- The investments held by Master Fund are measured and evaluated on a fair value basis and information about the investments made by Master Fund is provided to investors on a fair value basis through the feeder funds.

Master Fund and the feeder funds were formed in connection with each other for legal, regulatory, tax or similar requirements. When considered together, they display the following typical characteristics of an investment entity:

- The feeder fund indirectly holds more than one investment because Master Fund holds a portfolio of investments.
- Although Master Fund is wholly capitalised by feeder funds, the feeder funds are funded by many investors who are unrelated to the feeder funds (and to the general partner).
- Ownership in the feeder funds is represented by units of equity interests through a capital contribution.

[IFRS 10.IE12, IFRS 10.IE13, IFRS 10.IE14, IFRS 10.IE15].

10.2.10 Multi-layered fund structures

Illustration 10-3 above shows a multi-layered fund structure. The reason and purpose of these is usually to accomplish one or more of the following:

- Regulatory reasons to invest in certain jurisdictions
- Risk mitigation reasons, that is, to ring fence particular investees

Or

- Investment-return enhancement, where the after-tax returns on an investment can be enhanced by using vehicles in certain jurisdictions

When an investment entity has a subsidiary that is an intermediate parent that is formed in connection with the parent investment entity for legal, regulatory, tax or similar business reasons, the investment entity investor need not have an exit strategy for that subsidiary. This is on condition that the intermediate investment entity parent has appropriate exit strategies for its investments. [IFRS 10.B85H]. In addition, an entity must consider all facts and circumstances in assessing whether it is an investment entity, including its purpose and design. [IFRS 10.B85A]. Illustrative Example 4 of IFRS 10, represented by Illustration 10-3 above, indicates that funds formed in connection with each other for legal, regulatory, tax or similar requirements can be considered together to determine whether they display the characteristics of an investment entity. In Illustration 10-3 above, both Domestic Feeder and Offshore Feeder are considered to be investment entities.

10.3 Accounting by an investment entity

In its consolidated financial statements, an investment entity:

- Consolidates any subsidiary that is not an investment entity and whose main purpose and activities are providing services that relate to the investment entity's investment activities and apply the requirements of IFRS 3 to the acquisition of any such subsidiary (see section 10.2.1.A above)

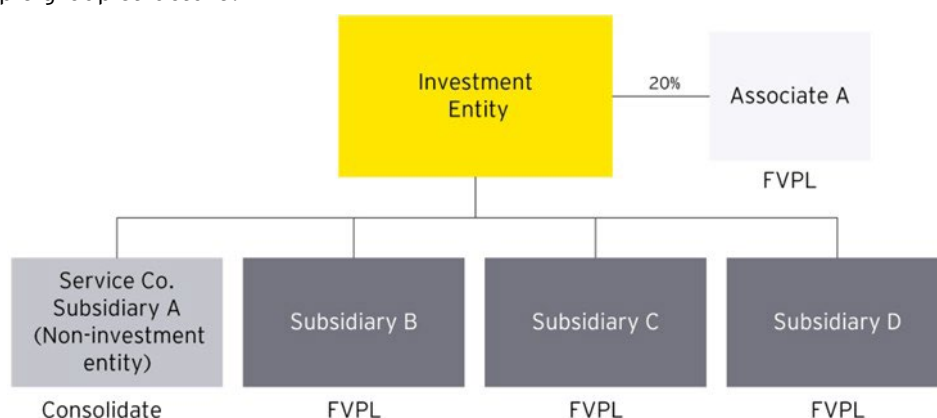

[IFRS 10.32]

And

- Measures all other investments in a subsidiary at fair value through profit or loss in accordance with IFRS 9 [IFRS 10.31]

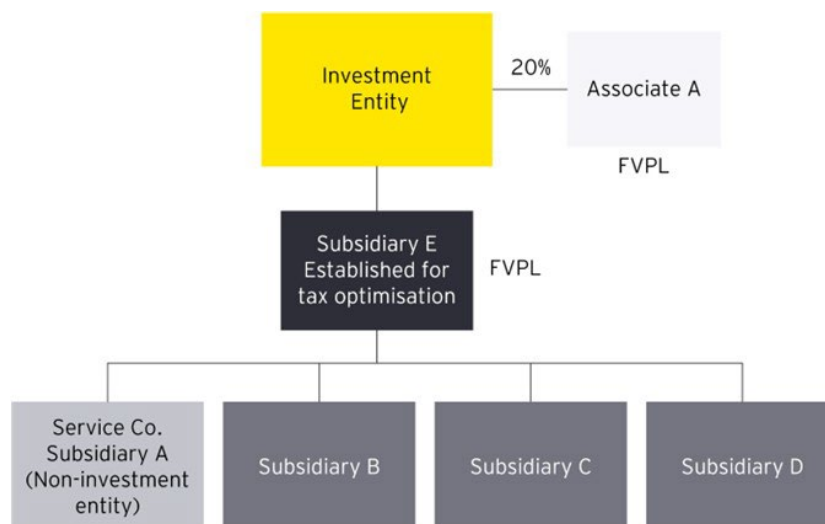

In addition, as discussed in section 10.2.4 above, the investment entity must elect to account for its own investments in investment property, associates, joint ventures and financial assets at fair value. However, where applicable, some of these investments could be measured at fair value through other comprehensive income. Other assets (e.g., property, plant and equipment) and financial liabilities need not be measured at fair value unless this is required by the relevant IFRS accounting standard.

The following diagram illustrates the accounting in the consolidated financial statements of an investment entity in a simple group structure:

The accounting is less intuitive for investment entities with intermediate holding company subsidiaries. If the intermediate holding company does not meet the conditions for consolidation, then the intermediate holding company, including its investments in subsidiaries, is measured at fair value through profit or loss. The underlying subsidiaries are not measured separately.

The diagram below illustrates the accounting for an investment entity parent using the same group structure as above but with an intermediate parent established for tax optimisation purposes inserted between the investment entity parent and the subsidiaries. As discussed in section 10.2.1.B above, the IFRS IC has clarified that intermediate holding companies established for tax optimisation purposes are measured by a parent investment entity at fair value through profit or loss. Therefore, in this situation, the underlying subsidiaries are not separately measured at fair value through profit or loss (or consolidated in the case of the non-investment entity service company). Instead, the intermediate holding entity, including its investments in subsidiaries, is measured at fair value through profit or loss. Parent investment entities with this type of group structure may wish to provide further information in their financial reports to help explain their performance.

If Subsidiary A (the non-investment entity service company) was owned directly by the investment entity parent, rather than by Subsidiary E, it would be consolidated.

When an investment entity has no subsidiaries that are consolidated (i.e., all subsidiaries are measured at fair value through profit or loss as illustrated above), it presents separate financial statements as its only financial statements. [IAS 27.8A].

When an investment entity parent prepares consolidated financial statements, any subsidiary measured at fair value through profit or loss in those consolidated financial statements must also be accounted for in the same way in its separate financial statements (i.e., at fair value through profit or loss). [IAS 27.11A]. When an investment entity parent has subsidiaries that are consolidated in its consolidated financial statements, the parent has a separate accounting policy choice to account for those subsidiaries either at cost, in accordance with IFRS 9 or using the equity method in its separate financial statements (see Chapter 9).

Fair value will be as determined by IFRS 13. Under IFRS 13, net asset value cannot be presumed to equal fair value as the asset being measured is the equity investment in an investment entity, not the underlying assets and liabilities of the investment entity itself. Instead, the characteristics of the investment being measured need to be considered when determining its fair value. The use of net asset value in determining fair value is discussed in Chapter 15.

10.3.1 Accounting for a change in investment entity status

A parent that either ceases to be an investment entity or becomes an investment entity accounts for its change in status prospectively from the date at which the change in status occurred. [IFRS 10.30].

10.3.1.A Becoming an investment entity

In summary, when an entity becomes an investment entity, the change in status is treated as a loss of control of the investment entity subsidiaries. Therefore, when an entity becomes an investment entity, it ceases to consolidate its subsidiaries from the date of the change in status, except for any non-investment entity subsidiary whose main purpose and activities are providing services that relate to the investment entity's investment activities, and apply the loss of control provisions of IFRS 10. [IFRS 10.B101].

This means that the parent:

- Derecognises the assets and liabilities of those subsidiaries from the consolidated statement of financial position
- Recognises any investment retained in those subsidiaries at fair value through profit or loss in accordance with IFRS 9

And

- Recognises a gain or loss associated with the loss of control attributed to the subsidiaries [IFRS 10.25]

Similarly, in the separate financial statements of the parent, when an entity becomes an investment entity, it accounts for an investment in a subsidiary at fair value through profit or loss in accordance with IFRS 9. The difference, if any, between the previous carrying amount of the subsidiary and its fair value at the date of the change in status of the investor is recognised as a gain or loss in profit or loss. If the parent has previously recorded its investment in accordance with IFRS 9 at fair value through other comprehensive income (OCI), the cumulative amount of any gain or loss recognised previously in OCI in respect of that subsidiary is treated as if the entity had disposed of it at the date of change in status. [IAS 27.11B(b)]. This gain or loss in OCI is not recycled to profit or loss.

IFRS 10 is silent in respect of any accounting changes required when an entity becomes an investment entity in respect of its own investment property, associates, joint ventures and financial assets. However, it is a condition of being an investment entity that a reporting entity must measure and evaluate the performance of substantially all of its investments on a fair value basis. This implies that those assets have been measured already on a fair value basis in order for the entity to meet the requirements of an investment entity.

10.3.1.B Ceasing to be an investment entity

In summary, when an entity ceases to be an investment entity, the event is treated similarly to a business combination. Therefore, when an entity ceases to be an investment entity, it applies IFRS 3 to any subsidiary that was previously measured at fair value through profit or loss. This means that all of the individual assets and liabilities of the subsidiary are recognised at fair value (unless IFRS 3 requires otherwise) and the difference between the previous fair value and the value of the individual assets and liabilities is goodwill. The date of change of status is the deemed acquisition date. The fair value of the subsidiary at the deemed acquisition date represents the transferred deemed consideration when measuring any goodwill or gain from a bargain purchase that arises from the deemed acquisition. All subsidiaries are consolidated in accordance with IFRS 10 from the date of change in status. [IFRS 10.B100].

In the separate financial statements of the parent, when the parent ceases to be an investment entity, it accounts for an investment in a subsidiary either at cost, in accordance with IFRS 9, or using the equity method as described in IAS 28. The date of the change in status is the deemed acquisition date. The fair value of the subsidiary at the deemed acquisition date when accounting for the investment, under any of the permitted methods, represents the transferred deemed consideration. [IAS 27.11B(a)].

10.4 Accounting by a parent of an investment entity

A parent of an investment entity that is not itself an investment entity cannot use the investment entity exception. It must therefore consolidate all entities that it controls including those controlled through an investment entity subsidiary. [IFRS 10.33].

According to the Board, non-investment entities do not have the unique business models of investment entities; they have other substantial activities besides investing or do not manage substantially all of their investments on a fair value basis. Consequently, in the Board's view, the argument for a fair value measurement is weakened at non-investment entity level. [IFRS 10.BC276, IFRS 10.BC277, IFRS 10.BC278].

The Board also noted the following in arriving at its conclusion:

- Concern that a non-investment entity could achieve different accounting outcomes by holding subsidiaries directly or indirectly through an investment entity [IFRS 10.BC280]
- Practical difficulties when a non-investment entity parent and an investment entity invest in the same investment or when an investment entity subsidiary holds a subsidiary that invests in the equity of a non-investment entity parent [IFRS 10.BC281]
- Although US GAAP permits 'rolled up' accounting in certain circumstances, this is linked to industry-specific guidance that is not generally contained in IFRS accounting standards [IFRS 10.BC282]
- Inconsistency with the roll-up of fair value accounting option permitted by IAS 28. However, the Board thought it was important to retain the fair value accounting that is currently allowed for venture capital organisations, mutual funds, unit trusts and similar entities and that the differences between using equity accounting and fair value accounting was considered to be smaller than between consolidation and fair value measurement for investments in subsidiaries. [IFRS 10.BC283].

Ultimately, due to concerns about potential abuses, the Board considered that the investment entity exception is not retained by a non-investment entity parent in its consolidated financial statements.

Appendix B - Defined terms

Extract from IFRS standards - Definitions	
acquisition date	The date on which the acquirer obtains control of the acquiree . <i>[IFRS 3 Appendix A].</i>
combined financial statements	Financial statements of a reporting entity that comprises two or more entities that are not all linked by a parent-subsidiary relationship. <i>[CF 3.12, CF Appendix Defined terms].</i>
consolidated financial statements	The financial statements of a group in which the assets, liabilities, equity, income, expenses and cash flows of the parent and its subsidiaries are presented as those of a single economic entity. <i>[IFRS 10 Appendix A].</i>
control of an investee	An investor controls an investee when the investor is exposed, or has rights, to variable returns from its involvement with the investee and has the ability to affect those returns through its power over the investee. <i>[IFRS 10 Appendix A].</i>
group	A parent and its subsidiaries . <i>[IFRS 10 Appendix A].</i>
investment entity	An entity that: <ul style="list-style-type: none"> (a) obtains funds from one or more investors for the purpose of providing those investor(s) with investment management services; (b) commits to its investor(s) that its business purpose is to invest funds solely for returns from capital appreciation, investment income, or both; and (c) measures and evaluates the performance of substantially all of its investments on a fair value basis. <i>[IFRS 10 Appendix A].</i>
joint control	The contractually agreed sharing of control of an arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control. <i>[IFRS 11 Appendix A].</i>
parent	An entity that controls one or more entities. <i>[IFRS 10 Appendix A].</i>
protective rights	Rights designed to protect the interest of the party holding those rights without giving that party power over the entity to which those rights relate. <i>[IFRS 10 Appendix A].</i>
reporting entity	A reporting entity is an entity that is required, or chooses, to prepare financial statements. <i>[CF 3.10, CF Appendix Defined terms].</i>
separate financial statements	Separate financial statements are those presented by an entity in which the entity could elect, subject to the requirements in this Standard, to account for its investments in subsidiaries, joint ventures and associates either at cost, in accordance with IFRS 9 <i>Financial Instruments</i> , or using the equity method as described in IAS 28 <i>Investments in Associates and Joint Ventures</i> . <i>[IAS 27.4].</i>
significant influence	Significant influence is the power to participate in the financial and operating policy decisions of the investee but is not control or joint control of those policies. <i>[IAS 28.3].</i>
structured entity	An entity that has been designed so that voting or similar rights are not the dominant factor in deciding who controls the entity, such as when any voting rights relate to administrative tasks only and the relevant activities are directed by means of contractual arrangements. Paragraphs B22-B24 provide further information about structured entities. <i>[IFRS 12 Appendix A].</i>
subsidiary	An entity that is controlled by another entity. <i>[IFRS 10 Appendix A].</i>

	Appendix B - Defined terms	646

Overview

IFRS 10 *Consolidated Financial Statements* sets out the principles for the presentation and preparation of consolidated financial statements when an entity controls one or more other entities.

Chapter 7 discusses the requirements of IFRS 10 relating to the concepts underlying control of an entity (a subsidiary) by its parent, the requirement to prepare consolidated financial statements and what subsidiaries are to be consolidated within a set of consolidated financial statements. It also covers the definition of an investment entity and the exception from consolidating particular subsidiaries of an investment entity. The development, objective, and scope of IFRS 10 are dealt with in Chapter 7.

This chapter deals with the accounting requirements of IFRS 10 relating to the preparation of consolidated financial statements. In particular, it covers topics such as: consolidation procedures, when to commence or cease consolidation, how to account for the acquisition of a subsidiary that is not a business (business combinations are addressed in Chapter 10), how to account for a loss of control (including deemed disposals and distributions in kind), how to account for changes in ownership interest without a loss of control, and how to account for non-controlling interests (NCI). The chapter also covers the accounting for put and call options over NCI ('NCI puts and calls'). Finally, the chapter includes a section on future developments being considered by the IASB or the IFRS IC.

What you need to know

- Consolidated financial statements represent the financial statements of a group (i.e., the parent and its subsidiaries) in which the assets, liabilities, equity, income, expenses and cash flows of the parent and its subsidiaries are presented as those of a single economic entity.
- Investment entities do not consolidate particular subsidiaries, instead including them at fair value through profit or loss. IFRS 10 provides specific guidance on the definition of and accounting for investment entities.
- If the subsidiary is not wholly-owned, the profit or loss and each component of other comprehensive income (OCI) of the subsidiary, and the equity of the subsidiary, are attributed to the parent's interest and to NCI. This allocation is usually done on the basis of existing ownership interests. IFRS 3 *Business Combinations* addresses the initial measurement of NCI arising from a business combination. However, IFRS accounting standards do not address the initial measurement of NCI arising from an acquisition that is not a business and different approaches have developed.
- A parent consolidates a subsidiary from the date on which the parent first obtains control, and ceases consolidating that subsidiary on the date on which the parent loses control.
- On a loss of control of a subsidiary, the group deconsolidates the assets and liabilities and any NCI relating to a former subsidiary. Any retained interest in the former subsidiary is measured at fair value. A gain or loss is recognised in profit or loss equal to the fair values of the consideration received and retained interest less the carrying amounts of the assets and liabilities and any NCI in the subsidiary that is deconsolidated. Certain elements of OCI relating to the former subsidiary are required to be reclassified to profit or loss on a loss of control.
- Where a subsidiary is sold (or contributed) to an associate or joint venture accounted using the equity method, conflicts between IFRS 10 (which requires a full gain or loss to be recognised in profit or loss on loss of control of the subsidiary) and IAS 28 *Investments in Associates and Joint Ventures* (which requires a partial gain or loss only to be recognised in a 'downstream transaction') have led to diversity in accounting approaches. The IASB and IFRS IC have also discussed other situations involving the loss of control of a subsidiary where it was unclear whether the requirements of IFRS 10 and/or other IFRS accounting standards applied.
- Increases or decreases in the ownership interest in a subsidiary that do not involve a loss of control are accounted for in equity. There is no change to the assets (including goodwill) and liabilities recognised in the consolidated financial statements but there may be reallocations in equity between the parent's interest and NCI in the subsidiary.
- IFRS 10 does not directly address the accounting for NCI puts and calls. IAS 32 *Financial Instruments: Presentation* requires that a financial liability is recognised for the present value of the redemption price for an NCI put. There is diversity of accounting approaches in accounting for NCI puts and this issue has been addressed in the IASB's *Financial Instruments with Characteristics of Equity* Project. An Exposure Draft *Financial Instruments with Characteristics of Equity* was published in November 2023.

1 Introduction

This chapter deals with the accounting requirements of IFRS 10 relating to the presentation and preparation of consolidated financial statements. IFRS 10's requirements on consolidation procedures are dealt with in section 2 below; accounting for changes in control in section 3 below; accounting for changes in ownership interest without loss of control in section 4 below; the recognition, measurement and presentation of NCI in section 5 below; and accounting for NCI puts and calls (or combinations of such options) in section 6 below. The final section covers future developments in section 7 below.

FASB differences

Differences between the IFRS and US GAAP guidance on this topic are not addressed in this chapter as the standards are not converged. Therefore, differences between IFRS and US GAAP may exist that are not addressed in this publication.

2 Consolidation procedures

2.1 Basic principles

Extract from IFRS 10

Appendix A

Defined terms

consolidated financial statements

The financial statements of a **group** in which the assets, liabilities, equity, income, expenses and cash flows of the **parent** and its **subsidiaries** are presented as those of a single economic entity.

[IFRS 10 Appendix A].

The above approach to preparing consolidated financial statements is referred to as 'the entity concept'. As noted in Chapter 7, an investment entity generally measures its investments in subsidiaries at fair value through profit or loss in accordance with IFRS 9 *Financial Instruments*, with limited exceptions. [IFRS 10.31, IFRS 10.32, IFRS 10.33].

IFRS 10 requires a parent to prepare consolidated financial statements using uniform accounting policies for like transactions and other events in similar circumstances (see section 2.6 below). [IFRS 10.19, IFRS 10.21, IFRS 10.B87]. Consolidation of an investee begins from the date the investor obtains control of the investee and ceases when the investor loses control of the investee. [IFRS 10.20, IFRS 10.21, IFRS 10.B88].

In order to present financial information about the group as that of a single economic entity, the entity must: [IFRS 10.21, IFRS 10.B86]

- (a) Combine like items of assets, liabilities, equity, income, expenses, and cash flows of the parent with those of its subsidiaries
- (b) Offset (eliminate) the carrying amount of the parent's investment in each subsidiary and the parent's portion of equity of each subsidiary (IFRS 3 explains how to account for any related goodwill - see Chapter 10) [IFRS 3.B63(a)]

And

- (c) Eliminate in full intragroup assets and liabilities, equity, income, expenses, and cash flows relating to transactions between entities of the group (profits or losses resulting from intragroup transactions that are recognised in assets, such as inventory and fixed assets, are eliminated in full). Intragroup losses may indicate an impairment that requires recognition in the consolidated financial statements. IAS 12 *Income Taxes* applies to temporary differences that arise from the elimination of profits and losses resulting from intragroup transactions. See section 2.4 below.

Income and expenses of a subsidiary are based on the carrying amounts of the assets and liabilities recognised in the consolidated financial statements at the acquisition date. Many items will have a fair value on acquisition that will affect subsequent recognition of income and expense. IFRS 10 gives the example of depreciation expense, which will be based on the fair values of the related depreciable assets recognised in the consolidated financial statements at the acquisition date. [IFRS 10.21, IFRS 10.B88].

Point (b) above refers to the elimination of the parent's investment and the parent's portion of equity. The equity in a subsidiary not attributable, directly or indirectly, to the parent, represents an NCI. [IFRS 10 Appendix A]. The profit or loss and each component of OCI of a subsidiary are attributed to the owners of the parent and to the NCI. [IFRS 10.24, IFRS 10.B94]. NCI in subsidiaries (in aggregate) are presented within equity, separately from the equity of the owners of the parent. [IFRS 10.22]. Changes in a parent's ownership interest in a subsidiary that do not result in the parent losing control of the subsidiary are accounted for as equity transactions. [IFRS 10.23]. Accounting for NCI is discussed in more detail in sections 2.2, 4 and 5 below.

2.2 Proportion of subsidiary's profit or loss, OCI and equity allocated to parent and NCI

The basic consolidation procedures described above effectively mean that 100% of the assets, liabilities, income, expenses, and cash flows of a subsidiary are consolidated with those of the parent, irrespective of the parent's ownership interest in the subsidiary. However, the profit or loss and each component of OCI of the subsidiary, and the equity of the subsidiary, are attributed to the parent and the NCI (if the subsidiary is not wholly-owned).

As discussed in Chapter 7, when assessing control, an investor considers any potential voting rights that it holds as well as those held by others. Common examples of potential voting rights include options, forward contracts, and conversion features of a convertible instrument.

If there are potential voting rights, or other derivatives containing potential voting rights, IFRS 10 contains the following guidance on the proportion of profit or loss, OCI and changes in equity allocated to the parent and NCI (see section 5.7 below) in preparing consolidated financial statements: [IFRS 10.21, IFRS 10.B89, IFRS 10.B90, IFRS 10.B91]

Extract from IFRS 10

Potential voting rights

- B89** When potential voting rights, or other derivatives containing potential voting rights, exist, the proportion of profit or loss and changes in equity allocated to the parent and non-controlling interests in preparing consolidated financial statements is determined solely on the basis of existing ownership interests and does not reflect the possible exercise or conversion of potential voting rights and other derivatives, unless paragraph B90 applies.
- B90** In some circumstances an entity has, in substance, an existing ownership interest as a result of a transaction that currently gives the entity access to the returns associated with an ownership interest. In such circumstances, the proportion allocated to the parent and non-controlling interests in preparing consolidated financial statements is determined by taking into account the eventual exercise of those potential voting rights and other derivatives that currently give the entity access to the returns.
- B91** IFRS 9 does not apply to interests in subsidiaries that are consolidated. When instruments containing potential voting rights in substance currently give access to the returns associated with an ownership interest in a subsidiary, the instruments are not subject to the requirements of IFRS 9. In all other cases, instruments containing potential voting rights in a subsidiary are accounted for in accordance with IFRS 9.

Generally, the proportion of NCI is determined solely on the basis of existing ownership interests. It does not reflect the possible exercise or conversion of potential voting rights and other derivatives. [IFRS 10.21, IFRS 10.24, IFRS 10.B89, IFRS 10.B94].

Usually, there is no difference between the existing ownership interests and the present legal ownership interests in the underlying shares. However, allocating the proportions of profit or loss, OCI, and changes in equity based on present legal ownership interests is not always appropriate. For example, there may be situations where the terms and conditions of the potential voting rights mean that the existing ownership interest does not correspond to the legal ownership of the shares. IFRS 10 recognises that, in some circumstances, an entity has, in substance, an existing ownership interest as a result of a transaction that currently gives it access to the returns associated with an ownership interest. In such circumstances, the proportion allocated to the parent and NCI is determined by taking into account the eventual exercise of those potential voting rights and other derivatives that currently give the entity access to the returns. [IFRS 10.21, IFRS 10.B90].

Where this is the case, such instruments are not within the scope of IFRS 9 (since IFRS 9 does not apply to subsidiaries that are consolidated). [IFRS 9.2.1(a)]. This scope exclusion prevents double counting of the changes in the fair value of such a derivative under IFRS 9, and of the effective interest created by the derivative in the underlying investment. In all other cases, instruments containing potential voting rights in a subsidiary are accounted for in accordance with IFRS 9. [IFRS 10.21, IFRS 10.B91].

Illustration 2-1 below shows this principle.

Illustration 2-1: Proportion of subsidiary's profit or loss, OCI and equity allocated to parent and NCI where potential voting rights exist

Entities A and B hold 40% and 60%, respectively, of the equity of Entity C. A also holds a currently exercisable option over one third of B's holding (of shares in C) which, if exercised, would give A a 60% interest in C. The terms of the option are such that it leads to the conclusion that C is controlled by and therefore is a subsidiary of A, but do not give A present access to the returns of the underlying shares. Therefore, in preparing its consolidated financial statements, A attributes 60% of profit or loss, OCI and changes in equity of C to the NCI.

How we see it

Whether potential voting rights and other derivatives, in substance, already provide existing ownership interests in a subsidiary that currently give an entity access to the returns associated with that ownership interest will be a matter of judgement.

Issues raised by NCI puts and calls, including whether or not such options give an entity present access to returns associated with an ownership interest (generally in connection with a business combination) are discussed further in section 6 below. That guidance may also be helpful in assessing whether potential rights and other derivatives, in substance, give present access to returns associated with an ownership interest in other contexts.

This chapter uses the term 'present ownership interest' to include existing legal ownership interests together with potential voting rights and other derivatives that, in substance, already provide existing ownership interests in a subsidiary because they currently provide the entity access to the returns associated with an ownership interest (as described in IFRS 10.B90). [IFRS 10.21, IFRS 10.B90].

2.2.1 Attribution when NCI change in an accounting period

NCI may change during the accounting period. For example, a parent may purchase shares in a subsidiary held by NCI.

By acquiring some (or all) of the NCI, the parent will be allocated a greater proportion of the profits or losses of the subsidiary in periods after the additional interest is acquired. [IFRS 10.BC2175]. Therefore, the profit or loss and OCI of the subsidiary for the part of the reporting period prior to the transaction are attributed to the owners of the parent and the NCI based on their ownership interests prior to the transaction. Following the transaction, the profit or loss and OCI of the subsidiary are attributed to the owners of the parent and the NCI based on their new ownership interests after the transaction.

2.3 Consolidating foreign operations

IFRS 10 does not specifically address how to consolidate subsidiaries that are foreign operations. As explained in IAS 21 *The Effects of Changes in Foreign Exchange Rates*, an entity is permitted to present its financial statements in any currency (or currencies). If the presentation currency differs from the entity's functional currency, it needs to translate its results and financial position into the presentation currency. Therefore, when a group contains individual entities with different functional currencies, the results and financial position of each entity are translated into the presentation currency of the consolidated financial statements. [IAS 21.38]. The requirements of IAS 21 in respect of this translation process are explained in Chapter 16.

A reporting entity comprising a group with intermediate holding companies is permitted to adopt either the 'direct method' or the 'step-by-step method' of consolidation. IFRIC 16 *Hedges of a Net Investment in a Foreign Operation* refers to these methods as follows:

- *Direct method* - The financial statements of the foreign operation are translated directly into the functional currency of the ultimate parent.
- And
- *Step-by-step method* - The financial statements of the foreign operation are first translated into the functional currency of any intermediate parent(s) and then translated into the functional currency of the ultimate parent (or the presentation currency, if different).

