR.

The new swap is considered 'economically equivalent' to the old swap, since the only change has been to refer to SOFR instead of LIBOR and to adjust the floating spread based on the current market rates (see section 2.1 above). As a result, the formal designation of the hedging instrument is amended without discontinuing the hedge.

SOFR is expected to be a separately identifiable component of US dollar interest rates within 24 months and, therefore, can now be designated as the hedged risk component (see section 4.2.5 above). Consequently, the description of the hedged item is also amended when the derivative transitions to a hedge of changes in fair value attributable to SOFR, of the component of the 4% asset equivalent to a 2.74% coupon plus principal, where 2.74% is the previous 3% less the 26 basis points spread. (An entity applying IAS 39 for hedge accounting must also update how hedge effectiveness will be assessed in future (see section 4.2.7 above)).

At the next period end, the swap is remeasured to its new fair value, based on SOFR, consistent with the normal hedge accounting requirements. This remeasurement will include any difference in fair value of the swap immediately before and after its modification, but as the derivative has been modified on an 'economically equivalent basis', the effect should be small. The asset is also adjusted for the difference in its fair value with respect to the designated hedged risk. This will include the difference in fair value between the 3% coupon plus principal discounted at 3-month US dollar LIBOR and the 2.74% coupon plus principal discounted at SOFR. This difference should also be small. Any net change of fair value on the amendment of the swap and of the designated hedged component, is recorded in profit or loss as part of the recorded hedge ineffectiveness for the period (see section 4.2.2 above).

Illustration 4-3: Application of Phase 2 relief to a fair value hedge where the swap is amended to reflect the current market rate of interest

Entity A is a party to a swap with a notional value of £10 million and a remaining five-year maturity on which, quarterly, it pays sterling 3-month LIBOR (fixed in advance at the beginning of the quarter) and receives 3% fixed. The swap has been designated as a fair value hedge of a 3% component of a 4% fixed liability for changes in LIBOR.

On 1 November 2021, when the market rate for a five-year SONIA swap is 2.7%, the swap is amended to refer to SONIA at a time when the basis difference between 3-month LIBOR and SONIA is considered to be 12bp. However, rather than amend the swap to receive 3% and pay SONIA+12bp, which would be economically equivalent, the swap is amended to reflect the current market rate of interest, so that Entity A receives 2.7% and pays SONIA, effective from the first time the floating leg resets to SOFR. The present value of the net 18bp difference between the fixed and floating rates on the old and new swaps ($3\% - 2.7\% - 12\text{bp}$) is settled in cash. The entity determines that:

- (i) The new swap is not economically equivalent to the old one, due to the combined 18bp change in the interest payments (12bp added to the floating pay leg and 30bp subtracted from the fixed receive leg).
- (ii) However, the revised contractual cash flows are not substantially different, so do not give rise to the swap's derecognition.
- (iii) Hence, applying IFRS 9.6.9.5, as all the other IFRS 9 hedge accounting criteria are considered to still be met, the hedge relationship is not discontinued.

As a consequence, the entity amends the hedge relationship to reflect the changes, that is, to be a fair value hedge of the SONIA risk of a net 2.88% ($3\% - 12\text{bp}$) fixed rate component of the 4% fixed rate liability, but using a receive 2.7%, pay SONIA swap. It is not possible to amend the hedged item to be a 2.7% fixed rate component, because the hedged item can only be amended to reflect changes required by the Reform. However, the cumulative change in fair value of a 2.88% component of a fixed rate debt for changes in SONIA should be more or less the same value as the previously recorded change in fair value of a 3% component for changes in 3-month sterling LIBOR, so there should be only a small change in value, if any, to be recorded in profit or loss on transition.

The 2.88% component and the 2.7% swap will have fair values with different sensitivities to changes in SONIA, which will be an additional source of ongoing hedge ineffectiveness. Meanwhile, the reduction in the swap's fixed rate will, over time, be compensated, in profit or loss, by fair value changes as the swap reverts to a nil fair value at maturity.

4.3.2 Cash flow hedges

For a cash flow hedge, both the hedging instrument and the hedged item are likely to be required to be amended as required by the Reform. It is possible that they will be amended at different times and it is also possible that they will be amended on different bases, so that, for instance, the hedging instrument transitions using the ISDA protocol, whereas the basis of transition for the hedged item depends on bilateral negotiation. Phase 1 will end for each of the hedging instrument and the hedged item when there is no uncertainty of timing or amount, which could be at different times, while Phase 2 will potentially need to be applied more than once, when each of the hedging instrument and hedged item are amended.

In general, the method of designating the hedged risk and, hence, a hypothetical derivative should not change just because of IBOR Reform beyond what is strictly required by the Reform. Accordingly, if prior to transition, the designated hedged risk was the variability of IBOR cash flows, the new designated risk would be the variability of RFR plus the transition spread cash flows, as this would be economically equivalent. This is also likely to result in no gain or loss to be recorded on revising the hypothetical derivative and should not lead to any increase in future hedge ineffectiveness if the spread is calculated using the ISDA fallback protocol and the hedging instrument is amended in the same manner.

Alternatively, if the previously designated hedged risk was the variability of all the cash flows of the hedged item, then going forward, any hypothetical derivative would need to reflect the actual transition spread on the hedged item as negotiated between the parties. If this results in a change in the fair value of the hedged item, this could give rise to a profit or loss when the hypothetical derivative is amended. Also, if the transition spread on the hedged item differs from that on the hedging instrument, this difference in spread could also introduce a new ongoing source of hedge ineffectiveness.

The following Illustration shows the application of Phase 2 to a cash flow hedge.

Illustration 4-4: Application of Phase 2 relief to a cash flow hedge relationship

The initial fact pattern is the same as that in Illustration 4-2 above, except that it is a cash flow hedge of the US dollar LIBOR risk of a US dollar LIBOR plus 100bp liability. Ineffectiveness has been assessed and measured using a hypothetical derivative on which Company A receives 3% fixed and pays 3-month US dollar LIBOR (fixed in advance at the beginning of the quarter).

As in Illustration 4-2, on 1 November 2022, the derivative is amended to pay fixed 3%, receive SOFR+26bp, effective from the first SOFR fixing date. The main difference in this example is that the US dollar LIBOR borrowing will also need to be amended as part of IBOR Reform, through bilateral negotiation, but at the time the derivative is amended, it is assumed that this will not happen for some time, potentially several months.

At this point the hedge documentation will need to be amended to describe the amended swap as the hedging instrument in a cash flow hedge of the US dollar LIBOR liability (see section 4.2.1 above). SOFR is expected to be a separately identifiable component of US dollar interest rates within 24 months. However, Company A does not consider SOFR will ever be a separately identifiable component of US dollar LIBOR (see section 4.2.5 above). As a result, the hypothetical derivative is not amended at this time and continues to be based on LIBOR.

The original hedge relationship continues (see section 4.2.1 above), and the amount recorded in the cash flow hedge reserve continues to be based on LIBOR as required by the Phase 1 Amendments.

Because the swap is valued based on SOFR+26bp and the liability based on LIBOR, this remeasurement will give rise to a degree of ineffectiveness which will need to be recorded in profit or loss. However, given that the ISDA protocol transition spread has been fixed, this is likely to be relatively small. The entity considers that there is still an 'economic relationship' between SOFR and US dollar LIBOR, such that hedge accounting continues to be permitted. (An entity applying IAS 39 would be relieved from the 80-125% retrospective effectiveness assessment but would need to meet the prospective effectiveness assessment (see section 4.2.7 above)).

At the end of each accounting period from when the swap is amended until the liability is also renegotiated, the cash flow hedge reserve is remeasured to the lower of:

- ▶ The cumulative gain or loss in fair value of the SOFR swap (which will include gains or losses accumulated prior to the swap's transition)
- And
- ▶ The cumulative gain or loss in fair value of the US dollar LIBOR hypothetical derivative

One month after the derivative is amended, the liability is renegotiated on 1 December 2022, when the basis difference between 3-month US dollar LIBOR and SOFR is agreed to be 25 basis points, based on observable US LIBOR and SOFR swap quotations at that date. However, as part of the bilateral negotiation to amend the liability, the credit spread is also reduced by 20bp, due to an improvement in the borrower's credit quality. The liability is accordingly amended to pay SOFR + 105bp (where 105bp is the previous 100bp plus the current 3-month US dollar LIBOR-SOFR basis of 25bp, less the change in credit spread of 20bp), with effect from the first time that the floating leg resets to SOFR.

Apart from the 20bp change in credit spread, the amendment is considered to be required as a direct consequence of the Reform and the new basis for determining the contractual cash flows is considered to be economically equivalent to the old basis (see section 2.1 above).

The 20bp change in credit spread is not considered to be a substantial modification of the liability, since quantitatively, the change in net present value discounted at the revised EIR of SOFR + 125bp is less than 10% and the change is also judged to be not substantial from a qualitative perspective. Hence, the liability is not derecognised.

Applying the Phase 2 relief on modification of a financial instrument (see section 2.2.1 above), the effective interest rate (EIR) on the liability is amended to SOFR + 125bp (where 125bp is the previous 100bp plus the current 3-month LIBOR-SOFR basis of 25bp).

The 20bp change in credit spread is not, however, covered by the Phase 2 relief and the net present value of the 20bp reduction, discounted at the revised EIR of SOFR plus 125bp, is recorded as an immediate credit to profit or loss.

The hedge documentation is now amended for a second time (see section 4.2.1 above). The Phase 1 relief requiring the hedged risk to continue to be based on LIBOR comes to an end and the hedge is now documented as a cash flow hedge of the SOFR risk in the SOFR + 105bp liability. (An entity applying IAS 39 for hedge accounting will also need to update the hedge documentation for any change in how hedge effectiveness will be assessed (see section 4.2.7 above)). Again, the amendment of the hedge documentation, to refer to the modified hedged item and the new designated risk component, does not constitute a discontinuation of the original hedging relationship (see section 4.2.1 above). Hence, the fixed leg of the hypothetical derivative is not updated to reflect current market conditions. Instead, it is amended to be a receive 3%, pay SOFR + 25bp swap.

The amount accumulated in the cash flow hedge reserve is now deemed to be based on SOFR (see section 4.2.1 above).

Note that because of the timing mismatch, the derivative (pay 3%, receive SOFR+26bp) and the hypothetical derivative (receive 3.0%, pay SOFR + 25bp) have a 1bp different net cash flow. A small degree of hedge ineffectiveness will, therefore, arise in the future, as changes in the fair values of the derivative and the hypothetical derivative will not be the same.

However, applying IFRS 9, the entity considers that there is still an 'economic relationship' (see Chapter 49) between the derivative and the hypothetical derivative going forward. For entities applying IAS 39, the hedge must be assessed prospectively to be highly effective and the level of retrospective hedge ineffectiveness will need to be monitored to ensure that the hedge continues to qualify for accounting purposes as there is no longer any relief from the 80/125% effectiveness requirements (see section 4.2.7 above).

The cash flow hedge reserve is remeasured at the next period end, to the lower of:

- ▶ The cumulative gain or loss in fair value of the amended swap
- And
- ▶ The cumulative gain or loss in fair value of the revised hypothetical derivative

Hence, the amount of ineffectiveness actually recorded will depend on whether the change in the fair value of the derivative is greater than that on the hypothetical derivative.

How we see it

Entities are recommended to ensure that there are as few mismatches as possible in the timing of the amendment of hedging instruments and hedged items, to minimise the level of recorded hedge ineffectiveness. For the US dollar LIBORs that ceased at the end of June 2023, since the ISDA fallback spreads had been fixed, this was no longer a major concern. This is because market spreads had largely converged on the ISDA fallbacks. But for those IBORs that are still to cease, such as JIBAR and other local IBORs, there could still be some variability in the market spread between the IBOR and the replacement RFR during the period until the IBOR ceases. Hedging relationships where the hedged item transitions to synthetic LIBOR may subsequently transition to an RFR, which would require the hedging relationship to be updated for each transition.

Ensuring that the hedged item and hedging instrument transition at a similar time could be especially challenging if an entity's swap traders do not know if a particular derivative is designated in a hedging relationship, as is more likely to be the case where a dynamic strategy is used or if derivatives are designated in 'proxy' hedges under IAS 39 and IFRS 9 (see Chapter 49 for a general discussion on designating proxy hedges). Procedures would need to be established to help ensure that derivatives are not modified without first considering the accounting consequences.

An EY Global IFRS video from November 2020 is available in which Tony Clifford, Jane Hurworth and David Bradbery discuss some practical issues in applying the IFRS IBOR Reform amendments. In the video, the Phase 2 Amendments are applied to illustrative examples of a fair value hedge and a cash flow hedge.

Access the EY video [here](#)

5 Transition

5.1 Phase 1

The effective date of the Phase 1 Amendments was for annual periods beginning on or after 1 January 2020, although earlier application was permitted. The requirements had to be applied retrospectively. However, the reliefs only applied to hedging relationships that existed at the beginning of the reporting period in which an entity first applies those requirements or were designated thereafter, and to the amount accumulated in the cash flow hedge reserve that existed at the beginning of the reporting period in which an entity first applies those requirements. It follows that it was not possible to apply the reliefs retrospectively to hedge relationships that were not previously designated as such. [IFRS 9.7.2.26(d)].

Extract from IFRS 9

- 7.2.26 As an exception to prospective application of the hedge accounting requirements of this Standard, an entity:
- (a) ...
 - (d) shall apply the requirements in Section 6.8 retrospectively. This retrospective application applies only to those hedging relationships that existed at the beginning of the reporting period in which an entity first applies those requirements or were designated thereafter, and to the amount accumulated in the cash flow hedge reserve that existed at the beginning of the reporting period in which an entity first applies those requirements.

5.2 Phase 2

The Phase 2 Amendments became effective for annual periods beginning on or after 1 January 2021, with earlier application permitted. [IFRS 9.7.1.10, IAS 39.108H]. Application of the Phase 2 Amendments is mandatory, to ensure comparability.

Application was retrospective although, as is normal under IFRS accounting standards, hedge relationships could not be designated retrospectively. However, discontinued hedging relationships had to be reinstated in certain circumstances as described below. [IFRS 9.7.2.43, IFRS 9.7.2.44, IFRS 9.7.2.45, IAS 39.108I, IAS 39.108J].

Extract from IFRS 9

- 7.2.43 An entity shall apply *Interest Rate Benchmark Reform-Phase 2* retrospectively in accordance with IAS 8, except as specified in paragraphs 7.2.44-7.2.46.
- 7.2.44 An entity shall designate a new hedging relationship (for example, as described in paragraph 6.9.13) only prospectively (ie an entity is prohibited from designating a new hedge accounting relationship in prior periods). However, an entity shall reinstate a discontinued hedging relationship if, and only if, these conditions are met:
- (a) the entity had discontinued that hedging relationship solely due to changes required by interest rate benchmark reform and the entity would not have been required to discontinue that hedging relationship if these amendments had been applied at that time; and
 - (b) at the beginning of the reporting period in which an entity first applies these amendments (date of initial application of these amendments), that discontinued hedging relationship meets the qualifying criteria for hedge accounting (after taking into account these amendments).
- 7.2.45 If, in applying paragraph 7.2.44, an entity reinstates a discontinued hedging relationship, the entity shall read references in paragraphs 6.9.11 and 6.9.12 to the date the alternative benchmark rate is designated as a non-contractually specified risk component for the first time as referring to the date of initial application of these amendments (ie the 24-month period for that alternative benchmark rate designated as a non-contractually specified risk component begins from the date of initial application of these amendments).

It should be noted that while discontinued hedges had to be reinstated if they met the criteria, there was no equivalent requirement or ability to account retrospectively for hedge relationships that never qualified for hedge accounting in the first place.

In practice, this meant, for instance, that an entity could not reinstate a hedging relationship that did not previously exist or was voluntarily de-designated, even if it could have met the conditions for hedge accounting and then failed as a direct consequence of IBOR Reform.

Continuing to meet all the qualifying criteria included the need for the risk management objective, as discussed in Chapter 49, of the discontinued hedge relationship to remain unchanged. This was unlikely to have been the case if either the hedged item or the hedging instrument was subsequently designated in a new hedge relationship, such that the hedging instrument was no longer designated as a hedge of the same hedged item.

To the extent that application of the practical expedient would have resulted in a different accounting treatment to that applied by the entity for changes made prior to application of the Phase 2 Amendments to the basis for determining contractual cash flows, this formed part of the transition adjustment.

If hedges for which RFR instruments were designated as a hedge of a risk component were previously discontinued and reinstated upon first application of the Phase 2 Amendments, the 24-month period to which the separately identifiable relief applies (see sections 4.2.4 and 4.2.5 above), began from the date of initial application of the Phase 2 Amendments.

An entity was not required to restate prior periods on application of the Phase 2 Amendments. It could do so, but only if it were possible without the benefit of hindsight. If it did not restate prior periods, the entity had to recognise any difference in carrying values as an adjustment to retained earnings (or other component of equity, if appropriate) at the beginning of the annual reporting period that included the initial date of application. [IFRS 9.7.2.46, IAS 39.108K].

6 Disclosures

6.1 Phase 1

Consequential amendments were made by the Phase 1 Amendments to IFRS 7, as shown below. [IFRS 7.24H].

Extract from IFRS 7

- Uncertainty arising from interest rate benchmark reform*
- 24H For hedging relationships to which an entity applies the exceptions set out in paragraphs 6.8.4-6.8.12 of IFRS 9 or paragraphs 102D-102N of IAS 39, an entity shall disclose:
- (a) the significant interest rate benchmarks to which the entity's hedging relationships are exposed;
 - (b) the extent of the risk exposure the entity manages that is directly affected by the interest rate benchmark reform;
 - (c) how the entity is managing the process to transition to alternative benchmark rates;
 - (d) a description of significant assumptions or judgements the entity made in applying these paragraphs (for example, assumptions or judgements about when the uncertainty arising from interest rate benchmark reform is no longer present with respect to the timing and the amount of the interest rate benchmark-based cash flows); and
 - (e) the nominal amount of the hedging instruments in those hedging relationships.

These requirements are illustrated in Practical example 6-1 below:

Practical example 6-1: Standard Chartered PLC (2023)

United Kingdom

Annual Report 2023 [extract]

Financial statements [extract]

Notes to the financial statements [extract]

Note 13. Financial instruments [extract]

Interest rate benchmark reform

During 2023, significant progress was made in support of LIBOR transition.

New LIBOR-referencing business had ceased and a full suite of Risk Free Rate-referencing derivative and cash products were standard offerings across the Group.

Having completed the remediation of all non-USD LIBOR exposures at the end of 2021 with no reliance on synthetic rates, the Programme focused on remediating legacy USD LIBOR stock ahead of the USD LIBOR cessation date (30 June 2023).

The Group made significant progress towards completing its remediation of legacy exposures over the course of 2023. Clients with legacy USD LIBOR loans were engaged to remediate their contracts via active conversion to alternative rates, or other suitable transition mechanisms such as the inclusion of robust fallbacks. For derivatives, the Group adhered to the International Swaps and Derivatives Association (ISDA) 2020 IBOR Fallbacks Protocol for all its trading entities and continued to engage clients to do the same or to negotiate remediation bilaterally. The Group also successfully participated in CCP conversion events, including both tranches of the London Clearing House (LCH) conversions for USD LIBOR and also the SGD/THB conversion, as well as the CME Eurodollar futures and the Hong Kong Exchanges and Clearing (HKEX) USD LIBOR events. This significantly reduced our overall notional exposure to USD LIBOR, as centrally cleared derivatives and bilateral derivatives with fallbacks represented a substantial portion of the Group's overall USD LIBOR notional exposure.

At 31 December 2023, a number of contracts remain subject to remediation but these are considered immaterial for the Group. The largest population of remaining exposures are syndicated loans, either on a standalone basis, or where the loans have been hedged with derivatives. These contracts currently operate under a synthetic USD LIBOR rate.

Risks which the Group is exposed to due to LIBOR transition

The Group has largely mitigated all material adverse outcomes associated with the cessation of IBOR benchmarks, and these have not required a change to the Group's risk management strategy.

However, the Group will continue to focus on the un-remediated contracts, and manage the risks of the transition until fully complete.

Particular attention will continue to be paid to: legal risk of any contracts that may remain outstanding after the end of synthetic LIBOR (currently scheduled for end of September 2024); conduct risk arising from continued remediation; financial and accounting risk in terms of the financial impact of IBOR transition for the outstanding contracts, and also financial instruments that may be affected by accounting issues such as accounting for contractual changes due to IBOR reform, fair value measurement and hedge accounting, as well as other risks inherent in the reform.

As at 31 December 2022 the Group had the following notional principal exposures to interest rate benchmarks that were subject to interest rate benchmark reform.

IBOR exposures by benchmark at 31 December 2022	USD LIBOR \$million	GBP LIBOR \$million	SGD SOR \$million	THB FIX \$million	Other IBOR \$million	Total IBOR \$million

Interest rate benchmark reform

As at 31 December 2023, there are no derivative instruments designated in fair value or cash flow hedge accounting relationships that were linked to IBOR reference rates (31 December 2022: \$65,769 million).

The Phase 1 disclosures do not cease to be required once the Phase 2 Amendments begin to be applied, although the population of instruments to be disclosed will decline over time as they transition to RFRs. The Phase 1 disclosures provide information on the hedging relationships that are still subject to the Phase 1 reliefs.

6.2 Phase 2

Consequential amendments were made by the Phase 2 Amendments to IFRS 7, to enable users of financial statements to understand the effect of interest rate benchmark reform on an entity's financial instruments and risk management strategy. [IFRS 7.24I, IFRS 7.24J].

Extract from IFRS 7

Additional disclosures related to interest rate benchmark reform

- 24I To enable users of financial statements to understand the effect of interest rate benchmark reform on an entity's financial instruments and risk management strategy, an entity shall disclose information about:
- (a) the nature and extent of risks to which the entity is exposed arising from financial instruments subject to interest rate benchmark reform, and how the entity manages these risks; and
 - (b) the entity's progress in completing the transition to alternative benchmark rates, and how the entity is managing the transition.
- 24J To meet the objectives in paragraph 24I, an entity shall disclose:
- (a) how the entity is managing the transition to alternative benchmark rates, its progress at the reporting date and the risks to which it is exposed arising from financial instruments because of the transition;
 - (b) disaggregated by significant interest rate benchmark subject to interest rate benchmark reform, quantitative information about financial instruments that have yet to transition to an alternative benchmark rate as at the end of the reporting period, showing separately:
 - (i) non-derivative financial assets;
 - (ii) non-derivative financial liabilities; and
 - (iii) derivatives; and
 - (c) if the risks identified in paragraph 24J(a) have resulted in changes to an entity's risk management strategy (see paragraph 22A), a description of these changes.

The quantitative disclosures provided by entities could exclude those exposures that are expected to expire or mature before the IBOR ceases. This is because for these instruments, the entity would not consider itself to be exposed to the risks relating to IBOR Reform. This disclosure would, therefore, relate only to a subset of the total population of instruments referencing a significant interest rate benchmark subject to the Reform. However, if an entity wished to include these exposures, it could be justified as they could still be affected by IBOR Reform related risk, such as reduced liquidity in the IBOR before it expires or matures. [IFRS 7.BC35LLL].

The proposal in the Phase 2 ED to disclose the carrying value of non-derivative financial assets and financial liabilities and the nominal value of derivatives, was replaced in the Phase 2 amendments with a more flexible approach. Entities can select the basis for the quantitative information they provide about financial instruments that have yet to transition to an alternative benchmark rate. Examples of approaches that may be followed, as set out in the Basis for Conclusions to the amendments to IFRS 7, include:

- The carrying amounts of non-derivative financial assets, the carrying amount of non-derivative financial liabilities and the nominal amount of derivatives
 - The amounts related to recognised financial instruments (for example, the contractual par amount of non-derivative financial assets and non-derivative financial liabilities, and nominal amounts of derivatives)
- Or
- The amounts provided internally regarding these financial instruments to key management personnel of the entity (as defined in IAS 24 *Related Party Disclosures*), for example, the entity's board of directors or chief executive officer

This approach is intended to reduce the incremental effort needed to provide the additional disclosure required by the Phase 2 Amendments, whilst still meeting the objective of the disclosure to provide relevant information on the entity's progress in implementing the Reform. [IFRS 7.BC35KKK]. Entities must provide the Phase 2 IFRS 7 disclosures when they apply the Phase 2 Amendments to IFRS 9 and IAS 39 (or IFRS 4). The Basis for Conclusions clarifies that, on initial application, the new disclosures need not be provided for prior reporting periods unless the entity also restates prior periods for the effects of the Phase 2 Amendments to IFRS 9 and IAS 39 (or IFRS 4). [IFRS 7.BC35OOO].

One of the concerns that some entities, in particular banks, identified when preparing to provide these quantitative disclosures was that, while reports on the instruments still subject to the Reform may be prepared for key management personnel and regulators, the information is not of the quality (in terms of completeness and accuracy) normally expected for disclosure in the audited financial statements. This is because, like any temporary reporting used to monitor a transition project, the information is built on a 'best effort basis' and was not intended to achieve the level of accuracy of the usual accounting disclosures.

A parallel can perhaps be drawn with the disclosure requirement in IAS 8.30 for new IFRSs that have been issued but are not yet effective, as both disclosures are temporary and deal with current known information about a future change. IAS 8.30 requires that an entity disclose "known or reasonably estimable information relevant to assessing the possible impact that application of the new IFRS will have on the entity's financial statements in the period of initial application", as discussed further in Chapter 3. The objective of the Phase 2 disclosures is to reflect how the entity is implementing the Reform, which for some entities may still be a reasonably complex project.

It is also relevant that the amendments to the IFRS Taxonomy 2021, which incorporate the Phase 2 Amendments' disclosures, included a 'text block' element (to allow text as opposed to numerical input), in the table to address the IFRS 9.24J(b) requirements. This was to address the fact that the information can be disclosed in various ways. The Taxonomy reflects that the Board permits the use of text block elements for the disclosure of quantitative information because the disclosure requirements are not prescriptive about how the quantitative information should be provided. The Phase 2 Amendments, therefore, permit an entity to choose the way in which it provides this quantitative information, for example an entity can provide such information as an amount or a percentage accompanied by qualitative information to explain the context of the quantitative information.

A variety of approaches have been used to provide the quantitative disclosures. For derivatives, the information presented has included notional values, fair values and both in combination. For non-derivatives, book values or nominal values were used.

6.2.1 Disclosure for instruments which have not transitioned

The Phase 2 Amendments require disclosure at the end of the reporting period of exposures which are still to transition from IBOR to RFR. [IFRS 7.24J(b)]. The FCA in its announcement on 5 March 2021³² confirmed that twenty-six of the thirty-five LIBOR settings 'will cease immediately after'

- 31 December 2021 for twenty-four of the LIBORs (all seven euro and Swiss franc LIBORs, the overnight, one-week, two- and twelve-month yen LIBORs, the overnight, one-week, two-month and twelve-month sterling LIBORs, and the one-week and two-month US dollar LIBORs
And
- 30 June 2023 for two US dollar LIBORs (overnight and twelve month)

For the nine remaining LIBORs the FCA confirmed on 29 September 2021 that:

- Publication for six of the LIBORs (one-, three- and six-month sterling and Japanese yen LIBOR) would continue for twelve months on a synthetic basis from 1 January 2022 using a new methodology to help ensure an orderly wind-down for legacy contracts only, with no new use of these LIBORs permitted.
And
- The FCA would consult on whether the three other US dollar LIBOR settings (one-, three- and six-month) would also continue on a synthetic basis after 30 June 2023.³³

In September 2022³⁴ they confirmed that:

- One and six-month synthetic sterling LIBOR would be required until the end of March 2023 after which they would permanently cease.
- A conclusion was not reached on whether three-month synthetic sterling LIBOR would continue beyond March 2023.
- Synthetic yen LIBOR (one-, three- and six-month) would permanently cease at the end of 2022.
And
- They will provide an update later whether synthetic US dollar LIBORs will be required.

32 FCA announcement on future cessation and loss of representativeness of the LIBOR benchmarks, 5 March 2021.

33 FCA announce further arrangements for the orderly wind-down of LIBOR at end-2021, 29 September 2021.

34 FCA announces decision on cessation of 1- and 6-month synthetic sterling LIBOR at end-March 2023, Financial Conduct Authority, 29 September 2022

In April 2023 the FCA confirmed³⁵ that:

- Three-month synthetic sterling LIBOR would continue until the end of March 2024, after which it would permanently cease.
- One-month, three-month and six-month US dollar LIBOR settings would continue in synthetic form until 30 September 2024, after which they will permanently cease. The use of these synthetic LIBORs for any new contracts was prohibited, but its use was permitted for all legacy contracts except cleared derivatives. Section 6.2.4 below describes the disclosure requirements for instruments that reference synthetic LIBOR, for which further transition is expected.

'Transition' is not defined by the Phase 1 or Phase 2 amendments, therefore, determining which exposures should be included in the disclosure is a matter of judgement. In making this judgement, entities should consider the Phase 2 Amendments' disclosure objective, which requires entities to disclose the nature and extent of risks arising from financial instruments subject to IBOR reform. [IFRS 7.24I].

Instruments could be changed from IBOR to RFR in a series of steps, each of which could represent a 'transition' and be eligible for the reliefs which the Phase 2 amendments provide, depending on the specific facts and circumstances. Transition dates for the application of the relief for resetting the effective interest rate are also likely to differ from the transition dates for applying the hedge accounting reliefs. These steps could potentially include: when a fall-back is added; when an entity decides to use the fallback or when bilateral negotiation is completed; when exposures are automatically converted by a central clearing house such as the LCH; when an IBOR ceases to be published; when a fallback is activated; or the first time the floating rate of an instrument resets to an RFR. Entities should determine at the reporting date the stage their exposures have reached in the transition from IBOR to RFR and include in the disclosure those exposures which they consider still present a risk arising from IBOR Reform.

Entities should disclose any significant judgements made in the determination, in order to meet the objectives of IFRS 7.24I (see section 6.4 below). For example, if an entity includes in its disclosure, IBOR exposures with fall-back provisions which will convert to an RFR immediately after the reporting date, we would generally expect adequate disclosure of this circumstance, including if no further changes are expected to these exposures/contracts due to IBOR Reform. For example, this would have applied for entities reporting as at 31 December 2021, which was immediately prior to the cessation of the majority of LIBORs and may have applied for entities reporting at 30 June 2023, which was immediately prior to the cessation of the remaining US dollar LIBORs. This could have included a quantification of those exposures separately from others for which either such fall-backs have not yet been agreed or else will not take effect immediately after the reporting date, e.g., the fallbacks relate to IBORs that will not cease for some time, such as those US dollar LIBORs that ceased after 30 June 2023 or other local IBORs for which a timetable for their replacement has not yet been set. This would provide more meaningful information to users about the nature and extent of the risks arising from these financial instruments.

6.2.2 Application to loan commitments

The Phase 2 Amendments describe that the quantitative disclosures should show separately non-derivative financial assets, non-derivative financial liabilities and derivatives. [IFRS 7.24J(b)]. However, the disclosures do not relate just to these items since the amendments to IFRS 7 are not restricted to just those financial instruments within the scope of IFRS 9. [IFRS 7.24I, IFRS 7.24J]. Rather, the Phase 2 disclosures apply to all financial instruments within the scope of IFRS 7, which includes recognised and unrecognised financial instruments, some of which are outside the scope of IFRS 9. [IFRS 7.4]. Certain loan commitments, for example, are excluded from the scope of IFRS 9 (other than for the calculation of the expected credit loss) but are within the scope of IFRS 7 since they are still considered to be derivatives in nature. [IFRS 9.BCZ2.2]. As a result, loan commitments outside the scope of IFRS 9, should be included in the quantitative disclosures, where their relevance for the IBOR Reform programme is material.

6.2.3 Level of detail for different categories

In terms of the level of granularity that should be provided in the quantitative information, there is no requirement to split the amounts into individual balance sheet line items. It would, however, be permissible to include this additional level of detail if it provided useful information on the entity's exposure to the risks posed by IBOR Reform, consistent with the disclosure objective of IFRS 7. [IFRS 7.1].

Similarly, there is no requirement to analyse the quantitative information by product type. Nor is there a requirement to include within the disclosure those exposures indirectly affected by IBOR Reform, for example, where a discount rate used by the entity in a valuation technique to calculate fair value is expected to change from IBOR to RFR.

³⁵ [FCA announces decision on synthetic US dollar LIBOR](#), FCA, 3 April 2023

How we see it

If the entity considers that different product types, or some other subdivision of the information, represent materially different risks in relation to IBOR Reform, then the provision of a further level of disaggregation would be consistent with the broader principles of IFRS 7 and the intention for this disclosure.

6.2.4 Exposures that reference a new rate but for which further transition could occur

As IBOR Reform has progressed, some IBORs were fully or partially reformed rather than being replaced. EURIBOR and the Canadian Overnight Repo Rate Average (CORRA) could be considered examples of such interest rates.

Some LIBORs were made available on a synthetic basis to help deal with tough legacy exposures by allowing them more time to run off. The synthetic LIBORs could not be used for new transactions. The FCA state that whilst the synthetic LIBORs are calculated using a new methodology, they do not meet the requirements of the Benchmarks Regulation.³⁶ Since exposures referencing synthetic IBORs do not reference a reformed benchmark interest rate, it would appear reasonable for them to still be included in the Phase 2 disclosures. If an entity's exposure to synthetic IBORs is material, they could require separate disclosure to distinguish between synthetic IBOR exposures that:

- The entity expects will transition to RFRs
 - Are expected to mature whilst the synthetic IBOR remains available
- And
- Are not expected to transition to RFRs

The Phase 2 quantitative disclosure requirements are shown in Illustration 6-1. While this shows one way to comply with IFRS 7.24J(b), other approaches are possible.

How we see it

Judgement is required to define the best measures to reflect the entity's progress towards completing the Reform, considering that the Basis for Conclusions indicates that entities should make use of information that is already available to reduce the cost of providing the information. Entities should also consider whether the disclosure is sufficient to meet the objective of IFRS 7.24I(a), to provide information about the nature and the extent of risks to which the entity is exposed arising from financial instruments subject to IBOR Reform.

³⁶ Further arrangements for the orderly wind-down of LIBOR at end-2021, Financial Conduct Authority, 29 September 2021.

6.2.5 Phase 2 disclosure: Illustrations and examples

Illustration 6-1: Phase 2 Quantitative Disclosures, our publication Good Bank (International) Limited 2022Extract from Note 48 *Risk Management* in EY's *Good Bank 2023*:³⁷**48.4.3.1 IBOR reform**

...

The tables below show the Bank's exposure to significant IBORs subject to reform that have yet to transition to RFRs as at the current year end and the prior year end. The tables exclude exposures to IBORs that will expire before transition is required.

In \$ million 31 December 2023	Non derivative financial assets - carrying value	Non-derivative financial liabilities - carrying value	Derivatives Nominal amount ¹
Goodland ³⁸ IBOR \$ (1 month)	1,247	1,610	1,474

NOTES TO CONSOLIDATED FINANCIAL STATEMENTS [extract]

NOTE 11 DERIVATIVES [extract]

Interest Rate Benchmark Reform

The Bank's hedging relationships no longer have exposure to USD LIBOR, but continue to have exposure to CDOR benchmark rates. As a result of IBOR reform, CDOR benchmark rates are subject to discontinuance, or may become illiquid after the adoption of ARR as established benchmark rates. Judgment may be required in determining whether certain hedging relationships that involve hedging changes in fair value or variability of cash flows attributable to interest rate or foreign exchange risk continue to qualify for hedge accounting.

Impacted hedging relationships will continue to be monitored for all remaining benchmark rates still subject to ARR transition. As the new ARRs will differ from the prior benchmark rates, new or revised hedging strategies may be required to better align derivative hedging instruments with hedged items. Given ongoing market developments, the assessment of the impact on the Bank's hedging strategies and its mitigation plans is progressing.

Derivative Instruments Designated in Qualifying Hedge Accounting Relationships¹

(millions of Canadian dollars)

	As at	
	October 31, 2023	October 31, 2022
	Hedging derivatives maturing after June 28, 2024 (for CDOR)	
Notional		
Interest rate risk		
Interest rate swaps	\$ 137,624	\$ 135,732
Foreign exchange risk		
Interest rate swaps	70,929	54,810
Cross-currency swaps ²	75,127	56,335
Total	\$ 283,680	\$ 246,877

¹ CDOR transitioning to Canadian Overnight Repo Rate Average.

² Cross-currency swaps may be used to hedge foreign exchange risk or a combination of interest rate risk and foreign exchange risk in a single hedge relationship. Both these types of hedges are disclosed under the Foreign exchange risk as the risk category.

As at October 31, 2023, the Bank has transitioned all derivative instruments designated in qualifying hedge accounting relationships referencing USD LIBOR to an ARR and it no longer has exposure to any residual USD LIBOR derivative notional amounts (October 31, 2022 – \$148 billion).

The following table discloses the notional amount of derivative instruments designated in qualifying hedge accounting relationships referencing CDOR that have yet to transition to an ARR and mature after June 28, 2024.

Credit Risk

Credit risk on derivatives, also known as counterparty credit risk, is the risk of a financial loss occurring as a result of the failure of a counterparty to meet its obligation to the Bank.

Derivative-related credit risks are subject to the same credit approval, limit and monitoring standards that are used for managing other transactions that create credit exposure. This includes evaluating the creditworthiness of counterparties, and managing the size, diversification and maturity structure of the portfolios. The Bank actively engages in risk mitigation strategies through the use of multi-product derivative master netting agreements, collateral and other risk mitigation techniques. Master netting agreements reduce risk to the Bank by allowing the Bank to close out and net transactions with counterparties subject to such agreements upon the occurrence of certain events. The current replacement cost and credit equivalent amount shown in the following table are based on the standardized approach for counterparty credit risk. According to this approach, the current replacement cost accounts for the fair value

Practical example 6-3: Shell plc (2022)

United Kingdom

Shell Annual Report and Accounts 2022 [extract]**CONSOLIDATED FINANCIAL STATEMENTS [extract]****NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]****20 - FINANCIAL INSTRUMENTS [extract]****Interbank Offered Rate (IBOR) reform**

USD London Interbank Offered Rate (LIBOR) is the most significant IBOR for Shell. USD LIBOR will transition immediately after June 30, 2023. Significant IBOR exposures, disaggregated by tenure at December 31, 2021, are as follows:

	\$ million December 31, 2021		
	Non-derivative financial assets – carrying value	Non-derivative financial liabilities – carrying value	Derivatives – Nominal amount
USD LIBOR (1 month)	62	–	
USD LIBOR (3 months)	1,155	1,200	5,828
USD LIBOR (6 months)	75		
Cross-currency interest rate swaps:			
EUR Fixed to USD LIBOR (3 months)			8,311
GBP Fixed to USD LIBOR (3 months)			1,227
CHF Fixed to USD LIBOR (3 months)			1,359
MYR LIBOR (3 months) to USD LIBOR (3 months)			360
Total	1,292	1,200	17,085

6.3 Sources of hedge ineffectiveness

As discussed in section 4.1.3 above, the Phase 1 Amendments provide relief under IAS 39 from the retrospective assessment of hedge effectiveness where effectiveness is outside the 80-125% range for any hedge relationships affected by IBOR Reform. Also, section 4.2.7 above discusses how the Phase 2 Amendments allow entities, for the purpose of the IAS 39 assessment of retrospective hedge effectiveness, to reset the cumulative fair value changes to zero. However, any actual hedge ineffectiveness continues to be recognised in full, which is the case under both IFRS 9 and IAS 39. As a result of the Reform, it could be necessary for entities to revise or expand the disclosures they provide in relation to hedge ineffectiveness.

For example, entities are required to disclose, by risk category, a description of the sources of hedge ineffectiveness that are expected to affect the hedging relationship during its term. [IFRS 7.23E]. Also, when other sources of hedge ineffectiveness emerge in a hedging relationship, an entity is required to disclose those sources by risk category and explain the resulting hedge ineffectiveness, as discussed in Chapter 50. Although there are no new specific disclosure requirements on this within the Phase 1 or Phase 2 Amendments, as a consequence of IBOR Reform and application of the Amendments, entities may need to enhance these disclosures to include the additional interest rate risk related hedge ineffectiveness that could reasonably be expected to arise as financial instruments designated in hedging relationships are affected by the Reform.

6.4 Significant judgements

Entities when applying the Phase 1 and Phase 2 amendments, could be required to make various judgements in order to apply the reliefs and produce the disclosures. Separate disclosure should be provided of any significant judgements in line with the requirements of IAS 1 *Presentation of Financial Statements*, paragraph 122, which is discussed further in Chapter 3. Since this disclosure requirement is already established in IFRS accounting standards, the IASB, did not specify additional disclosure for significant judgements when finalising the IBOR Reform amendments. [IFRS 7.BC35MMM].

Significant judgements which could arise for which entities would be required to provide disclosure could include (but are not limited to) the following:

- How entities assess whether transition has taken place on an 'economically equivalent' basis. This is discussed further in section 2 above.
- To determine when the Phase 1 reliefs should end, entities will need to assess whether there remains any uncertainty with respect to the amount or timing of IBOR Reform. This is discussed further in section 4.1.2 above.
- The assessment of whether an RFR is expected to be separately identifiable, as described in sections 4.2.4 and 4.2.5 above.
- To determine which exposures should be included in the Phase 2 Amendments quantitative disclosures, entities will need to identify those exposures which have not transitioned and continue to present a risk arising from IBOR Reform, as discussed in section 6.2.1 above.

How we see it

Although the IASB responded to preparers' concerns by making the Phase 2 quantitative disclosure requirements less onerous, by allowing entities to choose the basis for the quantitative information provided, production of these disclosures is still a significant element of any IBOR Reform financial reporting project.

6.5 Transition disclosures

The Phase 2 Amendments provided relief from having to meet some of the IAS 8 *Accounting Policies, Changes in Accounting estimates and Errors* disclosure requirements upon initial adoption. [IFRS 7.44HH]. On first adopting the Phase 2 Amendments, entities did not have to provide information for the current and prior period of the amount of the transitional adjustment for each financial statement line item affected and the impact on basic and diluted earnings per share. [IAS 8.28(f)].

Whilst relief was provided from one of the IAS 8 transition disclosures, the other disclosures were still required. This included the amount of any adjustment arising on transition relating to periods before the period of adoption (as an adjustment to opening retained earnings), along with a description of the transitional provisions. These requirements are discussed in Chapter 3. [IAS 8.28(a)-IAS 8.28(e), IAS 8.28(g), IAS 8.28(h)].

7 Amendments to IFRS 16 Leases

IFRS 16 has been amended to address situations where lease agreements specifically refer to an IBOR and will need to be amended to refer to an RFR.

To the extent that:

- The modification is necessary as a direct consequence of the Reform (see section 2.1.1 above)
- The new basis for determining lease payments is 'economically equivalent' to the previous basis (see section 2.1 above)
- There are no further modifications other than those required by the Reform

Lessees are required to remeasure their lease liabilities in similar fashion to any other change in future lease payments resulting from a change in an index or a rate used to determine those payments in accordance with IFRS 16.42, rather than as a lease modification. [IFRS 16.104, IFRS 16.105].

Applying IFRS 16, modifying a lease contract to change the basis for determining the variable lease payments meets the definition of a lease modification, because a change in the calculation of the lease payments would change the original terms and conditions determining the consideration for the lease. Without the relief, IFRS 16 would require an entity to account for a lease modification by remeasuring the lease liability by discounting the revised lease payments using a revised discount rate (with an offsetting adjustment to the right-of-use asset). Further guidance on accounting for lease modifications is discussed in Chapter 24. In the Board's view, reassessing the lessee's entire incremental borrowing rate when the modification is limited to what is required by the Reform would not reflect the economic effects of the modified lease. The practical expedient requires remeasurement of the lease liability using a discount rate that only reflects the change to the basis for determining the variable lease payments as required by the Reform.

If, in contrast, other changes to the lease are made at the same time, the normal modification rules in IFRS 16 apply, even to those modifications required by the Reform. [IFRS 16.106]. In contrast to the amendments for financial assets and financial liabilities in IFRS 9, the Board decided not to specify the order of accounting for lease modifications required by the Reform and other lease modifications. This is because the accounting outcome would not differ regardless of the order in which an entity accounts for lease modifications required by the Reform and other lease modifications.

For finance leases, a lessor is required to apply the requirements in IFRS 9 to a lease modification, so the amendments in paragraphs 5.4.5-5.4.9 of IFRS 9 would apply when those modifications are required by the Reform.

The effective date was for annual reporting periods beginning on or after 1 January 2021. Early application was permitted. An entity is not required to restate comparative periods and may have done so only if it was possible without the use of hindsight. [IFRS 16.C1B, IFRS 16.C20C, IFRS 16.C20D].

8 Amendments to IFRS 4 *Insurance Contracts*

At the time the amendments became effective, IFRS 4 *Insurance Contracts* provided insurers an election to defer the implementation of IFRS 9. These entities had to adopt IFRS 9 when *IFRS 17 Insurance Contracts* took effect from 1 January 2023. [IFRS 4.20R]. IFRS 4 was therefore amended so that insurers who were still using IAS 39 *Financial Instruments: Recognition and Measurement* could obtain the same reliefs as other entities. The amendments to IFRS 4 clarified that prior to these entities adopting IFRS 9, references in the amendments to IFRS 9.B5.4.5 should have been read as referring to IAS 39.AG7 and references to IFRS 9.5.4.3 and IFRS 9.B5.4.6 should have been read as referring to IAS 39.AG8. [IFRS 4.20S]. This means that those insurers that were still applying IAS 39 obtained the same reliefs for assessing derecognition and resetting the EIR as other entities.

The effective date was for annual reporting periods beginning on or after 1 January 2021. Early application was permitted. [IFRS 4.50]. An entity was not required to restate comparative periods and could do so only if it was possible without the use of hindsight. [IFRS 4.51].

Appendix B - Defined terms

Extract from IFRS standards - Definitions

derecognition	The removal of a previously recognised financial asset or financial liability from an entity's statement of financial position. <i>[IFRS 9 Appendix A].</i>
derivative	<p>A financial instrument or other contract within the scope of this Standard with all three of the following characteristics.</p> <ul style="list-style-type: none"> (a) its value changes in response to the change in a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index, or other variable, provided in the case of a non-financial variable that the variable is not specific to a party to the contract (sometimes called the 'underlying'). (b) it requires no initial net investment or an initial net investment that is smaller than would be required for other types of contracts that would be expected to have a similar response to changes in market factors. (c) it is settled at a future date. <i>[IFRS 9 Appendix A].</i>
effective interest rate	<p>The rate that exactly discounts estimated future cash payments or receipts through the expected life of the financial asset or financial liability to the gross carrying amount of a financial asset or to the amortised cost of a financial liability. When calculating the effective interest rate, an entity shall estimate the expected cash flows by considering all the contractual terms of the financial instrument (for example, prepayment, extension, call and similar options) but shall not consider the expected credit losses. The calculation includes all fees and points paid or received between parties to the contract that are an integral part of the effective interest rate (see paragraphs B5.4.1-B5.4.3), transaction costs, and all other premiums or discounts. There is a presumption that the cash flows and the expected life of a group of similar financial instruments can be estimated reliably. However, in those rare cases when it is not possible to reliably estimate the cash flows or the expected life of a financial instrument (or group of financial instruments), the entity shall use the contractual cash flows over the full contractual term of the financial instrument (or group of financial instruments). <i>[IFRS 9 Appendix A].</i></p>
financial asset	<p>A financial asset is any asset that is:</p> <ul style="list-style-type: none"> (a) cash; (b) an equity instrument of another entity; (c) a contractual right: <ul style="list-style-type: none"> (i) to receive cash or another financial asset from another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favourable to the entity; or (d) a contract that will or may be settled in the entity's own equity instruments and is: <ul style="list-style-type: none"> (i) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments.

	<p>For this purpose the entity's own equity instruments do not include puttable financial instruments classified as equity instruments in accordance with paragraphs 16A and 16B, instruments that impose on the entity an obligation to deliver to another party a pro rata share of the net assets of the entity only on liquidation and are classified as equity instruments in accordance with paragraphs 16C and 16D, or instruments that are contracts for the future receipt or delivery of the entity's own equity instruments. [IAS 32.11].</p>
insurer	<p>The party that has an obligation under an insurance contract to compensate a policyholder if an insured event occurs. [IFRS 4 Appendix A].</p>
modification gain or loss	<p>The amount arising from adjusting the gross carrying amount of a financial asset to reflect the renegotiated or modified contractual cash flows. The entity recalculates the gross carrying amount of a financial asset as the present value of the estimated future cash payments or receipts through the expected life of the renegotiated or modified financial asset that are discounted at the financial asset's original effective interest rate (or the original credit-adjusted effective interest rate for purchased or originated credit-impaired financial assets) or, when applicable, the revised effective interest rate calculated in accordance with paragraph 6.5.10. When estimating the expected cash flows of a financial asset, an entity shall consider all contractual terms of the financial asset (for example, prepayment, call and similar options) but shall not consider the expected credit losses, unless the financial asset is a purchased or originated credit-impaired financial asset, in which case an entity shall also consider the initial expected credit losses that were considered when calculating the original credit-adjusted effective interest rate. [IFRS 9 Appendix A].</p>

Overview

With the plethora of frameworks, methodologies and metrics for sustainability reporting that have been developed in recent years, there has been growing demand among stakeholders in wider corporate reporting and in particular sustainability reporting, to improve the global consistency and comparability of sustainability reporting. Following public consultations, the Trustees of the IFRS Foundation (the Foundation) established the International Sustainability Standards Board (ISSB) within the Foundation's governance structure in November 2021. The intention is for the ISSB to deliver a comprehensive global baseline of sustainability-related disclosure standards that provide investors and other capital market participants with information about companies' sustainability-related risks and opportunities to help them make informed decisions. The ISSB is supported by a number of advisory bodies and since its establishment, the ISSB has consolidated and collaborated with a number of sustainability standard setters. In June 2023, the ISSB issued its first two IFRS sustainability disclosure standards (ISSB standards), namely, IFRS S1 *General Requirements for Disclosure of Sustainability-related Financial Information* and IFRS S2 *Climate-related Disclosures*. ISSB standards can be used on a standalone basis or can be integrated into jurisdictional requirements to serve broader stakeholder or other public policy needs.

IFRS S1 sets out the general requirements for a complete set of sustainability-related financial disclosures and requires an entity to disclose information about all sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects. The effect on the entity's prospects refers to the effect on the entity's cash flows and its access to finance or cost of capital over the short, medium or long term. IFRS S2 sets out the requirements for an entity to disclose information about its climate-related risks and opportunities that is useful to primary users of general purpose financial reports in making decisions relating to providing resources to the entity. IFRS S2 is the first topic-based standard issued by the ISSB and is to be applied in conjunction with IFRS S1.

ISSB standards provide transition reliefs to support first time implementation by companies. Among others, a company, in the first annual reporting period applying ISSB standards, may disclose information on only climate-related risks and opportunities in accordance with IFRS S2 and consequently apply the requirements in IFRS S1 to the extent related to the disclosure of information on climate-related risks and opportunities.

Both IFRS S1 and IFRS S2 are effective for annual reporting periods beginning on or after 1 January 2024. However, the mandatory application of ISSB standards depends on each jurisdiction's endorsement or regulatory processes and is not linked to the application of IFRS accounting standards. Therefore, an entity applying IFRS accounting standards for financial reporting purposes is not required to also apply ISSB standards, and *vice versa*.

Following the ISSB's first agenda consultation in 2024, it has commenced projects to research sustainability-related disclosures about risks and opportunities associated with biodiversity, ecosystems and ecosystem services (BEES), and human capital.

What you need to know

- The Trustees of the IFRS Foundation established the ISSB in November 2021.
- The ISSB issued its first two standards, namely IFRS S1 and IFRS S2, in June 2023.
- The ISSB standards can be used on a standalone basis or integrated into jurisdictional requirements.
- In applying ISSB standards, IFRS S1 must be applied in conjunction with the other ISSB standards that provide requirements for specific sustainability-related topics (e.g., IFRS S2 for climate-related matters).
- IFRS S1 and IFRS S2 are effective for annual reporting periods beginning on or after 1 January 2024 and include various transition reliefs that are available in the first year of application. Mandatory application of ISSB standards will depend on each jurisdiction's endorsement or regulatory processes.
- In 2024, the ISSB decided to add to its work plan two sustainability-related research projects on:
 - a) biodiversity, ecosystems and ecosystem services, and
 - b) human capital.
- The application of IFRS S1 and IFRS S2 is not linked to the application of IFRS accounting standards. Therefore, entities that apply IFRS accounting standards for financial reporting purposes are not required to also apply ISSB standards, and *vice versa*.

1 Why ISSB standards matter

Sustainability reporting has attracted increasing interest from various stakeholders in recent years. A holistic approach to corporate reporting, with key components that include sustainability reporting, financial reporting and assurance has emerged. In response to both the demand for information from the investment community and broader public expectations of the role of businesses in society, a plethora of frameworks, methodologies and metrics for sustainability reporting have been developed.

Currently, there are a number of sustainability-related reporting frameworks, standards and metrics. Some focus on non-financial information and sustainability-related matters, while others focus specifically on climate-related disclosures. The target audience for those frameworks, standards and metrics varies, e.g., investors and wider society. Although information may overlap in certain respects, differences in subject matters and audience give rise to diverging approaches to materiality with either an emphasis on the impact of sustainability matters on an entity, or an entity's impact on the external environment, or both. This diversity in objectives and approaches underlines the urgent need for a global framework to provide greater comparability and reduce the complexity in sustainability reporting.

2 The IFRS Foundation and the ISSB

2.1 Standard setting structure, the IFRS Foundation and the Monitoring Board

Refer to Chapter 1 for discussion related to the standard setting structure, the Foundation and the Monitoring Board.

2.2 The ISSB

In recent years, there has been growing interest among stakeholders in wider corporate reporting, in particular, sustainability reporting. The Trustees of the Foundation set up a task force in October 2019 to undertake further research and analysis. In September 2020, it carried out public consultations to identify the demand from stakeholders in the area of sustainability reporting and understand what the Foundation could do in response to that demand.¹ The Foundation received feedback from multiple stakeholder consultations on both the need for it to play a role in sustainability standard setting and on the changes to its constitution. The message was clear - there is a growing demand to improve the global consistency and comparability of sustainability reporting and an urgent need for action.

As a result, the Trustees decided to take steps to formalise the creation of a sustainability board.² In November 2021, the Trustees amended the Constitution after public consultation to expand the Foundation's objectives to create the ISSB which will set IFRS sustainability disclosure standards (ISSB standards) within the Foundation's governance structure, set out the structure and function of the new board and align other parts of the Constitution with the creation of the new board.³ The intention is for the ISSB to deliver a comprehensive global baseline of sustainability-related disclosure standards that provide investors and other capital market participants with information about companies' sustainability-related risks and opportunities, to help them make informed decisions.⁴

Members of the ISSB are appointed by the Trustees.⁵ Currently, the ISSB comprises 14 members, including the Chair and Vice-Chair. The main qualifications for membership of the ISSB are professional competence and recent relevant professional experience.⁶ The Trustees are required to select ISSB members so that the ISSB, as a group, will comprise the best available combination of technical expertise and diversity of international business and market experience, including auditors, preparers, users, academics and market and/or financial regulators. No individual should be both a Trustee and a member of the ISSB at the same time.⁷ Furthermore, the ISSB, in consultation with the Trustees, is expected to establish and maintain liaison with national sustainability standard-setters and other official bodies concerned with standard setting to assist in the development of ISSB standards.⁸

The ISSB will normally be required to comprise:⁹

- Four members from Asia/Oceania
- Four members from Europe
- Four members from the Americas
- One member from Africa
- And
- One member appointed from any area, subject to maintaining overall geographical balance

1 [Consultation Paper on Sustainability Reporting](#), IFRS Foundation, September 2020. Available on the IFRS Foundation's website (accessed on 13 August 2025).

2 IFRS Foundation [Feedback Statement: IFRS Foundation Trustees' Feedback Statement on the on the Consultation Paper on Sustainability Reporting](#), April 2020. Available on the IFRS Foundation's website (accessed on 13 August 2025).

3 IFRS Foundation [Feedback Statement: IFRS Foundation Trustees' Feedback Statement on proposed amendments to the IFRS Foundation's Constitution](#), November 2021. Available on the IFRS Foundation's website (accessed on 13 August 2025).

4 [International Sustainability Standards Board](#), available on IFRS Foundation's website (accessed on 13 August 2025).

5 IFRS Foundation *Constitution*, November 2021, Section 44.

6 IFRS Foundation *Constitution*, November 2021, Section 45.

7 IFRS Foundation *Constitution*, November 2021, Section 45.

8 IFRS Foundation *Constitution*, November 2021, Section 47.

9 IFRS Foundation *Constitution*, November 2021, Section 46.

The responsibilities of the ISSB are listed in Section 58 of the Constitution. Its primary role is to have complete responsibility for all ISSB technical matters including preparing and issuing ISSB standards and exposure drafts, each of which is required to include any dissenting opinions.¹⁰

Approval by at least eight members of the ISSB is required for the publication of an exposure draft and ISSB standards, if there are fewer than 14 members of the ISSB. If there are 14 members, approval is required by at least nine members.¹¹ Other decisions of the ISSB, including the publication of a discussion paper, require a simple majority of the members present at a meeting that is attended by at least 60% of the members.¹² The ISSB has full discretion over its technical agenda and over project assignments on technical matters. It must, however, consult the Trustees on its agenda, and the Advisory Council on major projects, agenda decisions and work priorities. In addition, the ISSB is required to carry out a public consultation every five years in developing its technical agenda.¹³ The ISSB is also required to establish procedures in order to achieve the objective of developing ISSB standards that are compatible, and avoid inconsistencies and conflicts with IFRS accounting standards issued by the International Accounting Standards Board (IASB).¹⁴

The ISSB meets monthly, but not in August. These meetings are open to the public and meeting materials are available on the ISSB's website. It has a global and multi-location presence with offices in the Americas, EMEA (Europe, Middle East and Africa) and Asia.

2.3 Due Process

Refer to Chapter 1 for discussion of the standard setting due process.

2.4 IFRS Advisory Council

Refer to Chapter 1 for discussion of the IFRS Advisory Council.

2.5 Other advisory bodies

In addition to the Advisory Council, discussed in section 2.4 above, the ISSB has a number of other formal advisory bodies to consult that provide input on its work and resources. Meetings with the advisory bodies are held in public and meeting materials are available on the ISSB's website.

The ISSB's other advisory bodies are as follows:¹⁵

- Integrated Reporting and Connectivity Council - provides guidance on how reporting required by the IASB and the ISSB could be integrated and how the IASB and the ISSB could consider applying principles and concepts from the Integrated Reporting Framework to their projects
- Sustainability Standards Advisory Forum (SSAF) - provides an advisory forum where members can constructively contribute towards the achievement of the ISSB's goal of developing standards that provide a comprehensive global baseline of sustainability-related disclosures that is interoperable with jurisdictional standards on sustainability reporting
- ISSB Investor Advisory Group - serves as an advisory body to the ISSB, providing strategic guidance on developing ISSB standards and helping to ensure that the investor perspective is articulated clearly and is considered in the ISSB's standard-setting process
- Sustainability Consultative Committee - identifies, informs and advises the ISSB on priority sustainability matters and related technical protocols, as well as significant interdependencies between sustainability matters. Refer to section 3.3 for discussion on interoperability
- IFRS Taxonomy Consultative Group - advises the IASB and ISSB on their respective digital taxonomies and related activities
- Transition Implementation Group on IFRS S1 and IFRS S2 (TIG) - solicits, analyses and discusses stakeholder questions arising from implementation of the new ISSB standards, informs the ISSB about those implementation questions and provides a public forum for stakeholders to learn about the new standards from others involved with implementation.¹⁶ The TIG held its first meeting in March 2024 and held three meetings in total during that year. Refer to section 3.7 for further discussion.

3 IFRS S1 and IFRS S2

3.1 Background

The Foundation set up a Technical Readiness Working Group (TRWG) prior to the establishment of the ISSB, with the objectives of accelerating convergence in global sustainability reporting standards and the technical preparation, including the development of prototype, conceptual guidelines for standard setting and architecture of standards, for the ISSB under the governance of the Foundation. The TRWG was comprised of representatives from the Taskforce for Climate-related Financial Disclosures (TCFD), the Value Reporting Framework (VRF), the Climate Disclosure Standards Board (CDSB), the World Economic Forum (WEF) and the IASB, supported by the International Organization of Securities Commissions (IOSCO) and its Technical Expert Group of securities regulators.¹⁷ The TRWG's work on general requirements for the disclosure of sustainability-related financial information and the climate-related disclosure resulted in prototype standards titled *General Requirements for Disclosure of Sustainability-related Financial Information Prototype* and *Climate-related Disclosures Prototype* respectively, which were published on the Foundation's website in November 2021. The prototype standards were not subject to the Foundation's formal due process.

3.2 Issuance of IFRS S1 and IFRS S2

In March 2022, the ISSB published its first two exposure drafts on IFRS S1 and IFRS S2 for public comment. The comment period ended on 29 July 2022. On 26 June 2023, after a year of deliberations on the feedback on the two exposure drafts, the ISSB issued its first two ISSB standards, IFRS S1 and IFRS S2. The standards are aimed to enable users of general purpose financial reports to assess an entity's exposure to, and management of, sustainability-related risks and opportunities over the short, medium and long term, and to inform their decisions relating to providing resources to an entity. Moreover, the sustainability-related financial information is intended to complement the information in the entity's general purpose financial statements. Under the governance of the Foundation, the ISSB works closely with the IASB to ensure connectivity and compatibility between IFRS accounting standards and ISSB standards.

The ISSB standards are comprised of:

- The full text of IFRS S1 plus five appendices and the full text of IFRS S2 plus three appendices. The appendices are integral parts of IFRS S1 and IFRS S2 and have the same authority as the main text
- *Illustrative Guidance* and *Illustrative Examples* which accompany ISSB standards but are not part of them, nor are they intended to provide interpretative guidance. However, the examples illustrate aspects of the requirements in ISSB standards and help in their implementation
- The *Basis for Conclusions* which accompanies ISSB standards, but it is not part of them, nor is it intended to provide interpretative guidance. The *Basis for Conclusions* summarises the considerations of the ISSB in developing ISSB standards
- IFRS S2 is accompanied by *Industry-based Guidance on Implementing IFRS S2*, which is not intended to create additional requirements. IFRS S2 requires an entity to refer to and consider the applicability of the industry-based disclosure topics defined in the *Industry-based Guidance on Implementing IFRS S2*, when identifying its climate-related risks and opportunities. Even if an entity concludes not to use the *Industry-based Guidance on Implementing IFRS S2*, industry-specific disclosures are still required by ISSB standards. The disclosure topics identified and defined in the industry-based guidance include climate-related risks and opportunities that are typically associated with particular business models, activities or other common features that characterise participation in an industry. The industry-based guidance also suggests possible ways to measure and disclose information about climate-related risks and opportunities, including metrics and targets.

¹⁷ The VRF (which houses the Integrated Reporting Framework and the SASB standards) and the CDSB have now been consolidated into the ISSB.

3.3 Interoperability

ISSB standards can be used on a standalone basis or integrated into jurisdictional requirements to serve broader stakeholder or other public policy needs. The ISSB, with 14 board members from various parts of the world, is committed to formal engagement with jurisdictions that develop their own sustainability reporting requirements. Within the context of interoperability with other jurisdictions, several initiatives have been taken so far, including:

- Forming the Jurisdictional Working Group (JWG) to discuss important strategic matters relating to IFRS S1 and IFRS S2 and jurisdictional initiatives on sustainability reporting
- Establishing the SSAF as a formal technical advisory body to the ISSB, which is represented by jurisdictional and regional bodies that contribute their technical input and expertise to inform the ISSB's standard-setting work
- Collaborating with Global Reporting Initiative standards (GRI standards)
- Working closely with the European Commission and EFRAG (formerly the European Financial Reporting Advisory Group) to facilitate interoperability. On 2 May 2024, the Foundation and EFRAG published interoperability guidance on the alignment between ISSB standards and the European Sustainability Reporting Standards (ESRS)¹⁸
- Developing guidance for jurisdictions on how to adopt ISSB standards into the various jurisdictions¹⁹

In addition to the ongoing actions of the ISSB to achieve interoperability of ISSB standards with other jurisdictional requirements, IFRS S1 already includes requirements to support this goal. For example, sustainability-related financial information in accordance with ISSB standards is:

- Aimed at meeting the information needs of primary users, i.e., current and potential investors, creditors and other lenders
- Based on a materiality assessment consistent with that used in the application of IFRS accounting standards
- Presented with information disclosed to meet other requirements, such as specific jurisdictional requirements, but must not be obscured by such additional information
- Aligned with TCFD Recommendations on governance, strategy, risk management, and metrics and targets
- Required for short, medium and long-term time horizons without defining those horizons as this would be an entity- or industry-specific determination

3.4 The role of IFRS S1 in ISSB standards

IFRS S1 sets out the general requirements for a complete set of sustainability-related financial disclosures and requires an entity to disclose information about all sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects. The effect on the entity's prospects refers to the effect on the entity's cash flows and its access to finance or cost of capital over the short, medium or long term.

The information required by IFRS S1 relates to general aspects of how an entity operates, in particular, its governance, strategy, risk management, and metrics and targets associated with sustainability-related risks and opportunities. IFRS S1 refers to these four aspects as the 'core content', meaning information that is essential to users' understanding of how an entity identifies, assesses, prioritises, monitors and manages sustainability-related risks and opportunities. The focus on core content builds on the widely accepted recommendations of the TCFD. IFRS S1 also deals with some general matters such as the requirement for fair presentation of those sustainability-related risks and opportunities and the requirement to provide comparative information.

¹⁸ [IFRS Foundation and EFRAG publish interoperability guidance](#), available on the IFRS Foundation's website (accessed on 13 August 2025).

¹⁹ [Inaugural Jurisdictional Guide for the adoption or other use of ISSB Standards](#), available on the IFRS Foundation's website (accessed on 13 August 2025).

An entity is required to apply IFRS S1 in conjunction with all the other ISSB standards before it can assert compliance with ISSB standards. The other ISSB standards are intended to set out specific requirements for the sustainability-related topics with which they deal. The purpose of IFRS S1 is to establish the basis of application of all topic-based ISSB standards that will be developed by the ISSB in the future, in addition to IFRS S2 which is the first topic-based standard and covers disclosure requirements that are specific to climate. This purpose, in the context of sustainability-related financial disclosures is similar, in some respects, to that of the IASB's *Conceptual Framework*, IAS 1 *Presentation of Financial Statements* and IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*, which are applicable to general purpose financial statements prepared in accordance with IFRS accounting standards.²⁰

3.5 Relationship between IFRS S1 and IFRS S2

IFRS S2 is the first topic-based standard issued by the ISSB and is to be applied in conjunction with IFRS S1. Although in this first phase of their development, IFRS S2 is the ISSB's only topic-based standard, IFRS S1 requires entities to disclose material sustainability-related financial information about all sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects. This requirement effectively covers sustainability-related topics beyond climate (subject to the 'climate first' transition relief which allows an entity to provide only climate-related disclosures in its first year of applying IFRS S1 and IFRS S2). IFRS S1 also provides a list of other sources of guidance to help entities identify the relevant sustainability-related risks and opportunities and the material information about them, which includes references to pronouncements of other standard-setting bodies.

Chapter 53 deals with the requirements of IFRS S1 and Chapter 54 deals with the requirements of IFRS S2.

3.6 Effective date of IFRS S1 and IFRS S2

Both IFRS S1 and IFRS S2 are effective for annual reporting periods beginning on or after 1 January 2024. However, the mandatory application of ISSB standards depends on each jurisdiction's endorsement or regulatory processes and is not linked to the application of IFRS accounting standards. Therefore, an entity applying IFRS accounting standards for financial reporting purposes is not required to also apply ISSB standards, and *vice versa*.

3.7 ISSB's support in implementing IFRS S1 and IFRS S2

The ISSB is committed to supporting the implementation of ISSB standards. The related initiatives include:

- Creating the TIG to analyse and publicly discuss any questions that arise during the implementation phase of ISSB standards. The TIG is expected to support implementation in the initial phase of application of ISSB standards and will inform the ISSB to determine if any follow up actions are needed. The members of the TIG include sustainability reporting and financial statement preparers, auditors and other users from a variety of industries and countries, as well as public and private entities. The International Organization of Securities Commissions (IOSCO), the International Auditing and Assurance Standards Board (IAASB) and the International Public Sector Accounting Standards Board (IPSASB) have been assigned as official observers of the TIG. The TIG does not issue authoritative guidance and, therefore, the use of its materials and related discussions are not mandatory for an entity to assert compliance with ISSB standards. Throughout Chapter 53 and Chapter 54, there are summaries of the discussions that the TIG had up to September 2025.
- Developing educational material to explain and illustrate how an entity might apply some of the requirements in IFRS S1 and IFRS S2. The educational material is not intended to provide interpretative guidance. The ISSB's educational material is not part of ISSB standards and cannot add to or change their requirements. The examples included in the educational material focus on particular requirements and therefore are not intended to explain or illustrate how the entity would apply all of the core content requirements in IFRS S1 and IFRS S2.

3.8 Adoption of ISSB standards by local jurisdictions

At the time of writing, thirty six jurisdictions have adopted or otherwise used the ISSB standards or are in the process of finalising steps towards introducing them into their regulatory frameworks.²¹

²⁰ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024.

²¹ [IFRS - IFRS Foundation publishes jurisdictional profiles providing transparency and evidencing progress towards adoption of ISSB Standards](#), available on IFRS Foundation's website (accessed on 12 August 2025).

4 Agenda consultation and recent standard setting activities

In December 2023, the ISSB published amendments to the SASB standards to enable international application and help preparers apply the SASB standards regardless of the jurisdiction in which they operate or the type of accounting framework they use. The SASB standards are a source of guidance for applying ISSB standards.

In May 2023, the ISSB published the Request for Information *Consultation on Agenda Priorities* to seek feedback on its priorities for its next two-year work plan. Specifically, the ISSB requested constituents' views on the strategic direction and balance of ISSB activities, the criteria for assessing which sustainability-related matters to prioritise and add to the ISSB's work plan and the scope and structure of potential new research and standard-setting projects. The ISSB released the feedback statement on the agenda consultation in June 2024 and announced that it will commence projects to research disclosure about risks and opportunities associated with BEES and human capital. The research projects will focus on the common information needs of investors in assessing whether and how these risks and opportunities could reasonably be expected to affect an entity's prospects.²²

In April 2025, the ISSB published an exposure draft proposing targeted amendments to IFRS S2 to provide reliefs to ease application of requirements related to the disclosure of greenhouse gas emissions. Refer to Chapter 54 for further discussion.

In July 2025, the ISSB published two exposure drafts proposing amendments to the SASB standards and consequential amendments to the *Industry-based Guidance on Implementing IFRS S2*. Specifically, the proposed amendments present a comprehensive review of nine industries that were prioritised (eight industries in the extractives and minerals processing sector as well as the processed foods industry), align some metrics in a further 41 industries for topics such as water management and workforce health and safety and propose updates to *Industry-based Guidance on Implementing IFRS S2* (affecting the nine prioritised industries and 37 of the 41 industries) to maintain alignment with climate-related content in the SASB standards. The comment letter period will close on 30 November 2025.²³

22 [IFRS - ISSB to commence research projects about risks and opportunities related to nature and human capital](#), available on IFRS Foundation website, (accessed on 13 August 2025).

23 [IFRS - ISSB proposes comprehensive review of priority SASB Standards and targeted amendments to others](#), available on IFRS Foundation's website (accessed on 12 August 2025).