An entity has an accounting policy choice of which method to use, which it must apply consistently for all foreign operations. [IFRIC 16.17].

Both methods will result in the same amounts in the presentation currency for the statement of financial position. However, this does not necessarily hold true for income and expense items particularly if an indirectly held foreign operation is disposed of (as the different methods impact the amount of cumulative retranslation reserve subsequently reclassified to profit or loss). [IFRIC 16.BC36]. Differences will also arise between the two methods if an average rate is used, although these are likely to be insignificant. See Chapter 16 for further discussion and a comparison of the effect of the two approaches on accounting for a disposal of an indirectly held foreign operation.

IFRIC 16 also provides guidance on what does and does not constitute a valid hedge of a net investment in a foreign operation, and on how an entity determines the amounts to be reclassified from equity to profit or loss for both the hedging instrument and the hedged item, where the foreign operation is disposed of.

It notes that in a disposal of a subsidiary by an intermediate parent, the use of the 'step-by-step method' of consolidation may result in the reclassification to profit or loss of a different amount from that used to determine hedge effectiveness. An entity can eliminate this difference by determining the amount relating to that foreign operation that would have arisen if the entity had used the 'direct method' of consolidation. However, IAS 21 does not require an entity to make this adjustment. Instead, it is an accounting policy choice that should be followed consistently for all net investments. [IFRIC 16.17].

IFRIC 16 is discussed in more detail in Chapter 16 and Chapter 49.

2.4 Intragroup eliminations

IFRS 10 requires intragroup assets and liabilities, equity, income, expenses, and cash flows relating to transactions between entities of the group to be eliminated. Profits or losses resulting from intragroup transactions that are recognised in assets, such as inventory and fixed assets, are eliminated in full as shown in Illustration 2-2 in section 2.4.1 below. [IFRS 10.21, IFRS 10.B86(c)].

Even though losses on intragroup transactions are eliminated in full, they may still indicate an impairment that requires recognition in the consolidated financial statements. [IFRS 10.21, IFRS 10.B86(c)]. For example, if a parent sells a property to a subsidiary at fair value and this is lower than the carrying amount of the asset, the transfer may indicate that the property (or the cash-generating unit to which that property belongs) is impaired in the consolidated financial statements. This will not always be the case as the value-in-use of the asset (or cash-generating unit) may be sufficient to support the higher carrying value. Transfers between companies under common control involving non-monetary assets are discussed in Chapter 9; impairment is discussed in Chapter 21.

Intragroup transactions may give rise to a current and/or deferred tax expense or benefit in the consolidated financial statements. IAS 12 applies to temporary differences that arise from the elimination of profits and losses resulting from intragroup transactions. [IFRS 10.21, IFRS 10.B86(c)]. These issues are discussed in Chapter 29. The application of IAS 12 to intragroup dividends and unpaid intragroup interest, royalties or management charges is also discussed in Chapter 29.

Where an intragroup balance is denominated in a currency that differs to the functional currency of a transacting group entity, exchange differences will arise. See Chapter 16 for discussion of the accounting for exchange differences on intragroup balances in consolidated financial statements.

2.4.1 Intragroup eliminations - allocation between parent and NCI

IFRS 10 does not specify how the elimination of profits and losses are to be allocated between the parent and NCI.

Illustration 2-2 shows how intragroup transactions are eliminated in both upstream and downstream transactions between a parent and subsidiary.

Illustration 2-2: Eliminating intragroup transactions

Downstream transaction - parent sells to subsidiary

Entity A holds a 75% interest in its subsidiary, Entity B. A sold inventory costing CU100,000 to B for CU200,000, giving rise to a profit in A of CU100,000. B still held the inventory at the end of the reporting period. Tax effects are ignored in this example.

Under IFRS 10, as well as the intragroup sale between A and B, the unrealised profit (from the group's point of view) is eliminated in the consolidation as follows:

		CU'000	CU'000
Dr	Revenue in A	200	
	Cr Cost of sales in A		100
	Cr Inventory in B		100

The profit from the sale of inventory of CU100,000 is reversed against group profit or loss.

How we see it

In our view, since the parent made the sale, none of the elimination of the intragroup profit is attributed to the NCI. Instead, the elimination of all of the intragroup profit is attributed to the parent.

Upstream transaction - subsidiary sells to parent

If the fact pattern was reversed, such that B sold inventory to A, and A still held the inventory at the end of the reporting period, the CU100,000 of profit would still be reversed in the consolidated financial statements.

How we see it

In our view, an entity is permitted to select one of the following approaches as a policy choice, to be applied consistently:

- *Approach 1* - attribute elimination of the intragroup profit proportionately to the NCI and the parent since the intragroup profit is generated by the subsidiary making the sale. This approach aligns with how profit or loss is otherwise attributed between the parent and NCI.
- *Approach 2* - attribute elimination of all of the intragroup profit to the parent. Since the intragroup profit is generated by the subsidiary and the NCI holder is entitled to its proportionate share of the profit recognised by the subsidiary before any elimination, elimination of the intragroup profit is attributed entirely to the parent.

Under Approach 1, in this illustration, CU25,000 of the eliminated profit (i.e., the NCI's 25% share of the CU100,000 profit) would be allocated to the NCI. Therefore, the reduction in profit would be attributed to the owners of the parent and NCI, in their proportionate interests, 75% and 25%.

Under Approach 2, in this illustration, the eliminated profit of CU100,000 would be attributed to the parent.

Asset transferred in an intragroup sale subsequently sold to a third party

If the inventory held by B had been sold to a third party for CU300,000 before the end of the reporting period (resulting in a profit in A of CU100,000 for the sale to B at CU200,000 and a profit in B of CU100,000 for the sale to a third party at CU300,000), no intragroup elimination of profit is required. The group has sold an asset with a cost of CU100,000 for CU300,000 creating a profit to the group of CU200,000. In this case, the intragroup elimination is limited to the sale between A and B as follows:

		CU'000	CU'000
Dr	Revenue in A	200	
	Cr Cost of sales in B		200

2.5 Non-coterminous accounting periods

The financial statements of the parent and its subsidiaries used in the preparation of the consolidated financial statements shall have the same reporting date. If the end of the reporting period of the parent is different from that of a subsidiary, the subsidiary must prepare, for consolidation purposes, additional financial information as of the same date as the financial statements of the parent, unless it is impracticable to do so. [IFRS 10.21, IFRS 10.B92]. 'Impracticable' presumably means when the entity cannot apply the requirement after making every reasonable effort to do so. [IAS 1.7, IAS 8.5].

If it is impracticable for the subsidiary to prepare such additional financial information, then the parent consolidates the financial information of the subsidiary using the most recent financial statements of the subsidiary. These must be adjusted for the effects of significant transactions or events that occur between the date of those financial statements and the date of the consolidated financial statements. [IFRS 10.21, IFRS 10.B93].

How we see it

IFRS 10 does not give examples of 'significant transactions or events' that must be adjusted. However, there will commonly be items that will need to be eliminated as part of the consolidation process such as distributions from the subsidiary to the parent, cash transfers or settlement of intragroup balances. Care is needed to ensure such transactions are properly eliminated in order to avoid double counting effects, e.g., where assets transferred intragroup might otherwise be reported by both the subsidiary and parent. Significant transactions could also include significant acquisitions or disposals, impairments or developments on contingencies or provisions in the intervening period between the dates of the subsidiary and parent financial statements.

The difference between the date of the subsidiary's financial statements and that of the consolidated financial statements must not be more than three months. The length of the reporting periods and any difference between the dates of the financial statements must be the same from period to period.

[IFRS 10.21, IFRS 10.B93]. It is not necessary, as in some national GAAPs, for the subsidiary's reporting period to end before that of its parent.

How we see it

The requirements relating to coterminous accounting periods seem to imply that, where a subsidiary that was previously consolidated using non-coterminous financial statements is now consolidated using coterminous financial statements (i.e., the subsidiary changed the end of its reporting period), comparative information is restated so that financial information of the subsidiary is included in the consolidated financial statements for an equivalent period in each period presented. However, other approaches not involving restatement of comparatives might sometimes be acceptable (as discussed below).

Other approaches not involving restatement of comparatives might be acceptable, particularly where the comparative information had already reflected the effects of significant transactions or events during the period between the date of the subsidiary's financial statements and the date of the consolidated financial statements. Where comparatives are not restated, additional disclosures might be needed about the treatment adopted and the impact on the current period of including information for the subsidiary for a period different from that of the parent.

IAS 21 addresses what exchange rate is used in translating the assets and liabilities of a foreign operation that is consolidated on the basis of financial statements made up to a different date to the reporting date used for the reporting entity's financial statements. [IAS 21.46]. This issue is discussed further in Chapter 16.

2.6 Consistent accounting policies

IFRS 10 requires the use of consistent accounting policies by the group in consolidated financial statements. Accordingly, if a member of the group uses accounting policies that differ from those adopted in the consolidated financial statements for like transactions and events in similar circumstances, appropriate adjustments are made to that group member's financial statements in preparing the consolidated financial statements to ensure conformity with the group's accounting policies. [IFRS 10.21, IFRS 10.B87].

3 Changes in control

3.1 Commencement and cessation of consolidation

A parent consolidates a subsidiary from the date on which the parent first obtains control, and ceases consolidating that subsidiary on the date on which the parent loses control. [IFRS 10.20, IFRS 10.21, IFRS 10.B88]. IFRS 3 defines the acquisition date, which is the date on which the acquirer obtains control of the acquiree, [IFRS 3.8, IFRS 3 Appendix A], (see Chapter 10).

The requirement to continue consolidating (albeit in a modified form) also applies to a subsidiary held for sale accounted for under IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* (see Chapter 5).

3.1.1 Acquisition of a subsidiary that is not a business

The same basic requirement to consolidate a subsidiary (see section 3.1 above) also applies when a parent acquires a controlling interest in an entity that is not a business, as defined in IFRS 3 (see Chapter 10). [IFRS 3.3, IFRS 3 Appendix A, IFRS 3.B7-B12D]. As required by IFRS 10, the parent consolidates all investees that it controls, not just those that are businesses, and recognises any NCI in the subsidiary (see section 5 below). IFRS 3 states that when an entity acquires an asset or group of assets that is not a business, the acquirer allocates the cost of the group between the individual identifiable assets acquired and liabilities assumed based on their relative fair values at the date of purchase. Such a transaction or event does not give rise to goodwill. [IFRS 3.2(b)]. The cost of the group of assets is the sum of all consideration given, any NCI recognised, and transaction costs incurred, if any. The allocation of the transaction price (or cost) to the identifiable assets acquired and liabilities assumed is discussed further in Chapter 10.

However, neither IFRS 10 nor IFRS 3 address how NCI in the entity is initially measured, where the entity is not a business.

How we see it

In our view, if the NCI has a present ownership interest and is entitled to a proportionate share of net assets upon liquidation, the acquirer of a subsidiary that is not a business has a choice to recognise the NCI on initial measurement in one of the following ways:

- (a) Its proportionate share of the fair values of the entity's identifiable net assets
 - (b) Its fair value (measured in accordance with IFRS 13 *Fair Value Measurement*)
 - (c) Its proportionate share of the consolidated book values of the net assets, including transaction costs. The basis for including transaction costs is that these are included in the consolidated book values of the subsidiary's net assets
- Or
- (d) Its proportionate share of the consolidated book values of the net assets, excluding transaction costs. The basis for excluding transaction costs is that these are borne by the parent and are not part of the net assets attributable to the NCI

In all other cases, NCI is recognised at fair value (measured in accordance with IFRS 13), unless another measurement basis is required in accordance with IFRS accounting standards (e.g., any share-based payment transaction classified as equity is measured in accordance with IFRS 2 *Share-based Payment* - referred to as a 'market-based measure') - see section 5.2 below.

As discussed in section 2.2 above, IFRS 10 recognises that, in some circumstances, an entity has, in substance, an existing ownership interest as a result of a transaction that currently gives it access to the returns associated with an ownership interest. Consequently, there may be situations where no NCI is recognised in relation to, say, a derivative over a subsidiary's shares where the parent has, in substance, an existing ownership interest over those shares.

Approaches (a) and (b) above are consistent with the choices on the initial recognition of NCI required by IFRS 3. [IFRS 3.19]. However, it could be argued that an asset acquisition is an economically dissimilar transaction to a business combination, and therefore the guidance in IFRS 3 is not a 'similar and related issue' under the hierarchy in IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* for

selection and application of accounting policies.¹ [IAS 8.11(a)]. Under this view, Approaches (c) and (d) above, which are based on the proportionate share of the consolidated book values of the entity's net assets, could also be supported.

Illustration 3-1 below is an example of an acquisition of a subsidiary that is not a business (where there is no pre-existing interest). The determination of NCI where the entity acquired was an associate or joint venture accounted under the equity method is explained in Illustration 3-2 in section 3.1.2.B below.

Illustration 3-1:² Acquisition of a subsidiary that is not a business

Entity A pays CU160,000 to acquire an 80% controlling interest in the equity shares of Entity B, which holds a single building (measured using the cost model under IAS 16 *Property, Plant and Equipment*) and is not a business. The fair value of the building is CU200,000.

An unrelated third party holds the remaining 20% interest in B's equity shares. The fair value of the NCI is CU40,000. In this case, the fair value of the NCI (as an equity interest) is the same as the NCI's proportionate share of the fair values of the identifiable net assets of B. Transaction costs are CU4,000. Tax effects, if any, are ignored in this example. As noted in section 3.1.1 above, there are four approaches to determining NCI which are illustrated below.

Approach (a) - measure NCI based on the proportionate share of the fair values of B's identifiable net assets

A initially records the following accounting entry:

	CU'000	CU'000
Dr Building	204	
Cr NCI (20% × CU200,000)		40
Cr Cash		164

Approach (b) - measure NCI at its fair value

A initially records the following accounting entry:

	CU'000	CU'000
Dr Building	204	
Cr NCI (at fair value)		40
Cr Cash		164

Approach (c) - measure NCI based on the proportionate share of the consolidated book values of B's net assets, including transaction costs

A initially records the following accounting entry:

	CU'000	CU'000
Dr Building	205	
Cr NCI (at 20% ÷ 80% × CU164,000)		41
Cr Cash		164

The calculation effectively grosses up the consideration paid by the parent (together with transaction costs) and determines the NCI's proportionate share. This approach has the effect that the NCI is recorded at its proportionate share (20%) of the consolidated book values of the net assets, including transaction costs.

Approach (d) - measure NCI based on the proportionate share of the consolidated book values of B's net assets, excluding transaction costs

A initially records the following accounting entry:

	CU'000	CU'000
Dr Building	204	
Cr NCI (at 20% ÷ 80% × CU160,000)		40
Cr Cash		164

1 The consequential amendments resulting from IFRS 18 *Presentation and Disclosure in Financial Statements*, once effective, change the title of IAS 8 to 'Basis of Preparation of Financial Statements' to better reflect the amended content of IAS 8. See Chapter 4 for further details on the requirements of IFRS 18.

2 Illustrations which involve NCI assume that the NCI has a present ownership interest equal to the proportionate equity interest held, except where otherwise noted.

3.1.2 Step acquisition of an associate or joint venture (equity accounted) that is not a business and becomes a subsidiary

An entity that has an interest in an associate or joint venture that does not constitute a business may obtain control and so become a parent of a subsidiary that does not constitute a business. Current IFRS accounting standards do not address the accounting treatment for an acquisition in stages from associate or joint venture to a subsidiary that is considered as an asset acquisition rather than a business combination. This raises questions as to how to measure the previously held interest and the NCI on acquisition.

3.1.2.A Measuring the previously held interest

As discussed in section 3.1.1 above, the cost of the group of assets is the sum of all the consideration given (including transaction costs incurred, if any) and any NCI recognised. It is therefore necessary to determine the 'cost' of the previously held interest, being part of the consideration given for the group of assets acquired. [IFRS 3.2(b)]. In January 2019, the IFRS IC issued an agenda decision regarding a different, but relevant, example of the step acquisition of an investment in a subsidiary accounted for at cost in the separate financial statements of the parent. The IFRS IC concluded that a reasonable reading of the requirements in IFRS accounting standards could result in the application of either one of two approaches to determine 'cost': the 'fair value as deemed cost approach' or the 'accumulated cost approach'.³ See Chapter 9.

How we see it

Given the IFRS IC agenda decision relating to a step acquisition of a subsidiary in separate financial statements, in our view, the following approaches are both acceptable methods of measuring the previously held interest in the associate or joint venture:

- Approach 1 *Fair value as deemed cost*
- Approach 2 *Equity-accounted carrying amount as accumulated cost*

Consistent with that agenda decision, any adjustment to remeasure the previously held interest to its fair value meets the definition of income or expense in the *Conceptual Framework for Financial Reporting* and is, therefore, recognised in profit or loss.

Approach 1 *Fair value as deemed cost*

Where a 'fair value as deemed cost approach' is applied, the fair value of the previously held interest at the date that control is obtained is deemed to be the cost for the purposes of accounting for the acquisition of the subsidiary. Under this approach, the transaction is viewed as if the entity is exchanging its initial interest (plus consideration for the additional interest) for a controlling interest in the investee ('exchange view'). As noted above, any adjustment to remeasure the previously held interest to its fair value is recognised in profit or loss.

Approach 2 *Equity-accounted carrying amount as accumulated cost*

Following an 'accumulated cost approach', the carrying amount of the associate or joint venture could be considered the relevant cost in accounting for the acquisition of the subsidiary. Although there is a change in status, it is not appropriate to remeasure the existing ownership interest as the subsidiary is not a business. Accordingly, no gain or loss is recorded on the acquisition of the subsidiary, assuming that the carrying amount of the new subsidiary is recoverable.

In certain circumstances, it might be acceptable to take a third approach and consider the cost of the previously held interest to be the accumulated historical cost consideration for the investment in the associate or joint venture. Given the agenda decision of the IFRS IC mentioned above, any difference arising between the previous carrying amount and the accumulated historical costs will be recognised in profit or loss. However, caution needs to be taken with using this approach as it does not always provide relevant information. If the accumulated historical cost consideration was lower than the equity-accounted carrying amount of the previous associate or joint venture, there would be a loss recognised, even though there is no economic loss arising from the transaction. Where the accumulated historical cost consideration exceeds the equity-accounted carrying amount of the previous associate or joint venture, care is needed when using this approach to ensure that the subsidiary is not carried at above its recoverable amount.

³ [IFRIC Update](#), January 2019, available on the IFRS Foundation's website.

How we see it

In our view, the entity accounts for all amounts previously recognised in OCI in relation to the investment on the same basis as would have been required if the investee had directly disposed of the related assets or liabilities. That is, certain amounts previously recognised in OCI (such as cumulative translation differences relating to a foreign operation) must be reclassified to profit or loss upon disposal. See Chapter 12.

3.1.2.B Measuring the NCI

Illustration 3-2 shows the computation of the NCI and the cost of an asset in the consolidated financial statements where a subsidiary (that does not meet the definition of a business, but only holds an asset) is acquired following the purchase of an additional interest in an equity-accounted joint venture.

Illustration 3-2: Acquisition of a subsidiary that is not a business where previously held interest is an equity-accounted joint venture

Entity A acquires a 50% interest in Entity C upon formation of a joint venture with Entity B in 20X6. Each venturer contributed CU5 million which was used by C to purchase a building accounted using the cost model in IAS 16. All entities have the same functional currency, currency unit (CU).

In 20Y1, cumulative earnings of the joint venture were CU1.5 million and cumulative dividends declared were CU0.5 million. Immediately prior to the following transaction, A has an equity accounted joint venture with a carrying amount of CU5.5 million (CU5m initial investment + 50% × (CU1.5m - CU0.5m)).

A and B entered into an arrangement whereby A acquired 30% of the shares of C in exchange for CU4.5 million cash paid to B. Transaction costs incurred by A were CU0.2 million. Following the transaction, A has an 80% controlling interest in the equity shares of C, which holds a single building and is not a business. Assuming that there are no control premiums or other investment premiums or discounts, the fair value of the NCI is CU3 million. The fair value of 100% of C at the acquisition date is CU15 million. Tax effects, if any, are ignored in this example.

For an asset acquisition, the cost of the group of assets is the sum of all the consideration given (i.e., the cash paid of CU4.5 million plus the 'cost' of the previously held interest in C) and any NCI recognised, together with transaction costs.

How should A measure the previously held interest in C?

As noted in section 3.1.2.A above, there are two main approaches to determine the 'cost' of the previously held interest - Approach 1 and Approach 2.

Under Approach 1, A records the previously held interest in C at its fair value of CU7.5 million (50% × CU15m). Accordingly, on acquisition, A records a gain of CU2 million on remeasurement of the previously held interest.

Under Approach 2, A measures its previously held interest in C at its previous equity accounted value of CU5.5 million. No gain or loss is recognised on the transaction.

How should A measure the NCI in the step acquisition?

As noted in section 3.1.1 above, there are four approaches:

- Approach (a) *Measure NCI based on the proportionate share of the fair values of C's identifiable net assets*
 - Approach (b) *Measure NCI at its fair value*
 - Approach (c) *Measure NCI based on the proportionate share of the consolidated book values of C's net assets (including transaction costs)*
- And
- Approach (d) *Measure NCI based on the proportionate share of the consolidated book values of C's net assets (excluding transaction costs)*

A records the following amounts for NCI:

	Previously held interest - deemed cost	
	Approach 1	Approach 2
	(fair value)	(equity-accounted value)
	CU m	CU m
Fair value of building (i)	15.0	15.0
Deemed cost of previous interest (ii)	7.5	5.5
Consideration paid for second tranche (iii)	4.5	4.5
Transaction costs (iv)	0.2	0.2
Fair value of NCI (v)	3.0	3.0
NCI - Approach (a): 20% of fair value of building (i)	3.0	3.0
NCI - Approach (b): fair value (v)	3.0	3.0
NCI - Approach (c): 20/80 of [(ii) + (iii) + (iv)]	3.1	2.6
NCI - Approach (d): 20/80 of [(ii) + (iii)]	3.0	2.5

The cost of the building consolidated is as follows:

	Previously held interest - deemed cost	
	Approach 1	Approach 2
	(fair value)	(equity-accounted value)
	CU m	CU m
NCI - Approach (a)	15.2	13.2
NCI - Approach (b)	15.2	13.2
NCI - Approach (c)	15.3	12.8
NCI - Approach (d)	15.2	12.7

The cost of the building comprises the sum of:

- The deemed cost of the previously held interest (i.e., CU7.5 million under Approach 1 and CU5.5 million under Approach 2)
- The consideration paid for the second tranche of CU4.5 million
- Transaction costs of CU0.2 million
- And
- NCI recognised as in the earlier table above

3.2 Accounting for a loss of control

IFRS 10 clarifies that an investor is required to reassess whether it controls an investee if the facts and circumstances indicate that there are changes to one or more of the three elements of control. [IFRS 10.8, IFRS 10.B80]. The elements of control are: power over the investee; exposure, or rights, to variable returns from the investor's involvement with the investee; and the investor's ability to use its power over the investee to affect the amount of the investor's returns. [IFRS 10.7]. See Chapter 7 for further discussion, including examples of situations where a change in control may arise.

A parent may lose control of a subsidiary because of a transaction that changes its absolute or relative ownership level. For example, a parent may lose control of a subsidiary if:

- It sells some or all of the ownership interests
- It contributes or distributes some or all of the ownership interests
- Or
- A subsidiary issues new ownership interests to third parties (therefore a dilution in the parent's interests occurs)

Alternatively, a parent may lose control without a change in absolute or relative ownership levels. For example, a parent may lose control on expiry of a contractual agreement that previously allowed the parent to control the subsidiary, [IFRS 10.BCZ180], or on entry into a contractual arrangement which gives joint control with another party (or parties). A parent may also lose control if the subsidiary becomes subject to the control of a government, court, administrator, receiver, liquidator, or regulator. This evaluation may require the exercise of judgement, based on the facts and circumstances, including the laws in the relevant jurisdiction (see Chapter 7).

Extract from IFRS 10

- 25 If a parent loses control of a subsidiary, the parent:
- (a) derecognises the assets and liabilities of the former subsidiary from the consolidated statement of financial position.
 - (b) recognises any investment retained in the former subsidiary at its fair value when control is lost and subsequently accounts for it and for any amounts owed by or to the former subsidiary in accordance with relevant IFRSs. That fair value shall be regarded as the fair value on initial recognition of a financial asset in accordance with IFRS 9 or, when appropriate, the cost on initial recognition of an investment in an associate or joint venture.
 - (c) recognises the gain or loss associated with the loss of control attributable to the former controlling interest.

[IFRS 10.25]

If a parent loses control of a subsidiary, IFRS 10 further specifies that the parent is required to: [IFRS 10.25, IFRS 10.26, IFRS 10.B98]

- Derecognise the assets (including any goodwill) and liabilities of the former subsidiary at their carrying amounts at the date when control is lost
- Derecognise the carrying amount of any NCI in the former subsidiary at the date when control is lost. This includes any components of OCI attributable to them
- Recognise the fair value of the consideration received, if any, from the transaction, event or circumstances that resulted in the loss of control
- Recognise a distribution if the transaction, event, or circumstances that resulted in the loss of control involves a distribution of shares in the subsidiary to owners in their capacity as owners (see section 3.7 below)
- Recognise any investment retained in the former subsidiary at its fair value at the date when control is lost (see section 3.3 below)
- Reclassify to profit or loss, or transfer directly to retained earnings if required by other IFRS accounting standards, the amounts recognised in OCI in relation to the subsidiary

If a parent loses control of a subsidiary, the parent accounts for all amounts previously recognised in OCI in relation to that subsidiary on the same basis as would be required if the parent had directly disposed of the related assets or liabilities. This is discussed in section 3.5 below.

And

- Recognise any resulting difference as a gain or loss in profit or loss attributable to the parent

Any amounts owed to or by the former subsidiary (which cease to be eliminated on consolidation) are accounted for in accordance with the relevant IFRS accounting standards. Such balances are often financial assets or financial liabilities, which are initially recognised at fair value in accordance with IFRS 9 at the date of loss of control. [IFRS 9.5.1.1]. See Chapter 45.

Sometimes, the parent may receive contingent consideration on the sale of a subsidiary. In most cases, the parent will have a contractual right to receive cash or another financial asset from the purchaser and, therefore, such balances are often financial assets within the scope of IFRS 9, and consequently initially measured at fair value. [IFRS 9.5.1.1]. See also Chapter 41.

IFRS 5's requirements apply to a non-current asset (or disposal group) that is classified as held for sale. See Chapter 5. The presentation requirements when the subsidiary of which the parent loses control meets the definition of a discontinued operation are discussed in Chapter 5.

A proposed transaction that would, if implemented, lead to loss of control of a subsidiary could be an indicator of impairment under IAS 36 *Impairment of Assets*, or, if the subsidiary is held for sale, under IFRS 5. [IFRS 10.BCZ186].

Chapter 21 addresses the allocation of goodwill when an operation is disposed of which forms part of a cash-generating unit to which goodwill has been allocated.

IFRS 12 *Disclosure of Interests in Other Entities* requires disclosure of the gain or loss (if any) arising on loss of control of a subsidiary during the reporting period and the line item in which the gain or loss is recognised (if not presented separately). The portion of the gain or loss attributable to measuring any investment retained in the former subsidiary at its fair value (in accordance with IFRS 13) at the date when control is lost must also be disclosed. [IFRS 12.10(b)(iv), IFRS 12.19]. See Chapter 14. Similar disclosures are required where IFRS 19 *Subsidiaries without Public Accountability: Disclosures* is applied by eligible subsidiaries (see Chapter 4 for further details on the requirements of IFRS 19).⁴ [IFRS 19.81].

How we see it

Applying IFRS 10's requirements on loss of control of a subsidiary could pose some difficulties, where these interact with the requirements of certain other IFRS accounting standards, such as IFRS 15 *Revenue from Contracts with Customers* (sale of a single-asset entity containing real estate), IFRS 16 *Leases* (sale of a single-asset entity and leaseback of its building) and IAS 28 (sale or contribution of an asset to an associate or joint venture). In our view, this is partly caused by the fact that IFRS 10 refers only to loss of control of a subsidiary, without drawing a distinction between whether the subsidiary is a business or not, or whether the loss of control happens as part of the entity's ordinary activities or not. The interaction of the above standards with IFRS 10 has been the subject of discussions by the IFRS IC and by the IASB, as described further below.