5 Consolidation and collaboration with other sustainability standard setters

There is a commitment by leading investor-focused sustainability disclosure organisations to consolidate into the ISSB. Since November 2021, the Foundation has consolidated the Climate Disclosure Standards Board (an initiative of CDP) and the Value Reporting Foundation which houses the Integrated Reporting Framework and the SASB standards. In addition, in March 2022, the Foundation signed a collaboration agreement with the Global Reporting Initiative (GRI) such that their respective standard-setting boards, the ISSB and the Global Sustainability Standards Board, will seek to coordinate their work programmes and standard-setting activities.²⁴ In November 2023, GRI announced the establishment of the Sustainability Innovation Lab (SIL) in partnership with the Foundation. The SIL will enable companies to meet their evolving sustainability disclosure requirements, fostering professional development, training, practical solutions and innovative thinking.²⁵ In addition, since 2024, the Foundation has taken over the responsibilities of monitoring the progress of companies' climate-related disclosures from the TCFD. The recommendations from the TCFD have been fully incorporated into ISSB standards.²⁶

In April 2025, the Foundation and the Taskforce on Nature-related Financial Disclosures (TNFD) entered into a memorandum of understanding (MoU). Under the MoU, the ISSB and TNFD will "share research, knowledge and technical expertise to inform both the ISSB's BEES initiative and nature-related aspects of its SASB Standards enhancement work".²⁷

Chapter 53 General requirements for disclosure of sustainability- related financial information

Contents

Overview	4781
1 Introduction to IFRS S1	4782
1.1 The objective of IFRS S1	4782
1.1.1 Primary users	4782
1.1.2 Description of sustainability-related risks and opportunities	4783
1.1.2.A Sustainability is a broad term	4783
1.1.2.B The concept of value	4783
1.1.2.C The concept of value in the description of sustainability in IFRS S1	4783
1.1.2.D Requirement to identify sustainability-related risks and opportunities based on the description of sustainability in IFRS S1	4785
1.2 Identifying sustainability-related risks and opportunities	4786
1.2.1 The identification process	4786
1.2.2 Use of reasonable and supportable information	4793
1.2.2.A The concept of reasonable and supportable information	4793
1.2.2.B Application of the concept of reasonable and supportable information in IFRS S1	4793
1.2.3 Reassessing the scope of sustainability-related risks and opportunities	4794
2 Scope	4796
2.1 The scope of IFRS S1	4796
2.2 Application by public sector or entities other than profit-oriented entities	4796
3 Conceptual foundations	4797
3.1 Fair presentation of sustainability-related risks and opportunities	4797
3.1.1 Qualitative characteristics of sustainability-related financial information	4797
3.1.1.A Fundamental qualitative characteristics	4798
3.1.1.B Enhancing qualitative characteristics	4799

3.2	Materiality	4800
3.2.1	Definition of materiality	4800
3.2.2	Identifying material information	4801
3.2.2.A	Information needs of primary users	4802
3.2.2.B	Sources applied in assessing materiality	4803
3.2.2.C	Possible future events with uncertain outcomes	4803
3.2.3	Quantitative and qualitative factors in materiality judgements	4804
3.2.3.A	Making quantitative assessments	4805
3.2.3.B	Making qualitative assessments	4806
3.2.3.C	Combining quantitative and qualitative assessments	4807
3.2.4	Additional information disclosed by an entity	4808
3.2.4.A	Additional information provided when the requirements of ISSB standards are not sufficient	4808
3.2.4.B	Requirements for not obscuring material information	4808
3.2.4.C	Interaction with law or regulation	4809
3.2.5	Other characteristics of material information	4809
3.2.5.A	Aggregation and disaggregation	4809
3.2.5.B	Commercially sensitive information	4810
3.2.6	Reassessment of material information	4811
3.2.7	Example approach for identifying material information	4812
3.2.8	Interoperability considerations	4813
3.3	Reporting entity	4815
3.3.1	Definition of a reporting entity	4815
3.3.2	Breadth of reporting and the concept of the value chain	4815
3.3.3	Challenges in determining the scope of the value chain	4817
3.4	Connected information	4818
3.4.1	Connections between items to which the information relates	4819
3.4.2	Connections between disclosures provided in general purpose financial reports	4819
3.4.2.A	Connections between disclosures provided within an entity's sustainability-related financial disclosures	4819
3.4.2.B	Connections between disclosures provided across sustainability-related financial disclosures and other general purpose financial reports published by the entity	4820
3.4.3	Characteristics of connections	4821
4	Core content	4822
4.1	Overview of TCFD	4822
4.2	Governance	4823
4.2.1	Information about the oversight role	4823
4.2.2	Information about management's role	4824
4.3	Strategy	4827
4.3.1	Disclosures about sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects	4829
4.3.2	Disclosures about the effects of sustainability-related risks and opportunities on the entity's business model and value chain	4829
4.3.3	Disclosures about the effects of sustainability-related risks and opportunities on the entity's strategy and decision-making	4830
4.3.4	Disclosures about current and anticipated financial effects of sustainability-related risks and opportunities	4831

4.3.4.A	Disclosures about current financial effects	4832
4.3.4.B	Disclosures about anticipated financial effects: Next annual reporting period	4836
4.3.4.C	Disclosures about anticipated financial effects: Short, medium and long term	4836
4.3.4.D	Measurement of current and anticipated financial effects	4837
4.3.4.E	Preparing disclosures about anticipated financial effects	4837
4.3.4.F	Criteria and disclosures when quantitative information about current and anticipated financial effects is not required	4838
4.3.5	Disclosures about the resilience of the entity's strategy and business model to sustainability-related risks	4840
4.4	Risk management	4841
4.4.1	Risk management processes for identifying sustainability-related risks	4844
4.4.2	Risk management processes for identifying sustainability-related opportunities	4844
4.4.3	Integrating disclosures about risk management processes	4844
4.5	Metrics and targets	4845
4.5.1	Metrics	4845
4.5.1.A	Metrics required by ISSB standards	4845
4.5.1.B	Metrics developed by the entity	4845
4.5.2	Targets	4846
5	General requirements	4847
5.1	Sources of guidance	4847
5.1.1	Use of sources of guidance when identifying sustainability-related risks and opportunities	4847
5.1.1.A	Considerations when referring to the SASB standards to identify sustainability-related risks and opportunities	4848
5.1.1.B	Considerations when referring to other sources of guidance to identify sustainability-related risks and opportunities	4851
5.1.2	Sources of guidance when identifying material sustainability-related financial information	4854
5.1.2.A	Considerations when referring to the SASB standards to identify material information about sustainability-related risks and opportunities	4854
5.1.2.B	Considerations when referring to other sources of guidance to identify material information about sustainability-related risks and opportunities	4858
5.1.3	Disclosure of information about sources of guidance	4861
5.2	Location of disclosures	4861
5.2.1	Flexibility in location of disclosures	4861
5.2.2	Information included by cross-reference	4862
5.3	Timing of reporting	4865
5.3.1	Simultaneous reporting of sustainability-related financial disclosures and financial statements	4865
5.3.2	Reporting period of sustainability-related financial disclosures	4865
5.3.3	Interim reporting	4866
5.4	Comparative information	4867
6	Judgements, uncertainties and errors	4869
6.1	Judgements	4869
6.2	Measurement uncertainty	4869
6.2.1	Estimated amounts give rise to measurement uncertainty	4869
6.2.2	IFRS S1 requirements for measurement uncertainties	4869

6.2.3	Revised comparative information for estimated metrics	4870
6.2.3.A	New information for estimated metrics disclosed in the preceding period	4870
6.2.3.B	Revised comparatives for redefined, replaced and new metrics	4872
6.3	Errors	4873
7	Statement of compliance	4874
8	Effective date	4875
9	Transition reliefs	4876
9.1	Transition relief for simultaneous reporting	4876
9.2	Transition relief for comparative information	4876
9.3	'Climate-first' transition relief	4877

Overview

IFRS S1 *General Requirements for Disclosure of Sustainability-related Financial Information*, issued by the International Sustainability Standards Board (ISSB), sets out the general requirements for a complete set of sustainability-related financial disclosures. IFRS S1 requires an entity to disclose information about all sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects. The information required by IFRS S1 relates to general aspects of how an entity operates, in particular, its governance, strategy, risk management, and metrics and targets associated with sustainability-related risks and opportunities. IFRS S1 refers to these four aspects as the 'core content', meaning information that is essential to users' understanding of how an entity identifies, assesses, prioritises, monitors and manages sustainability-related risks and opportunities.

For further discussion about the development of the IFRS Sustainability Disclosure Standards (or ISSB standards), refer to Chapter 52.

IFRS S2 *Climate-related Disclosures* is the first topic-based standard issued by the ISSB and is to be applied in conjunction with IFRS S1. For further discussion about the requirements of IFRS S2, refer to Chapter 54. Although in this first phase of their development, IFRS S2 is the ISSB's only topic-based standard, IFRS S1 requires entities to disclose material sustainability-related financial information about all sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects (subject to the 'climate first' transition relief which allows an entity to provide only climate-related disclosures in its first year of applying IFRS S1 and IFRS S2).

1 Introduction to IFRS S1

1.1 The objective of IFRS S1

IFRS S1 sets out the general requirements for the content and presentation of information that an entity needs to provide about sustainability-related risks and opportunities. *[IFRS S1.4]*. The objective of providing such information is to support users of general purpose financial reports in their decision-making process that relates to providing resources to the entity which prepares the general purpose financial report.

[IFRS S1.1]. That is, this information is intended to enable those users to assess the entity's exposure to sustainability-related risks and opportunities over the short, medium and long term, as well as to assess how the entity manages those risks and opportunities in order to inform their decisions in providing resources to that entity.

General purpose financial reports are defined by IFRS S1 as those that provide financial information about an entity that is useful for the users of those reports in making decisions related to providing resources to the entity, and include, but are not restricted to, an entity's general purpose financial statements (or financial statements) and sustainability-related financial disclosures. *[IFRS S1 Appendix A]*. Information about an entity's sustainability-related risks and opportunities is incorporated in disclosures, referred to as sustainability-related financial disclosures, that constitute a particular form of general purpose financial report and which supplements and complements the information provided in the entity's financial statements.

To further clarify the objective of IFRS S1, there are certain components embedded in the standard as further discussed in the next sections:

- Users of general purpose financial statements as considered by IFRS S1 (see section 1.1.1 below)
- Sustainability-related risks and opportunities addressed by ISSB standards as described in IFRS S1 (see section 1.1.2 below)

1.1.1 Primary users

IFRS S1 defines primary users of general purpose financial reports (primary users) as the "existing and potential investors, lenders and other creditors".¹ *[IFRS S1 Appendix A]*. This definition was built on what is stated in paragraph 1.7 of the Conceptual Framework: "General purpose financial reports are not designed to show the value of a reporting entity; instead, they provide information to help existing and potential investors, lenders and other creditors estimate the value of the reporting entity".

According to this definition, ISSB standards focus on the information needs of primary users in making their decisions about providing resources to an entity, rather than the needs of a broader group of stakeholders. The Basis for Conclusions to IFRS S1 states that "Disclosures made in accordance with IFRS Sustainability Disclosure Standards are conceptually and practically complementary to - but not a replacement for - reporting on an entity's significant impacts on people, the environment and the economy". This clearly distinguishes sustainability-related financial information provided in accordance with ISSB standards from the broader, multi-stakeholder perspective adopted by other sustainability-related frameworks that focus on how an entity contributes to sustainable development. *[IFRS S1.BC49]*. For further discussion on the perspective adopted by other sustainability frameworks, see section 3.2.8 below.

Although focusing on the information needs of primary users is widely accepted by the market, identifying and assessing the information that would be useful to primary users may not always be straightforward. Primary users need sufficient and relevant information to make their decisions about where and when to provide resources to the entity that prepares the general purpose financial reports, as well as what type of resources to provide. Also, primary users are a diverse group with potentially differing objectives and types of risk exposure and the range of their interests on sustainability matters is rather wide and varies across industries, locations as well as business models and business activities. For further discussion on the identification of information that is useful to primary users, see section 3.2.2 below.

¹ The terms users of general-purpose financial reports, or primary users, or users are used within the IFRS sustainability disclosure standards to describe the same population.

1.1.2 Description of sustainability-related risks and opportunities

1.1.2.A Sustainability is a broad term

The term sustainability is a broad term and applies widely across environmental, social and governance matters and encompasses a wide range of notions. Sustainability is frequently linked to ‘sustainable development’, defined by the United Nations in 1987 as: “development that meets the needs of the present without compromising the ability of future generations to meet their own needs”.² IFRS S1 focuses on requiring disclosures about sustainability-related financial information related to an entity’s governance, strategy, risk management and metrics and targets in relation to those risks and opportunities. Therefore, the relationship of sustainability-related risks and opportunities with the established notions of sustainability and sustainable development, is fundamental to an understanding of the scope of IFRS S1 and ISSB standards in general. [IFRS S1.BC42, IFRS S1.BC43].

1.1.2.B The concept of value

In line with its commitment to leverage from the existing material available from other frameworks and standard-setters, the ISSB based the description of sustainability-related risks and opportunities on the concepts of the Integrated Reporting Framework.³ One of the fundamental concepts in the Integrated Reporting Framework is that an entity’s ability to create, preserve and erode value for itself over time (and thus to generate returns for the entity’s investors, lenders and other creditors) is inextricably linked to value that the entity creates, preserves or erodes for others. [IFRS S1.BC46]. In particular, the Integrated Reporting Framework contains the following key points:

Extract from the Integrated Reporting Framework

- 2.2 An integrated report explains how an organization creates, preserves or erodes value over time. Value is not created, preserved or eroded by or within an organization alone. It is:
- Influenced by the external environment
 - Created through relationships with stakeholders
 - Dependent on various resources.
- ...
- 2.6 The ability of an organization to create value for itself is linked to the value it creates for others.
- ...

This concept is also broadly consistent with the IASB’s Practice Statement on management commentary.⁴ [IFRS S1.BC47].

The broader concept of value reflects that primary users are interested not just in the value the entity creates for itself, but also in the value that the entity creates for others since that value may ultimately affect, for example, the cash flows generated by the entity, its cost of capital, or the availability of funding. The value concept also clarifies how important longer time horizons are. This is because, although the sources of value may not affect the entity’s financial performance in the near term, they may impact its performance, and ultimately its value, as assessed by primary users over time.

1.1.2.C The concept of value in the description of sustainability in IFRS S1

IFRS S1 explains how an entity’s ability to create, preserve or erode value is influenced by its interactions within the interdependent system in which it operates. In particular, an entity interacts, directly or indirectly, with its stakeholders, society, the economy and the natural environment throughout its value chain. Such interactions result from an entity’s own actions in operating its business model to achieve its strategic purposes, as well as from the influences it receives from the external environment in which it operates. In the context of IFRS S1, these interactions take place within an interdependent system and have a dual meaning. That is, an entity both: a) depends on resources and relationships throughout its value chain to generate cash flows; and b) affects those resources and relationships through its activities and outputs by contributing to the preservation, regeneration and development of those resources and relationships or to their degradation and depletion. [IFRS S1.2, IFRS S1.B2].

² [Sustainability | United Nations](#), available on the United Nations’ website (accessed in September 2024).

³ [Integrated Reporting Framework | Integrated Reporting](#), January 2021, available on the IFRS Foundation’s website.

⁴ [IASB issues revised Practice Statement on management commentary \(ifrs.org\)](#), IASB, June 2025, available on the IFRS Foundation’s website.

Resources and relationships can vary for a number of reasons, and they may take various forms. For example, resources and relationships could be natural (e.g., land, water, minerals, raw materials), manufactured (e.g., machinery, equipment, buildings, infrastructure), intellectual (e.g., patents, copyrights, trademarks), human (e.g., entity's workforce, workers in supply chains), social (e.g., stakeholder relationships, customers, indigenous communities), financial (e.g., cash, investments, access to financial resources). Resources and relationships can be internal (e.g., workforce, know-how, organisational processes) or external (e.g., accessing materials and services or relationships with suppliers, distributors and customers), and they can be recognised as assets in the entity's financial statements or not. Moreover, resources and relationships can be direct or extend throughout the entity's value chain. For example, the entity's supply and distribution channels, the effects of the consumption and disposal of the entity's products, the entity's sources of finance and its investments (including investments in associates and joint ventures). For further discussion about the concept of value chain, please refer to section 3.3.2 and 3.3.3 below.

Understanding an entity's dependencies and impacts (i.e., its dependence on resources and relationships and its impact on those resources and relationships) is important as these may give rise to sustainability-related risks and opportunities. An entity's activities and outputs can affect resources and relationships on which it depends, and the entity itself can be affected by its own impact on the resource or relationship. IFRS S1 provides the following example of the close relationship between the value the entity creates, preserves or erodes for others and the entity's own ability to succeed and achieve its goals: [IFRS S1.B3].

Extract from IFRS S1

B3 For example, if an entity's business model depends on a natural resource-such as water-the entity could both affect and be affected by the quality, availability and affordability of that resource. Specifically, degradation or depletion of that resource-including resulting from the entity's own activities and from other factors-could create a risk of disruption to the entity's operations and affect the entity's business model or strategy and could ultimately negatively affect the entity's financial performance and financial position. In contrast, regeneration and preservation of that resource-including resulting from the entity's own activities and from other factors-could positively affect the entity. Similarly, if an entity operates in a highly competitive market and requires a highly specialised workforce to achieve its strategic purposes, the entity's future success will likely depend on the entity's ability to attract and retain that resource. At the same time, that ability will depend, in part, on the entity's employment practices-such as whether the entity invests in employee training and wellbeing-and the levels of employee satisfaction, engagement and retention. These examples illustrate the close relationship between the value the entity creates, preserves or erodes for others and the entity's own ability to succeed and achieve its goals.

Although an entity's dependencies and impacts may not always be closely related (i.e., an entity can depend on something it does not affect and can affect something it does not depend on), a dependency and an impact may still give rise to sustainability-related risks and opportunities. Illustrations 1-1 and 1-2 below are based on examples provided in the ISSB's educational material on materiality:⁵

Illustration 1-1: Resource that the entity is dependent on that it does not affect

Entity A invests in the development of clean technologies which support the transition to a lower-carbon economy. Entity A depends on its access to cash and financial resources to fund its operations by depending on investor appetite to invest in entities whose business models support the transition to a lower-carbon economy. A changing financing environment related to a positive change in investor appetite for Entity A's business model could affect its access to the financial resources on which it depends.

⁵ [Educational material: Sustainability-related risks and opportunities and the disclosure of material information](#), ISSB, November 2024, available on the IFRS Foundation's website.

Illustration 1-2: Resource that the entity affects that it does not depend on

Entity B uses water to operate its business model, and through its water use, its activities could impact local marine species. The species that are most likely to be affected are not currently believed to be endangered. Entity B does not depend on this marine species to operate its business model. However, Entity B's activities may be considered to have the potential to contribute to the degradation or depletion of that water source and endanger particular marine species. If that is the case, these potential impacts could create a risk to Entity B's operations because of its dependency on its legal and social licence to operate (e.g., give rise to regulatory risks or reputational risks).

1.1.2.D Requirement to identify sustainability-related risks and opportunities based on the description of sustainability in IFRS S1

As described in section 1.1.2.C above, an entity's interactions (i.e., its dependence on resources and relationships and its impact on those resources and relationships by its activities and outputs) may give rise to sustainability-related risks and opportunities. IFRS S1 requires an entity to provide information about those sustainability-related risks and opportunities. However, according to IFRS S1, the sustainability-related risks and opportunities about which an entity is expected to provide information are limited to those that "could reasonably be expected to affect the entity's cash flows, its access to finance or cost of capital over the short, medium or long term". For the purposes of IFRS S1, these sustainability-related risks and opportunities are referred to as "sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects". [IFRS S1.3].

The effects of sustainability-related risks and opportunities on an entity's cash flows, its access to finance or cost of capital include: a) the amount, timing and uncertainty of an entity's incoming and outgoing cash flows; b) the entity's ability to obtain funding; and c) the cost incurred by the entity to secure funding for its operations and investments. These effects are assessed over the short, medium and long term to evaluate the potential implications of sustainability-related risks and opportunities for an entity. Short-, medium- and long-term time horizons can vary among entities and depend on many factors (see discussion in section 4.3.1 below). Although an entity assesses whether a sustainability-related risk or opportunity could reasonably be expected to affect its cash flows, its access to finance or cost of capital, this assessment does not require that the risk or opportunity affects all three, though often interrelated in practice. In assessing such effects, an entity considers how its interactions with other market participants may be affected. For example, if an entity has a negative reputation in terms of how it manages a sustainability-related risk, some lenders may avoid being associated with this entity because of the reputational risk that could arise from lending to it. This could result in the entity experiencing constrained access to capital, forcing it to seek capital elsewhere (sometimes on less favourable terms, e.g., higher interest rates, lower borrowing amounts, greater covenant restrictions compared with its peers).

The ISSB standards focus on sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects to ensure that entities are not required to identify every possible sustainability-related risk or opportunity that could be identified. That is, although an entity may depend on and affect many resources and relationships throughout its value chain, it will not disclose information about every sustainability-related risk or opportunity. Consider the example of clean air (a resource) on which an entity depends to generate cash flows. The entity could identify a sustainability-related risk related to the resulting disruption to business continuity if it was unable to access clean air. However, this is a risk that may not be reasonably expected to affect that entity's prospects, nor would identifying this possible, but not reasonably expected, risk likely result in the provision of material information, given that every entity depends on clean air to operate. However, in particular circumstances, an entity may identify a risk related to its access to clean air and, therefore, it may be appropriate to disclose information about that risk arising from its dependence on clean air (e.g., an entity may operate in a region in which the air is of such poor quality that the entity is or could reasonably be expected to be affected because its employees are unable to commute to the workplace or to live in the region).

How we see it

IFRS S1 provides a description of the concepts underlying sustainability-related risks and opportunities, rather than a definition for sustainability. This broad description does not set exact boundaries for the universe of topics covered by sustainability-related financial disclosures so as to reflect the evolving nature of these topics. It follows that the identification of sustainability-related risks and opportunities by an entity may change over time and reassessment of that identification may become necessary (see relevant discussion on reassessing the scope of sustainability-related risks and opportunities in section 1.2.3 below).

1.2 Identifying sustainability-related risks and opportunities

1.2.1 The identification process

To meet the objective of IFRS S1, an entity is required to identify the sustainability-related risks and opportunities that could reasonably be expected to affect its prospects and then to make a materiality assessment to identify and disclose the material information about the identified risks and opportunities. In both identifying sustainability-related risks and opportunities and the material information to be disclosed about them, an entity focuses on the objective of IFRS S1 (see section 1.1 above). As further discussed in section 1.1.1 above, ISSB standards focus on the information needs of primary users (e.g., investors), which distinguishes them from other sustainability-related frameworks that may adopt different perspectives, e.g., a broader or multi-stakeholder perspective or more focus on how an entity contributes to sustainable development.

For the purposes of identifying sustainability-related risks and opportunities, materiality is not an attribute of a risk or opportunity, rather it is an attribute of information about that risk and/or opportunity. This distinction is similar to the concepts applied in the IASB's *Conceptual Framework*.⁶ Also, the IASB's Practice Statement on management commentary requires an entity to focus on key matters and to provide material information about those key matters.

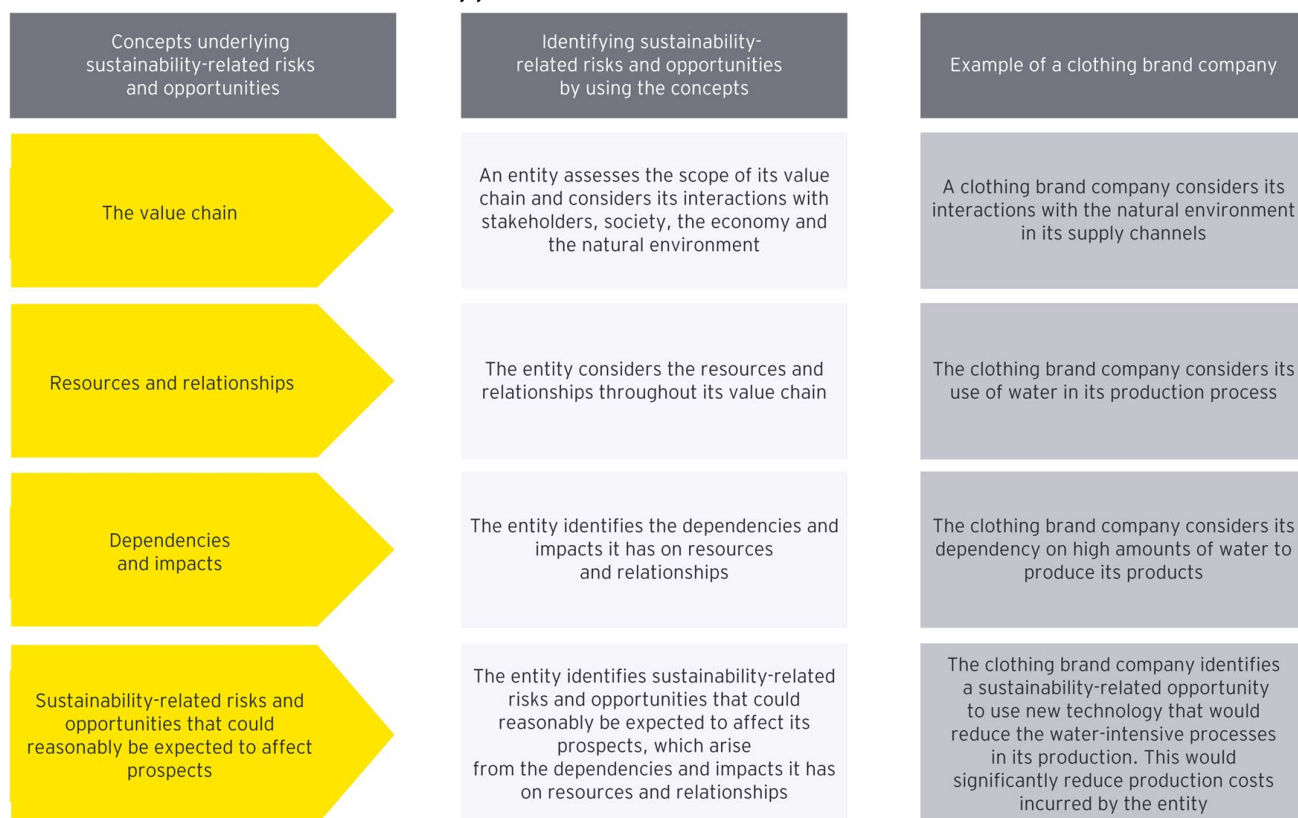

IFRS S1 does not explicitly require the two steps of: a) identifying the sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects; and b) identifying material information about those risks and opportunities, to be performed sequentially. In practice, the assessment performed under these two steps is likely to be iterative.

An entity needs to disclose information about the judgements it has made to prepare its sustainability-related financial disclosures that most significantly affect those disclosures. IFRS S1 refers to the process of identifying sustainability-related risks and opportunities that could be reasonably expected to affect the entity's prospects as an example of where judgement is expected to be needed (see further discussion on judgements in section 6.1 below). [IFRS S1.74].

The enhanced description of concepts that underlie sustainability-related risks and opportunities in IFRS S1 (discussed in section 1.1.2 above) is intended to assist entities in identifying them. Moreover, understanding its value chain is important for an entity to identify those sustainability-related risks and opportunities that could reasonably be expected to affect its prospects (for further discussion about determining the value chain, refer to section 3.3.2 and 3.3.3 below). The ISSB further emphasised those concepts and their importance while identifying sustainability-related risks and opportunities in its educational material on materiality, by using the following example shown in Figure 1-1 as a helpful approach to identify sustainability-related risks and opportunities:⁷

6 Paragraph 2.21 of the IASB's *Conceptual Framework* states: "The most efficient and effective process for applying the fundamental qualitative characteristics would usually be...First, identify an economic phenomenon, information about which is capable of being useful to users of the reporting entity's financial information. Second, identify the type of information about that phenomenon that would be most relevant. Third, determine whether that information is available and whether it can provide a faithful representation of the economic phenomenon".

7 [Educational material: Sustainability-related risks and opportunities and the disclosure of material information](#), ISSB, November 2024, available on the IFRS Foundation's website.

Figure 1-1: Example of using underlying concepts to assist in identifying sustainability-related risks and opportunities

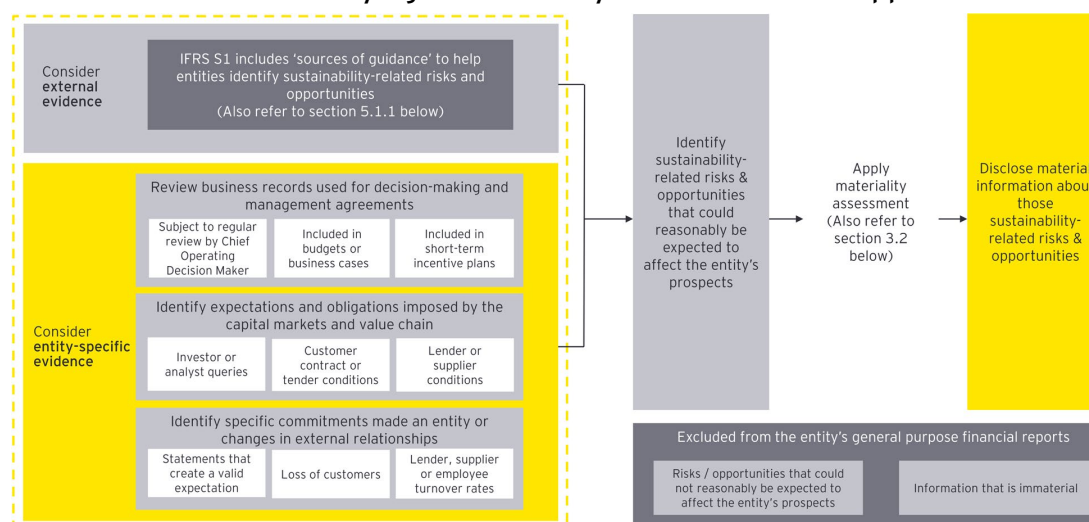

How we see it

Along with the description of concepts that underlie sustainability-related risks and opportunities (discussed in section 1.1.2 above) and an entity's value chain (discussed in 3.3.2 and 3.3.3 below), all relevant facts and circumstances need to be considered when identifying such risks and opportunities. Those facts and circumstances include both:

- External evidence
- And
- Entity-specific evidence

These sources of evidence are described below.

Figure 1-2 summarises the steps for identifying sustainability-related risks and opportunities and indicates when materiality is assessed.

Figure 1-2: Process for identifying sustainability-related risks and opportunities

External evidence

The sources of external evidence that provide insight into potential sustainability-related risks and opportunities may vary depending on the sector and jurisdiction in which the entity operates. ISSB standards do not require that an entity uses a specific approach or method to identify sustainability-related risks and opportunities. However, IFRS S1 requires entities to consider specific guidance provided in the section 'sources of guidance', which helps entities to identify sustainability-related risks and opportunities that could reasonably be expected to affect their prospects, including those across a range of sustainability-related issues and those that are specific to industries. For further discussion on those sources of guidance, see discussion in section 5.1.1 below.

Entity-specific evidence

An entity should also review evidence that is specific to the entity, to identify potential sustainability-related risks and opportunities. Figure 1-3 below outlines some common sources of entity-specific evidence.

Figure 1-3: Common sources of entity-specific evidence

Sources of entity-specific evidence	Description
Contents of business records used for decision-making and management agreements	<p>Evidence of the existence of a sustainability-related risk or opportunity may be found in various types of business records maintained by an entity. Sustainability-related risks or opportunities may arise from documents used for decision making or agreements such as:</p> <ul style="list-style-type: none"> ▪ Reports that are regularly reviewed by the Chief Operating Decision Maker of an entity ▪ Budgets or business cases for new investments or reorganisations ▪ Short-term incentive plans or other remuneration or performance management arrangements <p>These sources may be evidence that the risk or opportunity could reasonably be expected to affect the entity's prospects. This is based on the presumption that a sustainability-related risk or opportunity that could not reasonably be expected to affect the entity's prospects would not be expected to be mentioned in agreements and business records used for decision-making.</p>
Expectations and obligations imposed by the capital markets and value chain	<p>Sustainability-related questions from investors and analysts and sustainability-related conditions set by customers, suppliers and lenders may provide insight into the sustainability-related risks and opportunities faced by an entity.</p>

By considering both external evidence and entity-specific evidence, an entity will have identified a pool of potential sustainability-related risks and opportunities. A filter is applied to assess which of those sustainability-related risks and opportunities could reasonably be expected to affect an entity's prospects. This filter requires assessing whether there is a linkage between the sustainability-related risks and opportunities and the entity's future cash flows, access to finance or cost of capital over the short, medium or long term.

In its educational material on materiality, the ISSB highlighted that, in assessing what could reasonably be expected to affect an entity's prospects, the entity should consider an external perspective (i.e., what an external party could reasonably expect). The perspective of primary users is an important consideration for the entity. An entity may conclude that a sustainability-related risk or opportunity could reasonably be expected to affect its prospects based on the expectations of an external party, even though the entity itself may not have that expectation. Therefore, the entity needs to consider matters about which information, if misstated, omitted or obscured, could reasonably be expected to influence a decision by primary users. Illustration 1-3 is based on an example provided in that educational material:⁸

Illustration 1-3: Entity determines it could reasonably be expected to be affected by a sustainability-related risk to which it does not believe itself to be exposed

Entity Z is a clothing manufacturer that sources its supplies from a jurisdiction that is known for its effective human rights protections. However, Entity Z's peers source supplies from different jurisdictions and have disclosed risks of human rights violations throughout their value chains in their sustainability-related financial disclosures. In assessing its sustainability-related risks, Entity Z considers both entity-specific factors and external factors, including that:

- Entity Z does not expect the risk of human rights violations throughout its value chain to affect its prospects (entity-specific factor).
- The industry in which Entity Z operates is known to be exposed to risks of human rights violations throughout the value chain (external factor).

Entity Z does not believe itself to be exposed to such risk due to its concentration of suppliers in a jurisdiction that is known for its effective human rights protections. However, Entity Z determines that it could reasonably be expected that it is exposed to the risk of human rights violations in its value chain, because primary users expect this to be a risk for an entity in this industry.

In such circumstances, Entity Z should disclose material information about its exposure to human rights violations. For example, Entity Z could disclose that it is not exposed to the risk of human rights violations throughout its value chain and explain why this is the case. See also section 3.2.2.A below for assessing material information in such circumstances.

How we see it

An entity may assess that a sustainability-related risk or opportunity is not reasonably expected to affect its prospects. We generally believe that information about such a sustainability-related risk or opportunity is not expected to be material and, therefore, would not need to be disclosed in the entity's sustainability-related financial disclosures. However, while making this assessment, an entity may consider that comparable peer entities (such as entities operating in the same industry) have identified that same sustainability-related risk or opportunity as one that could reasonably be expected to affect their prospects. In such case, the entity needs to assess whether the information that this sustainability-related risk or opportunity has been assessed as not reasonably expected to affect its prospects may be, in itself, material information to its primary users. If that information is assessed as material, the entity needs to disclose it. We believe this logic is also aligned with Example K of IFRS Practice Statement 2 *Making Materiality Judgements*, which could be applied by analogy to the ISSB standards.

Frequently asked questions

Question 1-1: Would it be sufficient for entities to rely on their prior or existing sustainability reporting practices when identifying sustainability-related risks and opportunities?

In identifying sustainability-related risks and opportunities that could reasonably be expected to affect their prospects as required by ISSB standards, entities have different perspectives and different existing data sets to refer to. There are entities that have not previously prepared disclosures to comply with any sustainability-reporting framework, nor do they have a mature risk management function for the identification of key risk areas. There are also entities that have well-established prior or existing practices on sustainability reporting that may, or may not, have the same objective as ISSB standards (e.g., focusing on how an entity contributes to sustainable development, rather than the information needs of primary users).

It is expected that entities will use different starting points in identifying sustainability-related risks and opportunities. However, solely basing this process on prior or existing practices applied by the entity is not enough to ensure that an entity has considered all relevant factors in identifying those sustainability-related risks and opportunities to meet the objective of ISSB standards (see discussion about the objective in section 1.1 above). That is, in adopting ISSB standards, an entity needs to conduct a holistic and thorough analysis.

How we see it

Regardless of the starting point of an entity in the identification process of sustainability-related risks and opportunities that could reasonably be expected to affect its prospects, the assessment needs to be based on a fresh holistic analysis of the entity. This is because prior or existing practices applied by the entity in identifying sustainability-related risks and opportunities will not be sufficient to meet the requirements of ISSB standards.

Question 1-2: Can sustainability-related risks result to an entity losing its ability to operate as a 'going concern'?

In identifying the sustainability-related risks and opportunities that could reasonably be expected to affect its prospects, there may be cases that an entity identifies risks that could lead to situations affecting its ability to operate as a 'going concern'. For example, an entity may accidentally cause damage to nature or human beings while conducting its operations which could result to significant reputational damage or put on risk its licence to conduct business and therefore, affect the entity's prospects.

How we see it

It is possible that an entity's operations may accidentally cause damage to nature or people which could result in the entity being exposed to significant reputational damage or put on risk its licence to conduct business. When an entity exercises judgement in identifying sustainability-related risks, the entity should consider the likelihood and magnitude of the risk occurring. In cases such as this, an entity may conclude that the risk represents a sustainability-related risk that could reasonably be expected to affect its prospects because of the magnitude of the consequence of the risk, even though the likelihood of occurrence is low.

Question 1-3: Does an entity need to consider any mitigation activities, in place or planned, when identifying sustainability-related risks that could reasonably be expected to affect its prospects and when disclosing material information about them?

(TIG meeting 19 September 2024 - Agenda paper no. 2, ISSB meeting 20 November 2024 - Agenda paper no. 9C)

In September 2024, the TIG discussed whether an entity needs to consider any mitigation activities, either those that are already in place or those that have been planned, when identifying sustainability-related risks that could reasonably be expected to affect its prospects. The TIG also discussed whether the information about those identified sustainability-related risks needs to be disclosed separately from any relevant mitigation activities (i.e., on a gross basis) or after considering them (i.e., on a net basis).

The TIG noted that an entity's process to identify sustainability-related risks that could reasonably be expected to affect its prospects is a fundamental step to identify the information about those risks that is material to the users and, ultimately, meet the objective of IFRS S1 (see section 1.2 above). Such information is intended to help primary users in making decisions about providing resources to the entity and therefore, the entity needs to consider an external perspective in addition to its own.

With that in mind, the TIG acknowledged that the ISSB standards are not explicit on whether or how an entity needs to consider any mitigation activities when identifying sustainability-related risks that could reasonably be expected to affect its prospects. However, the TIG noted that judgement is expected to be applied when identifying sustainability-related risks which, depending on specific facts and circumstances, may include determining whether and how risk mitigation activities would be a factor for an entity to consider while identifying such risks. An entity should consider establishing a defined methodology or process to assess each sustainability-related risk and risk mitigation activity in a consistent manner. Moreover, the TIG emphasised that caution needs to be exercised when identifying sustainability-related risks 'net' of the effect of risk mitigation activities.

In applying judgement, the TIG highlighted that there are several considerations with respect to the mitigation activities for an entity to carefully think through, for example:

- The 'control' an entity has over a mitigation activity which indicates the entity's ability to manage the risk and how much visibility an entity has on how the mitigation activity progresses
- The effectiveness of a mitigation activity, how an entity assesses the effectiveness, any uncertainty that may exist related to the effectiveness of the mitigation activity once in place
- How much effort the entity puts in place to mitigate the risk or how prominent its mitigation activities are
- The phase of implementation of the mitigation activity (e.g., already put in place and implemented, initial stages of implementing, planning to put in place for a future period) and whether it is a one-time mitigation effort or an ongoing activity
- Whether the mitigation activity relates to a risk that is evolving. Depending on the nature of the risk that is being addressed, the entity's mitigation activities may need to be reassessed over-time to ensure that they are fit for purpose

Depending on its analysis of the various considerations about the risk mitigation activities (such as the ones listed above), an entity needs to determine whether these mitigants could affect the extent to which it is exposed to a risk and whether and how it expects its prospects to be affected. That is, depending on the specific circumstances, an entity may determine that, due to its mitigation activities, it may, or it may not be exposed to a sustainability-related risk that could reasonably be expected to affect its prospects.

The ISSB standards include various requirements that are either explicit or not explicit in terms of how information about an entity's risk mitigation activities should be disclosed. The TIG emphasised that, ultimately, an entity needs to ensure that primary users have a complete understanding of its thought process, with respect to identification of sustainability-related risks and how these are mitigated, to make their decisions. That is, entities need to identify what information would be useful to its primary users and what disclosures are to be provided based on its materiality assessment by considering whether omitting, misstating or obscuring information about its risk mitigation activities could reasonably be expected to influence the decisions of primary users. Such disclosures need to include information that primary users need to make their own assessment about the effect of mitigation activities.

In its agenda paper, the ISSB staff used some examples that illustrate the issue as well as the considerations involved in the thought process while applying the principles of the ISSB standards. The TIG noted that these examples have been primarily used for illustration purposes, rather than to provide an answer for all scenarios, and emphasised the judgement needed based on the specific facts in each situation. Consider the following illustrations from the TIG agenda paper:

Illustration 1-4: Sustainability-related risk is identified despite of in place or planned risk mitigation activities

Scenario A

An entity operates in an industry that is known for its supply chain activities being concentrated in jurisdictions with high incidences of human rights violations. Its supply chain activities are concentrated in jurisdictions with high incidences of human rights violations. Therefore, it is reasonably expected that entities in this industry are exposed to sustainability-related risks related to human rights violations. However, the entity has implemented risk mitigation activities, to ensure its suppliers operate entirely in one jurisdiction that is known for its effective policies to prevent human rights violations. Thus, due to its mitigation activities the entity determines this risk is not expected to affect its prospects. However, when considering whether it could reasonably be expected to affect its prospects, the entity notes that despite its risk mitigation activities, this risk is so pervasive in its industry, it is a risk that could be reasonably be expected to affect the entity's prospects. The entity therefore identifies this as a sustainability-related risk that could reasonably be expected to affect its prospects, effectively identifying the risk 'before' or despite the effect of its mitigation activities.

Scenario B

An entity's assets are at risk of damage due to increasing severe weather events that it considers to be attributable to climate-related risks, and therefore identifies a sustainability-related risk. The entity plans to mitigate this risk by selling these assets. However, as this risk mitigation activity is only planned and the entity still owns these assets, the entity remains exposed to this sustainability-related risk. The entity therefore identifies this as a sustainability-related risk that could reasonably be expected to affect its prospects. That is, despite planned mitigation activities, the entity identifies a sustainability-related risk.

Illustration 1-5: Sustainability-related risk is not identified due to risk mitigation activities

Scenario A

An entity operates in an industry that is subject to stringent regulations regarding its wastewater treatment. Ten years ago, the entity implemented risk mitigation activities including the introduction of 'best-in-class' equipment to facilitate wastewater treatment. This equipment undergoes mandatory routine maintenance, and the entity conducts daily random tests of water quality. The entity has never experienced any challenges associated with its water quality, and never failed to meet its regulatory obligations related to water quality. The entity considers whether exposure to a risk associated with its wastewater treatment would be one that is reasonably expected to affect its prospects, given the entity has effectively managed this risk for ten years, and that its primary users are aware of the stringent regulatory requirements for wastewater treatment and its approach to mitigate this risk. The entity does not identify this as a sustainability-related risk that could reasonably be expected to affect its prospects due to the effect of the risk mitigation.

Scenario B

An entity operates in the automobile industry and in 2024 20% of its manufactured vehicles were gasoline-powered. The entity operates in only one jurisdiction which has introduced a regulation that will tax the production of gasoline-powered vehicles produced after 2028. Therefore, the entity is, in 2024, exposed to a sustainability-related transition risk. However, by 2025, as part of its risk mitigation strategy, the entity has ended production of gasoline-powered vehicles. Therefore, when considering the sustainability-related risks that the entity is exposed to in 2025, the entity does not identify this as a sustainability-related risk that could reasonably be expected to affect its prospects.

How we see it

We believe that when identifying the sustainability-related risks that could reasonably be expected to affect its prospects, an entity would generally not consider mitigation activities that are in place or are planned to address those risks. However, identifying sustainability-related risks requires judgement to be applied and, in some cases, risk mitigation activities could affect this identification process. When identifying what information is material about sustainability-related risks, mitigation activities are part of the assessment, as such information could affect the decisions that primary users make about providing resources to the entity. In determining what information is material, the entity needs to consider the primary users' perspective in addition to its own.

1.2.2 Use of reasonable and supportable information

1.2.2.A The concept of reasonable and supportable information

Many stakeholders, during the consultation process for the Exposure Draft of IFRS S1, shared their concerns with the ISSB about the range of capabilities and preparedness of entities around the world to apply the requirements of ISSB standards. The cost of investing in and operating the systems and processes necessary to prepare the disclosures required by ISSB standards can be relatively high for some entities. Also, the availability of high-quality external data can be limited in some markets, industries and parts of the value chain, and some entities can struggle to access the skills or expertise needed to prepare the disclosures. [IFRS S1.BC8]. For example, despite the guidance provided in IFRS S1 to assist in the identification of sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects (discussed in section 1.2.1 above), entities may still find it challenging to make such an assessment and understand how far they should go within their value chain.

These concerns led the ISSB to make decisions about proportionality in the application of ISSB standards to ease the burden of disclosure and assist entities in this application process. One of these decisions was to introduce in IFRS S1 the concept of "all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort". This concept is not unique to sustainability-related financial disclosures. There are amounts recognised and measured according to IFRS accounting standards by also referring to this concept, but its use is limited to specific circumstances to guide an entity in applying requirements that involve a high level of measurement uncertainty, rather than being used as a broad principle. [IFRS S1.BC9, IFRS S1.BC10, IFRS S1.BC11].

Similarly, this concept only applies to specific requirements of IFRS S1 where judgement is involved. The ISSB believes that the use of this concept is beneficial where entities apply requirements that involve a high level of judgement or uncertainty because it establishes parameters for the type of information to consider, and for the effort required to obtain such information. [IFRS S1.BC15].

1.2.2.B Application of the concept of reasonable and supportable information in IFRS S1

IFRS S1 requires the concept of "all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort" to be applied: a) in the identification process of sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects and b) in the determination of the scope of an entity's value chain (including its breadth and composition) in relation to each of those sustainability-related risks and opportunities. [IFRS S1.B6, IFRS S1.B7]. For further discussion about the determination of the scope of the value chain, see section 3.3.3 below. IFRS S1 also requires this concept to be used with respect to the preparation of disclosures about the anticipated financial effects of a sustainability-related risk or opportunity (see discussion in section 4.3.4 below). This has been further explained in the ISSB's educational material: *Disclosing information about anticipated financial effects applying ISSB Standards* that was published in August 2025.⁹ The ISSB's intention is to avoid situations where entities overstate or understate their reported sustainability-related risks and/or opportunities. [IFRS S1.BC51].

⁹ [Educational material: Disclosing information about anticipated financial effects applying ISSB Standards](#), ISSB, August 2025, available on the IFRS Foundation's website.

IFRS S1 goes on to determine what qualifies as reasonable and supportable information as follows:
[IFRS S1.B8, IFRS S1.B9, IFRS S1.B10]

Extract from IFRS S1

Reasonable and supportable information

- B8** Reasonable and supportable information used by an entity in preparing its sustainability-related financial disclosures shall cover factors that are specific to the entity as well as general conditions in the external environment. In some cases—such as in identifying sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects—reasonable and supportable information includes information about past events, current conditions and forecasts of future conditions. Other IFRS Sustainability Disclosure Standards may specify what is reasonable and supportable information in specific cases.
- B9** An entity may use various sources of data that may be both internal and external. Possible data sources include the entity's risk management processes; industry and peer group experience; and external ratings, reports and statistics. Information that is used by the entity in preparing its financial statements, operating its business model, setting its strategy and managing its risks and opportunities is considered to be available to the entity without undue cost or effort.
- B10** An entity need not undertake an exhaustive search for information to identify sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects. The assessment of what constitutes undue cost or effort depends on the entity's specific circumstances and requires a balanced consideration of the costs and efforts for the entity and the benefits of the resulting information for primary users. That assessment can change over time as circumstances change.

This concept, in itself, does not introduce additional disclosure requirements, nor does it intend to exempt an entity from providing a disclosure. Rather, it is intended to emphasise that relevant and appropriate information is required. Also, it is intended to assist those entities that find it challenging to apply the requirements in ISSB standards and would otherwise be unable to comply fully with them. Entities need to provide only information that is supportable and reasonable and use all information that is available to them at the reporting date, without carrying out an exhaustive search that would represent 'undue cost or effort'. This is determined based on an entity's circumstances (e.g., a less exhaustive search for information is permitted if the cost of obtaining particular information is proportionately higher for the entity than for other entities with more resources). This does not mean that no effort is necessary, especially given the fact that such information relates to a risk or opportunity that could reasonably be expected to affect the entity's prospects. *[IFRS S1.BC16, IFRS S1.BC17]*.

How we see it

In identifying sustainability-related risks and opportunities, an entity needs to consider its specific circumstances when searching for reasonable and supportable information without undue cost or effort. However, we expect that searching for such information will only infrequently involve undue cost or effort. Although an entity is not required to carry out exhaustive search for information, the effort an entity makes in this identification process needs to be commensurate with the processes set up for identifying its sustainability-related risks and opportunities, as discussed in section 1.2.1 above.

1.2.3 Reassessing the scope of sustainability-related risks and opportunities

An entity's sustainability-related risks and opportunities, along with their effects and expectations of those effects on an entity, change over time and in relation to the interdependent system in which an entity operates. The ISSB initially considered requiring entities to reassess the scope of each sustainability-related risk and opportunity throughout their value chain at each reporting date. However, the ISSB decided that primary users would typically benefit from a reassessment only if a significant event or a significant change in circumstances occurs and that doing so at each reporting date was not necessary. However, an entity may choose to reassess the scope of any sustainability-related risk or opportunity throughout its value chain more frequently (e.g., annually). *[IFRS S1.B12, IFRS S1.BC45, IFRS S1.BC59, IFRS S1.BC60, IFRS S1.BC61, IFRS S1.BC62]*.

According to IFRS S1 "a significant event or significant change in circumstances can occur without the entity being involved in that event or change in circumstances, or as a result of a change in what the entity assesses to be important to users of general purpose financial reports". *[IFRS S1.B11]*. Generally, assessing whether an event or change in circumstances is significant and, therefore, reassessment of the scope of all affected sustainability-related risks and opportunities is required throughout the entity's value chain, is a matter of judgement. *[IFRS S1.75(d)]*. For further discussion on judgements, see section 6.1 below.

IFRS S1 provides examples of the types of events or changes in circumstances that would be considered significant. They also illustrate that a significant event or significant change in circumstances can occur without the entity being involved in that event or change in circumstances, or as a result of a change in what the entity assesses to be important to primary users. [IFRS S1.B11].

Extract from IFRS S1

- B11** On the occurrence of a significant event or significant change in circumstances, an entity shall reassess the scope of all affected sustainability-related risks and opportunities throughout its value chain. A significant event or significant change in circumstances can occur without the entity being involved in that event or change in circumstances or as a result of a change in what the entity assesses to be important to users of general purpose financial reports. For example, such significant events or significant changes in circumstances might include:
- (a) a significant change in the entity's value chain (for example, a supplier in the entity's value chain makes a change that significantly alters the supplier's greenhouse gas emissions);
 - (b) a significant change in the entity's business model, activities or corporate structure (for example, a merger or acquisition that expands the entity's value chain); and
 - (c) a significant change in an entity's exposure to sustainability-related risks and opportunities (for example, a supplier in the entity's value chain is affected by the introduction of a new regulation that the entity had not anticipated).

While an entity is required to reassess the scope of all affected sustainability-related risks and opportunities arising throughout its value chain when such a significant event or significant change in circumstances occurs, not all sustainability-related risks and opportunities will necessarily be affected. This is further explained by the example provided in the Basis for Conclusions to IFRS S1. [IFRS S1.BC61].

Illustration 1-6: Reassessing the scope of sustainability-related risks and opportunities

A regulation is introduced for greenhouse gas emissions associated with employee travel that an entity had not anticipated. Because of this regulation, the entity may be required to reassess which categories to include in the measurement of its Scope 3 greenhouse gas emissions. However, this regulation does not affect the entity's other sustainability-related risks and opportunities in its value chain (e.g., the entity's identified risk of water scarcity). Therefore, the entity is not required to reassess the scope of those other sustainability-related risks and opportunities.

It is not necessary to have a change in the entity's value chain to conclude that a significant event or significant change in circumstances has occurred. That is, the scope of a sustainability-related risk or opportunity may change even though the entity's value chain has not changed. [IFRS S1.BC61].

2 Scope

2.1 The scope of IFRS S1

Entities apply IFRS S1 when preparing and reporting sustainability-related financial disclosures in accordance with ISSB standards. The scope of IFRS S1 covers sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects (as discussed in section 1.1.2 above). Therefore, any sustainability-related risks and opportunities that could not reasonably be expected to affect an entity's prospects are outside the scope of IFRS S1. *[IFRS S1.5, IFRS S1.6].*

IFRS S1 sets out the general requirements for providing primary users with a complete set of sustainability-related financial disclosures (as discussed in section 1.1 above). This means that IFRS S1 focuses on the overall sustainability-related financial disclosures, while other ISSB standards specify information an entity is required to disclose about specific sustainability-related risks and opportunities (e.g., IFRS S2). *[IFRS S1.7].* In order to comply with the specific requirements set out by other ISSB standards for sustainability-related risks and opportunities related to specific topics that could reasonably be expected to affect an entity's prospects, it is also necessary to take into account the relevant requirements of IFRS S1.

The sustainability-related financial disclosures provided in accordance with the requirements of ISSB standards are part of an entity's general purpose financial reports (as discussed in section 1.1 above). Such disclosures can be applied regardless of which generally accepted accounting principles or practices (GAAP) the entity uses in preparing the related financial statements. *[IFRS S1.8].* IFRS S1 uses definitions and requirements that are consistent, if applicable, with the IASB's Conceptual Framework, IAS 1 *Presentation of Financial Statements* and IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*. However, its rationale is to introduce a base for decision-useful and comparable reporting of sustainability-related financial information by requiring the application of some established practices from financial reporting, rather than mandating the use of IFRS accounting standards used for the preparation of financial statements. *[IFRS S1.BC5].*

2.2 Application by public sector or entities other than profit-oriented entities

The terminology used in ISSB standards is suitable for profit-oriented entities, including public-sector business entities. However, the ISSB identified interest in ISSB standards from, among others, the public sector, entities other than profit-oriented entities, as well as regulators and other organisations that oversee financial market stability. Considering this interest, the ISSB decided not to preclude not-for-profit activities in the private sector or public sector from applying ISSB standards, but if they do so, IFRS S1 specifies that they may need to amend the descriptions used for particular items of information. *[IFRS S1.9, IFRS S1.BC4].*

3 Conceptual foundations

3.1 Fair presentation of sustainability-related risks and opportunities

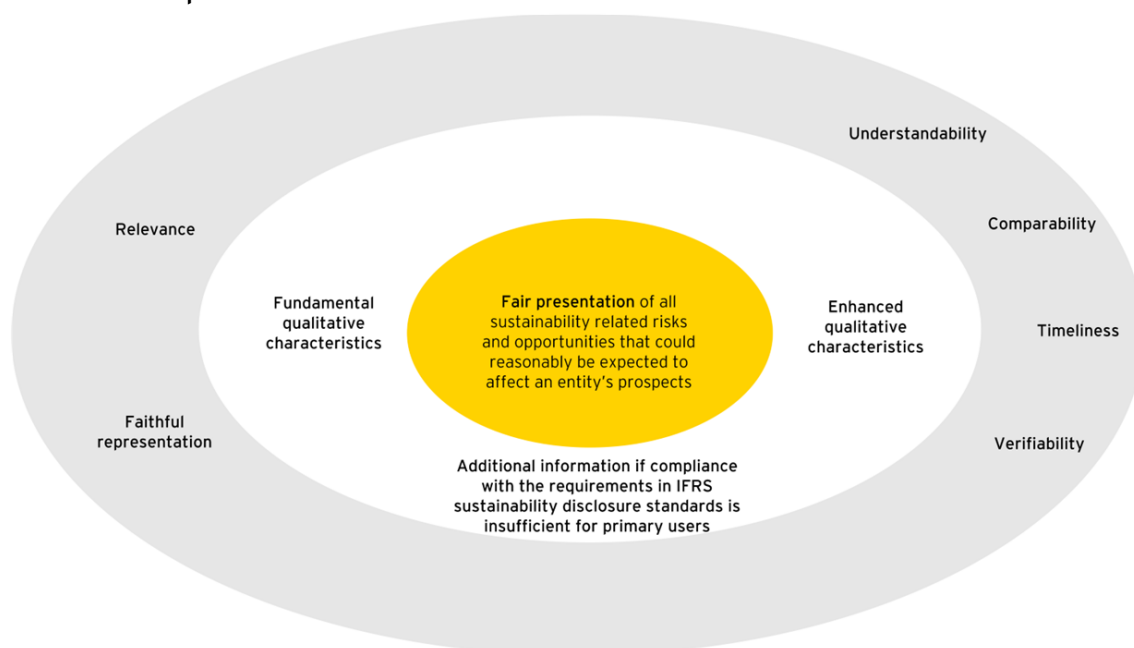

The concept of fair presentation is well-understood in IFRS accounting standards (as described in the IASB's Conceptual Framework and IAS 1) and in other GAAP. IFRS S1 adapted this concept in the context of sustainability-related financial disclosures.

IFRS S1 requires an entity to provide a complete set of sustainability-related financial disclosures that presents fairly all sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects. [IFRS S1.11]. Moreover, to meet the objective of IFRS S1, sustainability-related financial disclosures need to include information that is useful to primary users to enable their decision-making relating to providing resources to the entity (see section 1.1 above).

To achieve fair presentation of sustainability-related risks and opportunities and ensure that the information about them is useful, sustainability-related financial information needs to meet the fundamental qualitative characteristics of being relevant and faithfully representing what it purports to represent in accordance with the principles set out in IFRS S1. Along with the fundamental qualitative characteristics, IFRS S1 includes a list of additional qualitative characteristics that enhance the usefulness of sustainability-related financial information. These enhancing qualitative characteristics are: comparability; verifiability; timeliness; and understandability of the sustainability-related financial information. [IFRS S1.10, IFRS S1.13]. The qualitative characteristics are further discussed in section 3.1.1 below.

In addition to meeting the qualitative characteristics mentioned above, to achieve fair presentation, IFRS S1 also requires an entity to disclose additional information if compliance with the specifically applicable requirements in ISSB standards is insufficient to enable primary users to understand the effects of sustainability-related risks and opportunities on the entity's cash flows, its access to finance and cost of capital over the short, medium and long term. [IFRS S1.15, IFRS S1.BC63]. For further discussion on the additional information, see section 3.2.4.A below.

Figure 3-1: Fair presentation

3.1.1 Qualitative characteristics of sustainability-related financial information

While the nature of some of the information required to meet the objective of IFRS S1 differs in some respects from the information provided in financial statements (see further discussion in section 3.2.1 below), the qualitative characteristics have been adapted from the IASB's Conceptual Framework. The IASB's Conceptual Framework describes the objective of, and the concepts that apply to, general purpose financial reports and one of its purposes is to assist the IASB to develop IFRS accounting standards for preparing financial statements based on consistent concepts. Since the sustainability-related financial information is part of the general purpose financial reports, the qualitative characteristics of the IASB's Conceptual Framework also apply to sustainability-related financial disclosures. [IFRS S1.D1, IFRS S1.D2].

Given that there is no separate conceptual framework directly applicable to ISSB standards, IFRS S1 includes guidance on the qualitative characteristics (both the fundamental and the enhancing ones) of sustainability-related financial information. These qualitative characteristics are intended to assist entities in preparing their sustainability-related financial disclosures by explaining their applicability to sustainability-related financial information (e.g., the fact that information in the form of explanations or forward-looking statements is still verifiable). It is also intended to ensure that information in general purpose financial reports (both in sustainability-related financial disclosures and in financial statements) is useful to users of those reports. [IFRS S1.BC64, IFRS S1.BC65].

A description for each qualitative characteristic of sustainability-related financial information is included in section 3.1.1.A and 3.1.1.B below, which is based on Appendix D of IFRS S1. [IFRS S1 Appendix D].

3.1.1.A Fundamental qualitative characteristics

Relevance

Relevant sustainability-related financial information can make a difference to the decisions made by primary users. Information can make a difference in a decision even if some users choose not to take advantage of it or are already aware of it from other sources. This occurs when the information has predictive value, confirmatory value or both, in particular:

- Sustainability-related financial information with predictive value exists if the information can be used as an input to processes employed by primary users to predict future outcomes. This information does not need to be a prediction or forecast, rather it is employed by primary users in making their own predictions. For example, information about water quality, which can include information about the water being polluted, could inform the expectations of primary users about the ability of an entity to meet local water quality requirements.
- Sustainability-related financial information has confirmatory value if it provides feedback (confirms or changes) about previous evaluations.

These values (predictive and confirmatory) are interrelated; information that has predictive value often also has confirmatory value. For example, information for the current year about greenhouse gas (GHG) emissions, which can be used as the basis for predicting GHG emissions in future years, can also be compared with predictions about GHG emissions for the current year that were made in previous years. The results of those comparisons can help a primary user to correct and improve the processes that were used to make those predictions in previous years.

Moreover, sustainability-related financial information is relevant when it is material to the primary users of a specific reporting entity (materiality is further discussed in section 3.2 below). Because of the specificity of materiality to a particular reporting entity, Appendix D of IFRS S1 considers materiality to be an entity-specific aspect of relevance. This is because materiality is based on the nature or magnitude, or both, of the sustainability-related financial information for a specific entity. [IFRS S1.D4-D8].

Faithful representation

Sustainability-related financial information represents phenomena in words and numbers. To be useful, other than representing relevant phenomena, the information must also faithfully represent the substance of the phenomena that it purports to represent. Such faithful representation is achieved when the depiction of a sustainability-related risk or opportunity is complete, neutral and accurate. The objective of general purpose financial reports is to maximise those qualities to the extent possible. In particular: [IFRS S1.D9-D15]

- A complete depiction of a sustainability-related risk or opportunity includes all material information necessary for primary users to understand that risk or opportunity.
- A neutral depiction is one without bias in the selection or disclosure of information. The information is neutral if it is not slanted, weighted, emphasised, de-emphasised or otherwise manipulated to make it more likely that primary users will receive that information favourably or unfavourably. Neutral information is relevant (which, by definition, is capable of making a difference in primary users' decisions), rather than without purpose or without influence on behaviour. Some sustainability-related financial information (e.g., targets or plans) is aspirational. A neutral discussion of such matters covers both aspirations and the factors that could prevent an entity from achieving these aspirations. Neutrality is supported by the exercise of prudence, which is the exercise of caution when making judgements under conditions of uncertainty (i.e., that opportunities are not overstated and risks are not understated and vice versa).

- Information can be accurate without being perfectly precise in all respects. The required attainable precision and the factors that make information accurate, depend on the nature of the information and the nature of the matters to which it relates. For example, accuracy requires that:
 - Factual information is free from material error
 - Descriptions are precise
 - Estimates, approximations and forecasts are clearly identified as such
 - No material errors are made in selecting and applying an appropriate process for developing an estimate, approximation or forecast
 - Assertions and inputs used in developing estimates are reasonable and based on information of sufficient quality and quantity
 - Information on judgements about the future faithfully reflects both those judgements and the information on which they are based

The ISSB noted that, according to the IASB's Conceptual Framework, to be a perfectly faithful representation, a depiction would have three characteristics: it would be complete, neutral and free from error. However, considering that entities may not be familiar with the term 'free from error' in the context of sustainability-related financial disclosures, the ISSB decided to use the term 'accurate', instead of 'free from error', to describe a 'complete depiction' of an entity's sustainability-related financial information. [IFRS S1.BC66].

3.1.1.B Enhancing qualitative characteristics

Comparability

The decisions made by the primary users involve choosing between alternatives (e.g., selling or holding an investment, or investing in one reporting entity or another). Comparability is the characteristic that enables primary users to identify and understand similarities and differences in items. Unlike the other qualitative characteristics, comparability requires at least two items.

Information is more useful if it can also be compared with information provided by the entity in previous periods, as well as information provided by other entities, in particular, those with similar activities or operating within the same industry. Comparability should not be confused with uniformity. Appendix D of IFRS S1 notes that while consistency and comparability are related, the former refers to the use of the same approaches or methods for providing disclosures about the same sustainability-related risks and opportunities from period to period, both by a reporting entity and other entities. That is, consistency helps in achieving comparability, which is the goal. [IFRS S1.D17-D20].

Verifiability

Verifiability helps to give primary users confidence that information is complete, neutral and accurate (see also description for faithful representation above). Information is verifiable if it is possible to corroborate either the information itself or the inputs used to derive it.

Verifiability means that various knowledgeable and independent observers could reach consensus, although not necessarily complete agreement, that a particular depiction is a faithful representation. Quantified information need not be a single point estimate to be verifiable, rather a range of possible amounts and the related probabilities that can also be verified.

Verifiable information is more useful to primary users than information that is not verifiable. It can be enhanced by providing, for example:

- Information that can be corroborated by comparing it with other information available to primary users about: an entity's business, other businesses or the external environment in which the entity operates
- Information that can be supported by assurance providers
- Information about inputs and methods of calculation used to produce estimates or approximations
- Information that has been reviewed and agreed by the entity's board, board committees or equivalent bodies

Some sustainability-related financial information will be presented as explanations or forward-looking information. That information can be supportable, for example, by faithfully representing fact-based strategies, plans and risk analyses. To help primary users decide whether to use such information, a description of the underlying assumptions and methods of producing the information, as well as other factors that provide evidence that the information reflects the actual plans or decisions made by the entity would be necessary. [IFRS S1.D21-D24].

Timeliness

Timeliness means having information available to decision-makers in time to be capable of influencing their decisions. Although older information may be less useful, some may continue to be timely long after the end of a reporting period (e.g., when primary users need to identify and assess trends). [IFRS S1.D25].

Understandability

Information is understandable when it is clear and concise. In particular: [IFRS S1.D26-D33]

- The level of clarity in disclosures depends on the nature of the information. In some cases, in addition to narrative text, an entity may need to add tables, graphs or diagrams (or even additional text or tables for those additions to avoid obscuring material detail). Clarity can be enhanced by distinguishing information about developments in the reporting period from 'standing' information that remains unchanged, or changes little, from one period to the next (e.g., by separately describing features of an entity's sustainability-related governance and risk management processes that have changed since the previous reporting period). In some cases, information about sustainability-related risks and opportunities may be inherently complex and difficult to present in a manner that is easy to understand. Such information needs to be presented as clearly as possible, rather than being excluded. Excluding such information would render those reports incomplete and potentially misleading.
- Disclosures are concise if they include only material information. Any immaterial information included needs to be provided in a way that avoids obscuring material information (see also section 3.2.4.B below).

Having clear and concise information can be achieved when an entity:

- Avoids generic (i.e., 'boilerplate') information, that is not specific to the entity
- Avoids duplication of information in its general purpose financial reports, including unnecessary duplication of information also provided in the related financial statements

And

- Uses clear language and clearly structured sentences and paragraphs

The completeness, clarity and comparability of sustainability-related financial information all rely on information being presented as a coherent whole. Coherence is also important in meeting the requirements of IFRS S1 about connected information (see relevant discussion in section 3.4 below). For the information to be coherent, an entity needs to:

- Present it in a way that explains the context and the connections between the related items of information. That is, if sustainability-related risks and opportunities located in one part of an entity's general purpose financial reports have implications for information disclosed in other parts, the entity needs to include the information necessary for primary users to assess those implications.
- Provide it in a way that allows primary users to relate information about its sustainability-related risks and opportunities to information in the entity's financial statements.

3.2 Materiality

3.2.1 Definition of materiality

In meeting the objective of IFRS S1, an entity is required to disclose information about its sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects (see section 1.2 above). Such information needs to be useful to primary users to make their decisions relating to providing resources to the entity (see section 1.1 above). This occurs when the information disclosed by an entity is material. Materiality is used as a filter for an entity to assess whether information about a sustainability-related risk or opportunity would need to be provided to meet the requirements set out in ISSB standards. [IFRS S1.17, IFRS S1.B13].

IFRS S1 defines materiality as follows: *[IFRS S1.18]*

Extract from IFRS S1

- 18 In the context of sustainability-related financial disclosures, information is material if omitting, misstating or obscuring that information could reasonably be expected to influence decisions that primary users of general purpose financial reports make on the basis of those reports, which include financial statements and sustainability-related financial disclosures and which provide information about a specific reporting entity.

The definition of materiality was developed based on the definitions of 'material information' and 'material' in the IASB's Conceptual Framework and IAS 1, respectively. This definition is used in IAS 1 with a specific reference to the financial statements. The materiality assessment in the IASB's Conceptual Framework is not constrained to what is financially material in the financial statements but focuses on the identification of information that is useful to primary users. These primary users are consistent with those of the sustainability-related financial disclosures prepared in accordance with ISSB standards (see section 1.1.1 above). Such a consistency emphasises that the purpose of the materiality assessment is to ensure that the primary users have the information that is relevant to their decision-making and that users do not make their decisions on the basis of just one form of general purpose financial reports published by the entity. *[IFRS S1.BC68]*.

The alignment in the concept and definition of materiality, applicable to both sustainability-related financial information and information in the financial statements, facilitates the connectivity between them (for further discussion on connected information, see section 3.4 below) and it supports the application of ISSB standards, given the broad use of IFRS accounting standards. However, the materiality judgements for sustainability-related financial disclosures will inevitably differ from those for financial statements since they serve their specific objectives and provide different types of information about an entity. In fact, information about sustainability-related risks and opportunities is intended to capture a broader set of information that is not constrained by the definitions of assets, liabilities, equity, income and expenses under IFRS accounting standards, nor the criteria for recognising them. Compared with information included in financial statements, sustainability-related financial information may have different measurement bases or may consider financial implications over longer time periods, including interactions throughout an entity's value chain. It follows that the material information about sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects, aim to complement the information provided in the financial statements about the entity's assets, liabilities, equity, income and expenses. *[IFRS S1.BC1, IFRS S1.BC69]*.

Including a specific definition of materiality in IFRS S1 (applicable to all ISSB standards) was a deliberate decision by the ISSB given that ISSB standards are not designed to be applied only with IFRS accounting standards, but any GAAP (see section 2.1 above) that may not share the same definition of materiality. Also, given the variation in how the concept of materiality is interpreted, applied and enforced in various jurisdictions in the context of sustainability-related financial information, a definition of materiality in IFRS S1 was a key decision to make it clear to entities how the materiality concept needs to be applied and assessed under ISSB standards. *[IFRS S1.BC71, IFRS S1.BC72]*.

How we see it

Applying the materiality concept in the context of sustainability-related financial disclosures is relatively new and this is expected to evolve over time. Although this application can be informed by the assessment of materiality in financial statements, more judgement may be needed by an entity given the more qualitative nature of sustainability-related financial disclosures. Therefore, an entity needs to establish the appropriate processes to make materiality judgements based on its specific circumstances.

3.2.2 Identifying material information

As mentioned in section 3.2.1 above, an entity needs to disclose material information about its sustainability-related risks and opportunities such that the information is useful to primary users in making their decisions about providing resources to the entity. However, the identification of such material information requires judgement. IFRS S1 requires an entity to disclose information about the judgements it has made to prepare its sustainability-related financial disclosures that have the most significant effect on those disclosures. An example of making such a judgement is when an entity identifies material information to be included in the sustainability-related financial disclosures. For further discussion on judgements, see section 6.1 below. *[IFRS S1.74]*.

Similar to the process of identifying the sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects (discussed in section 1.2 above), the ISSB indicated in IFRS S1, various ways to assist in the identification of material information about those risks and opportunities. In particular, apart from the definition of materiality discussed in section 3.2.1 above, the following sections include:

- Guidance relating to identifying and meeting primary users' information needs (see section 3.2.2.A below)
- Requirements to be applied while identifying material information by considering:
 - The sources of guidance an entity uses in this identification process (see section 3.2.2.B below)
 - Possible future events with uncertain outcomes (see section 3.2.2.C below)
 - Other characteristics of material information (i.e., additional information disclosed by an entity, aggregation and disaggregation of information, interaction with law or regulation, commercially sensitive information) (see section 3.2.4 and 3.2.5 below)

3.2.2.A Information needs of primary users

In identifying the material information to be disclosed, apart from understanding the definition of materiality underpinned in the application of standards (see section 3.2.1 above), an entity needs to understand the types of decisions made by primary users and what it can do to meet those information needs. Materiality judgements involve considerations related to both who the primary users are and what decisions they make based on general purpose financial reports.

IFRS S1 gives an overview of what is involved in the primary users' decisions that relate to providing resources to the entity. These are decisions about: [IFRS S1.B14].

- Buying, selling or holding equity and debt instruments
- Providing or selling loans and other forms of credit
- Exercising rights to vote on, or otherwise influence, the actions of the entity's management that affect the use of the entity's economic resources

These types of decisions depend on primary users' expectations of their returns (e.g., dividends, principal and interest payments or market price increases). Such expectations depend on primary users' assessment of the amount, timing and uncertainty of future net cash inflows to the entity. Also, those expectations depend on the primary users' assessment of the stewardship that the entity's management and its governing body(s) or individual(s) exercises on the entity's economic resources. [IFRS S1.B15].

Having considered the types of decisions that primary users make and the expectations on which their decisions depend, an entity needs to consider both the characteristics of primary users and its own circumstances to determine what could reasonably be expected to influence their decisions made for a specific entity. IFRS S1 describes primary users as those "who have reasonable knowledge of business and economic activities and who review and analyse information diligently. At times, even well-informed and diligent users may need to seek the aid of an adviser to understand sustainability-related financial information". [IFRS S1.B16, IFRS S1.B17].

The information needs and desires of the primary users may differ among them, may be conflicting and could evolve over time. However, it is acknowledged that sustainability-related financial disclosures do not, and cannot, provide all the information that primary users need, such as specialised information needs that are unique to particular users. Instead, sustainability-related financial disclosures aim to meet the common information needs of an entity's primary users. [IFRS S1.B18].

The *Implementation Guidance* to IFRS S1 goes on to explain the approach an entity follows to meet the common information needs of its primary users. In particular, an entity identifies the information needs of one of the three types of primary users e.g., investors (existing and potential), and then those of the two remaining types i.e., lenders and other creditors (existing and potential). The combination of those information needs forms the set of common information needs that the entity aims to meet. There may be information needs shared by all types of primary users or specific to only one or two types. However, using this approach, an entity identifies the common information needs of primary users, without having to identify the information needs that are shared by all types of primary users (i.e., the information needs that the primary users have in common), as this would exclude potential information that meets the needs of only one type of primary users. [IFRS S1.IG5, IFRS S1.IG6].

As further explained in the ISSB's educational material on materiality, an entity assesses the materiality of information based on whether that information could reasonably be expected to influence decisions of primary users. The educational material emphasises that, despite the fact that this assessment is made by the entity itself, it is based on the perspective of primary users and their information needs, and provides the following examples:¹⁰

- Information that management determines could not reasonably be expected to influence primary users' decisions would not be considered to be material
- Information cannot be assumed to be immaterial simply because users have not asked for it
- Information that an entity assesses to have both a low likelihood of occurring and a low impact may still be material if an entity considers that primary users could reasonably be expected to take a different view (e.g., if primary users expect that there is a high likelihood or high impact of the risk occurring, information about the risk would need to be provided). See also the discussion in section 3.2.2.C below and Illustration 1-3 in section 1.2.1 above for an example of an entity that determines it could reasonably be expected to be affected by a sustainability-related risk to which it does not believe itself to be exposed.

In addition to primary users, other parties (e.g., the entity's management, regulators and members of the public) may be interested in sustainability-related financial disclosures and may find this information useful. However, sustainability-related financial disclosures prepared in accordance with ISSB standards are not primarily designed to meet these other parties' information needs and the disclosures are not directed at these other parties.

Apart from the general purpose financial reports, primary users also consider other sources to meet their information needs (e.g., the industry in which an entity operates, the entity's competitors and the state of the economy, the entity's press releases as well as other documents the entity has published). However, the fact that information needed by primary users is publicly available does not relieve an entity from disclosing material information about the sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects to comply with ISSB standards. [IFRS S1.IG7].

How we see it

In some cases, significant judgement may be required in determining what meets the primary users' information needs, especially because such needs may evolve over time.

3.2.2.B Sources applied in assessing materiality

The starting point for an entity in identifying material information about a sustainability-related risk or opportunity is to apply the requirements of the ISSB standard that specifically applies to that sustainability-related risk or opportunity (e.g., the requirements in IFRS S2 for climate-related disclosures as discussed in Chapter 54). However, in the absence of such an ISSB topical standard, the entity applies the requirements specified in the section of IFRS S1 related to the sources of guidance, which is further discussed in section 5.1.2 below. [IFRS S1.B20].

3.2.2.C Possible future events with uncertain outcomes

A materiality assessment is also required for information about possible future events with uncertain outcomes and IFRS S1 includes specific considerations for this assessment. In particular, IFRS S1 states: [IFRS S1.B22]

Extract from IFRS S1

- B22 In some cases, IFRS Sustainability Disclosure Standards require the disclosure of information about possible future events with uncertain outcomes. In judging whether information about such possible future events is material, an entity shall consider:
- (a) the potential effects of the events on the amount, timing and uncertainty of the entity's future cash flows over the short, medium and long term (referred to as 'the possible outcome'); and
 - (b) the range of possible outcomes and the likelihood of the possible outcomes within that range.

¹⁰ [Educational material: Sustainability-related risks and opportunities and the disclosure of material information](#), ISSB, November 2024, available on the IFRS Foundation's website.

If the potential effects of a possible future event are significant and the event is likely to occur, the information about that event is more likely to be material. However, information about low-probability and high-impact outcomes still needs to be considered as these may be material either individually or in combination with information about other low-probability and high-impact outcomes. For example, an entity is exposed to several sustainability-related risks that could individually cause the same type of disruption to the entity (e.g., disruption to its supply chain). Information about an individual source of risk is not material because disruption caused from that source is highly unlikely to occur. However, information about the aggregate risk (i.e., the risk of supply chain disruption from all sources) may be material. [IFRS S1.B23].

Moreover, if a possible future event is expected to affect an entity's cash flows, but only many years in the future, information about that event is usually less likely to be considered material than information about a possible future event with similar effects that are expected to occur sooner. However, in some circumstances, primary users' decisions could reasonably be expected to be influenced by information, regardless of the magnitude of the potential effects of the future event or the timing of that event (e.g., if information about a particular sustainability-related risk or opportunity is highly scrutinised by primary users of an entity's general purpose financial reports). [IFRS S1.B24].

Frequently asked questions

Question 3-1: Do the ISSB standards require an entity to consider the time value of money (e.g., using a discounted cashflow model) when making judgements about whether information is material?

IFRS S1 does not explicitly require an entity to use discounting techniques or cash flow models to quantify amounts when identifying which information about sustainability-related risks and opportunities is material to disclose. Entities are also not prohibited from using a mechanism to distinguish between the financial effect that is expected to occur in the short term compared to the long term. However, there is no specific requirement in the ISSB standards to do so.

However, the time value of money is relevant to the entity's materiality assessment. This is acknowledged in IFRS S1 by contrasting the expected effects on cash flows "many years in the future" with similar effects that are expected to "occur sooner". That is, the likelihood of the event occurring in both scenarios is comparable, but it is the timing of the occurrence of the event that is different. IFRS S1 goes on to explain that information about the former scenario is, usually, less likely to be considered material than the latter scenario (see discussion in this section above).