During 2019 and 2020, the IFRS IC and the IASB discussed whether IFRS 10 or IFRS 15 applies when an entity loses control of a single asset entity containing real estate as part of its ordinary activities.⁵ This is discussed further in section 3.2.1 below. Moreover, during 2020 and 2021, the IFRS IC discussed the interaction of IFRS 10 and IFRS 16 in relation to a transaction where the entity's equity interest in a wholly-owned subsidiary that held only a building was sold, resulting in loss of control of the former subsidiary, and the building was leased back. This is discussed further in section 3.2.2 below.

The conflict between the requirements of IFRS 10 and those of IAS 28 arises because IAS 28 restricts any gain arising on the sale of an asset to an associate or joint venture (or on the contribution of a non-monetary asset in exchange for an equity interest in an associate or a joint venture) to that attributable to the unrelated investors' interests in the associate or joint venture, whereas IFRS 10 does not. [IAS 28.28, IAS 28.30, IFRS 10.25]. In order to resolve the conflict, in September 2014, the IASB had issued *Sale or Contribution of Assets between an Investor and its Associate or Joint Venture* (Amendments to IFRS 10 and IAS 28) but subsequently deferred the effective date of application of the amendments. This issue is discussed further in sections 3.3.2 and 7.1 below.

The following parts of this section address further issues relating to accounting for the loss of control of a subsidiary including: where an interest is retained in the former subsidiary (see section 3.3 below), loss of control in multiple arrangements (see section 3.4 below), the treatment of OCI on loss of control (see section 3.5 below), deemed disposals (see section 3.6 below), and demergers and distributions (see section 3.7 below).

3.2.1 IFRS IC and IASB discussions about the sale of a single asset entity containing real estate

In June 2019, the IFRS IC discussed a request about the accounting for a transaction in which an entity, as part of its ordinary activities, enters into a contract with a customer to sell real estate by selling its equity interest in a subsidiary.⁶ The entity established the subsidiary some time before it enters into the contract with the customer; the subsidiary has one asset (real estate inventory) and a related tax asset or liability. The entity has applied IFRS 10 in consolidating the subsidiary before it loses control of the subsidiary as a result of the transaction with the customer. The IFRS IC discussed this issue but did not issue an agenda decision on this matter. Instead, the issue was referred to the IASB.

4 IFRS 19 *Subsidiaries without Public Accountability: Disclosures* was issued by the IASB in May 2024 to simplify the preparation of financial statements by eligible subsidiaries. Eligible subsidiaries that elect to apply IFRS 19 are allowed to provide reduced disclosures while still applying the recognition, measurement and presentation requirements in other IFRS accounting standards. IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). See Chapter 4 for further details on the requirements of IFRS 19.

5 [IFRIC Update](#), June 2019, [IASB Update](#), October 2019, [IASB Update](#), June 2020, available on the IFRS Foundation's website.

6 [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

In October 2019, the IASB directed its Staff to research the feasibility of narrow-scope standard setting.⁷ In June 2020, the IASB discussed a possible narrow-scope amendment that would have required an entity to apply IFRS 15, instead of IFRS 10, to sales of subsidiaries where all of the following apply:

- The entity contracts with a customer for goods or services that are the output of its ordinary activities in exchange for consideration
 - The subsidiary contains only inventory and any related income tax asset or liability
- And
- The entity retains no interest in the inventory transferred to the customer

The Board decided against proposing this amendment.⁸

During the discussions held by both the IFRS IC and the IASB, a number of members of the IFRS IC and the Board considered that, absent an amendment, IFRS 10 (rather than IFRS 15) would apply to the transaction considered. During the June 2020 discussion, some Board members thought there was merit in a narrow-scope amendment. However, concerns were raised about potential unintended consequences of proposing a narrow-scope amendment without a more comprehensive discussion. Any narrow-scope amendment would affect the scope of both IFRS 10 and IFRS 15 and, as such, Board members wanted to learn more from stakeholders about the need for, and the consequences of such a project.⁹ However, these considerations were not noted in the relevant *IFRIC Update* and *IASB Update* that were issued as summaries of the meetings. This matter was further considered as part of Phase 2 of the post-implementation review (PIR) of IFRS 10 (see section 7.5 below).¹⁰ In June 2022, the Board assessed this matter as a low priority and concluded this topic could be explored if identified as a priority in the next agenda consultation¹¹ (i.e., the Fourth Agenda Consultation, expected to start in 2025 or 2026). Indeed, the Board decided not to include a question on this matter as part of the PIR of IFRS 15.¹² The Board confirmed, during its discussion of responses to the Request for Information for the PIR, that it would defer this issue to the next agenda consultation.¹³

This issue is discussed further in Chapter 28.

How we see it

Even though the deliberation process on this question has been completed, there might continue to be some diversity in practice. However, in the meantime, entities might need to consider the discussions on this matter as they determine the appropriate standard to apply to transactions with customers involving the loss of control of a single asset entity.

3.2.2 IFRS IC discussions about a transaction where the entire equity interest in a subsidiary holding only a single building is sold and the building is leased back

In September 2020, a related issue was considered by the IFRS IC concerning the accounting for a sale and leaseback transaction.¹⁴ In the fact pattern, the parent sells all its equity interest in a wholly-owned subsidiary, losing control at the date of transfer. The subsidiary was established some time ago and holds only a single asset - a building (which does not constitute a business under IFRS 3) - and has no liabilities. The sales price (equal to the fair value of the building) exceeds the carrying amount of the transferred building, resulting in a gain. As part of the transaction, the entity enters into a contract to lease the building back, paying market rates for the lease rentals. The transfer of the building would meet the requirements to be accounted for as a 'sale' under IFRS 15.

¹² [Request for Information](#): *Post-implementation review of IFRS 15 Revenue from Contracts with Customers*, June 2023, Spotlight 9.4, available on the IFRS Foundation's website.

¹³ [IASB Update](#), July 2024, available on the IFRS Foundation's website.

¹⁴ [IFRIC Update](#), September 2020, available on the IFRS Foundation's website.

The question posed to the IFRS IC was whether the IFRS 16 sale and leaseback guidance applies, [IFRS 16.100(a)], (and therefore the entity recognises only the amount of the gain that relates to the rights transferred to the third party - see Chapter 24) or whether the transaction is accounted for as a loss of control of a subsidiary in accordance with IFRS 10. [IFRS 10.25, IFRS 10.26, IFRS 10.B98, IFRS 10.B99]. Under IFRS 10, a gain on loss of control would be recognised and then the parent would account for the lease entered into with the third party.

The IFRS IC noted that, in the transaction described in the request, the entity loses control of the subsidiary. Accordingly, the loss of control requirements in IFRS 10 apply to the transaction. In addition, the entity transfers the building to the third party (through the sale of its equity interest in the subsidiary) and leases the building back. The transaction is therefore a sale and leaseback transaction as described in IFRS 16.98, to which the sale and leaseback requirements in IFRS 16 apply. [IFRS 16.98].

The IFRS IC therefore tentatively concluded that, in the transaction described in the request, the entity is required to apply IFRS 10.25 and IFRS 10.B97-B99 to account for the loss of control of the subsidiary. In particular, IFRS 10.B98 requires the entity to derecognise the building held by the subsidiary and recognise the fair value of the consideration received. [IFRS 10.25, IFRS 10.26, IFRS 10.B97, IFRS 10.B98, IFRS 10.B99].

Since the transfer of the building satisfies the requirements in IFRS 15 to be accounted for as a sale of the building (the IFRS IC observed that this does not mean that the transaction is within the scope of IFRS 15), [IFRS 16.99], the entity must also apply IFRS 16.100(a). Therefore, the entity (a) measures the right-of-use asset arising from the leaseback at the proportion of the previous carrying amount of the building that relates to the right of use it retains; and (b) recognises only the amount of any gain that relates to the rights transferred to the third party. The entity also recognises a liability at the date of the transaction, the initial measurement of which is a consequence of how the right-of-use asset is measured and the gain on the sale and leaseback transaction determined. Consequently, the gain recognised by the entity on the transaction reflects the requirements in IFRS 16.100(a). [IFRS 16.100(a)].

The IFRS IC received a number of comment letters on the tentative agenda decision that raised concerns about the accounting requirements.¹⁵ Therefore, in February 2021, the IFRS IC decided to refer the matter to the IASB for further consideration of narrow-scope standard-setting. At the time of writing, the Board has not yet discussed this issue.¹⁶

Transactions involving corporate wrappers were further considered as part of Phase 2 of the PIR of IFRS 10 (see section 7.5 below).¹⁷ In June 2022, the Board assessed transactions involving corporate wrappers as a low priority and concluded this topic could be explored if identified as a priority in the next agenda consultation (i.e., the Fourth Agenda Consultation expected to start in 2025 or 2026).¹⁸

How we see it

In the absence of further guidance, we believe entities should consider the views of local regulators before establishing an initial accounting policy for transactions involving the transfer of a controlling interest in an entity that holds an underlying asset that will be leased back to the transferor. Entities also need to carefully consider the disclosure of these transactions to ensure that users of the financial statements can assess the impact. The disclosure requirements for sale and leaseback transactions are discussed in Chapter 24.

3.3 Accounting for a loss of control where an interest is retained in the former subsidiary

IFRS 10 requires that when a parent loses control of a subsidiary, it must recognise any investment retained in the former subsidiary at its fair value at the date when control is lost. Any gain or loss on the transaction will be recorded in profit or loss. The fair value of any investment that it retains at the date control is lost will be accounted for, as applicable, as: [IFRS 10.25(b)]

- The fair value on initial recognition of a financial asset (see Chapter 45)

Or

- The cost on initial recognition of an investment in an associate or joint venture (see Chapter 12)

As noted in section 3.2 above, any amounts owed to or by the former subsidiary (which cease to be eliminated on consolidation subsequent to the loss of control of the former subsidiary) are accounted for in accordance with the relevant IFRS accounting standards. Such balances are often financial assets or financial liabilities, which are initially recognised at fair value in accordance with IFRS 9 at the date of loss of control. [IFRS 9.5.1.1]. IAS 28 also clarifies that an entity applies IFRS 9 to other financial instruments in an associate or joint venture to which the equity method is not applied. These include long-term interests that, in substance, form part of the entity's net investment in an associate or joint venture although the standard explains the interaction of its requirements on recognition of losses under the equity method and impairment, where there are such long-term interests. [IAS 28.14A, IAS 28.38, IAS 28.40-43]. See Chapter 12 and Chapter 45.

The IASB's view is that the loss of control of a subsidiary is a significant economic event that marks the end of the previous parent-subsidiary relationship and the start of a new investor-investee relationship, which is recognised and measured initially at the date when control is lost. IFRS 10 is based on the premise that an investor-investee relationship differs significantly from a parent-subsidiary relationship. Therefore, the IASB decided that "any investment the parent has in the former subsidiary after control is lost should be measured at fair value at the date that control is lost and that any resulting gain or loss should be recognised in profit or loss." [IFRS 10.BCZ182].

The following discussion addresses the accounting for the loss of control in certain situations:

- The interest retained in the former subsidiary is a financial asset (see section 3.3.1 below)
- The interest retained in the former subsidiary is an associate or joint venture that is accounted for using the equity method (see section 3.3.2 below)

Or

- The interest retained in the former subsidiary is a joint operation (see section 3.3.3 below)

3.3.1 Interest retained in the former subsidiary - financial asset

Illustration 3-3 below demonstrates the above requirement where the interest retained in the former subsidiary is a financial asset.

Illustration 3-3: Disposal of a subsidiary with a retained interest that is a financial asset

A parent sells an 85% interest in a wholly-owned subsidiary as follows:

- After the sale the parent elects to account for the interest at fair value through other comprehensive income (FVOCI) under IFRS 9
 - The subsidiary did not recognise any amounts in OCI
 - Net assets of the subsidiary before the disposal are CU500 million
 - Cash proceeds from the sale of the 85% interest are CU750 million
- And
- The fair value of the 15% interest retained by the parent is CU130 million

The parent accounts for the disposal of an 85% interest as follows:

		CU m	CU m
Dr	Financial asset	130	
Dr	Cash	750	
	Cr Net assets of the subsidiary derecognised (summarised)		500
	Cr Gain on loss of control of subsidiary		380

The gain recognised on the loss of control of the subsidiary is calculated as follows:

	CU m	CU m
<i>Gain on interest disposed of</i>		
Cash proceeds on disposal of 85% interest	750	
Carrying amount of 85% interest (85% × CU500m)	(425)	
		325
<i>Gain on interest retained</i>		
Carrying amount of 15% investment carried at FVOCI	130	
Carrying amount of 15% interest (15% × CU500m)	(75)	
		55
Gain recognised on loss of control of subsidiary		380

Although IFRS 10 requires that any investment retained in the former subsidiary is to be recognised at its fair value at the date when control is lost, no guidance is given in the standard as to how such fair value is to be determined. However, IFRS 13 provides detailed guidance on how fair value is determined for financial reporting purposes. IFRS 13 is discussed in detail in Chapter 15.

3.3.2 Interest retained in the former subsidiary - associate or joint venture

It can be seen that the requirements in IFRS 10 discussed above result in a gain or loss arising on loss of control as if the parent had sold *all* of its interest in the subsidiary, not just that relating to the percentage interest that has been sold. IFRS 10's requirements also apply where a parent loses control over a subsidiary that has become an associate or a joint venture. However, there is a conflict between these requirements and those of IAS 28 for transactions where a parent sells or contributes an interest in a subsidiary to an associate or a joint venture (accounted for using the equity method) and the sale or contribution results in a loss of control in the subsidiary by the parent. This is because IAS 28 restricts any gain arising on the sale of an asset to an associate or a joint venture, or on the contribution of a non-monetary asset in exchange for an equity interest in an associate or a joint venture, to that attributable to unrelated investors' interests in the associate or joint venture. [IAS 28.28, IAS 28.30].

In order to resolve the conflict, in September 2014, the IASB had issued *Sale or Contribution of Assets between an Investor and its Associate or Joint Venture* (Amendments to IFRS 10 and IAS 28) (the September 2014 amendments). These amendments, where applied, would require the gain or loss resulting from the loss of control of a subsidiary that does *not* contain a business (as defined in IFRS 3, [IFRS 3.3, IFRS 3 Appendix A, IFRS 3.B7-B12D] - see Chapter 10) - as a result of a sale or contribution of a subsidiary to an associate or a joint venture accounted for using the equity method - to be recognised only to the extent of the unrelated investors' interests in the associate or joint venture. The same requirement applies to the remeasurement gain or loss relating to the parent's retained interest in the former subsidiary if, following the transaction, the former subsidiary is now an associate or a joint venture that is accounted for using the equity method. [IFRS 10.25, IFRS 10.26, IFRS 10.B99A]. See Illustration 3-4 in section 3.3.2.B below. However, a full gain or loss would be recognised on the loss of control of a subsidiary that constitutes a business, including cases in which the investor retains joint control of, or significant influence over, the investee. [IFRS 10.25, IFRS 10.26, IFRS 10.B98, IFRS 10.B99].

IFRS 10, prior to the revisions resulting from the September 2014 amendments, does not draw a distinction in accounting for the loss of control of a subsidiary that is a business and one that is not.

The September 2014 amendments were to be applied prospectively to transactions occurring in annual periods beginning on or after 1 January 2016, with earlier application permitted. However, in December 2015, the IASB issued a further amendment, *Effective Date of Amendments to IFRS 10 and IAS 28*. This amendment deferred the effective date of the September 2014 amendment indefinitely. [IFRS 10.C1C, IAS 28.45C]. Nevertheless, the IASB has continued to allow early application of the September 2014 amendments as it did not wish to prohibit the application of better financial reporting. [IFRS 10.BC190N, IFRS 10.BC190O, IAS 28.BC37I, IAS 28.BC37J].

The IASB commenced its research project on the equity method in 2020 and issued an Exposure Draft addressing application questions relating to the equity method in September 2024¹⁹ (see section 7.1 below). The Exposure Draft proposes that an investor, in applying IAS 28, would recognise the full gain or loss on all transactions with its associate and proposes improvements for the disclosure requirements when an investor recognises the full gain or loss on transactions with its associate. This is a different position to the September 2014 amendments.

The accounting treatment where the September 2014 amendments are not applied is explained in section 3.3.2.A below, whereas section 3.3.2.B below addresses the accounting treatment where the September 2014 amendments are applied. In these sections, IFRS 10's approach is also referred to as 'full gain recognition' whereas IAS 28's approach is also referred to as 'partial gain recognition'.

Sections 3.3.2.C to 3.3.2.G below explain additional issues relevant to loss of control transactions where the retained interest in the former subsidiary is an associate or joint venture accounted for using the equity method, whether or not the September 2014 amendments are applied (except where stated).

3.3.2.A Conflict between IFRS 10 and IAS 28 (September 2014 amendments not applied)

Examples of situations that result in the loss of control of a subsidiary, where the interest retained in the former subsidiary is an associate or joint venture accounted for using the equity method, include:

- Scenario 1 - a 'downstream' sale or contribution of the investment in the subsidiary (which is a business) to an existing associate or joint venture
 - Scenario 2 - a 'downstream' sale or contribution of the investment in the subsidiary (which is not a business) to an existing associate or joint venture
 - Scenario 3 - a direct sale or dilution of the investment in the subsidiary (which is a business) for cash in a transaction involving a third party with a retained interest in an associate or joint venture
- And
- Scenario 4 - a direct sale or dilution of the investment in the subsidiary (which is not a business) for cash in a transaction involving a third party with a retained interest in an associate or joint venture

While the discussion below refers to these scenarios for simplicity, the same principles apply where the consideration received is not cash, for example, receipt of non-cash assets such as an interest in a subsidiary, or the assumption of liabilities.

The scenarios above consider existing associates or joint ventures. Transactions involving the formation of a joint venture, with contributions (which could include an investment in a subsidiary) from the venturers, are discussed further in Chapter 12. [IAS 28.28, IAS 28.29, IAS 28.30, IAS 28.31]. While that chapter discusses the formation of a joint venture, similar accounting would be expected on the establishment of an associate with contributions from the investors.

In determining the accounting under the scenarios listed above prior to applying the September 2014 amendments, it is important first to determine whether the transactions fall within scope of IFRS 10's requirements on loss of control of a subsidiary (see section 3.2 above) or IAS 28's requirements on 'downstream transactions' with an associate or joint venture accounted using the equity method.

Extract from IAS 28

- | | |
|----|---|
| 28 | Gains and losses resulting from 'upstream' and 'downstream' transactions between an entity (including its consolidated subsidiaries) and its associate or joint venture are recognised in the entity's financial statements only to the extent of unrelated investors' interests in the associate or joint venture. 'Upstream' transactions are, for example, sales of assets from an associate or a joint venture to the investor. 'Downstream' transactions are, for example, sales or contributions of assets from the investor to its associate or its joint venture. The investor's share in the associate's or joint venture's gains or losses resulting from these transactions is eliminated. |
| 29 | When downstream transactions provide evidence of a reduction in the net realisable value of the assets to be sold or contributed, or of an impairment loss of those assets, those losses shall be recognised in full by the investor. ... |

¹⁹ Exposure Draft [IASB/ED/2024/7 Equity Method of Accounting - IAS 28 Investments in Associates and Joint Ventures](#), IASB, September 2024, paras. 53 to 54. Available on the IFRS Foundation's website.

These requirements in IAS 28 only apply to 'downstream' transactions with an associate or joint venture accounted for using the equity method and not to all transactions where the retained interest in the former subsidiary is an associate or joint venture accounted for using the equity method.

As noted in section 3.3.2 above, IFRS 10.25, prior to the revisions resulting from the September 2014 amendments, does not draw a distinction in accounting for the loss of control of a subsidiary that is a business and one that is not. The September 2014 amendments (and indeed other pronouncements, such as *Accounting for Acquisitions of Interests in Joint Operations* (Amendments to IFRS 11) issued May 2014), however, do set out different accounting treatments depending on whether an entity is a business or not.

How we see it

In our view, an entity is not precluded from applying IFRS 10.25, i.e., full gain recognition (see section 3.2 above), in accounting for the loss of control of a subsidiary that is not a business. We believe that entities *not* applying the September 2014 amendments are entitled to make an accounting policy determination as to whether IFRS 10.25 applies to *all* transactions involving a loss of control of a subsidiary ('wide view') or *only* to such transactions where the subsidiary is a business ('narrow view').

Where a transaction falls in scope of both IFRS 10.25 and IAS 28.28, we believe that there is a choice of which accounting standard takes precedence, to be applied consistently. Where a transaction falls outside the scope of both standards, an appropriate accounting policy must be determined, with regard to the requirements of IAS 8.

Therefore, in our view, the following accounting policy determinations are needed:

(a) Do the requirements of IFRS 10.25 apply to:

- A loss of control of a subsidiary that is a business ('narrow view')

Or

- A loss of control of a subsidiary (whether a business or not) ('wide view')?

(b) Where there is a conflict between the requirements of IFRS 10.25 ('IFRS 10 approach') and IAS 28.28 ('IAS 28 approach'), which accounting standard takes precedence?

And

(c) Where the transaction falls within the scope of neither IFRS 10.25 nor IAS 28.28, what accounting policy is applied?

Scenarios 1 and 3 fall within the scope of IFRS 10.25, whether a 'wide view' or 'narrow view' is taken for accounting policy determination (a) above. However, Scenarios 2 and 4 will only fall within the scope of IFRS 10 if a 'wide view' is taken. Only Scenarios 1 and 2 fall within the scope of IAS 28.28. This is because this requirement in IAS 28 only applies to 'downstream' transactions with an associate or joint venture accounted for using the equity method and not to all transactions where the retained interest in the former subsidiary is an associate or joint venture accounted for using the equity method.

Both the IFRS IC and IASB have discussed the accounting for certain transactions, where there was a question over the interaction of IFRS 10 with IFRS 15 (see section 3.2.1 above) and with IFRS 16 (see section 3.2.2 above). These discussions may have an impact on the accounting policy determinations outlined above.

How we see it

Until such time as the IASB issues further pronouncements, there is likely to continue to be diversity of practice.

However, in the meantime, considering the discussions on the interplay of IFRS 10 with other standards such as IFRS 15 and IFRS 16 above, entities may need to be mindful when applying a 'narrow view' of the scope of IFRS 10.25 as mentioned above.

Figure 3-1 below summarises how the above policy determinations apply to the four scenarios where the September 2014 amendments are not applied.

Figure 3-1: Loss of control transactions where the retained interest in the former subsidiary is an associate or joint venture accounted for using the equity method

	Subsidiary meets the definition of a business	Subsidiary does not meet the definition of a business
Sale or contribution of investment in former subsidiary in downstream transaction with existing associate or joint venture	Scenario 1 <ul style="list-style-type: none"> Both IFRS 10.25 (as the subsidiary is a business) and IAS 28.28 (as this is a 'downstream' transaction) apply to this scenario, so a conflict arises. An entity would need to develop an accounting policy to resolve the conflict, which would result in either applying full gain recognition (IFRS 10 approach) or partial gain recognition (IAS 28 approach). 	Scenario 2 <ul style="list-style-type: none"> IAS 28.28 (as this is a 'downstream' transaction) applies to this scenario. Therefore, partial gain recognition applies. However, if a 'wide view' is taken on the scope of IFRS 10.25, a conflict arises. An entity would then need to develop an accounting policy to resolve the conflict, which would result in either applying full gain recognition (IFRS 10 approach) or partial gain recognition (IAS 28 approach).
Sale or dilution of investment in former subsidiary for cash in transaction with third party	Scenario 3 <ul style="list-style-type: none"> IAS 28.28 does not apply (as this is not a 'downstream' transaction). IFRS 10.25 applies (as the subsidiary is a business). Therefore, an entity applies full gain recognition (IFRS 10 approach) to the transaction. 	Scenario 4 <ul style="list-style-type: none"> IAS 28.28 does not apply (as this is not a 'downstream transaction'). IFRS 10.25 only applies if a 'wide view' is taken. Therefore, if a 'wide view' over the scope of IFRS 10.25 applies, an entity applies full gain recognition (IFRS 10 approach) to the transaction. If a 'narrow view' over the scope of IFRS 10.25 applies, an entity must develop and apply an appropriate accounting policy that provides relevant and reliable information in accordance with IAS 8.

How we see it

Where it is determined that a loss of control transaction falls within the scope of neither IFRS 10.25 nor IAS 28.28 (which might be the case for Scenario 4 if a 'narrow view' of the scope of IFRS 10.25 is taken), management will need to use judgement in developing and applying an appropriate accounting policy that results in relevant and reliable information, which must be consistently applied.

Some transactions that fall within Scenarios 1 and 3, and in Scenarios 2 and 4 might be similar in substance, which could be a relevant consideration when developing an appropriate accounting policy. Nevertheless, different accounting outcomes could arise depending on the accounting policy determinations made by the entity. In our view, accounting policies must be applied consistently to like transactions. This does not preclude a different choice of which standard takes precedence in Scenario 1 to the choice made for transactions in Scenario 2.

An entity only needs to make a determination as to whether a 'wide view' or 'narrow view' of the scope of IFRS 10.25 applies, if it enters into a transaction that falls within Scenarios 2 or 4 (because Scenarios 1 and 3 always fall within that paragraph's scope). However, once that determination has been required to be made, the 'wide view' or 'narrow view' must be applied consistently.

However, a different accounting policy could be adopted for transactions that are businesses and transactions that are not businesses (even where a 'wide view' of the scope of IFRS 10.25 is taken). For example, an entity taking the 'wide view' might consider it appropriate that IFRS 10 takes precedence in Scenario 1 (where the subsidiary is a business) but IAS 28 takes precedence in Scenario 2 (where the subsidiary is not a business). This is because transactions involving the loss of control of a subsidiary that is a business have a different nature to those involving a subsidiary that is not a business and an entity might conclude that partial gain recognition is more appropriate for the loss of control of a subsidiary that is not a business.

Note that if the September 2014 amendments (discussed in sections 3.3.2.B and 7.1 below) were applied, full gain recognition would be required in Scenario 1, whereas partial gain recognition would be required in Scenario 2.

3.3.2.B Conflict between IFRS 10 and IAS 28 (September 2014 amendments applied)

As noted in section 3.3.2 above, in September 2014, the IASB had issued *Sale or Contribution of Assets between an Investor and its Associate or Joint Venture* (Amendments to IFRS 10 and IAS 28). Although the mandatory application of the September 2014 amendments was subsequently deferred, the amendments remain available for early application. However, these amendments have not been endorsed for use in all jurisdictions.

In the Basis for Conclusions, the IASB clarified that the amendments do not apply where a transaction with a third party leads to a loss of control (even if the retained interest in the former subsidiary becomes an associate or joint venture that is accounted for using the equity method), nor where the investor elects to measure its investments in associates or joint ventures at fair value in accordance with IFRS 9.

[IFRS 10.BC190].

How we see it

The September 2014 amendments regarding the sale or contribution of assets between an investor and its associate or joint venture impact the accounting for situations where there was a conflict between IAS 28 and IFRS 10 (i.e., for Scenarios 1 and 2 discussed above), as discussed in section 3.3.2.A above. The amendments do not specifically address the accounting for situations where such a conflict does not directly exist (i.e., Scenarios 3 and 4 discussed above), and the analysis included in section 3.3.2.A above remains relevant to such situations.

The September 2014 amendments added the guidance explained in the following paragraph in relation to the accounting for the loss of control of a subsidiary that *does not* contain a business. [IFRS 10.25, IFRS 10.26, IFRS 10.B99A]. Consequently, on the loss of control of a subsidiary that constitutes a business, including cases in which the investor retains joint control of, or significant influence over, the investee, the guidance below is not to be applied. In such cases, the full gain or loss determined under the requirements of IFRS 10.B98 and B99 (see section 3.2 above) is to be recognised. [IFRS 10.25, IFRS 10.26, IFRS 10.B98, IFRS 10.B99]. Corresponding amendments were made to IAS 28 to clarify that partial gain recognition would apply if the sale or contribution to the associate or joint venture involved assets that do not constitute a business. [IAS 28.28, IAS 28.30, IAS 28.31A, IAS 28.31B]. See Chapter 12.

Extract from IFRS 10 (as amended by September 2014 amendments)

B99A If a parent loses control of a subsidiary that does not contain a business, as defined in IFRS 3, as a result of a transaction involving an associate or a joint venture that is accounted for using the equity method, the parent determines the gain or loss in accordance with paragraphs B98-B99. The gain or loss resulting from the transaction (including the amounts previously recognised in other comprehensive income that would be reclassified to profit or loss in accordance with paragraph B99) is recognised in the parent's profit or loss only to the extent of the unrelated investors' interests in that associate or joint venture. The remaining part of the gain is eliminated against the carrying amount of the investment in that associate or joint venture. In addition, if the parent retains an investment in the former subsidiary and the former subsidiary is now an associate or a joint venture that is accounted for using the equity method, the parent recognises the part of the gain or loss resulting from the remeasurement at fair value of the investment retained in that former subsidiary in its profit or loss only to the extent of the unrelated investors' interests in the new associate or joint venture. The remaining part of that gain is eliminated against the carrying amount of the investment retained in the former subsidiary. If the parent retains an investment in the former subsidiary that is now accounted for in accordance with IFRS 9, the part of the gain or loss resulting from the remeasurement at fair value of the investment retained in the former subsidiary is recognised in full in the parent's profit or loss.

An example, based on one provided by IFRS 10 illustrating the application of this guidance, is reflected in Illustration 3-4 below.²⁰

Illustration 3-4: Loss of control of a subsidiary that does not contain a business as a result of a transaction involving an associate

A parent has a 100% interest in a subsidiary that does not contain a business. The parent sells 70% of its interest in the subsidiary to an associate in which it has a 20% interest. As a consequence of this transaction, the parent loses control of the subsidiary. The carrying amount of the net assets of the subsidiary is CU100 and the carrying amount of the interest sold is CU70 ($\text{CU}100 \times 70\%$). The fair value of the consideration received is CU210, which is also the fair value of the interest sold. The investment retained in the former subsidiary is an associate accounted for using the equity method and its fair value is CU90. The gain determined in accordance with IFRS 10.B98-B99 is CU200 and after the elimination required by IFRS 10.B99A amounts to CU146. [IFRS 10.B98, IFRS 10.B99, IFRS 10.B99A]. This gain comprises two parts:

- (a) A gain of CU140 resulting from the sale of the 70% interest in the subsidiary to the associate. This gain is the difference between the fair value of the consideration received (CU210) and the carrying amount of the interest sold (CU70). In accordance with IFRS 10.B99A, the parent recognises in its profit or loss the amount of the gain attributable to the unrelated investors' interests in the existing associate. [IFRS 10.B99A]. This is 80% of this gain, which is CU112 ($\text{CU}140 \times 80\%$). The remaining 20% of the gain ($\text{CU}28 = \text{CU}140 \times 20\%$), is eliminated against the carrying amount of the investment in the existing associate.

And

- (b) A gain of CU60 resulting from the remeasurement at fair value of the investment directly retained in the former subsidiary. This gain is the difference between the fair value of the investment retained in the former subsidiary (CU90) and 30% of the carrying amount of the net assets of the subsidiary ($\text{CU}30 = \text{CU}100 \times 30\%$). In accordance with IFRS 10.B99A, the parent recognises in its profit or loss the amount of the gain attributable to the unrelated investors' interests in the new associate. This is 56% ($70\% \times 80\%$) of the gain, which is CU34 ($\text{CU}60 \times 56\%$). [IFRS 10.B99A]. The remaining 44% of the gain ($\text{CU}26 = \text{CU}60 \times 44\%$) is eliminated against the carrying amount of the investment retained in the former subsidiary.

This example would therefore give rise to the following journal, assuming cash consideration of CU210:

	CU	CU
Dr Cash	210	
Dr Investment in new associate (former subsidiary) (see (1) below)	64	
Cr Gain on disposal (see (2) below)		146
Cr Net assets of former subsidiary (previously consolidated)		100
Cr Investment in existing associate		28

(1) This represents the fair value of the investment in the former subsidiary (now an associate) of CU90 less the eliminated gain of CU26 (see (b) above).

(2) This represents the gain of CU200 less the eliminated gains of CU28 (eliminated against the investment in the associate - see (a) above) and CU26 (eliminated against the investment in the new associate/former subsidiary - see (1) above).

3.3.2.C Reclassification of items of OCI where the interest retained in the former subsidiary is an associate or joint venture accounted using the equity method

As discussed in section 3.2 above, on loss of control of a subsidiary, an entity must reclassify to profit or loss, or transfer directly to retained earnings if required by other IFRS accounting standards, the amounts recognised in OCI in relation to the subsidiary (see section 3.5 below). Where the retained interest in the former subsidiary is an associate or joint venture accounted using the equity method, the question arises as to whether amounts recognised in OCI that are required to be reclassified to profit or loss are reclassified in full or in part.

²⁰ *Sale or Contribution of Assets between an Investor and its Associate or Joint Venture* (Amendments to IFRS 10 and IAS 28), IASB, September 2014, IFRS 10, paras. 25, 26, B99A, Example 17.

How we see it

In our view, where an IFRS 10 approach is applied, OCI reclassified is recognised in full on loss of control of the subsidiary, consistent with the full gain approach. While IAS 28 does not explicitly address this issue, we believe that where an IAS 28 approach is applied, partial gain reclassification of OCI applies such that only the proportion attributable to unrelated investors' interests in the associate or joint venture is reclassified. This treatment is consistent with the September 2014 amendments (see section 3.3.2.B above) but is also applicable where the September 2014 amendments are not applied.

3.3.2.D Application of partial gain recognition where the gain exceeds the carrying amount of the investment in the associate or joint venture accounted using the equity method

Occasionally, upon sale or contribution of a subsidiary to an associate or joint venture (that is accounted for using the equity method), the investor's share of the gain exceeds the carrying value of the investment in the associate or joint venture. Where an IAS 28 approach (partial gain recognition) is applied, the question arises as to what extent is any profit in excess of the carrying value of the investment eliminated. This is addressed in Chapter 12.

3.3.2.E Examples of accounting for sales or contributions to an existing associate (where the September 2014 amendments are not applied)

Scenario 1 is demonstrated in Illustration 3-5 below, showing both an IFRS 10 and an IAS 28 approach (a choice between these approaches is permitted where the September 2014 amendments are not applied). As noted in section 3.3.2.B above, an IFRS 10 approach is required for Scenario 1 where the September 2014 amendments are applied. Scenario 3 (where the IFRS 10 approach is required) is demonstrated in Illustration 3-9 in section 3.6 below (for a deemed disposal) and in Chapter 12 (a direct sale to a third party). The scenarios referred to in this paragraph are those set out in section 3.3.2.A above.

Illustration 3-5: Sale of a subsidiary to an existing associate

Parent P owns a 60% interest in its subsidiary S (which is a business). The carrying value of S's net identifiable assets in the consolidated financial statements of P is CU120 million. P measured the NCI using the proportionate share of net assets; therefore, the NCI is CU48 million (40% of CU120 million). In addition, goodwill of CU15 million was recognised upon the original acquisition of S and has not subsequently been impaired. The goodwill is allocated to S for the purposes of impairment testing.

Subsequently, P sells its interest in S to its associate A, in which it has a 40% interest, for CU96 million cash, being the fair value of its 60% interest in S. Therefore, P has a 40% interest in the enlarged associate A (which now holds the 60% interest in S).

If the September 2014 amendments to IFRS 10 and IAS 28 have *not* been early adopted, either a full gain is recognised (IFRS 10 approach), or the gain is restricted to that attributable to the other investors in A (IAS 28 approach). See section 3.3.2.A above. If the September 2014 amendments have been early adopted, the full gain is recognised as S is a business. See section 3.3.2.B above.

IFRS 10 approach

This results in a gain of CU9 million on disposal, recognised as follows:

		CU m	CU m
Dr	Cash	96.0	
Dr	NCI	48.0	
	Cr Gain on disposal		9.0
	Cr Net assets of S (previously consolidated)		120.0
	Cr Goodwill (previously shown separately)		15.0

IAS 28 approach

Where the September 2014 amendments are *not* early adopted and the gain recognised is restricted to the 60% attributable to the other investors in A, a gain of CU5.4 million on disposal is recognised (with the remaining CU3.6 million adjusted against the carrying amount of the investment in A), as follows:

		CU m	CU m
Dr	Cash	96.0	
Dr	NCI	48.0	
	Cr Gain on disposal		5.4
	Cr Investment in A		3.6
	Cr Net assets of S (previously consolidated)		120.0
	Cr Goodwill (previously shown separately)		15.0

3.3.2.F Determination of the fair value of the retained interest in a former subsidiary which is an associate or joint venture

As indicated in section 3.3.1 above, no guidance is given in IFRS 10 as to how the fair value of the retained interest in the former subsidiary should be determined. However, IFRS 13 provides detailed guidance on how fair value is to be determined for financial reporting purposes. IFRS 13 is discussed in detail in Chapter 15.

One particular issue that has been discussed by the IASB, which might be relevant in determining the fair value of a retained interest that is an associate or a joint venture, is the unit of account for investments in subsidiaries, joint ventures and associates. In September 2014, the IASB issued an Exposure Draft that proposed among other matters, the following clarifications to the requirements for measuring fair value, in accordance with IFRS 13, for investments in subsidiaries, joint ventures and associates:

- The unit of account for investments in subsidiaries, joint ventures and associates would be the investment as whole
- When a quoted price in an active market is available for the individual financial instruments that comprise the entire investment, the fair value measurement would be the product of the quoted price of the financial instrument (P) multiplied by the quantity (Q) of instruments held (i.e., $P \times Q$)²¹

During 2015, the IASB continued its deliberations on these proposals and decided that further research should be undertaken with respect to the fair value measurement of investments in subsidiaries, associates and joint ventures that are quoted in an active market.²² This topic was considered further in the PIR of IFRS 13. The IASB concluded that IFRS 13 is working as intended and that the project was complete with no further work required. Although the Project Report and Feedback Statement noted that many stakeholders expressed a view that the IASB should clarify how IFRS 13 deals with the issue of prioritising the unit of account or Level 1 inputs, the IASB decided that it would conduct no other follow up activities in this area (because the costs of further work would exceed its benefits).²³

These issues are discussed further in Chapter 15.

3.3.2.G Presentation of comparative information for a former subsidiary that becomes an investee accounted for using the equity method

Where a parent loses control of a subsidiary, so that the former subsidiary becomes an associate or a joint venture accounted for using the equity method, the effect is that the former parent/investor's interest in the investee is reported:

- Using the equity method from the date on which control is lost in the current reporting period
- Using full consolidation for any earlier part of the current reporting period, and of any earlier reporting period, during which the investee was controlled

21 Exposure Draft [ED/2014/4](#), *Measuring Quoted Investments in Subsidiaries, Joint Ventures and Associates at Fair Value* (Proposed amendments to IFRS 10, IFRS 12, IAS 27, IAS 28 and IAS 36 and Illustrative Examples for IFRS 13), IASB, September 2014.

22 [IASB Update](#), July 2015, available on the IFRS Foundation's website.

23 [IASB Update](#), March 2018; and IFRS Project Report and Feedback Statement: [Post-implementation Review of IFRS 13 Fair value Measurement](#), IASB, December 2018. Available on the IFRS Foundation's website.

It is not acceptable for an entity to restate financial information for reporting periods prior to the loss of control using the equity method to provide comparability with the new presentation. Consolidation continues until control is lost, [IFRS 10.21, IFRS 10.B88], and equity accounting starts only from the date on which an entity becomes an associate or joint venture, [IAS 28.32], (see Chapter 12).

3.3.3 Interest retained in the former subsidiary - joint operation

In some transactions, it is possible that an entity would lose control of a subsidiary but retain an interest in a joint operation to be accounted for under IFRS 11 *Joint Arrangements*. For example, a parent might contribute an existing business to a newly created joint operation and obtain joint control of the combined operation. Alternatively, it could be achieved by a parent with a 100% subsidiary selling a 50% interest to another party, with the transaction resulting in the formation of a joint operation, with each party having a 50% share of the assets and liabilities of the joint operation.

As set out in section 3.2 above, in accounting for a loss of control of a subsidiary, a parent is required, among other matters, to:

- Derecognise the assets and liabilities of the subsidiary
- Recognise any investment retained in the former subsidiary at fair value at the date when control is lost
- Recognise any resulting gain or loss in profit or loss

However, it is unclear how these requirements are to be applied when the retained interest is in the assets and liabilities of a joint operation. One view is that the retained interest is remeasured at fair value. Another view is that the retained interest is not derecognised or remeasured at fair value, but continues to be recognised and measured at its carrying amount.

In July 2016, the IFRS IC discussed whether an entity should remeasure its retained interest in the assets and liabilities of a joint operation when the entity loses control of a business, or an asset or group of assets that is not a business. In the transaction discussed, the entity either retains joint control of a joint operation or is a party to a joint operation (with rights to assets and obligations for liabilities) after the transaction.

The IFRS IC noted that IFRS 11.B34-B35 specify that an entity recognises gains or losses on the sale or contribution of assets to a joint operation only to the extent of the other parties' interests in the joint operation. [IFRS 11.22, IFRS 11.B34, IFRS 11.B35]. The requirements in these paragraphs could be viewed as conflicting with the requirements in IFRS 10, which specify that an entity remeasures any retained interest when it loses control of a subsidiary.

The IFRS IC observed that the IASB had issued amendments to IFRS 10 and IAS 28 in September 2014 to address the accounting for the sale or contribution of assets to an associate or a joint venture. Those amendments (which are discussed in section 3.3.2.B above and section 7.1 below) address a similar conflict that exists between the requirements in IFRS 10 and IAS 28. The IASB decided to defer the effective date of the amendments to IFRS 10 and IAS 28 and further consider a number of related issues at a later date.

Because of the similarity between the transaction discussed by the IFRS IC and a sale or contribution of assets to an associate or a joint venture (see section 3.3.2 above), the IFRS IC concluded that the accounting for the two types of transactions should be considered concurrently by the IASB. Consequently, the IFRS IC decided not to add this issue to its agenda but, instead, to recommend that the IASB consider the issue at the same time that it further considers the accounting for the sale or contribution of assets to an associate or a joint venture.²⁴ The interaction of IFRS 10 and IAS 28 has subsequently been considered as part of the IASB's equity method project (see section 7.1 below).

How we see it

Where an entity loses control of a former subsidiary, and retains an interest in a joint operation, there is a conflict between the requirements of IFRS 10 and IFRS 11 which means it is unclear whether remeasurement of the retained interest to its fair value is required or allowed. Until the IASB issues further guidance, we believe that, where a parent loses control over a subsidiary but retains an interest in a joint operation that is a business, entities have an accounting policy choice as to whether to remeasure the retained interest at fair value or not.

²⁴ [IFRIC Update](#), July 2016, available on the IFRS Foundation's website.

3.4 Loss of control in multiple arrangements

IFRS 10 only allows a parent to recognise a gain or loss on disposal of a subsidiary when the parent loses control over it. This requirement could present opportunities to structure the disposal in a series of disposals, thereby potentially reducing the loss recognised. Illustration 3-6 below, provides an example, based on one included in the Basis for Conclusions to IFRS 10. [IFRS 10.BCZ185].

Illustration 3-6: Step-disposal of a subsidiary (1)

A parent controls 70% of a subsidiary. The parent intends to sell all of its 70% controlling interest in the subsidiary. The parent could structure the disposal in two different ways:

- The parent could initially sell 19% of its ownership interest without loss of control and then, soon afterwards, sell the remaining 51% and lose control
- Or
- The parent could sell its entire 70% interest in one transaction

In the first case, any difference between the amount by which the NCI are adjusted and the fair value of the consideration received upon sale of the 19% interest would be recognised directly in equity (as it is a transaction with owners in their capacity as owners) while the gain or loss from the sale of the remaining 51% interest would be recognised in profit or loss (once control is lost). In the second case, however, a gain or loss on the sale of the whole 70% interest would be recognised in profit or loss.

However, if an entity wanted to conceal losses on a disposal of a subsidiary, the opportunities are limited given the requirements of IAS 36 and IFRS 5, which usually require recognition of an impairment loss even before the completion of any sale, [IFRS 10.BCZ186], (although they do not require reclassification of losses recognised in OCI).

In addition, IFRS 10 has the following guidance: [IFRS 10.26, IFRS 10.B97]

Extract from IFRS 10

- B97** A parent might lose control of a subsidiary in two or more arrangements (transactions). However, sometimes circumstances indicate that the multiple arrangements should be accounted for as a single transaction. In determining whether to account for the arrangements as a single transaction, a parent shall consider all the terms and conditions of the arrangements and their economic effects. One or more of the following indicate that the parent should account for the multiple arrangements as a single transaction:
- (a) They are entered into at the same time or in contemplation of each other.
 - (b) They form a single transaction designed to achieve an overall commercial effect.
 - (c) The occurrence of one arrangement is dependent on the occurrence of at least one other arrangement.
 - (d) One arrangement considered on its own is not economically justified, but it is economically justified when considered together with other arrangements. An example is when a disposal of shares is priced below market and is compensated for by a subsequent disposal priced above market.

These indicators clarify that arrangements that are part of a package are accounted for as a single transaction.

How we see it

Judgement is needed in determining whether the circumstances really do support multiple arrangements being accounted as a single transaction since there is a risk that an entity might end up accounting for a transaction that is truly separate as part of the transaction in which the loss of control occurred.

IFRS 10 is silent on how an entity accounts for multiple arrangements that are part of a single transaction. Depending on the facts and circumstances, the parent accounts for these transactions as either an advance payment or as an immediate disposal.

Advance payment - If the parent does not lose control over the subsidiary and access to the benefits associated with ownership until later steps in the transaction, then it accounts for the first step of the transaction as an advance receipt of consideration and continues to consolidate the subsidiary until the later date. In many cases, the assets and liabilities of the consolidated subsidiary could qualify as a disposal group held for sale under IFRS 5 (see Chapter 5).

Immediate disposal - If the parent loses control and access to the benefits associated with ownership on the first step of the transaction, then it ceases to consolidate the former subsidiary immediately, recognises a gain or loss on disposal, and accounts for the consideration due in the second step as deferred consideration receivable. Illustration 3-7 below shows a fact pattern where the entity would need to evaluate how to account for transactions that are linked.

Illustration 3-7: Step-disposal of a subsidiary (2)

A parent initially controls 70% of a subsidiary that has net assets of CU1,000,000 and a foreign currency translation loss that was recognised in OCI and is accumulated within equity of CU100,000. Of this amount, CU30,000 was allocated to NCI, and is included within the NCI of CU300,000. No goodwill was recognised in respect of this subsidiary and the subsidiary is not part of a CGU to which goodwill is allocated.

In November 20X0, the parent sells 19% of its ownership interest for CU200,000. In February 20X1, the parent sells the remaining 51% for CU550,000 in an arrangement that is considered part of a single overall transaction. It is assumed that there are no gains or losses in the intervening period. The effects of discounting for the deferral of consideration are assessed as immaterial.

The net assets of the subsidiary are not impaired under IAS 36, which is confirmed by the fact that the total sales price exceeds the parent's share in the net assets by CU50,000 (CU750,000 - CU700,000). The total loss on disposal can be calculated as follows:

	CU'000	CU'000
Dr Proceeds from the sale (CU200,000 + CU550,000)	750	
Dr NCI derecognised	300	
Dr Loss on disposal of the subsidiary attributable to the parent	20	
Cr Net assets of the subsidiary derecognised		1,000
Cr Reclassification of parent's share of the loss in OCI		70

If the parent is considered not to have lost control over the investment in the subsidiary until February 20X1 then it accounts for the CU200,000 received in the first step of the transaction as an advance receipt of consideration. The parent continues to consolidate the subsidiary until the later date, at which point the loss on disposal of CU20,000 would be recognised.

If the parent is considered to have lost control over the investment in the subsidiary on the first step of the transaction, then it ceases to consolidate the former subsidiary immediately, recognises a loss on disposal of CU20,000, and accounts for the consideration of CU550,000 due in the second step as deferred consideration receivable.

3.5 Treatment of OCI on loss of control of a subsidiary

If a parent loses control of a subsidiary, all amounts previously recognised in OCI are accounted for on the same basis as would be required if the parent had directly disposed of the related assets or liabilities. If a gain or loss previously recognised in OCI would be reclassified to profit or loss on the disposal of the related assets or liabilities, the parent reclassifies the gain or loss from equity to profit or loss (as a reclassification adjustment) when it loses control of the subsidiary. [IFRS 10.26, IFRS 10.B98(c), IFRS 10.B99]. Therefore:

- (a) If a revaluation surplus previously recognised in OCI would be transferred directly to retained earnings on the disposal of the asset, the parent transfers the revaluation surplus directly to retained earnings when it loses control of the subsidiary. [IFRS 10.26, IFRS 10.B99].
- (b) Remeasurement gains or losses on a defined benefit plan recognised in OCI would not be reclassified to profit or loss when the parent loses control of the subsidiary, but may be transferred within equity. [IAS 19.122].
- (c) On disposal of a subsidiary that includes a foreign operation, the cumulative amount of the exchange differences relating to that foreign operation (that is recognised in OCI and accumulated in the separate component of equity) is reclassified from equity to profit or loss, except for the amounts that have been attributed to the NCI. Those amounts are derecognised, and not reclassified to profit or loss. [IAS 21.48, IAS 21.48A, IAS 21.48B]. This would appear to mean that it is only the parent's share of the cumulative exchange differences that is reclassified; those attributable to the NCI are not reclassified as they have already been included within the carrying amount of the NCI that is derecognised as part of calculating the gain or loss attributable to the parent.
- (d) Changes in fair value of debt instruments measured at fair value through OCI and accumulated in equity would be reclassified from equity to profit or loss. [IFRS 9.4.1.2A, IFRS 9.5.7.10].
- (e) The effective portion of gains and losses on hedging instruments in a cash flow or net investment hedge previously recognised in OCI and accumulated in equity would be reclassified from equity to profit or loss. [IFRS 9.6.5.12, IFRS 9.6.5.14].

And

- (f) The 'cost of hedging' adjustments previously recognised in OCI and accumulated in equity would be reclassified from equity to profit or loss. [IFRS 9.6.5.15, IFRS 9.6.5.16].

How we see it

There are two different interpretations of how to treat OCI accumulated in equity (other than exchange differences related to the net investment in foreign operations) that would be reclassified to profit or loss on the disposal of the related assets or liabilities, both of which are acceptable:

- Approach 1 *Reclassification of OCI related to parent interest only*
- Approach 2 *Reclassification of OCI related to parent and the NCI*

These approaches for the treatment of OCI accumulated in equity (other than exchange differences related to the net investment in foreign operations) are described below.

Approach 1 *Reclassification of OCI related to parent interest only*

IFRS 10 requires derecognition of the NCI (including any components of OCI attributable to them) at the date when control is lost, which implies derecognition of the NCI without any need for reclassification. [IFRS 10.26, IFRS 10.B98(a)]. In addition, IFRS 10 requires recognition of a gain or loss in profit or loss to be attributable to the parent, [IFRS 10.26, IFRS 10.B98(d)], which again implies that there is no reclassification of OCI in respect of the NCI. Approach 1 is more consistent with the treatment of exchange differences relating to the net investment in foreign operations, as described at (c) above.

Approach 2 *Reclassification of OCI related to parent and the NCI*

IFRS 10 specifically requires that "if a gain or loss previously recognised in other comprehensive income would be reclassified to profit or loss on the disposal of the related assets or liabilities, the parent shall reclassify the gain or loss from equity to profit or loss (as a reclassification adjustment) when it loses control of the subsidiary." [IFRS 10.26, IFRS 10.B98(c), IFRS 10.B99]. That would clearly require reclassification of the entire balance of OCI accumulated within equity. However, where this is done, the portion of the reclassification adjustment attributable to the NCI is included as part of the profit or loss attributable to the NCI, not as part of the profit or loss attributable to the parent.

Illustration 3-8 below shows the application of the above requirements.

Illustration 3-8: Reclassification of OCI on loss of control of a subsidiary

A parent sells a 70% interest in a 90%-owned subsidiary to a third party for a cash consideration of CU28 million. The fair value of the 20% interest retained by the parent is CU8 million.

At the date of disposal, the net assets of the subsidiary were CU30 million. Included within those net assets, the subsidiary had recognised, in its own financial statements, the following:

- Property, plant and equipment of CU5 million that has resulted in a revaluation reserve of CU2 million
- Derivative financial assets of CU3.2 million (designated in a cash flow hedge) that have resulted in a cash flow hedge reserve of CU3 million
- A net defined benefit liability of CU3 million that has resulted in a reserve relating to net remeasurement losses of CU1.5 million on the defined benefit plan

And

- Net assets of a foreign operation of CU10 million that has resulted in a cumulative translation reserve in respect of net translation gains on the foreign operation of CU4 million

In the parent's consolidated financial statements, the parent has recognised 90% of these reserves in equivalent equity reserve balances, with the 10% attributable to the NCI included as part of the carrying amount of the NCI.

The impact of the subsidiary on the statement of financial position included in the parent's consolidated financial statements immediately prior to the disposal is as follows:

	CU m	CU m
Net assets of the subsidiary	30.00	
Equity attributable to parent		
▪ PP&E revaluation reserve		1.80
▪ Cash flow hedge reserve		2.70
▪ Net remeasurement loss reserve on defined benefit plan		(1.35)
▪ Cumulative translation reserve		3.60
▪ Other equity/retained earnings		20.25
Total equity attributable to parent		27.0
NCI		3.00

Approach 1

If the parent follows Approach 1 for the cash flow hedge reserve and makes a reserve transfer for the net remeasurement loss reserve on the defined benefit plan and the PP&E revaluation reserve, the impact of the disposal on the parent's consolidated financial statements is as follows:

	CU m	CU m
	DR	CR
Cash proceeds from the disposal	28.00	
Retained 20% investment at fair value	8.00	
Derecognition of net assets of the subsidiary		30.00
Derecognition of NCI	3.00	
Reserves reclassified to profit or loss		
▪ Cash flow hedge reserve (a)	2.70	
▪ Cumulative translation reserve (b)	3.60	
Reserves transferred to retained earnings:		
▪ PP&E revaluation reserve (c)	1.80	
▪ Net remeasurement loss reserve on defined benefit plan (d)		1.35
Retained earnings resulting from above transfers		0.45
Gain on disposal (attributable to parent)		15.30

The parent:

- (a) Reclassifies its CU2.7 million cash flow hedge reserve to profit or loss for the period. This is reflected in the gain on disposal. The remaining 10% (i.e., CU0.3 million) is included as part of the carrying amount of the NCI that is derecognised as part of the gain or loss recognised on disposal of the subsidiary but is not reclassified to profit or loss nor is it transferred within equity.
- (b) Reclassifies its cumulative translation reserve of CU3.6 million (90% × CU4 million) relating to the parent's interest to profit or loss. Again, this is reflected in the gain on disposal. The CU0.4 million (10% × CU4 million) relating to the NCI is included as part of the carrying amount of the NCI that is derecognised in calculating the gain or loss recognised on disposal of the subsidiary but is not reclassified to profit or loss nor is it transferred within equity.
- (c) Transfers its revaluation reserve of CU1.8 million relating to its 90% share of the revaluation surplus on property, plant and equipment within equity to retained earnings. It is not reclassified to profit or loss. The remaining 10% attributable to the NCI is included as part of the carrying amount of the NCI that is derecognised in calculating the gain or loss recognised on disposal of the subsidiary but is not reclassified to profit or loss nor is it transferred within equity.

And

- (d) Transfers its reserve of CU1.35 million relating to its 90% share of the net remeasurement losses on the defined benefit plan within equity to retained earnings. It is not reclassified to profit or loss. The remaining 10% attributable to the NCI is included as part of the carrying amount of the NCI that is derecognised in calculating the gain or loss recognised on disposal of the subsidiary but is not reclassified to profit or loss nor is it transferred within equity. This results in the same position as if the parent had not recognised a separate reserve for the net remeasurement losses on the defined benefit liability but had included them within retained earnings.

Approach 2

If, instead, the parent follows Approach 2 for the cash flow hedge reserve, the impact of the disposal on the parent's consolidated financial statements is as follows:

	CU m	CU m
	DR	CR
Cash proceeds from the disposal	28.00	
Retained 20% investment at fair value	8.00	
Derecognition of net assets of the subsidiary		30.00
Derecognition of NCI	3.00	
Reserves reclassified to profit or loss:		
▪ Cash flow hedge reserve (a)	2.70	
▪ Cumulative translation reserve (b)	3.60	
▪ NCI (reclassification of cash flow hedge reserve) (a)	0.30	
Reserves transferred to retained earnings:		
▪ PP&E revaluation reserve (c)	1.80	
▪ Net remeasurement loss reserve on defined benefit plan (d)		1.35
Retained earnings resulting from above transfers		0.45
Gain on reclassification of cash flow hedge reserve (attributable to NCI) (a)		0.30
Gain on disposal (attributable to parent)		15.30

The parent:

- (a) Reclassifies the entire CU3 million surplus on the cash flow hedge reserve to profit or loss for the period. The 90% of the balance (i.e., CU2.7 million) attributable to the parent is included within the gain on disposal that is attributable to the parent, while the remaining 10% (i.e., CU0.3 million) attributable to the NCI is reclassified to profit or loss and is included within the profit or loss attributable to the NCI.
- (b) Reclassifies its cumulative translation reserve of CU3.6 million ($90\% \times \text{CU4 million}$) relating to the parent's interest to profit or loss. Again, this is reflected in the gain on disposal. The CU0.4 million ($10\% \times \text{CU4 million}$) relating to the NCI is included as part of the carrying amount of the NCI that is derecognised in calculating the gain or loss recognised on disposal of the subsidiary but is not reclassified to profit or loss nor is it transferred within equity.
- (c) Transfers its revaluation reserve of CU1.8 million relating to its 90% share of the revaluation surplus on property, plant and equipment within equity to retained earnings. It is not reclassified to profit or loss. The remaining 10% attributable to the NCI is included as part of the carrying amount of the NCI that is derecognised in calculating the gain or loss recognised on disposal of the subsidiary but is not reclassified to profit or loss nor is it transferred within equity.