As explained in IFRS S1, in its materiality assessment, an entity needs to consider both quantitative and qualitative factors. Information could be material "regardless of the magnitude of the of the potential effects of the future event or the timing of that event" (see discussion at this section above and at section 3.2.3 below). Although the timing of cashflows is an important consideration, along with other quantitative factors, qualitative factors are equally important. Therefore, omitting such information, purely due to considering the time value of money, may lead to primary users missing material information.

3.2.3 Quantitative and qualitative factors in materiality judgements

Identifying material information about an entity's sustainability-related risks and opportunities that could reasonably be expected to affect its prospects requires judgement (see discussion in 3.2.2 above). An entity's materiality judgements focus on the objective of IFRS S1, which is to provide information that meets the needs of primary users (discussed in section 1.1 above). Therefore, there are various factors to consider when making these judgements, such as:

- The nature of the sustainability-related risk or opportunity.
- The nature of the entity's operations, assets, and liabilities (e.g., whether the majority of the entity's assets and liabilities are long-lived or short-lived).
- The growth prospects for the entity, the growth prospects of the industry in which the entity operates (e.g., high growth, stable, in decline) and the relationship between those two and the extent of the entity's exposure to the sustainability-related risk or opportunity. For example, whether an entity's exposure to a sustainability-related risk increases, remains constant or reduces relative to the prospects of the entity.

As further discussed in section 3.2.1 above, information is material if “omitting, misstating or obscuring that information could reasonably be expected to influence decisions that the primary users of general purpose financial reports make on the basis of those reports, which provide information about a specific reporting entity”. Appendix D of IFRS S1 describes materiality as an entity-specific aspect of relevance which is assessed in the context of an entity’s sustainability-related financial disclosures and is based on the nature or magnitude of the item to which the information relates, or both. Materiality judgements are specific to an entity and IFRS S1 does not specify any thresholds for materiality or predetermine what would be material in a particular situation. In identifying such information, an entity needs to assess whether this information, individually or in combination with other information, is material in the context of the entity’s sustainability-related financial disclosures taken as a whole. This assessment requires the consideration of both quantitative and qualitative factors (e.g., the magnitude and the nature of the effect of a sustainability-related risk or opportunity on the entity). [IFRS S1.B19, IFRS S1.B21, IFRS S1.D8].

3.2.3.A Making quantitative assessments

An entity assesses whether the effect of a sustainability-related risk or opportunity is of such a size that information about it could reasonably be expected to influence primary users’ decisions about providing resources to the entity. In doing so, an entity generally considers the size of such effect against other related measures to assess whether information about that sustainability-related risk or opportunity is quantitatively material (e.g., impact on cash flows, amount of resource consumption, return on investment or market share). Identifying measures against which an entity makes a quantitative materiality assessment is a matter of judgement. This judgement depends on the measures related to the sustainability-related risk or opportunity and the information that is relevant to the primary users. For example, when considering the materiality of information about a sustainability-related risk affecting a group of employees, an entity may consider the number of employees affected relative to the total number of employees. Also, when considering the materiality of information about a particular category of Scope 3 GHG emissions, an entity may consider the size of those emissions relative to other aspects of the entity’s GHG footprint (e.g., GHG emissions associated with other categories of Scope 3 GHG emissions, or the entity’s total Scope 3 GHG emissions).

Making materiality judgements by using quantitative factors is a relative concept and, generally, can be readily understood and applied when preparing financial statements. For example, an asset with a cost (and fair value) of CU100 may be material to an entity that has total net assets of CU500. However, the same asset may be immaterial to a different entity that has total net assets of CU10,000 (assuming that any loss on the asset would have an immaterial impact on the entity’s profit or loss and/or equity). The amounts considered for this assessment (i.e., the entity’s total net assets or profit or loss) must relate to the same reporting period. However, when preparing sustainability-related disclosures, such an assessment may not be straightforward, for example:

- When the sustainability-related risk or opportunity arises, the items subject to that risk or opportunity considered in the assessment (e.g., the asset) may not yet exist or their value (e.g., the value of the asset or the total net assets or profit or loss) when exposed to that risk or opportunity may be different from their current value/carrying amount.
- The level of uncertainty about the occurrence of a sustainability-related risk or opportunity and the magnitude of its impact on the entity’s prospects is likely to increase as the time horizon extends (see further discussion in section 3.2.2.C above).
- When considering the components of the assessment, these may be considered in their ‘current state’ or their ‘expected future state’. In particular:
 - ‘Current state’ refers to the components based on the entity’s measurement in the current reporting period, even though their exposure to the sustainability-related risk or opportunity is expected in the future.
 - ‘Expected future state’ refers to the components based on the entity’s forecasted measurements at the time of the expected exposure to the sustainability-related risk or opportunity.

Figure 3-2: Current versus expected future state

Current state	Expected future state
<p>Materiality judgements based on the 'current state' use more observable or objective measures. This could reduce the degree of judgement and the significant estimation uncertainty (that would otherwise be required for forecasted measurements), especially if the risk exposure extends over a prolonged period of time and there is a likelihood that the entity's measurements change over that time period.</p> <p>Using the 'current state' may make the materiality judgements: a) easier to apply, and b) more useful, in case of concerns of the primary users that the forecasted measurements may not present fairly the sustainability-risks or opportunities that could reasonably be expected to affect the entity's prospects.</p> <p>For example, an entity assesses that an asset is exposed to a climate-related risk which, if it eventuates, could result in the asset being fully impaired. To determine whether information about that risk is quantitatively material, the entity bases its assessment on its financial statements for the current reporting period.</p>	<p>Materiality judgements based on the 'expected future state' places the judgement in the context of the entity's expected situation at the time the entity is expected to be exposed to the sustainability-related risk or opportunity.</p> <p>Using the 'expected future state' may be more appropriate when an entity has no assets or operations exposed to sustainability-related risks or opportunities in the current period, but it expects to have such assets or operations in the future. In that case, the entity may conclude that its exposure to the future sustainability-related risk or opportunity is material information, even though the sustainability-related risk or opportunity does not materially affect the entity in the current reporting period. However, the perceived relevance of this information needs to be balanced against any concerns about the reliability and verifiability of that information.</p> <p>For example, an entity is constructing a new production facility that is expected to be fully operational in 3 years. Once the facility is operational, the entity expects its revenues to increase significantly. The entity considers that the new production facility will be exposed to a climate-related risk. In determining whether information about that risk is quantitatively material, the entity considers what the value of that facility may be when the risk may arise.</p>

How we see it

An entity needs to exercise judgement to identify the material information to be included in its sustainability-related financial disclosures. In many cases, entities make this judgement based on the 'current state' of the item to which the assessed information relates. We do not believe that making this judgement based on the 'expected future state' of such an item would be appropriate when the respective information about that item in its 'current state' would be material. In meeting the requirements of IFRS S1 with respect to the disclosure of such judgements (see further discussion in section 6.1. below), the context and assumptions used in the entity's assessment need to be disclosed. This includes disclosures about an entity's assessment on:

- Whether the entity uses the 'current state' of items being assessed and qualitative information about how its strategy and business model are expected to evolve over the time in relation to the exposure to the sustainability-related risk or opportunity.
- Whether the entity uses the 'expected future state' of items and an explanation about how the future state assumptions reconcile with the entity's measurements in the current period.

3.2.3.B Making qualitative assessments

The IASB's Practice Statement 2 *Making Materiality Judgements* explains that qualitative factors are "characteristics of an entity's transactions, other events or conditions, or of their context, that, if present, make information more likely to influence the decisions of the primary users of the entity's financial statements". The mere presence of a qualitative factor is not what necessarily makes the information material, but the presence of that qualitative factor is likely to increase the interest of primary users in that information and potentially make it material. Some information required by ISSB standards, by its nature, is likely to be material because of the presence of a qualitative factor. For example, information about how an entity structures its governance function to manage the topic of climate risk is likely to be material for all entities exposed to a climate-related risk that could reasonably be expected to affect their prospects.

Qualitative factors can include entity-specific factors (such as the involvement of a related party of the entity) and external factors (such as the geography, industry sector and markets in which the entity operates). The ISSB's educational material on materiality, introduces some examples of entity-specific and external qualitative factors:¹¹

- Entity-specific qualitative factors include:
 - The nature of the risk or opportunity
 - The extent to which the entity's business model and strategy depend on particular resources or relationships (e.g., relationships with important suppliers or customers)
 - Unexpected variation or change in trends (e.g., a quantitatively immaterial amount may be assessed as material because of an unexpected variation compared to the prior-period amount provided in sustainability-related financial disclosures)
- External qualitative factors (which could remain constant or change over time) include:
 - The entity's geographical location
 - The entity's industry or sector. Entities operating in the same industry or region may all be affected by similar external qualitative factors
 - The state of the economy or economies in which the entity operates

As discussed in section 1.2.1 above, lack of exposure to a risk or opportunity could reasonably be expected to influence primary users' decisions. That is, if an entity is not exposed to a risk or opportunity to which others in its industry are exposed, information about the lack of exposure to that particular risk or opportunity could be material.

3.2.3.C Combining quantitative and qualitative assessments

Materiality of information is assessed by considering both quantitative and qualitative factors with no specific hierarchy. An entity could identify information as material based on one or more quantitative or qualitative factors. In fact, the more factors that apply to a particular sustainability-related risk or opportunity, or the more significant the possible effect of those factors, the more likely it is that information about that risk or opportunity is material.

In its educational material on materiality, the ISSB noted that it would not be appropriate for the entity to rely only on numerical guidelines or to apply the same quantitative threshold for all materiality judgements. The presence of a qualitative factor is likely to lower the threshold for a quantitative assessment (i.e., the more significant the qualitative factors, the more likely it is that lower quantitative thresholds will apply, and, therefore, the more likely that the information is material). It may also be the case that, despite the presence of qualitative factors, information is not material because the effect of the factor is so small that it could not reasonably be expected to influence primary users' decisions. However, an entity is not required to model the effects of qualitative or quantitative factors on its future cash flows to make materiality judgements.

An entity may decide to first assess specific information using quantitative factors, or to first assess specific information using qualitative factors. Assessing materiality using quantitative factors first could be an efficient approach if an entity concludes the information is material solely based on its size. That is, if the information is material based on this quantitative threshold, it will not need to assess that information using other factors. Typically, in the context of financial statements, qualitative factors are considered if an item is not assessed to be quantitatively material. The same reasoning applies in the context of sustainability-related financial disclosures that represent or relate to amounts. Moreover, quantitative factors can be used to assess both the materiality of information of a quantitative nature (e.g., GHG emissions), but also information of a qualitative nature (e.g., narrative information about an entity's governance arrangements, its strategy and decision making, or its resilience to a specific risk).

On the other hand, assessing materiality using qualitative factors first could be an efficient approach if an entity concludes the information is material solely based on the interest primary users have in the topic. If this information is material based on a qualitative threshold, the entity will not need to assess that information using other factors.

¹¹ [Educational material: Sustainability-related risks and opportunities and the disclosure of material information](#), ISSB, November 2024, available on the IFRS Foundation's website.

3.2.4 Additional information disclosed by an entity

3.2.4.A Additional information provided when the requirements of ISSB standards are not sufficient

Under certain circumstances, an entity may need to provide information that is additional to the information provided to comply with the specifically applicable requirements in an ISSB standard. In particular, when compliance with the requirements of an ISSB standard that specifically applies to an entity's circumstances is not sufficient for primary users to understand the effects of sustainability-related risks and opportunities on the entity's cash flows, its access to finance and cost of capital over the short, medium and long term, the entity needs to disclose additional information. *[IFRS S1.B26].*

How we see it

Sometimes compliance with the specific requirements of ISSB standards is not sufficient and, therefore, additional information would be needed to support primary users in making their decisions about providing resources to an entity. Such additional information would constitute material information and be required by IFRS S1 (see discussion about the definition of materiality in section 3.2.1 above).

3.2.4.B Requirements for not obscuring material information

Generally, if information is not material, there is no need to disclose such information that is otherwise required by an ISSB standard, even if the specific ISSB standard contains a list of specific requirements or describes them as minimum requirements. *[IFRS S1.B25].* Moreover, sustainability-related financial information required by ISSB standards needs to be clearly identified and distinguished from other information provided by the entity that is additional to what is required by ISSB standards (see relevant discussion about location of information in section 5.2 below). However, when such information is included, an entity needs to ensure that material information is not obscured.

Because IFRS S1 uses a definition of material information that is consistent with IAS 1, the ISSB also decided to include guidance in IFRS S1 with respect to the concept of obscuring material information building on similar requirements in IAS 1. That is, information may be obscured when it is communicated in a way that would have a similar effect for primary users to omitting or misstating that information. *[IFRS S1.B27, IFRS S1.BC73].*

IFRS S1 provides examples of circumstances that may result in material information being obscured: *[IFRS S1.B27]*

Extract from IFRS S1

- B27 An entity shall identify its sustainability-related financial disclosures clearly and distinguish them from other information provided by the entity (see paragraph 62). An entity shall not obscure material information. Information is obscured if it is communicated in a way that would have a similar effect for primary users to omitting or misstating that information. Examples of circumstances that might result in material information being obscured include:
- (a) material information is not clearly distinguished from additional information that is not material;
 - (b) material information is disclosed in the sustainability-related financial disclosures, but the language used is vague or unclear;
 - (c) material information about a sustainability-related risk or opportunity is scattered throughout the sustainability-related financial disclosures;
 - (d) items of information that are dissimilar are inappropriately aggregated;
 - (e) items of information that are similar are inappropriately disaggregated; and
 - (f) the understandability of the sustainability-related financial disclosures is reduced as a result of material information being hidden by immaterial information to the extent that a primary user is unable to determine what information is material.

Material information required by ISSB standards must be presented prominently and be distinguishable from immaterial information (e.g., provided to comply with law, regulation or other requirements), to avoid being obscuring. Potential ways for achieving this distinction could be, for example, when the information required by ISSB standards is: *[IFRS S1.BC74]*

- Extracted by primary users by using digital tagging
- Presented together with immaterial information in a single report but is distinguished from it by using appropriate formatting (e.g., using boxes or shading to emphasise or make the distinction clear)
- Presented separately so that it is clearly distinguished from immaterial information (e.g., splitting the report into parts)

3.2.4.C Interaction with law or regulation

Frequently, entities may need to comply with law or regulation enforced in the jurisdictions they operate that specifies disclosure requirements on sustainability-related information. In such circumstances, the entity is permitted to include in its sustainability-related financial disclosures, information to meet legal or regulatory requirements, even if that information is not considered material under ISSB standards. Information to meet legal or regulatory requirements may be included in the same location as information required by ISSB standards, as discussed in section 5.2.1 below. However, the entity needs to ensure that such information does not obscure material information, as discussed in section 3.2.4.B above. *[IFRS S1.B31]*.

Material sustainability-related financial information is disclosed, even if law or regulation permits the entity not to disclose such information. However, an entity need not disclose information otherwise required by an ISSB standard if law or regulation prohibits the entity from disclosing that information. However, if such material information is omitted for that reason, an entity needs to identify the type of information not disclosed and explain the source of the restriction. *[IFRS S1.B32, IFRS S1.B33]*.

3.2.5 Other characteristics of material information

3.2.5.A Aggregation and disaggregation

Building on the principles of aggregation and disaggregation in IAS 1, IFRS S1 requires an entity to consider all facts and circumstances to determine how to aggregate and disaggregate information in its sustainability-related financial disclosures. *[IFRS S1.B29]*. The ISSB considered that the concepts of aggregation and disaggregation embedded in IAS 1 in relation to the information provided in the financial statements are equally important for sustainability-related financial disclosures. This is to ensure that primary users are provided with information at appropriately aggregated and disaggregated levels.

To avoid reducing the understandability of sustainability-related financial disclosures, an entity needs to ensure that material information is not obscured by immaterial information or material items of information that are dissimilar to each other are not aggregated. *[IFRS S1.B29]*. In general, information cannot be aggregated if doing so would obscure information that is material. Items of information that are eligible for being aggregated have shared characteristics, rather than those that do not have shared characteristics. For example, disaggregating information by geographical location or in consideration of the geopolitical environment may be necessary to ensure that material information is not obscured when reporting about the use of water drawn from abundant sources and water drawn from water-stressed areas. *[IFRS S1.B30]*.

The following example is based on the ISSB's *Educational material: Nature and social aspects of climate-related risks and opportunities* that was published in December 2023.¹²

Extract from Educational material: Nature and social aspects of climate-related risks and opportunities

Example 1- Disclosing disaggregated information about a climate-related risk (nature aspect)

Example 1 illustrates how an entity might apply paragraph 13(b) of IFRS S2 and the principles of aggregation and disaggregation in paragraphs B29-B30 of IFRS S1 to disclose information about where in its business model and value chain a climate-related risk is concentrated. The example is not intended to illustrate all of the information the entity might need to disclose when it applies these paragraphs.

...

Fact pattern

The entity operates in the agricultural products industry. It grows wheat itself in two regions: Region 1 and Region 2. The entity also buys wheat from a supplier who grows the crop in Region 1. The entity mills the wheat and sells it to customers.

The entity's business model depends on water because growing wheat relies on rainfall and on irrigation from other water sources. Region 1 currently has high baseline water stress and the entity expects the water stress to become worse over the medium term.

The entity identifies water scarcity as a climate-related risk to which it is exposed. Climate change drives water scarcity in Region 1 through increasing temperatures and changing precipitation patterns. As a result, there is likely to be a significant reduction in the water available in this region. Water scarcity can affect the entity's prospects because, for example, reduced water availability can disrupt its own wheat production and can increase the price it pays to purchase the crop from its supplier.

Application of IFRS S2

In accordance with paragraph 10 of IFRS S2, the entity discloses information that enables users of general purpose financial reports to understand water scarcity in Region 1 as a climate-related risk that the entity has determined could reasonably be expected to affect its prospects.

Water scarcity is a location-specific risk. Therefore, the entity decides that disclosing information about the amount of wheat exposed to this risk by region will provide material information to users of general purpose financial reports. Accordingly, applying paragraph 13(b) of IFRS S2 and the principles of aggregation and disaggregation in paragraphs B29-B30 of IFRS S1, the entity disaggregates its total amount of wheat (grown and purchased, in metric tonnes) between the region that has high baseline water stress (Region 1) and the region that does not (Region 2). Table 1 illustrates this disaggregation.

Table 1: Disaggregation of crop by region (in metric tonnes)

	Region with high baseline water stress (Region 1)			Other region (Region 2)		
	<i>grown</i>	<i>purchased</i>	<i>total</i>	<i>grown</i>	<i>purchased</i>	<i>total</i>
Total						
E = C + D	A	B	C = A + B	D	—	D

...

3.2.5.B Commercially sensitive information

While IFRS S1 was being developed, stakeholders were concerned about disclosing information that could be considered commercially sensitive. The concerns related to the potential impact on an entity's competitive advantage by revealing details about its strategy and planned actions through the disclosures required by ISSB standards. The concerns were mainly focused on disclosing commercially sensitive information about opportunities, rather than risks, as these could affect an entity's competitiveness in the market or otherwise be commercially harmful. [IFRS S1.BC76, IFRS S1.BC77].

¹² [Educational material: Nature and social aspects of climate-related risks and opportunities](#), ISSB, December 2023, available on the IFRS Foundation's website.

Considering these concerns, the ISSB introduced in IFRS S1 a targeted exemption by permitting an entity, in limited circumstances, to omit from its sustainability-related financial disclosures information about a sustainability-related opportunity. Such an omission is permitted even if information is otherwise required by an ISSB standard, and the information is material. [IFRS S1.B34].

The exemption is intentionally narrow and applies only to the disclosure of information about opportunities, and it is not permitted to be applied for non-disclosure of information about risks. Also, the exemption is not intended to permit broad non-disclosure of information about opportunities. [IFRS S1.BC79, IFRS S1.B37].

Rather, an entity qualifies for the exemption if, and only if: [IFRS S1.B35, IFRS S1.BC80, IFRS S1.BC81, IFRS S1.BC83]

- Information about the sustainability-related opportunity is not already publicly available. That is, the exemption does not apply to information that is already publicly available (e.g., continuous disclosure notices, investor presentations, briefings to analysts, or other publicly available documents) as it is unlikely that such disclosure will harm an entity's advantage in pursuing the opportunity.
- Disclosure of the information could reasonably be expected to prejudice seriously the economic benefits the entity would otherwise be able to realise in pursuing the opportunity.
- The entity has determined that it is impossible to disclose that information in a manner that would enable the entity to meet the objectives of the disclosure requirements without seriously prejudicing the economic benefits the entity would otherwise be able to realise in pursuing the opportunity. For example, an entity needs to first consider whether it is possible to disclose the information about the opportunity at a sufficiently aggregated level to resolve its concerns about commercial sensitivity, before applying the exemption. However, if it does so, an entity needs to ensure that aggregation does not obscure material information (as discussed in section 3.2.5.A above).

IFRS S1 requires additional disclosures when this exemption is applied. In particular, if an entity elects to use the exemption for each item of information omitted, the entity needs to: [IFRS S1.B36]

- Disclose the fact that it has used the exemption to make users aware that information has been excluded for reasons of commercial sensitivity
- And
- Reassess, at each reporting date, whether the information qualifies for the exemption and, if the entity is no longer eligible for the exemption, disclose that information at that reporting date

3.2.6 Reassessment of material information

The individual circumstances of an entity and/or the external environment may change and, therefore, the sustainability-related risks and opportunities that users reflect to make their decisions can also change over time. Accordingly, the material sustainability-related financial information disclosed by an entity may change from one reporting period to another due to changes in circumstances and assumptions to reflect the evolving information needs of primary users (see section 3.2.2.A above). For example, the entity's circumstances may change because it has expanded its operations into new jurisdictions, and, therefore, its materiality judgements will need to take into account its operations in these new jurisdictions. This means that some types of information included in an entity's sustainability-related financial disclosures for prior periods may no longer be material. Conversely, some types of information not previously disclosed may become material. For example, an unexpected change in an entity's external environment (e.g., the emergence of a new technology) may mean that additional information about a sustainability-related risk or opportunity becomes material. This dynamic nature of materiality led the ISSB to the decision of requiring entities to reassess their materiality judgements at each reporting date to take account of changes in circumstances and assumptions. [IFRS S1.B28].

In its education material on materiality, the ISSB provides examples where an entity makes materiality judgements at each reporting date based on its assessment at that time of the information that could reasonably be expected to influence primary users' decisions. For example:¹³

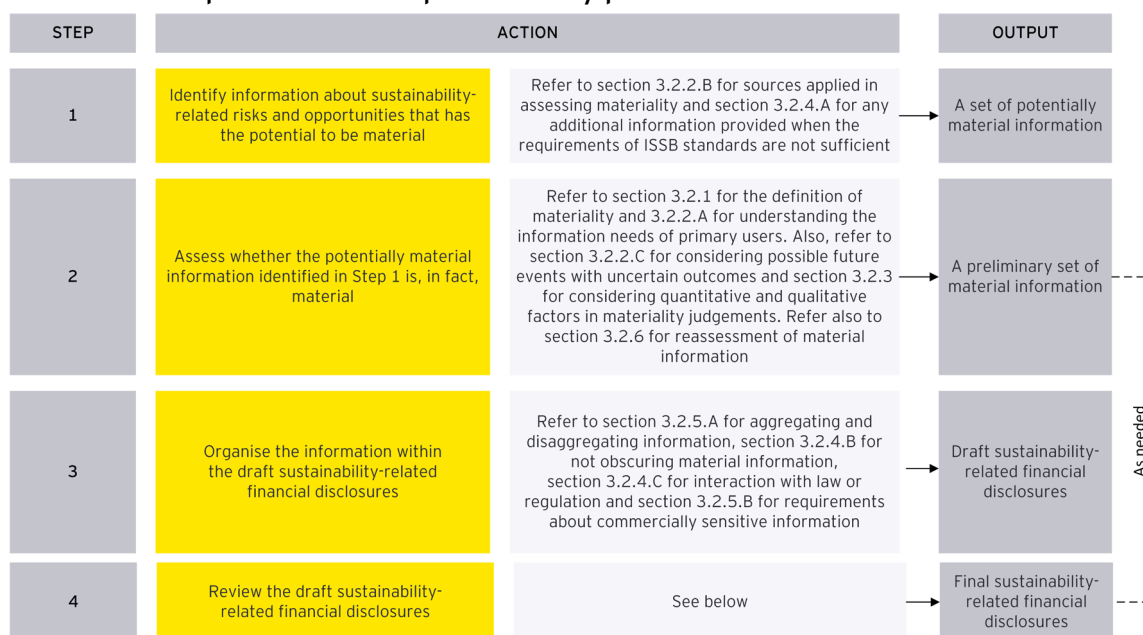

- An entity previously assessed and concluded information about a sustainability-related risk was not material. However, at the current reporting date, the entity assesses and concludes that the sustainability-related risk could reasonably be expected to affect its prospects and would now be required to provide material information about that matter.
- An entity has information about a sustainability-related risk that it has assessed and concluded is effectively managed. However, the entity concludes that primary users may take a different view and information about the risk may be material.
- An entity has information about a sustainability-related risk that it has assessed and concluded is effectively managed. However, the entity concludes that primary users may not be aware of the entity's mitigation activities and information about the risk may be material.
- An entity has information about a sustainability-related risk that primary users have not identified as a concern. However, that information may still be material if the information could reasonably be expected to influence primary users' decisions (e.g., information that would resolve primary users' misunderstanding about whether the entity is exposed to a sustainability-related risk).
- An entity has announced an intention to meet a sustainability-related target related to a sustainability-related risk or opportunity. However, the entity has not yet developed a plan to achieve this target, and that information may be material.

Moreover, the educational material on materiality emphasised the fact that an entity identifies sustainability-related risks and opportunities and provides material information about them based on facts and circumstances at the reporting date, including providing information that is forward-looking. If an entity is exposed to a sustainability-related risk or opportunity that may have consequences in the long term, the entity would disclose information, if material, about this sustainability-related risk or opportunity. For example, if at the reporting date an entity anticipates it will be subject to a potential change in climate-related legislation in the future, information about this long-term risk may be material, even though the consequences of that change in legislation would only crystallise in the future.

3.2.7 Example approach for identifying material information

In its educational material on materiality, the ISSB provides an example of a four-step process approach that an entity may find helpful to follow when identifying and disclosing material information about sustainability-related risks and opportunities that could reasonably be expected to affect its prospects. This process is described in the educational material on materiality as a guide to help an entity efficiently and effectively apply judgement and is similar to the 'four-step materiality process' explained in IFRS Practice Statement 2 Making Materiality Judgements (for further discussion on IFRS Practice Statement 2, refer to Chapter 3).

Figure 3-3: Example of a four-step materiality process

¹³ [Educational material: Sustainability-related risks and opportunities and the disclosure of material information](#), ISSB, November 2024, available on the IFRS Foundation's website.

As indicated in Figure 3.3 above, in Step 1, an entity identifies information about its sustainability-related risks and opportunities that primary users may need to understand to make decisions about providing resources to the entity. The output of this step is a set of potentially material information. In Step 2, the entity assesses whether the potentially material information identified in Step 1 is indeed material for its primary users. This assessment requires the entity to apply judgement, taking into consideration its facts and circumstances. The output of Step 2 is a preliminary set of material information. In Step 3, the entity organises the preliminary set of material information into the draft sustainability-related financial disclosures (the output of Step 3) in a way that communicates information clearly and concisely to primary users.

In Step 4, which is the final step, the entity assesses whether information is material both individually and in combination with other information in the context of its whole sustainability-related financial disclosures (e.g., the information may not be material on its own, but it may be material when considered in combination with other information in the complete set of sustainability-related financial disclosures). Using the draft sustainability-related financial disclosures from Step 3, the entity prepares its sustainability-related financial disclosures by 'stepping back' to consider its sustainability-related financial disclosures as a whole. The review conducted in Step 4 may lead an entity to reconsider its assessment in Step 2 and to reassess some information presented in its draft sustainability-related financial disclosures. For example, an entity may review whether:

- All relevant relationships between different items of information have been identified (e.g., in considering the requirements for connected information, which are further discussed in section 3.4 below). Identifying new relationships between information may lead to that information being identified as material for the first time. This review may lead to additional information being provided in the sustainability-related financial disclosures.
- Items of information that are individually immaterial, when considered together, could reasonably be expected to influence primary users' decisions. This review may lead to greater aggregation or disaggregation of information.
- The information in the sustainability-related financial disclosures is communicated in an effective and understandable way, and organised to avoid obscuring material information. This review may lead to removing immaterial information to avoid obscuring material information.
- The sustainability-related financial disclosures provide a fair presentation of the entity's sustainability-related risks and opportunities. This review may lead to information being reorganised within the sustainability-related financial disclosures.

The output of Step 4 is the final sustainability-related financial disclosures.

3.2.8 Interoperability considerations

Overall, the ISSB's intention is to establish a comprehensive global baseline of sustainability-related financial disclosures that meet the information needs of primary users in relation to sustainability-related risks and opportunities. This global baseline is intended to serve as a comprehensive foundation of disclosure requirements, for which jurisdictions will be able to add any necessary incremental disclosure requirements to this common baseline. To achieve this, interoperability with jurisdictional requirements is imperative. The more compatible ISSB standards are with the law or regulation in the jurisdictions in which entities operate (including law or regulation that specifies the documents, formats and structures for disclosing information), the more likely it is to achieve comparable, cost-effective and decision-useful sustainability-related financial disclosures that are designed to meet the needs of primary users. [IFRS S1.BC27, IFRS S1.BC28].

However, applying ISSB standards as global baseline along with other jurisdictional sustainability-related frameworks could be challenging. Not all sustainability-related frameworks share the same definition of materiality that is used in ISSB standards (discussed in section 3.2.1 above). There are similarities in the language used when referring to assessing material information in the context of the short, medium and long-term effects of sustainability issues. However, in practice, determining what is 'material' depends on the issue, the context, the time frame and the stakeholder. For example, the key difference between the GRI standards, the European Sustainability Reporting Standards (ESRS) and ISSB standards is the audience (i.e., ISSB standards focus on primary users, whereas GRI and ESRS have a broader set of 'users' of the information).

Lack of interoperability could be costly for entities and risks undermining the provision of clear and consistent information to primary users. Primary users need to be able to clearly identify which information is relevant to them and which information is relevant to a broader set of stakeholders, so that material information for primary users is not obscured. [IFRS S1.BC31]. Also, understanding the similarities and differences between ISSB standards and the requirements of other sustainability frameworks will avoid duplication of information in entity's general purpose financial report, consistent with what IFRS S1 requires (see relevant discussion in section 3.4.3 below).

In supporting the interoperability among ISSB standards and the other frameworks, the ISSB:

- Included in IFRS S1 clarifications on concepts and terminologies (e.g., an extensive description of sustainability and its connection with the value of an entity as discussed in section 1.1.2 above), as well as specific definitions (e.g., materiality as discussed in section 3.2.1 above), to explain their use by ISSB standards compared with other jurisdictional initiatives and sustainability reporting frameworks.
- Included a list of sources of guidance as part of the identification process of sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects and the identification of material information about those risks and opportunities (as discussed in section 3.2.2.B above) contributes to the interoperability with other sustainability-related frameworks and the reduction of the burden for entities already using or are mandated to comply with those other frameworks.
- Permits entities to include information disclosed to meet other requirements (e.g., specific jurisdictional requirements) as long as it does not obscure the material information provided in complying with ISSB standards (as discussed in section 3.2.4.B above).

Moreover, the IFRS Foundation proceeded with the following:

- Published in May 2024, the Inaugural Jurisdictional Guide for the adoption or other use of the ISSB Standards. As a growing number of jurisdictions are moving forward with their plans to adopt or otherwise use ISSB standards, this guide aims to set the basis for the development of jurisdictional profiles that describe jurisdictional approaches. Also, the guide aims to enable market participants and regulators to understand jurisdictional progress towards delivering globally consistent and comparable sustainability-related information for capital markets.¹⁴
- Collaborated with EFRAG and together published *interoperability guidance* on the alignment between ISSB standards and the ESRS, in May 2024. The guidance material focuses on climate-related disclosures, so it mainly covers the requirements in IFRS S2 and, where relevant, the requirements of IFRS S1. For further information, refer to our publication, *IFRS Sustainability Developments: Interoperability guidance published on ESRS and ISSB standards*.¹⁵
- Published in September 2024 'Voluntarily applying ISSB Standards - A guide for preparers'.¹⁶ This guide aims to support preparers as they start to apply ISSB standards voluntarily and help them communicate their progress to primary users. The guide highlights the two elements of ISSB standards that are designed to support implementation for preparers. These are: a) transition reliefs so that preparers can use a phased-in approach to the requirements (see discussion at section 9 and Chapter 54) and b) proportionality mechanisms that provide measures to address the range of capabilities and circumstances of entities (see discussion at Chapter 54).

How we see it

The interoperability guidance published by the IFRS Foundation and EFRAG will be useful for entities that want to claim compliance with both ISSB standards and ESRS. In particular, multi-national entities that may need to comply with both sets of standards if they have both reporting entities in jurisdictions that require compliance with ESRS, and reporting entities in jurisdictions that require compliance with ISSB standards. Entities starting with either set of standards should be aware of key differences between them and reflect these in their disclosures accordingly, to the extent they are applicable and material to the entity. However, entities should ensure that information required to be disclosed under ISSB standards is clearly identifiable alongside information required to be disclosed under ESRS. Entities should keep in mind that the guidance must be read in conjunction with the relevant standards in order to meet the requirements of either set of standards.

¹⁵ [IFRS Sustainability Developments: Interoperability guidance published on ESRS and ISSB standards](#), EY Global, May 2024, available on [ey.com/IFRS](#).

¹⁶ [Voluntarily applying ISSB Standards-A guide for preparers](#), September 2024, available on the IFRS Foundation's website.

3.3 Reporting entity

3.3.1 Definition of a reporting entity

IFRS S1 defines reporting entity as an entity that is required, or chooses, to prepare general purpose financial statements. [IFRS S1 Appendix A]. The entity that is required to disclose sustainability-related financial information is the same as the one that prepares the related financial statements. [IFRS S1.20]. For example, when the entity applies IFRS accounting standards, the consolidated financial statements provide information about the parent and its subsidiaries as a single reporting entity. The reporting entity's sustainability-related financial disclosures focus on the sustainability-related risks and opportunities that enable primary users to assess the effects of those risks and opportunities on the entity's prospects (i.e., the effects on the prospects of the parent and its subsidiaries, in the case of information presented in consolidated financial statements). [IFRS S1.B38].

Requiring the same reporting entity for both financial statements and sustainability-related financial disclosures is one of the decisions the ISSB made for the purposes of enabling information disclosed in the financial statements to be connected with sustainability-related financial information (as discussed in section 3.4 below). [IFRS S1.BC85].

3.3.2 Breadth of reporting and the concept of the value chain

The reporting entity is required to disclose information about sustainability-related risks and opportunities throughout its value chain (see section 1.2 above). This means that the reporting entity is required to identify the sustainability-related risks and opportunities that could reasonably be expected to affect its prospects and determine the scope of its value chain, including its breadth and composition, in relation to each of those sustainability-related risks and opportunities.

The value chain is also mentioned in the section of IFRS S1 on the 'core content' of information under the strategy pillar; an entity is required to disclose the current and anticipated effects of sustainability-related risks and opportunities that could reasonably be expected to affect its prospects throughout its business model and value chain and describe where these risks and opportunities are concentrated (see section 4.3.4 below).

IFRS S1 defines the value chain as follows: [IFRS S1 Appendix A]

Extract from IFRS S1

Appendix A

Defined terms

value chain	<p>The full range of interactions, resources and relationships related to a reporting entity's business model and the external environment in which it operates.</p> <p>A value chain encompasses the interactions, resources and relationships an entity uses and depends on to create its products or services from conception to delivery, consumption and end-of-life, including interactions, resources and relationships in the entity's operations, such as human resources; those along its supply, marketing and distribution channels, such as materials and service sourcing, and product and service sale and delivery; and the financing, geographical, geopolitical and regulatory environments in which the entity operates.</p>
--------------------	---

As explained in the definition above, an entity's value chain refers to its interactions, resources and relationships (including those along its supply, marketing and distribution channels), as well as the financing, geographical, geopolitical and regulatory environments in which the entity operates. As further explained in section 1.1.2.C above, resources and relationships can be direct or extend throughout the entity's value chain (e.g., the entity's supply and distribution channels, the effects of the consumption and disposal of the entity's products, the entity's sources of finance and its investments, including investments in associates and joint ventures). For example, an entity may interact directly with the natural environment through its use of timber or minerals as a raw material to create its products and therefore, depend on this resource to generate cash flows. However, it may be the case that an entity interacts indirectly with the natural environment through its suppliers if they use timber or minerals as a raw material to create a product the entity uses. That is, if the entity's business partners throughout its value chain face sustainability-related risks and opportunities, the entity could be exposed to related consequences of its own. [IFRS S1.B4, IFRS S1.B5].

In determining the scope of its value chain, an entity considers both its business model (i.e., aspects of its operations associated with creating value and generating cash flows) and its external environment (i.e., external conditions and events that affect its operations). Also, an entity considers the breadth and composition of its value chain by looking at what it uses and depends on throughout the full lifecycle of a product or service, from conception to delivery, consumption and end-of-life.

Illustrations 3-1 and 3-2 below are based on the examples provided in the ISSB's educational material on materiality, and include possible considerations for an entity when determining the scope of its value chain:¹⁷

Illustration 3-1: Considering the entity, its business model, the external environment and distribution channels when determining the scope of value chain

Entity A manufactures electronic devices and in determining the scope of its value chain, it considers the lifecycle to 'create' a product as well as the resources and relationships throughout its value chain:

Entity A also considers both its business model and the external environment in which it operates when determining the scope of its value chain. For example, when considering its distribution channels, Entity A considers its:

- **Business model:** as part of its activities, Entity A depends on third-party vendors to sell its products to customers. These third-party vendors represent aspects of Entity A's operations associated with generating cash flows and, therefore, reflect part of Entity A's business model and value chain.
- **External environment:** changes in the regulatory environment in a jurisdiction in which Entity A sells its products may affect which products Entity A sells to its customers. The regulatory environment relates to those regulatory conditions and events external to Entity A that can affect its operations (e.g., an industry regulation that standardises and limits the types of charging devices permitted to be manufactured, in an effort to reduce electronic waste). The regulatory environment that Entity A operates in is, therefore, part of its value chain.

Illustration 3-2: Considering interactions with stakeholders, society, the economy and the natural environment when determining the scope of value chain

Entity X operates in the Containers and Packaging industry and depends on suppliers in three jurisdictions (A, B and C) for raw materials. Since Entity X uses and depends on each supplier to operate its business and create its products, these three suppliers are part of its value chain. In determining its value chain, Entity X considers its direct and indirect interactions with stakeholders, society, the economy and the natural environment throughout its value chain. Entity X notes that:

- Jurisdiction A's local communities are protesting against Entity X's deforestation practices, which could affect the ability of its suppliers in Jurisdiction A to do business with Entity X (interactions with society)
- Jurisdiction B's government has introduced a tax incentive for entities pursuing sustainable operations, which could influence how Entity X's suppliers operate (interactions with the economy)
- Jurisdiction C is experiencing a drought, which could affect the ability of its suppliers in Jurisdiction C to produce the raw materials needed by Entity X (interactions with the natural environment)

In identifying its sustainability-related risks and opportunities, Entity X considers these factors which indicate that it may be exposed to sustainability-related risks and opportunities as a consequence of the business partners in its value chain facing sustainability-related risks and opportunities. For example, Entity X may determine that tax incentives in Jurisdiction B represent a sustainability-related opportunity that could reasonably be expected to affect its prospects.

¹⁷ [Educational material: Sustainability-related risks and opportunities and the disclosure of material information](#), ISSB, November 2024, available on the IFRS Foundation's website.

Therefore, even though the reporting entity that prepares sustainability-related financial disclosures is the same as the one that prepares the related financial statements, the breadth of reporting is not the same. That is, the sustainability-related financial disclosures are not constrained to what is recognised in the financial statements, but goes beyond that to capture information about the value chain.

3.3.3 Challenges in determining the scope of the value chain

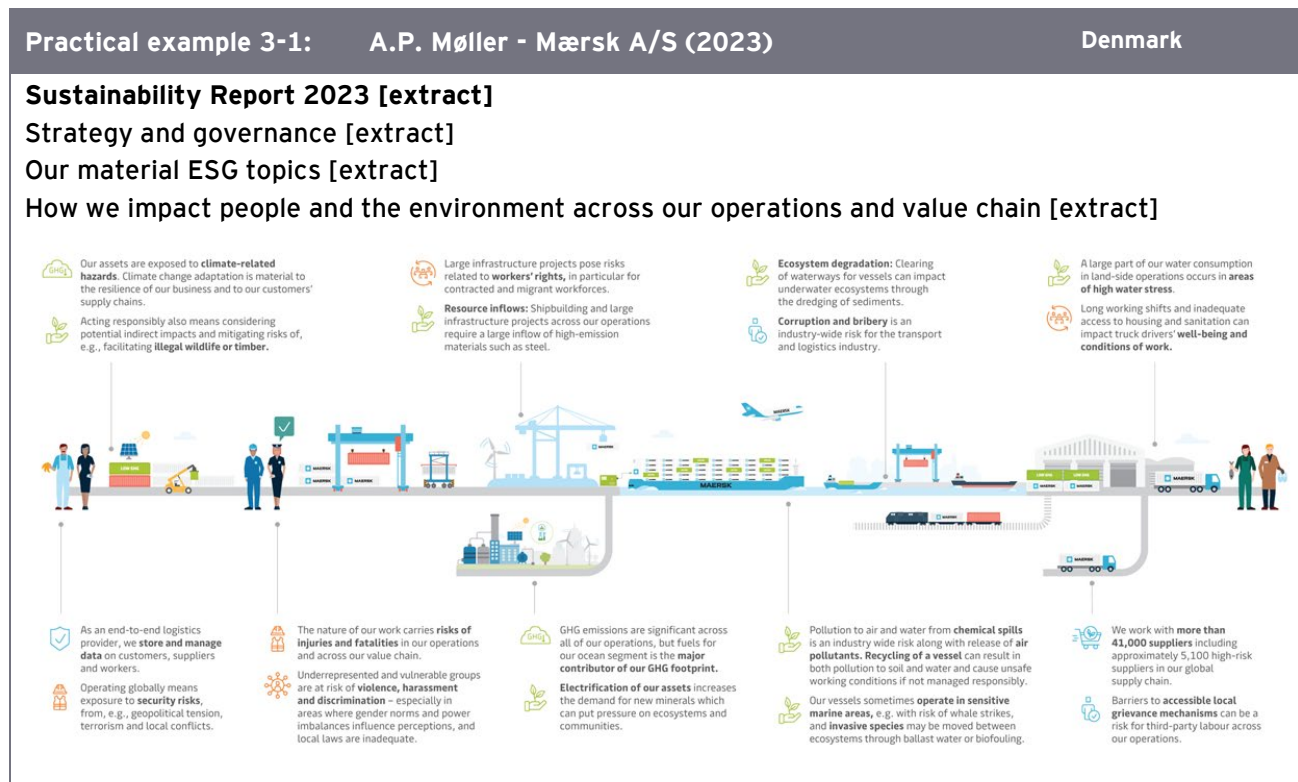

Determining the scope of an entity's value chain could be challenging due to the possible scope of the value chain, as well as potential complexities in obtaining information to prepare the required disclosures. This is because obtaining information about the value chain may require a reporting entity to collect information from parties that the entity does not control or in which it has no ownership interest. For example, the ultimate consumers of an entity's products may be the most important contributors to the entity's Scope 3 GHG emissions. Also, the employment practices of a supplier in an entity's supply chain could have a reputational effect on the entity, even if the supplier has no direct relationship with the reporting entity.

[IFRS S1.BC56, IFRS S1.BC57]. Joint ventures, associates and investments are not considered to be part of the reporting entity that is presenting consolidated financial statements. However, the reporting entity recognises these items in its financial statements and reports aspects of their performance. Likewise, sustainability-related financial information related to those investments is relevant to primary users in assessing the effects of sustainability-related risks and opportunities on the entity's prospects.

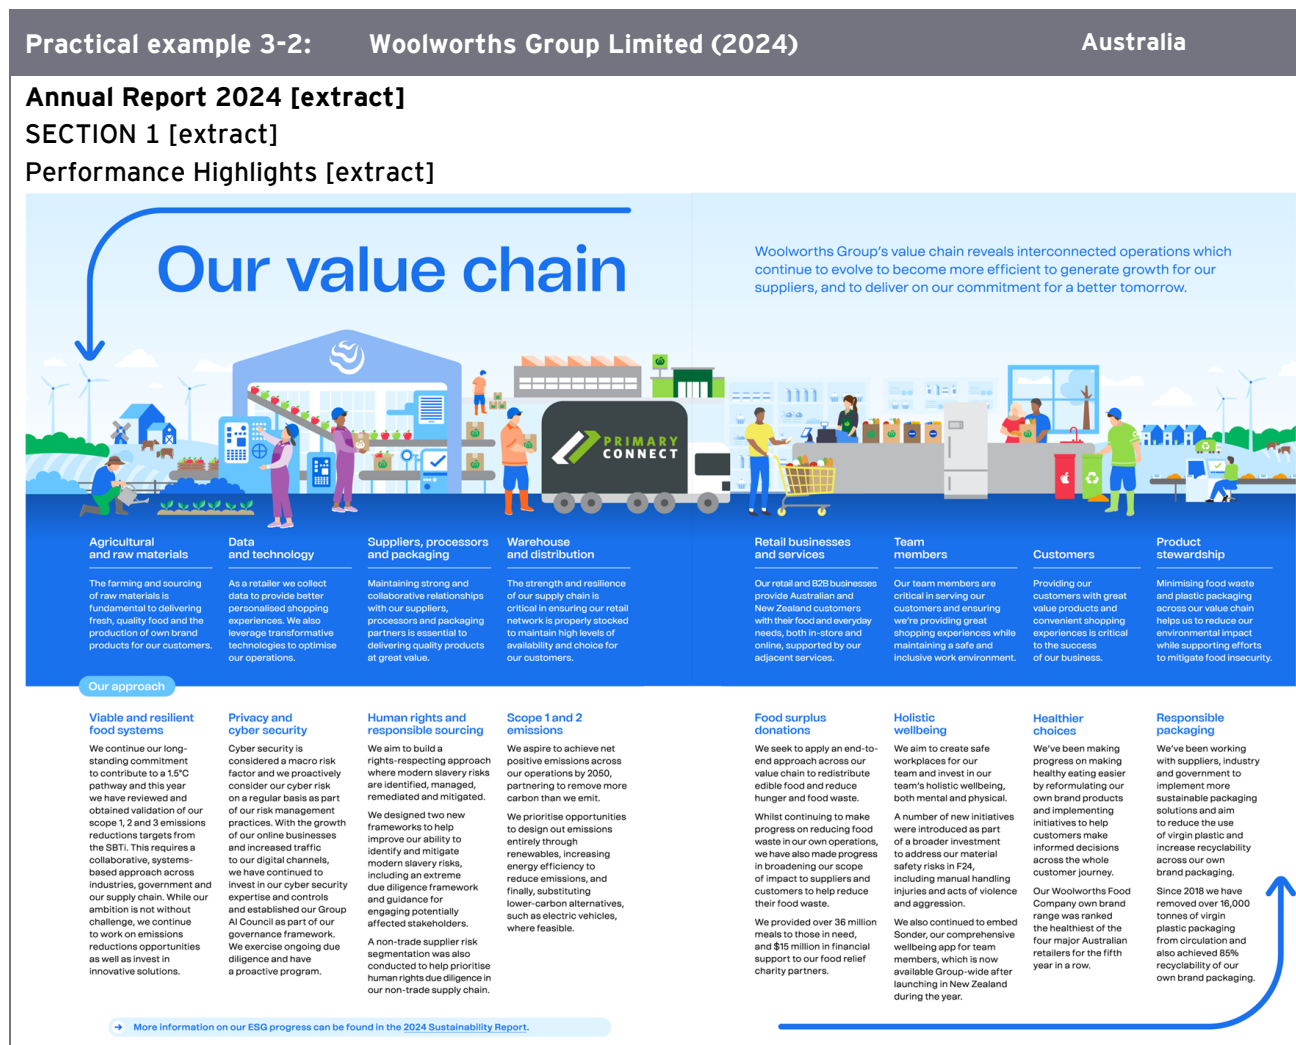

[IFRS S1.BC54].

Although assessing the scope of the value chain may be challenging, it is not new or unique to the field of sustainability reporting. As part of their general purpose financial reports, entities frequently produce management commentary that provides insights into factors that have affected the entity's financial performance and financial position and factors that could affect its ability to create value and generate cash flows in the future. These factors also capture aspects of the value chain including the activities of diverse investments and dependencies. Therefore, since entities also assess activities within their value chain for general planning and risk management purposes, the requirements in IFRS S1 are effectively following this approach in the analysis of risk management or strategic business model.

In its Sustainability Report 2023, A.P. Møller-Maersk A/S included a figure showing the considerations made across its operations and value chain when identifying potential sustainability-related risks and opportunities that could reasonably be expected to affect its prospects.

In its Annual Report 2024, Woolworths Group Limited disclosed how it has expanded its focus to consider food waste across its value chain:

The ISSB noted that determining the value chain and clarifying the breadth of reporting is a process that is unique for each entity and is difficult to specifically prescribe through principles or standards, as it is unlikely to apply in the same way to all types of entities. The ISSB also referred to the existing market guidance and practice around reporting on a broad range of activities in the value chain and across subsidiaries (e.g., the SASB standards contain disclosure topics and metrics that demonstrate how an entity could report on value chain activities, and which of those activities may be relevant for a given industry).

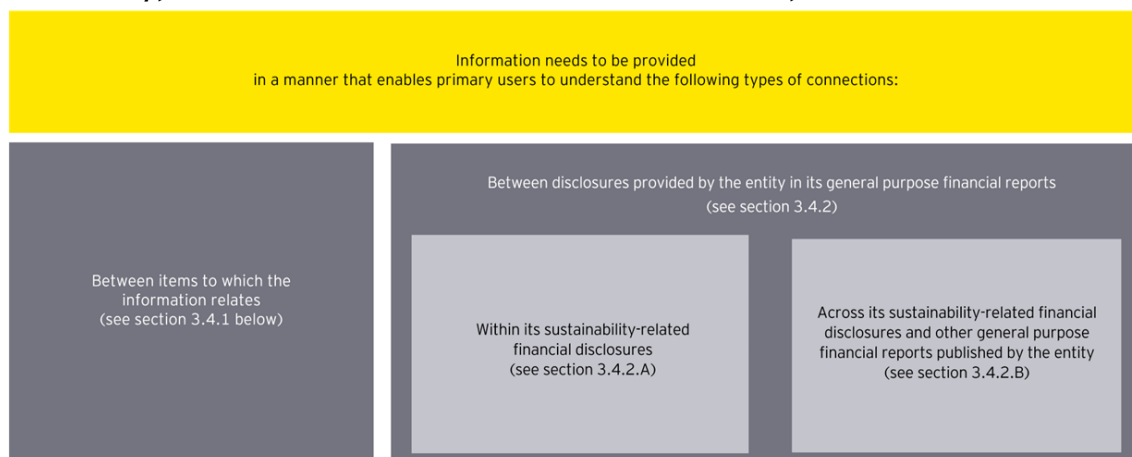

In determining the scope of its value chain, an entity is required to use "all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort", in relation to each sustainability-related risk and opportunity identified that could reasonably be expected to affect the entity's prospects. This concept assists entities by establishing parameters for the type of information they consider when preparing disclosures regarding the value chain, and the effort required to obtain such information. For further information about this concept, see section 1.2.2 above.

3.4 Connected information

Entities are required to provide information in a manner that enables primary users to understand connections between various disclosures in an entity's general purpose financial reports, as well as insight into the connections between the items to which the information relates. [IFRS S1.B39].

The following Figure 3-4 illustrates the types of connections for which information needs to be provided according to IFRS S1: [IFRS S1.21]

Figure 3-4: Types of connections for which information is required

3.4.1 Connections between items to which the information relates

IFRS S1 provides examples relating to information about connections between items to which the information relates: [IFRS S1.B40]

- An entity pursued a particular sustainability-related opportunity that resulted in revenue increase. The connected information will depict the relationship between the entity's strategy and its financial performance.
- An entity identified a trade-off between two sustainability-related risks it is exposed to and took action on the basis of its assessment of that trade-off. The connected information will depict the relationship between those risks and the entity's strategy.
- An entity committed to a particular sustainability-related target, but that commitment has not yet affected the entity's financial position or financial performance because the applicable recognition criteria have not been met. The connected information will depict that relationship.

3.4.2 Connections between disclosures provided in general purpose financial reports

With respect to the connections between various disclosures in an entity's general purpose financial reports, IFRS S1 distinguishes two categories: a) connections between disclosures provided by an entity within its sustainability-related financial disclosures; and b) connections between disclosures provided across an entity's sustainability-related financial disclosures and other general purpose financial reports published by the entity.

3.4.2.A Connections between disclosures provided within an entity's sustainability-related financial disclosures

IFRS S1 explains the nature of information about connections between disclosures provided by an entity within its sustainability-related financial disclosures, as follows: [IFRS S1.B41]

- Information about a particular sustainability-related risk or opportunity explaining the connections between disclosures on governance, strategy and risk management (i.e., relating to the four content pillars as further discussed in section 4 below).
- Information between disclosures about various sustainability-related risks and opportunities provided within an entity's sustainability-related financial disclosures. For example, when an entity integrates its oversight of sustainability-related risks and opportunities and, therefore, needs to integrate the disclosures on governance instead of providing separate disclosures on governance for each sustainability-related risk and opportunity.

3.4.2.B Connections between disclosures provided across sustainability-related financial disclosures and other general purpose financial reports published by the entity

Connected information also needs to be provided to explain the connections between disclosures provided across an entity's sustainability-related financial disclosures and other general purpose financial reports published by the entity. For example, an entity needs to explain how information provided in its sustainability-related financial disclosures is connected with the information provided in its related financial statements. However, this type of connections is not restricted to connections with the related financial statements, but it also relates to all other reports that constitute the general purpose financial report (e.g., the management commentary).

IFRS S1 requires information about the current and anticipated effects of sustainability-related risks and opportunities on an entity's financial position, financial performance and cash flows (see relevant discussion on the core content information about the strategy pillar in section 4.3.4 below). This requirement represents a specific application of connected information between sustainability-related financial disclosures and the related financial statements of an entity.

To promote this connectivity, IFRS S1 requires an entity to: [IFRS S1.22, IFRS S1.23, IFRS S1.24]

- Identify the financial statements to which the sustainability-related financial disclosures relate
- Use consistent data and assumptions in preparing the sustainability-related financial disclosures with the related financial statements (to the extent possible considering the requirements of IFRS accounting standards or other applicable GAAP)
- Use the presentation currency of its related financial statements, when currency is specified as the unit of measure in the sustainability-related financial disclosures

An entity is required to align data and assumptions to the extent possible by taking into consideration the requirements in IFRS accounting standards (or other GAAP) instead of mandating full alignment. This is because there could be legitimate reasons for data and assumptions to vary between an entity's sustainability-related financial disclosures and its financial statements. For example:

- An entity's net-zero commitment may not give rise to a provision, based on the requirements in IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*. That is, simply making a commitment to offset future GHG emissions does not in itself give rise to a present obligation for an entity and, therefore a provision would not be recognised until the entity has emitted the gas it has promised to offset. This was also discussed by the IFRS Interpretations Committee in its agenda decision in April 2024.¹⁸
- While testing specific assets for impairment according to the requirements in IAS 36 *Impairment of Assets*, an entity may only use a subset of the data and assumptions needed when preparing disclosures about climate resilience reflecting various climate scenarios according to IFRS S2 (see Chapter 54). For example, IAS 36 requires cash flow projections in the determination of value in use to be based on the most recent budgets or forecasts for a maximum of five years, unless management is confident that its projections are reliable and it can demonstrate its ability, based on past experience, to forecast cash flows accurately over a longer period.

The following examples are based on the Basis for Conclusions to IFRS S1: [IFRS S1.BC88]

Illustration 3-3: Examples of the types of connections

Entity W, a pharmaceutical company, has been exposed to claims of unethical testing. Therefore, it may need to explain how its strategic response has, or has not, led to the recognition of provisions and associated operating costs in its financial statements.

Entity X, an electronics manufacturer, has publicly announced a target of net zero for its corporate greenhouse gas emissions, which are primarily created during its manufacturing process. Entity X adopts a new strategy that involves shifting its procurement of energy to renewable sources and investing in more energy-efficient machinery. Therefore, Entity X may need to explain how this strategy to achieve the target led to an increase in capital expenditure and possibly an impairment review of non-energy-efficient machinery, as well as lower (and less volatile) energy prices, increased revenue due to a related increased demand from its customers, and an increase in margins on sales.

Entity Y, a supplier, finds that demand for its goods has risen due to its treatment of workers and its record on respecting workers' rights, especially because its approach in this area was better than many of its peers. Entity Y may need to explain how its strategy and performance in relation to the treatment of its workers has positioned it favourably and has led to increases in revenue.

¹⁸ [IFRIC Update](#), April 2024, available on the IFRS Foundation's website.

Entity Z has a net zero greenhouse gas emissions plan that relies on replacing its fleet of diesel-powered vehicles with electric vehicles. Shifting to electric vehicles will require much more capital investment than was necessary for diesel vehicles. The transition plan is that each vehicle will be replaced when it reaches the end of its useful economic life. Entity Z concludes that the vehicles are not impaired and no changes to depreciation rates or useful life estimates are required to be reflected in the financial statements. Entity Z may need to explain that the transition plan will have consequences for its future cash flows and that its accounting, as reflected in the financial statements, is consistent with its transition plan.

3.4.3 Characteristics of connections

Drawing connections between disclosures involves, but is not limited to, disclosing necessary explanations and cross-references and using consistent data, assumptions, and units of measure. In doing so, IFRS S1 requires: [IFRS S1.B42]

- Explanation of the connections between disclosures in a clear and concise manner
- Avoiding unnecessary duplication if an ISSB standard requires the disclosure of common items of information (see also discussion on the enhancing qualitative characteristic of understandability of information in section 3.1.1.B above)
- Disclosing information about significant differences between the data and assumptions used in preparing the entity's sustainability-related financial disclosures and the data and assumptions used in preparing the related financial statements, as explained in section 3.4.2.B above.

When disclosing sustainability-related financial information, there is a possibility that this information could result in duplication of information within the general purpose financial report. This is because other frameworks (such as IFRS accounting standards or other GAAP) may require similar information. Therefore, in identifying and explaining the connections both between the items to which the information relates and between disclosures provided by the entity in its general purpose financial reports (discussed in sections 3.4.1 and 3.4.2 above), an entity needs to avoid unnecessary duplication. To achieve this, one approach an entity may consider is to use cross references from sustainability-related financial disclosures to the other general purpose financial reports published by the entity, subject to the specified requirements being met. The requirements about information included in sustainability-related financial disclosures by cross-reference are further discussed in section 5.2.2 below.

The following examples are included in IFRS S1 to describe the nature of disclosures that could explain the various types of connections. For example, in providing connected information, an entity may: [IFRS S1.B43, IFRS S1.B44]

- Explain the effect or likely effect of its strategy on its financial statements and financial planning, or explain how that strategy relates to the metrics the entity uses to measure progress against targets.
- Explain how its use of natural resources or changes within its supply chain could amplify or, alternatively, reduce its sustainability-related risks and opportunities. The information about the use of natural resources or changes within its supply chain may need to be linked to information about current or anticipated financial effects on the entity's production costs, its strategic response to mitigate those risks and its related investment in new assets. Also, the narrative information about the related metrics and targets may need to be linked to information in the related financial statements.
- Explain the combined effects of its sustainability-related risks and opportunities and its strategy on its financial position, financial performance and cash flows over the short, medium and long term. For example, when the entity faces decreasing demand for its products because of consumer preferences for lower-carbon alternatives, it may need to explain how its strategic response (e.g., closing a major factory) could affect its workforce and local communities, and the effect of that response on the related financial statements (e.g., the effect of closing a major factory on the useful lives of its assets and on impairment assessments).
- Describe the alternatives it considered in setting its strategy in response to its sustainability-related risks and opportunities, including a description of the trade-offs between those risks and opportunities. For example, an entity may need to explain the potential effects of its decision to restructure its operations (e.g., developing new products) in response to a sustainability-related risk (e.g., how environmental risks affect its reputation or ability to operate) on the future size and composition of the entity's workforce, or financial performance reported in the entity's financial statements.

4 Core content

4.1 Overview of TCFD

IFRS S1 requires an entity to disclose information about its governance, strategy, risk management and metrics and targets in relation to its sustainability-related risks and opportunities. These disclosure requirements represent the 'core content' that provides information about the way the entity manages those risks and opportunities. Information disclosed in relation to this 'core content' is necessary for primary users to assess the effects of sustainability-related risks and opportunities on an entity's cash flows, its access to finance and cost of capital over the short, medium and long term.

The core content disclosure requirements are derived from, and build on, the four pillars of the TCFD Recommendations, as summarised in Figure 4-1 below.

Figure 4-1: Core content builds on the four TCFD pillars

In 2024, the IFRS Foundation took over the monitoring of the progress on climate-related disclosures from the TCFD. The TCFD recommendations are a good starting point for entities as they begin implementing ISSB standards. The TCFD recommendations have been fully incorporated into ISSB standards, therefore, entities applying IFRS S1 and IFRS S2 will meet the TCFD recommendations. Although the requirements in IFRS S2 are consistent with the four core TCFD recommendations and eleven recommended disclosures, IFRS S2 includes additional requirements, which means that if an entity meets the TCFD requirements, it does not automatically meet the requirements of IFRS S2. Examples of these additional requirements include disclosing industry-based metrics, information about planned use of carbon credits to achieve their net emissions targets, and additional information about financed emissions.¹⁹ The IFRS Foundation has published a comparison of the requirements in IFRS S2 and the TCFD recommendations.²⁰

An entity may have overarching processes, controls and procedures that are used to monitor and manage various sustainability-related risks and opportunities in an integrated manner. IFRS S1 does not require an entity to repeat disclosures relating to the core content for each type of sustainability-related risk and opportunity. Instead, an entity discloses that its approach to monitoring and managing a specific sustainability-related risk and opportunity is integrated into its overall process, controls and procedures and, if material, explain any adaptations made to those processes to address any unique characteristics of that specific risk and opportunity. [IFRS S1.B41(b), IFRS S1.B42(b), IFRS S1.BC94].

How we see it

The purpose of the core content disclosure requirements in IFRS S1 is to require an entity to explain its actual sustainability-related activities, instead of prescribing how it should govern, manage risks and opportunities, and set strategy in managing its business. If, for example, an entity has limited governance arrangements or strategies in place to monitor and manage its sustainability-related risks and opportunities, the entity is required to disclose that fact if that would be material information to primary users. Entities need to consider whether to introduce process improvements to strengthen their arrangements and processes for managing and monitoring sustainability-related risks and opportunities.

¹⁹ [Making the transition from TCFD to ISSB](#), ISSB, available on the IFRS Foundation's website.

²⁰ [Comparison of IFRS S2 with the TCFD Recommendations](#), ISSB, November 2024, available on the IFRS Foundation's website.

4.2 Governance

In defining ‘governance’, the TCFD includes a reference to the *G20/OECD Principles of Corporate Governance*, which states “Governance involves a set of relationships between an organization’s management, its board, its shareholders, and other stakeholders. Governance provides the structure and processes through which the objectives of the organization are set, progress against performance is monitored, and results are evaluated.”²¹

The objective of the governance disclosures in IFRS S1 is to enable primary users to understand the governance processes, controls and procedures an entity uses to monitor, manage and oversee sustainability-related risks and opportunities. [IFRS S1.26].

To help primary users evaluate whether and how much attention is given to sustainability-related risks and opportunities, IFRS S1 requires disclosure of: [IFRS S1.27]

- The governance body(s) or individual(s) with oversight of an entity’s sustainability-related risks and opportunities (see section 4.2.1 below)
- The management’s role in the governance processes, controls and procedures used to monitor, manage and oversee sustainability-related risks and opportunities (see section 4.2.2 below)

4.2.1 Information about the oversight role

‘Governance body(s)’ that may have oversight of sustainability-related risks and opportunities include boards, committees or equivalent bodies charged with governance. IFRS S1 acknowledges that, for some entities, the responsibility for the oversight of sustainability-related risks and opportunities may be held by an individual(s) rather than a governance body(s). An individual may be charged with the overall oversight of sustainability-related risks and opportunities because of their specific expertise and experience.

[IFRS S1.BC96].

IFRS S1 requires an entity to disclose information about oversight arrangements, as set out in Figure 4-2 below: [IFRS S1.27(a)]

Figure 4-2: Disclosures about oversight role

Theme	Disclosure required
Responsibility	Identify the governance body(s) or individual(s) responsible for oversight of sustainability-related risks and opportunities. This requirement includes information about how responsibilities for sustainability-related risks and opportunities is reflected in the terms of reference, mandates, role descriptions and other related policies applicable to that body(s) or individual(s). [IFRS S1.27(a)(i)].
Competency	Describe how the governance body(s) or individual(s) determines whether they have, or will need to develop, the appropriate skills and competencies to oversee strategies that respond to sustainability-related risks and opportunities. [IFRS S1.27(a)(ii)].
Inform	Explain how, and how often, they are informed about sustainability-related risks and opportunities. [IFRS S1.27(a)(iii)].
Address	Explain how they take sustainability-related risks and opportunities into account when overseeing strategy and risk management and assessing transactions. As part of this disclosure, explain whether the governance body(s) or individual(s) has considered trade-offs associated with those risks and opportunities. [IFRS S1.27(a)(iv)].
Monitor	Describe their oversight of the setting of targets and tracking progress against those targets. As part of this disclosure, explain whether and how related performance metrics are included in remuneration policies. [IFRS S1.27(a)(v)].

²¹ [Recommendations of the TCFD](#), Appendix 5: Glossary and Abbreviations, page 62, TCFD, June 2017. Available on the TCFD’s website.

4.2.2 Information about management's role

The governance disclosure requirements distinguish between oversight by a governance body or individual and the responsibilities of management-level positions or committees to enable primary users to understand how responsibilities are delegated within the entity in relation to sustainability-related matters. To illustrate this, the board of directors of an entity may provide oversight on broader sustainability-related matters, whereas executives within management may make operational decisions about how specific sustainability-related risks and opportunities are assessed and managed.

IFRS S1 requires an entity to make disclosures about management's role in the governance processes, controls and procedures used to monitor, manage and oversee sustainability-related risks and opportunities. These disclosures are summarised in Figure 4-3 below: [IFRS S1.27(b)]

Figure 4-3: Disclosures about management's role

Theme	Disclosure required
Delegation	Information about whether the role is delegated to a specific management-level position or committee and how oversight over that position or committee is exercised. [IFRS S1.27(b)(i)]. As such, this disclosure enables primary users to understand how responsibilities are delegated and how the individual(s) or the governance body(s) maintains oversight over those delegated responsibilities. [IFRS S1.BC99].
Processes	Information about whether management uses controls and procedures to support the oversight of sustainability-related risks and opportunities and, if so, how these controls and procedures are integrated with other internal functions. [IFRS S1.27(b)(ii)].

Given the nature of the disclosure requirements about the role of the governance body and the role of management, it is likely that entities will use narrative disclosures to meet those requirements.

Depending on the nature of the information, clarity of the disclosure may be enhanced through the use of tables, graphs or diagrams in addition to narrative text.

Practical examples 4-1, 4-2 and 4-3 below show how some entities, in applying the TCFD Recommendations, have identified and described the role and mandate of the governance bodies that have oversight of its sustainability-related risks and opportunities and management's delegated roles in the governance. These entities provide a visual representation of the role of each body which is explained further in the accompanying narrative disclosure included in the relevant reports, which also details the processes, controls and procedures used to monitor, manage and oversee their sustainability-related risks and opportunities.

Telstra Annual Report 2024 [extract]

Acting on climate and nature [extract]

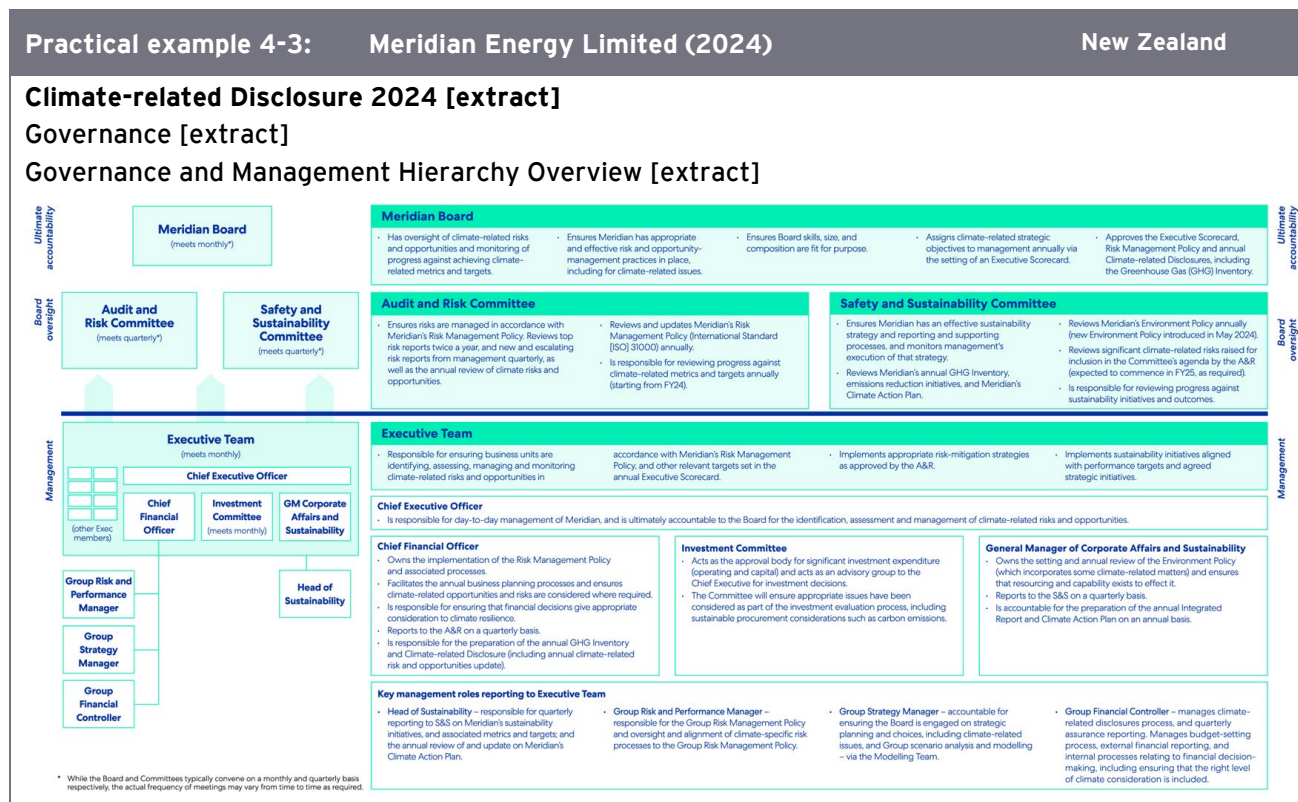

Governance of climate and nature-related matters [extract]

...

	Description	Key climate and nature responsibilities
Oversight	Board Oversees Telstra Group's approach to Environment, Social and Governance issues including approving key external environmental targets and selected environmental disclosures. Comprised of nine members with a diverse range of skills ⁵⁰ and experience including environment, social and governance and risk management.	Approves key external environment targets and selected environment disclosures, including IFRS 2 and TNFD reporting.
	Audit and Risk Committee (ARC) Oversees the design and implementation of Telstra's risk management framework. Reviews and monitors the Group's ESG performance and considers significant issues relating to ESG including reviewing reports from management on the Group's climate and nature-related risks and risk management plans to deal with those risks. Makes recommendations to the Board on key environmental targets and selected environmental disclosures, including IFRS S2 and TNFD disclosures.	Provide recommendations to the Board, for its approval on key external environment targets and selected environment disclosures, including IFRS S2 and TNFD reporting, and on changes to risk appetite set by the Board. In FY24, climate and nature-related topics presented included: greenwashing, nature and biodiversity, carbon credits and external positioning of our climate activities, and emerging mandatory reporting standards for climate.
	CEO Leadership Team The CEO and their senior leadership team including the CFO make up the CEOLT and hold ultimate accountability over the effectiveness of risk management in the company.	Review quarterly updates on climate and nature-related risks from the Sustainability Executive and Environment Executives Group (EEG). Deliver management decisions and oversight in relation to Telstra Group's sustainability strategy to effectively manage climate and sustainability risk within risk appetite.
Strategy and Management	Sustainability Executive Provides day-to-day management of nature and climate-related activities, risks, opportunities, dependencies and impacts.	Chairs the monthly Environment Executives Group and reports key progress and recommended actions to the CEOLT and ARC.
	Environment Executives Group (EEG) Meeting monthly, the EEG is attended by functional leads from across the business to discuss environment, nature and climate-related matters.	Determine climate and nature ambition and key priorities. Oversee execution of management decisions on climate and nature-related matters within function areas, identify resourcing and capability requirements and provide function specific climate and nature-related recommendations to the CEOLT.
	Sustainability Centre of Expertise (CoE) Reporting to the Sustainability Executive, the Sustainability CoE is a team of subject matter experts (including climate and nature) who liaise with internal and external stakeholders.	Accountable for the design and delivery of the sustainability strategy. Provide cross function support, education and capacity building on climate and nature-related matters. Monitor and prepare disclosures and mandatory sustainability reporting. Input into consultations with external bodies and agencies.
	Other governance forums Governance forums to bring together delivery leads, risk owners, subject matter experts and other stakeholders to lead specific components of the sustainability strategy.	Provide leadership, recommendations and guidance for the management of individual climate and nature-related targets such as scope 1+2 emissions reduction, network waste recycling or forums that manage biodiversity risks including pollution, invasive species and other risks. Oversee execution risk specific management actions and policies.
	Working Groups Specialist project groups which bring together cross function representatives and subject matter experts to progress actions towards our nature and climate targets, manage nature and climate-related risks, and develop internal capability and expertise.	Deliver project specific aims and objective, report on progress and provide recommendations to the EEG, including resourcing and training requirements. In FY24, a Nature and Biodiversity working group was formed, tasked with identifying and assessing existing and emerging nature and biodiversity issues to form our first nature and biodiversity register of risks and opportunities.

...

In its Climate-related Disclosure, Meridian Energy Limited discloses how its governance is structured for climate-related matters:

4.3 Strategy

The TCFD defines 'strategy' as referring to "an organization's desired future state. An organization's strategy establishes a foundation against which it can monitor and measure its progress in reaching that desired state. Strategy formulation generally involves establishing the purpose and scope of the organisation's activities and the nature of its businesses, taking into account the risks and opportunities it faces and the environment in which it operates."²²

The objective of the strategy disclosures in IFRS S1 is to enable primary users to understand an entity's strategy for managing sustainability-related risks and opportunities. [IFRS S1.28]. These disclosures can be used to inform primary users' expectations about the future performance of an entity.

²² [Recommendations of the TCFD](#), Appendix 5: Glossary and Abbreviations, pages 63-64, TCFD, June 2017. Available on the TCFD's website.