And

- (d) Transfers its reserve of CU1.35 million relating to its 90% share of the net remeasurement losses on the defined benefit plan within equity to retained earnings. It is not reclassified to profit or loss. The remaining 10% attributable to the NCI is included as part of the carrying amount of the NCI that is derecognised in calculating the gain or loss recognised on disposal of the subsidiary but is not reclassified to profit or loss nor is it transferred within equity. This results in the same position as if the parent had not recognised a separate reserve for the net remeasurement losses on the defined benefit liability but had included them within retained earnings.

3.6 Deemed disposal

A subsidiary may cease to be a subsidiary, or a group may reduce its interest in a subsidiary, other than by actual disposal. This is commonly referred to as a 'deemed disposal'. Deemed disposals may arise for many reasons, including:

- A group does not take up its full allocation in a rights issue by a subsidiary in the group
 - A subsidiary declares scrip dividends that are not taken up by its parent, so that the parent's proportional interest is diminished
 - Another party exercises its options or warrants issued by a subsidiary
 - A subsidiary issues shares to third parties
- Or
- A contractual agreement by which a group obtained control over a subsidiary is terminated or changed

A deemed disposal that results in the loss of control of a subsidiary is accounted for as a regular disposal. This accounting is shown in Illustration 3-9 below.

Illustration 3-9: Deemed disposal through share issue by subsidiary

A parent entity P owns 600,000 of the 1,000,000 shares issued by its subsidiary S, giving it a 60% interest. The carrying value of S's net identifiable assets in the consolidated financial statements of P is CU120 million. P measured the NCI using the proportionate share of net assets; therefore, the NCI is CU48 million (40% x CU120 million). In addition, goodwill of CU15 million was recognised upon the original acquisition of S and has not subsequently been impaired. The goodwill is allocated to S for the purposes of impairment testing. Subsequently, S issues 500,000 shares to a new investor for CU80 million. As a result, P's 600,000 shares now represent 40% of the 1,500,000 shares issued by S in total and S becomes an associate of P. IFRS 10 requires the remaining interest in the former subsidiary to be recognised at fair value. P considers that, based on the requirements of IFRS 13, the fair value of its 600,000 shares in S is CU96 million. This results in a gain of CU9 million on disposal, recognised as follows:

		CU m	CU m
Dr	Interest in S (now an associate)	96	
Dr	NCI	48	
	Cr Gain on disposal		9
	Cr Net assets of S (previously consolidated)		120
	Cr Goodwill (previously shown separately)		15

As indicated in section 3.3.2.F above, the IASB has discussed issues relating to the unit of account for investments in subsidiaries, joint ventures and associates, and their fair value measurement under IFRS 13.

3.7 Demergers and distributions of non-cash assets to owners

Groups may dispose of subsidiaries by way of a demerger. This situation typically involves the transfer of the subsidiaries to be disposed of, either directly to shareholders, by way of a dividend in kind or to a newly formed entity in exchange for the issue of shares by that entity to the shareholders of the disposing entity.

IFRS 10 requires recognition of a distribution of shares of the subsidiary to owners in their capacity as owners but does not describe how to account for such transactions. [IFRS 10.26, IFRS 10.B98(b)]. Instead, IFRIC 17 *Distributions of Non-cash Assets to Owners* addresses distributions of subsidiary shares to shareholders. [IFRIC 17.9]. The application of IFRIC 17 in the context of demergers is discussed below. The application of IFRIC 17 to assets in general is discussed in Chapter 9.

3.7.1 Scope of IFRIC 17

The scope of IFRIC 17 is explained in the following extract. [IFRIC 17.3].

Extract from IFRIC 17

- 3 This Interpretation applies to the following types of non-reciprocal distributions of assets by an entity to its owners acting in their capacity as owners:
- (a) distributions of non-cash assets (eg items of property, plant and equipment, businesses as defined in IFRS 3, ownership interests in another entity or disposal groups as defined in IFRS 5); and
 - (b) distributions that give owners a choice of receiving either non-cash assets or a cash alternative.

See Chapter 10 for further guidance on the definition of a business in IFRS 3, and Chapter 5 for further guidance on disposal groups as defined in IFRS 5.

The scope of IFRIC 17 is limited in several respects:

- It only applies to distributions in which all owners of the same class of equity instruments are treated equally. [IFRIC 17.4].
- It does not apply to “a distribution of a non-cash asset that is ultimately controlled by the same party or parties before and after the distribution”, [IFRIC 17.5], which means that IFRIC 17 does not apply when:
 - A group of individual shareholders receiving the distribution, as a result of contractual arrangements, collectively have the power to govern financial and operating policies of the entity making the distribution so as to obtain benefits from its activities, [IFRIC 17.6],
 - An entity distributes some of its ownership interests in a subsidiary but retains control of the subsidiary. The entity making a distribution that results in the entity recognising NCI in its subsidiary accounts for the distribution in accordance with IFRS 10. [IFRIC 17.7]. In this situation, the requirements of IFRS 10 discussed in section 4 below would be applied.

This exclusion applies to the separate, individual, and consolidated financial statements of an entity that makes the distribution. [IFRIC 17.5].

And

- It only addresses the accounting by an entity that makes a non-cash asset distribution. It does not address the accounting by shareholders who receive the distribution. [IFRIC 17.8].

The rest of this section describes the requirements of IFRIC 17. However, as noted above, certain transactions fall out of scope of the Interpretation. Chapter 9 includes guidance on the accounting by a subsidiary making a distribution of a non-cash asset to its parent.

3.7.2 Recognition and measurement in IFRIC 17

An entity making a non-cash distribution to its owners recognises a liability to pay a dividend when the dividend is appropriately authorised and is no longer at the discretion of the entity. This is the date: [IFRIC 17.10]

- When declaration of the dividend (e.g., by management or the board of directors) is approved by the relevant authority (e.g., shareholders) if the jurisdiction requires such approval
- Or
- When the dividend is declared (e.g., by management or the board of directors) if the jurisdiction does not require further approval

An entity measures the liability at the fair value of the assets to be distributed. [IFRIC 17.11]. If the owners have a choice between receiving a non-cash asset or cash, the entity estimates the dividend payable by considering both the fair value of each alternative and the associated probability of owners selecting each alternative. [IFRIC 17.12]. IFRIC 17 does not specify any method of assessing probability nor its effect on measurement. In a demerger involving the distribution of shares in a subsidiary, the fair value will be determined based on the guidance in IFRS 13. As indicated in section 3.3.2.F above, the IASB has discussed issues relating to the unit of account for investments in subsidiaries, joint ventures and associates, and their fair value measurement under IFRS 13.

IFRS 5's requirements apply also to a non-current asset (or disposal group) that is classified as held for distribution to owners acting in their capacity as owners (held for distribution to owners). [IFRS 5.5A, IFRS 5.12A]. This means that a non-current asset (or disposal group) classified as held for distribution within scope of IFRS 5 will be carried at the lower of its carrying amount and fair value less costs to distribute (i.e., incremental costs directly attributable to the distribution, excluding finance costs and income tax expense). [IFRS 5.15A]. Assets not subject to the measurement provisions of IFRS 5 are measured in accordance with the relevant standard. [IFRS 5.2, IFRS 5.5]. See further discussion in Chapter 5.

At the end of each reporting period and at the date of settlement, the carrying amount of the dividend payable is adjusted to reflect any changes in the fair value of the assets being distributed and changes are recognised in equity as adjustments to the amount of the distribution. [IFRIC 17.11, IFRIC 17.13].

When the dividend payable is settled, any difference between the carrying amount of the assets distributed and the carrying amount of the dividend payable is recognised as a separate line item in profit or loss. [IFRIC 17.14, IFRIC 17.15]. IFRIC 17 does not express any preference for particular line items or captions in the income statement.

The non-cash assets that are to be distributed are measured in accordance with other applicable IFRS accounting standards up to the time of settlement as IFRIC 17 does not override the recognition and measurement requirements of other IFRS accounting standards. While the IFRS IC recognised concerns about the potential 'accounting mismatch' in equity resulting from measuring the dividend payable and the related assets on a different basis, [IFRIC 17.BC55], it concluded that:

"... there was no support in IFRSs for requiring a remeasurement of the assets because of a decision to distribute them. The IFRIC noted that the mismatch concerned arises only with respect to assets that are not carried at fair value already. The IFRIC also noted that the accounting mismatch is the inevitable consequence of IFRSs using different measurement attributes at different times with different triggers for the remeasurement of different assets and liabilities." [IFRIC 17.BC56].

3.7.3 Presentation and disclosure

An entity is required to disclose the following information in respect of distributions of non-cash assets within the scope of IFRIC 17:

- The carrying amount of the dividend payable at the beginning and end of the reporting period [IFRIC 17.16]
- The increase or decrease in the carrying amount recognised in the reporting period as result of a change in the fair value of the assets to be distributed [IFRIC 17.16]
- And
- If an entity declares a dividend to distribute a non-cash asset after the end of a reporting period but before the financial statements are authorised for issue: [IFRIC 17.17]
 - The nature of the asset to be distributed
 - The carrying amount of the asset to be distributed as of the end of the reporting period
 - The fair value of the asset to be distributed as of the end of the reporting period, if it is different from its carrying amount
 - And
 - Information about the method(s) used to determine that fair value required by IFRS 13.93(b), (d), (g) and (i) and IFRS 13.99 (see Chapter 15) [IFRS 13.93, IFRS 13.99]

Chapter 5 discusses the presentation requirements of IFRS 5 where the demerger meets the definition of a discontinued operation and the presentation of non-current assets and disposal groups held for sale. The same requirements apply to non-current assets and disposal groups held for distribution. [IFRS 5.5A].

Less extensive disclosures are needed where IFRS 19 is applied (see Chapter 4).²⁵ [IFRS 19.38-40, IFRS 19.95-97].

25 IFRS 19 *Subsidiaries without Public Accountability: Disclosures* was issued by the IASB in May 2024 to simplify the preparation of financial statements by eligible subsidiaries. Eligible subsidiaries that elect to apply IFRS 19 are allowed to provide reduced disclosures while still applying the recognition, measurement and presentation requirements in other IFRS accounting standards. IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). See Chapter 4 for further details on the requirements of IFRS 19.

4 Changes in ownership interest without a loss of control

Extract from IFRS 10

- 23 Changes in a parent's ownership interest in a subsidiary that do not result in the parent losing control of the subsidiary are equity transactions (ie transactions with owners in their capacity as owners).

A parent's ownership interest can change without a loss of control, e.g., when a parent buys shares from or sells shares to NCI, a subsidiary redeems shares held by NCI (and changes the NCI's proportionate interest), or when a subsidiary issues new shares to NCI (and changes the NCI's proportionate interest).

Extract from IFRS 10

Changes in the proportion held by non-controlling interests

- B96 When the proportion of the equity held by non-controlling interests changes, an entity shall adjust the carrying amounts of the controlling and non-controlling interests to reflect the changes in their relative interests in the subsidiary. The entity shall recognise directly in equity any difference between the amount by which the non-controlling interests are adjusted and the fair value of the consideration paid or received, and attribute it to the owners of the parent.

This means that no changes to a subsidiary's assets (including goodwill) and liabilities are recognised in a transaction in which a parent increases or decreases its ownership interest in a subsidiary but retains control. [IFRS 10.BCZ173]. Increases or decreases in the ownership interest in a subsidiary do not result in the recognition of a gain or loss but adjust the carrying amounts of the controlling interest and NCI in equity. [IFRS 10.23, IFRS 10.24, IFRS 10.B96].

IFRS 12 requires an entity to disclose information on the consequences of such changes in ownership interest, through the presentation of a schedule showing the effects on the equity attributable to the owners of the parent (i.e., parent equity) of any changes in its ownership interest in a subsidiary that do not result in a loss of control. [IFRS 12.10(b)(iii), IFRS 12.18]. See Chapter 14.

4.1 Reattribution of OCI

If there has been a partial disposal of a subsidiary without a loss of control and the disposal includes a foreign operation, the proportionate share of the cumulative amount of exchange differences recognised in OCI is reattributed to the NCI in that foreign operation (see Chapter 16). [IAS 21.48C]. In other words, these exchange differences are not reclassified to profit or loss. The accounting is shown in Illustration 4-1 below.

If the entity subsequently disposes of the remainder of its interest in the subsidiary, the exchange differences previously attributed to the NCI (including prior reattributions on changes of ownership without loss of control) are derecognised (i.e., along with the rest of the NCI balance) but are not separately reclassified to profit or loss (see Chapter 16). [IAS 21.48B]. In other words, on loss of control, only the exchange differences attributable to the controlling interest immediately before loss of control are reclassified to profit or loss. [IAS 21.48]. The accounting is shown in Illustration 4-3 below and in Chapter 16.

Although not explicitly addressed in IFRS 10 or IAS 21, the IASB has clarified that IFRS accounting standards require the reattribution of other amounts recognised in OCI. The May 2009 *IASB Update* noted that in the Board's view "there is no need to clarify the following points, because the relevant requirements are clear:

- "...
- "When a change in ownership in a subsidiary occurs but does not result in the loss of control, the parent must reattribute other comprehensive income between the owners of the parent and the non-controlling interest."²⁶

26 [IASB Update](#), May 2009, available on the IFRS Foundation's website.

Illustration 4-1 below shows the accounting for reattribution of OCI.

Illustration 4-1: Reattribution of OCI upon a decrease in ownership interest that does not result in a loss of control

A parent has a wholly-owned subsidiary that has net assets of CU4,000,000, and total OCI accumulated within equity of CU1,000,000 related to exchange gains on a foreign operation. No goodwill has been recognised in respect of this subsidiary.

The parent sells a 10% interest in the subsidiary for CU500,000 and does not lose control. The carrying amount of the NCI is CU400,000 which includes CU100,000 (i.e., 10%) of the total OCI of CU1,000,000 related to exchange differences on a foreign operation reattributed to the NCI (as shown below).

The parent accounts for the transaction through equity as follows:

		CU'000	CU'000
Dr	Cash	500	
Dr	Parent's share of OCI (CU1,000,000 × 10%)	100	
Cr	Other components of parent equity		200
Cr	NCI's share of OCI (CU1,000,000 × 10%)		100
Cr	NCI (excluding share of OCI) ((CU4,000,000 × 10%) - (CU1,000,000 × 10%))		300

The effect of the above journals is an increase in the carrying amount of NCI of CU400,000, a reduction in the parent's cumulative translation reserve from CU1,000,000 to CU900,000, and an increase in other components of parent equity of CU200,000. As IFRS accounting standards do not specify where the adjustment to parent equity is recognised, this would be permitted in retained earnings or another component of parent equity that will not be reclassified on loss of control.

Illustration 4-2 below shows the reattribution approach upon an increase in ownership interest.

Illustration 4-2: Reattribution of OCI upon an increase in ownership interest that does not result in a loss of control

A parent holds an 80% interest in a subsidiary that has net assets of CU4,000,000. No goodwill has been recognised in respect of this subsidiary. The carrying amount of the 20% NCI is CU800,000 which includes CU200,000 that represents the NCI's share of total OCI of CU1,000,000 related to exchange gains on a foreign operation.

The parent acquires an additional 10% interest in the subsidiary for CU500,000, which increases its total interest to 90%. The carrying amount of the NCI is now CU400,000 which includes CU100,000 (i.e., 10%) of the total OCI of CU1,000,000 related to exchange differences on a foreign operation, after reattributing CU100,000 to the parent (as shown below).

The parent accounts for the transaction through equity as follows:

		CU'000	CU'000
Dr	NCI's share of OCI (CU1,000,000 × 10%)	100	
Dr	NCI (excluding share of OCI) ((CU800,000 × 10% ÷ 20%) - (CU1,000,000 × 10%))	300	
Dr	Other components of parent's equity	200	
Cr	Parent's share of OCI (CU1,000,000 × 10%)		100
Cr	Cash		500

The effect of the above journals is a reduction in the carrying amount of NCI of CU400,000, an increase in the parent's cumulative translation reserve from CU800,000 to CU900,000, and a decrease in other components of parent equity of CU200,000. As IFRS accounting standards do not specify where the adjustment to parent equity is recognised, this would be permitted in retained earnings or another component of parent equity that will not be reclassified on loss of control.

Illustration 4-3 below shows the reclassification of reattributed exchange differences upon subsequent loss of control. This demonstrates that the reattribution of the exchange differences arising on the change in the parent's ownership of the subsidiary (as shown in Illustration 4-1 and Illustration 4-2 above) affects the gain recognised on loss of control of the subsidiary.

Illustration 4-3: Reclassification of reattributed exchange differences upon subsequent loss of control

Assume the same facts as in Illustration 4-1 or Illustration 4-2 above. Following those transactions, the parent now holds a 90% interest in a subsidiary that has net assets of CU4,000,000. No goodwill has been recognised in respect of this subsidiary. The carrying amount of the 10% NCI is CU400,000 which includes CU100,000 of the total OCI of CU1,000,000 related to exchange gains on a foreign operation, as reattributed to the NCI. The parent subsequently sells its 90% interest for CU4,700,000. For the purposes of illustration, there have been no subsequent changes in net assets nor OCI up to the date of sale.

The parent accounts for the transaction as follows:

	CU'000	CU'000
Dr Cash proceeds from sale	4,700	
Dr NCI derecognised	400	
Dr Parent's share of OCI reclassified (CU1,000,000 × 90%)	900	
Cr Net assets of subsidiary derecognised		4,000
Cr Gain recognised on disposal of subsidiary attributable to parent		2,000

4.2 Goodwill attributable to NCI

It is not clear under IFRS 10 what happens to the NCI's share of goodwill, when accounting for transactions with NCI.

How we see it

We believe that when there are changes in their relative ownership interests, the parent is required to reallocate a proportion of the goodwill between the controlling interest and NCI. However, the amount of goodwill, if any, to be allocated may depend on whether NCI was recognised at fair value or not on initial acquisition, and on whether there is an increase or decrease in ownership of the NCI without a loss on control. If an appropriate amount of goodwill is not reallocated, the loss recognised upon loss of control (see section 3.2 above), or goodwill impairment would not reflect the ownership interest in the subsidiary applicable to that NCI (see Chapter 21).

The issues arising include:

- Calculation of the 'gross up' of the carrying amount of goodwill (for the purposes of the impairment test) because the NCI is measured at its proportionate share of net identifiable assets and hence its share of goodwill is not recognised
 - The allocation of impairment losses between the parent and NCI
- And
- Reallocation of goodwill between NCI and the controlling interest after a change in a parent's ownership interest in a subsidiary that does not result in loss of control

Under IFRS 3, the proportion of goodwill that is attributable to NCI is not necessarily equal to the ownership percentage. The most common situation where this occurs is when the parent recognised the NCI at its proportionate share of the acquiree's identifiable net assets and therefore does not recognise any goodwill for the NCI (see Chapter 10). This situation might also occur because goodwill has been recognised for both the parent's interest and the NCI, but the parent's goodwill reflects a control premium that was paid upon acquisition (see Chapter 10).

Illustration 4-4 below shows one approach to reallocating goodwill where there is a change in ownership of the subsidiary with no loss of control (for a situation where the NCI is recognised initially at its fair value).

Illustration 4-4: Reallocation of goodwill to NCI

A parent pays CU920 million to acquire an 80% interest in a subsidiary that owns net assets with a fair value of CU1,000 million. NCI is recognised initially at its fair value of CU220 million at the acquisition date.

	Share of net assets	Share of goodwill	Total
	CU m	CU m	CU m
Parent	800	120	920
NCI	200	20	220
	<u>1,000</u>	<u>140</u>	<u>1,140</u>

Decrease in ownership percentage

A year after the acquisition, the parent sells a 20% interest in the subsidiary to a third party for CU265 million. There has been no change in the net assets of the subsidiary since acquisition.

The parent's interest decreases to 60% and its share of net assets decreases to CU600 million. Correspondingly, the share of net assets attributable to the NCI increases from CU200 million to CU400 million. The parent company sold a 20% interest in its subsidiary. Therefore, one approach for reallocating goodwill is to allocate CU30 million ($20\% \div 80\% \times \text{CU}120 \text{ million}$) of the parent's goodwill to the NCI. After the transaction, the parent's share of goodwill is CU90 million (CU120 million - CU30 million).

In its consolidated financial statements, the parent accounts for this transaction as follows:

		CU m	CU m
Dr	Cash	265	
	Cr NCI ((CU400m - CU200m) + CU30m)		230
	Cr Equity of the parent		35

Increase in ownership percentage

Taking the initial fact pattern as a starting point, the parent acquires an additional 10% interest in the subsidiary for CU115 million. There has been no change in the net assets of the subsidiary since acquisition.

The parent's interest increases to 90% and its share of net assets increases to CU900 million. Correspondingly, the share of net assets attributable to NCI is reduced from CU200 million to CU100 million. The parent acquired half of the NCI. Using the proportionate allocation approach discussed above, the parent allocates CU10 million ($10\% \div 20\% \times \text{CU}20 \text{ million}$) of the NCI's goodwill to the parent.

In its consolidated financial statements, the parent accounts for this transaction as follows:

		CU m	CU m
Dr	NCI ((CU200m - CU100m) + CU10m)	110	
Dr	Equity of the parent	5	
	Cr Cash		115

In Illustration 4-4 above, the NCI was recognised and measured at its fair value at the acquisition date. If the NCI had been measured based on its proportionate share of net assets, the proportionate allocation approach described in the Illustration would have resulted in the same accounting for the transaction where the parent's ownership interest had decreased. However, where the parent increased its ownership interest, as the carrying amount of the NCI did not include any amount for goodwill, the adjustment to the NCI would only have been CU100 million resulting in a debit to the parent's equity of CU15 million.

How we see it

Reallocation of the goodwill between parent and NCI on a proportionate basis is one method that may result in relevant and reliable information. However, other approaches may also be appropriate depending on the circumstances (see Chapter 21).

We consider that an entity is not precluded from attributing goodwill on a basis other than ownership percentages if to do so is reasonable, e.g., because the NCI is measured on a proportionate share (rather than fair value) and because of the existence of a control premium. In such circumstances, an allocation approach which takes into account the acquirer's control premium will result in a goodwill balance that most closely resembles the balance that would have been recorded had the NCI been recorded at fair value.

An entity may also be able to allocate impairment losses on a basis that recognises the disproportionate sharing of the controlling interest and the NCI in the goodwill book value. This is discussed further in Chapter 21 which addresses how an entity tests goodwill for impairment where there is NCI.

4.3 Non-cash acquisition of NCI

One issue considered by the IFRS IC is the accounting for the purchase of NCI by the controlling shareholder when the consideration includes non-cash items, such as an item of property, plant and equipment. More specifically, the submitter asked the IFRS IC to clarify whether the difference between the fair value of the consideration given and the carrying amount of such consideration should be recognised in equity or in profit or loss. The submitter asserted that, according to the requirements of the then IAS 27 *Consolidated and Separate Financial Statements* (now reflected in IFRS 10), the difference described should be recognised in equity, whereas applying IFRIC 17 by analogy, the difference should be recognised in profit or loss (see section 3.7 above).

The IFRS IC noted that the requirements of the then IAS 27 (now reflected in IFRS 10), deal solely with the difference between the carrying amount of the NCI and the fair value of the consideration given; this difference is required to be recognised in equity. These requirements do not deal with the difference between the fair value of the consideration given and the carrying amount of such consideration.

[*IFRS 10.24, IFRS 10.B96*]. The difference between the fair value of the assets transferred and their carrying amount arises from the derecognition of those assets. Since IFRS accounting standards generally require an entity to recognise, in profit or loss, any gain or loss arising from the derecognition of an asset,²⁷ this difference has to be recognised in profit or loss.

4.4 Transaction costs

Although IFRS 10 is clear that changes in a parent's ownership interest in a subsidiary that do not result in the parent losing control of the subsidiary are equity transactions (i.e., transactions with owners in their capacity as owners), [*IFRS 10.23*], it does not specifically address how to account for related transaction costs. Only incremental costs directly attributable to the equity transaction that otherwise would have been avoided qualify as transaction costs. [*IAS 32.37*].

How we see it

In our view, any incremental directly attributable transaction costs incurred to acquire an outstanding NCI in a subsidiary, or to sell an NCI in a subsidiary without loss of control, are deducted from equity. This is regardless of whether the consideration is in cash or shares.

This is consistent with both guidance elsewhere in IFRS accounting standards regarding the treatment of such costs, [*IAS 32.35, IAS 32.37, IAS 1.109, IFRS 18.112*], and the view expressed by the IFRS IC.²⁸ Although where shares are given as consideration there is no change in total consolidated equity, there are in fact two transactions - an issue of new equity and a repurchase of existing equity. The entity accounts for the transaction costs on the two elements in the same manner as if they had occurred separately. The tax effects of transaction costs of equity instruments are discussed in Chapter 29.

IFRS accounting standards do not specify where to allocate the costs in equity - in particular, whether to the parent (who incurred the costs) or to the NCI (whose equity was issued/repurchased).

How we see it

As IFRS accounting standards have no guidance, the parent determines where in equity to allocate the transaction costs incurred to acquire or sell an outstanding NCI, based on the facts and circumstances surrounding the change in ownership, and any legal requirements of the jurisdiction.

Regardless of the account in equity to which the charge is allocated, we believe that the amount is not reclassified to profit or loss in future periods. Consequently, if the costs are allocated to NCI, this amount must be separately tracked. If a subsidiary is later sold in a separate transaction (i.e., loss of control), the transaction costs previously recognised directly in equity to acquire or sell NCI are not reclassified from equity to profit and loss, because they do not represent components of OCI.

²⁷ [IFRIC Update](#), January 2013, available on the IFRS Foundation's website.

²⁸ [IFRIC Update](#), May 2009, available on the IFRS Foundation's website.

The need to track any costs allocated to NCI (if material) is explained in the following illustration.

Illustration 4-5: Treatment of transaction costs arising on a previous NCI purchase/sale on subsequent loss of control of a subsidiary

Parent P owned 80% of the shares in Subsidiary S since its establishment (so there is no goodwill). P subsequently purchased 10% of the minority investor's shares for CU150,000, incurring transaction costs of CU10,000. At the time of the transaction, the net assets of S included in the consolidation were CU1 million. Two years later, the net assets of S had increased to CU2 million and P sold its 90% ownership interest in S for CU3 million. There were no amounts in OCI required to be reclassified on the loss of control of S.

If the transaction costs were originally debited to parent equity, the gain on disposal would be CU1.2 million (i.e., CU3 million proceeds less CU2 million net assets of S included in the consolidation plus CU0.2 million derecognition of NCI).

If the transaction costs were originally debited to NCI, the gain on disposal (if no re-allocation of the transaction costs was made at the date of disposal), would be CU1.19 million (i.e., CU3 million proceeds less CU2 million net assets of S included in the consolidation plus CU0.19 million derecognition of NCI). This is a lower gain and is the same amount that would be calculated if the transaction costs had been debited to parent equity and recycled to profit or loss on the disposal. Since the transaction costs are not a component of OCI, this would be inappropriate and, consequently, a transfer would be needed at the date of disposal to reallocate the transaction costs from NCI to parent equity before determining the gain or loss from the loss of control.

The same situation would arise if the transaction costs debited to NCI had arisen on an earlier sale of NCI without loss of control.

4.5 Contingent consideration on purchase of NCI

IFRS 10 does not provide guidance on accounting for remeasurement of contingent consideration relating to the purchase of NCI. The question arises as to whether the remeasurement is accounted for in profit or loss, or in equity (on the grounds that it is related to the purchase of the NCI - see section 4 above). This discussion assumes that the purchase of NCI is separate from the business combination. It is not uncommon for a written put and/or a purchased call option over NCI to be put in place at the time of a business combination. The accounting for such transactions (including forward contracts to sell NCI) is discussed in section 6 below.

IFRS 3 addresses the accounting for remeasurement of contingent consideration recognised by the acquirer in a business combination. Contingent consideration is initially recognised at its fair value. Contingent consideration classified as equity is not remeasured and its subsequent settlement is accounted for within equity. Other contingent consideration (not classified as equity) is measured at fair value at each reporting date and changes in its fair value are recognised in profit or loss. This is the case whether or not the contingent consideration is within the scope of IFRS 9. [IFRS 3.39, IFRS 3.40, IFRS 3.58, IFRS 9.4.2.1(e)]. See Chapter 10.

The purchase of NCI is not a business combination and, consequently, IFRS 3's requirements do not apply. In practice, most contingent consideration meets the definition of a financial liability and would fall within the scope of IFRS 9.

How we see it

In our view, a distinction needs to be drawn between the initial recognition of the financial liability for contingent consideration arising on the purchase of NCI (which is a transaction with NCI to be reflected as an equity transaction) and its subsequent measurement (which is not a transaction with NCI).

On initial recognition, contingent consideration is recognised at its fair value, [IFRS 3.39], the NCI purchased is derecognised (and any balancing adjustment is reflected in parent equity). Subsequent movements in contingent consideration classified as a financial liability are recognised in accordance with IFRS 9 (in profit or loss, as explained below) rather than regarded as relating to a transaction with NCI (and recognised in equity). If the contingent consideration is classified as an equity instrument, it will not be remeasured. [IFRS 3.58].

Depending on the terms and conditions, the contingent consideration is classified as a financial liability at amortised cost, or at fair value through profit or loss in accordance with IFRS 9. [IFRS 9.4.2.1, IFRS 9.4.2.2]. In both cases, subsequent remeasurements for any changes in estimated contractual cash flows or fair value, or on final settlement of the financial liability are recognised in profit or loss (except for any fair value movements attributable to own credit risk required to be recognised in OCI, where the financial liability is designated at fair value through profit or loss). See Chapter 44 and Chapter 46.

5 NCI

5.1 The definition of NCI

Extract from IFRS 10

Appendix A

Defined terms

non-controlling interest	Equity in a subsidiary not attributable, directly or indirectly, to a parent .
--------------------------	--

[IFRS 10 Appendix A].

The principle underlying accounting for NCI is that all residual economic interest holders of any part of the consolidated entity have an equity interest in that consolidated entity.

Consequently, NCI relates to consolidated subsidiaries, and not to those investments in subsidiaries accounted for at fair value through profit or loss in accordance with IFRS 9 by an investment entity (see Chapter 7). [IFRS 10.31, IFRS 10.32, IFRS 10.33]. This principle applies regardless of the decision-making ability of that interest holder and where in the group that interest is held. Therefore, any equity instruments issued by a subsidiary that are not owned by the parent (apart from those that are required to be classified by IAS 32 as financial liabilities in the consolidated financial statements, as discussed in section 5.6 below) are NCI, including, for example:

- Ordinary shares
 - Equity components of convertible debt and other compound financial instruments
 - Preference shares that are classified as equity (including both those with, and without, an entitlement to a *pro rata* share of net assets on liquidation)
 - Warrants that are classified as equity
 - Options over own shares that are classified as equity
- And
- Awards under equity-settled share-based payment transactions

Options and warrants classified as equity are NCI, regardless of whether they are vested and regardless of the exercise price (e.g., whether they are ‘in-the-money’ or not).

IAS 32 defines an equity instrument as “any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities”. [IAS 32.11]. This is consistent with the definition of ‘equity’ in the IASB’s *Conceptual Framework for Financial Reporting* published in 2018. [CF 4.63, CF 4.64]. Hence, the reference to ‘equity’ in the definition of NCI refers to those ‘equity instruments’ of a subsidiary that are not attributable, directly or indirectly, to its parent. This also means that financial instruments that are not classified within equity in accordance with IAS 32 (e.g., total return swaps) are not included within the definition of NCI.

If a parent has an indirect ownership interest in the subsidiary, this is taken into account in computing the NCI. For example, if a parent has a 60% direct interest in Subsidiary A (which in turn owns 80% of Subsidiary B), there will be a 52% (i.e., $100\% - (60\% \times 80\%)$) NCI in Subsidiary B’s equity. Where Subsidiary A acquired Subsidiary B in a business combination, there will also be a 40% NCI in the goodwill arising in the consolidated financial statements. This situation is shown in Illustration 5-3 in section 5.2.1 below (note though that, in this specific Illustration, the NCI in the goodwill arising on acquisition of the Target is not simply 40% of the goodwill amount, as the Target has also issued warrants).

5.2 Initial measurement of NCI

5.2.1 Initial measurement of NCI in a business combination

IFRS 3 requires any NCI in an acquiree to be recognised, [IFRS 3.10], but there are differing measurement requirements depending on the type of equity instrument.

There is a choice of two measurement methods for those components of NCI that are both present ownership interests and entitle their holders to a proportionate share of the entity's net assets in the event of a liquidation (referred to here as 'qualifying NCI'). They can be measured at either:

- Option 1 *Acquisition-date fair value* (consistent with the measurement principle for other components of the business combination)
- Or
- Option 2 *The present ownership instruments' proportionate share in the recognised amounts of the acquiree's identifiable net assets*

The choice of method is to be made for each business combination on a transaction-by-transaction basis, rather than being a policy choice. This choice of measurement is discussed in Chapter 10.

However, this choice is not available for all other components of NCI, which are required to be measured at their acquisition-date fair values, unless another measurement basis is required by IFRS accounting standards. [IFRS 3.19].

Of the items listed in section 5.1 above, entities are only given a choice of either proportionate share in the recognised amounts of the acquiree's identifiable net assets or acquisition-date fair value, for ordinary shares or preference shares classified as equity that are entitled to a *pro rata* share of net assets on liquidation.

Another measurement basis (referred to as a 'market-based measure') is required by IFRS 3 for share-based payment transactions classified as equity in accordance with IFRS 2 - these are measured in accordance with the method in IFRS 2. [IFRS 3.30, IFRS 3.B62A, IFRS 3.B62B]. The accounting for replaced and not replaced share-based payment transactions in a business combination is discussed in Chapter 10 and Chapter 30.

The other items listed in section 5.1 above, e.g., the equity component of convertible debt or other compound financial instruments, preference shares classified as equity without an entitlement to a *pro rata* share of net assets upon liquidation, warrants and options over own shares, must be measured at acquisition-date fair value.

The initial recognition of NCI in a business combination is discussed in more detail in Chapter 10. That chapter also addresses many of the topics discussed in this chapter as well as an indirect acquisition of NCI where the acquiree in a business combination is the owner of an NCI in an acquirer's existing subsidiary (see Chapter 10).

How we see it

While IFRS 3 permits the measurement of 'qualifying NCI' (as described above) at either acquisition-date fair value (Option 1) or at the present ownership instruments' proportionate share in the recognised amounts of the acquiree's identifiable net assets (Option 2), the standard is not clear on how Option 2 is to be applied where there are other elements of NCI arising in the business combination that are reported at fair value.

Sometimes, a non-wholly-owned subsidiary of the group acquires a subsidiary with NCI in a business combination. In this case, we believe that the goodwill arising will be the same as if the parent company itself acquired the subsidiary but that some of the goodwill is attributable to the NCI in the acquiring subsidiary. This is because the respective NCI have an ownership interest in the party making the acquisition that gives rise to the goodwill (and identifiable net assets of the subsidiary).

These scenarios are explained further in Illustrations 5-1 to 5-3 below.

Illustration 5-1 below is an example showing the measurement of NCI in a business combination.

Illustration 5-1: Initial measurement of NCI in a business combination (1)

Parent acquires 80% of the ordinary shares of Target for CU950,000 in cash. The total fair value of the equity instruments issued by Target is CU1,165,000 and the fair value of its identifiable net assets is CU850,000. The fair value of the 20% of the ordinary shares owned by non-controlling shareholders is CU190,000. In addition, the subsidiary has also written gross settled call options over its own shares with a fair value of CU25,000, which are considered equity instruments under IAS 32.

Option 1 - NCI at fair value

The impact of the business combination and the measurement of NCI are as follows:

	CU'000	CU'000
Dr Fair value of identifiable net assets	850	
Dr Goodwill (CU950,000 + CU215,000 - CU850,000)	315	
Cr Cash		950
Cr NCI (CU190,000 + CU25,000)		215

The NCI are measured at the fair value of all equity instruments issued by Target that are not owned by the parent (i.e., ordinary shares and gross settled call options).

Option 2 - Qualifying NCI are measured at proportionate share of identifiable net assets

The impact of the business combination and the measurement of NCI are as follows:

	CU'000	CU'000
Dr Fair value of identifiable net assets	850	
Dr Goodwill (CU950,000 - (80% × CU850,000) + CU25,000)	295	
Cr Cash		950
Cr NCI (20% × CU850,000 + CU25,000)		195

The NCI that are present ownership interests and entitle their holders to a proportionate share of the Target's net assets in the event of liquidation (i.e., the ordinary shares) are measured at the NCI's proportionate share of the identifiable net assets of Target. The NCI that are *not* present ownership interests or *do not* entitle their holders to a proportionate share of the Target's net assets in the event of liquidation (i.e., the gross settled call options) are measured at their fair value.

Reconciliation of goodwill

Goodwill as determined under the two methods can be reconciled as follows:

	CU'000
Option 2: Goodwill (CU950,000 - (80% × CU850,000) + CU25,000)	295
Goodwill related to the NCI in ordinary shares (CU190,000 - 20% × CU850,000)	20
Option 1: Goodwill (CU1,165,000 - CU850,000)	315

This makes clear that Option 2 effectively ignores the goodwill related to ordinary shares that are held by the NCI.

In Illustration 5-1 above, under Option 2, the computation of the NCI represented by the ordinary shares was based solely on the fair value of the identifiable net assets, i.e., no deduction was made in respect of the other component of NCI. IFRS 3 does not state whether this is the case. An alternative view would be that such other components of NCI are deducted from the value of the net identifiable net assets acquired based on their acquisition-date fair value (or market-based measure) or based on their liquidation rights, as demonstrated in Illustration 5-2 below. See also Chapter 10.

Illustration 5-2: Initial measurement of NCI in a business combination (2)**Option 3 - Qualifying NCI are measured at proportionate share of identifiable net assets net of other components of NCI**

The impact of the business combination and the measurement of NCI are as follows:

	CU'000	CU'000
Dr Fair value of identifiable net assets	850	
Dr Goodwill (CU950,000 - 80% × (CU850,000 - CU25,000))	290	
Cr Cash		950
Cr NCI ((20% × (CU850,000 - CU25,000)) + CU25,000)		190

The difference between goodwill of CU295,000 (Option 2 in Illustration 5-1 above) and CU290,000 is 20% of CU25,000, i.e., the amount attributable to the NCI in the call options.

In Illustration 5-1 above, Option 2 resulted in no goodwill being attributable to NCI. However, if the Target had been acquired, not by Parent, but by a 60% owned subsidiary of Parent, we believe that the goodwill recognised remains the same, but that some of the goodwill is attributable to the NCI in the acquiring subsidiary as demonstrated in Illustration 5-3 below. In such circumstances, particular care would be needed in determining the 'gross up' of the carrying amount of goodwill (for the purposes of the impairment test), in the allocation of any goodwill impairment to Parent and the NCI, and in any reallocation of goodwill between Parent and the NCI in a transaction with no loss of control. These issues are further discussed in section 4.2 above.

Illustration 5-3: Initial measurement of NCI in a business combination by a partly owned subsidiary

Assume the same facts as in Illustration 5-1 above, except that a 60% Subsidiary of Parent acquires 80% of the ordinary shares of Target for CU950,000 in cash.

Option 1

Under Option 1, the impact of the business combination and the measurement of NCI in Parent's consolidated financial statements are as follows:

	CU'000	CU'000
Dr Fair value of identifiable net assets	850	
Dr Goodwill (CU950,000 + CU215,000 - CU850,000)	315	
Cr Cash		950
Cr NCI in Target (CU190,000 + CU25,000)		215
Cr NCI in 60% Subsidiary		-

Although the overall impact on the NCI in the 60% Subsidiary is nil, this is represented by:

	CU'000	CU'000
Dr NCI share of cash consideration (40% × CU950,000)	380	
Cr NCI share of fair value of identifiable net assets (40% × 80% × CU850,000)		272
Cr NCI share of goodwill (40% × (CU315,000 - CU25,000 - CU20,000))		108

The NCI share of goodwill excludes the CU25,000 represented by the warrants and the Target NCI's interest in the goodwill of CU20,000, recognised by the 60% subsidiary. This is because these amounts are reflected directly in the NCI in Target.

Option 2

Under Option 2, the impact of the business combination and the measurement of NCI in Parent's consolidated financial statements are as follows:

	CU'000	CU'000
Dr Fair value of identifiable net assets	850	
Dr Goodwill (CU950,000 - (80% × CU850,000) + CU25,000)	295	
Cr Cash		950
Cr NCI in Target (20% × CU850,000 + CU25,000)		195
Cr NCI in 60% Subsidiary		-

Although the overall impact on the NCI in the 60% Subsidiary is nil, this is represented by:

	CU'000	CU'000
Dr NCI share of cash consideration (40% × CU950,000)	380	
Cr NCI share of fair value of identifiable net assets (40% × 80% × CU850,000)		272
Cr NCI share of goodwill (40% × (CU295,000 - CU25,000))		108

5.2.2 Initial measurement of NCI in a subsidiary that is not a business combination

The initial measurement of NCI in a subsidiary that is not a business combination is discussed in sections 3.1.1 and 3.1.2 above.

5.3 Measurement of NCI where an associate holds an interest in a subsidiary of the group

Neither IFRS 10 nor IAS 28 explains how to account for NCI when the group owns an associate which has a holding in a subsidiary of the group. NCI is defined as the equity in a subsidiary not attributable, directly or indirectly to a parent. [IFRS 10 Appendix A]. It is unclear whether this is to be computed based on the ownership interests held by the group (i.e., by the parent and any consolidated subsidiary), or whether it also must take into account the indirect ownership of the subsidiary held by the associate.

The reciprocal interests can also give rise to a measure of double counting of profits and net assets between the investor and its associate.

How we see it

Where an associate holds an interest in a subsidiary, we believe that there are two possible approaches to determine the amount of NCI in the subsidiary:

- The NCI are determined after considering the associate's ownership of the subsidiary ('look through approach')
- Or
- The NCI are determined based on the holdings of the group in the subsidiary ('black box approach')

An entity must apply the chosen approach consistently.

In applying the 'look through approach', the parent must not recognise the share of the subsidiary's results recognised by the associate applying the equity method, in order to avoid double counting. The 'black box approach' will often lead to reporting higher consolidated net assets and results than when using the 'look through approach' as this adjustment is not made, although the amounts attributed to the owners of the parent are expected to be the same under both approaches. The two approaches are shown in Illustration 5-4 below.

Illustration 5-4: Measurement of NCI where an associate accounted using the equity method holds an interest in a subsidiary

Parent P owns directly 60% of subsidiary S. P also directly owns 40% of associate A that in turn holds a 30% interest in S. S has earned profits of CU1,000,000 in the period and has net assets of CU3,000,000 (which are consolidated in both P's consolidated financial statements and equity accounted by A) at the reporting date. A has net assets of CU1,100,000 (excluding its share of the net assets of S). There are no transactions between A and S (which was not acquired in a business combination).

Approach 1 ('look through approach')

This approach involves determining the ownership attributable to the NCI *after* considering A's ownership of S. This approach views the equity method as primarily a method of consolidation (albeit on a single line), as further discussed in Chapter 12.

Therefore, under the 'look through' approach, P's total ownership interest in S is 72% (and the NCI's interest is 28%). P's effective ownership interest of 72% in S represents 60% held directly and an additional effective interest of 12% ($40\% \times 30\%$) via A.

Therefore, P consolidates the profits of S of CU1,000,000, with:

Profits of S attributable to the owners of P	CU720,000 ($\text{CU1,000,000} \times 72\%$)
Profits of S attributable to NCI	CU280,000 ($\text{CU1,000,000} \times 28\%$)

However, when equity accounting for A, P does not recognise its share of S's results recognised by A of CU120,000 ($\text{CU1,000,000} \times (40\% \times 30\%)$). This is to avoid double counting as S's results have already been consolidated and P's effective ownership of 12% of S that is indirectly held via A has been attributed to the owners of the parent.

The assets and liabilities of S are consolidated, with:

Net assets of S attributable to the owners of P	CU2,160,000 ($72\% \times \text{CU3,000,000}$)
Net assets of S attributable to NCI	CU840,000 ($28\% \times \text{CU3,000,000}$)
Investment in A	CU440,000 (Note 1)
Overall impact on P's consolidated net assets (including equity accounting)	CU3,440,000
▪ Of which, attributable to the owners of P	CU2,600,000 ($\text{CU3,440,000} - \text{CU840,000}$)

Note 1 - when equity accounting for A, P does not recognise its share of S's net assets recognised by A of CU360,000 ($\text{CU3,000,000} \times (40\% \times 30\%)$) to avoid double counting as the net assets of S owned by A have already been included in the amounts attributable to the owners of P. Therefore, the investment in A is reported at P's 40% share of A's net assets (excluding A's share of S), i.e., $40\% \times \text{CU1,100,000}$.

Approach 2 ('black box approach')

Under this approach (the 'black box approach'), when determining NCI, P considers the ownership interests in S not held by the group (i.e., by P and its subsidiaries). This approach views the equity method as primarily a method of valuing an investment, as further discussed in Chapter 12.

Accordingly, P's ownership interest is 60% and the NCI's ownership interest is 40%.

Therefore, P consolidates the profits of S of CU1,000,000, with:

Profits of S attributable to the owners of P	CU600,000 ($60\% \times \text{CU1,000,000}$)
Profits of S attributable to NCI	CU400,000 ($40\% \times \text{CU1,000,000}$)

The assets and liabilities of S are consolidated, with:

Net assets of S attributable to the owners of P	CU1,800,000 ($60\% \times \text{CU3,000,000}$)
Net assets of S attributable to NCI	CU1,200,000 ($40\% \times \text{CU3,000,000}$)
Investment in A	CU800,000 (Note 2)
Overall impact on P's consolidated net assets (including equity accounting)	CU3,800,000
▪ Of which, attributable to the owners of P	CU2,600,000 ($\text{CU3,800,000} - \text{CU1,200,000}$)

Note 2 - when equity accounting for A, P does not eliminate its share of S's results of CU120,000 and net assets of CU360,000. Therefore, the investment in A is reported at P's 40% share of A's net assets (including the associate's share of S), i.e., $40\% \times (\text{CU}1,100,000 + (30\% \times \text{CU}3,000,000))$.

The results and net assets in respect of S (including the effect of equity accounting for A's holding in S) that are attributed to the owners of P are the same as in Approach 1. However, the total consolidated results and net assets exceed those reported in Approach 1 by CU120,000 and CU360,000 respectively (being P's effective ownership interest of 12% in S's profits and net assets that are equity accounted in Approach 2). While this approach has the merit that the attribution of S's profits and net assets to NCI reflects the 40% ownership interests in S not held by the group, a downside is the double counting of 12% of S's profits and net assets that are equity accounted by A.

5.4 Measurement of NCI where a subsidiary owns shares in parent

Shares of a parent held by a subsidiary are reflected as treasury shares rather than outstanding shares in the statement of changes in equity. The same applies for the purposes of computing earnings per share (see Chapter 33). This is shown in the following Illustration.

Illustration 5-5: Presentation of shares in a parent held by a subsidiary in the parent's consolidated financial statements

Entity P owns 100% of subsidiary S. At the start of the period, S purchased 1 million shares in the parent for CU2 million. In its individual financial statements, S records the investment at fair value through OCI which is recorded at CU3 million at the end of the period.

In preparing P's consolidated financial statements, the following journals are required:

	CU m	CU m
Dr Treasury shares (parent equity)	2	
Dr Parent's share of OCI	1	
Cr Investment in parent shares		3

In computing earnings per share, the 1 million treasury shares are excluded from the number of shares included in the denominator.

Where there is NCI (with a present ownership interest) in a subsidiary, the NCI has an interest in the net income of the parent by virtue of the shares of the parent that the subsidiary owns. Consequently, the subsidiary's ownership share in the profit (or loss) and OCI of the parent would be included in determining the amounts attributable to the NCI in the subsidiary. Care, however, needs to be taken to avoid any double counting when determining the NCI.

5.5 Presentation and disclosure of NCI in primary financial statements

IFRS 10 requires NCI to be presented in the consolidated statement of financial position within equity, separately from the equity of the owners of the parent. [IFRS 10.22]. This amount is the aggregate of all NCI if there is NCI in more than one subsidiary.

The entity's profit or loss and each component of OCI are attributed to the owners of the parent and to the NCI. Attribution of total comprehensive income to the NCI continues even if it results in a deficit balance. [IFRS 10.24, IFRS 10.B94]. See section 2.2 above and section 5.7 below for further discussion. Deficit balances are considered further in section 5.7.1 below.

The presentation of NCI in the primary financial statements is addressed in Chapter 3 (statement of financial position), [IAS 1.54], (statement of profit or loss), [IAS 1.81B], (statement of comprehensive income), [IAS 1.81B], and (statement of changes in equity). [IAS 1.106].

There are similar requirements under IFRS 18 *Presentation and Disclosure in Financial Statements*.²⁹ The allocation of profit or loss attributable to owners of the parent and NCI is presented in the statement of profit or loss outside the five specified categories of income and expense [IFRS 18.76, IFRS 18.87, IFRS 18.104, IFRS 18.107]. See Chapter 4.

IFRS 12 includes further disclosures in respect of subsidiaries that have NCI that are material to the reporting entity. [IFRS 12.10(a)(ii), IFRS 12.12]. See Chapter 14.

²⁹ IFRS 18 *Presentation and Disclosure in Financial Statements*, which supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted) was issued by the IASB in April 2024. See Chapter 4 for further details on the new concepts and requirements of IFRS 18.

5.6 Non-controlling interests classified as financial liabilities

In spite of the general requirement in IFRS 10 to treat non-controlling interests as equity, a non-controlling interest is classified by IAS 32 as a financial liability and payments to the non-controlling interest as interest expense if the group as a whole has an obligation to deliver cash or another financial asset in respect of the instrument, or to settle it in a manner that results in its classification as a financial liability. [IAS 32.AG29]. See Chapter 43.

The subsidiary may have issued certain puttable instruments and instruments that impose an obligation on the entity to deliver to another party a *pro rata* share of the net assets of the entity only on liquidation. While such instruments impose a contractual obligation on the entity, they may meet the conditions to be classified as equity instruments under paragraphs 16A-16D of IAS 32 in the separate or individual financial statements of the subsidiary. [IAS 32.16A, IAS 32.16B, IAS 32.16C, IAS 32.16D]. See Chapter 43. This exception does not extend to the classification of non-controlling interests in the consolidated financial statements of the group, where such instruments are classified as liabilities. [IAS 32.AG29A]. This position was confirmed by the IFRS IC in November 2013.³⁰

In some cases, the effect of options over what are by law non-controlling interests may be such that no NCI is recognised in the financial statements, particularly when such options are issued as part of a business combination (see section 6 below).

How we see it

In our view, where NCI is classified as equity in consolidated financial statements, it is subject to all the requirements of IAS 32 relating to own equity. For example, put or call options over NCI accounted for as equity are accounted for in consolidated financial statements as contracts over own equity instruments under IAS 32 (see Chapter 43). These requirements do not apply where the non-controlling interests are classified as financial liabilities, or the effect of options means that there is no NCI recognised in the financial statements.

5.7 Subsequent measurement of NCI

Extract from IFRS 10

Non-controlling interests

- B94 An entity shall attribute the profit or loss and each component of other comprehensive income to the owners of the parent and to the non-controlling interests. The entity shall also attribute total comprehensive income to the owners of the parent and to the non-controlling interests even if this results in the non-controlling interests having a deficit balance.
- B95 If a subsidiary has outstanding cumulative preference shares that are classified as equity and are held by non-controlling interests, the entity shall compute its share of profit or loss after adjusting for the dividends on such shares, whether or not such dividends have been declared.

A proportion of profit or loss, OCI and changes in equity is only attributed to those instruments included within NCI if they give rise to an existing ownership interest. NCI that are potential voting rights and other derivatives that require exercise or conversion (such as options, warrants, or share-based payment transactions) generally do not receive an allocation of profit or loss, OCI and changes in equity. [IFRS 10.21, IFRS 10.24, IFRS 10.B89, IFRS 10.B94]. However, as discussed in section 2.2 above, allocating the proportions of profit or loss, OCI and changes in equity based on present legal ownership interests is not always appropriate. An entity also considers the eventual exercise of potential rights and other derivatives if, in substance, they provide an existing ownership interest that currently gives it access to the returns associated with that ownership interest. In that case, the proportion allocated to the parent and NCI takes into account the eventual exercise of those potential voting rights and other derivatives. [IFRS 10.21, IFRS 10.B90]. As noted in section 2.2 above, this chapter uses the term 'present ownership interest' to include existing legal ownership interests, together with potential voting rights and other derivatives that, in substance, already provide existing ownership interests in a subsidiary.

³⁰ [IFRIC Update](#), November 2013, available on the IFRS Foundation's website.

If a subsidiary has outstanding cumulative preference shares classified as equity that are held by NCI, the parent is required to compute its share of profits or losses after adjusting for the dividends on these shares, whether or not such dividends have been declared. [IFRS 10.24, IFRS 10.B95]. This effectively means that the NCI represented by the cumulative preference shares are being allocated a portion of the profit or loss equivalent to the dividends. This accounting treatment is shown in Illustration 5-6 below.

Illustration 5-6: Attribution to NCI where subsidiary has outstanding cumulative preference shares classified as equity

Entity X's ordinary shares are owned by its founders, Entity A (which has a controlling 70% ownership interest) and Entity B (which has 30% ownership interest). X also issued CU400,000 preference shares to Entity C which entitle holders to receive a 5% cumulative preferred dividend. However, as the payment of the fixed rate dividend is at the issuer's discretion and there is no maturity date or holder redemption right, the preference shares are classified as equity. On liquidation, the preference shares are entitled to repayment at par and cumulative unpaid dividends (whether or not declared). X is not a limited life entity.

The profits (losses) of X are CU60,000 (in Year 1), CU(10,000) (in Year 2) and CU30,000 (in Year 3).

Because C is entitled to a 5% cumulative dividend on CU400,000 shares, i.e., CU20,000 per year, the profit of X attributable to the NCI in A's consolidated financial statements is as follows:

	Year 1	Year 2	Year 3
	CU'000	CU'000	CU'000
Profit (loss) of X	60	(10)	30
Less amounts attributable to the NCI in preference shares held by C (1)	20	20	20
Profit (loss) attributable to ordinary shareholders	40	(30)	10
Owners of parent (70%)	28	(21)	7
NCI (30%) (2)	12	(9)	3
Total NCI ((1) + (2))			
(in ordinary shares and preference shares)	32	11	23

Although X incurred a net loss in Year 2, the NCI attributable to the preference shares would be attributed income associated with its stated dividend for that year. The NCI presented in the statement of profit and loss and other comprehensive income and in the statement of changes in equity will be the sum of the NCI for the ordinary and preference shares, i.e., CU32,000, CU11,000 and CU23,000 in Years 1 to 3 respectively.

In some cases, an entity may have a complex equity structure with several classes of equity shares or other contractual arrangements specifying different entitlements to net profits, equity or liquidation preferences. In such cases, the parent needs to assess carefully the rights attaching to each class of equity share or the effect of the contractual arrangements in determining whether and, if so, how these impact the appropriate attribution of profit or loss. The assessment will be very dependent on the particular facts and circumstances.

Illustration 5-7 below presents an example of a situation where the arrangements specify different contractual entitlements to net profits and final distribution of net assets to the proportionate ownership interests of the equity shares.

Illustration 5-7: Allocation of NCI where contractual entitlements to net profits and net assets differ from the proportionate ownership interests

Entity X and Entity Y set up Subsidiary Z, to undertake a real estate development for subsequent sale. The share capital of Z is owned 70% by X (which has been determined to control Z) and 30% by Y (which is the NCI) with X investing CU7 million and Y investing CU3 million.