In Note 16 of its 2024 financial statements, BHP Group Limited disclosed the focus of its climate-related strategy:

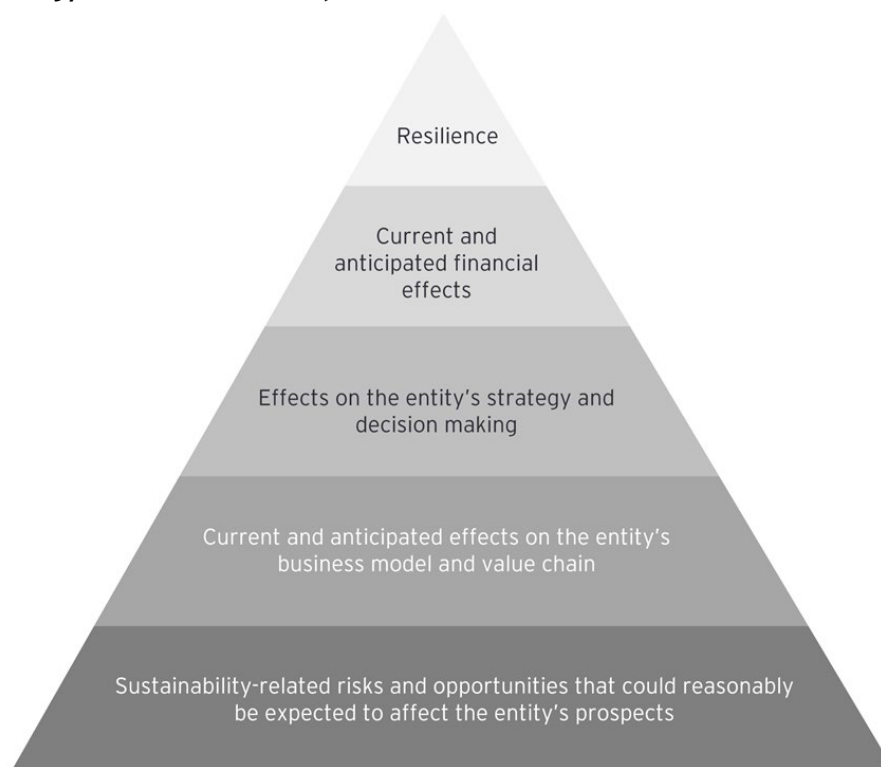

Practical example 4-4: BHP Group Limited (2024)	Australia
Annual Report 2024 [extract] Financial Statements [extract] 1 Consolidated Financial Statements [extract] 1.6 Notes to the Financial Statements [extract] 16 Climate change [extract] <p>The Group recognises that warming of the climate is unequivocal, the human influence is clear and physical impacts are unavoidable. Identifying, monitoring and assessing the actual and potential impacts of climate change is complex and the Group continues to develop its assessment of the actual and potential financial impacts of climate-related risks (threats and opportunities), including the transition to a net zero economy and physical risk impacts.</p> <p>The Group's current climate change strategy focuses on:</p> <ul style="list-style-type: none"> – building a portfolio to support the megatrends shaping our world, including future-facing commodities (copper, nickel and potash) and steelmaking materials (iron ore and steelmaking coal) – reducing operational (Scopes 1 and 2 from operated assets) greenhouse gas (GHG) emissions – investing in low to zero GHG emissions technologies – supporting Scope 3 GHG emissions reductions in the Group's value chain and promoting product stewardship – managing climate-related risks – working with others to enhance the global policy and market response <p>...</p>	

The foundation of the strategy disclosures is information about the sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects (see section 4.3.1 below). The other strategy disclosures build on that initial disclosure by providing information about: *[IFRS S1.29]*

- The current and anticipated effects of those sustainability-related risks and opportunities on the entity's business model and value chain (see section 4.3.2 below)
- The effects of those risks and opportunities on the entity's strategy and decision-making (see section 4.3.3 below)
- The current and anticipated effects of those risks and opportunities on the entity's financial position, financial performance and cash flows (see section 4.3.4 below)
- The resilience of the entity's strategy and its business model to those sustainability-related risks (see section 4.3.5 below)

These strategy disclosure sub-topics are summarised in Figure 4-4 below.

Figure 4-4: Strategy disclosure sub-topics

4.3.1 Disclosures about sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects

As discussed in section 1.2 above, an entity is required to identify the sustainability-related risks and opportunities that could reasonably be expected to affect its prospects. IFRS S1 requires an entity to disclose a description of each of those sustainability-related risks and opportunities. [IFRS S1.30].

To provide primary users with further context in relation to each of those sustainability-related risks and opportunities, IFRS S1 requires an entity to specify the time horizons over which the effects of each of those sustainability-related risks and opportunities could reasonably be expected to occur. IFRS S1 identifies the time horizons as being the short, medium or long term. [IFRS S1.30(b)].

The ISSB decided to not prescribe specific time frames that represent 'short term', 'medium term' and 'long term' because the ISSB considered that relevant information about an entity's sustainability-related risks and opportunities is best understood in the context of entity-specific assessments of short, medium and long term. For that reason, IFRS S1 requires an entity to also disclose an explanation of how the entity defines the 'short term', 'medium term' and 'long term' time horizons and how those definitions are linked to the planning horizons used by the entity for strategic decision-making. [IFRS S1.30(c), IFRS S1.BC102].

The ISSB's educational material on disclosing information about an entity's climate-related transition, emphasises that entities' definitions of short, medium and long term time horizons are likely to differ, depending, for example, on their sector or financial or business planning cycles.²³ In defining these time horizons, an entity needs to take into account a number of factors that can vary between entities and the industries in which they operate. Also, time horizons often become management processes, e.g., rolling forecast horizons, budget periods and strategic planning cycles. IFRS S1 includes the following examples as entity-specific or industry-specific factors: [IFRS S1.31, IFRS S1.BC102]

- Cash flow, investment and business cycles
- Planning horizons typically used in an entity's industry for strategic decision-making and capital allocation plans
- The time horizons over which primary users conduct their assessments of entities in that industry

The ISSB's educational material on disclosing information about an entity's climate-related transition, further notes that ISSB standards do not preclude the disclosure of multiple sets of definitions (e.g., when an entity has different business segments for which short, medium and long-term planning horizons vary). In certain cases, it may even be necessary to consider various timeframes in order to provide relevant information.²⁴

4.3.2 Disclosures about the effects of sustainability-related risks and opportunities on the entity's business model and value chain

IFRS S1 requires an entity to describe the current and anticipated effects of sustainability-related risks and opportunities on the entity's business model and value chain and where in that business model and value chain those sustainability-related risks and opportunities are concentrated. For example, the sustainability-related risks and opportunities may be concentrated across geographical areas, facilities or types of assets. [IFRS S1.32].

²³ [Educational material: Disclosing information about an entity's climate-related transition, including information about transition plans, in accordance with IFRS S2](#), ISSB, June 2025, available on the IFRS Foundation's website.

²⁴ [Educational material: Disclosing information about an entity's climate-related transition, including information about transition plans, in accordance with IFRS S2](#), ISSB, June 2025, available on the IFRS Foundation's website.

The examples below are based on the Basis for Conclusions to IFRS S1 and illustrate the type of information an entity may provide to disclose where in its business model and value chain sustainability-related risks and opportunities are concentrated: [IFRS S1.BC52]

Illustration 4-1: Examples showing where in the entity's business model and value chain sustainability-related risks and opportunities are concentrated

Entity A operates in the beverage industry and has identified that it needs to disclose risks associated with water use, especially in areas where water is scarce. Entity A may describe how its use of water affects the supply available to meet its operational needs. It may explain how its water consumption affects communities close to the entity's operations that rely on the same source of water. It may also explain how over-consumption of water in those locations could lead to risks of reputational damage and loss of customers, or to the imposition of taxes or limits on the use of the resource. It may also describe how these risks have been assessed throughout its supply chain.

Entity B is a clothing brand and has identified that it needs to describe the opportunity associated with changing to use less resource-intensive materials in its products and packaging. The potential effects may be driven by Entity B's commitments to sustainable business practices, or consumer preferences for more sustainable or recycled alternatives. Entity B may also disclose the areas of its value chain and operations that are potentially most affected by this opportunity, and the processes in place to assess and monitor the opportunity.

Entity C is an electronics manufacturer and has identified that it needs to describe the risks of human rights issues in its supply chain, including reputational damage and supply chain disruptions. In doing so, Entity C may describe the effects on its policies, actions it has taken to assess and monitor the risks, and how it manages any identified abuses.

4.3.3 Disclosures about the effects of sustainability-related risks and opportunities on the entity's strategy and decision-making

To enable primary users to understand the effects of sustainability-related risks and opportunities on an entity's strategy and decision-making, IFRS S1 requires an entity to disclose information about: [IFRS S1.33]

- How the entity has responded to, and plans to respond to, sustainability-related risks and opportunities in its strategy and decision-making
- The entity's progress in respect of plans it has disclosed in previous reporting periods, including quantitative and qualitative information
- Trade-offs between sustainability-related risks and opportunities that the entity considered

The example below illustrates disclosures about trade-off between sustainability-related risks and opportunities:

Illustration 4-2: Example on trade-offs between sustainability-related risks and opportunities

During the reporting period, Entity A decided where to locate its new manufacturing facility that would replace the existing facility that was approaching the end of its useful life. Entity A had considered two alternative sites for its new manufacturing facility:

- Site X is located in the same region as the existing facility. However, the site is prone to flash flooding during heavy rains due to the poor drainage systems at the site and its surrounding area.
- Site Y is located in a different region, which is not prone to flood risk. A consequence of relocating to Site Y is that Entity A is currently the main employer in the community that surrounds Site X. A decision by Entity A to relocate to Site Y is that it would have an adverse effect on its local workforce and indirectly on the economic prospects for the entire community.

Entity A performed impact assessments to investigate the extent of flood risk of Site X and the social risk of moving to Site Y and identified options for mitigating those risks. Entity A decided, on cost/benefit grounds, to build its new manufacturing facility at Site X and as part of the development works, install new drainage systems that can divert flood waters away from the site and the community. In reaching this decision, Entity A also considered the benefit of continued access to the locally trained and engaged workforce to operate the facility.

4.3.4 Disclosures about current and anticipated financial effects of sustainability-related risks and opportunities

IFRS S1 requires an entity to disclose quantitative and qualitative information about: [IFRS S1.34]

- The effects of the entity's sustainability-related risks and opportunities on its financial position, financial performance and cash flows for the reporting period, which is referred to as 'current financial effects'
- The anticipated effects of those sustainability-related risks and opportunities on its financial position, financial performance and cash flows over the short, medium and long term, taking into consideration how the entity includes those sustainability-related risks and opportunities in its financial planning. These are referred to as 'anticipated financial effects'

The timescales contemplated by the meaning of 'current financial effects' and 'anticipated financial effects' are illustrated in Figure 4-5 below.

Figure 4-5: Timeline for current and anticipated financial effects

Disclosures of current and anticipated financial effects are intended to supplement or expand upon information provided in the related financial statements. This includes identifying and explaining the connections between sustainability-related risks and opportunities and the information reported in the financial statements (see discussion on connected information in section 3.4.2.B above). Connections between items of information may be able to be explained without duplicating information by using cross-references. For example, a cross reference to information disclosed in the notes to the financial statements may satisfy the requirement in IFRS S1 to disclose how sustainability-related risks and opportunities have affected an entity's current and anticipated financial position, financial performance and cash flows. The use of cross-references is subject to the requirements in IFRS S1 (see further discussion in section 5.2.2 below).

In Note 16 of its 2024 financial statements, BHP Group Limited disclosed the areas of the financial statements that could be affected by its strategy and decision-making related to climate-related risks and opportunities.

Practical example 4-6: BHP Group Limited (2024)

Australia

Annual Report 2024 [extract]**Financial Statements [extract]****1 Consolidated Financial Statements [extract]****1.6 Notes to the Financial Statements [extract]****16 Climate change [extract]**

...

Areas of these Financial Statements that may be impacted in connection with this strategy throughout the value creation and delivery cycle of the Group's operations, include:

Phase	Areas of potential Financial Statement impact
Exploration and acquisition	– Financial impact of portfolio decisions
Development and mining / Process and logistics	– Impact of transition risks on asset carrying values – Physical climate-related risks and asset carrying values – Application of carbon pricing assumptions and acquisition of carbon credits – Useful economic lives of property, plant and equipment – Expenditure on operational (Scopes 1 and 2 from operated assets) decarbonisation
Sales, marketing and procurement	– Expenditure to support value chain (Scope 3) decarbonisation
Closure and rehabilitation	– Timing, scope and expected cost of closure and rehabilitation activities

At the date of issue of these Financial Statements, indicators show the appropriate measures are not in place globally to drive decarbonisation at the pace or scale required to achieve the aim of the Paris Agreement to limit the global average temperature increase to 1.5°C above pre-industrial levels. The significant judgements and key estimates used in the preparation of these Financial Statements reflect the Group's current planning range (which implies a projected global average temperature increase of approximately 2°C by CY2100), as described below.

While not the basis of preparation of these Financial Statements, the Group continues to perform sensitivity analysis under the Group's 1.5°C scenario to consider potential Financial Statement impacts of commodity and carbon prices in a rapidly decarbonising world. The Group's 1.5°C scenario is not a forecast of what is likely to occur.

Future changes to the Group's climate change strategy or global decarbonisation trends may impact the Group's significant judgements and key estimates, and result in material changes to financial results, cash flows and the carrying values of certain assets and liabilities in future reporting periods.

The Group has developed three unique planning cases which comprise the Group's planning range: a 'most likely' base case, used as the basis for judgements and assumptions in these Financial Statements, and an upside case and downside case that provide the range's boundaries. The three cases reflect proprietary forecasts for the global economy and associated sub-sectors (i.e. energy, transport, agriculture and steel) and the resulting market outlook for the Group's core commodities.

Given the complexity and inherent uncertainty of long run forecasting, these pathways are reviewed periodically to reflect new information, with a process in place to assess the need to update internal long-term price

...

4.3.4.A Disclosures about current financial effects

IFRS S1 requires an entity to disclose quantitative and qualitative information about how sustainability-related risks and opportunities have affected its financial position, financial performance and cash flows for the reporting period. [IFRS S1.35(a)].

An entity may also be required to disclose these current financial effects in the notes to its financial statements when applying IFRS accounting standards or other GAAP. As discussed in section 4.3.4 above, an entity should consider whether it can include a cross reference to this information to avoid unnecessary duplication of disclosures.

There may be cases where sustainability-related risks and opportunities have affected an entity's financial position, financial performance and cash flows for the reporting period. This is illustrated in the Illustration 4-3 below:

Illustration 4-3: Sustainability-related risks and opportunities with effects in the current reporting period

Entity A is an energy provider operating in country Z where the government imposed a regulation that includes certain targets to entities for reducing carbon dioxide emissions. The regulation was enacted a few years ago and is applicable in the next reporting period. Entity A identified climate-related risks due to that regulation.

Entity A applies IFRS accounting standards. This regulation is considered by Entity A to be a triggering event for an impairment assessment, which has led to partial impairment of certain power production facilities and the reduction of their useful life.

Entity A would need to disclose in its sustainability-related financial disclosures how these climate-related risks have affected its financial position, financial performance and cash flows for the reporting period. To avoid duplicating this information, Entity A may cross-reference to the notes to its financial statements such as the notes discussing about property, plant and equipment, impairment, and provisions.

There may be cases where sustainability-related risks and opportunities have not affected an entity's financial position, financial performance and cash flows for the reporting period. However, explaining that fact may still be material information for primary users. This is reflected in the Illustration 4-4 below:

Illustration 4-4: Sustainability-related risks and opportunities with no effects in the current reporting period

Entity B operates in the leasing industry of diesel-powered cars which have negligible value. Cars are leased for a minimum of five years. Entity B identified climate-related risks and opportunities relating to the significant contribution of Scope 1 GHG emissions by diesel-powered cars. Therefore, Entity B included in its business plan a target to gradually replace those cars with electric-powered ones. The replacement of cars will be conducted gradually based on when current lease term of each car ends. There is no capital commitment during the lease term in the current reporting period. Entity B assessed the effects of those risks and opportunities on its financial position, financial performance and cash flows for the current period and concluded that there are no implications.

Entity B would need to disclose in its sustainability-related financial disclosures how these climate-related risks and opportunities have affected its financial position, financial performance and cash flows for the reporting period. Although Entity B assessed that there are no implications in the current reporting period, it may conclude that disclosing the fact that there are no current financial implications could still be a material information for primary users.

Even though there is no effect in the current reporting period from these sustainability-related risks and opportunities, anticipated financial effects arising may exist (see Illustration 4-5 below).

In Note 16 of its 2024 financial statements, BHP Group Limited specifically disclosed the potential effect of climate-related risks and opportunities on the carrying values of assets recognised in its financial statements.

Practical example 4-7: BHP Group Limited (2024)

Australia

Annual Report 2024 [extract]

Financial Statements [extract]

1 Consolidated Financial Statements [extract]

1.6 Notes to the Financial Statements [extract]

16 Climate change [extract]

Impact of transition risks on asset carrying values

Significant judgements and key estimates in relation to the preparation of these Financial Statements, including asset carrying values and impairment assessments, are impacted by the Group's current assessment of the range of economic and climate-related conditions that could exist in the world's transition to a net zero economy, considering the current trajectory of society and the global economy as a whole.

For example, demand for the Group's commodities may decrease due to policy, regulatory (including carbon pricing mechanisms), legal, technological, market or societal responses to climate change, resulting in a proportion of a cash generating unit's (CGU) reserves becoming incapable of extraction in an economically viable fashion. Alternatively, technological or market developments increasing demand for commodities in the portfolio that help enable decarbonisation may have a positive impact on prices for those commodities.

The Group has developed three unique planning cases which comprise the Group's planning range: a 'most likely' base case, used as the basis for judgements and assumptions in these Financial Statements, and an upside case and downside case that provide the range's boundaries. The three cases reflect proprietary forecasts for the global economy and associated sub-sectors (i.e. energy, transport, agriculture and steel) and the resulting market outlook for the Group's core commodities.

Given the complexity and inherent uncertainty of long run forecasting, these pathways are reviewed periodically to reflect new information, with a process in place to assess the need to update internal long-term price outlooks for developments in the periods between pathway updates.

The Group reflects the planning range and associated price outlooks in the internal valuations used as the basis for the Group's impairment assessments.

The discount rate used in the internal valuations reflects a real post-tax weighted average cost of capital (WACC), including country and state risk premia where appropriate, and ranges from 7.0 per cent to 9.5 per cent across the Group (2023: 7.0 per cent to 9.5 per cent). Cash flow forecasts used as the basis for impairment testing include asset specific risks, including climate-related risks such as operational interruptions as a result of physical climate-related risks, and therefore the Group does not include a separate climate-related risk adjustment in the Group's WACC.

Further detail on the Group's significant judgements and estimates that inform the planning range and FY2024 impairment assessments, is included in note 13 'Impairment of non-current assets'.

In addition to the planning range, and as described below in 'Paris Agreement and 1.5°C scenarios', the Group uses its 1.5°C scenario, which implies a global average temperature increase of 1.5°C by CY2100, to test resilience of the Group's portfolio in a rapidly decarbonising world.

Physical climate-related risks and asset carrying values

The Group's operations are exposed to physical climate-related risks. In FY2024, the Group continued to progress studies of physical climate-related risks to better understand the potential impacts on safety, productivity and cost, with the work to continue in FY2025.

The studies consider potential impacts of acute and chronic risks from material climate hazards, which differ based on an operated asset's geographic region, asset infrastructure and operational processes. The studies are ongoing and therefore the Group's consideration of physical climate-related risks, including factors such as potential operational interruptions caused by extreme weather events, therefore includes only the Group's current best estimates of related potential financial impacts.

Given the complexity of physical climate-related risk modelling and the status of the Group's ongoing physical risk assessment process, the identification of additional risks and/or the detailed development of the Group's response may result in material changes to financial results and the carrying values of assets and liabilities in future reporting periods.

Useful economic lives of property, plant and equipment

The determination of useful lives of the Group's PP&E requires judgement, including consideration of the Group's climate change strategy, targets and goals, decarbonisation plans and the possible impact of transition risks on demand for the Group's commodities.

Useful lives are reviewed each reporting period, including to ensure they do not exceed the remaining expected operating life of the operation in which they are utilised. The remaining lives of the Group's operations reflect the Group's planning range and its underlying climate-related assumptions.

A key component of the Group's operational decarbonisation strategy is the displacement of diesel within the Group's operations, particularly the haul truck fleet. The Group is supporting the development of new equipment by original equipment manufacturers, including entering into partnerships focused on the development and trialling of electric locomotives and haul trucks.

While technical and commercial development of the technology needed is progressing, the Group's operational plans generally assume replacement of haul trucks, and other diesel powered equipment, at the end of their useful lives in line with the Group's regular fleet renewal programs. For example, a significant proportion of the Group's existing WAIO mining fleet is due for replacement prior to the expected availability of battery electric vehicle solutions. As such, the Group's decarbonisation plans have not had a material impact on the estimated remaining useful lives of the Group's existing fleet of assets in FY2024.

Woolworths Group Limited in Note 3.6 (Property, plant and equipment) and Note 3.9 (Impairment of non-financial assets) of its Annual Report, disclosed that there is no effect in the current reporting period from sustainability-related matters but indicates that there may be an effect in future reporting periods.

Practical example 4-8: Woolworths Group Limited (2024)

Australia

Annual Report 2024 [extract]

SECTION 4 Financial Report [extract]

Consolidated Financial Statements [extract]

Notes to the Consolidated Financial Statements [extract]

3 Assets and liabilities [extract]

3.6 Property, plant and equipment [extract]

Financial reporting impacts of sustainability-related matters

The Group has identified climate-related physical risks to its assets and is currently working through actions to address these risks, including improving the resilience of its assets through the implementation of generators for areas exposed to a high risk of power outages, flood barriers, rainwater harvesting, and roof strengthening.

Useful lives

During the period, there were no changes to the useful lives of property, plant and equipment as a result of climate-related risks. If in future reporting periods there are changes to the proposed useful lives and/or residual values due to climate-related risks, these changes will be accounted for on a prospective basis.

3.9 Impairment of non-financial assets [extract]

Financial reporting impacts of sustainability-related matters

Notwithstanding that the Group continues to assess the potential impacts of climate change on its impairment testing, the Group has identified climate-related physical risks to its assets and is currently working through actions to address these risks. These actions include the replacement of its existing assets with more environmentally-friendly alternatives, such as refrigeration, solar and LED lighting, and converting the Group's home delivery fleet to electric vehicles, as well as increasing the resilience of the Group's store and supply chain assets through the implementation of generators for areas exposed to a high risk of power outages. Furthermore, the Group incorporates the potential increase of future flood risk into its existing site selection and design procedures.

Given that the average remaining useful life of the Group's significant non-financial tangible assets is approximately eight years, the potential impacts of climate change are not considered to present a risk of impairment of the carrying value of non-financial assets in the near term.

4.3.4.B Disclosures about anticipated financial effects: Next annual reporting period

Anticipated financial effects refer to those financial effects anticipated in the next annual reporting period and to those financial effects anticipated over the short, medium and long term.

IFRS S1 requires disclosure of information that connects the current financial effects with the anticipated financial effects in the next annual reporting period. In accordance with this disclosure requirement in IFRS S1, an entity is required to disclose quantitative and qualitative information about those sustainability-related risks and opportunities that have both of the following characteristics: [IFRS S1.35(b)]

- The sustainability-related risks or opportunities were identified as having current financial effects (see also section 4.3.4.A above).
- Within the next annual reporting period, there is a significant risk of a material adjustment to the carrying amounts of assets and liabilities reported in the related financial statements.

Similar to the disclosure of current financial effects, the information required by this disclosure may also be disclosed in the notes to the entity's financial statements due to requirements in IAS 1 for the disclosure of sources of estimation uncertainty. Therefore, an entity may need to consider whether to include a cross reference to this information to avoid unnecessary duplication of disclosures.

How we see it

In our view, when an entity prepares sustainability-related financial disclosures about current financial effects and about anticipated effects for the next annual reporting period, it needs to base its materiality assessment for these disclosures on assumptions and data used for the information included in the financial statements and vice versa. This is consistent with the requirements of IFRS S1 to use 'consistent data and assumptions' in both the preparation of financial statements and in disclosing sustainability-related financial information (discussed in section 3.4.2.B).

4.3.4.C Disclosures about anticipated financial effects: Short, medium and long term

IFRS S1 requires an entity to disclose quantitative and qualitative information about how the entity expects its financial position to change over the short, medium and long term, given its strategy to manage sustainability-related risks and opportunities, taking into consideration the entity's:

[IFRS S1.35(c)]

- Investment and disposal plans, including plans for which the entity is not contractually committed
- Planned sources of funding to implement its strategy

An entity's investment and disposal plans may include plans for capital expenditure, major acquisitions and divestments, joint ventures, business transformation, innovation, new business areas, and asset retirements.

Similarly, IFRS S1 also requires an entity to disclose quantitative and qualitative information about how the entity expects its financial performance and cash flows to change over the short, medium and long term, given its strategy to manage sustainability-related risks and opportunities. [IFRS S1.35(d)].

Illustration 4-5: Sustainability-related risks and opportunities with anticipated financial effects

Consider the same facts as in Illustration 4-4 above.

Although the climate-related risks identified in Illustration 4-4 do not affect Entity B's financial position, financial performance, and cash flows in the current reporting period, there are anticipated financial effects. Entity B needs to disclose those anticipated effects. For example, shifting the fleet to electric-powered cars will require Entity B to make an additional capital investment of approximately CU1million for the replacement of the petrol-powered cars with electric-powered ones and the installation of charging points where needed. It is expected that 30% of the total fleet will be replaced each year with the aim of replacing the total feel within the next three years. The shift to electric-powered cars aims to reduce Entity B's Scope 1 GHG emissions produced by petrol-powered cars by approximately 20,000 tons each year.

4.3.4.D Measurement of current and anticipated financial effects

IFRS S1 does not provide guidance on how to measure current and anticipated financial effects other than to indicate that quantitative information may be disclosed as a single amount or a range. The ISSB acknowledged that, in some cases, ranges of possible outcomes could be more useful than single estimates. [IFRS S1.36, IFRS S1.BC89].

How we see it

Given the variety of factors that may need to be considered in quantifying the anticipated financial effects of a sustainability-related risk or opportunity, an entity may need to use judgement to determine how to measure those effects. Such judgement relates to selecting the method that an entity expects that it will best reflect the anticipated effect on its financial position, financial performance and cash flows. In exercising judgement to select a relevant measurement method, an entity may consider whether the measurement methods used in IFRS accounting standards or other GAAP (such as expected value or the most likely amount) could be relevant to apply by analogy to quantify the anticipated financial effects.

4.3.4.E Preparing disclosures about anticipated financial effects

Stakeholders raised concerns about the difficulties that some entities may face in disclosing information about anticipated financial effects. To address these concerns, specifically for the preparation of disclosures about the anticipated financial effects of a sustainability-related risk or opportunity, IFRS S1 allows an entity to: [IFRS S1.37, IFRS S1.BC106, IFRS S1.BC107]

- Use all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort (for further information see discussion in section 1.2.2 above). The ISSB further clarified this requirement in the context of anticipated effects as summarised in Figure 4-6 below.
- Use an approach that is commensurate with the skills, capabilities and resources that are available to the entity for preparing those disclosures.

Figure 4-6: The concept of reasonable and supportable information in the context of disclosures for anticipated effects

Phrase	Meaning
"use all reasonable and supportable information"	An entity is prohibited from overstating or understating the anticipated financial effects of opportunities or risks premised on information that is unsupported or unreasonable. An entity needs to have an appropriate basis for using the information and cannot disregard information that is known or publicly available.
"use... information that is available to the entity at the reporting date"	An entity is permitted to use only the information that is available to the entity at the reporting date (including information about past events, current conditions and forecasts of future conditions).
"use... information that is available to the entity... without undue cost or effort"	An entity is not required to carry out an exhaustive search for information to determine or measure the anticipated financial effects of risks and opportunities. Instead, an entity is permitted to carry out an information search that is proportional to the cost and effort involved in obtaining that information.

As emphasised in the ISSB's educational material on disclosing information about anticipated financial effects, by using the concept of "all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort" as a proportionality mechanism, the ISSB seeks to set a reasonable basis for the effort required to gather information to prepare disclosures in applying ISSB standards and to explain the intended parameters.²⁵ An entity needs to consider the benefits for primary users and the incremental effort, or costs required, to provide material information. The greater the usefulness of information about a sustainability-related risk or opportunity is to primary users, the greater the effort expected of an entity in obtaining that information. As explained in section 1.2.2 above, the proportionality mechanism does not exempt an entity from disclosing information. Rather, entities are required to use the information that is available to them to meet disclosure requirements, but only the information that is available without undue cost or effort. Such information can change over time.

Moreover, the ISSB's educational material clarifies that the requirement of using an approach that is commensurate with an entity's skills, capabilities and resources has been included to ensure that what is required is proportionate to the entity's circumstances. An entity's available skills, capabilities and resources can be internal and external and provide the context to inform the entity's consideration of the potential costs and level of effort required by a particular approach. An entity's circumstances are likely to change over time. Therefore, it is expected that an entity will reassess its circumstances and will be able to develop its skills and capabilities to improve disclosures over time. The Basis for Conclusions to IFRS S2 provides an example of the development of skills, capabilities and resources in the context of climate-related scenario analysis (please refer to Chapter 54 for further discussion on this example).

The ISSB clarified that an entity cannot avoid providing quantitative information for anticipated financial effects because it does not have the skills or capabilities to do so, if it has the resources available to obtain or develop those skills or capabilities. It is not always necessary for an entity to be well resourced or to be capable of undertaking sophisticated analysis to provide quantitative information. For example, it could be information such as amount of planned investment in new energy-efficient equipment included in an entity's near-term budget. However, the ISSB acknowledges that providing quantitative information can be challenging in some circumstances. In the absence of such resources, the proportionality mechanisms seek to accommodate the development of skills or capabilities over time.

4.3.4.F Criteria and disclosures when quantitative information about current and anticipated financial effects is not required

The ISSB has established criteria for when an entity is not required to disclose quantitative information about the financial effects of a sustainability-related risk or opportunity. In particular: [IFRS S1.38, IFRS S1.39, IFRS S1.BC109]

- For either current or anticipated financial effects of a sustainability-related risk or opportunity, IFRS S1 states that an entity is not required to provide quantitative information if:
 - Those current or anticipated financial effects are not separately identifiable. That is, the financial effects may arise from many risks or opportunities and affect many items in the financial statements. As such, it may be difficult to attribute financial effects to an individual sustainability-related risk or opportunity.
 - Or
 - The level of measurement uncertainty involved in estimating those effects is so high that the resulting quantitative information would not be useful. See section 6.2 below for a further discussion on measurement uncertainty.
- Specifically for anticipated financial effects of a sustainability-related risk or opportunity, IFRS S1 does not require an entity to provide quantitative information on those anticipated financial effects if the entity lacks the skills, capabilities or resources to do so.

²⁵ [Educational material: Disclosing information about anticipated financial effects applying ISSB Standards](#), ISSB, August 2025, available on the IFRS Foundation's website.

The reliefs from providing quantitative information if the effects are not separately identifiable or if the level of measurement uncertainty involved in estimating those effects is so high are available both for current and anticipated financial effects. These reliefs relate to the characteristics or nature of the financial effects. There could be cases where it is not possible for an entity to separately identify the financial effects of a sustainability-related risk or opportunity, as these may arise from more than one source and affect several line items in the related financial statements. For example, an entity may consider the effects from a trend of decreasing demand for products inseparable, as it is partially driven by adverse economic and market conditions and partially driven by changing consumer demands related to climate considerations. Therefore, the entity provides quantitative information about the combined effects of decreasing demand as it cannot isolate the decrease in demand due to the effects of climate-related risk from the effects of other causes. These reliefs apply to all entities, irrespective of their resources and experience, and are not only relevant in the initial years of application of ISSB standards. That is, an effect may not be separately identifiable even when an entity is a well-resourced entity that has applied the ISSB standards for many years.

The additional relief from providing quantitative information about anticipated financial effects if an entity does not have the necessary skills, capabilities or resources is designed to be used by all entities, whether large or small, when needed. However, it is expected to be more relevant for more well-resourced entities in their initial years of applying ISSB standards (for further discussion about refer to section 4.3.4.E above).

For current or anticipated financial effects of a particular sustainability-related risk or opportunity, the ISSB clarified that, even if an entity is not in a position to disclose quantitative information, it is still required to provide other quantitative and qualitative information that would be useful to primary users. For that reason, if an entity concludes that it is unable to provide quantitative information, IFRS S1 requires to:

[IFRS S1.40]

- Explain why the entity has not provided quantitative information.
- Provide qualitative information about those financial effects—this is to include identifying line items, totals and subtotals within the related financial statements that are likely to be affected, or have been affected, by that sustainability-related risk or opportunity.
- Provide quantitative information about the combined financial effects of that sustainability-related risk or opportunity with other sustainability-related risks or opportunities and other factors. However, disclosing quantitative information about the combined financial effects is not required if the entity determines that this information would not be useful.

Illustrations 4-6 and 4-7 below are based on examples provided in the ISSB's educational material on disclosing information about anticipated financial effects:²⁶

Illustration 4-6: Anticipated financial effects of the opportunity of e-waste disposal

Entity E provides information technology infrastructure solutions, including hardware, software and recycling services for electronic devices (e-waste disposal). Entity E has only recently begun to explore applying climate-related scenario analysis to assess the potential effects of climate change on its business and it has identified that extreme weather events can damage electronic devices, increasing the amount of e-waste. To take advantage of the opportunity to recycle more e-waste, Entity E may need to adapt its infrastructure and processes to increase its recycling capacity.

Entity E's time horizons have been defined in line with its strategic planning cycle as:

- Short term: 1 year
- Medium term: 2-4 years
- Long term: more than 4 years

Entity E is undertaking studies of climate-related physical risks to progressively identify, assess and quantify the amount of e-waste that will be produced in the future. The studies will support ongoing evaluation and maturation of its processes. Entity E has not modelled financial effects before and does not currently have the necessary skills, capabilities and resources to model and quantify the anticipated effects on its operating results of its plans under development to respond to the increased need for e-waste recycling. Entity E expects it will be able to develop its skills and capabilities over time and hire additional resources.

Entity E discloses that it has not provided quantitative information about this opportunity because it does not currently have the skills and capabilities to do so. As Entity E determined that it does not need to provide quantitative information, it instead provides qualitative information about the possible effects of this opportunity including the line items in the financial statements that are likely to be affected.

²⁶ [Educational material: Disclosing information about anticipated financial effects applying ISSB Standards](#), ISSB, August 2025, available on the IFRS Foundation's website.

Illustration 4-7: Anticipated financial effects of the opportunity related to growing market demand for homes made of timber

Entity D is operating in the construction industry and builds high-end residential housing, specifically, custom homes offering different floorplans, styles and construction materials depending on the customers' preferences. Entity D has observed a growing demand from its customers to use more environmentally-friendly construction materials (e.g., timber) as this can help to reduce GHG emissions. Entity D has identified the growing market demand for homes made with timber as a climate-related opportunity.

Entity D's time horizons have been defined in line with its strategic planning cycle as:

- Short term: 1 year
- Medium term: 2-6 years
- Long term: 7-25 years

Entity D determined that it can increase its revenue in the short, medium and long term by responding to growing demand for houses made of timber. However, Entity D has identified uncertainties associated with this opportunity, such as mortgage rates and increasing competition for market share, which could affect the price that its customers are willing to pay for custom homes. Climate change poses significant risks to the timber supply and the forestry industry, such as increased temperatures that affect growing patterns and extreme weather events (e.g., heatwaves, wildfires and flooding). Other factors such as the spread of pests and diseases can also negatively affect tree growth and therefore, increase the cost for homebuilders.

Entity D determined that it is not possible to identify the effect of the rising demand for houses made of timber on its revenue separately from other effects such as the effects of broader economic factors (e.g., the overall level of consumer demand and timber supply). Therefore, Entity D determines that it does not need to provide quantitative information about this climate-related opportunity.

In its disclosures, Entity D explains why it has not provided quantitative information. Also, Entity D provides qualitative information about the climate-related opportunity to increase sales of homes made with timber including identifying the line items, totals and subtotals within the related financial statements that are likely to be affected by the opportunity of growing market demand for timber houses. It determines that the line items affected include:

- Financial performance: revenue, and operating expenditure (cost of timber)
- Financial position: property, plant and equipment
- Cash flows: net operating activities for the year (cash inflow), purchase of raw materials (cash outflow)

4.3.5 Disclosures about the resilience of the entity's strategy and business model to sustainability-related risks

IFRS S1 requires a resilience assessment of an entity's strategy and business model. The purpose of the resilience assessment is to inform primary users about the entity's ability to cope with and withstand the effects of sustainability-related risks and related uncertainties in different scenarios.

In particular, IFRS S1 requires an entity to disclose an assessment of the resilience of the entity's strategy and business model in relation to its sustainability-related risks, including information about how the assessment was carried out and its time horizon. The assessment is to be a qualitative and, if applicable, quantitative assessment. When providing quantitative information, IFRS S1 permits an entity to disclose a single amount or a range. [IFRS S1.41].

IFRS S1 acknowledges that other ISSB standards may specify the type of information an entity is required to disclose about its resilience to specific sustainability-related risks and how to prepare those disclosures, including whether a scenario analysis is required. [IFRS S1.42]. For example, IFRS S2 includes specific requirements for resilience assessments for an entity's climate-related risks (see Chapter 54).

The requirements to disclose information about the resilience of an entity's strategy and business models and to disclose information about the current and anticipated financial effects of an entity's sustainability-related risks and opportunities are designed to meet different information needs. The requirements for a resilience assessment relate to an entity's capacity to adjust to the uncertainties arising from sustainability-related risks, whereas the requirements on the current and anticipated financial effects of sustainability-related risks and opportunities relate to the effects of risks and opportunities on an entity's financial performance, financial position and cash flows. Therefore, these requirements can be applied independently. However, while an entity is not required to carry out a resilience assessment to determine the anticipated financial effects of sustainability-related risks and opportunities, the ISSB also acknowledged that an entity may find the resilience assessment useful and relevant in determining the anticipated financial effects of sustainability-related risks and opportunities. [IFRS S1.BC113].

4.4 Risk management

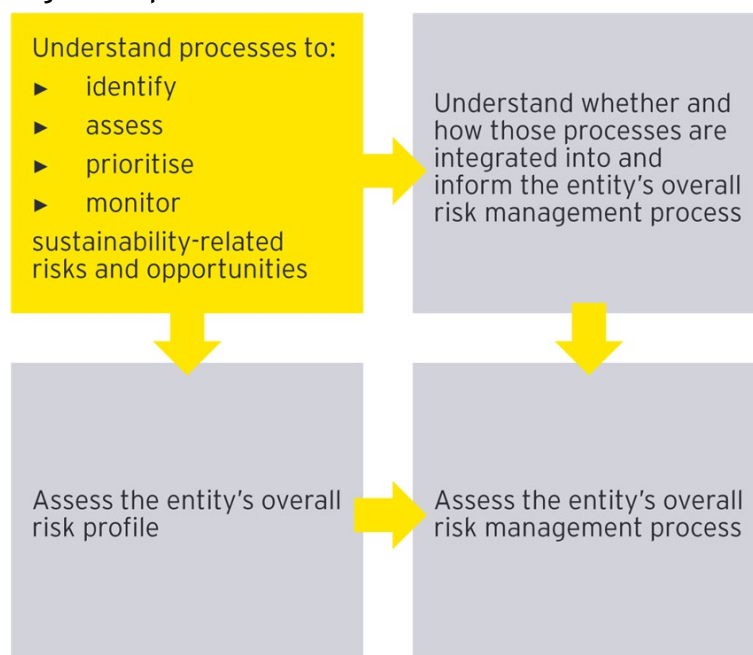

The TCFD defines ‘risk management’ as referring to “a set of processes that are carried out by an organization’s board and management to support the achievement of the organization’s objectives by addressing its risks and managing the combined potential impact of those risks”.²⁷

The objective of risk management disclosures in IFRS S1 is to enable primary users to to: [IFRS S1.43]

- Understand an entity’s processes to identify, assess, prioritise and monitor sustainability-related risks and opportunities (see discussion in section 4.4.1 and 4.4.2 below)
- Understand whether and how those processes are integrated into and inform the entity’s overall risk management process (see discussion in section 4.4.3 below)
- Assess the entity’s overall risk profile and its overall risk management process

This objective is summarised in Figure 4-7 below:

Figure 4-7: Risk management processes

The TCFD noted that in assessing an entity’s financial and operating results, many investors want insight into the governance and risk management context in which such results are achieved.²⁸ This focus helps to draw a distinction between the purpose of the risk management disclosures and the strategy disclosures. The ISSB explained that disclosures about risk management processes relate to the risk management framework that the entity has put in place. In contrast, disclosures about strategy are focused on providing information about an entity’s strategy for managing sustainability-related risks and opportunities. [IFRS S1.BC116].

Environmental, Social and Governance Report 2023 [extract]

NEUTRALISING OUR FOOTPRINT [extract]

Climate Change Management [extract]

Identifying, Assessing, and Managing Climate-related Risks

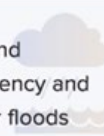

To evaluate the potential impacts of climate change on our assets, businesses and value chain, we conduct comprehensive climate risk assessments using various climate models and scenarios analyses. This helps us account for a wide range of potential impacts and uncertainties and prepare for future climate-related risks. To ensure comprehensive strategic planning and informed decision-making for the future, we regularly review and update our assessments, strategies and scenario analysis to address emerging climate-related risks and opportunities in different time horizons. We also maintain open communication with stakeholders and explore strategies for strengthening our resilience against transition and physical climate-related risks. For more details, please refer to *the Guide* and sections below.

Physical Risks

Physical risks associated with climate change impacts can be broadly classified as acute (e.g., floods, droughts) and chronic (e.g., sea-level rise, temperature increases). In order to evaluate the impacts of physical risks present in our assets, three Representative Concentration Pathways (RCP) scenarios (RCP 2.6, RCP 4.5, RCP 8.5) were used. These scenarios ranged from limiting the global average temperature of 1.5°C to align with The Paris Agreement (RCP 2.6) to managing the challenges of a drastic increase in average temperature of 4°C (RCP 8.5).

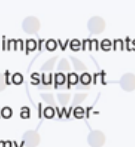

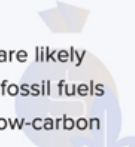

In 2021 we conducted a deep asset physical risk assessment for our Tai Po Gas Production Plant and an asset level assessment of 100 major assets on the Chinese mainland. To extend the assessment coverage across the Chinese mainland, we included new projects and conducted asset level assessments of over 300 assets in 2023. Focusing on chronic risks, we used a climate model to identify climate-sensitive/vulnerable assets, i.e. assets most exposed to extreme impacts such as extreme temperature, rainfall and water stress.

Visits to over 10 selected assets were conducted in 2023 to understand their vulnerability and capacity to adapt to key hazards. We ensure that effective systems are in place to withstand different climate stressors. We also held ESG and climate change training for managerial employees on site to show them the climate impact projections for the assets, as well as to equip them with the knowledge required to tackle climate hazards in the future.

Risk	Time Horizon ¹	Potential Financial Implications	Mitigation Plan/Response
Acute  Heavy rainfall and increased frequency and intensity of river floods	Medium to Long Term	 Costs and  revenue from asset damage  Resilience upgrade expenses  Insurance costs and claims	<ul style="list-style-type: none"> Review plan for adapting our infrastructure to climate change Strengthen crisis management plans
Chronic  Increased temperatures	Long Term	 Revenue from gas-related services  Operating costs due to energy use	<ul style="list-style-type: none"> Diversify businesses to transform into a multi-energy provider

Transition Risks and Opportunities

In 2020, we analysed various assumptions under four self-developed scenarios based on the International Energy Agency's (IEA) *World Energy Outlook 2019*, which consider technological advancements and policy implementations. This enabled us to identify potential transition risks that could impact the Group under different time horizons. To ensure our analysis aligns with the latest trends, we updated these scenarios using the Network for Greening the Financial System (NGFS) scenarios and developed the Net Zero 2050 Scenario to align with the goal of limiting a global temperature rise to 1.5°C. We then prioritised top transition risks under the Net Zero 2050 Scenario and Below 2°C Scenario specifically for gas-related businesses.

Risk	Time Horizon ¹	Potential Financial Implications	Mitigation Plan/Response Measure
Policy and Legal  Mandates on/regulation of products and services	Short to Medium Term	↓ Revenue from gas-related services ↑ Compliance and insurance costs ↑ Income from low-carbon offerings	<ul style="list-style-type: none"> Align with government policies for low-carbon development Reduce GHG emissions via low-carbon energy and efficiency improvements
Technology  Technological improvements or innovations to support the transition to a lower-carbon economy	Medium to Long Term	↑ Investment in new technologies ↑ R&D spending ↓ Operational costs due to energy efficiency	<ul style="list-style-type: none"> Reduce operational GHG emissions Support R&D with proprietary technologies
Market  Shifting consumer behaviour	Medium to Long Term	↓ Revenue from gas-related services ↑ Operating costs due to raw material price changes ↑ Income from low-carbon products	<ul style="list-style-type: none"> Diversify businesses to transform into a multi-energy provider
Reputation  Shareholders are likely to divest from fossil fuels and invest in low-carbon businesses	Long Term	↓ Change in capital availability ↑ Communication costs	<ul style="list-style-type: none"> Enhance open disclosure for increased capital availability

¹Short term runs to 2025, aligned with our near-term targets that cover carbon reduction, energy efficiency, etc.; medium term runs to 2035, aligned with the Group's plan to replace fossil fuels in phases by introducing and using zero-carbon fuels in our HK operations; long term runs to 2050, aligned with the Hong Kong's Climate Action Plan 2050 to achieve carbon neutral before 2050

4.4.1 Risk management processes for identifying sustainability-related risks

IFRS S1 requires an entity to disclose information about the processes and related policies that it uses to identify, assess, prioritise and monitor sustainability-related risks. The information to be disclosed includes information about: *[IFRS S1.44(a)]*

- The inputs and parameters used by the entity in the processes and policies that identify, assess, prioritise and monitor sustainability-related risks (e.g., information about data sources and the scope of operations covered in those processes)
- Whether and how scenario analysis is used to inform the entity's identification of sustainability-related risks
- How the nature, likelihood and magnitude of the effects of those risks is assessed by the entity (e.g., whether qualitative factors, quantitative thresholds or other criteria are considered)
- Whether and how sustainability-related risks are prioritised by the entity relative to other types of risk
- How sustainability-related risks are monitored by the entity
- Whether and how the entity has changed the processes it uses compared with the previous reporting period

4.4.2 Risk management processes for identifying sustainability-related opportunities

IFRS S1 also requires an entity to disclose information about the processes that it uses to identify, assess, prioritise and monitor sustainability-related opportunities. *[IFRS S1.44(b)]*.

Unlike the disclosures for risk management processes for sustainability-related risks, IFRS S1 does not detail specific information that needs to be disclosed about the entity's risk management processes that apply to its opportunities. The ISSB explained that the disclosure requirements for sustainability-related risks are more detailed than those for opportunities, because of the relative maturity of risk management processes and to meet the primary users' needs for information about an entity's processes for identifying, assessing, prioritising and monitoring risks. *[IFRS S1.BC119]*.

How we see it

Disclosures relating to risk management may also enable primary users to understand an entity's processes for managing its sustainability-related opportunities. Therefore, some of those disclosures could also inform the disclosures relating to sustainability-related opportunities.

4.4.3 Integrating disclosures about risk management processes

IFRS S1 requires an entity to also disclose the extent to which, and how, an entity's processes for identifying, assessing, prioritising and monitoring sustainability-related risks and opportunities are integrated into and inform the entity's overall risk management process. *[IFRS S1.44(c)]*. This information assists primary users in evaluating the entity's overall risk profile and risk management activities.

When an entity uses the same risk management process to identify, assess, prioritise or monitor different sustainability-related risks and opportunities, the entity needs to integrate those disclosures instead of providing separate risk management disclosures for each sustainability-related risk and opportunity. To illustrate this, the ISSB provided the following example: An entity discloses that its climate-related risks and opportunities are integrated into its overall process for managing risks and opportunities. However, other (non-climate) sustainability-related risks and opportunities are identified, assessed, prioritised and monitored separately due to being subject to specific risk management processes that are not part of its overall risk management process. *[IFRS S1.BC118]*.

4.5 Metrics and targets

4.5.1 Metrics

The objective of disclosures on metrics and targets is to enable primary users to understand an entity's performance in relation to its sustainability-related risks and opportunities. [IFRS S1.45].

For each sustainability-related risk and opportunity that could reasonably be expected to affect the entity's prospects, IFRS S1 requires an entity to disclose: [IFRS S1.46]

- The metrics required by an applicable ISSB standard
- The metrics the entity uses to measure and monitor:
 - That sustainability-related risk and opportunity (even if those metrics are not required by ISSB standards)
 - And
 - The entity's performance in relation to that risk and opportunity, including the entity's progress towards any targets it has set and any targets it is required to meet by law or regulation

When disclosing the metrics as specified above, IFRS S1 requires an entity to include industry-based metrics in relation to its sustainability-related risks and opportunities. That is, an entity needs to include metrics that are associated with particular business models, activities or other common features that characterise participation in an industry. [IFRS S1.48, IFRS S1.BC125].

4.5.1.A Metrics required by ISSB standards

For metrics that apply to climate-related risks and opportunities, IFRS S1 requires an entity to apply the requirements of IFRS S2. IFRS S2 requires an entity to refer to and consider the applicability of the industry-based disclosure topics defined in the *Industry-based Guidance on Implementing IFRS S2*, when identifying the climate-related risks and opportunities that could reasonably be expected to affect an entity's prospects. These are typically associated with particular business models, activities or other common features that characterise participation in an industry. Moreover, the industry-based guidance also suggests possible ways to measure and disclose information about climate-related risks and opportunities (see Chapter 54). Even if an entity concludes not to use the *Industry-based Guidance on Implementing IFRS S2*, industry specific disclosures are still required by ISSB standards.

For metrics that apply to sustainability-related risks and opportunities other than climate, the ISSB is yet to issue other topic-based ISSB standards that may otherwise specifically apply to that sustainability-related risk or opportunity. Accordingly, in the absence of an ISSB standard that specifically applies to a sustainability-related risk or opportunity, IFRS S1 requires an entity to apply the sources of guidance requirements to identify applicable metrics. An entity is also required to identify the source (the specific standards, pronouncements, industry practice and other sources of guidance) and the metric when the metric is taken from a source other than an ISSB standard. [IFRS S1.47, IFRS S1.49]. For further discussion on sources of guidance, see section 5.1.2 below.

4.5.1.B Metrics developed by the entity

For metrics developed by an entity, IFRS S1 requires an entity to disclose the following information: [IFRS S1.50]

Figure 4-8: Disclosures for metrics developed by an entity

Theme	Disclosure required
Definition	How the metric is defined, including: <ul style="list-style-type: none"> ▪ Whether the metric is derived by adjusting a metric taken from a source other than ISSB standards ▪ If so, which source and how the metric disclosed by the entity differs from the metric specified in that source
Nature	Whether the metric is an absolute measure, a measure expressed in relation to another metric or a qualitative measure. The ISSB gives an example of a qualitative measure as indicating status by using the red, amber, green 'traffic light' colours
Validation	Whether the metric is validated by a third party and, if so, which party
Calculation	The method used to calculate the metric and the inputs to the calculation, including: <ul style="list-style-type: none"> ▪ The limitations of the method used ▪ The significant assumptions made

4.5.2 Targets

An entity's targets will include any targets it has set to monitor progress towards achieving its strategic goals as well as any targets it is required to meet by law or regulation. *[IFRS S1.51]*.

For each target, IFRS S1 requires an entity to disclose: *[IFRS S1.51]*

- The metric used to set the target and to monitor progress towards reaching the target
- The specific quantitative or qualitative target the entity has set or is required to meet
- The period over which the target applies
- The base period from which progress is measured
- Any milestones and interim targets
- Performance against each target and an analysis of trends or changes in the entity's performance
- Any revisions to the target and an explanation for those revisions

An entity is required to consistently define and calculate metrics for each reporting period, including those metrics used to set the entity's targets and monitor progress towards reaching them. In the event a metric is redefined or replaced in a reporting period, an entity is required to: *[IFRS S1.52, IFRS S1.B52]*

- Disclose a revised comparative amount, unless it is impracticable to do so
- Explain the changes to the metric
- Explain the reasons for those changes, including why the metric that has been redefined or replaced provides more useful information

The metrics and targets disclosed by entity have to be labelled and defined using names and descriptions that are meaningful, clear and precise. *[IFRS S1.53]*.

5 General requirements

5.1 Sources of guidance

As discussed in sections 1.2 and 3.2.2 above, IFRS S1 requires an entity to identify sustainability-related risks and opportunities that could reasonably be expected to affect the entity's prospects, as well as material information that apply to those risks and opportunities. Both identification processes are informed by the sources of guidance included in IFRS S1.

In these identification processes, an entity is required to first apply ISSB standards that specifically apply to that sustainability-related risk or opportunity. [IFRS S1.54, IFRS S1.56]. IFRS S1 also includes other sources of guidance which are intended to give direction to entities, especially in situations where there are no directly applicable requirements in ISSB standards. Such guidance effectively provides entities with a roadmap for the appropriate use of other standards and frameworks to produce decision-useful disclosures for primary users about sustainability-related risks and opportunities. The sources of guidance included in IFRS S1 are those that, if selected, would likely result in the provision of information that would enable entities to meet the objective of IFRS S1. The ISSB believes that this can contribute to reducing diversity in practice and improving comparability between information provided by peer entities. [IFRS S1.BC128].

Up to the date of issuance of this chapter, the ISSB has so far issued specific requirements for disclosing information about sustainability-related risks and opportunities in relation to climate (i.e., IFRS S2). The use of other sources of guidance is particularly useful in these early days of the ISSB's standard setting activities, until more ISSB standards, beyond climate, are developed and issued. The ISSB believes that, as additional ISSB standards will be developed, the reliance of entities on those other sources of guidance will gradually decrease. This is because the range of the future ISSB standards will assist in identifying sustainability-related risks and opportunities, as well as in setting out disclosures designed to meet the needs of primary users and, therefore, there will be fewer gaps to fill. [IFRS S1.BC128].

Despite the importance of other sources of guidance during the period of development of the full range of ISSB standards as described above, the ISSB expects that these other sources will continue to be useful to entities to meet the objective of IFRS S1 even after that period. [IFRS S1.BC128]. The rationale behind the requirements of IFRS S1 in respect of other sources of guidance is similar to that of IAS 8 applied under IFRS accounting standards. That is, there will be circumstances where a particular event, transaction or other condition is not specifically addressed by any ISSB standard. Also, the range of sustainability topics and the information needs of primary users are continuously evolving and it is likely that ISSB standards may not provide specific guidance for all possible circumstances. Moreover, the ISSB considered that this guidance can be particularly useful for entities that have not previously reported sustainability-related financial disclosures that focus on meeting the needs of primary users.

5.1.1 Use of sources of guidance when identifying sustainability-related risks and opportunities

As discussed in section 5.1 above, in identifying the sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects, an entity needs to apply ISSB standards. That is, an entity needs to consider the sustainability-related topics and the respective sustainability-related risks and opportunities associated with those topics included in ISSB standards. [IFRS S1.54].

In addition to ISSB standards, IFRS S1 provides a list of other sources of guidance to assist in the judgement involved in this identification process. The ISSB decided to distinguish the sources of guidance between those that an entity is required to refer to and consider the applicability of and sources that an entity is permitted, but not required, to refer to and consider the applicability of. The ISSB clarified that the use of "refer to and consider the applicability of" a source of guidance is intended to require or permit an entity to refer to that source of guidance and consider whether it is applicable. If it is, then an entity is required or permitted to apply that source of guidance. [IFRS S1.BC131, IFRS S1.BC132].

The list of sources of guidance that an entity is required to refer to and consider the applicability of is limited to the Sustainability Accounting Standards Board standards (the SASB standards). This was decided by the ISSB to make the application of the requirements less burdensome rather than an entity being required to refer to and consider the applicability of a long list of sources. The ISSB considered that using the SASB standards could reduce application costs for entities and produce useful and comparable disclosures for primary users. This is because the SASB standards were developed with a similar objective to IFRS S1 and their overall design with respect to disclosure topics and associated metrics generally follows the structure of the requirements in IFRS S1. In fact, the industry-based guidance provided by the SASB standards is complementary to the general requirements of IFRS S1, and includes disclosure topics that are focused on sustainability-related risks and opportunities that arise in an industry throughout the value chain. [IFRS S1.55(a), IFRS S1.BC129, IFRS S1.BC130, IFRS S1.BC134].

In February 2024, the ISSB issued educational material for using SASB standards which points out the usefulness of SASB standards as source of guidance.²⁹ In particular, the educational material emphasised that using the SASB standards can be beneficial because they are designed to provide primary users with decision-useful information that is comparable with peers. SASB standards are tailored to specific industries which enables entities to access guidance relevant to their business activities on sustainability-related topics beyond climate. Moreover, the ISSB's educational material outlines how to use the SASB standards in order to meet the requirements in IFRS S1.

Each SASB standard contains: [IFRS S1.IG12]

- *Industry descriptions:* Intended to support entities in identifying applicable industry guidance by describing the business models, activities and other common features that characterise participation in the industry (see section 5.1.1.A below)
- *Disclosure topics:* Describe specific sustainability-related risks or opportunities associated with the activities conducted by entities within a particular industry (see section 5.1.1.A below)
- *Metrics:* Accompany disclosure topics and are designed to provide useful information regarding an entity's performance for a specific disclosure topic (either individually or as part of a set) (see section 5.1.2.A below)
- *Technical protocols:* Provide guidance on definitions, scope, implementation and presentation of associated metrics (see section 5.1.2.A below)
- *Activity metrics:* Quantify the scale of specific activities or operations of an entity and they are intended to be used in conjunction with metrics accompanying the disclosure topics to normalise data and facilitate comparisons (see section 5.1.2.A below)

5.1.1.A Considerations when referring to the SASB standards to identify sustainability-related risks and opportunities

SASB industry descriptions

Entities can start identifying the relevant sustainability-related risks and opportunities by searching for the applicable SASB standards. In considering the applicability of SASB standards, an entity first needs to understand the activities that a particular SASB standard relates to. The SASB standards have descriptive names (e.g., Oil & Gas - Exploration & Production) and are organised by sector (e.g., Extractives & Minerals Processing). In addition, each industry SASB standard includes an 'industry description' section which summarises the typical business activities to which the SASB standard applies. The industry descriptions summarise the business that each SASB standard covers so that an entity understands the activities addressed and determines if a SASB standard is likely to be applicable to its business model and associated activities.

As further explained in the ISSB's educational material on using ISSB Industry-based Guidance when applying ISSB standards, to identify the relevant industry (or industries), an entity could review the list of sectors and then, for the sectors that may be relevant, consider the industries and industry descriptions to identify those which reflect the entity's business model and associated activities, in whole or in part. In this way, an entity will be able to narrow down the list of industries to a subset of industries that are potentially relevant. For example, an entity involved in the manufacture of footwear would review the 11 sectors in the SASB standards and select the 'Consumer Goods' sector for further consideration. It then reviews the seven industries and industry descriptions within the 'Consumer Goods' sector and determines that the 'Apparel, Accessories & Footwear' industry reflects relevant aspects of its business model and associated activities. The entity therefore determines this industry to be relevant.

²⁹ [Educational material: Using the SASB Standards to meet the requirements in IFRS S1](#), ISSB, February 2024, available on the IFRS Foundation's website.

The industry names and descriptions may not precisely align with the industry an entity considers itself to be a part of because industries can be classified and defined according to varying conventions. In performing that assessment, an entity may determine that: [IFRS S1.IG14, IFRS S1.IG15, IFRS S1.IG16]

- Its business model and activities closely align with the description of a single SASB standard, in which case, the entity may need to refer only to that particular applicable SASB standard.
- Its business model and activities closely align with the description of more than one SASB standard (e.g., when the entity constitutes a hybrid or complex business model with activities spanning a wider array of activities than those reflected in any single SASB standard) and, therefore, needs to refer to and consider the applicability of those SASB standards.
- Its industry does not precisely align with the industry name of the SASB standard to which it considers itself to be part of, or its activities may not be specifically addressed by a SASB standard(s) for a particular industry. However, other SASB standards are likely to address those activities or similar activities.

SASB disclosure topics

The disclosure topics in the SASB standards are useful in helping entities understand the range of sustainability-related risks and opportunities that are within the scope of IFRS S1, which is particularly important in the identification of the sustainability-related risks and opportunities. This is because the disclosure topics have been informed by market input and empirical research, and they focus on sustainability-related risks and opportunities that are likely to affect an entity's prospects in a particular industry. Furthermore, the metrics that accompany disclosure topics in the SASB standards are commonly tailored to the activities of entities within a particular industry (see discussion on metrics in section 5.1.2.A below). Many entities may find they are already managing activities and disclosing information related to the disclosure topics in the SASB Standards. [IFRS S1.BC134].

Having identified the SASB standard(s) that closely align(s) with its activities, an entity needs to determine which disclosure topic(s) within that SASB standard(s) align(s) with its activities in order to identify the sustainability-related risks and opportunities based on its business model and activities. [IFRS S1.IG17]. The disclosure topics and associated metrics may relate to an entity's own activities or to activities that occur in the entity's value chain.

Consider the following Illustration, based on an example provided in the *Implementation Guidance* to IFRS S1, about using disclosure topics of the SASB standards to enable entities to consistently identify sustainability-related risks and opportunities based on their business model and activities: [IFRS S1.IG18, IFRS S1.IG19]

Illustration 5-1: Identifying sustainability-related risks and opportunities by referring to and considering the applicability of SASB standards

Entity B conducts meat, poultry and dairy operations and, therefore, refers to and considers the applicability of the Meat, Poultry & Dairy SASB standard. Entity B concludes that the disclosure topics in that SASB standard that are applicable in its circumstances include disclosure topics such as the food safety and the workforce health & safety. Effectively, Entity B's process of identification of sustainability-related risks and opportunities is informed by the using the disclosure topics in this SASB standard.

In applying those disclosure topics, Entity B explains that a failure to maintain the quality and safety of its product may result in costly recalls, harm the reputation of its brand, lead to fines, reduce its revenues and increase regulatory scrutiny, including the imposition of trade restrictions.

Moreover, Entity B uses the disclosure topics to meet the requirements of IFRS S1 about how it manages the identified risks. In particular, Entity B provides information about its robust workforce safety practices to avoid reputational impairment, costly turnover, low worker morale and productivity, risks associated with potential liability for injuries, associated healthcare and workers' compensation costs.

The approach described in Illustration 5-1 above can be repeated for each of the applicable disclosure topics of the entity. However, the disclosure topics of the SASB standards are meant to inform the identification of sustainability-related risks and opportunities of a typical entity within a given industry, rather than every entity within a given industry. That is, SASB standards may include disclosure topics that would not result in useful information for primary users for every entity within a given industry. For example, an entity operating in a particular industry may not engage in activities that are covered by a disclosure topic of that industry in the SASB standards. Therefore, information resulting from that disclosure topic would not be useful to its primary users. Also, the disclosure topics in SASB standards are not exhaustive and, as such, they are not meant to include every disclosure topic that would result in useful information and be applicable to all entities in a given industry. [IFRS S1.IG13, IFRS S1.IG20].

Therefore, when an entity considers the applicability of the disclosure topics of SASB standards, it may, for the reasons explained above, conclude that those disclosure topics are not sufficient to inform the identification of all sustainability-related risks and opportunities that could reasonably be expected to affect its prospects.

The ISSB's educational material for using SASB standards includes five key questions an entity may consider when identifying which industry SASB standard and disclosure topics are applicable:³⁰

- What are the principal business activities of the entity?
- What are the business activities of peers or competitors of the entity?
- Does the SASB standard reviewed by the entity contain disclosure topics that accurately describe sustainability-related risks and opportunities relevant to the entity?
- Which sustainability-related risks and opportunities do investors most often ask the entity to discuss or disclose?
- Do the disclosure topics align with any risks or opportunities identified by the entity's enterprise risk management processes?

Moreover, the ISSB's educational material on using ISSB Industry-based Guidance when applying ISSB standards notes that an entity that operates in multiple industries may determine that multiple sectors and industries are relevant because of the breadth of its business model and activities. In such circumstances, the entity may identify disclosure topics and metrics from particular industries that are applicable only to part of its business.³¹ SASB standards are helpful in this respect to identify specific information that may be relevant for different parts of an entity's business. However, the educational material emphasises the fact that an entity is required to present information in an understandable manner and therefore, it will need to make materiality judgements considering its sustainability-related financial disclosures as a whole. In particular, with operations spanning multiple industries, an entity will need to make judgements to:

- Determine what information about its various activities is material to disclose. The entity may determine that information about some parts of its business is not material in the context of its sustainability-related financial disclosures taken as a whole and therefore, does not need to be disclosed.
- Meet the aggregation and disaggregation requirements in IFRS S1 and avoid aggregating material items of information that are dissimilar to each other (see discussion in section 3.2.5.A above). Based on its materiality assessment, an entity may decide to disclose information about parts of its business aggregated with similar information about other parts of its business, but disclose other information disaggregated by industry or business unit.

The following examples from the *Implementation Guidance* to IFRS S1 illustrate the identification of sustainability-related risks and opportunities by referring to and considering the applicability of the SASB standards: [IFRS S1.IE Example 1, IFRS S1.IE3, IFRS S1.IE4, IFRS S1.IE Example 2, IFRS S1.IE9, IFRS S1.IE10, IFRS S1.IE11]

Extract from IFRS S1

Example 1-An entity with a single line of business

Entity Y is a regional passenger airline company. In identifying sustainability-related risks and opportunities that could reasonably be expected to affect its prospects, Entity Y is required to apply IFRS Sustainability Disclosure Standards in accordance with paragraph 54 of IFRS S1. In addition to applying IFRS Sustainability Disclosure Standards, Entity Y is required to refer to and consider the applicability of the disclosure topics in the SASB Standards. Entity Y concludes that its business model and activities most closely align with the *Airlines* SASB Standard.

Entity Y applies IFRS S2 *Climate-related Disclosures* and identifies climate-related risks or opportunities that could reasonably be expected to affect its prospects. In addition, Entity Y refers to and considers the applicability of the disclosure topics in the *Airlines* SASB Standard in accordance with paragraph 55(a) of IFRS S1. Entity Y concludes that all four disclosure topics in the *Airlines* SASB Standard are applicable to its activities and uses those disclosure topics to inform its identification of sustainability-related risks and opportunities that could reasonably be expected to affect its prospects.

31 [Educational material: Using ISSB Industry-based Guidance when applying ISSB Standards](#), ISSB, July 2025, available on the IFRS Foundation's website.

Example 2-A large conglomerate with diverse activities

Entity A is a large conglomerate with diverse activities. Entity A produces electrical and industrial equipment for use in a range of industries. In addition to IFRS Sustainability Disclosure Standards, Entity A is required to refer to and consider the applicability of the disclosure topics in the SASB Standards in identifying its sustainability-related risks and opportunities. Because of the wide-ranging nature of its activities, Entity A begins its consideration of the applicability of the SASB Standards by considering the various sectors into which the SASB Standards are grouped. Entity A conducts activities in industries in the Health Care, Resource Transformation and Infrastructure sectors, and in some cases owns particular parts of its production process rather than relying on suppliers. It also has some activities in the Transportation and Consumer Goods sectors.

Entity A refers to and considers the applicability of the disclosure topics in the SASB Standards. Entity A concludes that eight SASB Standards are applicable to its business model and activities. Entity A considers the disclosure topics in the eight standards. Although Entity A observes that it engages in activities related to all of those disclosure topics, Entity A concludes that some of those disclosure topics are not applicable in the entity's circumstances. For example, Entity A concludes that the sustainability-related risk or opportunity characterised by a particular disclosure topic could not reasonably be expected to affect its prospects over the short, medium or long term because the disclosure topic relates to activities that are insignificant for the entity.

Entity A concludes that most of the disclosure topics in the SASB Standards it has considered are applicable to its significant activities. In some cases where it has less significant activities, it finds that only particular disclosure topics in those related industries are applicable. For example, Entity A concludes that most of the disclosure topics that it considered for its transportation and retail businesses are not applicable, due to the relatively small size of these businesses. However, Entity A concludes that incidents related to safety and labour practices in these businesses, although unlikely to have a large effect on its cash flows in the short term, could have a major effect on its reputation over the medium and long term. This reputational risk could affect the performance of its larger businesses, including its ability to attract and retain talent, over a medium- and long-term time horizon, which could be reasonably expected to affect its medium- and long-term cash flows, access to finance and cost of capital. Thus, Entity A considers these topics in identifying sustainability-related risks and opportunities that could reasonably be expected to affect its prospects.

5.1.1.B Considerations when referring to other sources of guidance to identify sustainability-related risks and opportunities

The entity may also need to consider additional sources of guidance specified in IFRS S1 to identify its sustainability-related risks or opportunities. [IFRS S1.IG13, IFRS S1.IG20]. In particular, an entity may refer to and consider the applicability of the CDSB Framework Application Guidance for Water-related Disclosures and the CDSB Framework Application Guidance for Biodiversity-related Disclosures (collectively referred to as 'CDSB Framework Application Guidance'). [IFRS S1.55(b)(i)].

For example, the CDSB Framework Application Guidance can support entities in identifying biodiversity-related risks (e.g., reduction in soil fertility, reduction in pollination for crop production, reduced availability of fish stocks) or water-related opportunities (e.g., improved water efficiency, development of new products and services, conservation and restoration of ecosystems through engagement and collaboration with stakeholders). However, that does not preclude an entity from having identified water- or biodiversity-related risks and opportunities in accordance with the SASB standards or other sources of guidance. [IFRS S1.IG26, IFRS S1.IG27]. Moreover, the CDSB Framework Application Guidance explains how water- and biodiversity-related risks may be connected to other sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects (e.g., water-related risks such as more frequent flooding are often inherently linked to climate-related risks). This information is necessary for an entity in meeting the requirements of IFRS S1 about connected information, as discussed in section 3.4 above.

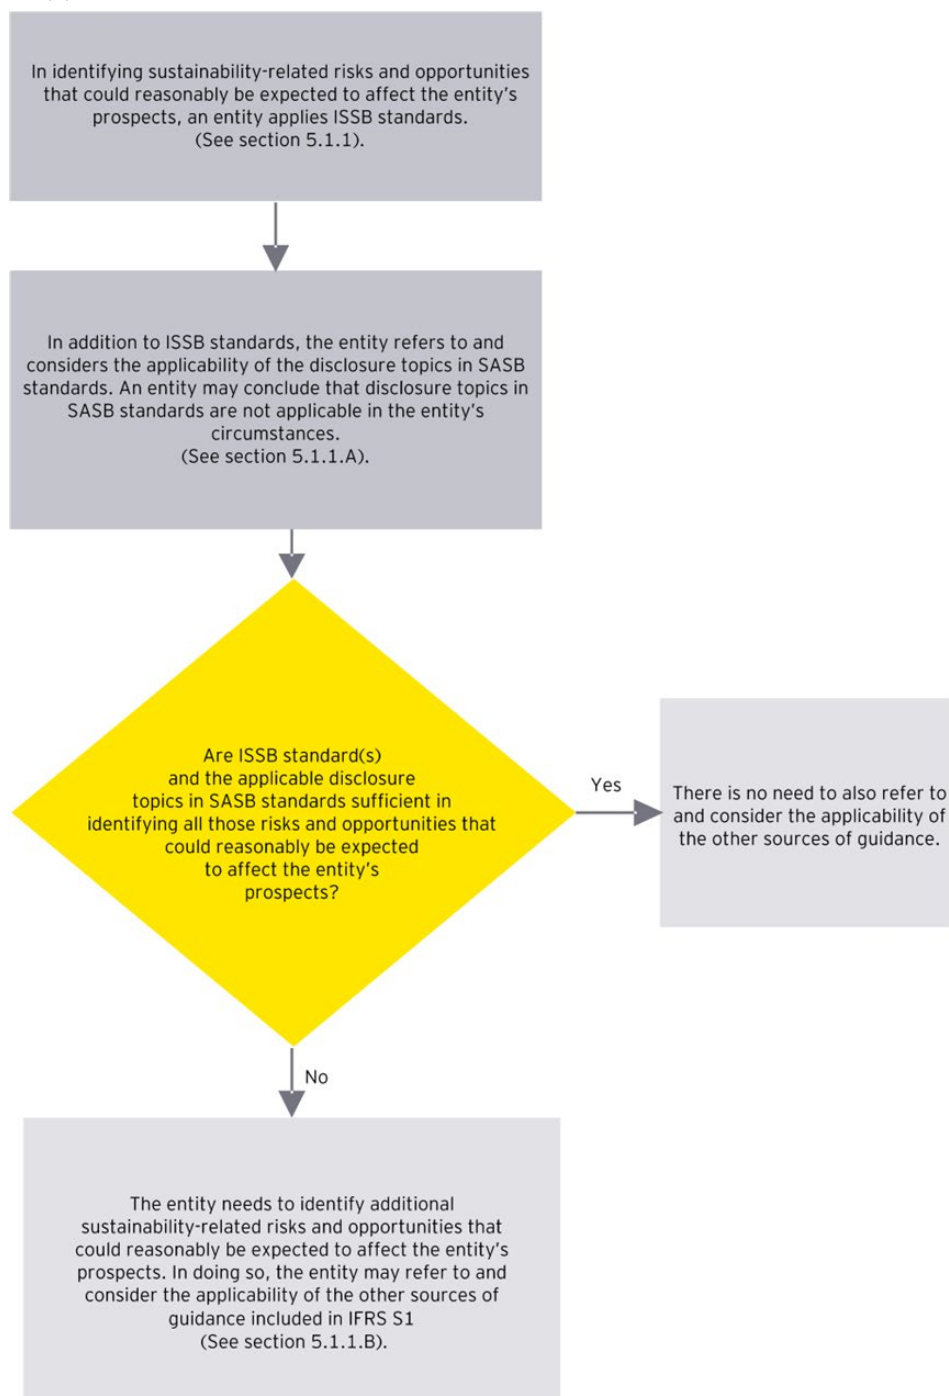

In addition, an entity is permitted to refer to and consider the applicability of the most recent pronouncements of other standard-setting bodies whose requirements are designed to meet the needs of primary users. [IFRS S1.55(b)(ii)]. For example, an entity operates in a jurisdiction whose national standard-setter is responsible for the issuance of standards designed to meet the information needs of primary users. This national standard setter has issued a standard on human capital-related disclosures. IFRS S1 permits the entity to consider the applicability of this standard when identifying sustainability-related risks and opportunities.

IFRS S1 also permits an entity to refer to and consider the applicability of the sustainability-related risks and opportunities identified by entities that operate in the same industries or geographical regions.

[IFRS S1.55(b)(iii)]. In practice, some regulators may focus on specific areas in relation to their oversight of sustainability reporting. These focus areas may include references to sustainability-related risks and opportunities that could be common in a specific geographic region or industry operating within that region. However, when referring to peer disclosures prepared in accordance with sustainability-related frameworks other than ISSB standards, an entity needs to understand how relevant these sources are for the preparation of disclosures in accordance with ISSB standards. That is, an entity needs to ensure that the process of identifying sustainability-related risks and opportunities meets the information needs of primary users. For example, consider an entity that operates in the medical equipment and supplies industry which recently acquired an entity that operates in the health care distributors industry. While reassessing the scope of sustainability-related risks and opportunities throughout its value chain (which is required on the occurrence of a significant event as discussed in section 1.2.3 above), the acquiring entity considers the sustainability-related risks and opportunities that may be prevalent in the health-care distributors industry. In doing so, the acquiring entity refers to sustainability-related risks and opportunities identified in the sustainability-related financial disclosures of entities operating in that industry.