Under the shareholders' agreement between X and Y:

- No dividends will be distributed until the exit date, i.e., on disposal of the developed property, which is expected to occur in 3 years.
- There is a contractual waterfall for the final distribution of Z's net assets which will vary depending on the final profit achieved:
 - The first CU1 million of profit is allocated only to Y.
 - The next CU0.5 million of profit is allocated 50:50 to X and Y.
 - Any profit in excess of CU1.5 million is allocated 70:30 to X and Y.
 - Losses will be allocated 70:30 to X and Y, in accordance with their proportionate shareholdings.

The asymmetric allocation of profits reflected the fact that Y, a passive investor, demanded a higher return for its funding, given the riskiness of the venture. The allocations are consistent with the entitlements of X and Y on liquidation of Z.

At the end of the reporting period, the profit is CU0.9 million. However, the final cumulative profit in Year 3, based on the approved business plan, is forecast to be CU4 million.

How should the NCI be determined for reporting periods prior to the exit date?

How we see it

IFRS 10 does not specifically address how to attribute profits to the NCI where the entitlements under the contractual arrangement differ to the proportionate ownership interests. Judgement is, therefore, required, based on the particular facts and circumstances. In our view, an appropriate method in this case could be determination of the NCI in line with its entitlement, based on the cumulative profit achieved at each reporting date, applying the contractual waterfall rules. Where material, it is important that the basis of allocation and the judgements involved are disclosed.

The initial balance of the NCI is CU3 million. However, the profit from Z will not be allocated to the parent until there is a cumulative profit exceeding CU1 million. Accordingly, the NCI at the end of the reporting period is CU3.9 million (i.e., CU3m+CU0.9m). This is consistent with the fact that X, the parent, would not receive distribution of profit from Z if it was liquidated at the end of the reporting period.

This conclusion could be analogised to IFRS 10.B95 which explains that if a subsidiary has outstanding cumulative preference shares that are classified as equity and are held by NCI, the entity computes its share of profit or loss after adjusting for the dividends on such shares, whether or not such profits have been declared. [IFRS 10.24, IFRS 10.B95].

Where a gain or loss is recognised by a non-wholly-owned subsidiary in an upstream transaction with its parent or a gain or loss is recognised by a parent in a downstream transaction with its non-wholly-owned subsidiary, the gain or loss is eliminated on consolidation. See section 2.4.1 above for discussion of the allocation of the eliminated profit between the parent and NCI.

Where a subsidiary has granted options over its own shares under an equity-settled share-based payment transaction, the share-based payment expense recognised in profit or loss will be attributable to the parent and any other NCI that has a present ownership in the subsidiary. None of the expense is attributed to the NCI represented by the options under the share-based payment transaction. The corresponding entry taken to equity by the subsidiary in respect of the options under the share-based payment transaction will be recognised as NCI in the consolidated financial statements, as shown in Illustration 5-8 below.

Illustration 5-8: Share-based payment over a subsidiary's shares

On 1.1.20X0, Entity X, a wholly-owned subsidiary with 900 shares in issue, grants share options over 200 shares to its employees with a grant-date fair value of CU300 which vest at the end of 2 years' service. The aggregate exercise price (if all options were exercised) is CU50.

At the end of 20X1, all the options vest and 50% of the employees exercise their options over 100 shares. Therefore, the parent P's ownership interest in X falls to 90%. Prior to the exercise of the awards, the net assets of X are CU975.

At the end of 20X2, the remaining share options lapse unexercised.

In P's consolidated financial statements, the following entries are reflected:

		CU	CU
	20X0		
Dr	Share-based payment expense (P&L)	150	
	Cr NCI in share options		150
	20X1		
Dr	Share-based payment expense (P&L)	150	
	Cr NCI in share options		150

Note that, as X is a wholly-owned subsidiary, the share-based payment expense is allocated to P as the holders of the share option awards do not have a present ownership in X's shares. If the shares in X were instead partly owned (e.g., owned 80% by the parent), the share-based payment expense would be allocated to the parent (80%) and the NCI (20%) in accordance with their present ownership.

However, the grant of the share option awards gives rise to an NCI in X's equity, so NCI is increased by the full amount of the credit entry in the statement of changes in equity and equals CU300 at the end of 20X1 (immediately prior to the exercise of the share option awards).

At the end of 20X1, 50% of the awards are exercised and X issues 100 shares to employees for CU25 cash. The employees now own 10% of X's shares and X has net assets of CU1,000. The exercise of the awards is reflected as follows:

		CU	CU
Dr	Cash	25	
Dr	NCI in share options exercised (50% x CU300)	150	
	Cr NCI in shares (10% x CU(975 + 25)) (‘ordinary NCI’)		100
	Cr Parent equity		75

In 20X2, X makes profits of CU200 which are allocated between owners of the parent (90%) and ordinary NCI (10%). The remaining share options lapse unexercised and therefore the remaining NCI of 150 in the share options is derecognised against parent equity (e.g., retained earnings). Consequently, there only remains ordinary NCI in X's shares.

The ordinary NCI will be allocated a 10% share of X's profit or loss and OCI. Closing NCI represents 10% of X's net assets of CU1,200.

These accounting entries would be reflected in the Statement of Changes in Equity as follows:

	Parent equity CU	NCI CU	Total equity CU
At 1.1.20X0			
Profit for year	(150)		(150)
Share-based payment of subsidiary		150	150
At 31.12.20X0	(150)	150	-
Profit for year	(150)		(150)
Share-based payment of subsidiary		150	150
Exercise of share options in subsidiary	75	(50)	25
At 31.12.20X1	(225)	250	25
Profit for the year	180	20	200
Lapse of share awards	150	(150)	-
At 31.12.20X2	105	120	225

Ordinary share dividends paid to NCI proportionate to the NCI's shareholding are changes in equity allocated to the NCI. Accordingly, an ordinary share dividend paid to NCI reduces cash (or other net assets) and the carrying amount of NCI in the consolidated financial statements.

When the proportion of equity held by the NCI changes (and the parent retains control of the subsidiary), the carrying amount originally recognised in NCI is adjusted to reflect the change in the relative interests in the subsidiary. [IFRS 10.24, IFRS 10.B96]. This situation might arise, for example, if a potential voting right like a share option is exercised into ordinary shares of the subsidiary carrying a proportionate right to dividends. Accordingly, the carrying amount of the NCI, if any, relating to the potential voting right now exercised is derecognised but, in its place, NCI representing the proportionate interest in the underlying shares now held is recognised. The difference between the consideration received by the parent on exercise of the option, and the adjustment to the carrying amount of NCI is recognised in parent equity.

How we see it

In our view, the requirements in IFRS 10 mean that if potential voting rights lapse unexercised, the amount originally recognised in NCI, if any, is reversed to parent equity, so that the carrying amounts of the controlling and NCI reflect the relative interests in the subsidiary. Otherwise, amounts previously recognised related to lapsed potential voting rights would remain recognised as part of the NCI until the next remeasurement of NCI occurs, which may be an unrelated transaction, or which may never occur.

5.7.1 Loss-making subsidiaries

Total comprehensive income is attributed "to the owners of the parent and to the non-controlling interests even if this results in the non-controlling interests having a deficit balance." [IFRS 10.24, IFRS 10.B94]. This approach is consistent with the fact that the controlling interest and the NCI participate proportionately in the risks and rewards of an investment in the subsidiary. The IASB observed that "although it is true that non-controlling interests have no further obligation to contribute assets to the entity, neither does the parent." [IFRS 10.BCZ165].

Guarantees or other support arrangements by the parent often protect the NCI from losses of the subsidiary in excess of their equity. The IASB believes that the parent ought to account for such arrangements separately, and that the accounting for these arrangements should not affect how an entity should attribute comprehensive income to the parent and the NCI. [IFRS 10.BCZ162].

6 Call and put options over NCI

Some business combinations involve options over some or all of the outstanding shares. For example, the acquirer might have a call option, i.e., a right to acquire the outstanding shares at a future date for a particular price. Alternatively, the acquirer might have granted a put option to the other shareholders whereby they have the right to sell their shares to the acquirer at a future date for a particular price. In some cases, there may be a combination of such call and put options, the terms of which may be equivalent or may be different.

How we see it

IFRS 3 gives no guidance as to how to account for a combination of call and put options over NCI in a business combination. Therefore, when determining the appropriate accounting in the consolidated financial statements in such situations, IFRS 10, IAS 32, and IFRS 9 need to be considered. The accounting for call and put options depends on whether or not the acquirer has obtained present access to returns associated with the ownership interest in the shares of the acquiree subject to the call and/or put option.

Potential voting rights that represent a present ownership interest are discussed in general in sections 2.2 and 5.7 above but specific considerations for call and/or put options are discussed in sections 6.1 and 6.2.2 below.

While the discussion below deals with options, similar considerations to those discussed in sections 6.1 and 6.2 below apply where the acquirer entered into a forward purchase contract for the shares held by the other shareholders (see section 6.3 below).

Although the discussion in sections 6.1 to 6.3 below focuses on call and put options entered into at the same time as control of the subsidiary is gained, an entity may enter into the options with non-controlling shareholders after gaining control. This situation is discussed in section 6.4 below, although the appropriate accounting in the consolidated financial statements will still be based on the discussions in sections 6.1 to 6.3 below.

How we see it

Sometimes, the operation of put and/or call options over NCI are subject to employment conditions. Often, such put and/or call options over NCI arise as part of a business combination. The guidance in sections 6.1 to 6.5 below is intended to apply to put and/or call options over NCI held in the holder's capacity as a shareholder.

Accounting for put and/or call options over NCI subject to employment conditions (holders of such instruments are referred to below as 'employee-shareholders') involves a careful analysis of how the requirements of the relevant IFRS accounting standards apply to the specific transaction. Such arrangements could, in whole or in part, constitute an employee benefit (accounted under IAS 19 *Employee Benefits* - see Chapter 31) or share-based payment arrangement (accounted under IFRS 2 - see Chapter 30).

Judgement is often required in determining whether and to what extent there is a remuneration element to be accounted for and whether the company or the NCI have a present ownership interest in the shares that are legally owned by the NCI.

Examples of situations which might indicate a remuneration element include where:

- There is a discount on the NCI put exercise price if the employee-shareholder leaves before completing a specified period of service
- Or
- The entity can exercise a call at a lower exercise price than the exercise price on the NCI put if the employee-shareholder leaves

In certain arrangements, an employee-shareholder is entitled to a minimum amount even if no service was provided and it might be appropriate to account for part of the arrangement in line with the guidance for NCI puts and calls (in sections 6.1 to 6.4 below), and part as an employee benefit or share-based payment arrangement. See Chapter 30 and Chapter 31 for discussion of when cash-settled awards may fall within the scope of IAS 19 or IFRS 2.

Even if the NCI put held by employee-shareholders has an exercise price equal to fair value of the shares at the date of exercise, this does not necessarily mean that the NCI has a present ownership interest in the shares legally owned at the date of the business combination. For example, it might be the case that the NCI are able to benefit from dividends and/or fair value gains accreting to the shares only after completion of a period of service. In such cases, it might be considered that the shares have not economically vested in the NCI at the date of the business combination. This assessment will be very dependent on the particular facts and circumstances.

6.1 Call options only

Call options are considered when determining whether the entity has obtained control, as discussed in Chapter 7. Where it is determined that an entity has control over another entity, the proportions of profit or loss, OCI and changes in equity allocated to the parent and NCI are based on present ownership interests, and generally do not reflect the possible exercise or conversion of potential voting rights under call options. [IFRS 10.21, IFRS 10.24, IFRS 10.B89, IFRS 10.B94]. The eventual exercise of potential voting rights under the call option is reflected in the proportion of profit or loss, OCI and changes in equity allocated only if in substance the entity already has access to the returns associated with that ownership interest. [IFRS 10.21, IFRS 10.24, IFRS 10.B90, IFRS 10.B94]. This assessment depends on the terms of the call option, and judgement is required.

6.1.1 Options giving the acquirer present access to returns associated with that ownership interest

A call option is likely to give the acquirer present access to returns associated with the ownership interest in the shares subject to the call in limited circumstances, for example:

- When the option price is fixed with an exercise price sufficiently low in relation to the fair value of the underlying shares (that substantially all expected variations in the fair value of the underlying shares will be realised by the acquirer) and either (i) it is agreed between the parties that no dividends will be paid to the other shareholders (or the acquiring entity can control that no dividends will be paid prior to the exercise of the option) or (ii) the dividend payments lead to an adjustment of the option exercise price
Or
- When the terms are set such that the other shareholders effectively receive only a lender's return

This is because any accretion in the fair value of the underlying ownership interest under the option (for example, due to improved financial performance of the acquiree subsequent to the granting of the call option) is likely to be realised by the acquirer.

How we see it

If a call option gives the acquiring entity present access to returns over all of the shares held by non-controlling shareholders (see discussion above), then there will be no NCI presented in equity. The acquirer accounts for the business combination as though it acquired a 100% interest. The acquirer also recognises a financial liability for the present value of the exercise price to be paid to the non-controlling shareholders under the call option.

Changes in the carrying amount of the financial liability are recognised in profit or loss, in accordance with IFRS 9. If the call option expires unexercised, then the entity has effectively disposed of a partial interest in its subsidiary in return for the amount recognised as the 'liability' at the date of expiry. Where the entity continues to control the subsidiary, it accounts for the transaction as a change in ownership interest without a loss of control, as discussed in section 4 above. Where the lapse of the call option leads to a loss of control, this is accounted for as discussed in sections 3.2 to 3.6 above.

6.1.2 Options not giving the acquirer present access to returns associated with that ownership interest

A call option is not expected to give the acquirer present access to the returns associated with the ownership interest in the shares subject to the call where, for example, the option's terms contain one or more of the following features:

- The option exercise price has not yet been determined or will be the fair value (or an amount that approximates fair value) of the underlying shares at the date of exercise
 - The option exercise price is not sufficiently low in relation to the fair value of the underlying shares (that substantially all expected variations in the fair value of the underlying shares will be realised by the acquirer)
 - The option exercise price is based on expected future results or net assets of the subsidiary at the date of exercise
- Or
- It has been agreed between the parties that, prior to the exercise of the option, all retained profits are to be freely distributed to the existing shareholders according to their current shareholdings (and there is no adjustment to the option exercise price for dividends paid)

If a call option does not give the acquirer present access to the returns associated with the ownership interest in the shares subject to the call, IFRS 10 requires that the instruments containing the potential voting rights be accounted for in accordance with IFRS 9. [IFRS 10.21, IFRS 10.B91]. Derivatives on an interest in a subsidiary are accounted for as financial instruments unless the derivative meets the definition of an equity instrument of the entity in IAS 32. [IFRS 9.2.1(a)].

How we see it

The accounting for the call option over NCI by the parent in its consolidated financial statements depends on whether the call option meets the definition of a financial asset or an equity instrument.

Where settlement is not exclusively by an exchange of a fixed number of shares for a fixed amount of cash (or another financial asset), the purchased call option does not meet the definition of an equity instrument in IAS 32 and is treated as a derivative financial asset. [IAS 32.11(d), IAS 32.26, IAS 32.27, IFRS 9 Appendix A].

Therefore, the classification will be a financial asset, unless both the fixed-for-fixed criterion is met and the option is gross-settled in the subsidiary's equity instruments. The classification of purchased call options is discussed further in Chapter 43.

Financial asset - A purchased call option is initially recognised as a financial asset at its fair value, with any subsequent changes in its fair value recognised in profit or loss. If the call option is exercised, the fair value of the option at that date is included as part of the consideration paid for the acquisition of the NCI (see section 4 above). If it lapses unexercised, any carrying amount is expensed in profit or loss.

Equity instrument - A purchased call option is accounted for in a similar way to a call option over an entity's own equity shares, as discussed in Chapter 43. This is because it is an option over the NCI in the consolidated financial statements, and IFRS 10 regards the NCI as 'equity' in those financial statements. Because such a call option over the NCI's shares will be gross settled, the initial fair value of the option is recognised as a debit to equity (and is not subsequently remeasured). If the call option is exercised, this initial fair value is included as part of the consideration paid for the acquisition of the NCI (see section 4 above). If a call option lapses unexercised, there is no entry required within equity.

The above discussion addresses the initial debit entry on recognising the call option at fair value (as a financial asset, or within equity). However, the related initial credit entry will depend on the transactions giving rise to the call option. For example, the entity may have paid consideration for the option in a separate transaction or as part of a larger transaction (such as where a business combination involves an outright purchase of shares as well as the acquisition of a call option over the remaining shares). In the latter case, part of the consideration paid in the larger transaction needs to be allocated to the acquisition of the call option.

6.2 Put options only

Under current IFRS accounting standards, it is not clear how to account for put options that are granted to holders of NCI ('NCI puts') at the date of acquiring control of a subsidiary (or, indeed, after gaining control). There is a lack of explicit guidance in IFRS accounting standards and potential contradictions between the requirements of IFRS 10 (in respect of accounting for NCI and changes in ownership without loss of control - see sections 4 and 5 above) and IAS 32 (see section 6.2.1 below).

How we see it

The accounting for put options over NCI has been the subject of much debate over the years. It is clear that, under current IFRS accounting standards, the NCI put itself gives rise to a liability representing the present value of the exercise price (see section 6.2.1 below for a discussion of the measurement of this liability). However, there are a number of decisions that must be made in order to account for the arrangements, including:

- Whether or not the terms of the NCI put mean that it gives the parent a present ownership interest in the underlying securities (see section 6.2.2 below)
- And
- Where the parent does not have a present ownership interest, whether or not an NCI continues to be recognised, i.e., does the parent recognise both the NCI and the financial liability for the NCI put (see section 6.2.3 below)

In the latter case, there are a number of additional decisions that must be made, in particular the basis on which the NCI is recognised.

Although the IFRS IC unequivocally confirmed as early as 2006 that an NCI put with an exercise price to be settled in cash is itself a financial liability,³¹ the nature of the financial liability remains controversial and has been discussed by the IFRS IC and the IASB on a number of occasions.

The previous deliberations have been in the context of an NCI put that is required to be settled in cash. The IFRS IC has also considered a request in 2016 regarding how an entity accounts for an NCI put in its consolidated financial statements where the NCI put has a strike price that will be settled by delivery of a variable number of the parent's own equity instruments. Specifically, the IFRS IC was asked to consider whether, in its consolidated financial statements, the parent recognises:

(a) A financial liability representing the present value of the option's strike price - in other words, a gross liability

Or

(b) A derivative financial liability presented on a net basis measured at fair value.

The IFRS IC was also asked whether the parent applies the same accounting in its consolidated financial statements for NCI puts for which the parent has the choice to settle the exercise price either in cash or by way of delivery of a variable number of its own equity instruments to the same value.

However, on the basis of its previous discussions and the IASB's Financial Instruments with Characteristics of Equity (FICE) project (see section 7.3 below), the IFRS IC decided in November 2016 not to add this issue to its agenda.³²

How we see it

Given that the IFRS IC did not conclude on this matter, in our view, both approaches to accounting for an NCI put - for which the parent must or has the choice to settle the exercise price by way of delivery of a variable number of its own equity shares - are acceptable. Therefore, the parent is permitted to measure the financial liability at the present value of the option's strike price or as a derivative financial liability measured at its fair value.

In June 2018, the IASB issued a DP, *Financial instruments with Characteristics of Equity*³³ which further considered the accounting for NCI puts and in November 2023 issued an Exposure Draft *Financial Instruments with Characteristics of Equity* - Proposed amendments to IAS 32, IFRS 7 and IAS 1.³⁴ At the time of writing, the IASB is considering stakeholder feedback on the proposals, and is expected to issue final amendments during 2026.³⁵ The Exposure Draft is discussed further in section 7.3 below.

Like the previous deliberations of the IFRS IC and the IASB, the discussion that follows relates to NCI puts that are required to be settled in cash.

6.2.1 The financial liability for the NCI put

Extract from IAS 32

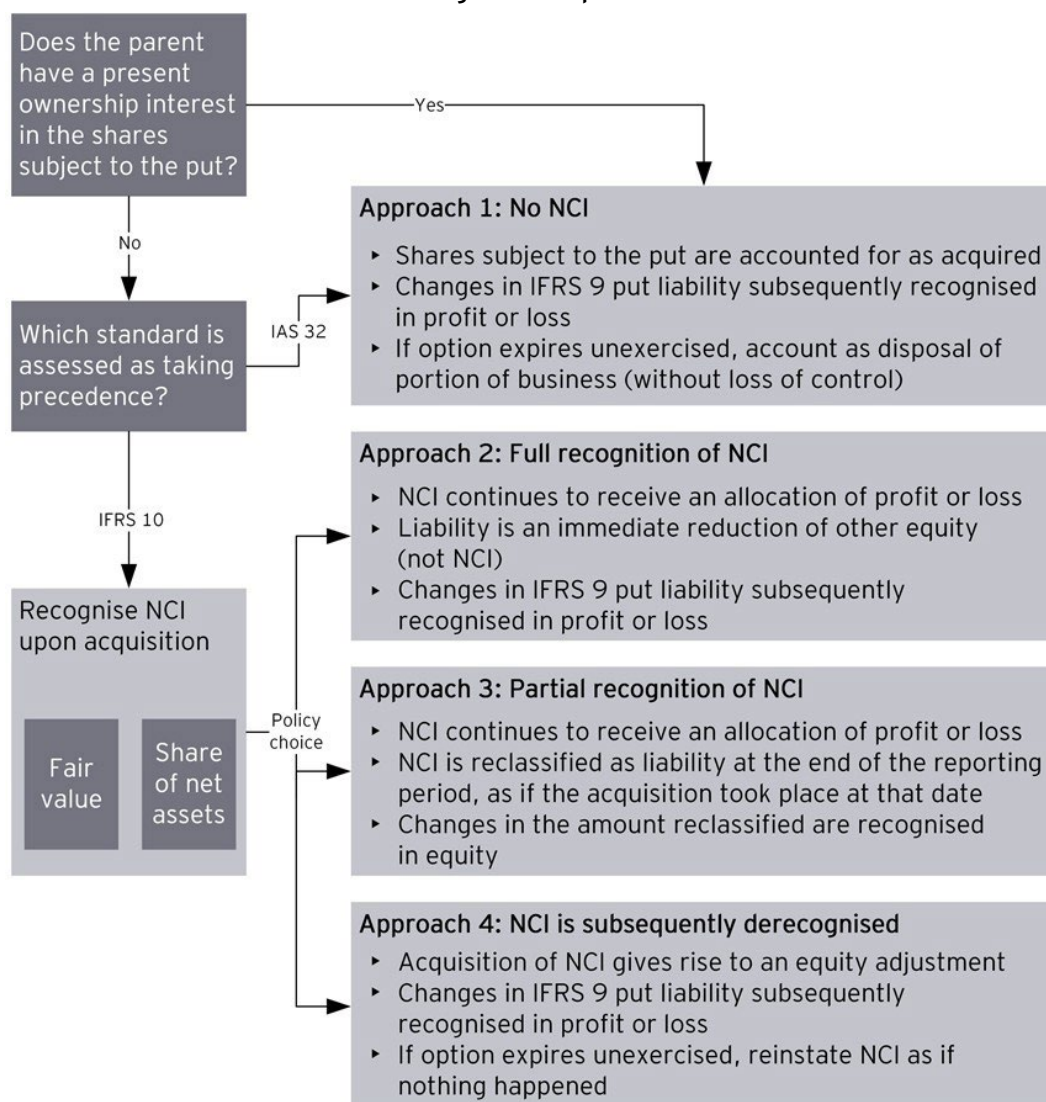

23 With the exception of the circumstances described in paragraphs 16A and 16B or paragraphs 16C and 16D, a contract that contains an obligation for an entity to purchase its own equity instruments for cash or another financial asset gives rise to a financial liability for the present value of the redemption amount (for example, for the present value of the forward repurchase price, option exercise price or other redemption amount). This is the case even if the contract itself is an equity instrument. One example is an entity's obligation under a forward contract to purchase its own equity instruments for cash. The financial liability is recognised initially at the present value of the redemption amount, and is reclassified from equity. Subsequently, the financial liability is measured in accordance with IFRS 9. If the contract expires without delivery, the carrying amount of the financial liability is reclassified to equity. An entity's contractual obligation to purchase its own equity instruments gives rise to a financial liability for the present value of the redemption amount even if the obligation to purchase is conditional on the counterparty exercising a right to redeem (eg a written put option that gives the counterparty the right to sell an entity's own equity instruments to the entity for a fixed price).

As indicated in section 5.1 above, IFRS 10 regards the NCI as 'equity' in the consolidated financial statements. Therefore, in applying IAS 32.23, any contractual obligation to purchase NCI - such as an NCI put - gives rise to a financial liability measured at the present value of the redemption amount which is subsequently measured in accordance with IFRS 9 (see Chapter 43). [IAS 32.23].

IAS 32 offers no guidance as to how the financial liability is measured if the number of shares to be purchased and/or the date of purchase are not known.

How we see it

In our view, in measuring the NCI put liability it would be consistent with the requirement of IFRS 13 that liabilities with a demand feature such as a demand bank deposit have to be measured at not less than the amount payable on demand, to adopt a 'worst case' approach (see Chapter 15). In other words, it should be assumed that the purchase will take place on the earliest possible date for the maximum number of shares. This is also consistent with IAS 32's emphasis, in the general discussion of the differences between liabilities and equity instruments, on a liability arising except to the extent that an entity has an 'unconditional' right to avoid delivering cash or other financial assets. See also Chapter 43.

Figure 6-1: Decision tree for accounting for NCI puts

The diagram above (and explanations about the different approaches given in sections 6.2.3.A to 6.2.3.D below) indicate that, under Approaches 1, 2 and 4, changes in the IFRS 9 financial liability subsequent to initial recognition are recognised in profit or loss. This would be the case regardless of whether the financial liability is subsequently remeasured at amortised cost or at fair value through profit or loss under IFRS 9. However, if the financial liability is designated at fair value through profit or loss under IFRS 9, the fair value changes attributable to changes in own credit risk are normally recognised in OCI (see Chapter 46).

How we see it

Under all approaches, a financial liability representing the present value of the exercise price is recognised for an NCI put settled in cash. The accounting for the remaining aspects of the NCI put depends in part upon an assessment of the terms of the transaction and, in some areas, involves a choice of accounting policy which, once selected, must be applied consistently.

Figure 6-1 above summarises the analysis that we believe needs to be performed, the questions to be addressed and the approaches to be applied.

6.2.2 The NCI put provides a present ownership interest

How we see it

In our view, in the same way as for call options, an entity has to consider whether the terms of the transaction give it present access to the returns associated with the ownership interest in the shares subject to the NCI put.

Factors to consider in determining whether the NCI put might provide a present ownership interest to the acquirer include:

- *Pricing* - to the extent that the price is fixed or determinable, rather than being at fair value (or an amount that approximates fair value) of the underlying share - so that substantially all the variations in fair value of the underlying share accrete to the acquirer. However, in situations where there is only an NCI put, the level of the exercise price needs to be sufficiently high compared to the fair value of the underlying shares to exceed likely fair value variations in order to provide a present ownership interest. If the exercise price is low compared to fair value of the underlying shares, it is unlikely that the NCI will exercise the put. Even if the exercise price exceeds fair value of the underlying shares at the outset, reasonably possible upward fair value movements might mean that the NCI put does not provide a present ownership interest to the acquirer.
 - *Voting rights and decision-making* - to the extent that the voting rights or decision-making connected to the shares concerned are restricted.
 - *Dividend rights* - to the extent that the dividend rights attached to the shares concerned are restricted. It is likely that the NCI retains a present ownership interest where it has been agreed between the parties that, prior to the exercise of the option, all retained profits are to be freely distributed to the existing shareholders according to their current shareholdings (and there is no adjustment to the option exercise price for dividends paid). However, in many cases, dividend rights do not affect the assessment as the parent (through its control) can generally prevent distributions to the NCI prior to exercise or the exercise price of the NCI put is adjusted downwards for payment of any dividends to the NCI.
- And
- *Issue of call options* - a combination of NCI puts and calls, with the same period of exercise and same or similar pricing indicates that the arrangement is in the nature of a forward contract. This feature means that the instrument is highly likely to be exercised by one of the counterparties in situations where the exercise price is not at fair value (or an amount that approximates fair value) of the underlying shares. See section 6.3 below.

The parent will generally have obtained a present ownership interest if there is an NCI put and call with matching terms and a fixed exercise price (or a fixed price forward contract to purchase the entity's shares held by the NCI). Where the pricing of the NCI put and call is at fair value (or an amount that approximates fair value), the present ownership will generally remain with the NCI. Other situations, including where the exercise price is based on a formula, are likely to require further analysis, based on the factors outlined above.

If it is concluded that the acquirer has a present ownership interest in the shares concerned, it is accounted for as an acquisition of those underlying shares, and no NCI is recognised. The accounting is described in section 6.2.3.A below.