The main reasons that the ISSB decided to permit and not require entities to consider these sources were:

a) to prevent entities from having to consider an extensive list of open-ended sources of guidance that would lead to an increased burden for entities; and b) to facilitate the transition to ISSB standards by enabling entities to use sources that they may already be familiar with. The application of those sources of guidance is intended to support the application of ISSB standards and, therefore, an entity is still required to comply with all the requirements in ISSB standards to assert compliance with them. *[IFRS S1.BC135]*.

Figure 5-1: Use of sources of guidance to identify sustainability-related risks and opportunities

How we see it

An entity applies ISSB standards as a starting point and refers to and considers the applicability of the SASB standards to identify its sustainability-related risks and opportunities. However, an entity needs to use its judgement to determine whether these two sources are sufficient to identify all those sustainability-related risks and opportunities that could reasonably be expected to affect its prospects. If they do not, the entity needs to identify additional sustainability-related risks and opportunities that could reasonably be expected to affect its prospects. In doing so, an entity may refer to and consider the applicability of the other sources of guidance discussed in this section. Although the other sources of guidance listed in IFRS S1 constitute an extensive list of open-ended sources, if an entity does refer to any of those, its goal remains that it must meet the information needs of primary users, rather than a broader remit of users.

5.1.2 Sources of guidance when identifying material sustainability-related financial information

As discussed in section 5.1 above, in determining whether information about sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects is material, an entity needs to apply the requirements of the ISSB standard that specifically applies to that sustainability-related risk or opportunity. For example, if an entity identifies climate-related risks and opportunities that could reasonably be expected to affect its prospects, the requirements in IFRS S2 (that are discussed in Chapter 54) are those that the entity needs to apply since IFRS S2 is ISSB standard that specifically applies to climate-related risk and opportunities. *[IFRS S1.56].*

However, as mentioned in section 5.1 above, ISSB has, thus far, only issued specific requirements for disclosing information about sustainability-related risks and opportunities in relation to climate (i.e., IFRS S2). Moreover, the information needs of primary users is continuously evolving and it is possible that ISSB standards may not provide specific guidance for all circumstances. Therefore, in the absence of an ISSB standard that specifically applies to a sustainability-related risk or opportunity, an entity needs to apply the requirements to sources of guidance specified in IFRS S1. Those requirements emphasise the judgement that is expected to occur when identifying information to ensure that the sustainability-related risks and opportunities are presented fairly in an entity's disclosures (see also discussion on fair presentation in section 3.1.1.A above). That is, while developing disclosures in the absence of an ISSB standard, an entity is required to identify information from sources of guidance that: *[IFRS S1.57, IFRS S1.C1]*

- Is relevant to the decision-making needs of primary users
- Faithfully represents the entity's risks and opportunities in relation to the specific sustainability-related risk or opportunity

The list of sources of guidance included in IFRS S1 is intended to assist in making this judgement by including metrics that may be relevant to a particular sustainability-related risk or opportunity for a particular industry or in specified circumstances.

IFRS S1 requires an entity to provide information that fairly presents the sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects (see section 3.1 above). Therefore, when an entity needs to refer to and consider the applicability of other sources of guidance to identify material information, it needs to ensure that the disclosures developed are relevant to the decision-making of primary users, and faithfully represent the entity's sustainability-related risks and opportunities.

5.1.2.A Considerations when referring to the SASB standards to identify material information about sustainability-related risks and opportunities

SASB metrics, technical protocols and activity metrics

As discussed in section 5.1.2 above, in the absence of an ISSB standard that specifically applies to a sustainability-related risk or opportunity, an entity needs to apply judgement to identify information that is relevant and faithfully represents that sustainability-related risk or opportunity. In making this judgement, IFRS S1 requires an entity to refer to and consider the applicability of the metrics associated with the disclosure topics included in the SASB standards. For each disclosure topic that an entity identifies as reasonably likely to affect its prospects (as discussed in section 5.1.1.A above), the entity would refer to and consider the applicability of metrics related to that disclosure topic. Those metrics accompany the disclosure topics and are designed to, either individually or as part of a set, provide useful and comparable information regarding an entity's performance for a specific disclosure topic (i.e., an entity's performance in responding to a specific sustainability-related risk or opportunity). Each of these metrics is supported by technical protocols that provide guidance on definitions, scope, implementation and presentation. The technical protocols may also serve as criteria against which the disclosed information can be verified (which is one of the enhancing qualitative characteristics of the provided information as discussed in section 3.1.1.B above). In conjunction to those metrics, there are activity metrics that quantify the scale of specific activities or operations by an entity and are used to normalise data and facilitate comparison. *[IFRS S1.58(a), IFRS S1.IG12, IFRS S1.IG23].*

By considering the applicability of the metrics associated with each relevant topic, and any relevant activity metrics, an entity is able to identify applicable disclosures. The ISSB's educational material for using SASB standards³² suggests reviewing the list of metrics associated with each relevant disclosure topic and reviewing the list of activity metrics together with the metrics to normalise data and facilitate comparison. Moreover, the educational material includes seven key questions that an entity may consider when identifying which industry SASB standard and disclosure topics are applicable:

- Would a metric in the SASB standard help investors understand the entity's performance in relation to sustainability-related risks and opportunities to which it may be exposed?
- Do the entity's peers or competitors report metrics specified by SASB standards?
- Have investors asked the entity to discuss or disclose information consistent with metrics in the SASB standards?
- Has the entity reviewed the underlying technical protocols in the SASB standard that accompany each metric to help ensure that metrics are compiled consistently?
- Does the metric in the SASB standards align with information that is already managed or disclosed by the entity?
- If the entity already collects information similar to that required by the metric, how could the information be better aligned?
- Does the entity employ methodologies for data collection that are similar to those specified in the SASB standards' technical protocols?

The ISSB's educational material on using ISSB Industry-based Guidance when applying ISSB standards also emphasises the fact that a systematic process is expected to be put in place by an entity when considering the applicability of SASB standards. Such a process enables an entity to determine whether the disclosure topics and metrics fit its circumstances. ISSB standards do not require an entity to document its consideration process, nor do they require specific documentation to be prepared about how assessments were made in meeting the requirements in ISSB standards. This is because ISSB standards do not prescribe how an entity should manage its business (including what internal processes were put in place to meet the disclosure requirements). However, the design and operation of an entity's consideration process (including documentation, controls and oversight) may be informed by expectations or requirements from its governance body, assurance provider or relevant regulators. For example, regulators may have requirements related to controls that must be in place as part of external reporting requirements or may highlight the importance of an entity's controls or oversight, such as documentation of considerations and judgements related to the entity's external reporting.

An entity could apply its consideration process at any point in its review of sustainability-related risks and opportunities, e.g., at beginning of its identification of sustainability-related risks and opportunities or at the end of its identification process as a completeness check. For example, an entity may use its existing risk assessment processes to identify sustainability-related risks and opportunities and then 'refer to and consider the applicability of' SASB standards. The process is likely to require more effort in an entity's first year of implementation of ISSB standards. In subsequent reporting periods, the entity's consideration could be focused on assessing whether there have been any changes that would cause it to reconsider that applicability (e.g., changes in business model and activities when acquiring or disposing of a business unit or entering a new market).³³

Consider the following Illustration, based on an example provided in the *Implementation Guidance* to IFRS S1, which is a continuation of the example provided in Illustration 5-1 in section 5.1.1.A above. The example relates to requirement in IFRS S1 to refer to and consider the applicability of the metrics associated with the disclosure topics included in SASB standards: [IFRS S1.IG18, IFRS S1.IG22, IFRS S1.IG23, IFRS S1.IG24]

32 [Educational material: Using the SASB Standards to meet the requirements in IFRS S1](#), ISSB, February 2024, available on the IFRS Foundation's website.

33 [Educational material: Using ISSB Industry-based Guidance when applying ISSB Standards](#), ISSB, July 2025, available on the IFRS Foundation's website.

Illustration 5-2: Identifying material information about sustainability-related risks and opportunities by referring to and considering the applicability of SASB standards

Entity B conducts meat, poultry and dairy operations and therefore, refers to and considers the applicability of the Meat, Poultry & Dairy SASB standard. Entity B concludes that the disclosure topics in that SASB standard that are applicable in its circumstances include disclosure topics such as the food safety and the workforce health & safety. In identifying material information about the sustainability-related risks and opportunities it has identified based on those disclosure topics, Entity B refers to and consider the applicability of the following metrics included in the Meat, Poultry & Dairy SASB Standard:

(a) food safety:

- (i) FB-MP-250a.1-Global Food Safety Initiative (GFSI) audit (1) non-conformance rate and (2) associated corrective action rate for (a) major and (b) minor non-conformances
 - (ii) FB-MP-250a.2-Percentage of supplier facilities certified to a Global Food Safety Initiative (GFSI) food safety certification program
 - (iii) FB-MP-250a.3-(1) Number of recalls issued and (2) total weight of products recalled
- And
- (iv) FB-MP-250a.4-Discussion of markets that ban imports of the entity's products

(b) workforce health & safety:

- (i) FB-MP-320a.1-(1) Total recordable incident rate (TRIR) and (2) fatality rate
- And
- (ii) FB-MP-320a.2-Description of efforts to assess, monitor, and mitigate acute and chronic respiratory health conditions

In applying the accompanying technical protocols of the SASB standards, Entity B discloses information related to workforce health and safety for all of its workers, regardless of their location and type of employment (e.g., full-time, part-time, direct, contract, executive, labour, salary, hourly or seasonal). Entity B applies the accompanying technical protocols as a guide in supplementing its metrics with appropriate context (e.g., a discussion of notable recalls, including information related to the cause, amount, remediation cost, nature (voluntary or involuntary), associated corrective actions and other significant outcomes related to the recall, such as legal proceedings or consumer illness).

The importance of providing industry-specific disclosures to primary users is also explicit in the section of IFRS S1 that relates to the core content of disclosures about metrics (see discussion in section 4.5 above), which requires an entity to disclose industry-based metrics in relation to its sustainability-related risks and opportunities (i.e., metrics associated with particular business models, activities or other common features that characterise participation in an industry). The associated metrics are likely to be applicable in assessing the effects of sustainability-related risks and opportunities on the entity's cash flows, its access to finance and cost of capital over the short, medium and long term. Entity-specific judgement is needed for the metrics chosen in the information about sustainability-related risks and opportunities to be material. [IFRS S1.BC125, IFRS S1.BC133].

The following examples are a continuation of the Illustrative Example 1 and Example 2 included in the *Implementation Guidance* to IFRS S1 provided in the respective extract in section 5.1.1 above and relate to the identification of information about sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects by referring to and considering the applicability of the SASB standards: [IFRS S1.IE Example 1, IFRS S1.IE Example 2, IFRS S1.IE5-9, IFRS S1.IE12-15]

Extract from IFRS S1

Example 1-An entity with a single line of business

Entity Y is a regional passenger airline company. In identifying sustainability-related risks and opportunities that could reasonably be expected to affect its prospects, Entity Y is required to apply IFRS Sustainability Disclosure Standards in accordance with paragraph 54 of IFRS S1. In addition to applying IFRS Sustainability Disclosure Standards, Entity Y is required to refer to and consider the applicability of the disclosure topics in the SASB Standards. Entity Y concludes that its business model and activities most closely align with the *Airlines* SASB Standard.

...

In disclosing information about its sustainability-related risks and opportunities, Entity Y applies IFRS Sustainability Disclosure Standards that specifically apply to its identified sustainability-related risks and opportunities. For example, Entity Y applies IFRS S2 to disclose information about its greenhouse gas emissions. In the absence of an IFRS Sustainability Disclosure Standard that specifically applies to the sustainability-related risks and opportunities which Entity Y has identified, Entity Y refers to and considers the applicability of the metrics associated with the applicable disclosure topics in the *Airlines SASB Standard*. Entity Y concludes that applying these metrics will provide information that is relevant to the decision-making of users of general purpose financial reports and faithfully represents the sustainability-related risks and opportunities that it has identified. For example, the metrics associated with the 'Accident & Safety Management' disclosure topic include:

- (a) TR-AL-540a.1-Description of implementation and outcomes of a Safety Management System;
- (b) TR-AL-540a.2-Number of aviation accidents; and
- (c) TR-AL-540a.3-Number of governmental enforcement actions of aviation safety regulations.

In identifying information to provide, Entity Y considers the applicability of the technical protocols accompanying the metrics. For example, while disclosing a description of the implementation and outcomes of a Safety Management System, Entity Y might describe any actions or measures it has implemented to mitigate any safety risks and hazardous situations that it has identified. These actions or measures include, for example, particular changes in controls, operations, management, processes, products, business partners, training or technology.

Entity Y is required to apply the requirements relating to 'core content' in IFRS S1. Entity Y considers the disclosure topics, metrics and associated technical protocols in the *Airlines SASB Standard* when providing information required by IFRS S1, including information relating to strategy and metrics and targets.

Entity Y discloses that it applied the disclosure topics and metrics in the *Airlines SASB Standard* in preparing its sustainability-related financial disclosures, in accordance with paragraphs 49 and 59 of IFRS S1.

Example 2 - A large conglomerate with diverse activities

Entity A is a large conglomerate with diverse activities. Entity A produces electrical and industrial equipment for use in a range of industries. In addition to IFRS Sustainability Disclosure Standards, Entity A is required to refer to and consider the applicability of the disclosure topics in the SASB Standards in identifying its sustainability-related risks and opportunities. Because of the wide-ranging nature of its activities, Entity A begins its consideration of the applicability of the SASB Standards by considering the various sectors into which the SASB Standards are grouped. Entity A conducts activities in industries in the Health Care, Resource Transformation and Infrastructure sectors, and in some cases owns particular parts of its production process rather than relying on suppliers. It also has some activities in the Transportation and Consumer Goods sectors.

...

In the absence of an IFRS Sustainability Disclosure Standard that specifically applies to the sustainability-related risks and opportunities that Entity A has identified, Entity A refers to and considers the applicability of the metrics associated with applicable disclosure topics. In identifying applicable metrics, Entity A considers whether the metric will provide information that is relevant to the decision-making of users of general purpose financial reports and that faithfully represents the sustainability-related risks and opportunities that it has identified.

In preparing its sustainability-related financial disclosures, Entity A concludes that some information should be aggregated to avoid obscuring material information with immaterial information. For example, it concludes that information about its strategy for sourcing critical materials for devices produced by its various activities should be aggregated because the entity manages the supplier relationships for those critical materials centrally.

In contrast, for other types of information, Entity A concludes aggregation would result in obscuring material information. For example, it concludes that information about the number of recalls related to its equipment in the Health Care sector should not be aggregated with information about the number of recalls related to its equipment in the Consumer Goods sector because the technologies, production processes and markets for each sector differ. Therefore, there are also varied reasons for the occurrence of product recalls in these sectors.

Entity A discloses information about the SASB Standards it has applied in preparing its sustainability-related financial disclosures, in accordance with paragraphs 49 and 59 of IFRS S1, including identifying the specific SASB Standards, disclosure topics and metrics it applied. Entity A also provides information to enable users of general purpose financial reports to understand the judgements that it has made in the process of preparing its sustainability-related financial disclosures and that have the most significant effect on the information included in those disclosures in accordance with paragraph 74 of IFRS S1.

The ISSB expects (as in the case of disclosure topics discussed in section 5.1.1 above) the associated metrics in the SASB standards to be typically applicable for an entity with the given business model and associated activities. Also, those metrics are not exhaustive. In situations where an entity concludes that metrics specified in the SASB standards are not applicable in its circumstances or are not sufficient to identify information that would fairly present all sustainability-related risks and opportunities that could reasonably be expected to affect its prospects (as discussed in 5.1.2 above), an entity needs to exercise judgement to refer to and consider other sources of guidance in accordance with IFRS S1 in this identification process. [IFRS S1.57, IFRS S1.C1, IFRS S1.IG13, IFRS S1.BC133]. This was also emphasised in the ISSB's educational material on using ISSB Industry-based Guidance when applying ISSB standards, where it is noted that in cases in which an entity determines that the disclosure topics or metrics in the SASB standards are not applicable, the entity is not relieved from meeting the requirement to provide decision-useful information about sustainability-related risks and opportunities, including industry-based metrics. For example, when considering the applicability of the metrics associated with a disclosure topic in the SASB standards, an entity may determine that a different metric that is disclosed by other entities that operate in the entity's industry or geographical region would provide more useful information about that disclosure topic. In this situation, the entity may decide to use that metric instead to meet the requirements in ISSB standards (refer also to discussion on other sources of guidance in section 5.1.1.B above and 5.1.2.B below).³⁴

5.1.2.B Considerations when referring to other sources of guidance to identify material information about sustainability-related risks and opportunities

To the extent that there is no conflict with ISSB standards, an entity is permitted to refer to and consider the applicability of: a) the CDSB Framework Application Guidance; b) the most recent pronouncements of other standard-setting bodies whose requirements are designed to meet the needs of primary users; and c) the information, including metrics, disclosed by entities that operate in the same industry(s) or geographical region(s). [IFRS S1.58(b)].

For example, an entity refers to and considers the applicability of the CDSB Framework Application Guidance in identifying information, including metrics, about the water- or biodiversity-related risks or opportunities that could reasonably be expected to affect an entity's prospects. An entity may consider the CDSB Framework Application Guidance in applying the core content requirements that are discussed in section 4 above. The Illustrative example below is based on the *Implementation Guidance* to IFRS S1: [IFRS S1.IG27]

Illustration 5-3: Identifying material information to disclose about the sustainability-related risks and opportunities by referring to and considering the applicability of CDSB Framework Application Guidance

- (a) Governance-in providing disclosures on governance relating to water- related risks and opportunities, the CDSB Framework Application Guidance on Water-related Disclosures suggests an entity may provide information about how water policies, strategy and information are delegated to management. In relation to collaboration with stakeholders to achieve effective water management, the guidance also suggests an entity may provide information about whether there are specific bodies, individuals or mechanisms located in areas that are affected by significant water loss whose function is to ensure compliance with water-related regulation and engagement with stakeholders.
- (b) Strategy-in providing disclosures on strategy relating to biodiversity- related risks and opportunities, the CDSB Framework Application Guidance on Biodiversity-related Disclosures suggests an entity may provide, for example, information about the geographic-specificity of biodiversity-related risks and opportunities and how those risks and opportunities may vary over the short, medium and long term. The guidance also suggests the type of quantitative and qualitative information an entity may consider providing in accordance with paragraphs 34-40 of IFRS S1, for example, the operational expenses, cost savings and revenue associated with biodiversity management, such as information about remediation costs or provisions in the case of accidents such as polluting spills, costs of staff training and revenue from biodiversity-efficient products and services.

34 [Educational material: Using ISSB Industry-based Guidance when applying ISSB Standards](#), ISSB, July 2025, available on the IFRS Foundation's website.

- (c) Metrics and targets—the CDSB Framework Application Guidance on Biodiversity-related Disclosures provides examples of common biodiversity metrics such as concentrations of key pollutants in wastewater, the volume of timber and non-timber forest products harvested and areas of forest, grassland or wetland converted due to urbanisation. Due to changes in biodiversity over time, the guidance suggests an entity provides information about the time frames it has set for targets. The guidance also discusses targets tailored to specific locations due to geographical variation in biodiversity priorities, as well as differing legal and regulatory requirements.

Moreover, an entity may refer to and consider the applicability of the sources specified in Appendix C to IFRS S1, namely the GRI standards and the European Sustainability Reporting Standards (ESRS). Unlike the SASB standards and the CDSB Framework Application Guidance, the GRI standards and ESRS are intended to meet the information needs of a different audience than only primary users. Therefore, IFRS S1 states that, if an entity refers to and considers the applicability of the GRI standards and ESRS, this is only allowed to the extent that these sources assist the entity in meeting the objective of IFRS S1 (see section 1.1 above) and do not conflict with ISSB standards. Allowing an entity to refer to and consider the applicability of those sources in identifying material information about sustainability-related risks or opportunities, but not in identifying the sustainability-related risks or opportunities themselves, is intended to ensure that any information disclosed by entities relates to a topic that has been identified as being of interest to primary users. [IFRS S1.58(c), IFRS S1.C2, IFRS S1.BC137, IFRS S1.BC138].

Although a subset of disclosures provided in accordance with GRI standards or ESRS could produce information that is useful to primary users, an entity still needs to consider the requirements in ISSB standards and not just repurpose a report prepared in accordance with those standards to automatically consider it as meeting the requirements in ISSB standards. In addition, an entity needs to comply with the requirement of IFRS S1 not to obscure material information required by ISSB standards (discussed in section 3.2.4.B above). Otherwise, if an entity applies these standards without applying the requirements in ISSB standards, it will not be able to make an explicit and unreserved statement of compliance with ISSB standards (see discussion about compliance also in section 7 below). [IFRS S1.58(c), IFRS S1.C3, IFRS S1.BC138, IFRS S1.BC139]. Illustration 5-4 is based on an example about referring to and considering the applicability of GRI standards when identifying information to disclose about a sustainability-related opportunity, as included in the ISSB's educational material on materiality:³⁵

Illustration 5-4: Referring to and considering the applicability of GRI standards to identify information to disclose about a sustainability-related opportunity

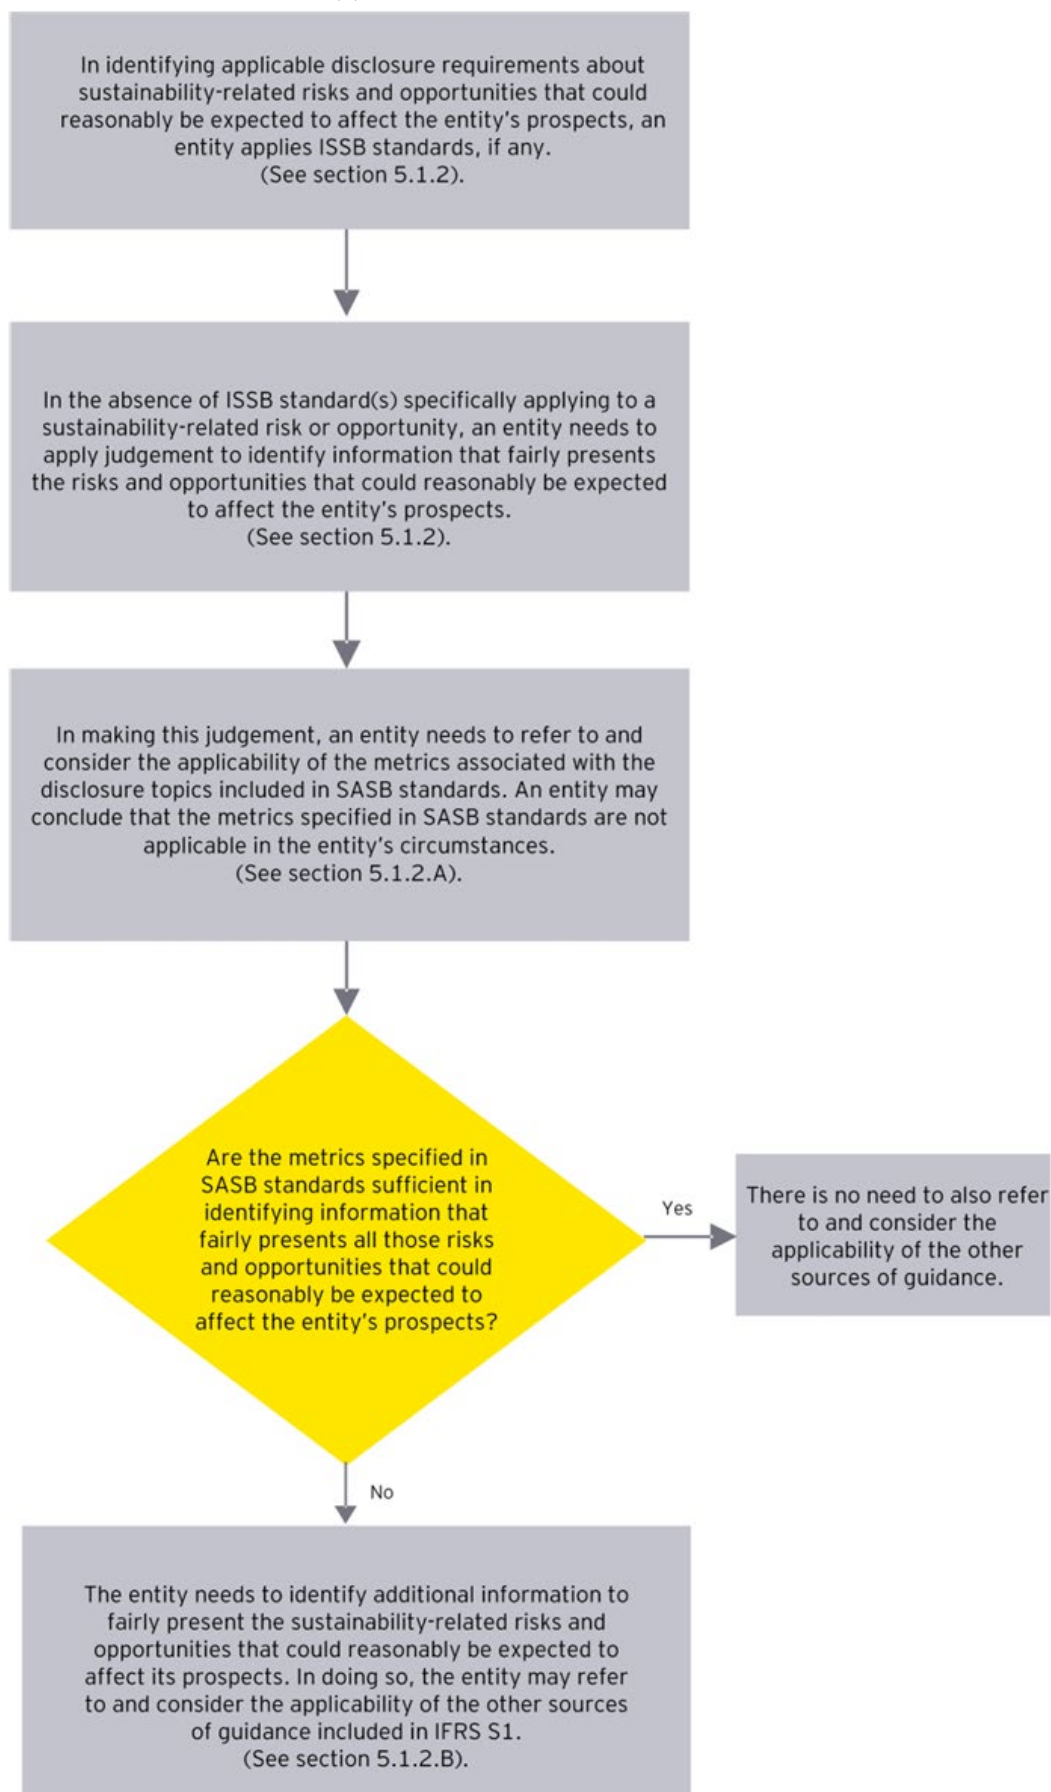

Entity Z operates in the technology industry and depends on highly skilled employees to operate its business model. Having referred to and considered the relevant SASB standards, Entity Z has identified Employee Recruitment, Inclusion & Performance as a sustainability-related opportunity that could reasonably be expected to affect its prospects.

In the absence of an ISSB standard that specifically applies to this sustainability-related opportunity, Entity Z refers to and considers the metrics associated with this disclosure topic in the relevant SASB standard. In addition to the SASB standards, Entity Z decides to refer to and consider the applicability of GRI standards to develop disclosures about this sustainability-related opportunity. Entity Z refers to GRI 404 Training and Education 2016 and considers if the following disclosures would provide useful information to primary users:

- Disclosure 404-1 *Average hours of training per year per employee*: Entity Z concludes that this information is material and would help it to meet the objective of IFRS S1 without conflicting with ISSB standards. Along with this disclosure, Entity Z discloses the specific GRI standard it applied to prepare this disclosure as required by IFRS S1 (see section 5.1.3 below).
- Disclosure 404-3 *Percentage of employees receiving regular performance and career development reviews*: Entity Z concludes that this information is not material and thus does not include such information in its sustainability-related financial disclosures.

³⁵ [Educational material: Sustainability-related risks and opportunities and the disclosure of material information](#), ISSB, November 2024, available on the IFRS Foundation's website.

Figure 5-2: Use of sources of guidance to identify material information about sustainability-related risks and opportunities

5.1.3 Disclosure of information about sources of guidance

To enable primary users to understand how sustainability-related financial disclosures have been prepared, an entity is required to identify and disclose:

- The sources of guidance (e.g., specific standards, pronouncements, industry practice or other sources, including, if applicable, the disclosure topics in the SASB standards) it applied in preparing its sustainability-related financial disclosures. *[IFRS S1.59(a)].*
- The industry or industries specified in ISSB standards, the SASB standards or other sources of guidance relating to a particular industry or industries that the entity has applied to the disclosures it has provided, including in identifying applicable metrics. This is intended to help primary users to understand the materiality judgements made by an entity in applying the industry-based disclosure requirements (e.g., if an SASB standards were used to prepare disclosures). By disclosing the industry as required above, primary users will be able to understand if a metric applicable for an entity in that industry has been omitted. *[IFRS S1.59(b), IFRS S1.BC140].*
- Information about the judgements an entity has made in the process of preparing its sustainability-related financial disclosures that have the most significant effect on the information included in those disclosures (see section 6.1 below) that include the sources of guidance applied. As part of this disclosure, it may be necessary for an entity to also disclose that it considered other sources of guidance but did not apply them. *[IFRS S1.74, IFRS S1.75, IFRS S1.BC141].* For example, an entity may determine that it has made a significant judgement in not applying the disclosure topics and associated metrics from the SASB standards for a specific industry because: a) primary users would ordinarily consider that source of guidance for a specific industry to be applicable to the entity and b) this judgement has a significant effect on the information included in its sustainability-related financial disclosures. Disclosing information about that judgement would help that entity's primary users understand how it considered the applicability of the SASB standards.

5.2 Location of disclosures

The disclosures required by ISSB standards need to be part of an entity's general purpose financial reports. As explained in section 1.1 above, general purpose financial reports are those that provide financial information about a reporting entity that is useful to primary users in making decisions relating to providing resources to the entity. Therefore, requiring sustainability-related financial disclosures to be part of an entity's general purpose financial report, is intended to ensure that the primary users of those reports are provided with a comprehensive and connected package of reports. *[IFRS S1.60, IFRS S1.BC142].*

Illustration 5-5: Publishing sustainability-related financial disclosures as part of an entity's general purpose financial reports

Entity X makes its annual financial statements available to the public in late January of each year. However, Entity X's entire package of general purpose financial reports is published in late February of each year. Entity X is not applying the transition relief in IFRS S1.E4.

According to ISSB standards, an entity's sustainability-related financial disclosures are part of its general purpose financial reports. Although Entity X makes its financial statements publicly available in late January, these do not constitute the complete package of Entity X's general purpose financial reports. The complete package of general purpose financial reports is only available in late February. Therefore, Entity X reports its sustainability-related financial disclosures when it publishes its general purpose financial reports in late February.

5.2.1 Flexibility in location of disclosures

Apart from requiring the sustainability-related financial disclosures to be part of an entity's general purpose financial report, IFRS S1 does not prescribe the exact location of those disclosures within general purpose financial reports. There are various possible locations in which the sustainability-related financial information can be disclosed, but this may be subject to regulations or other requirements that apply in the jurisdiction in which an entity operates. That is, there may be regulations or other requirements that specify the exact location in which an entity is required to provide its sustainability-related financial disclosures. For example, in some jurisdictions, entities prepare management commentary (also known as the 'management report', 'management's discussion and analysis', 'operating and financial review', 'integrated report' or 'strategic report') or a similar report. When such a report forms part of an entity's general purpose financial reports, this can be considered a possible location for sustainability-related financial disclosures. *[IFRS S1.61, IFRS S1.BC143].*

Moreover, the information required by ISSB standards can be included in the same location as the information disclosed to meet other requirements, such as information required by regulators (as discussed in section 3.2.4.C above). However, in such cases, the entity needs to ensure that the sustainability-related financial disclosures are clearly identifiable and not obscured by the additional information provided to meet those other requirements. See also section 3.2.4.B above for the requirements for not obscuring material information. [IFRS S1.62].

5.2.2 Information included by cross-reference

There are cases where information required by ISSB standards may be available in another report published by the entity. For example, the required information could be disclosed in the related financial statements. As discussed in section 3.4.3 above, IFRS S1 specifies that when ISSB standards require the disclosure of common items of information, an entity is required to avoid unnecessary duplication. In such cases, IFRS S1 permits an entity to include cross-reference in another report published by the entity to provide sustainability-related financial disclosures. [IFRS S1.63, IFRS S1.B45].

Despite the benefit of cost-effectiveness when including information by cross-reference, IFRS S1 includes specific conditions in which cross-referencing is permitted. In particular, if material information is included in an entity's sustainability-related financial disclosures by cross-reference (cross-referenced information), that information is required to be available whenever an entity's sustainability-related financial disclosures are available. That is, the cross-referenced information needs to be available on the same terms and at the same time as all other sustainability-related financial disclosures. [IFRS S1.B45, IFRS S1.BC144].

When the cross-referenced information is not part of the same report as the entity's sustainability-related financial disclosures, an entity needs to explain how primary users can access that information. In doing so, an entity needs to clearly identify in its sustainability-related financial disclosures, the report within which the cross-referenced information is located, and explain how to access that report. Also, the cross-reference needs to indicate a precisely specified part of that report. [IFRS S1.B47, IFRS S1.BC144].

The cross-referenced information, effectively, becomes part of the complete set of sustainability-related financial disclosures and, therefore, it needs to comply with the requirements of ISSB standards (e.g., it needs to meet the qualitative characteristics discussed in section 3.1.1 above). An entity needs to ensure that this complete set of sustainability-related financial disclosures is not made less understandable because of including information by cross-reference. Moreover, the responsibility of the governance body(ies) or individual(s) authorising general purpose financial reports is the same for information included by cross-reference as for the information included directly. [IFRS S1.B45, IFRS S1.B46].

In its Annual Report 2024, Telstra Group Limited listed the documents that comprise its reporting suite for 2024, as follows:

Practical example 5-1: Telstra Group Limited (2024)	Australia
<p>Telstra Annual Report 2024 [extract]</p> <h2>Our reporting suite</h2> <p>Our FY24 reporting suite includes:</p> <ul style="list-style-type: none"> Our 2024 Telstra Annual Report (this report) which describes our strategy, financial performance and remuneration practices for FY24. It also includes climate and nature related disclosures guided by ISSB (International Sustainability Standards Board) IFRS (International Financial Reporting Standards) S2 and the recommendations of the TNFD (Taskforce on Nature-related Financial Disclosures). Our 2024 Corporate Governance Statement which provides information about governance at Telstra. Our 2024 Bigger Picture Sustainability Report which provides an in-depth look at our approach and performance in relation to our most material sustainability impacts. Our 2024 Modern Slavery Act Statement which explains how we identify, manage and mitigate the specific risks of modern slavery in our operations and supply chains. <p>All reports are available at telstra.com/governance.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p>The sections of our Annual Report titled FY24 financial performance, FY24 highlights, Chair's message, CEO's message, Strategy and performance, Our material risks, Outlook, and Full year results and operations review comprise our operating and financial review (OFR) and form part of the Directors' report. Our OFR, Directors' report and Financial report were released to the ASX on 15 August 2024 in the document titled 'Financial results for the year ended 30 June 2024' which is available at telstra.com/investor.</p> </div>	

Moreover, in its Bigger Picture Sustainability Report 2024, Telstra Group Limited included various cross-references to its Annual Report 2024, where the sustainability-related information can be found without duplicating it:

Practical example 5-2: Telstra Group Limited (2024)

Australia

Telstra Annual Report 2024 [extract]

Sustainability at Telstra [extract]

Governance

Our governance arrangements and practices are essential for the long-term performance and sustainability of our company. They provide the structure through which our strategy and business objectives are set, our performance is monitored and the risks we face are managed.

For more information, see our **2024 Corporate Governance Statement** available on our [reports page](#).

For an overview of sustainability governance at Telstra, see our ***In focus: Sustainability at Telstra*** paper available on our [reports page](#).

For specific information on governance in relation to climate and nature, see the 'Acting on climate and nature' section in our **2024 Annual Report** available on our [reports page](#).

Note D1 of the financial statements 2024 of Meridian Energy Limited includes cross-references to its Climate-related Disclosures 2024 as well as other notes within the financial statements where the effect from climate risks has been disclosed:

Practical example 5-3: Meridian Energy Limited (2024)

New Zealand

INTEGRATED REPORT 2024 [extract]

Financial performance [extract]

Notes to the Group financial statements: [extract]

D: Financial instruments used to manage risk [extract]

D1: Financial risk management [extract]

Refer to the Foreign Exchange section for derivatives used for term debt raised in foreign currencies.

Meridian swaps a significant portion of its borrowings to floating rates at loan inception, and hedges the resulting interest rate exposure over a tenure based profile of fixed IRS. This is achieved using a combination of CIRS and IRS hedges. Where Meridian borrows in foreign currency it uses CIRSs to swap all foreign currency denominated interest and principal repayments to the reporting currency. This results in floating rate borrowings in the entity's reporting currency. Meridian uses IRS hedges to fix floating interest rates in line with the Board approved hedging policy and profile.

Climate risk

Meridian is exposed to future changes in climate, which may impact on our industry, our business and our customers.

Future impacts may be physical, such as changes in weather patterns or rising temperatures, or they may be more transitional in nature, such as amendments to government policy and regulation, or changes in customer energy needs and demands.

Meridian actively assesses the operating environment in New Zealand, in respect of the potential future impacts that changes in climate may have on Meridian. We report formally on this process each year in our Climate-related Disclosure.

Climate-related Disclosures
bit.ly/3SziIVK

As part of preparing this report, Meridian considers climate-related risk and whether it may have any impact on our financial statements and associated disclosures. The most material area we see climate risk potentially having a future impact is on our valuation of generation structures, which we account for at fair value. Refer to Note B1 of the financial report for further detail on this asset class, including a sensitivity analysis indicating how much their value may change with variations in key inputs, such as generation volumes and wholesale market prices.

How we see it

IFRS S1 permits an entity to cross-reference to another report published by that entity if that other report includes information required by ISSB standards (as discussed in this section).

We believe that IFRS S1 does not explicitly require 'another report published by the entity' to be part of the entity's general purpose financial reports. However, local laws and regulations may have more specific requirements than ISSB standards indicating to which other reports an entity can cross-reference. Therefore, the extent of cross-reference may differ according to each jurisdiction.

Moreover, IFRS S1 does not define which reports constitute an entity's general purpose financial reports. The definition of 'general purpose financial reports' in Appendix A of IFRS S1 states that "general purpose financial reports include-but are not restricted to-an entity's general purpose financial statements and sustainability-related financial disclosures". Therefore, it is at the entity's discretion to define which other reports (apart from the general purpose financial statements and sustainability-related financial disclosures) it considers to be 'general purpose financial reports' based on the definition provided in Appendix A of IFRS S1 "Reports that provide financial information about a reporting entity that is useful to primary users in making decisions relating to providing resources to the entity...".

For example, Entity A publishes a climate-related transition plan in 2024. The climate-related transition plan includes information that meets specific requirements in ISSB standards and is issued on the same terms and at the same time as Entity A's sustainability-related financial disclosures. Entity A intends to cross-reference to the specific information included in the transition plan to avoid duplicating this information in its 2024 sustainability-related financial disclosures. Entity A's conclusion would differ depending on: a) how it determines what its general purpose financial reports are comprised of, and b) the jurisdiction in which it operates. For example:

- Entity A does not consider its climate-related transition plan to be part of its general purpose financial reports. Entity A operates in country Y where cross-references both within general purpose financial reports and to other reports published by the entity are allowed. Entity A decides to cross-reference to information included in the 2024 climate-related transition plan.
- Entity A does not consider its climate-related transition plan to be part of its general purpose financial reports. Entity A operates in country X where cross-references are only allowed as part of the information provided in an entity's general purpose financial reports. Entity A concludes that it cannot cross-reference to information included in its climate-related transition plan, but needs to repeat it in its sustainability-related financial disclosures.
- Entity A considers its climate-related transition plan to be part of its general purpose financial reports. Depending on whether the jurisdiction in which Entity A operates allows cross-references within its general purpose financial reports, it can cross-reference to information included in the 2024 climate-related transition plan to avoid repeating the same information in its sustainability-related financial disclosures.

5.3 Timing of reporting

5.3.1 Simultaneous reporting of sustainability-related financial disclosures and financial statements

IFRS S1 requires an entity to provide its sustainability-related financial disclosures at the same time as it issues its related financial statements. This is also a natural consequence of the requirement in IFRS S1 that information included in an entity's sustainability-related financial disclosures by cross-reference needs to be available on the same terms and at the same time as all other sustainability-related financial disclosures. This simultaneous issuance is intended to provide primary users with a coherent, holistic and connected picture of an entity's financial position and performance, and to provide users with a comprehensive set of sustainability-related financial disclosures to enable more informed decisions. [IFRS S1.64, IFRS S1.BC142, IFRS S1.BC145].

5.3.2 Reporting period of sustainability-related financial disclosures

An entity normally prepares sustainability-related financial disclosures for a 12-month period (unless, for practical reasons, an entity prefers to report, for example, a 52-week period which is not precluded by IFRS S1). Regardless of this determination, an entity's sustainability-related financial disclosures need to cover the same reporting period as the related financial statements. [IFRS S1.64, IFRS S1.65].

IFRS S1 requires an entity to provide specific disclosures when it changes the end of its reporting period and provides sustainability-related financial disclosures for a period longer or shorter than 12 months. In particular, it needs to disclose the period covered by the sustainability-related financial disclosures, the reason for using a longer or shorter period, and the fact that the amounts disclosed in the sustainability-related financial disclosures are not entirely comparable. [IFRS S1.64, IFRS S1.66].

Sometimes entities receive information after the end of the reporting period about conditions that existed at the end of that reporting period. If such information is received before the date on which the sustainability-related financial disclosures are authorised for issue, the entity needs to update disclosures that relate to those conditions in the light of the new information. [IFRS S1.67].

Moreover, there may be transactions, other events and conditions that occur after the end of the reporting period, but before the date on which the sustainability-related financial disclosures are authorised for issue. In such cases, an entity needs to disclose information about those transactions, other events and conditions if non-disclosure of that information could reasonably be expected to influence decisions that primary users make on the basis of those reports. [IFRS S1.68].

How we see it

IFRS S1 requires the reporting period covered by the sustainability-related financial disclosures to be the same as the related financial statements. However, the reporting period of an entity may be different from the reporting periods used by some or all entities in a group (when the reporting entity is a parent of a group and prepares consolidated financial statements) and/or in its value chain. Although all entities in a group need to have the same reporting period, there may be situations where the applicable GAAP allows a mismatch if certain criteria are met. We believe that, if such an exception applies in the related financial statements, this exception will also apply for the sustainability-related financial disclosures of that reporting entity. This is consistent with the requirements of IFRS S1 for connectivity between financial statements and sustainability-related financial information (discussed in section 3.4.2.B above). Moreover, IFRS S2 acknowledges a potential mismatch in the reporting period of entities in the value chain with respect to GHG emissions, that may result in information not being readily available for the reporting entity to use when it prepares its own disclosures for its reporting period (see Chapter 54).

5.3.3 Interim reporting

IFRS S1 does not mandate which entities are required to provide interim sustainability-related financial disclosures, or the frequency, or timing of such disclosures after the end of an interim period. However, entities may be required to publish interim general purpose financial reports by governments, securities regulators, stock exchanges and accountancy bodies, when their debt or equity securities are publicly traded.

Unlike IFRS accounting standards, ISSB standards do not include a standard that is specific to interim reporting. Instead, there are requirements within IFRS S1 that relate to interim reporting. In particular, entities that are required, or elect, to publish interim sustainability-related financial disclosures may be required, or choose, to provide less information than is provided in that of their annual sustainability-related financial disclosures. This is due to timeliness and cost considerations, and to avoid repetition of information previously reported. In general, interim sustainability-related financial disclosures are intended to provide an update on the latest complete set of the respective annual disclosures and therefore, focus on new information, events and circumstances without duplicating information previously reported. However, although more condensed sustainability-related financial disclosures may be provided, IFRS S1 does not prohibit or discourage an entity from publishing a complete set of sustainability-related financial disclosures (according to the requirements in IFRS S1) as part of its interim general purpose financial report. [IFRS S1.69, IFRS S1.B48].

5.4 Comparative information

IFRS S1 requires an entity to disclose comparative information in respect of the preceding period for all amounts disclosed in the reporting period, unless another ISSB standard permits or requires otherwise. Moreover, IFRS S1 requires an entity to disclose comparative information for narrative and descriptive sustainability-related financial disclosures if that information is useful to primary users to understand the reporting period's disclosures. [IFRS S1.70, IFRS S1.B49].

The IASB decided to not limit this requirement to metrics, but to expand it to 'all amounts' as this would be more useful to primary users. Amounts reported in sustainability-related financial disclosures may relate, e.g., to the current and anticipated financial effects of sustainability-related risks and opportunities or to metrics and targets. [IFRS S1.71, IFRS S1.BC147].

For specific disclosure requirements about comparative information when changes occur in amounts that are estimates, see discussion in section 6.2.3 below.

Frequently asked questions

Question 5-1: How do the requirements in IFRS S1.70 on providing comparative information apply in the case of acquiring or disposing of a subsidiary of the reporting entity?

(TIG meeting 13 June 2024 - Agenda paper no. 2, ISSB meeting 24 July 2024 - Agenda paper no. 9)

In June 2024, the TIG discussed a question about the application of the requirements in IFRS S1.70 to disclose comparative information. The question related to the provision of comparative information where there is a change in the composition of the reporting entity as a result of acquiring or disposing of a subsidiary. In particular, there are situations where a reporting entity discloses in the current reporting period amounts that relate to a newly acquired subsidiary in which it previously did not hold an interest. Also, there are situations where a reporting entity disposes of its entire interest in a subsidiary at the start of the current reporting period and therefore, there are not any amounts to be disclosed relating to that disposed subsidiary in the current reporting period.

In discussing a situation similar to the one described above, the TIG agreed that, unless another ISSB standard permits or requires otherwise, IFRS S1.70 requires an entity to disclose comparative information for all amounts disclosed in the current period but does not further prescribe what the entity should include or exclude from the amounts presented in the preceding reporting period. To determine the amounts required to be presented as comparative information, IFRS S1.70 is applied together with the other requirements in IFRS S1, such as the requirements in IFRS S1.20 on 'reporting entity' and IFRS S1.21-24 on 'connected information'.

Therefore, if during the current reporting period the reporting entity acquires a subsidiary in which it previously did not hold an interest (i.e., the subsidiary is only part of the group in the current reporting period from the date of acquisition, based on applicable GAAP), for amounts disclosed in the current reporting period, the comparative information will not include amounts related to the newly acquired subsidiary. Similarly, if during the current reporting period the reporting entity disposes of its entire interest in a subsidiary (i.e., the subsidiary is only part of the group up until the date of its disposal, based on applicable GAAP), for amounts disclosed in the current reporting period, the comparative information will include amounts relating to that subsidiary. In particular, the TIG used the following examples:

- An entity had a subsidiary throughout the entire preceding period but disposed of that subsidiary three months after the beginning of the current reporting period. The subsidiary is part of the group for the purposes of consolidated financial statements based on the applicable GAAP up until the date of disposal (three months into the reporting period). The comparative information will include amounts related to the subsidiary as part of the reporting entity for the entire preceding period (i.e., twelve months).
- An entity had a subsidiary throughout the entire preceding period and that subsidiary solely represented its operations in a specific industry. The entity disposed of that subsidiary on the first day of the current reporting period. In the comparative period, some industry-specific metrics that were disclosed related only to the industry represented by that subsidiary. As the entity no longer undertakes any activities in this specific industry, those industry-specific metrics are not disclosed in the current reporting period. Therefore, the entity is not required to provide comparative information for those industry metrics, because the metrics are not disclosed in its current reporting period. However, the TIG described such a situation as an 'extreme scenario' and further clarified that, if metrics are still disclosed in the current reporting period and the disposed subsidiary contributed to the corresponding comparative information for those metrics (e.g., amounts relating to Scope 2 GHG emissions), the comparative information would not be adjusted as a result of the disposal of the subsidiary in the current reporting period.

With respect to the application of IFRS S1.70 in combination with the other requirements in IFRS S1, the TIG specifically emphasised the following:

- An entity's sustainability-related financial disclosures need to be for the same reporting entity as the related financial statements (discussed in section 3.3 above). The requirements related to comparative information in IFRS S1.70 are bound by the composition of that reporting entity in the related financial statements in the comparative period. Therefore, when there has been a change to the composition of the reporting entity (such as an acquisition or disposal), in applying IFRS S1.70, the comparative information provided about the reporting entity needs to reflect the composition of the reporting entity in the related financial statements in the comparative period. That is, for information accompanying the consolidated financial statements, what information is given will depend on the composition of the group at that time, in accordance with applicable GAAP.
- IFRS S1 requires information explaining the connections between disclosures across an entity's sustainability-related financial disclosures and its related financial statements. Also, data and assumptions used when preparing sustainability-related financial disclosures need to be consistent with the corresponding ones used in the preparation of the related financial statements (discussed in section 3.4.2.B above). Therefore, to the extent information is provided about the effects of an acquisition or disposal in the sustainability-related financial disclosures, the entity needs to be led by the respective information that was provided in the related financial statements. Such a consideration would establish the connection between the information provided in the disclosures and enable primary users to understand the connections between those disclosures. For example, where the decision about an acquisition or disposal of a subsidiary is part of an entity's strategy, this may lead to the identification of a new sustainability risk and therefore, the recognition of a liability in the related financial statements, in relation to that sustainability risk.
- In practice, more complex scenarios may arise in which the composition of the reporting entity may not be the only relevant factor in explaining changes in comparative information between periods. Such scenarios could be step acquisitions, step disposals or scenarios in which the reporting entity had a business relationship with the acquired entity prior to acquisition and therefore, was part of its value chain, or where the entity is still part of the value chain by virtue of a business relationship after disposal. In such scenarios, relevant information about sustainability-related risks and opportunities related to that entity that arises from the reporting entity's value chain, would still be included in current and comparative information.

In its Sustainability Report 2023, A.P. Møller-Maersk A/S clarified that any data from divestments and acquisitions relating to ESG performance have been included until the day of the transaction or from the reporting year following the transaction respectively.

Practical example 5-4: A.P. Møller - Mærsk A/S (2023)

Denmark

Sustainability Report 2023 [extract]

Data and assurance [extract]

ESG performance data accounting policies [extract]

Basis of reporting [extract]

Scope and consolidation [extract]

Data from divestments are included until the day of transaction, while data from acquisitions are included from the reporting year following the transaction. In 2023, data from Pilot Freight Services (Pilot), Senator International (Senator) and LF Logistics, which were acquired in 2022, has been included in the ESG performance data. During 2023, the acquisitions of Martin Bencher Group and Grindrod Logistics was completed. Data from these companies will be included in the Annual Report 2024. Data from Maersk Supply Services is included up until the divestment date of 15 May 2023.

Along with the above mentioned question, the TIG discussed the application of the requirements in IFRS S1.70 when applying IFRS S2 where there is a change in the composition of the reporting entity, such as an acquisition or a disposal of a subsidiary. Please refer to the relevant discussion in Chapter 54.

6 Judgements, uncertainties and errors

6.1 Judgements

In preparing and presenting sustainability-related financial disclosures, an entity will need to apply various judgements. IFRS S1 requires an entity to disclose information about the judgements (apart from those involving estimations of amounts discussed in section 6.2 below) an entity has made in the process of preparing its sustainability-related financial disclosures. This requirement specifically relates to judgements that have the most significant effect on the information included in the sustainability-related financial disclosures. Providing such information to primary users enables them to understand how sustainability-related financial disclosures have been prepared. [IFRS S1.74, IFRS S1.BC158].

IFRS S1 provides some examples where judgement is required by an entity in preparing its sustainability-related financial disclosures. These are when an entity is: [IFRS S1.75]

- Identifying sustainability-related risks and opportunities that could be reasonably expected to affect the entity's prospects (see section 1.2 above)
- Determining which sources of guidance to apply (see section 5.1 above)
- Identifying material information to include in the sustainability-related financial disclosures (see section 3.2.2 above)
- Assessing whether an event or change in circumstances is significant and requires reassessment of the scope of all affected sustainability-related risks and opportunities throughout the entity's value chain (see section 1.2.3 above)

This requirement builds on the principle of IAS 1 relating to judgements made by an entity in applying its accounting policies that have the most significant effects on the amounts recognised in an entity's financial statements. The ISSB decided to include this overarching requirement for judgements made by an entity in the absence of a specifically applicable disclosure requirement about judgements in other ISSB standards. Other ISSB standards may require disclosure of judgements and estimates. In such cases, the requirements in IFRS S1 would complement those more specific requirements. However, other ISSB standards may also require disclosure of some of the information that an entity would otherwise be required to disclose in accordance with this overarching requirement in IFRS S1. [IFRS S1.76, IFRS S1.BC159, IFRS S1.BC160, IFRS S1.BC162].

6.2 Measurement uncertainty

6.2.1 Estimated amounts give rise to measurement uncertainty

Measurement uncertainty arises when amounts included in sustainability-related financial disclosures cannot be measured directly and can only be estimated. Such measurement uncertainty not only arises when estimating metrics, but also in other cases, such as when providing information about the effects of sustainability-related risks and opportunities on an entity's financial position, financial performance and cash flows for the reporting period, and the anticipated financial effects over the short, medium and long term (see further discussion in section 4.3.4 above). [IFRS S1.BC163].

The following example is based on the Basis for Conclusions to IFRS S1: [IFRS S1.BC163].

Illustration 6-1: Example of measurement uncertainty

Entity N's assets are increasingly at risk from climate-related forest fire events. This risk is considered as part of the impairment analysis and measurement of those assets. The frequency and severity of these fires are highly uncertain. Therefore, primary users need information about this uncertainty, including the fact that there is a significant risk of a material adjustment within the next annual reporting period to the carrying amounts of these assets.

6.2.2 IFRS S1 requirements for measurement uncertainties

IFRS S1 requires an entity to disclose information to enable primary users to understand the most significant uncertainties affecting the amounts reported in the sustainability-related financial disclosures. In doing so, an entity identifies the amounts it has disclosed that are subject to a high level of measurement uncertainty and, for each of those amounts, it needs to disclose: (i) the sources of measurement uncertainty (e.g., the dependence of the amount on the outcome of a future event, on a measurement technique or on the availability and quality of data from the entity's value chain), and (ii) the assumptions, approximations and judgements the entity has made in measuring the amount. [IFRS S1.77, IFRS S1.78, IFRS S1.82, IFRS S1.BC163].

These disclosure requirements relate to estimates used in preparing sustainability-related financial disclosures and are the entity's most difficult, subjective or complex judgements. In some cases, estimates involve assumptions about possible future events with uncertain outcomes. The greater the number of variables and assumptions, the more subjective and complex those judgements become. Accordingly, the uncertainty affecting the amounts reported in the sustainability-related financial disclosures increases. [IFRS S1.79, IFRS S1.80].

The use of reasonable estimates is essential in preparing sustainability-related financial disclosures. However, estimates need to be accurately described and explained to avoid undermining the usefulness of the information that includes those estimates. IFRS S1 is explicit that even a high level of measurement uncertainty would not necessarily prevent such an estimate from providing useful information. [IFRS S1.79]. The type and extent of the information an entity may need to disclose will vary according to the nature of the amount reported in the sustainability-related financial disclosures, i.e., the sources of and the factors contributing to the uncertainty and other circumstances.

IFRS S1 provides examples of the type of information an entity may need to disclose: [IFRS S1.81]

Extract from IFRS S1

- 81 The type and extent of the information an entity might need to disclose vary according to the nature of the amount reported in the sustainability-related financial disclosures—the sources of and the factors contributing to the uncertainty and other circumstances. Examples of the type of information an entity might need to disclose are:
- (a) the nature of the assumption or other source of measurement uncertainty;
 - (b) the sensitivity of the disclosed amount to the methods, assumptions and estimates underlying its calculation, including the reasons for the sensitivity;
 - (c) the expected resolution of an uncertainty and the range of reasonably possible outcomes for the disclosed amount; and
 - (d) an explanation of changes made to past assumptions concerning the disclosed amount, if the uncertainty remains unresolved.

How we see it

There may be cases where specific sustainability-related information about conditions that existed at the end of that reporting period is not available before the date on which the sustainability-related financial disclosures are authorised for issue (see discussion in section 5.3.2 above). In such cases, the use of reasonable estimates may be essential in preparing sustainability-related financial disclosures relating to the information that is not yet available. IFRS S1 is explicit that even a high level of measurement uncertainty would not necessarily prevent such an estimate from providing useful information. Therefore, estimating such information is required unless estimates are not reasonable considering the concept of 'reasonable and supportable information' discussed in section 1.2.2 above.

6.2.3 Revised comparative information for estimated metrics

6.2.3.A New information for estimated metrics disclosed in the preceding period

As explained in section 5.4 above, an entity is required to provide comparative information in respect of the preceding period for all amounts disclosed in the reporting period (unless another ISSB standard permits or requires otherwise). Sometimes, the amount disclosed for a metric is an estimate (as discussed in section 6.2.1 above), and there may be cases where an entity identifies new information in relation to the estimated metric that was disclosed in the preceding period. If this new information provides evidence of circumstances that existed in that preceding period, IFRS S1 requires an entity to: [IFRS S1.B50]

- Disclose a revised comparative amount that reflects that new information
- Disclose the difference between the amount disclosed in the preceding period and the revised comparative amount
- Explain the reasons for revising the comparative amount

Although the feedback that the ISSB received for the principle of providing comparative information was widely accepted, there were concerns over its application specifically to comparative information of amounts that are estimates. One of the main concerns related to the fact that the requirement to revise comparative information differs from the approach to changes in estimates in financial statements prepared under IFRS accounting standards. That is, according to the requirements in IFRS accounting standards, changes in estimates are recognised in the current and future periods affected by the change and, therefore, the comparative information is not changed. Instead, the change in estimate is reflected in the profit or loss of the reporting period that the change occurs and in equity because they are part of a double-entry model. However, in sustainability-related financial disclosures, estimates cannot affect equity (e.g., a change in a Scope 3 GHG emissions estimate affects only the estimate itself). Therefore, revised comparatives that reflect updated estimates are useful information for primary users to understand trends. Consequently, the ISSB decided that an entity would provide more useful information if the entity revised comparatives to reflect changes in estimates that relate to the preceding period rather than changing reporting period information. [IFRS S1.BC149, IFRS S1.BC150, IFRS S1.BC151].

IFRS S1 acknowledges that sometimes it may be impracticable to revise a comparative amount to achieve comparability with the reporting period (e.g., data may not have been collected in the preceding period in a way that allows retrospective application of a new definition of a metric which may make it impracticable to recreate the data). Therefore, a revised comparative amount for the preceding period does not need to be disclosed if it is impracticable to do so, but an entity needs to disclose that fact. [IFRS S1.B51, IFRS S1.B54].

However, if a metric is forward-looking and relates to possible future transactions, events and other conditions, the entity is permitted, but not required, to revise a comparative amount for that forward-looking metric (e.g., when disclosing expected expenditure on new equipment for a future year and the price of that equipment subsequently increases). If the entity chooses to provide comparative information for a forward-looking metric, it needs to ensure that this does not involve the use of hindsight. [IFRS S1.B51].

How we see it

As more reliable information becomes available in the current reporting period that supports sustainability-related metrics that are based on estimates, it may be appropriate to revise previously reported estimates to improve comparability of the information provided to primary users. For example, in the case of assessing progress towards net zero targets, improved or more granular GHG emissions data may become available in future periods. Therefore, an entity needs to set up appropriate processes and controls to collect the necessary data to provide revised estimates retrospectively and disclose what has changed compared to the preceding period.

Please refer to Chapter 54 for the discussion that the TIG had on specific question about providing estimates in the current period by using information disclosed in the prior period and whether these estimates need to be revised in the following year when these become comparative information.

Frequently asked questions

Question 6-1: Does the requirement in IFRS S1.B50 to revise estimated amounts disclosed in a preceding period relate only to estimated amounts disclosed for metrics or all estimated amounts disclosed, including those disclosed for metrics?

(TIG meeting 15 March 2024 - Agenda paper no. 2, ISSB meeting 16 May 2024 - Agenda paper no. 9)

The TIG agreed with the ISSB staff analysis that revision of estimated amounts disclosed in the preceding period (as long as the relevant circumstances outlined in IFRS S1.B50 exist) is required when those amounts are metrics, rather than requiring revision of all estimated amounts. However, this requirement does not apply to errors as IFRS S1 has specific requirements for errors.

The TIG agenda paper noted that, the first sentence of IFRS S1.B50 states that “in some cases, the amount disclosed for a metric is an estimate”. This is immediately followed by the sentence referring to “the estimated amount disclosed in the preceding period” to imply that the specific ‘amount disclosed’ refers to that which is indicated in the first sentence i.e., ‘amount disclosed for a metric’. Therefore, by no means is the use of word ‘amounts’ intended to expand the requirement in IFRS S1.B50 to all amounts.

Moreover, the TIG agenda paper noted that, although the Basis for Conclusions of IFRS S1 is not part of IFRS S1 and does not establish requirements, it does provide useful context. In this respect, the TIG agenda paper refers to IFRS S1.BC147-BC155 where the ISSB’s considerations have been included in relation to the requirements in IFRS S1 on comparative information. However, the fact that the requirement in IFRS S1.B50 is not explained in the Basis for Conclusions of IFRS S1 should not be interpreted as applying to all estimated preceding period amounts disclosed.

During its discussion, the TIG pointed out the following:

- IFRS S1 does not define ‘amounts’, nor does it define ‘metrics’. However, there are examples of ‘amounts’ provided in IFRS S1.71 that include metrics and targets as well as current and anticipated financial effects of sustainability-related risks and opportunities. Also, IFRS S1.46, IFRS S1.48 and IFRS S2.28 set out requirements for disclosing metrics, including cross-industry metrics and industry-specific metrics. The TIG suggested that entities to consider listing clearly and consistently what their metrics are to allow them to better scope the implications of the requirements to revise preceding period estimated amounts. Also, data quality scoring may be useful when assessing the level of estimation within metrics.
- Although the requirements in ISSB standards do not change the requirements in the accounting standards applied by an entity (e.g., IFRS accounting standards), the connection with the related financial statements is still necessary. That is, explaining the relationship between prior period amounts that are adjusted in accordance with ISSB standards and the respective unadjusted information in the related financial statements may be necessary.
- In certain cases, narrative or descriptive disclosures may be necessary to explain the consequential effects from revising preceding period estimated amounts that are metrics as this may be material information for the primary users. Therefore, although IFRS S1.BC152 explains that such narrative or descriptive disclosures are not required, entities need to apply judgement to determine whether these additional explanations would be useful to primary users.

Question 6-2: When an entity estimates Scope 3 GHG emissions in the current period by using information disclosed in the prior period, in applying the requirements of IFRS S1.B50, does that entity need to revise those estimated amounts in the following year when these become comparative information?

See response in Chapter 54.

6.2.3.B Revised comparatives for redefined, replaced and new metrics

If an entity redefines, replaces or introduces a new metric in the reporting period, it needs to disclose a revised comparative amount for that metric, unless it is impracticable to do so. IFRS S1 includes a definition for the term ‘impracticable’ in Appendix A, clarifying that “applying a requirement is impracticable when an entity cannot apply it after making every reasonable effort to do so”. This definition is based on IAS 1 for consistent use with IFRS accounting standards. Accordingly, IFRS S1 also sets a high threshold for how an entity determines whether it is impracticable to meet the requirements and this threshold is higher than a cost-benefit threshold. In addition, an entity needs to explain the changes in the metric and the reasons for those changes, including why the redefined or replacement metric provides more useful information than the previous metric. [IFRS S1.B52, IFRS S1.B53, IFRS S1.BC152, IFRS S1.BC155].

6.3 Errors

IFRS S1 describes prior period errors as omissions from and misstatements in the entity's sustainability-related financial disclosures for one or more prior periods. These errors can be the effects of mathematical mistakes, mistakes in applying the definitions for metrics or targets, oversights or misinterpretations of facts, or fraud. Such errors arise from a failure to use, or the misuse of, reliable information that was available when the sustainability-related financial disclosures for that period(s) were authorised for issue. Also, errors arise when such reliable information is not used or misused, while it could reasonably be expected to have been obtained and considered in the preparation of those disclosures. [IFRS S1.84, IFRS S1.B56].

Potential reporting period errors are corrected before the sustainability-related financial disclosures are authorised for issue, if these are discovered in the reporting period to which they relate. However, material errors are sometimes not discovered until a subsequent period. If an entity identifies a material error in its prior period sustainability-related financial disclosures, this needs to be corrected by restating the comparative amounts for the prior period(s) disclosed, unless it is impracticable to do so. [IFRS S1.83, IFRS S1.86, IFRS S1.B57].

Moreover, if a material error is identified in the sustainability-related financial disclosures for its prior periods, an entity needs to disclose the nature of that error, and the correction (to the extent practicable) for each prior period disclosed. Also, if correction of that error is impracticable, an entity needs to disclose the circumstances that led to the existence of that condition and a description of how and from when the error has been corrected. When it is impracticable to determine the effect of an error on all prior periods presented, the comparative information is restated to correct the error from the earliest date practicable. [IFRS S1.B58, IFRS S1.B59].

Corrections of errors are distinguished from changes in estimates. This is because estimates are approximations that an entity may need to revise due to additional information that becomes known (see also discussion in section 6.2 above), rather than omissions or misstatements. Therefore, IFRS S1 distinguishes the requirements for an entity that revises a comparative amount (e.g., to update an estimate for a metric or redefine a metric), as discussed in section 6.2.3 above, and the requirements for restating an amount due to an error. [IFRS S1.85, IFRS S1.BC165].

7 Statement of compliance

An explicit and unreserved statement of compliance can be included only if an entity's sustainability-related financial disclosures comply with all the requirements of ISSB standards. Qualified statements of compliance with ISSB standards are not allowed. Including a statement of compliance is important information to communicate to primary users about the entity having applied all the requirements of ISSB standards, rather than having been selective in its approach to reporting sustainability-related financial information. [IFRS S1.72, IFRS S1.BC156].

However, there are situations where IFRS S1 relieves an entity from disclosing information that is specifically required by an ISSB standard, without preventing that entity from asserting compliance with them. These situations relate to where: [IFRS S1.73]

- Law or regulation may prohibit an entity from disclosing information that is specifically required by an ISSB standard (see discussion on interaction with law or regulation in section 3.2.4.C above)
- The information about a sustainability-related opportunity is commercially sensitive (see discussion on commercially sensitive information in section 3.2.5.B above)

To assert compliance with ISSB standards, an entity does not necessarily need to implement strategic goals. For example, an entity does not need to follow a particular transition plan to a lower-carbon economy, but it is required to disclose information about the targets it has set or is required to set by law or regulation. That is, an entity that does not manage some of its sustainability-related risks and opportunities, or that has not established its own metrics and targets for them, could still assert compliance with ISSB standards by disclosing that fact, as this is often material for primary users to know. Similarly, an entity may not have governance processes, controls or procedures in place to monitor and manage specific sustainability-related risks and opportunities, but that fact, in itself, is often material for primary users to know through a disclosure. [IFRS S1.BC157].

As discussed in section 3.2.8 above, the aim of the Inaugural Jurisdictional Guide issued in May 2024 is to set the basis for the development of jurisdictional profiles and enable market participants and regulators to understand the progress that each jurisdiction makes towards developing sustainability-related information. This jurisdictional guide also discusses the assertion of compliance with ISSB standards by confirming the fact that such compliance is only possible if an entity complies with all requirements in ISSB standards (subject to the exemptions mentioned above relating to situations where law or regulation prohibits specific disclosures or situations of information that is commercially sensitive). Additionally, the jurisdictional guide emphasises that the ISSB has provided transition reliefs from specific requirements in ISSB standards to facilitate their initial application (see discussion in section 9 below). The reliefs are available to all entities in the first year they apply ISSB standards and entities using those reliefs will be able to assert compliance with ISSB standards. For example, using the 'climate-first' relief (discussed in section 9.3 below), an entity can limit its disclosures to information that relates only to climate-related risks and opportunities in the first annual reporting period in which it applies ISSB standards, and still be able to assert compliance.

However, in the jurisdictional guide it is acknowledged that the pace of progress in adopting ISSB standards will vary by jurisdiction. Therefore, to facilitate primary users understanding of the application of the climate-relevant requirements in ISSB standards, after the first year of using the 'climate-first' transition relief, entities that comply with all the requirements in IFRS S2 and with the climate-relevant provisions in IFRS S1 (including those in jurisdictions described as 'adopting climate requirements in ISSB Standards') can state that they comply with the climate-related requirements in ISSB standards.

Moreover, some jurisdictions may consider extending the transition reliefs for periods beyond those included in ISSB standards. This is further explained in the additional guide for preparers 'Voluntarily applying ISSB Standards - A guide for preparers' issued in September 2024 (see also discussion in section 3.2.8 above). In particular, an entity would not be able to state compliance if those reliefs are extended beyond the first year. In such case, an entity would state that it partially applied ISSB standards and needs to identify the requirements that were not met. An entity would need to state this 'partial application' by describing how its disclosures only partially reflect the requirements of ISSB standards and how it is progressing. The reasons for phasing its disclosures beyond the first year of application that is allowed for by the transition reliefs could also be useful information for an entity to disclose.

8 Effective date

Several stakeholders stressed the fact that, due to the urgency of creating a global baseline of sustainability-related financial disclosures, the effective dates for IFRS S1 and IFRS S2 should not be more than 12 months after their issuance. The ISSB decided that setting an effective date for annual reporting periods beginning on or after 1 January 2024 is consistent with its current pace in meeting primary users' urgent need for sustainability-related and climate-related financial disclosures. [IFRS S1.BC167, IFRS S1.BC171]. In particular, an entity needs to apply IFRS S1 for annual reporting periods beginning on or after 1 January 2024. Earlier application is permitted, however, if doing so, an entity needs to disclose that fact and apply IFRS S2 at the same time. [IFRS S1.E1]. The actual effective date for entities will depend on when ISSB standards become mandatory in the jurisdictions in which they operate, unless those entities voluntarily apply ISSB standards before they become mandatory in their jurisdictions. See also the relevant discussion in Chapter 52.

9 Transition reliefs

How well prepared an entity is to apply ISSB standards will depend on various factors such as an entity's current reporting approach for sustainability-related risks and opportunities, its size and the jurisdiction in which it operates, etc. Taking into consideration the level of preparedness, the ISSB acknowledged that entities may need time to create or adjust internal systems, processes and controls to prepare the disclosures required by ISSB standards. Therefore, the ISSB decided to introduce transition reliefs. [IFRS S1.BC170].

IFRS S1 includes transition reliefs available in the first annual reporting period in which an entity applies ISSB standards that are discussed in section 9.1, 9.2 and 9.3 below. [IFRS S1.E3].

9.1 Transition relief for simultaneous reporting

The ISSB considered the feedback received from stakeholders expressing a number of concerns about data availability and preparer readiness to meet the requirement of simultaneous reporting of sustainability-related financial disclosures and financial statements, especially in the first year of application of ISSB standards. For example, challenges due to the potential reporting burden and higher costs, time-consuming collection and aggregation of data due to underdeveloped systems, delayed calculation of metrics due to later finalisation of financial statements.

In response to these concerns, the ISSB decided to provide transition relief to give entities more time to prepare and align reporting of sustainability-related financial disclosures and financial statements. The transition relief is available in the first annual reporting period in which an entity applies IFRS S1 and allows an entity to not report its sustainability-related financial disclosures at the same time as its related financial statements. [IFRS S1.BC145, IFRS S1.BC146, IFRS S1.BC172]. In particular, Appendix E states: [IFRS S1.E4]

Extract from IFRS S1

- E4 In the first annual reporting period in which an entity applies this Standard, the entity is permitted to report its sustainability-related financial disclosures after it publishes its related financial statements. In applying this transition relief, an entity shall report its sustainability-related financial disclosures:
- (a) at the same time as its next second-quarter or half-year interim general purpose financial report, if the entity is required to provide such an interim report;
 - (b) at the same time as its next second-quarter or half-year interim general purpose financial report, but within nine months of the end of the annual reporting period in which the entity first applies this Standard, if the entity voluntarily provides such an interim report; or
 - (c) within nine months of the end of the annual reporting period in which the entity first applies this Standard, if the entity is not required to and does not voluntarily provide an interim general purpose financial report.

As indicated above, the relief permits the annual sustainability-related financial disclosures to be provided with the following second-quarter or half-year interim general purpose financial report. The ISSB decided to specify the timing of delay to enable primary users to know when the information would be provided. However, this relief is not suggesting that an entity is required to provide quarterly or half-yearly reporting (see also discussion about interim reporting in section 5.3.3 above). [IFRS S1.BC172, IFRS S1.BC173].

9.2 Transition relief for comparative information

Considering that entities may be able to apply the requirements in IFRS S1 sooner if comparative information is not required in the first annual reporting period in which they apply IFRS S1, the ISSB decided to provide a relief from the requirement to disclose comparative information. This relief allows an entity to report on only that first annual reporting period without being required to provide disclosures specified in IFRS S1 for any period before the date of initial application. That is, an entity is not required to disclose comparative information in the first annual reporting period in which it applies IFRS S1. [IFRS S1.E3, IFRS S1.BC174].

9.3 'Climate-first' transition relief

Limiting an entity's disclosures to information that relates only to climate-related risks and opportunities in the first annual reporting period in which an entity applies ISSB standards, is another relief that the ISSB decided to provide to entities. This transition relief temporarily narrows the scope of reporting in accordance with IFRS S1 from the provision of information about all sustainability-related risks and opportunities that could reasonably be expected to affect an entity's prospects, to the provision of information about only climate-related risks and opportunities. It does not otherwise alter the requirements of IFRS S1. Therefore, the entity would apply the requirements in IFRS S1 only to the extent that they relate to the disclosure of information about climate-related risks and opportunities. [IFRS S1.E5, IFRS S1.BC175].

In particular, if an entity applies this relief: [IFRS S1.E5, IFRS S1.E6, IFRS S1.BC176]

- It applies IFRS S2 (that is discussed in Chapter 54) to identify climate-related risks and opportunities and discloses information about them.
- It is required to disclose that fact.
- The relief from providing comparative information would be extended. Specifically, in the first annual reporting period in which it applies IFRS S1, the entity is not required to disclose comparative information about its climate-related risks and opportunities. Also, in the second annual reporting period in which the entity applies IFRS S1, the entity is not required to disclose comparative information about its sustainability-related risks and opportunities, other than its climate-related risks and opportunities. Therefore, comparative information in relation to climate-related risks and opportunities is required in the second annual reporting period.

Asserting compliance with ISSB standards means application of all the requirements in IFRS S1 and IFRS S2. However, electing to use this transition relief allows an entity to assert such compliance in its first year of applying ISSB standards, even though it discloses only information about climate-related risks and opportunities in accordance with IFRS S2 (see further discussion about compliance with ISSB standards in section 7 above).

In January 2025, the ISSB issued educational material, *Applying IFRS S1 when reporting only climate-related disclosures in accordance with IFRS S2*.³⁶ This educational material is intended to help preparers understand which requirements in IFRS S1 are applicable when an entity discloses information on only climate-related risks and opportunities in accordance with IFRS S2. For completeness, the educational material also includes an appendix that contains the requirements in IFRS S1 that are not applicable when reporting on only climate-related risks and opportunities.

³⁶ [Educational material: Applying IFRS S1 when reporting only climate-related disclosures in accordance with IFRS S2](#), ISSB, January 2025, available on the IFRS Foundation's website.

Frequently asked questions

Question 9-1: In identifying climate-related risks and opportunities, does an entity need to refer to and consider the applicability of SASB standards in addition to the requirements of IFRS S2 when applying the 'climate-first' transition relief?

The ISSB's educational material *'Applying IFRS S1 when reporting only climate-related disclosures in accordance with IFRS S2'* clarified that the requirement in IFRS S1 to refer to and consider the applicability of the disclosure topics in SASB standards, in addition to applying ISSB standards when identifying sustainability-related risks and opportunities (as discussed in section 5.1.1 above), is not applicable when using the 'climate-first' transition relief.

The ISSB's educational material further explains that, in identifying climate-related risks and opportunities that could reasonably be expected to affect an entity's prospects, the entity needs to apply IFRS S2, which requires referring to and considering the applicability of the industry-based disclosure topics defined in the Industry-based Guidance on Implementing IFRS S2 (see Chapter 54 for further discussion relating to the Industry-based Guidance on Implementing IFRS S2). Since the Industry-based Guidance on Implementing IFRS S2 has been derived from SASB standards, the climate-related metrics in it are identical to corresponding requirements in SASB standards. Therefore, for entities reporting only on climate-related risks and opportunities in accordance with IFRS S2, there is no need to also refer to and consider the applicability of SASB standards.

Some entities that decide to take advantage of the 'climate-first' transition relief in the first year of application of ISSB standards, may also wish to disclose information about sustainability-related risks and opportunities, beyond those relating to climate. The ISSB clarified that this relief is not intended to restrict an entity from providing incremental information to primary users. Instead, the relief is still available to entities that want to also provide information for sustainability-related risks and opportunities, in addition to those relating to climate, to the extent that this additional information does not reflect information about all sustainability-related risks and opportunities that could be reasonably expected to affect the entity's prospects. Therefore, the ISSB emphasised the importance of ensuring in those cases where the relief is used, that the information about climate-related risks and opportunities provided in accordance with IFRS S1 and IFRS S2 is not obscured by the incremental information. [IFRS S1.BC177].

How we see it

Entities may already have been disclosing information about sustainability-related topics, other than climate, in their general purpose financial reports. In the first annual reporting period that these entities apply ISSB standards, they may continue providing information in their sustainability-related financial disclosures about the other sustainability-related topics for consistency and comparability purposes with their prior year reporting. However, they need to be explicit that the 'climate-first' transition relief is applied and that the additional information is not provided for the purposes of complying with the full requirements of ISSB standards had the 'climate-first' relief not been applied. They also need to ensure that material information provided in accordance with ISSB standards is not obscured by this additional information.

Appendix B - Index of Frequently asked questions

Question 1-1:	Would it be sufficient for entities to rely on their prior or existing sustainability reporting practices when identifying sustainability-related risks and opportunities?	4790
Question 1-2:	Can sustainability-related risks result to an entity losing its ability to operate as a 'going concern'?	4791
Question 1-3:	Does an entity need to consider any mitigation activities, in place or planned, when identifying sustainability-related risks that could reasonably be expected to affect its prospects and when disclosing material information about them?	4791
Question 3-1:	Do the ISSB standards require an entity to consider the time value of money (e.g., using a discounted cashflow model) when making judgements about whether information is material?	4804
Question 5-1:	How do the requirements in IFRS S1.70 on providing comparative information apply in the case of acquiring or disposing of a subsidiary of the reporting entity?	4867
Question 6-1:	Does the requirement in IFRS S1.B50 to revise estimated amounts disclosed in a preceding period relate only to estimated amounts disclosed for metrics or all estimated amounts disclosed, including those disclosed for metrics?	4872
Question 6-2:	When an entity estimates Scope 3 GHG emissions in the current period by using information disclosed in the prior period, in applying the requirements of IFRS S1.B50, does that entity need to revise those estimated amounts in the following year when these become comparative information?	4872
Question 9-1:	In identifying climate-related risks and opportunities, does an entity need to refer to and consider the applicability of SASB standards in addition to the requirements of IFRS S2 when applying the 'climate-first' transition relief?	4878

Appendix C - Defined terms

Extract from IFRS standards - Definitions	
business model	An entity's system of transforming inputs through its activities into outputs and outcomes that aims to fulfil the entity's strategic purposes and create value for the entity and hence generate cash flows over the short, medium and long term.
disclosure topic	A specific sustainability-related risk or opportunity based on the activities conducted by entities within a particular industry as set out in an IFRS Sustainability Disclosure Standard or a SASB Standard.
general purpose financial reports	<p>Reports that provide financial information about a reporting entity that is useful to primary users in making decisions relating to providing resources to the entity. Those decisions involve decisions about:</p> <ul style="list-style-type: none"> (a) buying, selling or holding equity and debt instruments; (b) providing or selling loans and other forms of credit; or (c) exercising rights to vote on, or otherwise influence, the entity's management's actions that affect the use of the entity's economic resources. <p>General purpose financial reports include-but are not restricted to-an entity's general purpose financial statements and sustainability-related financial disclosures.</p>
IFRS Sustainability Disclosure Standards	Standards of that name issued by the International Sustainability Standards Board.
impracticable	Applying a requirement is impracticable when an entity cannot apply it after making every reasonable effort to do so.
material information	In the context of sustainability-related financial disclosures , information is material if omitting, misstating or obscuring that information could reasonably be expected to influence decisions that primary users of general purpose financial reports make on the basis of those reports, which include financial statements and sustainability-related financial disclosures and which provide information about a specific reporting entity .
primary users of general purpose financial reports (primary users)	Existing and potential investors, lenders and other creditors.
reporting entity	An entity that is required, or chooses, to prepare general purpose financial statements.
scenario analysis	A process for identifying and assessing a potential range of outcomes of future events under conditions of uncertainty.
sustainability-related financial disclosures	A particular form of general purpose financial reports that provide information about the reporting entity's sustainability-related risks and opportunities that could reasonably be expected to affect the entity's cash flows, its access to finance or cost of capital over the short, medium or long term, including information about the entity's governance, strategy and risk management in relation to those risks and opportunities, and related metrics and targets.
users of general purpose financial reports (users)	See primary users of general purpose financial reports (primary users) . These definitions describe the same population.

value chain

The full range of interactions, resources and relationships related to a **reporting entity's business model** and the external environment in which it operates.

A value chain encompasses the interactions, resources and relationships an entity uses and depends on to create its products or services from conception to delivery, consumption and end-of-life, including interactions, resources and relationships in the entity's operations, such as human resources; those along its supply, marketing and distribution channels, such as materials and service sourcing, and product and service sale and delivery; and the financing, geographical, geopolitical and regulatory environments in which the entity operates.

Overview

IFRS S2 *Climate-related Disclosures* is the first topic-based standard issued by the International Sustainability Standards Board (ISSB). IFRS S2 cannot be applied by an entity in isolation of other requirements. The ISSB standards are designed such that IFRS S2 needs to be applied in conjunction with IFRS S1 *General Requirements for Disclosure of Sustainability-related Financial Information*, even if an entity elects to apply the 'climate first' transition relief in its first year of applying ISSB standards.

In supporting the initial application of ISSB standards, the ISSB created the Transition Implementation Group (TIG) to analyse and publicly discuss any questions that arise during the implementation phase of ISSB standards. The TIG does not issue authoritative guidance and, therefore, the use of its materials and related discussions are not mandatory for an entity to assert compliance with ISSB standards. Throughout this chapter, there are summaries of the discussions that the TIG had up to September 2024.

For more explanation on the relationship between IFRS S1 and IFRS S2 and the development of these standards as well as the formation of the TIG, refer to Chapter 52.

1 Introduction to IFRS S2

1.1 The objective and scope of IFRS S2

IFRS S2 requires an entity “to disclose information about its climate-related risks and opportunities that is useful to primary users of general purpose financial reports in making decisions relating to providing resources to the entity”. To meet this objective, an entity is required to disclose information about the climate-related risks and opportunities that could reasonably be expected to affect the entity’s prospects. Consistent with the requirements in IFRS S1, risks and opportunities that could reasonably be expected to affect the entity’s prospects are those that could reasonably be expected to affect its cash flows, its access to finance or cost of capital over the short, medium, and long term. [IFRS S2.1, IFRS S2.2].

Those climate-related risks and opportunities that are not reasonably expected to affect an entity’s prospects are outside the scope of IFRS S2. [IFRS S2.4].

An entity’s climate-related risks and opportunities are a subset of its sustainability-related risks and opportunities that are required to be disclosed in accordance with IFRS S1. For further information on the identification of sustainability-related risks and opportunities, refer to Chapter 53.

In developing IFRS S2, the ISSB acknowledged that climate change is likely to present risks for nearly all entities and economic sectors. The ISSB also acknowledged that climate change opportunities might be available to entities, such as opportunities arising from an entity’s actions to mitigate climate change or adapt to the effects of climate change. [IFRS S2.BC2].

An entity’s exposure to climate-related risks and opportunities might be direct (i.e., the impact is on the entity’s own resources) or indirect through its value chain and relationships with, for example, suppliers and customers. The concept of a ‘value chain’ is explained in Chapter 53. Furthermore, the extent of an entity’s exposure to climate-related risks and opportunities will depend on factors such as the sector, industry, location (geographical and geopolitical) in which the entity operates and other specific circumstances including its business model. The nature and extent of an entity’s exposure to climate-related risks and opportunities will affect how primary users assess an entity’s overall risk profile and, therefore, influence users’ decisions about whether they will provide resources to the entity. [IFRS S2.BC2].

When an entity prepares the climate-related financial disclosures required by IFRS S2 (such as the cross-industry metric disclosures about the amount and percentage of assets or business activities vulnerable to climate-related transition risks and physical risks - see section 4.5.1 below), the entity needs to consider the linkages between the amounts disclosed in its climate-related financial disclosures and the amounts recognised and disclosed in its corresponding financial statements. Connections between these disclosures may be able to be explained by cross reference to information already reflected in the entity’s financial statements. To assist an entity in assessing and disclosing the extent to which climate change affects its financial statements prepared in accordance with IFRS accounting standards, refer to *Applying IFRS: Connected Financial Reporting: Accounting for Climate Change (Updated May 2025)*.¹ [IFRS S2.BC133].

¹ [Applying IFRS Connected Financial Reporting: Accounting for Climate Change May 2025, EY Global, May 2025](https://www.ey.com/ifrs), available on [ey.com/ifrs](https://www.ey.com/ifrs).

2 Climate-related risks and opportunities

IFRS S2 applies to the climate-related risks to which an entity is exposed and the climate-related opportunities that are available to the entity. [IFRS S2.3].

2.1 Climate-related risks

Consistent with the Taskforce for Climate-related Financial Disclosures (TCFD) Recommendations, climate-related risks to which IFRS S2 applies are either: [IFRS S2.BC18]

- Physical risks from climate change ('climate-related physical risks')
- Or
- Transition risks associated with the transition to a lower-carbon economy ('climate-related transition risks')

IFRS S2 defines the 'climate-related physical risks' and 'climate-related transition risks', as follows:
[IFRS S2 Appendix A]

Extract from IFRS S2

Appendix A

Defined terms

climate-related physical risks	<p>Risks resulting from climate change that can be event-driven (acute physical risk) or from longer-term shifts in climatic patterns (chronic physical risk). Acute physical risks arise from weather-related events such as storms, floods, drought or heatwaves, which are increasing in severity and frequency. Chronic physical risks arise from longer-term shifts in climatic patterns including changes in precipitation and temperature which could lead to sea level rise, reduced water availability, biodiversity loss and changes in soil productivity.</p> <p>These risks could carry financial implications for an entity, such as costs resulting from direct damage to assets or indirect effects of supply-chain disruption. The entity's financial performance could also be affected by changes in water availability, sourcing and quality; and extreme temperature changes affecting the entity's premises, operations, supply chains, transportation needs and employee health and safety.</p>
climate-related transition risks	<p>Risks that arise from efforts to transition to a lower-carbon economy. Transition risks include policy, legal, technological, market and reputational risks. These risks could carry financial implications for an entity, such as increased operating costs or asset impairment due to new or amended climate-related regulations. The entity's financial performance could also be affected by shifting consumer demands and the development and deployment of new technology.</p>

An entity may seek to manage the physical and transition risks related to climate change by developing mitigation and adaptation responses: [IFRS S2.BC21]

- Mitigation efforts relate primarily to an entity's responses to transition risks (e.g., adopting new technologies or changing business models to reduce greenhouse gas (GHG) emissions).
- Adaptation responses primarily involve an entity preparing for both the current and anticipated effects of physical risks (e.g., infrastructure investments to improve resilience to physical risks).

The ISSB explained that an entity's climate-related risks and opportunities will not necessarily be mutually exclusive. This is because, for example, a customer preference for low-carbon products might simultaneously represent both a risk to the demand for an entity's existing product line and an opportunity for the entity to produce an alternative low-carbon product or gain market share. [IFRS S2.BC23].

2.2 Climate-related opportunities

In the same way that climate-related risks refer to the potential negative effects that climate change may have on an entity, climate-related opportunities refer to the potential positive effects arising from climate change for an entity. IFRS S2 also clarifies that climate-related opportunities may arise from an entity's efforts to mitigate and adapt to climate change. [IFRS S2 Appendix A].

2.3 Nature and social aspects of climate-related risks and opportunities

IFRS S2 does not define the scope of the term 'climate-related'. The ISSB explained that this is because climate change impacts are wide ranging and interrelated and their effects on an entity will vary depending on the region, market and industry in which an entity operates, which means it is not possible to precisely define the full scope of climate-related risks and opportunities that might affect an entity. [IFRS S2.BC25].

Extract from the Basis for Conclusions to IFRS S2

BC25 Although the requirements in IFRS S2 do not explicitly reference some climate-related matters such as reduced access to fresh water, biodiversity loss, deforestation and climate-related social impacts, disclosures about these and other such matters are required if an entity determines that the information is material for users of general purpose financial reports. For example, if a beverage manufacturer determines it is exposed to short-, medium- or long-term effects of climate change on water availability-especially in water-stressed regions-the entity might determine that information about the implications of reduced water availability for its strategy, operations, capital planning and asset values is material. Therefore, this information would be required by IFRS S2.

In some cases, a risk or opportunity identified by an entity may have attributes that are related to climate as well as nature or socioeconomic factors. The impact that the risk or opportunity may have on an entity is unaffected by how it is classified or viewed. However, the timing of when information about that risk or opportunity is disclosed could be affected by its classification if the entity applies the 'climate first' transition relief (as discussed in Chapter 53).

In December 2023, the IFRS Foundation published *Education material: Nature and social aspects of climate-related risks and opportunities* to explain whether and how entities should consider the nature and social aspects of climate-related risks and opportunities when applying IFRS S2. The education material includes three examples of climate-related risks and opportunities with a nature or social aspect. While the educational material is not part of the standard and does not add or change requirements in IFRS S2, these examples indicate that climate-related risks and opportunities can be broad in scope.²

² [Educational material: Nature and social aspects of climate-related risks and opportunities](#), ISSB, December 2023, available on the IFRS Foundation's website.

Extract from Educational material: Nature and social aspects of climate-related risks and opportunities

Example 3-Disclosing information about a company's response to a climate-related risk (social aspect)

...

Fact pattern

An entity operates in the electric utilities and power generators industry. It generates electricity from both renewable and fossil fuel sources and sells that electricity to customers in its jurisdiction.

The entity operates in a jurisdiction with a nationally determined contribution (NDC) arising from the latest international agreement on climate change (as defined in Appendix A of IFRS S2). To align with that NDC, the entity has set a greenhouse gas (GHG) emissions reduction target for 20XY.

To achieve its GHG emissions reduction target, the entity plans to phase out its coal-based plants by 20X0 and increase its renewable energy production by X%. The entity currently has X00 employees working in its coal-based plants. Those plants operate next to the only remaining coal mining site in the jurisdiction, which currently employs more than X,000 people.

Considering the NDC in the entity's jurisdiction, the entity is pursuing a 'just transition' to a lower-carbon economy. That is, the entity is transitioning to a lower-carbon economy in a way that is as fair and inclusive as possible to everyone concerned and maximises opportunities for decent work among all communities, workers and social groups. The entity anticipates that its jurisdiction will introduce regulation requiring entities to undertake their transition to a lower-carbon economy in this manner.

Consequently, the entity identifies regulatory risk associated with the NDC in its jurisdiction as a climate-related risk to which it is exposed. The latest international agreement on climate change, and the NDC arising from it, were developed to combat climate change. If the entity is not able to comply with the 'just transition' requirements associated with the NDC, there can be regulatory, reputational and legal consequences, which can affect the entity's prospects.

Application of IFRS S2

In accordance with paragraph 10 of IFRS S2, the entity discloses information that enables users of general purpose financial reports to understand the regulatory risk associated with how the entity manages its workforce as it transitions to a lower-carbon economy as a climate-related risk that it has determined could reasonably be expected to affect its prospects.

...

How we see it

Climate-related social impacts, nature and biodiversity loss, water, and deforestation could represent climate-related risks and opportunities that are within the scope of IFRS S2. Therefore, an entity that elects to use the 'climate first' transition relief in their first year of applying ISSB standards will still need to disclose information about those risks and opportunities if the entity judges that:

- The risks and opportunities are climate-related
- And
- The risks and opportunities could reasonably be expected to affect the entity's prospects

3 Identifying climate-related risks and opportunities

Similar to sustainability-related risks and opportunities (as discussed in Chapter 53), climate-related risks and opportunities arise from an entity's impacts and dependencies on natural resources and its relationships with stakeholders and society, the economy and its interaction with the natural environment. [IFRS S2.BC26].

The importance of understanding the role of impacts and dependencies in the identification of climate-related risks and opportunities is explained further in Figure 3-1 below.

Figure 3-1: Impacts and dependencies

Topic	Explanation	Example
Dependencies	A climate-related risk may arise from changes in the availability, quality or cost-stability of essential inputs that an entity depends on.	A sports drink company depends on the availability and quality of water to manufacture its products. Supplies of fresh water become limited during times of drought, which could result in water supply disruptions and higher water costs. This could affect production volumes and costs and, therefore, affect the amount of future cash flows that the sports drink company can expect to generate from its operations. [IFRS S2.BC27].
Impacts	A climate-related risk or opportunity may arise if an entity's impacts on climate change affect the resources and relationships on which the entity depends.	A manufacturing company expects a carbon tax to be introduced in a key jurisdiction in which it has emissions-intensive operations. The introduction of a carbon tax will increase the company's costs of production which it will pass onto consumers through higher product prices. Higher prices will affect the demand of the company's products and thus the amount of its future cash flows and the useful life of its manufacturing plant. [IFRS S2.BC28].

The TCFD provided categories for climate-related risks and opportunities, which may help an entity to identify its climate-related risks and opportunities under IFRS S2. A list of these categories is provided in Figure 3-2 below. Furthermore, the ISSB noted that the *Industry-based Guidance on Implementing IFRS S2*, which is based on the SASB standards but is not intended to be comprehensive or interpreted as such, provides some parameters for identifying climate-related risks and opportunities. This is discussed further in section 4.3.1.B below. [IFRS S2.BC24].

Figure 3-2: Categories of climate-related risks and opportunities

Physical risks	Transition risks	Opportunities
<ul style="list-style-type: none"> ▪ Acute risk ▪ Chronic risk 	<ul style="list-style-type: none"> ▪ Policy and legal risks ▪ Market risk ▪ Technology risk ▪ Reputation risk 	<ul style="list-style-type: none"> ▪ Resource efficiency ▪ Energy source ▪ Products and services ▪ Markets ▪ Resilience

4 Core content

4.1 Overview

The core content disclosures in IFRS S2 are structured around four thematic areas that address how an entity oversees and manages its climate-related risks and opportunities. The core content areas require an entity to disclose information about its governance, strategy, risk management, and metrics and targets. This disclosure is intended to provide primary users with a complete set of information that enables them to understand the entity's exposure to and management of its climate-related risks and opportunities. [IFRS S2.BC30]. These disclosure requirements in IFRS S2 for climate-related risks and opportunities are structured around the same core content disclosure requirements in IFRS S1 for general sustainability-related risks and opportunities. The purpose of the core content disclosures and guidance on avoiding duplication in disclosures are discussed in Chapter 53.

4.1.1 Comparison with TCFD Recommendations

In July 2023, the ISSB published *Comparison IFRS S2 Climate-related Disclosures with the TCFD Recommendations*, which notes that the requirements of IFRS S2 integrate and are consistent with the 11 recommended disclosures of the TCFD.³ In analysing the core content requirements in IFRS S2 and the associated core recommendations, recommended disclosures and guidance in the TCFD, the ISSB categorised the differences between IFRS S2 and TCFD Recommendations into three types, which are summarised in Figure 4-1 below:

Figure 4-1: Comparing TCFD Recommendations and IFRS S2

Type of difference	What IFRS S2 requires
Different wording	In some cases, IFRS S2 uses different wording to capture the same information as the TCFD Recommendations. In those cases, the requirements in IFRS S2 are considered to be broadly consistent with the TCFD Recommendations.
More detailed information	In some cases, IFRS S2 requires the disclosure of more detailed information, noting that the IFRS S2 disclosure requirements remain in line with the corresponding TCFD Recommendations.
Different guidance	In some cases, IFRS S2 requirements differ from the TCFD Recommendations, but mainly as a result of providing additional requirements and guidance. However, there is no intended difference between IFRS S2 and the TCFD's overall recommendations.

The specific differences between the IFRS S2 requirements and the TCFD Recommendations for each of the core content areas are identified and explained in the sections below.

How we see it

Entities that are currently preparing climate-related disclosures in accordance with the TCFD Recommendations cannot assume that their existing disclosures will be sufficient to comply with ISSB standards. As noted in the table above, IFRS S2 includes additional requirements and guidance. IFRS S1 also specifies additional disclosure considerations. All of these requirements need to be met in order to provide a complete set of sustainability-related financial disclosures in accordance with ISSB standards.

4.2 Governance

The governance disclosure requirements in IFRS S2 for climate-related risks and opportunities correspond with the governance disclosure requirements for sustainability-related risks and opportunities in IFRS S1. As such, the commentary in Chapter 53 on governance disclosure requirements in IFRS S1 is also applicable to the preparation of governance disclosures relating to climate-related risks and opportunities. An entity is not required to provide separate governance disclosures for each sustainability-related risk and opportunity if oversight of the entity's sustainability-related risks and opportunities is managed on an integrated basis. In such cases, an entity needs to avoid unnecessary duplication by providing an integrated governance disclosure that meets the requirements set out in both IFRS S2 and IFRS S1. [IFRS S2.7].

³ Further guidance provided by the ISSB on the TCFD can be found at [Making the transition from TCFD to ISSB](#), available on the ISSB Foundation's website.

TCFD comparison

The ISSB indicates that IFRS S2 disclosure requirements for an entity's governance on climate-related risks and opportunities is broadly consistent with the TCFD recommended disclosures.

However, in its TCFD comparison document, the ISSB noted that IFRS S2 requires disclosure of more detailed information about the description of the board's oversight of climate-related risks and opportunities. For example, how responsibilities for climate-related risks and opportunities are reflected in the terms of reference, mandates, role descriptions and other related policies applicable to the governance body(ies) or individual(s) who have oversight of those risks and opportunities.

4.3 Strategy

The strategy requirements in IFRS S2 for climate-related risks and opportunities correspond with the strategy disclosure requirements for sustainability-related risks and opportunities in IFRS S1, except that IFRS S2 has additional requirements and provides additional guidance in relation to:

- Identifying and classifying climate-related risks and opportunities that could reasonably be expected to affect the entity's prospects
- The effects of an entity's climate-related risks and opportunities on its strategy and decision-making, including information about its climate-related transition plan (if it exists)
- The resilience of the entity's strategy and business model to climate-related changes, developments and uncertainties

The following sections discuss each of these additional requirements and guidance.

For the remainder of the strategy disclosure requirements in IFRS S2, the commentary in Chapter 53 on strategy disclosure requirements in IFRS S1 is also applicable to the preparation of strategy disclosures relating to climate-related risks and opportunities.

4.3.1 Disclosures about climate-related risks and opportunities

4.3.1.A Classifying climate-related risks

IFRS S2 requires an entity to classify each climate-related risk identified as either a climate-related physical risk or climate-related transition risk. [IFRS S2.10(b), IFRS S2.B5]. The differences between physical risks and transition risks are discussed in sections 2 and 3 above.

In its Integrated Report and Financial Statements 2023, Mondi plc discloses its physical risks, transition risks and its climate-change related opportunities. It describes one of physical risks, as follows:

Practical example 4-1: Mondi plc (2023)

United Kingdom

Integrated report and financial statements 2023 [extract]

Strategic report [extract]

Mondi Action Plan 2030 (including our TCFD disclosure) [extract]

Taking Action on Climate: TCFD [extract]

Climate change-related risks: Physical risks [extract]

Risk	Risk description	How we manage and mitigate this risk	Estimated financial impact (€m)
1. Higher wood procurement costs Timeframe: Long term	Temperature increase, changes in rainfall patterns and windstorms can result in large-scale forest damage. In Europe, at lower altitudes, fibre losses from pests (e.g. bark beetles) and diseases are expected to continue unless precipitation increases. A reduction in the cutting capacity of the sawmilling industry due to a lack of spruce saw logs could lead to a change in the mix of available pulpwood and sawmill chips. Increasing competition for wood is being driven by demand for renewable raw materials and timber for green energy generation to achieve EU GHG reduction and Net-Zero targets. At the same time, there is a call to increase forest areas set aside for conservation, which is reflected in the 2030 EU Forest Strategy.	In mountainous regions, we expect an increase in yearly forest growth due to rising temperatures. At lower altitudes, spruce will be mainly replaced with other softwood species. We are investigating alternatives to support flexibility in species mix for our future pulp production. We invest in research and development projects and are building strategic partnerships with forest owners and industries, NGOs and scientific institutions to foster sustainable forest management. This is supported by the sustainable working forest model and fit-for-purpose certification concepts, which we developed and promote with our partners. We have started to explore approaches to climate-fit forestry to enhance forest ecosystems' resilience. We also promote the cascading use of wood nationally and via Cepi on a European level.	90-180

4.3.1.B Using industry-based guidance to identify climate-related risks and opportunities

In identifying the climate-related risks and opportunities that could reasonably be expected to affect an entity's prospects, IFRS S2 requires an entity to refer to and consider the applicability of the industry-based disclosure topics defined in the *Industry-based Guidance on Implementing IFRS S2*, which was issued by the ISSB at the same time as IFRS S1 and IFRS S2.⁴ [IFRS S2.12].

In the Exposure Draft of IFRS S2, the ISSB proposed industry-based requirements that were derived from SASB standards (with enhancements made to the international applicability of some requirements) to enable comparable disclosures among industry peer entities. Feedback on the proposed industry-based requirements was mixed, in part because of concerns about the ability and relevance of applying some of the proposals internationally given the SASB standards were primarily developed for the US market. In response to that feedback, the ISSB decided to retain the industry-based guidance with some enhancements to its international applicability but issued it as non-authoritative guidance that "suggests possible ways to apply some of the disclosure requirements in IFRS S2 but does not create additional requirements".

The disclosure topics identified and defined in the industry-based guidance list climate-related risks and opportunities that are typically associated with particular business models, activities or other common features that characterise participation in an industry. For example, in the real estate industry, the industry-based guidance identifies energy management, water management, management of tenant sustainability impacts and climate change adaptation as disclosure topics. [IFRS S2.BC135, IFRS S2.BC136].

The industry-based guidance also suggests possible ways to measure and disclose information about climate-related risks and opportunities. This is discussed further in relation to metrics and targets in section 4.5 below.

IFRS S2 requires an entity to "refer to and consider the applicability of" the disclosure topics defined in the *Industry-based Guidance on Implementing IFRS S2*. [IFRS S2.12]. The same requirements are included in IFRS S1 in relation to the sources of guidance. As discussed in Chapter 53, this requirement means that, after referring to the industry-based guidance, an entity is not required to apply that guidance if the entity considers that it is not applicable.⁵ However, even if an entity decides not to use the Industry-based Guidance on Implementing IFRS S2, industry specific disclosures are still required by ISSB standards.

The ISSB included this requirement to refer to the industry-based guidance because it considers the guidance to be a helpful starting point for identifying climate-related risks and opportunities about which an entity may need to prepare disclosures. The ISSB also noted that the disclosure topics and associated metrics set out in the guidance are not intended to be exhaustive and, therefore, it should not be interpreted as comprehensive. Consequently, an entity will also need to disclose climate-related financial information about other topics that are common to an industry but that are not included in the industry-based guidance if those topics relate to climate-related risks and opportunities that could reasonably be expected to affect the entity's prospects. [IFRS S2.BC137, IFRS S2.BC24].

4.3.1.C Using reasonable and supportable information to identify climate-related risks and opportunities

In identifying the climate-related risks and opportunities that could reasonably be expected to affect an entity's prospects, IFRS S2 requires an entity to use all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort. This information includes information about past events, current conditions and forecasts of future conditions. [IFRS S2.11].

The requirement that an entity "use all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort" is a concept that is employed in both IFRS S1 and IFRS S2 so that the ISSB could clarify its expectations about the level of effort needed to comply with a specific disclosure requirement.

4 [Industry-based Guidance on implementing Climate-related Disclosures](#), ISSB, June 2023, available at the IFRS Foundation's website.

5 An entity that has elected to use the climate-first transition relief in its first year of applying ISSB Standards is required to refer to and consider the applicability of the Industry-based Guidance, but it is not required to also refer to and consider the applicability of the SASB Standards (in accordance with IFRS S1.55(a)) in that first year of reporting. This clarification was made in the ISSB's Education material: Applying IFRS S1 when reporting only climate-related disclosures in accordance with IFRS S2 (January 2025), which noted that the Industry-based Guidance was derived from the SASB Standards (refer to footnote 7 of the Education Material).

More information about the application of the “use all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort” concept is provided in Chapter 53.

Frequently asked questions

Question 4-1: Can an entity use scenario analysis to assist in identifying climate-related risks and opportunities?

Many entities that have been previously reporting in accordance with the TCFD may have used scenario analysis to assist in the identification of their climate-related risks and opportunities. Under ISSB standards, an entity can, but is not required to, use scenario analysis to assist in identifying its climate-related risks and opportunities. This is acknowledged in the Basis for Conclusions on IFRS S2, which states that “climate-related scenario analysis can be used to inform a variety of other disclosures required by IFRS S2, including the identification and assessment of risks and opportunities”. Furthermore, IFRS S2 requires an entity to disclose in its risk management disclosures whether and how scenario analysis is used to inform the entity's identification of climate-related risks. [IFRS S2.25(a)(ii), IFRS S2.BC69].

Although an entity is not required to use scenario analysis in the identification of climate-related risks and opportunities, IFRS S2 requires scenario analysis to be used for the purposes of assessing the resilience of the entity's strategy and business model to climate-related changes. This is discussed further in section 4.3.3 below.

How we see it

Scenario analysis is an analytical tool that can be used for different purposes. An entity may, but is not required under IFRS S2 to, perform such an analysis to inform the identification of climate-related risks and opportunities that an entity considers could reasonably be expected to affect its prospects. However, under IFRS S2, an entity is required to use scenario analysis in order to assess the resilience of its business model and strategy based on a range of outcomes that may be plausible but uncertain.

If an entity discloses that it uses scenario analysis to inform its identification of climate-related risks and opportunities, it needs to make it apparent to primary users that the risks and opportunities identified are those could be reasonably expected to affect its prospects rather than just being presented as outputs of the scenario analysis. Identifying a valid and complete set of climate-related risks and opportunities is important as they form the foundation of other disclosures that seek to provide information to primary users about the entity's exposure to climate-related risks and opportunities and the entity's planned response to that exposure. This includes disclosures about:

- The current and anticipated effects of the risks and opportunities on the entity's business model and value chain
- How the entity is responding/plans to respond to those risks and opportunities in its strategy and decision-making
- The current and anticipated effects of the risks and opportunities on the entity's financial position, financial performance and cash flows
- The resilience of the entity's strategy and business model to those risks and opportunities

4.3.2 Disclosures about the effects of climate-related risks and opportunities on the entity's strategy and decision-making

Consistent with IFRS S1, IFRS S2 requires an entity to disclose information to enable primary users to understand the effects of climate-related risks and opportunities, including how it has responded, and plans to respond, to such risks and opportunities in its strategy and decision-making. However, IFRS S2 is more prescriptive by also requiring the disclosure of: [IFRS S2.14(a)]

- How the entity plans to achieve any climate-related targets it has set,
And
- Any targets it is required to meet by law or regulation

Figure 4-2 below outlines the specific disclosures that IFRS S2 requires an entity to provide about its responses or planned responses to climate-related risks and opportunities.

Figure 4-2: An entity's responses to climate-related risks and opportunities

Required disclosure	Remarks
Information about current and anticipated changes to the entity's business model, including its resource allocation, to address climate-related risks and opportunities. [IFRS S2.14(a)(i)].	Examples include: <ul style="list-style-type: none"> Plans to manage or decommission operations that are carbon, energy or water-intensive Reallocation of resources due to demand or supply-chain changes Reallocation of resources due to new business development resulting in capital expenditure or additional expenditure on research and development Acquisitions or divestments
Information about current and anticipated <i>direct</i> mitigation and adaptation efforts. [IFRS S2.14(a)(ii)].	Examples include: <ul style="list-style-type: none"> Changes in production processes Equipment changes Relocation of facilities Workforce adjustments Product specification changes
Information about current and anticipated <i>indirect</i> mitigation and adaptation efforts. [IFRS S2.14(a)(iii)].	Examples include: <ul style="list-style-type: none"> Working with customers Working with supply chains
Information about an entity's climate-related transition plan (if it has one). [IFRS S2.14(a)(iv)].	Information to be disclosed about an entity's transition plan includes: <ul style="list-style-type: none"> Key assumptions used in developing the transition plan Dependencies on which the transition plan relies upon
Information about how the entity plans to achieve any climate-related targets, including any GHG emission targets. [IFRS S2.14(a)(v)].	This includes targets that the entity has set and targets that the entity is required to meet by law or regulation. The targets are discussed further in section 4.5 below.

With respect to the entity's plans, IFRS S2 also requires an entity to disclose:

- Information about how the entity is resourcing, and intends to resource, those plans [IFRS S2.14(b)]
- Information (both quantitative and qualitative) about the progress of those plans compared to previous reporting periods [IFRS S2.14(c)]

Illustrations 4-1, 4-2 and 4-3 below are based on examples provided in the ISSB's educational material on disclosing information about anticipated financial effects:⁶

⁶ [Educational material: Disclosing information about anticipated financial effects applying ISSB Standards](#), ISSB, August 2025, available on the IFRS Foundation's website.

Illustration 4-1: Anticipated financial effects of the risk of carbon prices

Entity A that explores, extracts and processes natural resources has identified the introduction of a carbon tax in Jurisdiction A as a climate-related risk. This is because, if a carbon tax is implemented, Entity A's carbon-intensive mining operations in Jurisdiction A are likely to face higher operating costs than other jurisdictions.

Entity A would be subject to a tax if its GHG emissions generated in Jurisdiction A exceed a specified threshold. In response to that, Entity A developed a climate-related transition plan that focuses on actions to embed more energy-efficient equipment and low-carbon technology into its processes in Jurisdiction A. It has also adjusted the impairment analysis and useful life accordingly for plant and equipment in Jurisdiction A that are becoming obsolete (stranded assets). Entity A may determine that it is appropriate to provide information regarding the carrying amount and depreciation of these assets by cross-reference to its financial statements. Entity A's time horizons have been defined in line with its strategic planning cycle as follows:

- Short term: 2 years
- Medium term: 3-6 years
- Long term: 7-20 years

In providing information about the anticipated financial effects of its plan to reduce its GHG emissions in Jurisdiction A, Entity A discloses that it expects it will make investments in more energy-efficient plant and equipment of up to CU100 million, of which CU10-12 million is anticipated to be incurred in the short term, CU25-30 million in the medium term and CU58-65 million in the long term.

Entity A discloses its planned sources of funding for the investments and that the anticipated effects on operating costs for the repairs and maintenance of these investments in plant and equipment are estimated to be CU1 million in the short term, CU4 million in the medium term and CU10 million in the long term.

Illustration 4-2: Anticipated financial effects of the risk of floods

Entity B is a retailer that sells products manufactured by other entities in its value chain and operates brick-and-mortar stores in coastal locations. Entity B has identified a climate-related physical risk due to its operations being in areas exposed to increased frequency and severity of floods. Severe flooding is expected to increase in some of the coastal areas in which Entity B's stores are located. This could reasonably be expected to lead to physical damage to Entity B's stores and inventory, reductions in customer traffic, restricted access for employees and disruption in the supply chain. Entity B has flood insurance that covers business interruption and damage to real estate and inventory and the insurance premiums for these risks have increased in recent years and are expected to further increase due to the increased flood risk.

Entity B's time horizons have been defined in line with its strategic planning cycle as:

- Short term: 1 year
- Medium term: 2-3 years
- Long term: 4-10 years

Entity B considered the inputs and assumptions that it could use to determine the anticipated financial effects of the flood risk such as:

- Historical flood insurance premiums information readily available from managing its business operations.
- Information about the projected rise in floods based on scientific studies (instances and severity) in the areas its stores are located, which are available from its risk management process.

Entity B does not have access to information about whether the historical increases in insurance premiums already factored in future rising flood risks or the extent to which the increasing flood risk has been factored into existing premium rates. Therefore, Entity B determines that this information is not available to it at the reporting date without undue cost or effort and decided to use the most recent annual increase in premium as a proxy for future annual increases. Being unable to separately identify the effect of the flood risk on the future insurance premiums, Entity B considered recent trends in premium rates to determine the anticipated increase in insurance premiums and decided to disclose information that combines the effect of increases in insurance premiums as a result of increasing flood risk with the effects of other factors.

Using this information, Entity B estimated that the anticipated financial effects on its financial performance are increases in insurance premiums due to the risk of floods. Entity B discloses that the effect of the increase in insurance premiums on operating costs is CU7-9 million in the short term, CU15-20 million in the medium term and up to CU50 million in the long term. Entity B would also disclose the amount and percentage of stores and inventory vulnerable to the risk of floods as part of applying paragraph 29(c) of IFRS S2.

Illustration 4-3: Anticipated financial effects of the risk of water scarcity

Entity C operates in the agricultural products industry by growing, harvesting and packaging rice for sale. Entity C relies on a third-party supplier in another jurisdiction to supplement its own production, and its business model depends on water because of the reliance of growing rice on rainfall and on irrigation from other water sources. Although Entity C's own water supply is not exposed to scarcity risks, the third-party supplier is exposed to rising water scarcity risks in the region in which it operates through increasing temperatures and changing precipitation patterns. The third-party supplier's baseline water stress is expected to worsen over the medium term. The specific type of rice that Entity C purchases is only available in that region and water scarcity would likely affect all suppliers in the area. Entity C has identified a risk of water scarcity in the region in which the third-party supplier operates because Entity C is reliant on this source of rice, and water scarcity gives rise to the risk of increased cost for that rice and risk of delivery failure.

Entity C's time horizons have been defined in line with its strategic planning cycle as:

- Short term: 2 years
- Medium term: 3-6 years
- Long term: more than 6 years

Entity C conducts climate-related scenario analysis to assess how various climate change scenarios may affect its operations in various locations. Based on its analysis, Entity C expects a significant reduction in the water available in the third-party supplier's region for irrigation of rice fields in the medium term. Water scarcity can affect the availability of rice which can increase the price that Entity C's buys the rice from the third-party supplier. Entity C determined that the estimated effect on its operating result of expected increases in the cost of rice from the third-party supplier is:

- Not assessed to be material to investors in the short term and therefore, information is not disclosed about the short-term anticipated financial effect of the risk of water scarcity.
- Negative in the medium term by approximately CU16-18 million per year, considering the expected cost and volume of rice that will be purchased from the third-party and assuming an average increase in the price of rice of 3% per year arising from water scarcity (excluding inflation). This is disclosed as Entity C's anticipated financial effect.
- Uncertain in the long term, due to the variables involved, such as the volume of rainfall that could affect the area and Entity C's ability to obtain agreements with other suppliers in the regions that do not have the same exposure to water scarcity. Entity C determined that the level of measurement uncertainty involved in estimating those effects is so high that the resulting quantitative information would not be useful. Entity C discloses an explanation of why it has not provided quantitative information about this effect in the long term and, instead, provides qualitative information about the financial effects of the risk of water scarcity.

Among other things, these illustrative examples highlight that:

- Narrative disclosure can complement the disclosure of quantified financial effects
- Financial effects can be described and disclosed according to the main drivers of the mitigation and adaptation efforts (e.g., the investment in more energy-efficient plant and equipment, the sources of funding for the investment, and the expected increase in lifecycle costs associated with the plant and equipment in Illustration 4-1)
- Connections exist between disclosures (e.g., the connection between anticipated financial effects associated with rising insurance premiums and the vulnerability metric disclosing the amount and percentage of stores and inventory vulnerable to the risk of floods in Illustration 4-2)
- Inputs and assumptions should be included in the disclosure of financial effects (e.g., assumed average increase in price of rice and no adjustment being made for inflation in Illustration 4-3)

In its Sustainability-Related Financial Information Report 2024, Vale S.A. discloses information about the current financial effects and anticipated financial effects for one of its transition risks, which is described as “exposure to regulations related to GHG emissions, resulting in a possible reduction in market share and higher operating costs”. It discloses the current and anticipated financial effects of this risk, as follows:

Practical example 4-2: Vale S.A. (2024)
Brazil
Sustainability-Related Financial Information report 2024 [extract]
8. Risks and opportunities related to climate change [extract]
Climate risks [extract]

TR1 Exposure to regulations related to GHG emissions, resulting in a possible reduction in market share and higher operating costs [extract]

d) Current financial effects

The following table shows the financial impacts of decarbonization projects and costs related to carbon pricing expenses.

	Reference	December 31, 2024	Year ended December 31, 2024		Year ended December 31, 2024
		Balance Sheet	Income statement		Cash flows Statement
		Property, plant and equipment	Depreciation	Costs and Expenses	Payments
Briquettes and Mega Hubs	c.1	288	(2)	(25)	(116)
Renewable energy	b.1	219	(18)	(5)	(17)
Energy efficiency	b.2	93	(12)	(2)	(5)
Low-carbon process inputs	b.3	41	–	(3)	(39)
Biofuels, low-carbon energy solutions and natural gas	b.4	26	(1)	(31)	(46)
Other decarbonization projects		23	(2)	(3)	(12)
Carbon pricing ²		–	–	(11)	(5)
Total		690	(35)	(80)	(240)

² Due to GHG emission regulations in Canada. The Company also has assets in other jurisdictions that have regulated carbon markets, such as the United Kingdom and Japan, for which there were no expenses related to this matter in the 2024.

e) Anticipated financial effects

The Company estimates that it may incur costs arising from carbon pricing mechanisms from US\$1 billion to US\$3.5 billion, measured at present value. These costs may impact the Company's income statement and cash flows substantially from 2030 onwards, therefore, over the long-term horizon as defined in [section 4](#). The amount and timing of disbursements will depend on the achievement of Vale's emissions targets and the significant uncertainties described in [section 9](#). For more details on the Company's targets, please refer to [section 10](#).

In the steel industry, the Company invests in its own technologies and partnerships for the transition from blast furnaces and has developed iron ore briquettes. These investments are estimated at up to US\$1 billion (present value) and are substantially linked to the construction and development of Mega Hubs. Disbursements will occur in the short (4%), medium (74%) and long term (22%), and will be recognized on the balance sheet as property, plant and equipment or investments in associates and joint ventures. In addition, Vale estimates research and development expenses of up to US\$250 (present value), which disbursements will occur in the short (44%) and medium (56%) term.

As another example, Lojas Renner S.A., in its Sustainability-Related Financial Information Report 2024, discloses information about the current financial effects and anticipated financial effects for one of its physical risks, which is described as the “physical risk of floods and road blockages, leading to a decrease in customer traffic to physical stores, restricted access for employees, and challenges in logistics processes”. It discloses the current and anticipated financial effects of this risk together with the judgements and uncertainties associated with the calculation of those financial effects, as follows:

Practical example 4-3: Lojas Renner S.A. (2024)

Brazil

Sustainability-related financial information report 2024 [extract]

03. Strategy [extract]

Climate risks [extract]

2. Floods [extract]

2.5 Financial impacts

To calculate the financial impact of flooding, the Company considered all business units with stores classified as very high risk according to its internal impact matrix.

The analysis focused on reduced customer foot traffic and road blockages due to flooding, both of which may result in loss of sales.

The measurement estimated the number of days stores would remain closed, using past events and regional/yearly frequencies as a baseline, based on the Company's impact matrix (learn more on [page 32](#)). It also factored in the likelihood of intensification of such climate events.

From these scenarios, projected sales for affected stores were incorporated into short-, medium-, and long-term cash flow models, adjusted according to each store's expected growth rate depending on its maturity stage. Present value was calculated using a WACC rate of 13.8%.

2.5.1 Current financial impacts

For the fiscal year ended December 31, 2024, the Company recorded a negative impact of approximately R\$10 million on operational results due to the financial effects of flood risk.

There were no significant inventory losses or material property damage that would require impairment provisions. As a result, there is no expectation of accounting adjustments for the upcoming fiscal year, especially considering that most stores are located in shopping centers with broad geographic distribution and that the Company has implemented risk response actions.

Note 3.7 of the Company's 2024 Annual Financial Statements includes disclosures on the accounting estimates related to this event.

2.5.2 Future financial impacts

The estimated negative financial impact on the Company's net cash flow (after taxes) over the next 10 years is presented in the table below:

Short	Up to 1 year	R\$ 3 a 4 MM
Medium	1 to 3 years	R\$ 4 a 5 MM
Long	3 to 10 years	R\$ 14 a 16 MM

2.5.3 Conclusion

The Company concludes that both the measured current effects and projected future impacts are not financially material.

Nonetheless, it considers the risk to be relevant due to the increasing recurrence of such climate events, which highlights the importance of continuous risk monitoring and response actions, especially as new store locations are evaluated regionally.

Judgments and Uncertainties

The calculation of the financial effects of this risk involves limitations in measurement and estimation, due to the complexity of the variables involved. These variables are difficult to predict, such as the specific regions that may be affected in the coming years, the volume of rainfall that could impact these areas, the extent of damage to store structures and products, the duration of operational downtime, as well as potential losses of equipment. This variability makes it difficult to precisely quantify the future financial impact.

4.3.2.A Climate-related transition plans

IFRS S2 defines the 'climate-related transition plan' as follows: *[IFRS S2 Appendix A]*

Extract from IFRS S2

Appendix A

Defined terms

climate-related transition plan

An aspect of an entity's overall strategy that lays out the entity's targets, actions or resources for its transition towards a lower-carbon economy, including actions such as reducing its **greenhouse gas** emissions.

The ISSB considers that disclosure of an entity's transition plan, or set of plans, to respond to the expected transition to a lower-carbon economy (if it has such plans) will help primary users assess the effects of climate-related risks and opportunities on the entity's cash flows, its access to finance and cost of capital. [IFRS S2.BC46].

IFRS S2 does not specify what is included in a transition plan. The ISSB notes that a transition plan will reflect an entity's individual circumstances, therefore, its focus is to enhance the comparability and consistency of disclosures about transition plans. [IFRS S2.BC52]. Transition plans can vary; for some entities, their transition plans form part of their overall business strategy as the plan is being used to adjust the entity's business model in response to its climate-related risks and opportunities. Whereas for some other entities, the plan does not form part of the overall business strategy and instead applies only to a particular product line, business unit or set of activities. [IFRS S2.BC47].

To assess the credibility of an entity's transition plan and to be able to make comparisons between entities' transition plans, primary users need to understand the assumptions and dependencies that underpin an entity's transition plan. For that reason, IFRS S2 requires an entity to disclose:

- The assumptions it made in developing its climate-related transition plan
- The dependencies on which the plan's achievement relies

The ISSB explains the difference between assumptions and dependencies in the context of transition plans in Figure 4-3 below: [IFRS S2.BC52]

Figure 4-3: Differences between assumptions and dependencies in transition plans

	Meaning	Examples
Assumption	A belief, expectation, hypothesis or premise that the entity expects will occur and, therefore, builds into its climate-related transition plan. Assumptions are uncertain.	<ul style="list-style-type: none"> ▪ Expectations about regulatory requirements ▪ Expectations about the ability of an entity to implement planned changes within its value chain
Dependencies	Critical factors and conditions that are required for an entity's transition plan to be realised.	<ul style="list-style-type: none"> ▪ An emission removal technology that an entity will rely upon to meet its GHG emission targets ▪ The minimum level of resource availability needed so that the entity can implement its transition plan

In preparing its climate-related financial disclosures, an entity needs to consider how to make connections between information disclosed in its transition plan and the disclosure of other information such as its GHG emissions, its emission targets and climate resilience. [IFRS S2.BC49].

How we see it

IFRS S2 does not require an entity to develop a transition plan. The standard only requires the disclosure of particular information about transition plans if an entity has such a plan. In our view, given the importance that primary users place on information about an entity's transition plan, an entity that does not have a transition plan needs to consider disclosing that fact.

Some organisations that are external to the ISSB have also been working on guidance on the preparation of transition plans. One such initiative is the Transition Plan Taskforce (TPT) which was launched by the UK Government with the intention to set out good practices for robust and credible transition plan disclosures as part of an entity's annual reporting on forward business strategy. The TPT published its *Disclosure Framework* in October 2023, which sets out five key elements of a good practice transition plan, which are expanded upon through 19 sub-elements and a series of disclosure recommendations for each sub-element.⁷ The IFRS Foundation assumed responsibility for the TPT materials in 2024.

⁷ [TPT Disclosure Framework](#), TPT, October 2023, available in the IFRS Foundation's website.

TPT's five key elements of a good practice transition plan are summarised in Figure 4-4 below.

Figure 4-4: Key elements of a transition plan

Key element	Details
Foundations	"An entity shall disclose the Strategic Ambition of its plan. This shall comprise the entity's objectives and priorities for responding and contributing to the transition towards a low GHG emissions, climate-resilient economy, and set out whether and how the entity is pursuing these objectives and priorities in a manner that captures opportunities, avoids adverse impacts for stakeholders and society, and safeguards the natural environment. Under this element, an entity should also disclose the high-level implications that this transition plan will have on its business model and value chain, as well as the key assumptions and external factors on which the plan depends."
Implementation Strategy	"An entity shall disclose the actions it is taking within its business operations, products and services, and policies and conditions to achieve its Strategic Ambition, as well as the resulting implications for its financial position, financial performance, and cash flows."
Engagement Strategy	"An entity shall disclose how it is engaging with its value chain, industry peers, government, public sector, communities, and civil society in order to achieve its Strategic Ambition."
Metrics & Targets	"An entity shall disclose the metrics and targets that it is using to drive and monitor progress towards its Strategic Ambition."
Governance	"An entity shall disclose how it is embedding its transition plan within its governance structures and organisational arrangements in order to achieve the Strategic Ambition of its transition plan."

In June 2025, the ISSB published Guidance Material to guide entities in reporting information about their transition towards a lower-carbon and/or climate-resilient economy when applying IFRS S2.⁸ This guidance builds on the disclosure-specific material developed by the TPT. The guidance is not intended to help entities design a transition plan and it does not add to or change the requirements in IFRS S2. Instead, the guidance focuses on the disclosure aspects of transition plans. In particular, the guidance:

- Is designed to enable entities to provide high-quality information about their climate-related transition when applying IFRS S2 and includes examples of the type of information that an entity may determine as relevant to disclose
- Covers disclosures about any 'transition plan' an entity has, including both mitigation efforts and adaptation responses

The guidance also clarifies the distinction between mitigation efforts and adaptation, as follows:

- Mitigation efforts are primarily associated with transition risks, such as efforts intended to reduce an entity's GHG emissions (e.g., an entity considers adopting new technologies or changing its business model to introduce new products to reduce its GHG emissions).
- Adaptation responses are primarily associated with physical risks and involve an entity preparing for both the current and anticipated effects of climate change (e.g., an entity considers investing in changes to infrastructure to improve its resilience to physical risks).

How we see it

Initiatives such as the TPT Disclosure Framework may provide a useful source of insight and guidance that entities may choose to refer to when preparing their transition plan disclosures in accordance with IFRS S2. In our view, these initiatives may help to improve good disclosure practices and, as such, an entity may wish to consider the relevance of those initiatives to its own disclosures. However, entities need to be mindful that ISSB standards do not require an entity to comply with the guidance or recommendations in the TPT Disclosure Framework or other initiatives external to the ISSB and that, similarly, compliance with the TPT Disclosure Framework or other initiatives external to the ISSB will not necessarily mean that the entity's disclosures comply with ISSB standards.

All requirements in IFRS S1 and IFRS S2 need to be met in order to provide a complete set of sustainability-related financial disclosures in accordance with ISSB standards.

⁸ Guidance document: Disclosing information about an entity's climate-related transition, including information about transition plans, in accordance with IFRS S2, ISSB, June 2025, available on the IFRS Foundation's website.

4.3.3 Disclosures about the resilience of the entity's strategy and business model

Because the likelihood, magnitude and timing of climate-related risks and opportunities affecting an entity are uncertain and often complex, primary users have indicated that they need to understand the resilience of the entity's strategy and business model to climate change. [IFRS S2.BC57].

IFRS S2 defines 'climate resilience', as follows: [IFRS S2 Appendix A]

Extract from IFRS S2

Appendix A

Defined terms

climate resilience	The capacity of an entity to adjust to climate-related changes, developments or uncertainties. Climate resilience involves the capacity to manage climate-related risks and benefit from climate-related opportunities , including the ability to respond and adapt to climate-related transition risks and climate-related physical risks . An entity's climate resilience includes both its strategic resilience and its operational resilience to climate-related changes, developments and uncertainties.
---------------------------	---

Compared to IFRS S1, the climate resilience disclosure requirements in IFRS S2 are more extensive and prescriptive and require a scenario analysis to be completed. In providing quantitative information, IFRS S2 permits an entity to disclose a single amount or a range. [IFRS S2.22].

IFRS S2 requires disclosure of:

- An entity's assessment of its climate resilience as at the reporting date. [IFRS S2.22(a)].
- How and when the entity carried out climate-related scenario analysis, which is used to inform the resilience assessment. [IFRS S2.22(b)].

The relationship between a resilience assessment and scenario analysis is explained in Figure 4-5 below.

Figure 4-5: Difference between a resilience assessment and scenario analysis

Topic	Explanation
Resilience assessment	Using a range of plausible but uncertain climate outcomes (i.e., scenarios), management assesses the implications for the entity's business model and strategy and its capacity to adapt or respond. [IFRS S2.BC59]. Information about an entity's assessment of its climate resilience has to be disclosed as at each reporting date. [IFRS S2.BC68].
Scenario analysis	An analytical exercise used to inform that resilience assessment. An entity is not required to disclose the specific results of its scenario analysis. Instead, an entity is required to disclose information about its interpretation of those results. [IFRS S2.BC59]. A scenario analysis does not need to be performed every year. [IFRS S2.BC68].

4.3.3.A Resilience assessment

Within the context of an entity's identified climate-related risks and opportunities, paragraph 22(a) requires disclosure of information about the resilience of the entity's strategy and business model to the following factors described in Figure 4-6 below: [IFRS S2.BC58]

Figure 4-6: Assessing resilience

Factor	Explanation	Example
Climate-related changes	Such as events or changes resulting from climate change	<ul style="list-style-type: none"> ▪ Pervasive wildfires ▪ Rising sea levels
Climate-related developments	Such as evolving macroeconomic factors, e.g., regulatory responses and demographic shifts	<ul style="list-style-type: none"> ▪ Regulatory limits on the use of particular fossil fuels
Climate-related uncertainties	Such as different confidence intervals associated with climate-related changes and climate-related developments	<ul style="list-style-type: none"> ▪ Assumptions about the pervasiveness of wildfires ▪ Assumptions about the stringency of regulation

A resilience assessment involves interpreting the results of the scenario analysis. In particular, IFRS S2 requires that an entity's disclosure of the assessment of its climate resilience as at the reporting date enables primary users to understand: [IFRS S2.BC59, IFRS S2.22(a)]

- The implications (if any) for its strategy and business model, including how the entity would need to respond to the effects identified in the scenario analysis
- The significant areas of uncertainty considered in the entity's assessment of its climate resilience
- The entity's capacity to adjust or adapt its strategy and business model to climate change over the short, medium and long term, including:
 - The availability of, and flexibility in, the entity's existing financial resources to respond to the effects identified in the climate-related scenario analysis, including to address climate-related risks and to take advantage of climate-related opportunities
 - The entity's ability to redeploy, repurpose, upgrade or decommission existing assets
 - The effect of the entity's current and planned investments in climate-related mitigation, adaptation and opportunities for climate resilience

The following Illustration is based on the example used in the Basis for Conclusions to IFRS S2 to explain the type of information that an entity might disclose about the significant areas of uncertainty considered in its climate resilience assessment: [IFRS S2.BC60]

Illustration 4-4: Example showing disclosure of significant areas of uncertainty

In performing scenario analysis, Entity A identifies that future climate-driven migration could have implications in the long term for some of the assets and operations of Entity A and its major suppliers that are located near Region X which might become uninhabitable due to rising sea levels. Depending upon where those affected local communities relocate, the ability for Entity A and its suppliers to continue to run their operations at full capacity could be adversely impacted. It is not known whether, where or when the local communities may relocate and the consequential impact on Entity A's operations and its supply chain is also uncertain.

In accordance with paragraph 22(a)(ii) of IFRS S2, Entity A discloses that its resilience assessment is subject to significant uncertainty arising from the effects of future climate-driven migration from Region X, which, in turn, has implications for the stability of Entity A's supply chain and the resilience of its own assets and operations that are located near Region X. Given the time horizon that applies to this risk in the long term, Entity A also discloses that the degree of judgement required to interpret the results of this scenario analysis also increases.

In its 2024 Climate Report, Commonwealth Bank of Australia discloses its assessment of the resilience of its portfolio, as follows:

Practical example 4-4: Commonwealth Bank of Australia (2024)

Australia

Climate Report 2024 [extract]

Risk [extract]

Our approach to climate risk [extract]

Identifying and assessing [extract]

Assessing the resilience of our portfolio

Our assessment of the Bank’s resilience to climate risks through the CRMA considers the extent to which industries or regions we lend to are exposed to *physical* or *transition risks*. The table below identifies sub sectors, primarily based on ANZSIC classifications within our portfolio which are exposed to elevated climate-related *physical* or *transition risk*. This year, we have tested the resilience of 48% and 89% of our lending portfolios to potential climate-related *physical* and *transition risks*, respectively.

Sectors ²	Jun 24		Jun 23 ¹			
	Total sector TCE \$bn	TCE % of total	Total sector TCE \$bn	TCE % of total	Physical risk ³	Transition risk ⁴

4.3.3.B Scenario analysis

As noted above, IFRS S2 does not require an entity to disclose the results of its scenario analysis. Instead, IFRS S2 requires disclosure of information about the approach the entity used to carry out its scenario analysis.

In relation to how the scenario analysis was carried out, IFRS S2 requires disclosure of: *[IFRS S2.22(b)]*

- Information about the inputs used in the analysis
- Key assumptions made in the analysis

Disclosures about inputs and assumptions used in the analysis are discussed in Figure 4-7 below (noting these lists are not exhaustive).

Figure 4-7: Scenario analysis inputs and assumptions

Disclosures about inputs	Disclosures about assumptions
<ul style="list-style-type: none"> ▪ Which climate-related scenarios were used for the analysis and the sources of those scenarios ▪ Whether the analysis included a diverse range of climate-related scenarios ▪ Whether the scenarios used are associated with climate-related transition risks or climate-related physical risks ▪ Whether a climate-related scenario aligned with the 'latest international agreement on climate change' was used ▪ Why the entity decided that its chosen scenarios are relevant to assessing its resilience to climate-related changes, developments or uncertainties ▪ The time horizons used in the analysis ▪ What scope of operations (e.g., the operating locations and business units) was used in the analysis 	<ul style="list-style-type: none"> ▪ Climate-related policies in the jurisdictions in which the entity operates ▪ Macroeconomic trends ▪ National- or regional-level variables (e.g., local weather patterns, demographics, land use, infrastructure and availability of natural resources) ▪ Energy usage and mix ▪ Developments in technology

The 'latest international agreement on climate change' is defined by IFRS S2 to mean "An agreement by states, as members of the United Nations Framework Convention on Climate Change, to combat climate change. The agreements set norms and targets for a reduction in greenhouse gases." *[IFRS S2 Appendix A]*.

When the ISSB issued IFRS S2, the Paris Agreement of April 2016 was the latest international agreement on climate change. Signatories to the Paris Agreement agreed to: *[IFRS S2.BC145]*

- Limit the increase in the global average temperature to well below 2 degrees Celsius above pre-industrial levels
- Pursue efforts to limit the temperature increase to 1.5 degrees Celsius above pre-industrial levels

However, the ISSB decided against requiring the use of scenarios consistent with the latest international agreement on climate change or particular science-based scenarios for the following reasons: *[IFRS S2.BC67]*

- It would not be practical to specify which scenarios an entity should be required to use
- Any scenarios specified in the standards might quickly become out of date and could lead to an entity disclosing information that does not reflect its circumstances or the views of management on what might be plausible

IFRS S2 requires disclosure of the reporting period in which the climate-related scenario analysis was carried out. This is because the ISSB decided that, for the purposes of IFRS S2, an entity could carry out scenario analysis as part of its multi-year strategic planning cycle (e.g., every 3-5 years) rather than be required to update its scenario analysis at each reporting date.

Although an entity is not required to update its scenario analysis at each reporting date, IFRS S2 requires the entity to: *[IFRS S2.B18, IFRS S2.BC68]*

- At a minimum, update its climate-related scenario analysis in line with its strategic planning cycle
- Assess its climate resilience on an annual basis to reflect updated insight into the implications of climate uncertainty for the entity's business model
- Disclose the information required in section 4.3.3 above at each reporting date, including the information about how and when the scenario analysis was carried out, even if the scenario analysis had not been updated during the reporting period

IFRS S2 only requires scenario analysis to be used in assessing an entity's climate resilience. However, an entity may choose to use scenario analysis to inform a variety of other disclosures that are required by IFRS S2, including: [IFRS S2.BC69]

- Identifying and assessing climate-related risks and opportunities (see section 3 above)
- Assessing the anticipated financial effects associated with those risks and opportunities (see section 4.3.3.C below)
- Developing transition plans (see section 4.3.2.A above)

In its 2024 Climate Report, Commonwealth Bank of Australia discloses information about the scenarios used in its scenario analysis. This includes the following information:

Practical example 4-5: Commonwealth Bank of Australia (2024)	Australia				
<p>Climate Report 2024 [extract] Appendix [extract] 4. Approach to climate scenario analysis [extract]</p> <p>Climate scenario analysis is a rapidly evolving field, with global scenarios regularly produced and updated. We use assumptions and inputs drawing from credible, global climate scenarios produced by parties such as the <i>Network for Greening the Financial System (NGFS)</i>.</p> <p>We review our choice of scenarios to check that, in our view, they present plausible and appropriately severe outcomes; are consistent with market practices (including use by regulators and peer banks); and that they have detailed sector and geographic data readily available.</p> <p>Depending on the nature of changes in the scenarios, in some cases, we may look to re-run previous analyses using updated information.</p> <p>Climate scenario analysis considers the effects of climate risk over the long term (~30 years), medium term (~10 years) and short term (~3 years) time horizons. In some cases we may focus on specific time horizons. This approach helps us to consider the changing impacts on the Bank's risk profile over time, due to longer term <i>chronic physical risks</i>; increasingly frequent and severe <i>acute physical risks</i>; and evolving <i>transition risks</i> arising from regulatory change, technological advancements and evolving stakeholder expectations.</p> <h2>Climate scenarios used in the Group Climate Risk Materiality Assessment</h2> <p>Our CRMA was based on the following two severe, but plausible, climate scenarios:</p> <table border="1"> <thead> <tr> <th>Severe physical risk scenario</th><th>Severe transition risk scenario</th></tr> </thead> <tbody> <tr> <td> <p>Source: based on the NGFS 'Current Policies' scenario which assumes that only current global and local climate policies are maintained.</p> <p>Scenario description:</p> <ul style="list-style-type: none"> Global emissions continue to rise until 2080 and the world warms to >3°C above pre-industrial levels by 2100. This leads to irreversible changes such as sea level rises and increasing severity and frequency of weather events. For example: <ul style="list-style-type: none"> Increasing number of severe cyclones which may track further south. Fire activity is larger and more intense. Increased intensity of rainfall events drives moderate increases in flooding in coastal catchments. Agricultural productivity in certain geographies and commodities decreases significantly by 2050. Government action and demand for finance shifts towards climate resilience and adaptation measures. </td><td> <p>Source: based on the NGFS 'Sudden Wake-up Call' short-term scenario, and the NGFS 'Delayed Transition' mid- and long-term scenario.</p> <p>Scenario description:</p> <ul style="list-style-type: none"> Globally coordinated government policies are rapidly introduced to further reduce greenhouse gas emissions. This is followed by a disruptive transition that ultimately limits global warming to well below 2°C above pre-industrial levels by 2100. Climate policy leads to a fossil fuel market crash, including asset stranding, abrupt devaluation of polluting firms, and a general tightening of financial conditions. Stakeholder expectations for corporate action on climate change continue to increase. Severe weather events continue to increase in intensity to 2030, before stagnating at those levels. </td></tr> </tbody> </table>		Severe physical risk scenario	Severe transition risk scenario	<p>Source: based on the NGFS 'Current Policies' scenario which assumes that only current global and local climate policies are maintained.</p> <p>Scenario description:</p> <ul style="list-style-type: none"> Global emissions continue to rise until 2080 and the world warms to >3°C above pre-industrial levels by 2100. Potential climate-related risks and opportunities		

4.3.3.C Application guidance on preparing climate-related scenario analysis

During the development of IFRS S2, the ISSB received feedback that scenario analysis might be challenging, and especially so for entities that lack the skills, capabilities and resources to carry out that analysis. In response to that feedback, the ISSB confirmed that an entity is required to use climate-related scenario analysis to assess its climate resilience and also: [IFRS S2.BC62, IFRS S2.BC63]

- Included application guidance in IFRS S2 for preparing climate-related scenario analysis, noting that scenario analysis encompasses a range of practices, from qualitative scenario narratives to sophisticated quantitative modelling
- Clarified that the approach an entity uses for scenario analysis needs to be 'commensurate with its circumstances'

The application guidance in IFRS S2 was developed to support an entity to select an approach to scenario analysis that is commensurate with its circumstances. This application guidance is based on the range of practices outlined in documents published by the TCFD, including, *Technical Supplement: The Use of Scenario Analysis in Disclosure of Climate-related Risks and Opportunities* and *TCFD: Guidance on Scenario Analysis for Non-Financial Companies*.^{9,10} [IFRS S2.BC64].

This application guidance requires an entity to use an approach to scenario analysis that enables it to consider all reasonable and supportable information available to the entity at the reporting date without undue cost or effort. In making judgements on the selection of an approach to scenario analysis, the application guidance specifies: [IFRS S2.B1]

- The factors to consider when assessing an entity's circumstances (see (i) in this section below)
- The factors to consider when determining an entity's appropriate approach to climate-related scenario analysis (see (ii) in this section below)
- Additional factors to consider when determining an entity's approach to climate-related scenario analysis over time (see (iii) in this section below)

⁹ [Technical Supplement: The Use of Scenario Analysis in Disclosure of Climate-Related Risks and Opportunities](#), TCFD, June 2017, available in the TCFD's website.

¹⁰ [TCFD: Guidance on Scenario Analysis for Non-Financial Companies](#), TCFD, October 2020, available in the TCFD's website.

(i) Assessing an entity's circumstances

Assessing an entity's circumstances requires consideration of: [IFRS S2.B2]

- The entity's exposure to climate-related risks and opportunities
- The skills, capabilities and resources available to the entity for the climate-related scenario analysis

An entity's approach to climate-related scenario analysis needs to be commensurate with the entity's circumstances at the time the climate-related scenario analysis is carried out. For example, an entity with a relatively low climate risk exposure and limited resources might develop a scenario narrative that is focused on a key product, business unit or operating location. In contrast, a large entity that is highly exposed to climate risks and has strong analytical expertise might perform sophisticated quantitative modelling that uses a range of scenarios to capture multiple risk transmission channels across the entity's own operations and value chain. [IFRS S2.BC65].

Figure 4-8: Assessing an entity's circumstances

Factors to consider	Explanation
Exposure to climate-related risks and opportunities	<p>An entity's exposure to climate-related risks and opportunities will inform the entity's assessment of:</p> <ul style="list-style-type: none"> ▪ Its circumstances ▪ The approach to use for its climate-related scenario analysis <p>Generally speaking, the greater the entity's exposure to climate-related risks or opportunities, the more likely it is the entity would determine that a more technically sophisticated form of climate-related scenario analysis is required. [IFRS S2.B4].</p>
Skills, capabilities and resources available	<p>An entity considers both internal and external skills, capabilities and resources when determining an appropriate approach to use for its climate-related scenario analysis.</p> <p>Context is necessary when assessing an entity's skills and capabilities, noting also that the ISSB expects entities to develop their skills and capabilities and strengthen their disclosures over time through a process of learning and iteration. For instance, an entity that is only just starting to explore scenario analysis in assessing climate resilience or that participates in an industry where scenario analysis is not commonly used might need more time to develop its skills and capabilities. Consequently, such entities might be unable to use a quantitative or technically sophisticated approach to scenario analysis without undue cost or effort. In contrast, an entity that participates in an industry whereby scenario analysis is an established practice (such as the extractive industries) would be expected to have had experience to develop its skills and capabilities.</p> <p>However, if an entity's climate-related risk exposure warrants a sophisticated approach to scenario analysis, IFRS S2 states that the entity cannot use a lack of skills or capabilities to justify using a less sophisticated approach if it has the resources available to invest in obtaining or developing the necessary skills and capabilities. [IFRS S2.B6, IFRS S2.B7, IFRS S2.BC65].</p>

Each time an entity carries out scenario analysis, it is required to assess its circumstances. The following Illustration is based on the example used in IFRS S2 to explain when an entity reassesses its circumstances: [IFRS S2.B3]

Illustration 4-5: Reassessing an entity's circumstances

Entity A carries out its climate-related scenario analysis every three years to align with its strategic planning cycle. In accordance with paragraph B3 of IFRS S2, Entity A would be required to assess its circumstances every three years when it carries out its scenario analysis. Each time Entity A assesses its circumstances, it needs to reconsider its exposure to climate-related risks and opportunities and the skills, capabilities and resources available at that time.

(ii) Determining the appropriate approach to climate-related scenario analysis

Determining an approach to climate-related scenario analysis that considers all reasonable and supportable information available to the entity at the reporting date without undue cost or effort involves: *[IFRS S2.B8]*

- Selecting inputs to the climate-related scenario analysis
- Making analytical choices about how to carry out the climate-related scenario analysis

According to IFRS S2, reasonable and supportable information includes information that is obtained from an external source or owned or developed internally and is about: *[IFRS S2.B9]*

- Past events
- Current conditions
- Forecasts of future conditions
- Quantitative or qualitative information

Judgement is needed to determine the mix of inputs and analytical choices that enables an entity to consider all reasonable and supportable information that is available to it at the reporting date without undue cost or effort. The degree of judgement required depends on the availability of detailed information and the time horizon (i.e., the degree of judgement required increases as the time horizon increases and the availability of detailed information decreases). *[IFRS S2.B10]*.

Selecting inputs

An entity also needs to consider all reasonable and supportable information available to it at the reporting date without undue cost or effort when selecting the scenarios, variable and other inputs to use in its climate-related scenario analysis. *[IFRS S2.B11]*.

The ISSB clarified that publicly available climate-related scenarios from authoritative sources that describe future trends and a range of pathways to plausible outcomes are inputs that are available to the entity without undue cost or effort. *[IFRS S2.B11]*.

Having a reasonable and supportable basis for selecting a particular scenario or set of scenarios means that the inputs to an entity's climate-related scenario analysis need to be relevant to the entity's circumstances. Therefore, when selecting a scenario or set of scenarios, the entity considers factors such as: *[IFRS S2.B12, IFRS S2.13, IFRS S2.BC66]*

- The type and nature of activities undertaken by the entity
- The geographical location of those activities
- The physical and transition risks to which it is exposed

IFRS S2 does not specify the scenarios that an entity is required to use, because the ISSB decided that it would not be practical, the scenarios specified might become outdated and it could lead to information being disclosed that fails to reflect the entity's specific circumstances and management's view of what is plausible. *[IFRS S2.BC67]*.

The below Illustration is based on an example used in IFRS S2: *[IFRS S2.B12]*

Illustration 4-6: Selecting relevant scenarios

Entity A's assets and operations are concentrated in Jurisdiction X where emissions are likely to be regulated in the near future. To carry out scenario analysis, Entity A selects a scenario that is consistent with Jurisdiction X's commitments to the latest international agreement on climate change.

IFRS S2 also requires an entity to disclose information such as the number of scenarios used and whether the scenarios cover different outcomes or pathways (such as, orderly and disorderly transition scenarios). This forms part of the requirement to disclose whether the analysis included a diverse range of scenarios. *[IFRS S2.22(b)(i)(2), IFRS S2.BC66]*.

How we see it

In our view, IFRS S2 requires an entity to perform scenario analysis using at least two scenarios. Some entities may identify a scenario as their 'base case' for the purposes of identifying the climate-related risks and opportunities that can reasonably be expected to affect their prospects. When this occurs, and depending on facts and circumstances, it may be possible for an entity to meet the disclosure objectives of IFRS S2 by assessing the resilience of the entity's strategy and business model using only one other scenario. However, in our view, good practice is for an entity to assess resilience using at least two other scenarios that are different from the 'base case'.

In our view, there may be circumstances in which an entity can meet the objective of the resilience assessment disclosures by selecting different scenarios for transition risk and physical risk when performing its resilience assessment. That is, an entity can use one scenario (or scenarios) for assessing the resilience of its strategy and business model to transition risks and another scenario (or scenarios) for assessing resilience to physical risks.

Making analytical choices

Analytical choices include whether an entity uses qualitative analysis or quantitative modelling in carrying out climate-related scenario analysis.

IFRS S2 requires an entity to prioritise the analytical choices that will enable it to consider all reasonable and supportable information that is available to it at the reporting date without undue cost or effort. For example, an entity's resilience assessment needs to incorporate multiple carbon price pathways associated with a given outcome (e.g., a 1.5 degree Celsius outcome) if information about those pathways is available without undue cost or effort and this approach is warranted by the entity's risk exposure. [IFRS S2.B14].

In making those analytical choices, the ISSB noted that: [IFRS S2.B15]

- The use of quantitative information will often enable a more robust assessment of an entity's climate resilience.
- The use of qualitative information including scenario narratives, which might or might not be combined with quantitative data, can also provide a reasonable and supportable basis for an entity's resilience assessment.

(iii) Additional considerations when determining an entity's approach to climate-related scenario analysis over time

IFRS S2 states that an entity's approach to climate-related scenario analysis may not be the same from one reporting period or strategic planning cycle to the next. [IFRS S2.B16]. This is because:

- Climate-related scenario analysis is an evolving practice.
- The approach to scenario analysis that an entity uses is based on its particular circumstances (i.e., its exposure to climate-related risks and opportunities and the skills, capabilities and resources available to the entity). Therefore, as those circumstances change over time, the entity's approach to climate-related scenario analysis will change too.

For example, an entity that is highly exposed to climate-related risks might initially carry out scenario analysis by using qualitative scenario narratives because it does not currently have the skills, capabilities or resources to carry out quantitative climate-related scenario analysis. However, as the entity builds its capabilities through experience over time, the entity would begin to apply a more advanced quantitative approach to climate-related scenario analysis. In contrast, an entity that is highly exposed to climate-related risks which does have access to the necessary skills, capabilities or resources, is required to apply a more advanced quantitative approach to climate-related scenario analysis. [IFRS S2.B17].

TCFD comparison

The ISSB indicates that IFRS S2 disclosure requirements for an entity's strategy for managing climate-related risks and opportunities is broadly consistent with the TCFD recommended disclosures. However, in its TCFD comparison document, the ISSB noted that there are some differences, including those outlined below.

For disclosures related to an entity's climate-related risks and opportunities, IFRS S2:

- Includes an additional requirement for an entity to refer to and consider the applicability of industry-based disclosure topics in the *Industry-based Guidance on Implementing IFRS S2*, when identifying climate-related risks and opportunities
- Requires more detailed information to be disclosed about where climate-related risks and opportunities are concentrated within an entity's business model and value chain

For disclosures related to the impact of an entity's climate-related risks and opportunities on its business strategy and financial planning, IFRS S2:

- Requires more detailed information about the entity's response to the identified risks and opportunities, including any transition plans that the entity has and how the entity plans to achieve its climate-related targets
- Sets out criteria for when quantitative and qualitative information is required when disclosing the current and anticipated effects of the risks and opportunities on an entity's financial position, financial performance and cash flows
- Sets out the parameters for the information and approach to be used in disclosing the anticipated financial effects (i.e., to use all reasonable and supportable information that is available at the reporting date without undue cost or effort and to use an approach that is commensurate with the entity's circumstances)

For disclosures related to the resilience of the entity's strategy, IFRS S2:

- Does not specify specific scenarios that an entity must use in its climate-related scenario analysis
- Requires more detailed information to be disclosed about the resilience assessment, including significant areas of uncertainty in the assessment, the entity's capacity to adjust and adapt its strategy and business model, and how and when the scenario analysis was carried out
- Sets out the parameters for the information and approach to be used in climate-related scenario analysis (i.e., to consider all reasonable and supportable information that is available at the reporting date without undue cost or effort and to use an approach that is commensurate with the entity's circumstances)

4.4 Risk management

The risk management requirements in IFRS S2 for climate-related risks and opportunities correspond with the risk management disclosure requirements for sustainability-related risks and opportunities in IFRS S1, except that IFRS S2 requires an entity to provide information about the use of climate-related scenario analysis in its risk management processes.

Specifically, IFRS S2 requires an entity to explain whether and how the entity uses climate-related scenario analysis to inform its identification of climate-related opportunities when disclosing information about the processes it uses to identify, assess, prioritise and monitor climate-related opportunities. [IFRS S2.25(b)].

In respect of the remainder of the risk management disclosure requirements in IFRS S2, the commentary in Chapter 53 on risk management disclosure requirements also applies to the preparation of risk management disclosures relating to climate-related risks and opportunities.

An entity is not required to provide separate risk management disclosures for each sustainability-related risk and opportunity if oversight of the entity's sustainability-related risks and opportunities is managed on an integrated basis. In such cases, an entity is required to avoid unnecessary duplication by providing an integrated risk management disclosure that meets the requirements set out in IFRS S2 and IFRS S1. [IFRS S2.26].

TCFD comparison

The ISSB indicates that IFRS S2 disclosure requirements about risk management for climate-related risks and opportunities is broadly consistent with the TCFD recommended disclosures, which focus more on risks.

For disclosures that describe an entity's processes for identifying, assessing, and managing climate-related risks, the ISSB noted in its TCFD comparison document that IFRS S2:

- Requires more detailed information about: the input parameters that an entity uses to identify risks; if and how the entity uses scenario analysis to identify risks; and whether the entity's processes for identifying, assessing, prioritising and monitoring risks have changed since the last reporting period
- Includes additional disclosures of the entity's processes for identifying, assessing, prioritising and monitoring opportunities

For disclosures related to describing how an entity's processes for identifying, assessing, and managing climate-related risks are integrated into the entity's overall risk management, the ISSB noted that IFRS S2 includes additional disclosures on the extent to which, and how, the processes used to identify, assess, prioritise and monitor opportunities are integrated into and inform the entity's overall risk management process.

4.5 Metrics and targets

The disclosure requirements in IFRS S2 for metrics and targets are much more detailed than the general disclosure requirements for metrics and targets in IFRS S1 because IFRS S2 specifically addresses the metrics and targets that are relevant to climate-related risks and opportunities.

To enable primary users to understand an entity's performance in relation to its climate-related risks and opportunities, including progress towards any of the climate-related targets it has set, and any targets it is required to meet by law or regulation, IFRS S2 requires an entity to disclose:

- Information related to seven cross-industry metric categories (i.e., metrics that are industry agnostic) (see section 4.5.1 below)
- Industry-based metrics associated with the entity's business model and economic activities (i.e., metrics that are relevant to the industry that the entity participates in) (see section 4.5.2 below)
- Climate-related targets, which may be set either by the entity or required by laws or regulations that apply to the entity, to mitigate or adapt to climate-related risks or take advantage of climate-related opportunities, including metrics used by the government body or management to measure progress towards these targets (see section 4.5.3 below) [IFRS S2.27, IFRS S2.28]

IFRS S2 requires an entity to disclose information about metrics even if the entity does not have governance arrangements, strategies or risk management processes that address climate-related risks and opportunities. The ISSB clarified that the objective of the disclosures on metrics is to require an entity to disclose information about its performance against: [IFRS S2.BC73]

- The metrics it uses for measuring and monitoring climate-related risks and opportunities (which may include metrics that are not specified by IFRS S2)
- The metrics specified by IFRS S2 (even in cases where the entity does not use those metrics to measure and monitor its climate-related risks and opportunities)

4.5.1 Cross-industry metrics

IFRS S2 requires entities to disclose information about seven cross-industry metric categories that the ISSB derived from the TCFD's *Guidance on Metrics, Targets and Transition Plans*,¹¹ which was published in October 2021.

11 [TCFD: Guidance on Metrics, Targets and Transition Plans](#), TCFD, October 2021, available in the TCFD's website.

The seven cross-industry metric categories are summarised in Figure 4-9 below. [IFRS S2.29].

Figure 4-9: Cross-industry metrics

#	Category	Information to be disclosed
1	GHG emissions	Absolute gross GHG emissions generated during the reporting period (in metric tonnes of CO ₂ equivalent), classified as: <ul style="list-style-type: none"> ▪ Scope 1 GHG emissions ▪ Scope 2 GHG emissions ▪ Scope 3 GHG emissions This disclosure and other GHG-related disclosures are discussed further in sections 4.5.1.A and 5 below.
2	Climate-related transition risks	The amount and percentage of assets or business activities vulnerable to climate-related transition risks (see section 4.5.1.B below).
3	Climate-related physical risks	The amount and percentage of assets or business activities vulnerable to climate-related physical risks (see section 4.5.1.B below).
4	Climate-related opportunities	The amount and percentage of assets or business activities aligned with climate-related opportunities (see section 4.5.1.B below).
5	Capital deployment	The amount of capital expenditure, financing or investment deployed towards climate-related risks and opportunities (see section 4.5.1.C below).
6	Internal carbon pricing	<ul style="list-style-type: none"> ▪ An explanation of whether and how the entity is applying a carbon price in decision-making ▪ The price of GHG emissions (per metric tonne) that the entity uses to assess the costs of its GHG emissions See section 4.5.1.D below.
7	Remuneration	<ul style="list-style-type: none"> ▪ A description of whether and how climate-related considerations are factored into executive remuneration ▪ The percentage of executive management remuneration recognised in the current reporting period that is linked to climate-related considerations See section 4.5.1.E below.

By requiring entities to provide common information to primary users regardless of the industries to which they belong, the cross-industry metrics are intended to allow users to: [IFRS S2.BC75]

- Assess an entity's exposure to, and management of, its climate-related risks and opportunities
- Gain an understanding of key aspects and drivers of climate-related risks and opportunities
- Gain insight into the potential effects of climate change on the entity

4.5.1.A GHG emissions disclosures

An entity is required to disclose its absolute gross GHG emissions generated during the reporting period. An entity's gross GHG emissions are classified as: [IFRS S2.29(a)(i)]

- Scope 1 GHG emissions
- Scope 2 GHG emissions
- Scope 3 GHG emissions

An entity's disclosure of its GHG emissions is expressed as metric tonnes of CO₂ equivalent. This means that the entity needs to aggregate the seven constituent GHG gases into CO₂ equivalent value. Refer to section 5.3.2 for further discussion.

The ISSB's Education material, *Greenhouse Gas Emissions Disclosure requirements applying IFRS S2 Climate-related Disclosures*, clarified that:

- 'Gross' refers to the measurement of GHG emissions without considering any removal efforts (e.g., the use of carbon credits)
- 'Absolute' refers to the disclosure of the total amount of GHG emissions. The disclosure of GHG emissions intensity would not be an example of absolute GHG emissions.

In its 2023 Annual Report, Standard Chartered plc discloses its total GHG emissions for Scope 1, Scope 2 and Scope 3 (by category) in tonnes of CO₂ equivalent. The footnotes indicate where restatements have been made.

Practical example 4-7: Standard Chartered PLC (2023)

United Kingdom

Annual Report 2023 [extract]

Sustainability Review [extract]

Sustainability Strategic Pillars [extract]

Pillar 3: Deliver on our annual milestones set forth in our net zero roadmap [extract]

Our emission sources [extract]

Scopes of GHG emissions	2023 ⁴ (tCO ₂ e)	2022 (tCO ₂ e)	2021 (tCO ₂ e)
Scope 1 emissions ¹	8,488	2,071	2,902
Scope 2 emissions ²	26,246	47,363	82,761
Total Scope 1 and 2 emissions³	34,734	49,434	85,663
Scope 3 emissions:			
Category 1: Purchased goods and services (other)	286,304	380,732	330,224
Category 1: Purchased goods and services (data centres) ⁵	4,431	7,060	43,132
Category 2: Capital goods	42,707	34,496	47,217

Category 5: Waste generated in operations ⁶	520	747	
Category 6: Business travel (air travel)	60,279	39,107	3,654
Category 6: Business travel (miscellaneous other than air travel)	8,918	2,654	4,994
Category 7: Employee commuting	71,228	61,917	
Category 13: Downstream leased assets (real estate)	7,898	8,594	
Category 15: Investments ^{7,8}	41,944,000	49,512,000	45,200,000
Total Scope 3 emissions	42,450,410	50,067,607	45,650,190
Total emissions	42,485,144	50,117,041	45,735,853

- 1 As we aim to improve our emissions measurement and reporting year-on-year, we have included fugitive emissions in our Scope 1 figures for the first time in 2023: 5,266 tCO₂e. Prior year data was not available for fugitive emissions. For more information on the methodology and assumptions used to calculate GHG emissions, please refer to the Environmental Reporting Criteria at sc.com/sustainabilityhub.
- 2 Scope 2 indirect emissions include indirect emissions from purchased electricity measured under the market-based approach as set out in the GHG protocol.
- 3 Our Scope 1 and 2 emissions calculations for the most recent reporting year were independently assured by Global Documentation Ltd., the assurance scope excluded fugitive emissions. Market-based emissions have decreased from 2022 to 2023 due to footprint reduction, efficiency gains and the purchase of additional energy attribution certificates by the Group.
- 4 The reporting period for GHG emissions is 1 October to 30 September. This only differs for Category 1: Purchased Goods (other); Category 2: Capital goods; Category 4: Upstream transportation and distribution; Category 6: Business travel (miscellaneous other than air travel) and Category 15: Investments where a period of 1 January to 31 December is used. Emissions data for these categories is also on a one-year lag with emissions reported in 2023 based on 2022 emissions data.
- 5 Purchased goods and services (data centres) have been restated from 706tCO₂e to 7,060tCO₂e due to an error in converting the unit of emissions.
- 6 Waste emissions have been restated from 498tCO₂e to 747tCO₂e due to an out of date emissions factor being used in prior year.
- 7 Category 15: Investments only includes financed emissions and are measured on a one-year lag, with emissions reported in 2023 being based on 2022 emissions and financial data. Financed emissions are included on page 110. A facilitated emissions baseline was measured for the first time during the year. Refer to page 112 for more details.
- 8 2022 absolute emissions have been restated from 58.5MtCO₂e to 49.5MtCO₂e. This is due to (i) reduction in shipping absolute emissions as improved data has resulted in individual ship-level fair values being obtained; (ii) pausing of aviation emissions reporting due to the sale of the Group's aviation leasing and lending business; (iii) decreases in Automotive Manufacturers' emissions due to changes in the industry emissions reporting methodology referenced earlier on page 95; (iv) decreases in emissions from the 'Others' sector where improved data has been obtained to calculate emissions; and (v) the sectoral baselining of emissions reporting for Cement and Commercial Real Estate as separate high-emitting sectors.

In its 2023 Sustainability Report, Magna International Inc. discloses information about its GHG intensity metrics.

Practical example 4-8: Magna International Inc. (2023)

Canada

FY 2023 Sustainability Report [extract]

Sustainability Metrics [extract]

5.1 Energy Management and Emissions [extract]

5.1.2 Emissions

Energy consumed can be converted to CO₂ emissions based on regional conversion factors. In order to help us and our stakeholders better assess trends related to the emissions we generate, we track emissions "intensity" on the basis of total sales, employee headcount and aggregate square footage of our facilities and offices. These intensity metrics assist us in determining whether we are becoming more efficient by normalizing emissions on a per dollar of sales, per employee and per square footage basis. The raw data for Scope 1 & 2 emissions, together with intensity metrics are set out below. Magna adheres to the GHG Protocol Corporate Accounting and Reporting Standard ("GHG Protocol") for its Scope 1 and 2 reporting. Magna adheres to the GHG Protocol Corporate Value Chain (Scope 3) Standard and guidance from the SBTi for its Scope 3 reporting. We use commonly accepted emission factors such as those available from the GHG Protocol, International Energy Association (IEA), United States EPA, including its eGrid database, United Kingdom Department for Energy Security and Net Zero,ecoinvent and CEDA (Comprehensive Environmental Data Archive), as well as other local or regional references. Our Scope 1 and 2 emissions data is verified annually by an independent third party verification firm.

ISSB S2, 29(a)(i)	2023	2022	2021 ⁽¹⁾
Scope 1 Emissions (metric tons)	424,561	433,636	436,267
Scope 2 Emissions (metric tons) ⁽²⁾	1,150,656	1,168,803	1,089,730
Scope 1 & 2 Emissions (metric tons) ⁽²⁾	1,575,217	1,602,439	1,525,997
Sales (USD, millions)	42,797	37,840	36,242
Sales Intensity (CO ₂ metric tons/\$ Sales)	0.0000368	0.0000424	0.0000421
Employees	179,000	168,000	158,000
Employee Intensity (metric tons/employee)	8.8	9.5	9.7
Square Footage (million sq. ft.)	83.8	84.4	83.5
Square Footage Intensity (metric tons/sq. ft.)	0.0188	0.0189	0.0183

Notes:
 (1) Market-based emissions calculation method.
 (2) Sales Intensity, Employee Intensity and Square Footage Intensity are calculated based on combined Scope 1 and 2 Emissions.

In connection with our net-zero commitment and submission of near-term and net-zero targets to SBTi for validation, we submitted our Scope 1, 2 and 3 baseline emissions for 2021 as per the table below:

Emission Type	2021 Baseline Year
Scope 1 (tCO ₂ e)	436,267
Scope 2 (tCO ₂ e)	1,089,730
Scope 3 (tCO ₂ e)	58,655,441
Total	60,181,438

IFRS S2 requires the *Greenhouse Gas Protocol: A Corporate Accounting and Reporting Standard* (2004) to be used to measure an entity's GHG emissions unless a jurisdictional authority or a securities exchange on which the entity is listed requires a different method to be used to measure the entity's GHG emissions. [IFRS S2.29(a)(ii)]. The *Greenhouse Gas Protocol: A Corporate Accounting and Reporting Standard* (2004) is one of the publications that are collectively referred to as the GHG Protocol. Refer to section 5 below for more details on the GHG Protocol and the use of other methods.

An entity is required to disclose the approach that it uses to measure GHG emissions, including: [IFRS S2.29(a)(iii)]

- The measurement approach, inputs and assumptions used to measure its GHG emissions
- The reason why the entity has chosen the measurement approach, inputs and assumptions used to measure its GHG emissions
- Any changes the entity made to the measurement approach, inputs and assumptions during the reporting period and the reasons for those changes (see section 5.3.1 below for further discussion)

In its 2023 Climate-Related Disclosures Report, Scales Corporation Limited discloses information about measurement approach, inputs and assumptions the entity uses to measure its GHG emissions:

Practical example 4-9: Scales Corporation Limited (2023)

New Zealand

Climate-Related Disclosures Report - 2023 [extract]

5. Metrics and Targets [extract]

5.2.3 Inclusions [extract]

Table 8: Inclusions, methodologies and uncertainties

Scope	Emission Category	Activity	Data Source	Gwp Source	Methodology, Data Quality, Uncertainty (Qualitative)
Scope 1	Stationary combustion	Fossil fuels used by plant equipment	Invoices	MFE guidelines 2023	Fuel based method, Low uncertainty
	Mobile combustion	Fossil fuels used by fleet/pool vehicles and forklifts	Fuel purchase transaction history	MFE guidelines 2023	Fuel based method, Low uncertainty
	Fugitive emissions	Refrigerant used by refrigeration equipment	Maintenance reports and invoices	MFE guidelines 2023	Top up method, Applicable to Scales' owned refrigeration equipment, Low uncertainty
Scope 2	Purchased energy	Electricity consumption	Invoices	Selection of electricity grid factors by operating location	Location based method, High data quality and low uncertainty due to complete invoice sets
Scope 3	Business travel	Air travel	Travel itineraries, reimbursements, credit card purchase history	MFE guidelines 2023, Consumption emissions modelling report	Hybrid method, Distance based where data is available, otherwise dollars spent, Variable data quality, medium uncertainty overall
		Rental car/taxis	Travel itineraries, reimbursements, credit card purchase history	MFE guidelines 2023, Consumption emissions modelling report	Hybrid method, Distance/fuel based for rental cars where data is available, otherwise dollars spent, Dollars spent for taxis, Variable data quality, medium uncertainty overall
		Hotels and accommodation	Travel itineraries, reimbursements, credit card purchase history	MFE guidelines 2023, Consumption emissions modelling report	Nights stayed method, Country selected based on itineraries, and conservatively approximated where unspecified, High uncertainty overall
	Employee commuting	Employee commuting and working from home	Internal reports/ staff survey	MFE guidelines 2023	Distance based method to determine commuting, days working from home approximated, Data quality is low due to difficulty in validating survey results, High uncertainty
	Upstream transportation and distribution	Movement of product from suppliers	Logistics shipping and freight reports	UK GHG conversion factors 2023	Tonnes km (tkm) based method, Distances and weight determined between supplier and plant, Only includes emissions from upstream freight we are responsible for, Variable data quality, medium uncertainty
	Downstream transportation and distribution	Movement of product to customers	Logistics shipping and freight reports	MFE guidelines 2023, UK GHG conversion factors 2023	tkm based method, Distances and weight determined between plant and customer, Only includes emissions from downstream freight we are responsible for, Variable data quality, medium uncertainty
	Purchased goods and services	Coldstores/toll processing provided by a third party (toll processing relates specifically to Shelby)	Third-party supplier warehouse volume reports/invoices	Selection of electricity grid factors by operating location	Hybrid method, Used data from owned facilities to extrapolate out to third-party coldstorage and toll processing sites, For coldstorage we used m3 to kWh conversion factor, High uncertainty
	Fuel and energy related activities	Transmission and distribution (T&D) losses		Selection of electricity T&D loss factors by operating location	Electricity consumption approach, Methodology as per MFE guidelines, Grid-average transmission losses estimation based on national generator and consumption totals, High data quality, low level of uncertainty
		Well-to-tank emissions		UK GHG conversion factors 2023	Fuel consumption approach, methodology based on UK GHG conversion factors, High data quality, medium uncertainty
	Waste generated in operations	Waste	Supplier invoices and waste reports	MFE guidelines 2023	Hybrid method, Weight based where data is available, otherwise weight is estimated by bin volumes and number of collections, Landfills use gas capture technology, Variable data quality, medium uncertainty
		Water supply and wastewater	Council invoices and meter data	MFE guidelines 2023	Hybrid method, Volume based where council data is available for processing sites, Per capita basis for office spaces, Domestic wastewater treatment factors used as industrial factors are unavailable, Variable data quality, medium uncertainty
	Upstream leased assets	Short-term leased space	Property measurements and invoices	MFE guidelines 2023	Estimate based on energy intensity (square meter energy consumption) of existing sites for offices, Used site footprints and m3 to kWh conversion factor for coldstorage consumption, High uncertainty

Additional disclosure requirements relating to an entity's absolute gross Scope 1, Scope 2 and Scope 3 GHG emissions are outlined in Figure 4-10 below. [IFRS S2.29(a)(iv)].

Figure 4-10: GHG emissions disclosures

GHG emissions	Specific disclosures
Scope 1 and Scope 2	<p>An entity is required to disaggregate Scope 1 and Scope 2 GHG emissions between:</p> <ul style="list-style-type: none"> ▪ The consolidated accounting group (e.g., the parent and its consolidated subsidiaries); and ▪ Other investees excluded from the consolidated accounting group (e.g., investees include associates, joint ventures and unconsolidated subsidiaries) <p>An Illustration of this disaggregation is provided in Illustration 4-7 below.</p>
Scope 2	<p>For Scope 2 GHG emissions, an entity discloses:</p> <ul style="list-style-type: none"> ▪ Its location-based Scope 2 GHG emissions ▪ Information about any contractual instruments that will inform users' understanding of the entity's Scope 2 GHG emissions (i.e., IFRS S2 does not require an entity to also disclose its market-based Scope 2 GHG emissions) <p>The meaning of 'location-based' and 'market-based' Scope 2 GHG emissions is discussed further in section 5.2.3 below.</p>
Scope 3	<p>For Scope 3 GHG emissions, an entity is required to disclose the categories included within the entity's measure of Scope 3 GHG emissions, in accordance with the Scope 3 categories described in the <i>Greenhouse Gas Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard (2011)</i>. These categories are:</p> <ul style="list-style-type: none"> ▪ Category 1. Purchased goods and services ▪ Category 2. Capital goods ▪ Category 3. Fuel- and energy-related activities (not included in Scope 1 or Scope 2) ▪ Category 4. Upstream transportation and distribution ▪ Category 5. Waste generated in operations ▪ Category 6. Business travel ▪ Category 7. Employee commuting ▪ Category 8. Upstream leased assets ▪ Category 9. Downstream transportation and distribution ▪ Category 10. Processing of sold products ▪ Category 11. Use of sold products ▪ Category 12. End-of-life treatment of sold products ▪ Category 13. Downstream leased assets ▪ Category 14. Franchises ▪ Category 15. Investments <p>Additional disclosures are required for Scope 3 'financed emissions' if an entity is engaged in asset management, commercial banking or insurance activities. Financed emissions are discussed further in section 5.7 below.</p>

The following Illustration is based on Illustrative Example 1 in *Accompanying Guidance on Climate-related Disclosures*: [IFRS S2.IE3, IFRS S2.IE4, IFRS S2.IE5]

Illustration 4-7: Disaggregating Scope 1 and Scope 2 GHG emissions

Entity A has an 80% interest in SubCo and a 40% interest in an incorporated joint venture, JVCo. Entity A and the other parties to the joint venture jointly control JVCo. Entity A has been appointed as the operator of JVCo, which means that Entity A is responsible for managing and conducting the activities and operations approved by the joint venturers.

Entity A prepares financial statements in accordance with IFRS accounting standards. Entity A's consolidated financial statements present the assets, liabilities, equity, income, expenses and cash flows of Entity A and the entities it controls as single economic entity. Entity A determines that it controls SubCo. The reporting entity of Entity A's consolidated financial statements, therefore, consists of Entity A and SubCo. The assets, liabilities, equity, income, expenses and cash flows of JVCo are not included in the Entity A consolidated group because Entity A does not control JVCo. Instead, Entity A recognises its interest in JVCo as an equity accounted investment.

Entity A's consolidated group is also the reporting entity for the preparation of Entity A's sustainability-related financial disclosures, including its disclosure of GHG emissions. Entity A has selected the operational control approach¹² to measure its GHG emissions. Because Entity A has operational control over JVCo, all of JVCo's GHG emissions are included in Entity A's GHG emissions (as the reporting entity).

The Scope 1 and Scope 2 GHG emissions for each individual entity is:

	GHG emissions (metric tonnes CO ₂ e)		
	Scope 1	Scope 2	Total
Entity A (parent)	1,000	350	1,350
SubCo	3,000	800	3,800
JVCo	6,000	1,400	7,400

The Scope 1 and Scope 2 GHG emissions for the Entity A reporting entity in accordance with operational control is measured as follows (noting that by having operational control, Entity A would include 100% of the GHG emissions into the measurement of its GHG emissions):

	GHG emissions (metric tonnes CO ₂ e)		
	Scope 1	Scope 2	Total
Entity A (parent)	1,000	350	1,350
SubCo	3,000	800	3,800
JVCo	6,000	1,400	7,400
Total	10,000	2,550	12,550

In accordance with paragraph 29(a)(iii) of IFRS S2, Entity A discloses the disaggregation of its Scope 1 and Scope 2 GHG emissions between the consolidated group and its other investee as follows:

	GHG emissions (metric tonnes CO ₂ e)		
	Scope 1	Scope 2	Total
Entity A consolidated group	4,000	1,150	5,150
Investment in JVCo	6,000	1,400	7,400
Total Scope 1 and Scope 2 GHG emissions (operational control basis)	10,000	2,550	12,550

¹² The operational control approach is discussed in section 5.2.2.B (ii) below.

Frequently asked questions

Question 4-2: Does Category 15: Investments apply only to financial institutions?

Category 15 is relevant for any entity with investments that are not included in the entity's Scope 1 and Scope 2 GHG emissions. Financial institutions such as commercial banks often have a large number of investments in this category.

Question 4-3: How do the requirements in IFRS S1 for comparative information apply to the disclosure of GHG emissions when a subsidiary in a group has been acquired or disposed of?

(TIG meeting 13 June 2024 - Agenda paper no. 2, ISSB meeting 24 July 2024 - Agenda paper no. 9)

Having considered its issue in Chapter 53, the TIG further discussed the application of the requirements in IFRS S1.70 about comparative information when applying IFRS S2 when there has been a change in the composition of the reporting entity (such as the acquisition or disposal of a subsidiary) and whether IFRS S2 would require a different approach than IFRS S1.

The TIG noted that IFRS S1.70 applies to all information disclosed using ISSB standards, unless another ISSB standard requires or allows otherwise. Considering this requirement, the TIG agreed that since IFRS S2 does not include any additional specific requirements related to the disclosure of comparative information, the principles of IFRS S1 need to be applied in the application of IFRS S2. Therefore, consistent with the outcome for relevant question discussed in Chapter 53, the TIG agreed that when there has been a change in the composition of the reporting entity as a result of acquiring or disposing of a subsidiary, comparative climate-related information reflects the composition of the reporting entity in the related financial statements in the comparative period. That is, for information accompanying the consolidated financial statements, what information is given will depend on the composition of the group at that time, in accordance with applicable GAAP.

In its discussion, the TIG considered the requirement in IFRS S2 to measure GHG emissions in accordance with the GHG Protocol. IFRS S2.29a(ii) requires an entity to measure its GHG emissions in accordance with the GHG Protocol only to the extent that the requirements in the GHG Protocol do not conflict with the requirements in IFRS S2. Apart from requirements associated with the measurement of GHG emissions, the GHG Protocol also includes requirements associated with other aspects of GHG emissions reporting. However, the TIG referred to IFRS S2.B23 and agreed that an entity is only required to use the GHG Protocol to measure the GHG emissions of the reporting entity using the relevant measurement approach selected in applying the GHG protocol. That is, the GHG Protocol is only used to measure what is required to be disclosed by ISSB standards and any other requirements in the GHG Protocol (including those relating to comparative information) would not affect the application of IFRS S1 requirements. Therefore, the information provided for the current reporting period and the comparative period relating to GHG emissions needs to reflect the composition of the reporting entity at each of those points in time based on the applicable GAAP, in accordance with IFRS S1.

The TIG also pointed out that while information about GHG emissions is required to be provided for the consolidated group (according to the applicable GAAP), the composition of the group does not limit the choice of approach about how the emissions are measured. Any of the alternative GHG emissions measurement approaches included in the GHG Protocol is available to the entity and permitted by IFRS S2 (see further discussion at section 5.2.2). The difference between the boundaries of a reporting entity and the approach to measurement may not necessarily lead to a direct relationship between changes in the reporting entity and changes in the measurement of GHG emissions. The TIG used the following example: An entity acquires a subsidiary in the current period but had operational control over that subsidiary's operations in the comparative period. The change in the reporting entity in the current period does not lead to any change in the measurement of the GHG emissions for the reporting entity with respect to the comparative period because the entity already had operational control over the subsidiary for the comparative period.

Question 4-4: When an entity estimates Scope 3 GHG emissions in the current period by using information disclosed in the prior period, in applying the requirements of IFRS S1.B50, does that entity need to revise those estimated amounts in the following year when these become comparative information?

(TIG meeting 13 June 2024 - Agenda paper no. 1, ISSB meeting 24 July 2024 - Agenda paper no. 9)

The TIG discussed a situation where a reporting entity has the same reporting period as an entity in its value chain but the information about Scope 3 GHG emissions included in Category 15 Investments of that entity in its value chain is not available in time for the reporting entity's year-end reporting.

Therefore, to estimate its GHG emissions for the current reporting period, the reporting entity uses, as a reasonable estimate, the information disclosed by the entity in its value chain from the prior period.

Illustration 4-8: Estimated information for the comparative period

Entity A is the reporting entity and Entity B is an entity that is included in Entity A's value chain. Both entities have a 12-month reporting period that ends on 31 December. Entity A reports two years of information, the current reporting period (ended 31 December 20X2) and comparative period (ended 31 December 20X1) by estimating and disclosing GHG emissions information as follows:

- In its prior period report (20X1), Entity A used GHG emissions data from Entity B's 20X0 report as an estimate for 20X1.
- For its current period (20X2), Entity A used GHG emissions data from Entity B's 20X1 report as a reasonable estimate for 20X2.
- For its comparative period in the 20X2 report (i.e., 20X1 information included as comparative information in the 20X2 report), Entity A updated the comparative period's estimated amounts based on the new information as it now has the actual data of Entity B's 20X1 report.

As a result, Entity A uses for both 20X2 (Entity B's 20X1 published GHG emissions data as an estimate) and 20X1 (actual Entity B's 20X1 published GHG emissions data) the same 20X1 GHG emissions data set.

The TIG considered the concerns raised in the situation described above with respect to the comparability of information reported when applying IFRS S1.B50(a) and whether changes as a result of decarbonisation, in Entity B's GHG emissions would be reflected appropriately over time. However, the TIG agreed that even in such situations, it is still necessary to apply the requirements of IFRS S1.B50 to revise preceding period estimates (assuming these have been considered by the entity as a reasonable estimate) when presenting comparative information to reflect new information that provides evidence of circumstances that existed in that preceding period. In doing so, the entity will provide primary users with information about what was changed, how much it changed by and why it was changed.

During its discussion, the TIG pointed out the following:

- IFRS S1.B50 requires an entity to revise an estimated amount disclosed in the preceding period if new information is identified and the new information provides evidence of circumstances that existed in the preceding period. However, purely revising the estimates to comply with this requirement would not be sufficient. An entity is also required to disclose the difference between the amount disclosed in the preceding period and the revised comparative amount, as well as to explain the reasons for revising the comparative amount. Such information, which complements the revised estimates, enhances the primary users' understandability of the disclosed information (see discussion in Chapter 53). Moreover, current period disclosure about the likelihood of revising estimates in future periods (e.g., in anticipation of receiving updated information for an estimated amount that is currently being disclosed) could be material to users (see also Chapter 53 for further discussion on disclosure requirements about measurement uncertainties).
- In preparing disclosures to meet the requirements in IFRS S1.B50, an entity is required to apply materiality. Whether information is material is a matter of judgement and depends on the facts involved and the circumstances of a specific entity. An entity needs to determine whether revising preceding period estimated amounts when providing comparative information as well as providing information about the difference between a preceding period amount and a current period revised amount is material. An entity may assess, based on both qualitative and quantitative factors, that such information would influence decisions that primary users make or may determine that this is not material information and therefore, not apply the requirements IFRS S1.B50. See discussion on the application of materiality in Chapter 53.

- The TIG noted that, although the question was discussed in the context of Scope 3 Category 15 GHG emissions for an entity operating in the financial services industry, the outcome and the points emphasised above would be equally applicable to all other metrics that are estimates (in specific circumstances) and to entities across different industries. However, the TIG made some additional points that specifically apply to the measurement of Scope 3 GHG emissions:
 - The approach of using prior period information from an entity in the value chain as the basis to estimate current period information is appropriate in the circumstances of an entity to measure GHG emissions according to the requirements in IFRS S2. This includes the use of a measurement approach, inputs and assumptions that result in a faithful representation of this measurement as well as the use all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort (for further discussion, see section 5.6.1 below).
 - IFRS S1 and IFRS S2 are applied together. Requirements in IFRS S1 are applied in the context of the overall disclosure objective and specific disclosure objectives in IFRS S2. Therefore, the TIG emphasised the requirements of IFRS S2 with respect to providing information that: a) enables primary users to understand the most significant uncertainties affecting amounts reported in an entity's sustainability-related financial disclosures (see Chapter 53), b) is a complete, neutral and accurate depiction of an entity's sustainability-related risks and opportunities (see Chapter 53), c) is of sufficient quality and quantity and includes estimates for which reasonable assertions and inputs are used (see Chapter 53) and, d) is clear and concise (see Chapter 53).

4.5.1.B Assets or business activities vulnerable to climate-related risks or aligned to climate-related opportunities

An entity is required to disclose the amount and percentage of assets or business activities that are:

- Vulnerable to climate-related transition risks
- Vulnerable to climate-related physical risks
- Aligned with climate-related opportunities

These disclosures are required separately for transition risks, physical risks and opportunities.

Figure 4-11 below lists some example metrics, which are provided in *Accompanying Guidance on IFRS S2 Climate-related Disclosures*.

Figure 4-11: Cross-industry metrics relating to risks and opportunities

Metric category	Example metrics (expressed in amount and percentage)
Climate-related transition risks	<ul style="list-style-type: none"> ▪ volume of real estate collaterals highly exposed to transition risk ▪ concentration of credit exposure to carbon-related assets ▪ percentage of revenue from coal mining ▪ percentage of revenue passenger kilometres not covered by the Carbon Offsetting and Reduction Scheme for International Aviation
Climate-related physical risks	<ul style="list-style-type: none"> ▪ proportion of property, infrastructure or other alternative asset portfolios in areas subject to flooding, heat stress or water stress ▪ proportion of real assets exposed to climate-related hazards ▪ number and value of mortgage loans in 100-year flood zones ▪ wastewater treatment capacity located in 100-year flood zones ▪ revenue associated with water withdrawn and consumed in regions of high or extremely high baseline water stress
Climate-related opportunities	<ul style="list-style-type: none"> ▪ revenues from products or services that support the transition to a lower-carbon economy ▪ net premiums written related to energy efficiency and lower-carbon technology ▪ number of (1) zero-emissions vehicles, (2) hybrid vehicles and (3) plug-in hybrid vehicles sold ▪ proportion of homes delivered certified to a third-party, multi-attribute, green-building standard

In preparing these disclosures, IFRS S2 states that an entity must use all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort. [IFRS S2.30]. The application of this requirement is discussed further in sections 4.3.1.C above as well as Chapter 53.

Frequently asked questions

Question 4-5: What do the terms ‘business activities’ and ‘vulnerable’ mean in the absence of definitions in IFRS S2?

(TIG meeting 15 March 2024 - Agenda paper no. 1, ISSB meeting 16 May 2024 - Agenda paper no. 9)

The TIG agreed with the ISSB staff analysis that the nature of an entity’s assets and business activities and associated vulnerabilities could vary greatly, depending on the entity. The ISSB staff explained that this is why specific metrics are not prescribed in paragraph 29 of IFRS S2. Instead, decisions about the disclosure of those metrics should be made in the context of the disclosure objectives of IFRS S2. The disclosure objectives provide an entity with an ‘anchor’ to apply judgement to determine the information to be disclosed and the level of granularity at which that information is disclosed. The information that is required to be disclosed is that which is reasonably expected to influence an investor decision, which also means that materiality judgements are critical in determining the information to provide.

The TIG observed that factors that could be considered when identifying ‘business activities’ include:

- Activities that are exposed to climate-related risks which may impact the entity’s operations and future performance. This is based on the specific disclosure objectives on metrics and targets to enable primary users to understand ‘an entity’s performance’ in relation to such risks.
- The types of activities involved in revenue generation or that result in costs incurred.
- Activities based on the various types of operations within the business.

This determination will require an entity to exercise judgement including considering the disclosure that would provide the most decision-useful information to primary users.

Given IFRS S2 requires an entity to disclose separately the business activities vulnerable to physical risks and transition risks because those types of risks might materialise over different time horizons, the TIG also observed that this fact should be considered when determining the types of business activities impacted by physical or transition risks.

The TIG also made the following observations on the term ‘vulnerable’:

- An entity’s ‘exposure’ to a risk is a helpful guide for determining ‘vulnerability’ to a risk.
- An assessment of the breadth and composition an entity’s value chain is relevant in identifying potential vulnerabilities across the business as a result of climate-related risks.
- The *Industry-based Guidance on implementing IFRS S2* might assist in the identification of relevant types of vulnerabilities based on the entity’s business.
- Scenario analysis can provide insights into the entity’s exposure to climate-related risks and, therefore, the resulting vulnerabilities.
- An entity might consider the inputs for an asset impairment test for financial statement preparation purposes, as part of an assessment of vulnerabilities across assets for sustainability-related financial disclosures.

Question 4-6: Does the ‘amount’ of assets or business activities that are vulnerable to climate-related risks or aligned to climate-related opportunities need to be expressed as a monetary amount?

No. The *Accompanying Guidance on IFRS S2 Climate-related Disclosures* has some examples of metrics whereby the amount of assets that are vulnerable to climate-related risk or aligned to climate-related opportunities is expressed as a non-monetary amount (refer to Figure 4-11 above). One of those example metrics that is expressed as a non-monetary amount is wastewater treatment capacity located in 100-year flood zones.

Given that IFRS S2 does not prescribe a basis for measuring or presenting the amount that is used for these metrics, judgement will be required. In exercising that judgement, an entity is required to consider the specific disclosure objective for metrics and targets under IFRS S2.27, which is to enable users of general-purpose financial reports to understand the entity’s performance in relation to its climate-related risks and opportunities, as well as connectivity with other general purpose financial reports published by the entity. In some cases, a non-monetary metric may be considered to better meet the disclosure objective. In other cases, the disclosure objective may be better met with a metric expressed as a monetary amount.

Illustration 4-9: Selecting a vulnerability metric

Entity A has a mining project that is exposed to a climate-related physical risk. The mine has been approved to enter into the development phase. The mine asset is measured in Entity A's statement of financial position at historical cost. The carrying amount of the mine is negligible because Entity A's accounting policy is to expense the costs to explore and evaluate the mineral deposit.

In preparing the metric for the amount of assets vulnerable to the climate-related physical risk, Entity A first considers which amounts would provide connectivity between Entity A's financial statements and its climate-related financial disclosures.

- Entity A concludes that a metric based on the mine asset carrying amount would not provide useful information to users because the carrying amount bears no correlation to the future cash flows that Entity A expects to generate from the production of minerals from the mine when it has been developed. Furthermore, because the carrying amount is negligible, the amount also does not provide useful information about Entity A's risk of exposure to a future impairment loss.
- Entity A identifies no other amounts in the financial statements that would provide information to users about the extent of vulnerability of Entity A's assets or business activities to climate-related physical risk. This is because, for example, the mine asset is not yet generating revenue because the minerals are yet to be extracted.

Instead of disclosing the mine's vulnerability arising from the climate-related physical risk using a monetary amount, Entity A identifies that the volume of mineral reserves (i.e., the economically recoverable quantities of minerals in the ground) at the mine would be an amount that provides users with insight into vulnerability to the climate-related physical risk even though this is a non-monetary amount measured in tonnes. Using this amount in the disclosure would also provide connectivity between Entity A's climate-related financial disclosures and its reserves statement, which is a separate report that many mining companies publish to meet the information needs of investors and other users.

In its 2023 Annual Report, NZX Limited discloses information about cross-industry metrics:

Practical example 4-10: NZX Limited (2023)**New Zealand****2023 Annual Report [extract]****NZX 2023 CLIMATE STATEMENT [extract]****5. Metrics & Targets [extract]****5.2 Other metrics [extract]**

Cross-industry metric category	
Transition risks: Assets or business activities vulnerable	72.1% of total operating revenue (Capital Markets Origination, Secondary Markets and Funds Management revenue streams)
Physical risks: Assets or business activities vulnerable	9.7% of total assets (Property, plant & equipment and right-of-use lease assets)
Climate-related opportunities: revenue, assets or business activities	No assets linked to climate-related opportunities
Capital deployment: capital expenditure, financing or investment	No capital is currently deployed in low-emissions products and services
Internal emissions price:	\$143 per tCO ₂ e (Price of carbon credit offsets that we purchase from Toitū)
Remuneration	Air travel-linked KPIs (Air travel is NZX's largest emission source)

4.5.1.C Capital deployment

An entity is required to disclose the amount of capital expenditure, financing or investment deployed towards climate-related risks and opportunities. [IFRS S2.29(e)].

IFRS S2 does not provide application guidance that is specific to this disclosure requirement, but it does provide some general guidance, which is outlined in section 4.5.1.F below. In addition, the Accompanying Guidance on IFRS S2 lists the following as example metrics:

- Percentage of annual revenue invested in research and development of lower-carbon products/services
- Percentage of investment in climate adaptation measures (for example, soil health, irrigation and technology)

The following Practical examples illustrate the disclosure of information about capital deployment:

Practical example 4-11: Z Energy Limited (2023)		New Zealand
Climate Statements [extract]		
Metrics and Targets [extract]		
Exposure to transition and physical risks [extract]		
Capital deployment		
Expenditure against future energy solutions commitments under Overseas Investment Act		
In 2022, a commitment was made as part of Ampol's application for consent under the Overseas Investment Act 2005 to acquire Z to spend at least \$50 million toward low carbon investments by 30 April 2029 to support future energy solutions in New Zealand. At the end of 2023, \$47.8 million (which includes \$17.5m for taking the Group's holding in Flick Energy to 100 per cent) has been spent aligned with this commitment.		
2023 total capital expenditure on climate-related risks and opportunities		
Total capital expenditure, financing and investment deployed towards climate-related risks and opportunities in 2023 was \$32.6 million, and included investment in the following climate-related risks and opportunities:		
Description	Associated risk/opportunity	Approach and assumptions
EV charging rollout	Reputation Market and technology changes Investment in low carbon Optimise asset base	Installation of additional 82 EV charging bays at Z retail sites
Additional capital investment in Flick	Reputation Market and technology changes Invest in low carbon	Additional capital investment in Flick Electric to bring Z's ownership up to 100%
Investment in Red Phase	Reputation Market and technology changes Investment in low carbon Optimise asset base	Investment in Red Phase
Forest Partners	Emissions Trading Scheme (ETS) Obligations	Investment in the Forest Partners forestry joint venture to help meet Z's future carbon credit obligations

Practical example 4-12: Shell plc (2023)

United Kingdom

Annual Report and Accounts [extract]

Our journey to net zero [extract]

Energy transition strategy [extract]

Cash capital expenditure evolution by segment

Cash capital expenditure by segment for 2024 is expected to be approximately \$8 billion for Upstream, \$5 billion for Integrated Gas, \$3 billion for Marketing, \$3-4 billion for Chemicals and Products, and \$4-5 billion for Renewables and Energy Solutions.

Investing in the energy transition

Total cash capital expenditure* of \$24.4 billion in 2023

Non-energy products [A]

\$2.3 billion

Low-carbon energy solutions [B]

\$5.6 billion

LNG, gas and power marketing and trading [C]

\$4.0 billion

Oil, oil products and other [D]

\$12.5 billion

Operational expenditure evolution by segment

[A] Products for which usage does not cause Scope 3, Category 11 emissions: Lubricants, Chemicals, Convenience Retailing, Agriculture & Forestry, Construction & Road.

[B] E-Mobility and Electric Vehicle Charging Services, Low-Carbon Fuels, Renewable Power Generation, Environmental Solutions, Hydrogen, CCS. We define low-carbon energy products as those that have an average carbon intensity that is lower than conventional hydrocarbon products, assessed on a life-cycle basis.

[C] LNG Production & Trading, Gas & Power Trading, and Energy Marketing.

[D] Upstream segment, GTL, Refining & Trading, Marketing fuel and hydrocarbon sales, Shell Ventures, Corporate segment.

Movements in cash capital expenditure in 2023 versus 2022 were driven by:

- Non-energy products: 41% lower in 2023 than in 2022 due to the completion of Shell Polymers Monaca in 2022 and greater inorganic expansion in Lubricants and Convenience Retailing in 2022.
- Low-carbon energy solutions: increased by 30% mainly due to the acquisition of Nature Energy (nearly \$2 billion) and the roll-out of electric vehicle charging.
- LNG, gas and power marketing and trading: comparable year on year.
- Oil, oil products and other: remained at a similar level to 2022.

Energy transition: Total cash capital expenditure* by segment

				\$ billion	
Classification	Segment	2023		2022	
Non-energy products [A]	Marketing	0.9	2.3	1.5	3.9
	Chemicals and Products	1.4		2.4	
Low-carbon energy solutions [B]	Marketing	3.3		1.4	4.3
	Renewables & Energy Solutions	2.3	5.6	2.9	
LNG, gas and power marketing and trading [C]	Integrated Gas	3.7		3.8	
	Renewables & Energy Solutions	0.3	4.0	0.4	4.2
Oil, oil products and other [D]	Integrated Gas	0.5		0.5	
	Upstream	8.3		8.1	
	Marketing	1.4	12.5	2.0	12.5
	Chemicals and Products	1.8		1.4	
	Renewables & Energy Solutions	0.1		0.2	
	Corporate	0.4		0.3	
Total		24.4	24.4	24.8	24.8

[A] Products for which usage does not cause Scope 3, Category 11 emissions: Lubricants, Chemicals, Convenience Retailing, Agriculture & Forestry, Construction & Road.

[B] E-Mobility and Electric Vehicle Charging Services, Low-Carbon Fuels, Renewable Power Generation, Environmental Solutions, Hydrogen, CCS. We define low-carbon energy products as those that have an average carbon intensity that is lower than conventional hydrocarbon products, assessed on a life-cycle basis.

[C] LNG Production & Trading, Gas & Power Trading, and Energy Marketing.

[D] Upstream segment, GTL, Refining & Trading, Marketing fuel and hydrocarbon sales, Shell Ventures, Corporate segment.

* Non-GAAP measure (see page 365).

4.5.1.D Internal carbon prices

An entity is required to disclose: [IFRS S2.29(f), IFRS S2.BC130]

- An explanation of whether and how the entity is applying a carbon price in decision-making (e.g., investment decisions, transfer pricing and scenario analysis) - this is referred to as an 'internal carbon price'
- The price of GHG emissions (per metric tonne) that the entity uses, if any, to assess the costs of its GHG emissions

Extract from IFRS S2

Appendix A Defined terms

Internal carbon price	<p>Price used by an entity to assess the financial implications of changes to investment, production and consumption patterns, and of potential technological progress and future emissions-abatement costs. An entity can use internal carbon prices for a range of business applications. Two types of internal carbon prices that an entity commonly uses are:</p> <p>(a) a shadow price, which is a theoretical cost or notional amount that the entity does not charge but that can be used to understand the economic implications or trade-offs for such things as risk impacts, new investments, the net present value of projects, and the cost and benefit of various initiatives; and</p> <p>(b) an internal tax or fee, which is a carbon price charged to a business activity, product line, or other business unit based on its greenhouse gas emissions (these internal taxes or fees are similar to intracompany transfer pricing).</p>
------------------------------	--

In explaining how the internal carbon price is used in decision-making, an entity is expected to explain whether it is using a current price, shadow price or another price to represent the price for each metric tonne of carbon. However, if the entity does not have an internal carbon price, the entity needs to consider disclosing that fact. [IFRS S2.BC130].

In its 2023 TCFD Report, Cemex, S.A.B. de C.V. discloses information about its use of internal carbon pricing:

Practical example 4-13: Cemex, S.A.B. de C.V. (2023)

Mexico

Report 2023 [extract]

Task Force on Climate-Related Financial Disclosure Response (TCFD) [extract] Strategy [extract]

Internal Carbon Pricing

Since 2020, Cemex designed a methodology to implement an internal carbon price as a shadow price with the primary objective of driving low-carbon investments and changing internal behaviors, reflecting a cost for CO₂ emissions that simulates a scenario in which all our sites in the world operate under an emission trading system (ETS). Every year, we update the price of carbon according to the latest EU ETS average price forecast from a ten analysts' report (83.5 EUR/t for 2023 and 142 EUR/t for 2030; UKA 2023: 53.6 GBP/ton), which also includes UK ETS price forecast. California market price increased based on Analyst's Best Estimate used for California operation (33 USD/t in 2023, 28 USD/t in 2022 and 48 USD/t in 2030). A carbon floor price is used for non-regulated countries outside EU and California (22 USD/ton in 2023, 20 USD/ton in 2022 and 36 USD/t in 2030). These forecasts are used in all our business units, allowing managers to make operational and investment decisions taking into consideration the impact of CO₂ emissions on their present and future financial performance.

4.5.1.E Executive remuneration

An entity is required to disclose: [IFRS S2.29(g)]

- A description of whether and how climate-related considerations are factored into executive remuneration
- The percentage of executive management remuneration recognised in the current period that is linked to climate-related considerations

How we see it

IFRS S2 does not define 'executive management'. As such, entities will need to exercise judgement in determining which management roles will represent 'executive management' and are, therefore, within the scope of this disclosure requirement.

In our view, this disclosure would allow primary users to understand whether, and to what extent, the managers of an entity that have the authority and responsibility for managing the activities of the entity are incentivised through remuneration for their performance in managing the entity's climate-related risks and opportunities. In that context, to identify the management roles that represent 'executive management', an entity could consider the definition of 'key management personnel' in IAS 24 *Related Party Disclosures*, which states that "Key management personnel are those persons having authority and responsibility for planning, directing and controlling the activities of the entity, directly or indirectly, including any director (whether executive or otherwise) of that entity".

IFRS S2 also does not define 'remuneration'. In our view, the ordinary meaning of 'remuneration' would be sufficient to apply this disclosure requirement. In determining what constitutes 'remuneration', an entity could also consider referring to the definition of 'compensation' in IAS 24, which includes short-term employee benefits (e.g., wages), post-employment benefits (e.g., pensions), other long-term employee benefits (e.g., long-service leave), termination benefits and share-based payment.

4.5.1.F Preparation guidance

In preparing the cross-industry metric disclosures other than GHG emissions mentioned above, IFRS S2 states that an entity is required to consider: [IFRS S2.B65]

- The time horizons over which the effects of climate-related risks and opportunities could reasonably be expected to occur (refer to Chapter 53)
- Where in the entity's business model and value chain climate-related risks and opportunities are concentrated (e.g., geographical areas, facilities or types of assets) (refer to Chapter 53)
- The information disclosed in relation to the effects of climate-related risks and opportunities on the entity's financial position, financial performance and cash flows for the reporting period (refer to Chapter 53)
- Whether industry-based metrics partially or completely provide the information required by the cross-industry metric disclosures
- Connectivity between the cross-industry metric disclosures and the amounts recognised and disclosed in the related financial statements. Connectivity also includes consistency in the data and assumptions used (to the extent possible) in the disclosures and in the preparation of the financial statements

4.5.2 Industry-based metrics

In addition to cross-industry metrics, IFRS S2 requires an entity to disclose industry-based metrics that are associated with one or more particular business models, activities or other common features that characterise participation in an industry. Disclosure of industry-based metrics is required to enable primary users to understand an entity's exposure to and management of climate-related risks and opportunities that are common to the entity's industry. [IFRS S2.BC134].

IFRS S2 requires an entity to refer to the *Industry-based Guidance on Implementing IFRS S2* and consider the applicability of the industry-based metrics corresponding to the disclosure topics identified for the relevant industry. [IFRS S2.32]. As discussed in section 4.3.1.B above, this requirement means that, after referring to the industry-based guidance, an entity is not required to apply that guidance if the entity considers that it is not applicable. However, even if an entity concludes that the industry-based guidance does not apply, IFRS S2 still requires the entity to disclose industry-based metrics. As the ISSB has explained, the disclosure topics and metrics included in the industry-based guidance is not intended to be exhaustive. Therefore, information about other topics not included in the industry-based guidance will need to be disclosed if the entity determines that the information is material. [IFRS S2.BC37].

4.5.3 Climate-related targets

IFRS S2 requires an entity to disclose:

- Its climate-related targets (see section 4.5.3.A below)
- Information about its approach to setting, reviewing and monitoring progress against each target (see section 4.5.3.B below)
- Information about its performance against each target (see section 4.5.3.C below)
- Specific information for each GHG emission target the entity has (if any) (see section 4.5.3.D below)

4.5.3.A Disclosures about an entity's climate-related targets

IFRS S2 requires an entity to disclose its quantitative and qualitative climate-related targets. These may be either: [IFRS S2.33]

- Targets that the entity has set to monitor progress towards achieving its strategic goals
- Or

- Targets that the entity is required to meet by law or regulation (if any)

These targets include any GHG emissions targets.

For each target, IFRS S2 requires an entity to disclose the following:

Figure 4-12: Climate-related target disclosures

Information to disclose	Further information
The metric used to set the target [IFRS S2.33(a)]	IFRS S2 also requires an entity to consider cross-industry metrics and industry-based metrics when identifying and disclosing metrics used to set climate-related targets and to measure progress. [IFRS S2.B67]. For metrics that were developed by an entity to measure progress towards a target, IFRS S1 specifies additional disclosures that the entity is required to make (see Chapter 53).
The objective of the target [IFRS S2.33(b)]	An entity might refer to, for example, mitigation, adaptation or conformance with science-based initiatives.
The part of the entity to which the target applies [IFRS S2.33(c)]	An entity might refer to, for example, whether the target applies to the entity in its entirety or only a part of the entity (e.g., a specific business unit or specific geographical region).
Target measurement considerations	Specifically, an entity is required to disclose: <ul style="list-style-type: none"> ▪ The period over which the target applies [IFRS S2.33(d)] ▪ The base period from which progress is measured [IFRS S2.33(e)] ▪ Any milestones and interim targets. [IFRS S2.33(f)].
If the target is quantitative, whether it is an absolute target or an intensity target [IFRS S2.33(g)]	IFRS S2 describes: <ul style="list-style-type: none"> ▪ An <i>absolute target</i> as “a total amount of a measure or a change in the total amount of a measure” ▪ An <i>intensity target</i> as “a ratio of a measure, or a change in the ratio of a measure, to a business metric” [IFRS S2.B66]
How the latest international agreement on climate change has informed the target [IFRS S2.33(h)]	This disclosure includes any jurisdictional commitments that arise from the latest international agreement.

4.5.3.B Approach to set, review and monitor progress against targets

An entity is required to disclose information about the entity's approach to: [IFRS S2.34]

- Setting and reviewing each target
- Monitoring its progress against each target

The information to be disclosed includes: *[IFRS S2.34]*

- Whether a third party has validated the target and the methodology for setting the target
- The entity's processes for reviewing the target
- The metrics used by the entity to monitor its progress towards reaching the target
- Any revisions that have been made to the target and an explanation for those revisions

4.5.3.C Reporting performance against each target

An entity is required to disclose information about its performance against each climate-related target. The information disclosed also needs to include an analysis of trends or changes in the entity's performance. *[IFRS S2.35]*.

In identifying and disclosing the metrics used to set and monitor progress towards reaching a target, IFRS S2 requires that an entity refers to and considers the applicability of cross-industry metrics and industry-based metrics. The metrics include those described in an applicable ISSB standard and metrics that otherwise satisfy the IFRS S1 requirements. *[IFRS S2.37]*.

4.5.3.D GHG emission targets

In addition to the requirements outlined above, IFRS S2 also requires information to be disclosed in relation to any GHG emissions target(s) that an entity has set (or is required to meet by law or regulation) which is summarised in Figure 4-13 below. *[IFRS S2.36]*.

Figure 4-13: GHG emission target disclosures

Information to disclose	Further information
The scope of the GHG emissions target	Specifically, an entity is required to disclose: <ul style="list-style-type: none"> ▪ Which GHG emissions are covered by the target (noting that the various constituent gases are described in section 5.2 below) <i>[IFRS S2.36(a)]</i> ▪ Whether the target covers Scope 1, Scope 2 or Scope 3 GHG emissions <i>[IFRS S2.36(b)]</i>
Whether the target is a gross GHG emissions target or net GHG emissions target <i>[IFRS S2.36(c)]</i>	IFRS S2 describes: <ul style="list-style-type: none"> ▪ Gross GHG emissions targets as "reflect[ing] the total changes in greenhouse gas emissions planned within the entity's value chain". ▪ Net GHG emissions targets as "the entity's targeted gross greenhouse gas emissions minus any planned offsetting efforts (for example, the entity's planned use of carbon credits to offset its greenhouse gas emissions)". <p>For net GHG emissions targets, the entity is also required to separately disclose its associated gross GHG emissions target. IFRS S2 also clarifies that the net GHG emissions target disclosure cannot obscure information about the entity's gross GHG emissions target. <i>[IFRS S2.B68, IFRS S2.B69]</i>.</p>
Whether the target was derived using a sectoral decarbonisation approach <i>[IFRS S2.36(d)]</i>	In the Basis for Conclusions to IFRS S2 the ISSB explains that a sectoral decarbonisation approach sets GHG emissions targets on a sector-by-sector basis by translating GHG gas emissions targets made at the international level (e.g., established through the latest international agreement on climate change) into sector-based benchmarks, against which the performance of individual entities can be compared.

A sectoral decarbonisation approach acknowledges that entities operating in different sectors will have specific challenges associated with the transition to a lower-carbon economy (because, for example, the location of where in an entity's value chain that GHG emissions are concentrated will vary by sector).

The Science Based Targets Initiative (SBTi) uses a sectoral decarbonisation approach. *[IFRS S2.BC150]*.

Information to disclose	Further information
<p>The entity's planned use of carbon credits to offset GHG emissions to achieve any net GHG emissions target <i>[IFRS S2.36(e)]</i></p>	<p>IFRS S2 defines a carbon credit as "An emissions unit that is issued by a carbon crediting programme and represents an emission reduction or removal of greenhouse gases. Carbon credits are uniquely serialised, issued, tracked and cancelled by means of an electronic registry". <i>[IFRS S2 Appendix A]</i>.</p> <p>Information to be disclosed about an entity's planned use of carbon credits includes: <i>[IFRS S2.36(e)]</i></p> <ul style="list-style-type: none"> ▪ The extent of the entity's use of carbon credits to achieve its net GHG emissions targets (if any) ▪ The identity of the third-party scheme(s) that will verify or certify the carbon credits ▪ The type of carbon credit - this includes whether the underlying offset will be nature-based or based on technological carbon removals (see further discussion below) ▪ Any other factors that primary users might need to understand the credibility and integrity of the scheme from which the entity obtains carbon credits (e.g., assumptions regarding the permanence of the carbon offset) <p>An entity might also disclose information about carbon credits it has already acquired and which the entity is planning to use to meet its GHG emissions targets. <i>[IFRS S2.B71]</i>.</p>

Carbon credits

Carbon credits may be nature-based (i.e., aim to enhance natural carbon sinks, such as through afforestation, soil-based carbon sequestration and the use of other biomass stores) or based on technological carbon removals. The ISSB noted that disclosure about the type of carbon credit helps primary users to assess an entity's risk profile. For example, if an entity plans to use carbon credits based on technological carbon removals, a user will want to understand whether the technological solution is currently economical at commercial scales or whether it will likely require substantial investment to be economically viable in the future. In contrast, nature-based approaches are often more cost-effective than technological solutions. However, nature-based approaches may be subject to concerns about:

- Quality of the carbon offset scheme based on 'permanence' (i.e., how long the GHG emissions will be safely removed from the atmosphere) and 'additionality' (i.e., whether any new climate benefits have been brought about by a particular investment that would not have occurred anyway)

And

- Their secondary effects on other social and environmental issues, such as food production

Consequently, disclosures about an entity's reliance on carbon credits, how credits are generated, and the credibility and integrity of the scheme from which the entity obtains the credits provide important information to users because additional climate-related risks and opportunities may arise from uncertainty about the suitability of some schemes, the available technology and future prices of carbon credits. The ISSB notes that this may happen because, for example: *[IFRS S2.BC154, IFRS S2.BC155, IFRS S2.BC156]*

- Carbon capture and storage technology solutions might prove to be ineffective.

Or

- Regulations might be introduced or revised to discourage or ban the use of specified carbon credit schemes due to climate activism efforts, policy changes or concerns about food shortage issues that might arise as a consequence of decisions made.

TCFD comparison

The ISSB indicates that some of the IFRS S2 disclosure requirements for metrics and targets relating to climate-related risks and opportunities are broadly consistent with the TCFD recommended disclosures.

For disclosures related to the metrics used by an entity to manage and assess its climate-related risks, the ISSB noted in its TCFD comparison document that IFRS S2 requires the disclosure of industry-based metrics in addition to the categories of cross-industry metrics which are also included in TCFD guidance.

For disclosures related to GHG emissions, the ISSB noted that IFRS S2 includes additional requirements to:

- Separately disclose Scope 1 and Scope 2 GHG emissions for the consolidated group and for investees that are not part of the consolidated group (e.g., equity accounted investments)
- Disclose Scope 2 GHG emissions according to the location-based approach and to disclose information about any contractual instruments relating to Scope 2 GHG emissions
- Disclose 'financed emissions' if the entity has activities in asset management, commercial banking or insurance
- Disclose the measurement approach, inputs and assumptions used to measure Scope 3 GHG emissions

IFRS S2 also specifies a Scope 3 measurement framework for preparing disclosures on Scope 3 GHG emissions. The general 'disaggregation' principle in IFRS S1 would also require an entity to disaggregate its GHG emissions disclosure by constituent gases if that disaggregation provides material information to users of the entity's general purpose financial reports.

For disclosures related to targets used by the entity to manage its climate-related risks and opportunities and its performance against those targets, the ISSB noted that IFRS S2:

- Differs from the TCFD Recommendations by requiring an entity to disclose how the latest international agreement on climate change has informed its target and whether the target has been validated by a third party
- Requires more detailed information to be disclosed about the entity's GHG emissions targets and additional requirements about the planned use of carbon credits to achieve the entity's net GHG emissions targets
- Includes additional requirements to disclose information about the entity's approach to setting and reviewing targets, monitoring progress against those targets, including whether a sectoral decarbonisation approach was used in setting the targets

5 Greenhouse gas emissions

5.1 Measurement of GHG emissions

IFRS S2 requires an entity's disclosure of its GHG emissions to be measured in accordance with the *Greenhouse Gas Protocol: A Corporate Accounting and Reporting Standard (2004)*. The ISSB clarified that an entity applies the requirements in the GHG Protocol only to the extent that those requirements do not conflict with IFRS S2. In other words, an entity uses the GHG Protocol to measure what is required to be disclosed by IFRS S1 and IFRS S2. Therefore, as an example, an entity is required to disclose its Scope 3 emissions because that it is a requirement in IFRS S2 even though the GHG Protocol does not require the disclosure of Scope 3 GHG emissions. [IFRS S2.29(a)(ii), IFRS S2.B23]. Furthermore, other requirements and guidance that are included in the GHG Protocol Corporate Standard that do not relate to the measurement of GHG emissions is not relevant to the application of IFRS S2.

An exception to the general requirement in IFRS S2 to use the GHG Protocol to measure GHG emissions applies if an entity is required by a jurisdictional authority, or a securities exchange on which it is listed, to use a different method for measuring its GHG emissions. This exception applies for as long as the jurisdiction's, or securities exchange's, requirement to use a different method applies to the entity. Furthermore, in some cases, the jurisdiction's, or securities exchange's, specific requirements might apply only to one part of the reporting entity (e.g., its operations in a specific jurisdiction) or for only some categories of GHG emissions (e.g., Scope 1 and Scope 2 GHG emissions). In such cases, the exception that IFRS S2 allows does not exempt the entity from being required to disclose its Scope 1, Scope 2 and Scope 3 GHG emissions for the whole of the entity. [IFRS S2.B24, IFRS S2.B25].

5.2 Overview of GHG Protocol

The GHG Protocol provides standards and guidance for accounting for, measuring and reporting emissions of the following seven GHGs identified by the United Nations Framework Convention on Climate Change (UNFCCC):

- Carbon dioxide (CO₂)
- Methane (CH₄)
- Nitrous oxide (N₂O)
- Hydrofluorocarbons (HFCs)
- Perfluorocarbons (PFCs)
- Sulphur hexafluoride (SF₆)
- Nitrogen trifluoride (NF₃)

These gases are classified as GHGs because they trap heat in the atmosphere.

The following publications are collectively known as the GHG Protocol:

- *Corporate Accounting and Reporting Standard* (Corporate Standard)¹³
- *Scope 2 Guidance*¹⁴
- *Corporate Value Chain (Scope 3) Accounting and Reporting Standard* (Scope 3 Standard)¹⁵
- *Technical Guidance for Calculating Scope 3 Emissions* (Scope 3 Guidance)¹⁶

The following sections provide a brief introduction to some of the key concepts in the GHG Protocol that may be relevant for measuring an entity's GHG emissions. Detailed guidance on the application of the GHG Protocol can be found in the EY publication, *Sustainability reporting developments - A comprehensive guide - Greenhouse Gas Protocol Interpretative guidance*.¹⁷

13 Refer to [Corporate Standard](#), available in the GHG Protocol website.

14 Refer to [Scope 2 Guidance](#), available in the GHG Protocol website.

15 Refer to [Corporate Value Chain \(Scope 3\) Standard](#), available in the GHG Protocol website.

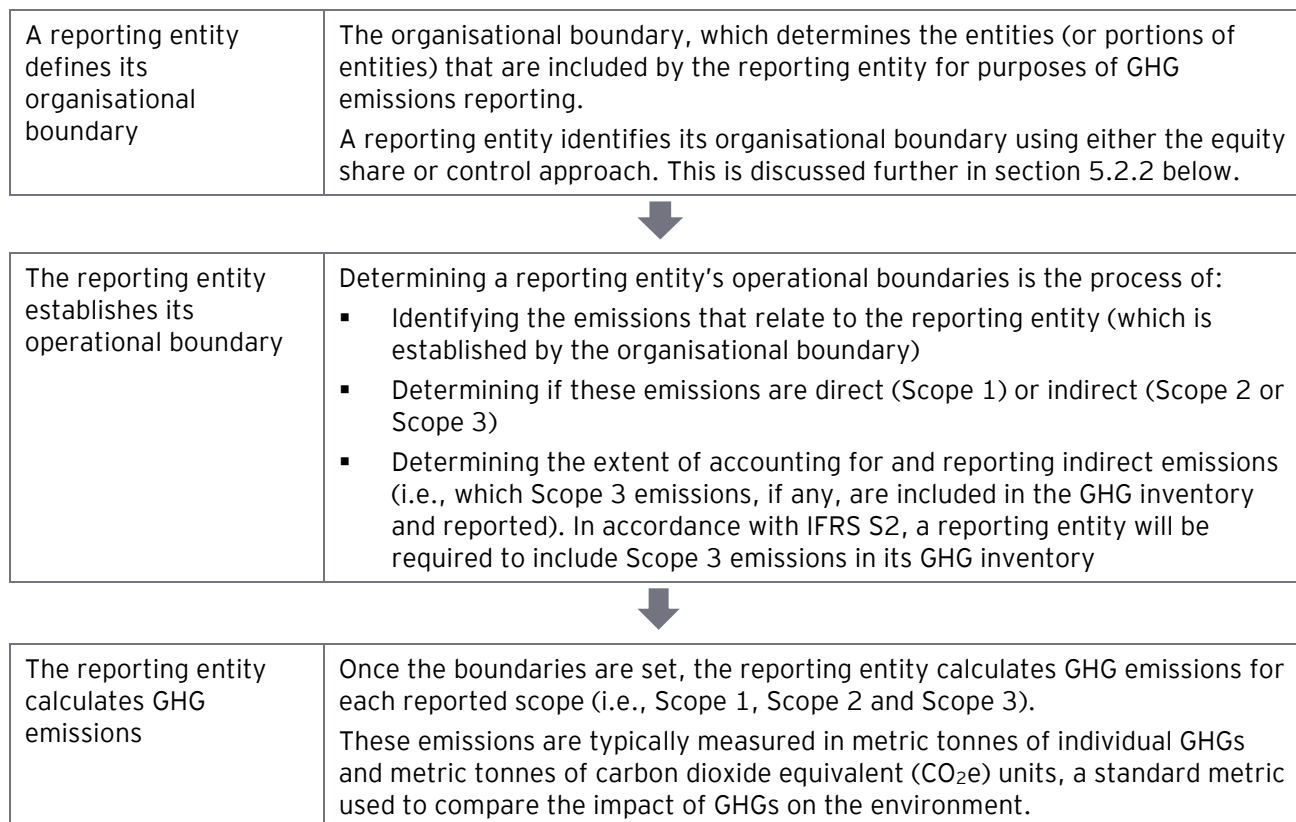

16 Refer to [Scope 3 Calculation Guidance](#), available in the GHG Protocol website.

17 [Sustainability reporting developments: A comprehensive guide, Greenhouse Gas Protocol, Interpretative guidance](#), EY Global, June 2025, available at www.ey.com.

5.2.1 Accounting for, measuring and reporting GHG emissions

Accounting for, measuring and reporting GHG emissions in accordance with the GHG Protocol is based on the following process:

Figure 5-1: Process under the GHG Protocol

The GHG Protocol is designed to enable reporting entities to track and report consistent and comparable GHG emissions data over time. Therefore, it requires a reporting entity to establish a base year (a specific year or an average of multiple years) against which subsequent emissions can be compared. The GHG Protocol requires the base year emissions to be retrospectively recalculated in certain circumstances to maintain comparability over time.

5.2.2 Organisational boundary

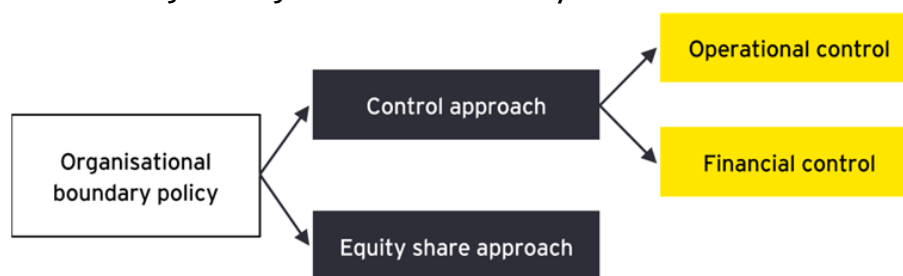

A reporting entity may have many different entities in its legal and organisational structure, which may include wholly owned subsidiaries, partially owned subsidiaries and equity method investments. The GHG Protocol provides guidance on whether a reporting entity must include emissions from these various entities when measuring its GHG emissions. The GHG Protocol refers to the process of identifying which entities to include as “setting organisational boundaries”.

The GHG Protocol allows a reporting entity to select one of two methods of setting organisational boundaries:

- The equity share approach
- Or
- The control approach

The GHG Protocol calls these methods consolidation approaches. For entities that wholly own and control all their operations, either approach will result in the same organisational boundary. However, for entities that have partially owned operations (or for entities that only have an economic interest in the operations without control), the organisational boundary identified, and therefore, the GHG emissions included in their inventory, can differ depending on the consolidation approach used.

Because control can be defined from an operational or financial perspective, the GHG Protocol further divides the control approach into the operational control approach and financial control approach. The decision tree below shows the options available to a reporting entity for determining its organisational boundary:

Figure 5-2: Determining the organisational boundary

5.2.2.A Equity share approach

Under the equity share approach, a reporting entity sets its organisational boundary based on its share of the equity of an owned, or partially owned, entity (i.e., the reporting entity includes the same proportionate share of emissions of the owned entity as its share of equity of the entity). The equity share percentage used by the reporting entity should reflect the extent of the rights the reporting entity has to both the risks and rewards generated by an owned entity. This percentage is often the same as the legal ownership share of the owned entity, but it may not be in all cases. For example, the equity share and ownership share will differ when the ownership share does not faithfully represent the economic interest in the owned entity.

5.2.2.B Control approach

Under the control approach, a reporting entity includes within its organisational boundaries 100% of the emissions of operations over which it has control, regardless of the equity share or legal ownership share held by the reporting entity. For example, a reporting entity that has an equity share of 65% and control over a subsidiary would account for and report 100% of the subsidiary's emissions using the control approach. Conversely, if the reporting entity has an equity share of 35% in an entity that it does not control, none of the emissions of the uncontrolled entity would be included in the reporting entity's GHG inventory.

The GHG Protocol provides two methods of determining control:

- Financial control (see (i) of this section below)
- Operational control (see (ii) of this section below)

The selected control approach must be used consistently throughout the entire organisation and over time.

(i) Financial control

A reporting entity has financial control over another entity if it can control the entity to gain economic benefits from the entity's activities. Financial control is often obtained if the reporting entity has the right to the majority of the economic benefits of the operation. Similar to the concept of equity share above, the determination of financial control depends on the economic substance of the relationship rather than the legal ownership. That is, financial control is not determined by legal ownership but by whether the reporting entity holds the rights to the majority of the economic benefits of the operation (e.g., the risks and rewards of ownership of the entity's assets). For example, a reporting entity may have financial control over another entity that is a variable interest entity, even though it owns less than 50% of the other entity.

When financial control is shared jointly by two or more parties (e.g., a joint venture under IFRS 11 *Joint Arrangements*), emissions are accounted for using the equity share approach even when the financial control approach is applied throughout the remainder of the reporting entity.

How we see it

We believe that the determination of financial control will often be consistent with the determination of control for financial reporting purposes under IFRS accounting standards (i.e., if an entity is consolidated for financial reporting purposes, it will likely be included in the organisational boundaries under the financial control approach).

However, the financial accounting guidance on the assessment of control under IFRS accounting standards has changed since the Corporate Standard was first issued. Therefore, there may be differences between the consolidation conclusion under the GHG Protocol's financial control approach and the conclusion for financial accounting.

(ii) Operational control

The GHG Protocol specifies that a reporting entity that applies the operational control approach needs to include any facility over which it has operational control in the organisational boundary, even if it is not the owner of the facility. This is particularly relevant for leased assets and other assets that are operated under a contractual arrangement.

A reporting entity that elects to use the operational control approach determines control by whether it has the authority to introduce and implement operating policies at an operation or facility. Operational control does not mean that the reporting entity can make **all** decisions concerning the operation or facility. For example, operational control may include decisions about how the day-to-day functions are performed but may not include certain other significant decisions (e.g., financing decisions, buying/selling significant assets) otherwise relevant to the financial control conclusions.

Certain facilities or operations may be under joint control (e.g., joint ventures). Under the operational control approach, a reporting entity needs to determine whether it can introduce and implement operating policies for each facility or operation to determine whether the facilities or operations under joint control are included in its reporting boundary. A reporting entity that has operational control over an operation will include 100% of the operation's emissions in its reporting boundary even though it only owns 50% of the investee.

The following Practical example explains how SAP SE has determined its organisational boundary:

Practical example 5-1: SAP SE (2022)**Germany****SAP Integrated Report 2022 [extract]****Non-Financial Notes: Environmental Performance [extract]****Carbon Emissions [extract]****Organizational Boundaries**

SAP defines its organizational boundaries by applying the operational control approach as set out in the GHG Protocol.

Operational control is established when SAP has the full authority to introduce and implement its operating policies. The emissions of all operations over which the company has operational control and all owned, leased facilities, co-location data centers, and vehicles that the company occupies or operates are accounted for in the carbon emissions. They are based either on measurements or, where no measured data is available, on estimations and extrapolations.

A portion of SAP's leased facilities operates under full-service or multitenant leases, where SAP does not have access to actual energy consumption information. SAP includes these facilities in our definition of operational control and accounts for them by estimating related energy consumption.

To support the growing demand for SAP's cloud offerings, we subcontract computation power in local third-party data centers. Carbon emissions are approximated and included based on the consumed or extrapolated computation power.

In most instances, however, SAP has 100% ownership of its subsidiaries. Accordingly, the difference between applying the control versus the equity approach is about 0.98% based on SAP revenue. If investments in associates were included, the difference would be even smaller, about 0.71%.

Frequently asked questions**Question 5-1: What is the difference between the reporting entity concept in IFRS S1 and the organisational boundary for GHG emissions disclosures?**

IFRS S1 specifies that sustainability-related financial disclosures are prepared for the same reporting entity as the related financial statements. A reporting entity would prepare consolidated financial statements if the reporting entity was a consolidated group comprised of a parent entity and its subsidiaries. The sustainability-related financial disclosures would be similarly prepared for the consolidated group. Therefore, the sustainability-related financial information disclosed would be the sustainability-related risks and opportunities that either affect the consolidated group directly or affect the consolidated group's value chain.

The organisational boundary determined for GHG emissions is only relevant for the purposes of preparing the reporting entity's GHG emissions disclosures. The organisational boundary is not relevant for determining whether other sustainability-related financial information needs to be disclosed in the reporting entity's sustainability-related financial disclosures.

Consolidated financial statements and organisational boundaries are different concepts and determined based on different criteria. Therefore, the composition of a consolidated group and an organisational boundary will align only if the specific facts and circumstances of an entity's operations and structure are such that they happen to align. In many cases, they will not align which may explain why paragraph 29(a)(iv) requires an entity to disaggregate emissions between the consolidated accounting group and other investees that are not part of the consolidated accounting group.

Question 5-2: What are examples of entities (or assets) that would be included in the organisational boundary for GHG emissions disclosure purposes that would not form part of the consolidated group?

As stated in the previous question, paragraph 29(a)(iv) of IFRS S2 requires an entity to disaggregate emissions between the consolidated accounting group and other investees that are not part of the consolidated accounting group. The types of entities (or assets) that would not be part of a consolidated group depends on the applicable accounting policies as well as measurement approach that is adopted for GHG emissions reporting purposes.

Equity share approach

The equity share approach (which is explained above in Section 5.2.2.A) typically includes the following entities in the organisational boundary to the extent they are outside of the consolidated accounting group:

- Associates
- Joint ventures
- Unconsolidated subsidiaries
- Any other entity not being a subsidiary, associated or joint venture subject to GHG emission disclosure requirements under the equity share approach

The equity share approach will include those entities in the organisational boundary, but only include emissions attributable to that entity to the extent of the entity's share of equity in that entity. Similarly, for subsidiaries of a consolidated group that are not wholly-owned subsidiaries, the equity share approach will include those subsidiaries in the organisational boundary and only include emissions attributable to those subsidiaries to the extent of the entity's share of equity in them.

Operational control approach

The operational control approach (which is explained above in Section 5.2.2.B) typically includes the following in the organisational boundary to the extent they are outside of the consolidated accounting group:

- Unconsolidated entities (including subsidiaries, associates, joint ventures and other entities) where the entity has operational control (e.g., an organisational boundary based on operational control would include GHG emissions attributable to interests of other joint venture partners in a joint venture that is classified as a joint operation in accordance with IFRS 11)
- Facilities that are not recognised as assets in the consolidated group's financial statements but the entity has operational control

In each of these cases, all of the emissions attributable to the entity or assets that within the entity's operational control (i.e., 100% of the GHG emissions) will form part of the entity's Scope 1 and Scope 2 GHG emissions.

Financial control approach

The financial control approach (which is explained above in Section 5.2.2.B) typically includes the following in the organisational boundary to the extent they are outside of the consolidated accounting group:

- Unconsolidated subsidiaries (e.g., when the investment entity exception is used in IFRS accounting standards)
- Joint ventures accounted for in accordance with the equity method of accounting. As noted in this section above, emissions are accounted for using the equity share approach when financial control is shared jointly by two or more parties.

Question 5-3: How should an entity classify GHG emissions from leased assets?

There are several factors that can determine the classification of GHG emissions from leased assets. These include:

- Whether the entity is a lessee or a lessor
- The accounting classification of the lease
- The measurement approach that is applied for GHG emissions reporting purposes (i.e., equity share, financial control or operational control)

The guidance in the GHG Protocol for classifying emissions from leased assets is based on the finance/capital lease and operating lease classifications that were included in the financial reporting requirements in effect when the GHG Protocol was published in 2004, such as IAS 17 *Leases*. These classifications applied to both lessees and lessors. However, the financial reporting requirements for leases have changed since the GHG Protocol was first published. For instance, under IFRS accounting standards, IAS 17 has been superseded by IFRS 16 *Leases*, which has removed the finance lease and operating lease distinction for lessees and, instead, generally requires leases to be recognised on the lessee's statement of financial position. Under IFRS 16, the classification of leases by lessors has remained largely unchanged.

Classification based on IAS 17 (or comparable standards)

Applying the guidance in the GHG Protocol, the classification by lessees of GHG emissions from lease assets is, as follows:

Accounting classification of the lease under IAS 17 (or comparable standards)	GHG measurement approach being applied	Classification of emissions associated with leased asset
Finance lease	Either equity share, financial control or operational control approach	Scope 1 and Scope 2, on the basis that the lessee has either ownership, financial control or operational control of asset
Operating lease	Either equity share or financial control approach	Scope 3, on the basis that the lessee does <i>not</i> have ownership or financial control of asset
	Operational control	Scope 1 and Scope 2, on the basis that the lessee has operational control of asset*

*However, the GHG Protocol acknowledges that emissions from a leased asset could be classified as Scope 3 emissions in circumstances where the entity does not have operational control over a leased asset held in an operating lease. This could be an area of significant judgement.

Applying the guidance in the GHG Protocol, the classification by lessors of GHG emissions from lease assets is, as follows:

Accounting classification of the lease under IAS 17 (or comparable standards)	GHG measurement approach being applied	Classification of emissions associated with leased asset
Finance lease	Either equity share, financial control or operational control approach	Scope 3, on the basis that the lessor does <i>not</i> have either ownership, financial control or operational control of asset
Operating lease	Either equity share or financial control approach	Scope 1 and Scope 2, on the basis that the lessor has either ownership or financial control of asset
	Operational control	Scope 3, on the basis that the lessor does <i>not</i> have operational control of asset*

* However, the GHG Protocol acknowledges that emissions from a leased asset could be classified as Scope 1 and Scope 2 emissions in circumstances where the entity continues to have operational control over a leased asset held in an operating lease. This could be an area of significant judgement.

Classification based on IFRS 16

For the reasons noted above, the GHG Protocol does not provide any guidance on classification of GHG emissions from leased assets when an entity accounts for its leases in accordance with IFRS 16. Given the changes to accounting classifications for leases since the GHG Protocol was published, some entities may encounter challenges in how they determine the classification of emissions from leased assets.

How we see it

At present, there is an inconsistency between the model referred to in the GHG Protocol for the classification of leases (based on the previous accounting standards such as IAS 17) and currently applicable accounting standards upon which an entity's financial statements will be based, such as IFRS 16. Until such time as the GHG Protocol is revised to address this inconsistency, our view is that an entity can choose to classify GHG emissions from leased assets based on either:

- The finance and operating lease classifications in IAS 17 or comparable standards
- Or
- The accounting model according to IFRS 16

If an entity chooses to apply the lease classifications in IAS 17 or comparable standards, the GHG emissions from leased assets will be classified on the basis set out in Question 5-3 above.

If an entity instead chooses to apply the accounting model in IFRS 16, our view is that the GHG emissions from leased assets will be classified on the basis set out below.

For lessees:

Accounting treatment under IFRS 16	GHG measurement approach being applied	Classification of emissions associated with leased asset
Lease is recognised on the entity's statement of financial position (i.e., right-of-use asset, which represents the entity's right to the underlying asset)	Either equity share, financial control or operational control approach	Scope 1 and Scope 2, on the basis that the lessee has either ownership, financial control or operational control of asset
Short-term lease exemption or low-value assets exemption is applied	Either equity share or financial control approach	Scope 3, lessee on the basis that the does <i>not</i> have ownership or financial control of asset
	Operational control	Scope 1 and Scope 2, lessee on the basis that the has operational control of asset*

*Consistent with the reasoning in the GHG Protocol, emissions from a leased asset could be classified as Scope 3 emissions in circumstances where the entity does not have operational control over a leased asset held in a short-term lease or related to a low-value asset. This could be an area of significant judgement.

For lessors, our view is that an entity is required to follow the guidance for lessors in the GHG Protocol given that lessor accounting has largely remained unchanged under IFRS 16 and, as such, lessors continue to be required to classify each lease as either an operating lease or finance lease.

5.2.3 Scope 2 GHG emissions calculation methods

Scope 2 GHG emissions measurement methods are:

- Location-based method (see section 5.2.3.A below)
- Market-based method (see section 5.2.3.B below)

5.2.3.A Location-based method

The location-based method reflects the average emissions factors of the electricity grids on which a reporting entity consumes electricity. The location-based method is required to be used by all reporting entities. A reporting entity's electricity procurement decisions (e.g., a decision to purchase electricity generated from renewable sources) are not factored into the location-based method calculation of Scope 2 emissions. Therefore, this method can be applied in all locations and provides information on emissions from the overall mix of generation sources used in the grid. The location-based method results in Scope 2 emissions from a reporting entity's activities in the respective regions that are consistent with the Scope 2 emissions from other entities' activities in the same region. This provides better comparability of entities based on the location of their activities.

Under the location-based method, a reporting entity uses an emissions factor that represents the average emissions from energy generation within a defined geographical area (e.g., local, subnational or national level) during a defined time period, which is often 12 months (i.e., the grid average emissions factor). Supplier-specific emissions factors should not be used under this method. Additionally, these emissions factors do not reflect the impact of contractual instruments.

5.2.3.B Market-based method

The market-based method represents the emissions associated with the choices a reporting entity makes when acquiring electricity. Scope 2 emissions under the market-based method are derived from a reporting entity's contractual relationships or instruments. For example, if a reporting entity chooses a specific energy generation supplier or enters into a supply agreement for electricity from a regional wind farm, it would use the emissions factors resulting from these contracts in its Scope 2 emissions calculation under the market-based method. Unlike the location-based method, the market-based method provides information about the decisions a reporting entity has made to reduce emissions from its consumption of electricity.

Contractual instruments include direct contracts with a supplier (e.g., power purchase arrangements, virtual power purchase arrangements) and bundled or unbundled attribute claims (e.g., renewable energy certificates, energy attribute certificates, guarantees of origin, supplier-specific emission rates, residual mix factors).

While the GHG Protocol requires the disclosure of Scope 2 GHG emissions on both location-based as well as the market-based method, IFRS S2 only requires the disclosure of the location-based method. In addition to this, entities are required to provide information about any contractual instruments that is necessary to inform users' understanding of the entity's Scope 2 GHG emissions. [IFRS S2.29(a)(v)].

5.3 Categories of GHG emissions

Appendix A to IFRS S2 includes definitions of:

- Direct GHG emissions, specifically Scope 1 GHG emissions
- Indirect GHG emissions, which refer to Scope 2 and Scope 3 GHG emissions

These definitions from IFRS S2 are reproduced below:

Extract from IFRS S2

Appendix A

Defined terms

indirect greenhouse gas emissions	Emissions that are a consequence of the activities of an entity, but occur at sources owned or controlled by another entity.
Scope 1 greenhouse gas emissions	Direct greenhouse gas emissions that occur from sources that are owned or controlled by an entity.
Scope 2 greenhouse gas emissions	Indirect greenhouse gas emissions from the generation of purchased or acquired electricity, steam, heating or cooling consumed by an entity. Purchased and acquired electricity is electricity that is purchased or otherwise brought into an entity's boundary. Scope 2 greenhouse gas emissions physically occur at the facility where electricity is generated.
Scope 3 greenhouse gas emissions	Indirect greenhouse gas emissions (not included in Scope 2 greenhouse gas emissions) that occur in the value chain of an entity, including both upstream and downstream emissions. Scope 3 greenhouse gas emissions include the Scope 3 categories in the Greenhouse Gas Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard (2011):

5.3.1 Measurement approach, inputs and assumptions

As noted in section 4.5.1.A above, IFRS S2 requires an entity to disclose the measurement approach, inputs and assumptions used to measure its GHG emissions. This disclosure required includes information about: [IFRS S2.B26]

- The measurement approach the entity uses in accordance with the GHG Protocol (see section 5.3.1.A below)
- The applicable method if the entity is not using the GHG Protocol and the measurement approach the entity uses (see section 5.3.1.B below)
- The emission factors the entity uses (see section 5.3.1.C below)

5.3.1.A GHG Protocol measurement approaches

Because the GHG Protocol includes different measurement approaches for measuring its GHG emissions, IFRS S2 requires an entity to disclose: [IFRS S2.B27]

- The approach it uses to determine its GHG emissions (e.g., the equity share or control approach)
- The reason(s) for the entity's choice of measurement approach and how that approach enables users of the entity's general purpose financial reports to understand the entity's performance in relation to its climate-related risks and opportunities, including progress towards its climate-related targets (if any)

5.3.1.B Other methods and measurement approaches

If an entity discloses its GHG emissions measured in accordance with another method (as outlined in section 5.1), IFRS S2 requires the entity to disclose: [IFRS S2.B28]

- The applicable method and measurement approach the entity uses to determine its GHG emissions
- The reason(s) for the entity's choice of method and measurement approach and how that approach enables users of the entity's general purpose financial reports to understand the entity's performance in relation to its climate-related risks and opportunities, including progress towards its climate-related targets (if any)

Frequently asked questions

Question 5-4: Is an entity permitted to use the relief that allows for the use of a method other than the GHG Protocol Corporate Standard to measure the entity's GHG emissions in a circumstance in which only part of the entity is required by a jurisdictional authority to use another method to measure its GHG emissions?

(TIG meeting 19 September 2024 - Agenda paper no. 3, ISSB meeting 20 November 2024 - Agenda paper no. 9C)

The ISSB staff's analysis of this question noted that an entity applying IFRS S2 would be:

- Permitted to measure part of its GHG emissions using a measurement method that is different from the GHG Protocol Corporate Standard, but only to the extent that part of the entity is required by a jurisdictional authority or an exchange on which it is listed to use that different method for measuring those GHG emissions
- Required to measure the remainder of its GHG emissions in accordance with the GHG Protocol Corporate Standard

The part of an entity's GHG emissions that is measured using a method that is different from the GHG Protocol Corporate Standard could refer, for example, to a subsidiary of the entity or to specific assets or operations of the entity.

If and when an entity applies this relief based on the ISSB staff's analysis, the entity's GHG emissions disclosures would be comprised of amounts measured using different methods (i.e., some measured using the GHG Protocol Corporate Standard, and others measured using a different method). To ensure that an entity's GHG emissions disclosures are understood by users of the general purpose financial reports, the ISSB staff's analysis noted that the entity would need to:

- Disclose the applicable method the entity has used to measure its GHG emissions if the entity is not using the GHG Protocol Corporate Standard, including the measurement approach the entity uses
- If material, disaggregate total GHG emissions by
 - GHG emissions measured using the GHG Protocol Corporate Standard
 - GHG emissions measured using a method(s) that is different from the GHG Protocol Corporate Standard
- Consider the qualitative characteristics of sustainability-related financial information, such as the understandability and comparability of the GHG emissions information.

There were mixed views among TIG members on this question. While many TIG members agreed with the ISSB staff's analysis, some other TIG members acknowledged a tension between that analysis and the requirement in IFRS accounting standards (specifically IFRS 10 *Consolidated Financial Statements*) that a reporting entity applies uniform accounting policies in the preparation of its consolidated financial statements.

An entity is not required to apply this relief. If the relief is not applied, the entity would be required to measure all of its GHG emissions in accordance with the GHG Protocol Corporate Standard. This may mean that an entity would need to recalculate some of its GHG emissions that were measured in accordance with the requirements of the jurisdictional authority or exchange for the purposes of preparing its sustainability-related financial disclosures in accordance with ISSB Standards.

Following the discussion at the TIG meeting, the ISSB has proposed amendments to IFRS S2 to clarify this issue. The proposed amendments are discussed further in section 8 below.

An example of how an entity might apply the jurisdictional relief based on the ISSB staff analysis (refer Question 5-4 above) is outlined in the following Illustration:

Illustration 5-1: Disclosure considerations when applying jurisdictional relief to part of an entity

Entity P is incorporated in Country X and prepares sustainability-related financial disclosures for its consolidated group, which includes a subsidiary Entity S which is incorporated in Country Y. Entity S is required by the regulations in Country Y to separately report its Scope 1 and Scope 2 GHG emissions using a measurement method that is different from the GHG Protocol Corporate Standard. Entity S's GHG emissions are material to Entity P's consolidated group.

In preparing the sustainability-related financial disclosures for the consolidated group, Entity P elects to use the jurisdictional relief permitted by paragraph 29(a)(ii) of IFRS S2. Accordingly, Entity P discloses its absolute gross GHG emissions generated during the reporting period in accordance with paragraph 29(a)(i) of IFRS S2 as follows:

	GHG emissions (metric tonnes CO ₂ e)			
	Scope 1	Scope 2	Scope 3	Total
GHG emissions measured using GHG Protocol Corporate Standard	8,000	2,700	32,000	42,700
Entity S's GHG emissions measured according to local regulations	3,000	1,100	-	4,100
Total GHG emissions for the consolidated group	11,000	3,800	32,000	46,800

In accordance with paragraph 29(a)(iii), Entity P would disclose the measurement approaches, inputs and assumptions it used to measure its GHG emissions. This would include disclosing that a method that is different from the GHG Protocol Corporate Standard was used to measure the Scope 1 and Scope 2 GHG emissions attributable to Entity S.

5.3.1.C Emissions factors

If an entity estimates the GHGs emitted using activity data and emissions factors as its basis for measuring its GHG emissions, IFRS S2 requires the entity to use the emissions factors that best represent the entity's activity. IFRS S2 does not specify the emissions factors that an entity is required to use. [IFRS S2.B29]. These estimates require:

- 'Activity data', which refers to the number of times that a specific activity occurs for which an emissions factor is available and can be applied. For Scope 1 emissions, activity data is often denominated in fuel consumed (e.g., litres of petrol, cubic feet of natural gas) or units of product produced
- An 'emissions factor', which refers to a value that represents the quantity of a specific GHG (or CO₂e) emitted for a specific unit of activity. For example, CO₂e emissions by fuel type for specific vehicles are common emissions factors used for calculating Scope 1 mobile emissions

Consequently, IFRS S2 requires an entity to disclose information so that primary users can understand the emission factors that the entity has used to measure its GHG emissions. [IFRS S2.B29].

5.3.2 Aggregation of GHGs into CO₂ equivalents

Although there are seven constituent GHGs, IFRS S2 requires an entity's disclosure of its absolute gross GHG emissions generated during the reporting period to be expressed in metric tonnes of CO₂ equivalent (CO₂e). [IFRS S2.29(a)(i)].

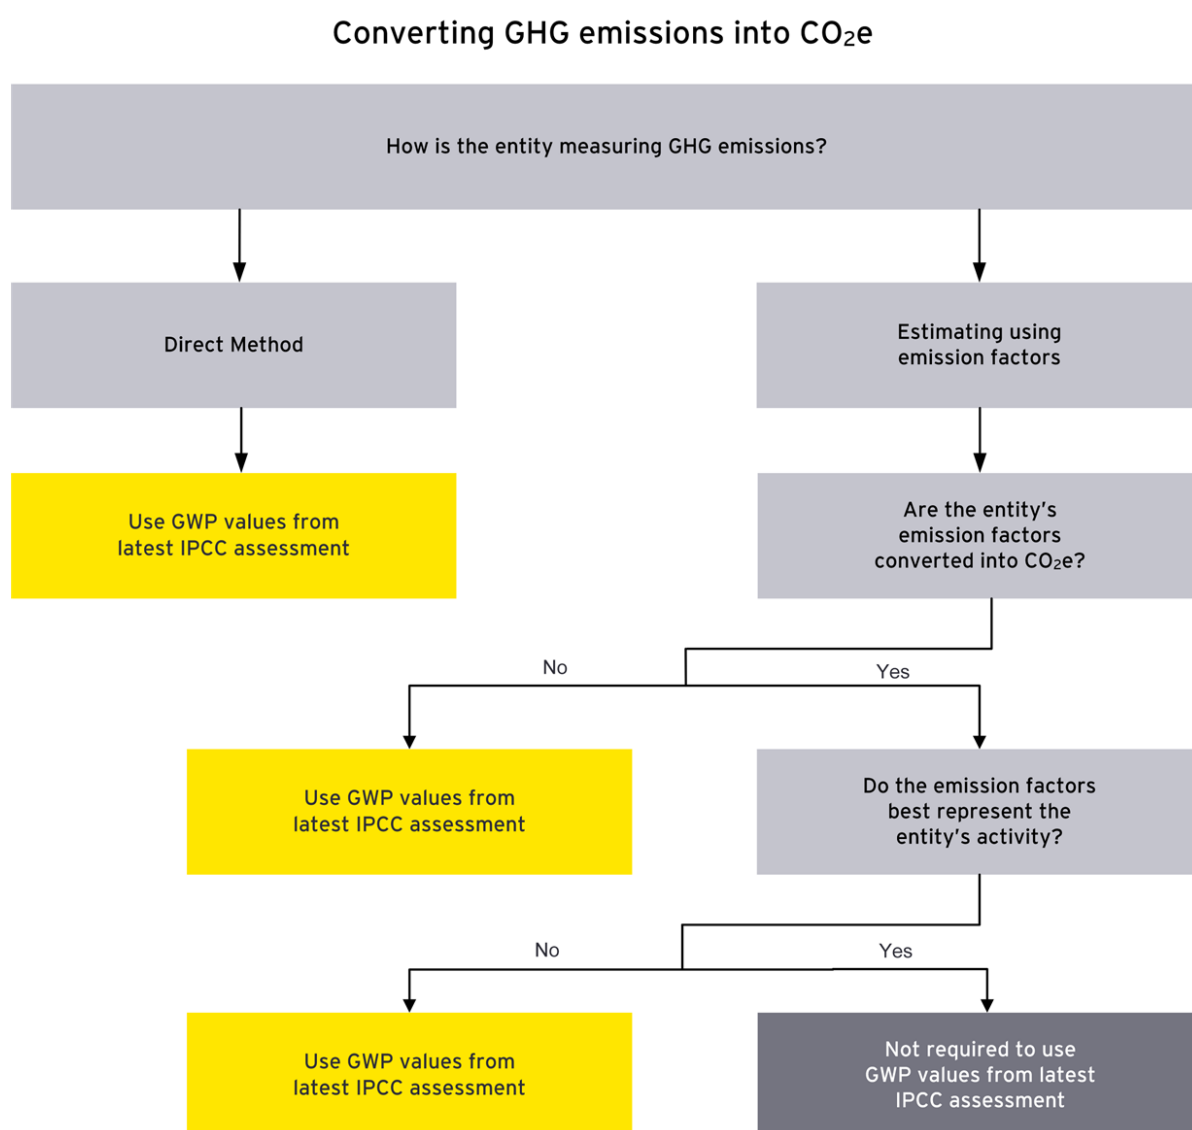

If an entity uses direct measurement (also known as 'direct monitoring') to measure its GHG emissions by measuring the concentration of GHGs and the rate of emissions from operations and processes, this means that the entity will be directly, and separately, measuring the specific constituent GHG emitted (e.g., the units of methane (CH₄) emitted). To convert the constituent GHGs into a CO₂ equivalent value, IFRS S2 requires an entity to use global warming potential (GWP) values based on a 100-year time horizon, from the latest Intergovernmental Panel on Climate Change assessment available at the reporting date. [IFRS S2.B21].

Each of the seven constituent GHGs have a different GWP. The GWP of a given GHG indicates how much energy one unit of the GHG absorbs (i.e., the ability of that gas to trap heat in the atmosphere) compared to one unit of carbon dioxide, generally over a 100-year period. The larger the GWP, the more that the GHG warms the earth compared to carbon dioxide over the stated time period. For example, PFCs and HFCs often absorb thousands of times more energy than carbon dioxide. The GWP of each GHG is used to convert GHGs, other than carbon dioxide, into carbon dioxide equivalent (CO₂e) units. Therefore, the CO₂e unit of measurement is used to evaluate releasing (or avoiding releasing) different GHGs against a common basis. [IFRS S2 Appendix A].

If an emission factor used by an entity has already converted the constituent gases into CO₂e values, IFRS S2 does not require the entity to recalculate the emission factors using GWP values based on a 100-year time horizon from the latest Intergovernmental Panel on Climate Change assessment available at the reporting date. However, if the emission factors are not converted into CO₂e values, then the entity is required to use the GWP values based on a 100-year time horizon from the latest Intergovernmental Panel on Climate Change assessment available at the reporting date. [IFRS S2.B22].

Figure 5-3 below, which is based on a flowchart from TIG meeting 19 September 2024 - Agenda paper no. 5, illustrates factors that an entity needs to consider when converting GHG emissions into a CO₂ equivalent value:

Figure 5-3: Decisions in converting GHG emissions into CO₂e

At its September 2024 meeting, the TIG discussed whether the jurisdictional relief in IFRS S2 can be applied to relieve an entity from the requirement to use GWP values from the latest IPCC assessment in circumstances where the entity is required by a jurisdictional authority to use different GWP values. Following the discussion at the TIG meeting, the ISSB has proposed amendments to IFRS S2 to clarify this issue. The proposed amendments are discussed further in section 8 below.

5.3.3 Using information from reporting periods that are different from the entity's reporting period

An entity's reporting period may be different from the reporting periods used by some or all the entities in its value chain. A consequence of mismatched reporting periods is that GHG emissions information that relates to the entity's value chain may not be readily available for the entity to use when it prepares its own disclosures for its reporting period. The ISSB acknowledged that different reporting periods can cause challenges in preparing disclosures that rely on value chain information. For that reason, where an entity's reporting period is different from the reporting periods of entities in its value chain, IFRS S2 permits an entity to measure its GHG emissions using information for reporting periods that are different from its own reporting period if all of the following conditions are met: *[IFRS S2.B19]*

- The entity uses the most recent data available from those entities in its value chain without undue cost or effort to measure and disclose its GHG emissions.
- The length of the reporting periods is the same.
- The entity discloses the effects of significant events and changes in circumstances (relevant to its GHG emissions) that occur between the reporting dates of the entities in its value chain and the date of the entity's general purpose financial reports.

5.4 Scope 1 GHG emissions

Scope 1 emissions are emissions from sources owned or controlled by a reporting entity. For example, emissions from equipment, a vehicle or production processes that are owned or controlled by the reporting entity are considered Scope 1 emissions. These emissions include all direct emissions within the entity's inventory boundary. The combination of organisational and operational boundaries makes up a reporting entity's inventory boundary, which is also called the reporting boundary.

Two or more reporting entities should never account for the same emissions as Scope 1 emissions. For example, emissions from the generation of heat, electricity or steam that is sold to another entity are not subtracted from Scope 1 emissions but are reported as Scope 2 emissions by the entity that purchases the related energy. Theoretically, if every entity and individual throughout the world reported their GHG emissions using the same organisational boundary (e.g., equity share, financial control or operational control approach), the total of all Scope 1 emissions would equal the total GHGs emitted throughout the world.

5.5 Scope 2 GHG emissions

According to the GHG Protocol, an entity's Scope 2 GHG emissions need to be measured using either a location-based approach or a markets-based approach. This is described further in section 5.2.3 above on the application of the GHG Protocol.

As noted in section 5.2.3 above, IFRS S2 requires an entity to: *[IFRS S2.29(a)(v), IFRS S2.B30]*

- Disclose its location-based Scope 2 GHG emissions
- Provide information about any 'contractual instruments' the entity has entered into if it has entered into those instruments and information about those instruments would inform users' understanding of the entity's Scope 2 GHG emissions

The meaning of a 'contractual instrument' is explained in IFRS S2: *[IFRS S2.B31]*

Extract from IFRS S2

B31 Contractual instruments are any type of contract between an entity and another party for the sale and purchase of energy bundled with attributes about the energy generation or for unbundled energy attribute claims (unbundled energy attribute claims relate to the sale and purchase of energy that is separate and distinct from the greenhouse gas attribute contractual instruments). Various types of contractual instruments are available in different markets and the entity might disclose information about its market-based Scope 2 greenhouse gas emissions as part of its disclosure.

5.6 Scope 3 GHG emissions

IFRS S2 requires an entity to disclose information about its Scope 3 GHG emissions according to the 15 categories of Scope 3 GHG emissions as described in the GHG Protocol. The purpose of this disclosure is to enable primary users to understand the source of the entity's Scope 3 emissions. [IFRS S2.29(a)(vi), IFRS S2.B32].

As such, when an entity prepares its Scope 3 GHG emissions disclosures, IFRS S2 requires the entity to: [IFRS S2.B32, IFRS S2.B34]

- Consider its entire value chain (upstream and downstream)
- Reassess which Scope 3 categories and entities throughout its value chain to include in the measurement of its Scope 3 GHG emissions if a significant event or a significant change in circumstances has occurred. This reassessment is consistent with the requirements in IFRS S1 about reassessing the scope of sustainability-related risks and opportunities (see Chapter 53)

Frequently asked questions

Question 5-5: What is the relationship between the GHG Corporate Value Chain Standard and IFRS S2 in measuring an entity's Scope 3 GHG emissions?

(TIG meeting 13 June 2024 - Agenda paper no. 1, ISSB meeting 24 July 2024 - Agenda paper no. 9, TIG meeting 19 September 2024 - Agenda paper no. 1, ISSB meeting 20 November 2024 - Agenda paper no. 9C)

The Greenhouse Gas Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard (2011) (GHG Corporate Value Chain Standard) is referenced by IFRS S2 in the:

- Definition of Scope 3 GHG emissions [IFRS S2 Appendix A]
- Requirements about the disclosure of Scope 3 GHG emissions categories [IFRS S2.29(a)(vi)(1)]

However, the GHG Protocol Corporate Value Chain Standard is not referenced by IFRS S2 in relation to the measurement of Scope 3 GHG emissions. Consequently, an entity is required to use the Scope 3 measurement framework in paragraphs B38-B57 of IFRS S2 to measure its Scope 3 GHG emissions. This means that the entity measures its Scope 3 GHG emissions using:

- A measurement approach, inputs and assumptions that result in a faithful representation of this measurement [IFRS S2.B38]
- All reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort [IFRS S2.B39]

Question 5-6: Is an entity required to include all 15 Scope 3 categories in its measurement of Scope 3 GHG emissions?

No. IFRS S2 requires an entity to include the GHG emissions associated with each relevant Scope 3 category in the GHG Protocol Corporate Value Chain Standard if that disclosure would provide primary users with material information. Therefore, the categories included in an entity's measurement of Scope 3 GHG emissions and the particular GHG emissions included within a category that is included within that measurement depends on the facts and circumstances specific to the entity. Refer to the ISSB's Educational material Greenhouse Gas Emissions Disclosure requirements applying IFRS S2 *Climate-related Disclosures* issued in May 2025.¹⁸

Materiality judgements require considering both quantitative and qualitative factors. Questions 5-9 to 5-11 provide some further factors to consider when making judgements about the measurement of an entity's Scope 3 GHG emissions.

Question 5-7: Can an entity limit its measurement and disclosure of Scope 3 GHG emissions for each relevant category on the basis of the minimum boundaries set out in the GHG Protocol Corporate Value Chain Standard?

No, the minimum boundaries outlined in the GHG Protocol Corporate Value Chain Standard, which limit the measurement and disclosure of Scope 3 GHG emissions, are not applicable to entities that are measuring and disclosing their Scope 3 GHG emissions in accordance with IFRS S2. This is because:

- IFRS S2 requires entities to disclose material information about their Scope 3 GHG emissions considering all of the categories set out in the GHG Protocol Corporate Value Chain Standard; and
- IFRS S1 also requires entities to consider their entire value chain when providing information about the sustainability-related risks and opportunities that could reasonably be expected to affect their prospects.

¹⁸ [Educational material: Greenhouse Gas Emissions Disclosure requirements applying IFRS S2 Climate-related Disclosures](#), ISSB, May 2025, available on the IFRS Foundation's website.

As such, this may represent a difference between how an entity measures its Scope 3 emissions under the GHG Protocol and how its Scope 3 emissions will be measured under IFRS S2. Refer to the ISSB's Educational material *Greenhouse Gas Emissions Disclosure requirements applying IFRS S2 Climate-related Disclosures* issued in May 2025.¹⁹

Question 5-8: Does the relevance principle in the GHG Protocol apply when measuring and disclosing GHG emissions in accordance with IFRS S2?

No, the relevance principle in the GHG Protocol is not applicable in disclosing GHG emissions in accordance with IFRS S2. Instead, in applying IFRS S2, materiality judgements (made in accordance with IFRS Sustainability Disclosure Standards) will determine which categories are included in the measurement of an entity's Scope 3 GHG emissions.

This question has arisen because entities that have historically been measuring and disclosing Scope 3 emissions in accordance with the GHG Protocol will have been applying the relevance principle to their disclosed Scope 3 emissions. The GHG Protocol Corporate Value Chain (Scope 3) Standard notes that "Companies should follow the principles of relevance, completeness, accuracy, consistency, and transparency when deciding whether to exclude any activities from the scope 3 inventory. Companies should not exclude any activity that would compromise the relevance of the reported inventory." It includes a table that lists size, influence, risk, stakeholders, outsourcing, sector guidance and other factors as criteria for identifying relevant Scope 3 activities.

Some observers have interpreted the commentary in the Basis for Conclusions on IFRS S2 as indicating that the relevance principle also applies when measuring and disclosing Scope 3 emissions in accordance with IFRS S2. This is based on paragraph BC110 stating that "an entity is required to consider the relevance of all 15 categories but might determine that not all categories are applicable to the entity and therefore do not need to be included in the measurement of its Scope 3 greenhouse gas emissions". However, this is not considered to be a reference to the relevance principle in the GHG Protocol. Instead, as the ISSB's Education material *Greenhouse Gas Emissions Disclosure requirements applying IFRS S2 Climate-related Disclosures* (May 2025) clarifies "Although an entity is required to consider the relevance of all 15 categories-including by considering whether information about the GHG emissions within those categories and their measurement would provide material information about an entity's exposure to transition risk-it might find that not all are relevant". In those circumstances, the ISSB's Education material gives an example of a Scope 3 category not being relevant because it is not applicable to the entity.

In many cases, judgements about relevance (per the GHG Protocol) and materiality (per ISSB Standards) might result in the same conclusion regarding which categories of Scope 3 GHG emissions need to be included in the disclosure of an entity's absolute gross Scope 3 GHG emissions generated during the reporting period. However, there could be a risk that an entity might exclude a Scope 3 category applying the GHG Protocol based on relevance considerations, even though that category could be considered quantitatively or qualitatively material when applying the ISSB standards.

Question 5-9: When measuring Scope 3 GHG emissions, is an entity required to consider if categories that are individually immaterial could be material in aggregate when applying IFRS Sustainability Disclosure Standards?

Yes, an entity is required to include categories that are individually immaterial, but material in aggregate, in the disclosure of its Scope 3 GHG emissions for the reporting period in accordance with IFRS S2.29(a)(i)(3). However, categories that are too small (i.e., *de minimis* or trivial in amount), even in aggregate, to materially change the total Scope 3 calculation can be excluded from an entity's scope 3 GHG emissions measurement.

Aggregating all categories, including the categories that are individually immaterial (from a quantitative and qualitative perspective), in the measurement of Scope 3 GHG emissions is consistent with how similar calculations in financial reporting are viewed. If an entity were to exclude categories that are individually immaterial, but material in aggregate, from the disclosure of its Scope 3 GHG emissions, the measurement of the entity's Scope 3 emissions might be considered incomplete and not fairly present the extent of an entity's exposure to GHG emissions in its value chain for those users interested in an entity's total Scope 3 GHG emissions generated during the reporting period as well as a disaggregation of its GHG emissions by category.

¹⁹ [Educational material: Greenhouse Gas Emissions Disclosure requirements applying IFRS S2 Climate-related Disclosures](#), ISSB, May 2025, available on the IFRS Foundation's website.

Although paragraph 29(a)(vi)(1) of IFRS S2 requires the disclosure of the categories included within an entity's measure of its Scope 3 GHG emissions, IFRS S2 does not specifically require an entity to disclose Scope 3 GHG emissions by individual category. Instead, as with all disclosure requirements in ISSB standards, an entity disclosing GHG emissions does need to apply:

- the materiality requirements in IFRS S1.17-18; and
- principles of aggregation and disaggregation set out in IFRS S1.B29-B30, which requires an entity to consider all facts and circumstances and decide how to aggregate and disaggregate information in its sustainability-related financial disclosures.

A consequence of applying these requirements is that an entity may need to disclose information about one or more of its Scope 3 categories. The table below provides an illustration of how these judgements might be made in the measurement and disclosure of Scope 3 GHG emissions.

Stream	Category	Analysis	Separately disclosed
Upstream	1 - Purchased goods and services	Individually material	Yes
Upstream	2 - Capital goods	Individually immaterial, but assessed as material in aggregate with other categories	Disclosed as an aggregated category 'remainder of Scope 3 emissions'
Upstream	3 - Fuel and energy related activities	Individually immaterial, but assessed as material in aggregate with other categories	Disclosed as an aggregated category remainder of Scope 3 emissions'
Upstream	4 - Upstream transportation and distribution	Immaterial. Not calculated as too insignificant to even be material in aggregate	No
Upstream	5 - Waste generated in operations	Immaterial. Not calculated as too insignificant to even be material in aggregate	No
Upstream	6 - Business travel	Individually immaterial, but assessed as material in aggregate with other categories	Disclosed as an aggregated category remainder of Scope 3 emissions'
Upstream	7 - Employee commuting	Individually immaterial, but assessed as material in aggregate with other categories	Disclosed as an aggregated category remainder of Scope 3 emissions'
Upstream	8 - Upstream leased assets	Not applicable	No
Downstream	9 - Downstream transportation and distribution	Individually material	Yes
Downstream	10 - Processing of sold products	Individually material	Yes
Downstream	11 - Use of sold products	Individually material	Yes
Downstream	12 - End-of-life treatment of sold products	Not applicable	No
Downstream	13 - Downstream leased assets	Not applicable - no downstream leased assets	No
Downstream	14 - Franchises	Not applicable - no franchising arrangements	No
Downstream	15 - Investments	Not applicable	No

Question 5-10: What are some qualitative factors that might indicate that information about GHG emissions is material?

Even if a GHG emission or Scope 3 category is not quantitatively material (based on magnitude considerations), the emission or category might be material on qualitative grounds. Factors that might indicate that a GHG emission or Scope 3 category is qualitatively material include, but is not limited to, the following:

- **Reduction Targets:** Has the entity committed to achieving GHG emissions reduction targets, and does the specific scope or category within Scope 3 forms part of its reduction strategy in meeting this target? Have the targets been set on total Scope 1, 2 and 3 GHG emissions or there are separate targets for, say, Scope 1 and 2 combined versus Scope 3?
- **Public statements:** Has the entity made any public commitments about net zero or carbon neutral goals? Does the entity advertise any products as 'green', carbon neutral, or similar assertions?
- **Specific Targets:** Whether the entity has set any specific GHG reduction targets for this scope or category of Scope 3.
- **Jurisdictional Impact:** Does the entity operate in jurisdictions with nationally determined contributions that could impact the entity or its value chain, such as suppliers being subject to increasingly strict emissions-related regulations and taxation policies for certain scopes or categories? Further, does compliance with other jurisdictions have a material effect on the entity's financial position through potential fines or required changes to products or services?
- **Executive remuneration:** Does the achievement of certain levels of GHG emissions affect executive compensation?
- **Transition Plan:** Does the entity have any specific emissions reduction strategies in relation to this scope or category noted within their transition plan?

Another factor that may be relevant when assessing qualitative factors that could indicate whether GHG emissions would be material is the potential to manage or influence GHG emissions. Entities may be able to manage Scope 1 and 2 GHG emissions more directly, exerting direct influence over decisions which result in these GHG emissions, whereas with Scope 3 GHG emissions the decisions are made within the value chain, with the entity having less influence over those decisions. While this could be a relevant factor to consider when assessing materiality of GHG emissions, entities should not use their potential to influence or manage emissions as a basis for exclusion if the emissions would otherwise be quantitatively material. For example, an entity with significant Scope 3 Category 1 emissions from purchased goods and services cannot justify excluding this category from disclosure based on influence or management potential if the total (Scope 1, Scope 2 and Scope 3) GHG emissions or total Scope 3 GHG emissions is considered material information to the users of the general purpose financial reports.

Question 5-11: Should the materiality of a GHG emission be assessed based on the size of that emission relative to its particular Scope or relative to the total of Scope 1, Scope 2 and Scope 3 GHG emissions?

Materiality judgements may be different for different GHG emissions because investors and other primary users might have different information needs for different scopes of emissions. For this reason, an entity is required to assess the materiality of a GHG emission component in relation to the specific related scope of GHG emissions. For instance, the materiality of a Scope 1 GHG emission would be assessed in relation to the entity's total Scope 1 GHG emissions. However, qualitative factors will also need to be considered to determine the materiality of GHG emissions. For instance, an entity might have a direct cost exposure arising from Scope 1 emissions or might be required by law to reduce its Scope 1 emissions. This information may be relevant to a primary user even though those emissions might be insignificant relative to the entity's total GHG footprint (Scope 1, 2 and 3) or even relative to its particular Scope.

5.6.1 Scope 3 measurement framework

Scope 3 GHG emissions can be quantified by either direct measurement (i.e., the direct monitoring of GHG emissions) or estimation (which involves approximate calculations of data based on assumptions and appropriate inputs). The ISSB considers that, in theory, direct measurement provides the most accurate evidence of an entity's Scope 3 GHG emissions. However, the ISSB also acknowledges that, due to the challenges of directly measuring Scope 3 GHG emissions, an entity's measurement of Scope 3 GHG emissions is likely to include the use of estimation rather than solely comprising direct measurement. [IFRS S2.B38, IFRS S2.B43, IFRS S2.B44, IFRS S2.B45].

IFRS S2 requires an entity to use a measurement approach, inputs and assumptions that result in a faithful representation of its measurement of Scope 3 GHG emissions. Although IFRS S2 does not specify the inputs an entity is required to use to measure its Scope 3 GHG emissions, the standard does require the entity to prioritise inputs and assumptions using the following identifying characteristics:

- Data based on direct measurement (see section 5.6.1.A below)
- Data from specific activities within the entity's value chain (see section 5.6.1.B below)
- Timely data that faithfully represents the jurisdiction of, and the technology used for, the value chain activity and its GHG emissions (see section 5.6.1.C below)
- Data that has been verified (see section 5.6.1.D below)

Each of these characteristics are explained further in the sections below, noting that these characteristics are not listed in a particular order and, as such, an entity's prioritisation of the measurement approach, inputs and assumptions may require management to use judgement to make trade-offs between data.

[IFRS S2.B40, IFRS S2.B42].

An example of a trade-off that management may need to make is between the timeliness of the data and specificity of the data. Recent data may provide less detail about the specific value chain activity (such as technology used, location and jurisdiction of the activity) whereas data that is older and published infrequently might be more representative of the value chain activity and its GHG emissions. [IFRS S2.B42].

When an entity selects the measurement approach, inputs and assumptions to measure its Scope 3 GHG emissions, IFRS S2 specifies that the entity is required to use all reasonable and supportable information that is available to the entity at the reporting date without undue cost or effort. [IFRS S2.B39].

IFRS S2 states that an entity is required to apply the Scope 3 measurement framework to prioritise inputs and assumptions even if: [IFRS S2.B41]

- The entity is required by a jurisdictional authority or securities exchange to use a method other than the GHG Protocol to measure its GHG emissions
- The entity has elected to use the transition relief that allows the entity to measure its GHG emissions using a method other than the GHG Protocol for its first annual reporting period when it applies IFRS S2

5.6.1.A Data based on direct measurement

IFRS S2 requires an entity to prioritise direct measurement of Scope 3 GHG emissions, but acknowledges that it expects that Scope 3 GHG emissions data will include estimation. [IFRS S2.B43, IFRS S2.B44].

IFRS S2 outlines that estimates of Scope 3 GHG emissions are likely to use two types of inputs: [IFRS S2.B45]

- Data that represents the entity's activity that results in GHG emissions (activity data). For example, the entity might use distance travelled as activity data to represent the transport of goods within its value chain.
- Emission factors that convert activity data into GHG emissions. For example, the entity will convert the distance travelled (activity data) into GHG emissions data using emission factors.

5.6.1.B Data from specific activities within the entity's value chain

Measurement of an entity's Scope 3 GHG emissions will be based on: [IFRS S2.B46]

- Primary data - data obtained directly from specific activities within the entity's value chain (e.g., data provided by suppliers)
- Secondary data - data not obtained directly from activities within the entity's value chain (e.g., data from third party data providers and industry-average data)
- A combination of both primary and secondary data

IFRS S2 requires an entity to prioritise primary data when estimating the entity's Scope 3 GHG emissions. This is because the ISSB considers that data from specific activities within an entity's value chain provides a more accurate representation of the entity's specific value chain activities and, thus, primary data provides a better basis to measure an entity's Scope 3 GHG emissions. However, if an entity uses secondary data to measure its Scope 3 GHG emissions, IFRS S2 requires the entity to consider the extent to which the secondary data faithfully represents the entity's activities. [IFRS S2.B47, IFRS S2.B48, IFRS S2.B49].

Examples of primary and secondary data are provided in Figure 5-4 below:

Figure 5-4: Primary and secondary data

Type of data	Examples
Primary data	<ul style="list-style-type: none"> Data sources include meter readings, utility bills and other methods that represent specific activities in the entity's value chain. Data sources may be from internal sources such as from the entity's own records or from external sources such as from suppliers and other value chain partners (e.g., supplier-specific emission factors for purchased goods or services). <i>[IFRS S2.B48].</i>
Secondary data	<ul style="list-style-type: none"> Data sources include third-party data providers and industry-average data (e.g., from published databases, government statistics, literature studies and industry associations). Secondary data includes both: <i>[IFRS S2.B49]</i> <ul style="list-style-type: none"> Data used to approximate the activity or emission factors Primary data from a specific activity (proxy data) that is used to estimate GHG emissions for another activity

5.6.1.C Timely data that faithfully represents the jurisdiction of, and the technology used for, the value chain activity and its GHG emissions

If an entity uses secondary data to measure its Scope 3 GHG emissions, IFRS S2 requires the entity to prioritise the use of activity or emissions data that is: *[IFRS S2.B50, IFRS S2.B51, IFRS S2.B52]*

- Based on, or represents, the technology used in the value chain activity the data is intended to represent (see Illustration 5-2 below)
- Based on, or represents, the jurisdiction in which the activity happened (e.g., where the entity operates or where the activity took place)
- Timely and representative of the entity's value chain activity during the reporting period (e.g., considering whether the secondary data sources relied on information collected in the entity's current reporting period or in a reporting period that is different from the entity's current reporting period)

The Illustration below is based on an example used in IFRS S2: *[IFRS S2.B50]*

Illustration 5-2: Use of secondary data

In measuring its Scope 3 GHG emissions from business travel, Entity A obtains primary data from its business travel activities including data about:

- The specific aircraft model used for each flight
- Distance travelled for each flight
- Travel-class used by the travelling employees

Entity A would then estimate its GHG emissions from business travel by applying this primary data with secondary data on the GHG emissions relating to each of those activities.

5.6.1.D Verified data

IFRS S2 requires an entity to prioritise Scope 3 GHG emissions data that is verified. Data can be subject to internal or external verification and may involve on-site checking, reviewing calculations, or cross-checking of data against other sources. *[IFRS S2.B53].*

The ISSB acknowledges that an entity might need to use unverified data if it is unable to verify its Scope 3 GHG emissions without undue cost or effort. *[IFRS S2.B54].*

5.6.1.E Disclosure of inputs to Scope 3 GHG emissions

As part of an entity's disclosure of information about the measurement approach, inputs and assumptions that the entity uses to measure its Scope 3 GHG emissions in accordance with IFRS S2 (as discussed in section 5.3.1 above), the entity is required to disclose information about: *[IFRS S2.B55, IFRS S2.B56]*

- The characteristics of the data inputs referred to in section 5.6.1 on Scope 3 measurement framework that are used in the measurement of Scope 3 GHG emissions
- How the entity has prioritised the highest quality data available, which faithfully represents the value chain activity and its Scope 3 GHG emissions
- The extent to which the entity's Scope 3 GHG emissions are measured using:
 - Inputs from specific activities within the entity's value chain
 - Inputs that are verified

IFRS S2 includes a specifically stated presumption that Scope 3 GHG emissions can be estimated reliably using secondary data and industry averages. However, if an entity determines it is impracticable to estimate its Scope 3 GHG emissions (i.e., the entity cannot apply the requirement after making every reasonable effort to do so), IFRS S2 requires the entity to disclose how it is managing its Scope 3 GHG emissions. The ISSB expects that cases when measuring Scope 3 GHG emissions is impracticable will be rare. *[IFRS S2.B57]*.

5.7 Financed emissions

IFRS S2 requires an entity participating in financial activities, including commercial and investment banks, asset managers and insurance entities to provide additional and specific disclosures about its Category 15 Scope 3 GHG emissions or those emissions associated with its investments, specifically its 'financed emissions' in: *[IFRS S2.B59]*

- Asset management (see section 5.7.1 below)
- Commercial banking (see section 5.7.2 below)
- Insurance (see section 5.7.3 below)

Extract from IFRS S2

Appendix A

Defined terms

financed emissions	The portion of gross greenhouse gas emissions of an investee or counterparty attributed to the loans and investments made by an entity to the investee or counterparty. These emissions are part of Scope 3 Category 15 (investments) as defined in the Greenhouse Gas Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard (2011).
---------------------------	---

The amount of financed emissions of an entity participating in financial activities is a key focus area for primary users because it is an indicator of an entity's exposure to climate-related risks and opportunities and how the entity might need to adapt its financial activities over time. This is because: *[IFRS S2.B58]*

- Investees, borrowers and counterparties with high GHG emissions could be more susceptible to risks associated with technological changes, shifts in supply and demand and policy changes.
- As a consequence, those risks could increase the exposure of entities providing financial services to counterparties, borrowers and investees to credit risk, market risk, reputational risk and other financial and operational risks (such as credit risk associated with financing borrowers affected by carbon taxes or reputational risks from financing fossil fuel projects).

The application guidance in IFRS S2 supports the use of different measurement approaches to calculate an entity's financed emissions. In developing this application guidance, the ISSB's intention was to allow for measurement methodologies for different asset classes to emerge and be accepted by the market, such as the measurement methodologies developed by the Partnership for Carbon Accounting Financials. *[IFRS S2.BC125]*.

Frequently asked questions

Question 5-12: Does the scope of the requirement to disclose 'financed emissions' also determine what is included or excluded from an entity's Scope 3 Category 15 GHG emissions disclosures?

(TIG meeting 19 September 2024 - Agenda paper no. 4, ISSB meeting 20 November 2024 - Agenda paper no. 9C)

No. The TIG noted that the 'financed emissions' disclosure requirements in paragraph 29(a)(vi)(2) of IFRS S2 is directed at requiring entities engaged in specific activities (i.e., asset management, commercial banking or insurance) to disclose additional information about the GHG emissions included in Scope 3 Category 15 beyond the general requirement for all entities to disclose Scope 3 GHG emissions.

As such, many TIG members noted that the inclusion or exclusion of activities or asset classes in these financed emissions requirements has no bearing on the general requirement for all entities to disclose Scope 3 GHG emissions in accordance with paragraph 29(a)(i)(3) of IFRS S2.

5.7.1 Asset management

IFRS S2 requires an entity that participates in asset management activities to disclose the information set out in Figure 5-5 below:

Figure 5-5: Asset management disclosures

Information to disclose	Further considerations
The entity's absolute gross financed emissions, disaggregated by Scope 1, Scope 2 and Scope 3 GHG emissions [IFRS S2.B61(a)]	-
For each of the disaggregated Scope 1, Scope 2 and Scope 3 GHG emissions disclosures, the total amount of assets under management (AUM) included in the entity's financed emissions disclosures, expressed in the presentation currency of the entity's financial statements [IFRS S2.B61(b)]	-
The percentage of the entity's total AUM included in the financed emissions calculation [IFRS S2.B61(c)]	Explain the exclusions, including the type of assets excluded and associated amount of AUM, if the percentage of the entity's total AUM included in the financed emissions calculation is less than 100%.
The methodology used by the entity to calculate its financed emissions [IFRS S2.B61(d)]	Describe the allocation method used by the entity to attribute its share of emissions in relation to the size of its investments.

5.7.2 Commercial banking

IFRS S2 requires an entity that participates in commercial banking activities to disclose the information set out in Figure 5-6 below:

Figure 5-6: Commercial banking disclosures

Information to disclose	Further considerations	
The entity's absolute gross financed emissions, disaggregated by Scope 1, Scope 2 and Scope 3 GHG emissions for each industry by asset class. <i>[IFRS S2.B62(a)].</i>	For disaggregation by industry	The Global Industry Classification Standard (GICS) 6-digit industry-level code is required to classify counterparties (using the latest version of the classification system available at the reporting date).
	For disaggregation by asset class	Asset classes include: <ul style="list-style-type: none"> Loans Project finance Bonds Equity investments Undrawn loan commitments If financed emissions are calculated and disclosed for other asset classes, the entity is required to explain why including those additional asset classes provides relevant information to primary users.
The entity's gross exposure to each industry by asset class, expressed in the presentation currency of the entity's financial statements. <i>[IFRS S2.B62(b)].</i>	For funded amounts	Gross exposure is to be calculated as the funded carrying amounts (before subtracting any loss allowance), whether prepared in accordance with IFRS accounting standards or other GAAP.
	For undrawn loan commitments	The full amount of the commitment is disclosed separately from the drawn portion of loan commitments.
The percentage of the entity's gross exposure included in the financed emissions calculation. <i>[IFRS S2.B62(c)].</i>	For exclusions	Explain the exclusions, including the type of assets excluded, if the percentage of the entity's gross exposure included in the financed emissions calculation is less than 100%.
	For funded amounts	Exclude all impacts of risk mitigants (if applicable) from gross exposure.
	For undrawn loan commitments	Separately disclose the percentage of the entity's undrawn loan commitments included in the financed emissions calculation.
The methodology used by the entity to calculate its financed emissions. <i>[IFRS S2.B62(d)].</i>	Describe the allocation method used by the entity to attribute its share of emissions in relation to the size of its gross exposure.	

5.7.3 Insurance

IFRS S2 requires an entity that participates in insurance activities to disclose the information set out in Figure 5-7 below:

Figure 5-7: Insurance disclosures

Information to disclose	Further considerations	
The entity's absolute gross financed emissions, disaggregated by Scope 1, Scope 2 and Scope 3 GHG emissions for each industry by asset class. <i>[IFRS S2.B63(a)].</i>	For disaggregation by industry	The GICS 6-digit industry-level code is required to classify counterparties (using latest version of the classification system available at the reporting date).
	For disaggregation by asset class	Asset classes include: <ul style="list-style-type: none"> Loans Bonds Equity investments Undrawn loan commitments If financed emissions are calculated and disclosed for other asset classes, the entity is required to explain why including those additional asset classes provides relevant information to primary users.
The entity's gross exposure for each industry by asset class, expressed in the presentation currency of the entity's financial statements. <i>[IFRS S2.B63(b)].</i>	For funded amounts	Gross exposure is to be calculated as the funded carrying amounts (before subtracting any loss allowance), whether prepared in accordance with IFRS accounting standards or other GAAP.
	For undrawn loan commitments	The full amount of the commitment is disclosed separately from the drawn portion of loan commitments.
Information to disclose	Further considerations	
The percentage of the entity's gross exposure included in the financed emissions calculation. <i>[IFRS S2.B63(c)].</i>	For exclusions	Explain the exclusions, including the type of assets excluded, if the percentage of the entity's gross exposure included in the financed emissions calculation is less than 100%.
	For undrawn loan commitments	Separately disclose the percentage of the entity's undrawn loan commitments included in the financed emissions calculation.
The methodology used by the entity to calculate its financed emissions. <i>[IFRS S2.B63(d)].</i>	Describe the allocation method used by the entity to attribute its share of emissions in relation to the size of its gross exposure.	

Frequently asked questions

Question 5-13: Can an entity exclude Scope 3 emissions relating to its investment or lending activity from its measurement of financed emissions?

No, IFRS S2 requires an entity that participates in either asset management activities, commercial banking activities or financial activities associated with the insurance industry to disclose its absolute gross financed emissions, disaggregated by Scope 1, Scope 2 and Scope 3 GHG emissions. Therefore, the measurement of an entity's financed emissions must include the Scope 1, Scope 2 and Scope 3 GHG emissions related to those investments or lending.

This represents a difference from the GHG Protocol Corporate Value Chain Standard, which provides the following guidance on accounting for emissions from investments, "Where relevant, companies should also account for the scope 3 emissions of the investee or project".²⁰ Consistent with the explanation provided above in Question 5-7, minimum boundaries and other measurement and disclosure limitations outlined in the GHG Protocol Corporate Value Chain Standard are not applicable to entities that are measuring and disclosing their Scope 3 GHG emissions in accordance with IFRS S2.

5.8 Facilitated and associated emissions

Although not specifically addressed in IFRS S2, the Basis for Conclusions on IFRS S2 indicates that, due to the lack of an established methodology, the ISSB decided that the calculation of financed emissions is not required to include: [IFRS S2.BC127, IFRS S2.BC129]

- Derivatives
- 'Associated emissions' of underwriting portfolios in the insurance and reinsurance industries
- 'Facilitated emissions' relating to financial activities associated with investment banking

At its September 2024 meeting, the TIG discussed whether an entity with facilitated or associated emissions (i.e., asset class: derivatives, underwriting activities in the insurance and reinsurance industries and investment bank activities in the investment banking industry) would be required to include those emissions within its measurement of Scope 3 GHG emissions. Following the discussion at the TIG meeting, the ISSB has proposed amendments to IFRS S2 to clarify this issue. The proposed amendments are discussed further in section 8 below.

²⁰ Refer Corporate Value Chain (Scope 3) Standard, available in the GHG Protocol website

6 Effective date

IFRS S2 is effective for annual reporting periods beginning on or after 1 January 2024. An entity is permitted to apply IFRS S2 earlier than 1 January 2024, but to do so, the entity is required to disclose that fact and it is also required to apply IFRS S1 at the same time. [IFRS S2.C1].

The actual effective date for entities will depend on when ISSB standards become mandatory in the jurisdictions in which they operate, unless those entities voluntarily apply the standards before they become mandatory in their jurisdictions. See also relevant discussion in Chapter 53.

7 Transition reliefs to IFRS S2

In developing IFRS S2, the ISSB decided to provide some relief to ease an entity's transition to the new requirements in the entity's first year of applying those requirements.

The transition reliefs set out in Table 7-1 below are available for an entity to use in the first annual reporting period in which the entity applies IFRS S2. The entity can choose to use all, some, or none of those reliefs in its first annual reporting period. [IFRS S2.C4, IFRS S2.BC174].

Figure 7-1: Transition reliefs for IFRS S2

Relief topic	Nature of relief that applies to the first annual reporting period in which the entity applies IFRS S2
Comparative information	An entity is not required to disclose comparative information. [IFRS S2.C3].
GHG Protocol	An entity is permitted to continue to use a method other than the GHG Protocol to measure its GHG emissions if the entity used that method to measure its GHG emissions in the annual reporting period immediately preceding the date of initial application of IFRS S2. [IFRS S2.C4(a)]. The date of initial application is the start of the reporting period in which an entity first applies IFRS S2.
Scope 3 GHG emissions	An entity is not required to disclose its Scope 3 GHG emissions, including the additional information about financed emissions (if applicable). [IFRS S2.C4(b)].

If an entity uses either of the abovementioned reliefs relating to the GHG Protocol or Scope 3 GHG emissions, IFRS S2 allows the entity to continue to use that relief so that it is not required to present that information as comparative information in subsequent reporting periods. [IFRS S2.C5]. This is explained further in Illustration 7-1 below:

Illustration 7-1: Comparative information transition relief

Entity A applies ISSB standards for the first time for the annual reporting period ending 31 December 2024. In its first set of sustainability-related financial disclosures, Entity A elects to not disclose its Scope 3 GHG emissions in accordance with the transition relief options available in IFRS S2.

In its second set of sustainability-related financial disclosures, which is for the annual reporting period ending 31 December 2025, Entity A is required to disclose its Scope 3 GHG emissions for the 2025 reporting period. However, in accordance with the transition relief in IFRS S2, Entity A elects to not disclose its Scope 3 GHG emissions for the 2024 comparative period.

In its third set of sustainability-related financial disclosures, which is for the annual reporting period ending 31 December 2026, Entity A is required to disclose its Scope 3 GHG emissions for the 2026 reporting period and its Scope 3 GHG emissions for the 2025 comparative period. This is because the transition relief for Scope 3 GHG emissions only applies to the Scope 3 GHG emissions that relate to the first annual reporting period.

Frequently asked questions

Question 7-1: Is an entity that applies the transition relief not to disclose Scope 3 GHG emissions in its first year of reporting required to disclose its Scope 3 GHG emissions if it has a Scope 3 GHG emissions reduction target?

Some entities applying ISSB Standards for the first time may already have existing Scope 3 GHG emissions reduction targets that they have set or are required to meet by law or regulation.

In our view, if an entity has a Scope 3 target and elects to apply the transition relief in IFRS S2.C4(b), which permits an entity not to disclose Scope 3 GHG emissions in its first annual reporting period in which it applies ISSB Standards, the entity is not required to disclose its Scope 3 emissions as a metric in that reporting period. Under this view, the transition relief in IFRS S2.C4(b) is considered to apply broadly to any requirement that would otherwise require the disclosure of Scope 3 GHG emissions.

However, in that first reporting period, the entity would still be required to disclose information about its Scope 3 target, including (but not limited to):

- General information about the characteristics of the target (see paragraph 33(a)-(h)) and specific information about the GHG emissions aspects of the target (see paragraph 36)
- Information about the entity's approach to setting and reviewing the target and how it monitors progress against the target, including the metrics used to monitor progress towards reaching the target (see paragraph 34(c))
- Information about the entity's performance against the target and an analysis of trends or changes in the entity's performance (see paragraph 35).

Given the entity is applying the transition relief in IFRS S2.C4(b), it could meet these climate-related target disclosure requirements by disclosing qualitative information about its progress towards the target. Disclosure of the related Scope 3 emissions would not be required.

8 Future developments

In response to challenges faced by stakeholders in implementing the requirements of IFRS S2, the ISSB published an Exposure Draft (ED) *Amendments to Greenhouse Gas Emissions Disclosures* on 28 April 2025.

The ED proposes the following targeted amendments to IFRS S2 to:

- Provide relief to allow entities to exclude some Scope 3 Category 15 GHG emissions including those related to derivatives, facilitated emissions and insurance-associated emissions when measuring and disclosing Scope 3 GHG emissions (see section 5.8 above).
- Provide relief to entities involved in commercial banking and insurance activities from using the GICS in some circumstances to allow the use of an alternative industry-classification system when disclosing information about their financed emissions (see section 5.7 above).
- Amend the relief that allows entities to use an alternative method to the GHG Protocol when measuring GHG emissions (if required by a jurisdictional authority or an exchange), clarifying that it applies to an entity either in whole or in part (see section 5.1 above).
- Allow entities to use alternative GWP values instead of using the GWP values based on the latest IPCC assessment, to the relevant part of the entity that is required by a jurisdictional authority or exchange to apply those different GWP values (see section 5.3.2 above).

The proposed amendments to such GHG emissions disclosure requirements are expected to be widely applicable to entities that apply IFRS S2. However, those most likely to be affected include: entities subject to jurisdictional requirements related to the use of specific GHG emissions measurement methods or the use of specific GWP values; and entities in the financial sector that have Scope 3 Category 15 GHG emissions.

The comment letter period ended on 27 June 2025. The ISSB intends to set the effective date of the proposed amendments as early as possible and to permit early application. After its analysis of the feedback from the comment letters, the ISSB will redeliberate the proposals in September 2025 with the intention to issue the amendments soon thereafter.

Appendix B - Index of Frequently asked questions

Question 4-1:	Can an entity use scenario analysis to assist in identifying climate-related risks and opportunities?	4894
Question 4-2:	Does Category 15: Investments apply only to financial institutions?	4919
Question 4-3:	How do the requirements in IFRS S1 for comparative information apply to the disclosure of GHG emissions when a subsidiary in a group has been acquired or disposed of?	4919
Question 4-4:	: When an entity estimates Scope 3 GHG emissions in the current period by using information disclosed in the prior period, in applying the requirements of IFRS S1.B50, does that entity need to revise those estimated amounts in the following year when these become comparative information?	4920
Question 4-5:	What do the terms 'business activities' and 'vulnerable' mean in the absence of definitions in IFRS S2?	4922
Question 4-6:	Does the 'amount' of assets or business activities that are vulnerable to climate-related risks or aligned to climate-related opportunities need to be expressed as a monetary amount?	4922
Question 5-1:	What is the difference between the reporting entity concept in IFRS S1 and the organisational boundary for GHG emissions disclosures?	4935
Question 5-2:	What are examples of entities (or assets) that would be included in the organisational boundary for GHG emissions disclosure purposes that would not form part of the consolidated group?	4936
Question 5-3:	How should an entity classify GHG emissions from leased assets?	4936
Question 5-4:	Is an entity permitted to use the relief that allows for the use of a method other than the GHG Protocol Corporate Standard to measure the entity's GHG emissions in a circumstance in which only part of the entity is required by a jurisdictional authority to use another method to measure its GHG emissions?	4940
Question 5-5:	What is the relationship between the GHG Corporate Value Chain Standard and IFRS S2 in measuring an entity's Scope 3 GHG emissions?	4944
Question 5-6:	Is an entity required to include all 15 Scope 3 categories in its measurement of Scope 3 GHG emissions?	4944
Question 5-7:	Can an entity limit its measurement and disclosure of Scope 3 GHG emissions for each relevant category on the basis of the minimum boundaries set out in the GHG Protocol Corporate Value Chain Standard?	4944
Question 5-8:	Does the relevance principle in the GHG Protocol apply when measuring and disclosing GHG emissions in accordance with IFRS S2?	4945
Question 5-9:	When measuring Scope 3 GHG emissions, is an entity required to consider if categories that are individually immaterial could be material in aggregate when applying IFRS Sustainability Disclosure Standards?	4945
Question 5-10:	What are some qualitative factors that might indicate that information about GHG emissions is material?	4947
Question 5-11:	Should the materiality of a GHG emission be assessed based on the size of that emission relative to its particular Scope or relative to the total of Scope 1, Scope 2 and Scope 3 GHG emissions?	4947
Question 5-12:	Does the scope of the requirement to disclose 'financed emissions' also determine what is included or excluded from an entity's Scope 3 Category 15 GHG emissions disclosures?	4951
Question 5-13:	Can an entity exclude Scope 3 emissions relating to its investment or lending activity from its measurement of financed emissions?	4954
Question 7-1:	Is an entity that applies the transition relief not to disclose Scope 3 GHG emissions in its first year of reporting required to disclose its Scope 3 GHG emissions if it has a Scope 3 GHG emissions reduction target?	4956

Appendix C - Defined terms

Extract from IFRS standards - Definitions

carbon credit	An emissions unit that is issued by a carbon crediting programme and represents an emission reduction or removal of greenhouse gases . Carbon credits are uniquely serialised, issued, tracked and cancelled by means of an electronic registry.
climate resilience	The capacity of an entity to adjust to climate-related changes, developments or uncertainties. Climate resilience involves the capacity to manage climate-related risks and benefit from climate-related opportunities , including the ability to respond and adapt to climate-related transition risks and climate-related physical risks . An entity's climate resilience includes both its strategic resilience and its operational resilience to climate-related changes, developments and uncertainties.
climate-related physical risks	<p>Risks resulting from climate change that can be event-driven (acute physical risk) or from longer-term shifts in climatic patterns (chronic physical risk). Acute physical risks arise from weather-related events such as storms, floods, drought or heatwaves, which are increasing in severity and frequency. Chronic physical risks arise from longer-term shifts in climatic patterns including changes in precipitation and temperature which could lead to sea level rise, reduced water availability, biodiversity loss and changes in soil productivity.</p> <p>These risks could carry financial implications for an entity, such as costs resulting from direct damage to assets or indirect effects of supply-chain disruption. The entity's financial performance could also be affected by changes in water availability, sourcing and quality; and extreme temperature changes affecting the entity's premises, operations, supply chains, transportation needs and employee health and safety.</p>
climate-related risks and opportunities	<p>Climate-related risks refers to the potential negative effects of climate change on an entity. These risks are categorised as climate-related physical risks and climate-related transition risks.</p> <p>Climate-related opportunities refers to the potential positive effects arising from climate change for an entity. Efforts to mitigate and adapt to climate change can produce climate-related opportunities for an entity.</p>
climate-related transition plan	An aspect of an entity's overall strategy that lays out the entity's targets, actions or resources for its transition towards a lower-carbon economy, including actions such as reducing its greenhouse gas emissions.
climate-related transition risks	<p>Risks that arise from efforts to transition to a lower-carbon economy. Transition risks include policy, legal, technological, market and reputational risks. These risks could carry financial implications for an entity, such as increased operating costs or asset impairment due to new or amended climate-related regulations. The entity's financial performance could also be affected by shifting consumer demands and the development and deployment of new technology.</p>
CO2 equivalent	The universal unit of measurement to indicate the global warming potential of each greenhouse gas , expressed in terms of the global warming potential of one unit of carbon dioxide. This unit is used to evaluate releasing (or avoiding releasing) different greenhouse gases against a common basis.
financed emissions	The portion of gross greenhouse gas emissions of an investee or counterparty attributed to the loans and investments made by an entity to the investee or counterparty. These emissions are part of Scope 3 Category 15 (investments) as defined in the Greenhouse Gas Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard (2011).
global warming potential	A factor describing the radiative forcing impact (degree of harm to the atmosphere) of one unit of a given greenhouse gas relative to one unit of CO2.

greenhouse gases	The seven greenhouse gases listed in the Kyoto Protocol-carbon dioxide (CO ₂); methane (CH ₄); nitrous oxide (N ₂ O); hydrofluorocarbons (HFCs); nitrogen trifluoride (NF ₃); perfluorocarbons (PFCs) and sulphur hexafluoride (SF ₆).
indirect greenhouse gas emissions	Emissions that are a consequence of the activities of an entity, but occur at sources owned or controlled by another entity
internal carbon price	<p>Price used by an entity to assess the financial implications of changes to investment, production and consumption patterns, and of potential technological progress and future emissions abatement costs. An entity can use internal carbon prices for a range of business applications. Two types of internal carbon prices that an entity commonly uses are:</p> <ul style="list-style-type: none"> (a) a shadow price, which is a theoretical cost or notional amount that the entity does not charge but that can be used to understand the economic implications or tradeoffs for such things as risk impacts, new investments, the net present value of projects, and the cost and benefit of various initiatives; and (b) an internal tax or fee, which is a carbon price charged to a business activity, product line, or other business unit based on its greenhouse gas emissions (these internal taxes or fees are similar to intracompany transfer pricing).
latest international agreement on climate change	An agreement by states, as members of the United Nations Framework Convention on Climate Change, to combat climate change. The agreements set norms and targets for a reduction in greenhouse gases .
Scope 1 greenhouse gas emissions	Direct greenhouse gas emissions that occur from sources that are owned or controlled by an entity.
Scope 2 greenhouse gas emissions	<p>Indirect greenhouse gas emissions from the generation of purchased or acquired electricity, steam, heating or cooling consumed by an entity.</p> <p>Purchased and acquired electricity is electricity that is purchased or otherwise brought into an entity's boundary. Scope 2 greenhouse gas emissions physically occur at the facility where electricity is generated.</p>
Scope 3 greenhouse gas emissions	Indirect greenhouse gas emissions (not included in Scope 2 greenhouse gas emissions) that occur in the value chain of an entity, including both upstream and downstream emissions. Scope 3 greenhouse gas emissions include the Scope 3 categories in the Greenhouse Gas Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard (2011).
Scope 3 categories	<p>Scope 3 greenhouse gas emissions are categorised into these 15 categories-as described in the Greenhouse Gas Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard (2011):</p> <ul style="list-style-type: none"> (1) purchased goods and services; (2) capital goods; (3) fuel- and energy-related activities not included in Scope 1 greenhouse gas emissions or Scope 2 greenhouse gas emissions; (4) upstream transportation and distribution; (5) waste generated in operations; (6) business travel; (7) employee commuting; (8) upstream leased assets; (9) downstream transportation and distribution; (10) processing of sold products; (11) use of sold products; (12) end-of-life treatment of sold products; (13) downstream leased assets; (14) franchises; and (15) investments.

EY | Building a better working world

EY is building a better working world by creating new value for clients, people, society and the planet, while building trust in capital markets.

Enabled by data, AI and advanced technology, EY teams help clients shape the future with confidence and develop answers for the most pressing issues of today and tomorrow.

EY teams work across a full spectrum of services in assurance, consulting, tax, strategy and transactions. Fueled by sector insights, a globally connected, multi-disciplinary network and diverse ecosystem partners, EY teams can provide services in more than 150 countries and territories.

All in to shape the future with confidence.

EY refers to the global organization, and may refer to one or more, of the member firms of Ernst & Young Global Limited, each of which is a separate legal entity. Ernst & Young Global Limited, a UK company limited by guarantee, does not provide services to clients. About EY Global Corporate Reporting Services Group

A global set of accounting and sustainability disclosure standards provides the global economy with one measure to assess and compare the financial position and performance of entities, and the sustainability-related factors affecting them. For entities applying or transitioning to International Financial Reporting Standards (IFRS) - which includes IFRS Accounting Standards and IFRS Sustainability Disclosure Standards (collectively, IFRS Standards) - authoritative and timely guidance is essential to navigating IFRS Standards that continue to develop and evolve. The EY Global Corporate Reporting Services Group has helped develop international resources – people and knowledge – to support the application and interpretation of IFRS accounting and sustainability disclosure standards. In doing so, the EY Global Corporate Reporting Services Group provides deep subject matter knowledge and broad sector experience to the market, including the latest insights from the global EY network.