6.2.3 The NCI put does not provide a present ownership interest

How we see it

When the terms of the transaction do not provide the parent with a present ownership interest of the shares subject to an NCI put, there are four approaches that can be taken. Key policy decisions that management must make in order to conclude an accounting approach, are:

- Due to the potential contradictions between IAS 32 and IFRS 10, which standard takes precedence?
And
- If an NCI is recognised on initial acquisition, whether or not it continues to be recognised?

If the entity chooses to base its accounting policy on IAS 32, i.e., IAS 32 takes precedence, then it will only recognise a financial liability for the NCI put and not recognise an NCI. The approach is described in section 6.2.3.A below.

If the accounting policy choice is that IFRS 10 takes precedence, the entity will initially recognise both the NCI and the financial liability under the NCI put.

It initially measures any 'qualifying NCI' (i.e., those components of NCI that are both present ownership interests and entitle their holders to a proportionate share of the entity's net assets in the event of a liquidation) at the date of the business combination, either at fair value or at the proportionate share of net assets, with this choice available for each transaction (as discussed in section 5.2.1 above). [IFRS 3.19]. There is then a further accounting policy choice as to whether the NCI that was initially recognised continues to be recognised (as described in sections 6.2.3.B to 6.2.3.D below).

6.2.3.A NCI is not recognised - financial liability recognised (Approach 1)

Approach 1 must be used when the entity has a present ownership interest in the shares concerned (see section 6.2.2 above).

Approach 1 could be used when the entity does not have a present ownership interest but concludes that IAS 32 takes precedence over IFRS 10. By recognising a liability for the put option over the shares held by the NCI, no NCI is recognised. The business combination is accounted for on the basis that the underlying shares subject to the NCI put have been acquired. Thus, if the acquirer has granted a put option over all of the remaining shares, the business combination is accounted for as if the acquirer has obtained a 100% interest in the acquiree. No NCI is recognised when the acquirer completes the purchase price allocation and determines the amount of goodwill to recognise. The consideration transferred for the business combination includes the present value of the amount payable upon exercise of the NCI put to the non-controlling shareholders.

Approach 1 is based on the requirements and guidance within IAS 32.

IAS 32 requires the NCI put to be recognised as a liability, as discussed in section 6.2.1 above. [IAS 32.23]. IAS 32 explains that when a subsidiary issues a financial instrument and a parent or other entity in the group agrees additional terms directly with the holders of the instrument (e.g., a guarantee), it could be the case that the group does not have discretion over distributions or redemption. Even though the subsidiary appropriately classifies the instrument without regard to these additional terms in its financial statements, their effect is taken into account in the consolidated financial statements. To the extent that there is such an obligation or settlement provision, the instrument (or the component of it that is subject to the obligation) is classified as a financial liability in the consolidated financial statements. [IAS 32.AG29]. The implication is that the underlying financial instruments (i.e., the shares in the subsidiary) are represented by the financial liability. Accordingly, since the shares held by those non-controlling shareholders are not treated as equity interests in the consolidated financial statements, there is no NCI to be accounted for under IFRS 10. This means that the profit or loss (and changes in OCI) with respect to the subsidiary are allocated to the owners of the parent and not to the NCI, as there is none.

Under this approach, any dividends paid to the other shareholders are recognised as an expense in the consolidated financial statements, except where they represent a repayment of the liability (e.g., where the exercise price is adjusted by the dividends paid).

The NCI put is accounted for as a financial liability under IFRS 9. [IAS 32.23]. Changes in the carrying amount of the financial liability are recognised in profit or loss. [IFRS 9.4.2.1, IFRS 9.4.2.2].

If the NCI put is exercised, the financial liability is extinguished by the payment of the exercise price.

If the NCI put is not exercised, then the entity has effectively disposed of a partial interest in its subsidiary, without loss of control, in return for the amount recognised as the financial liability at the date of expiry. The entity accounts for the transaction as discussed in section 4 above. The consideration received is the amount of the financial liability extinguished and any difference between this and the carrying amount of the NCI (as of the date that the NCI put expires) is recognised within equity attributable to the owners of the parent (i.e., parent equity).

6.2.3.B Full recognition of NCI (Approach 2)

Approach 2 is one of the alternatives that could be used when the entity does not have a present ownership interest in the shares concerned and concludes that IFRS 10 takes precedence. The acquirer initially recognises the NCI at the date of the business combination, either at fair value or at the proportionate share of the acquiree's net assets. [IFRS 3.19].

Approach 2 takes the view that the NCI continues to be recognised within equity until the NCI put is exercised. The carrying amount of the NCI changes due to allocations of profit or loss, allocations of changes in OCI and dividends made for the reporting period (see section 5.7 above).

The financial liability for the NCI put is recognised at the present value of the amount payable upon exercise of the NCI put and is subsequently accounted for under IFRS 9 like any other written put option on equity instruments. On initial recognition, the corresponding debit is made to another component of parent equity, not to the NCI.

All subsequent changes in the carrying amount of the financial liability that result from the remeasurement of the present value of the amount payable upon exercise of the NCI put are recognised in the profit or loss attributable to the owners of the parent, and not the NCI's share of the profit or loss of the subsidiary.

If the NCI put is exercised, the entity accounts for an increase in its ownership interest as an equity transaction (see section 4 above). Consequently, the financial liability, as remeasured immediately before the transaction, is extinguished by payment of the exercise price and the NCI purchased is derecognised against parent equity.

If the NCI put expires unexercised, the financial liability is reclassified to the same component of parent equity that was previously reduced (on initial recognition).

6.2.3.C Partial recognition of NCI (Approach 3)

Approach 3 is one of the alternatives that could be used when the entity does not have a present ownership interest in the shares concerned but initially applies IFRS 10 and recognises the NCI at the date of the business combination, either at fair value or at the proportionate share of the acquiree's net assets.

[IFRS 3.19].

Under Approach 3, while the NCI put remains unexercised, the accounting at the end of each reporting period is as follows:

- (a) The entity determines the amount that would have been recognised for the NCI, including an update to reflect allocations of profit or loss, allocations of changes in OCI and dividends declared for the reporting period, as required by IFRS 10 (see section 5.7 above).
- (b) The entity derecognises the NCI as if it was acquired at that date.
- (c) The entity recognises a financial liability at the present value of the amount payable on exercise of the NCI put in accordance with IFRS 9. There is no separate accounting for the unwinding of the discount due to the passage of time.

And

- (d) The entity accounts for the difference between (b) and (c) as an equity transaction.

If the NCI put is exercised, the same treatment is applied up to the date of exercise. The amount recognised as the financial liability at that date is extinguished by the payment of the exercise price.

If the NCI put expires unexercised, the position is unwound so that the NCI is recognised at the amount it would have been, as if the put option had never been granted (i.e., measured initially at the date of the business combination, and remeasured for subsequent allocations of profit or loss, OCI and changes in equity attributable to the NCI). The financial liability is derecognised, with a corresponding credit to the same component of parent equity that was previously reduced.

6.2.3.D NCI is subsequently derecognised (Approach 4)

Approach 4 could be used when the entity does not have a present ownership interest in the shares concerned and concludes that IFRS 10 takes precedence. When the NCI put is granted in a business combination, the acquirer initially recognises the NCI, either at fair value or at the proportionate share of the acquiree's net assets. [IFRS 3.19].

When the parent recognises the financial liability for the NCI put, it derecognises the NCI. There are two ways of viewing this, but the accounting effect is the same:

- This transaction is an immediate acquisition of the NCI. The NCI is treated as having been acquired when the NCI put is granted, as in Approach 1. However, in accordance with IFRS 10, any difference between the liability recognised (at the present value of the amount payable upon exercise of the NCI put) and the amount of NCI derecognised is recognised directly in equity. (Under Approach 1, the difference is reflected in the measurement of goodwill.)

Or

- This transaction is viewed as a reclassification of an equity instrument to a financial liability. In accordance with IAS 32, when the financial liability is recognised, the present value of the amount payable upon exercise of the NCI put is reclassified from equity with the effect that the NCI is derecognised. Any difference between the carrying value of NCI and the liability is adjusted against another component of parent equity.

The financial liability for the NCI put is subsequently accounted for under IFRS 9, with all changes in the carrying amount recognised in profit or loss.

Dividends paid to the other shareholders are recognised as an expense of the group, unless they represent a repayment of the liability (e.g., where the exercise price is adjusted by the dividends paid). This means that the profit or loss (and changes in OCI) with respect to the subsidiary are allocated to the parent and not to the NCI, as there is none.

If the NCI put is exercised, the carrying amount of the financial liability at that date is extinguished by the payment of the exercise price.

If the NCI put expires unexercised, the liability is derecognised with the NCI being reinstated as if nothing happened. Any difference between the liability and NCI is recognised against another component of equity, generally the same component reduced when the liability was initially recognised.

6.2.4 Assessing whether to account for multiple transactions as a single arrangement

As discussed in section 3.4 above, IFRS 10 provides guidance on when to account for two or more arrangements as a single transaction when a parent loses control of a subsidiary. [IFRS 10.26, IFRS 10.B97]. However, neither IFRS 10 nor IFRS 3 specifically addresses the accounting for a sequence of transactions that begins with an acquirer gaining control over another entity, followed by acquiring additional ownership interests shortly thereafter. This frequently happens where public offers are made to a group of shareholders and there is a regulatory requirement for an acquirer to make an offer to the non-controlling shareholders of the acquiree.

The IFRS IC considered this issue and tentatively agreed that the initial acquisition of the controlling stake and the subsequent mandatory tender offer should be treated as a single transaction. However, there was no consensus among the IFRS IC members on whether a liability should be recognised for the mandatory tender offer at the date that the acquirer obtains control of the acquiree. A small majority expressed the view that a liability should be recognised in a manner that is consistent with IAS 32. Other IFRS IC members expressed the view that a mandatory tender offer to purchase NCI is not within the scope of IAS 32 or IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* and that a liability should therefore not be recognised.³⁶ The issue was escalated to the IASB³⁷ and the accounting for mandatory tender offers has subsequently been considered as part of the FICE project. See sections 7.3 and 7.4 below.

How we see it

In our view, when determining the appropriate accounting, a simple distinction between a statutory obligation and a contractual obligation is not always clear and the effects of a mandatory tender offer may, in any event, be economically similar to a contractual NCI put.

Statutory requirements (such as a mandatory tender offer or a statutory process that has the same effect) may have the effect of modifying the contractual terms of the equity instruments, thereby giving rise to a contractual obligation to purchase the equity instruments. The rules and regulations regarding tender offers differ by jurisdiction and careful analysis of the facts and circumstances is needed.

In any event, even if it is established there is no contractual obligation, the effects of a mandatory tender offer are economically similar to a contractual NCI put and, in the absence of specific requirements in IFRS accounting standards, it might be appropriate to account in the same way. We believe that this is an area where the IASB needs to provide further clarification.

³⁶ [IFRIC Update](#), March 2013, available on the IFRS Foundation's website.

³⁷ [IASB Update](#), May 2013, available on the IFRS Foundation's website.

How we see it

In the absence of any specific requirements in IFRS accounting standards for transactions such as mandatory tender offers arising in connection with a business combination, we believe that entities generally have an accounting policy choice to:

- (a) Account for the transaction as a single linked transaction in which control is gained (a single business combination), where the indicators of a linked transaction are met
- Or
- (b) Account for the transaction as a discrete transaction (a business combination followed by an acquisition of NCI)

However, policy (a) can only be applied where the acquisition of NCI is assessed as linked to the same transaction as that by which control is gained (as explained in section 6.2.4.A below). Entities would need to apply the policy consistently (for example, if policy (a) is applied, it needs to be applied for all transactions where the criteria for linked transactions are met). Entities applying policy (a) should refer to section 6.2.4.B below for accounting for linked transactions.

Where an entity adopts policy (b) to account for the transaction as a discrete transaction, a further determination needs to be made as to whether (and at what point), based on the facts and circumstances, the mandatory tender offer gives rise to a contractual obligation.

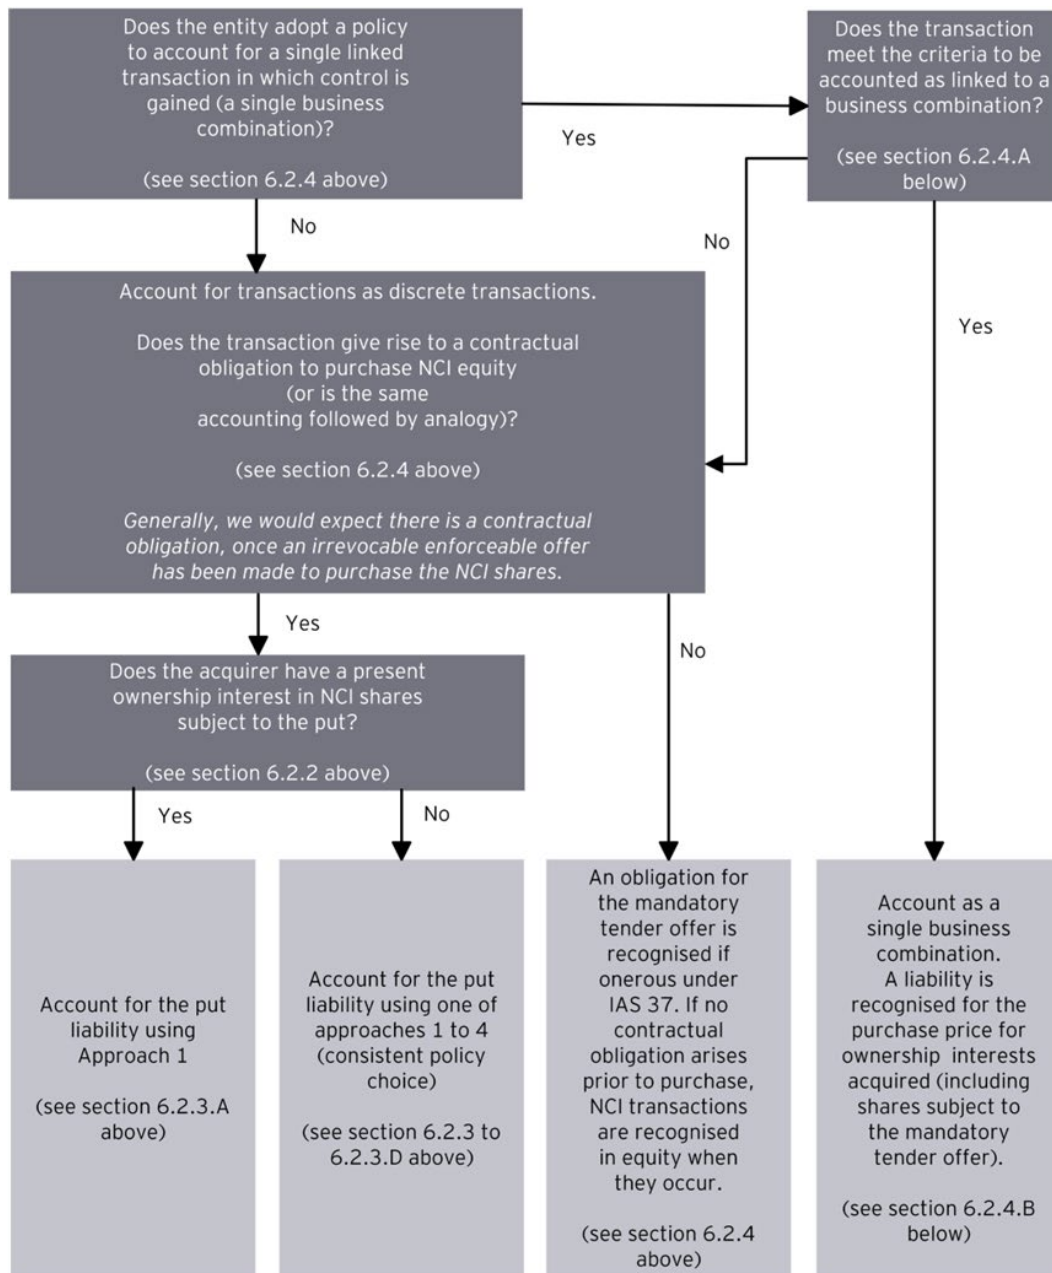

The accounting under policy (b) is as follows:

- Where a mandatory tender offer is considered to give rise to a contractual obligation to purchase the equity shares (or the transaction is accounted by analogy in the same way as a contractual put), an obligation for the NCI put is recognised in accordance with the guidance on Approaches 1 to 4 described in sections 6.2 to 6.2.3.D above (and consistent with the guidance in section 6.4 below). While the exact point at which a contractual obligation arises in the mandatory tender process will depend on the specific facts and circumstances in the relevant jurisdiction, we would generally expect that an irrevocable and enforceable offer made by the acquirer to purchase the NCI will constitute a contractual obligation.
- Or
- If no contractual obligation arises in advance of the purchase (and the transaction is not accounted by analogy in the same way as a contractual put), the purchase of the NCI is accounted for as a separate equity transaction when it occurs (see section 4 above). An obligation is recognised for the statutory obligation for the mandatory tender offer, if onerous, in accordance with IAS 37.

This is summarised in the following decision tree at Figure 6-2 below.

Figure 6-2: Accounting for a mandatory tender offer

This shows a simplified decision chart for accounting for a mandatory tender offer following the acquisition of a controlling stake in an investee. It is important that this is read in conjunction with the text in section 6.2.4 above as well as the sections cross referenced from the boxes in the chart.

6.2.4.A Identifying a linked transaction

The acquisition of the NCI is a linked transaction when it arises from the same transaction as that by which control was gained. This will generally be the case where it arises as part of the same offer, including where legal or regulatory requirements lead to the offer being extended through the creation of a shareholder put, or acquirer compulsory acquisition rights.

How we see it

In many cases where NCI is acquired in connection with a transaction in which control is gained, it will be clear where there is a single offer. Where it is not clear, the existence of all of the following factors indicate a linked transaction:

- The option over the remaining interest and subsequent acquisition is not negotiated separately by the non-controlling shareholders
- The offer period is short
- And
- The price per share offered for subsequent increases in shareholding is fixed and consistent with the price paid for the controlling interest

These factors are generally all present in the case of public offers to the entire group of shareholders. This is not necessarily the case for private offers where, for example, some of the options may be for extended terms.

If a put option is granted over the NCI and the terms of the put option are such that the present ownership interest attached to the underlying shares is gained at the same time as gaining control, this will satisfy the factor that 'the offer period is short'. Even if the put nominally extends over a long period, the effect is that ownership has already passed to the acquirer. See section 6.2.2 above for the factors to be considered in assessing whether or not the acquirer gains present ownership interest over the underlying shares. Where the other factors listed in the 'How we see it' box above are also met, this is a linked transaction.

6.2.4.B Accounting for the linked transaction (where a policy to account as a single business combination is followed)

A linked transaction is accounted for as if all ownership interests were acquired at the acquisition date as part of the transaction to gain control.

The consideration transferred is the sum of the amount paid for the controlling interest and NCI (that is acquired as part of the linked transaction) and the percentage acquired is the sum of the respective shareholdings. If, at the date of gaining control the NCI has not actually been acquired, a financial liability is recognised at the present value of the amount payable upon exercise of the option to acquire the NCI.

If, at the date the NCI is actually acquired, the percentage acquired differs to that originally accounted for as being acquired, the purchase accounting is adjusted to reflect the actual percentage acquired. A 'true up' exercise is performed to adjust the total consideration paid and therefore the amount of goodwill recognised. It is not accounted for as a partial disposal of NCI (changes in ownership interest without loss of control are addressed in section 4 above). The NCI is measured as of the date of acquisition, not as of the date that the offer expires.

When the transaction is linked because the arrangement provides a present ownership interest in the NCI, the entity will not recognise the NCI. Accounting for the transaction is as described in Approach 1 in section 6.2.3.A above.

Illustration 6-1 below shows the accounting for a linked transaction.

Illustration 6-1: Put option and gaining control accounted for as a single transaction

Entity A acquires a 60% controlling interest in listed Entity B. As A has obtained a controlling interest in B, the regulator requires A to offer to purchase the remaining shares of B from all other shareholders of B, paying the same price per share as in the transaction in which A obtained control of B ('mandatory tender offer'). A makes the mandatory tender offer immediately and the offer period lasts for 30 days.

At the end of 30 days, other shareholders of B owning 30% accept the mandatory tender offer for their shares. The offer to acquire the remaining 10% of shares held in B expires unexercised.

When considering whether the mandatory tender offer is linked to the acquisition of 60% of B's shares, in which A gained control, it is relevant that:

- The price per share is fixed and at the same price as paid by A to acquire 60% of B's shares
- The shareholders of B who own the 40% did not negotiate to receive the offer
- The offer benefits the shareholders of B (by providing the same opportunity to sell their shares that the shareholder(s) who sold the 60% received)
- Although the offer was initiated by A, it stemmed from a regulatory requirement triggered by the acquisition of B (it was not at A's discretion to make the offer)
- And
- The offer period is relatively short

A concludes that the mandatory tender offer is linked to the transaction when control was gained and is therefore part of the business combination. Therefore, A records the following journal entries:

- a) Acquisition of 60% and entering into the mandatory tender offer over the remaining 40% of B's shares (granting the offer):

Dr Net assets
(summarised, 100% of fair value of net assets of B, as required by IFRS 3)

Dr Goodwill (as if A acquired 100% of B)

Cr Cash transferred (on acquisition date)

Cr Financial liability
(present value of offer price to be paid at the expiry date of the option relating to the 40% of B's shares subject to the mandatory tender offer)

- b) Accounting for the liability in accordance with IFRS 9 (unwinding of the discount during the 30-day period):

Dr Finance expense

Cr Financial liability

- c) Actual acquisition of 30% offered at the end of the 30-day period is accounted for as a reduction of the financial liability:

Dr Financial liability

Cr Cash

- d) Reclassification of the financial liability to equity for the 10% outstanding at the end of the offer period. A adjusts the initial purchase price allocation related to Entity B to recognise any NCI, with an offset to goodwill:

Dr Financial liability (offer price of 10% of shares)

Cr NCI
(either (1) fair value of the NCI in B or (2) the 10% shareholders' proportionate share of B's identifiable net assets), measured as of the acquisition date (the date that control was gained, and not the date that the offer expires)

Dr/Cr Goodwill (difference, if applicable).

If the adjustment to goodwill resulted in 'negative goodwill', any excess after eliminating the original positive goodwill would be recognised in profit or loss.

6.3 Combination of call and put options

In some business combinations, there might be a combination of call and put options, the terms of which may be equivalent or may be different.

How we see it

The appropriate accounting for a combination of call and put options over NCI is determined based on the discussions in sections 6.1 and 6.2 above. However, where there is a call and put option with matching terms, particularly at a fixed price, the combination of the options is more likely to mean that they give the acquirer a present ownership interest. Where the exercise price is at fair value (or an amount that approximates fair value), however, the returns of ownership arising from fair value movements will accrete to the NCI and consequently, this situation is unlikely to give the acquirer a present ownership interest.

In cases where the combination of call and put options gives the acquirer a present ownership interest, where the options are over all of the shares not held by the parent, the acquirer has effectively acquired a 100% interest in the subsidiary at the date of the business combination. The entity is likely to be economically in a similar position as if it had acquired a 100% interest in the subsidiary with either deferred consideration (where the exercise price is fixed) or contingent consideration (where the settlement amount is not fixed, but is dependent upon a future event). See Chapter 10.

As noted in section 6 above, similar considerations would apply where the acquirer entered into a forward purchase contract for the shares held by the other shareholders.

6.4 Call and put options entered into in relation to existing NCI - additional accounting considerations

The discussion in sections 6.1 to 6.3 above focused on call and put options entered into at the same time as control is gained of the subsidiary. However, an entity may enter into the options with non-controlling shareholders after gaining control.

How we see it

The appropriate accounting policy for call and put options entered into in relation to existing NCI will be based on the discussions in sections 6.1 to 6.3 above.

Where the entity already has a controlling interest and as a result of the options now has a present ownership interest in the remaining shares concerned, or concludes that IAS 32 takes precedence, the NCI is no longer recognised within equity. The transaction is accounted for as an acquisition of the NCI, i.e., it is accounted for as an equity transaction, (see section 4 above), because such acquisitions are not business combinations under IFRS 3.

6.5 Call and put options in separate financial statements

Purchased call options (and written put options) over shares in an acquired subsidiary are derivatives in the separate financial statements. [IFRS 9.2.1(a)]. Note that this treatment differs from that in the consolidated financial statements which is addressed generally in section 6 above.

A purchased call option over shares in an acquired subsidiary is initially recognised as a financial asset at its fair value, with any subsequent changes in the fair value of the option recognised in profit or loss. Similarly, a written put option over shares in an acquired subsidiary is initially recognised as a financial liability at its fair value, with any subsequent changes in the fair value of the option recognised in profit or loss.

The initial credit entry for the call option (and the initial debit entry for the put option) will depend on the transactions giving rise to the options. For example, the entity may have paid (or received) consideration for the call (or put option) in a separate transaction or as part of a larger transaction.

Where a purchased call option (or written put) option lapses, the financial asset (or financial liability) is derecognised, with a debit (or credit) to profit or loss. Where a purchased call option (or written put option) is exercised, the financial asset (or financial liability) is derecognised with an adjustment to the cost of investment of purchasing the shares subject to the option.

The fair value of the purchased call option (or written put option) is not expected to be significant if the option is exercisable at the fair value (or at an amount that approximates fair value) of the underlying shares at the date of exercise. Where there is both a purchased call and a written put option, particularly where the options have the same fixed redemption price, it is likely that the fair values of the purchased call option and written put option will differ.

7 Future developments

The IASB has been engaged in a number of implementation projects that might change the accounting for transactions where there is a loss of control of a subsidiary, the accounting for NCI or the accounting for NCI puts and calls. In many cases, the accounting for the transactions is at the intersection of IFRS 10 and a different IFRS accounting standard. These issues are discussed in sections 7.1 to 7.5 below.

In addition, during 2019 and 2020, the IFRS IC and the IASB held discussions about the accounting for a transaction in which an entity, as part of its ordinary activities, enters into a contract with a customer to sell real estate by selling its equity interest in a subsidiary.³⁸ Having considered feedback from the PIR of IFRS 10, IFRS 11 and IFRS 12 (see section 7.5 below), the Board intends no further action on this topic.³⁹ The IASB decided not to include a question in the PIR of IFRS 15.⁴⁰ However, some stakeholder feedback to the PIR of IFRS 15 raised the issue of sales of corporate wrappers again.⁴¹ In response to the feedback, the Board reconfirmed in April 2024 that it will consider the priority of matters relating to applying IFRS 15 with IFRS 10 and IFRS 11 in the next agenda consultation (i.e., the Fourth Agenda Consultation, expected to start in 2025 or 2026) instead of as part of the PIR of IFRS 15.⁴² This issue is discussed further in section 3.2.1 above.

Similarly, in 2020 and 2021, the IFRS IC discussed the interaction of IFRS 10 and IFRS 16 in relation to a transaction where the entity's equity interest in a wholly-owned subsidiary that held only a building was sold, resulting in loss of control, and the building was leased back. The IFRS IC recommended, following review of feedback on a previous tentative agenda decision, that the IASB undertake narrow-scope standard-setting to address this and similar transactions. The IASB is expected to discuss this recommendation at a future meeting.⁴³ However, transactions involving corporate wrappers were identified as low priority in the PIR of IFRS 10, IFRS 11 and IFRS 12 (see section 7.5 below).⁴⁴ This issue is discussed further in section 3.2.2 above.

7.1 Sale or contribution of assets between an investor and its associate or joint venture (amendments to IFRS 10 and IAS 28)

One issue that the IASB has been trying to resolve was a conflict between the IFRS 10 requirements relating to loss of control over a subsidiary and those of IAS 28 for transactions where a parent sells or contributes an interest in a subsidiary to an associate or a joint venture. In order to resolve the conflict, in September 2014, the IASB had issued *Sale or Contribution of Assets between an Investor and its Associate or Joint Venture* (Amendments to IFRS 10 and IAS 28).

These amendments, where applied, would require the gain or loss resulting from the loss of control of a subsidiary that does not contain a business (as defined in IFRS 3) - as a result of a sale or contribution of a subsidiary to an associate or a joint venture (that is accounted for using the equity method) - to be recognised in profit or loss only to the extent of the unrelated investors' interests in the associate or joint venture. The same requirement applies to the remeasurement gain or loss relating to the former subsidiary if, following the transaction, a parent retains an investment in a former subsidiary and the former subsidiary is now an associate or a joint venture that is accounted for using the equity method. However, a full gain or loss would be recognised on the loss of control of a subsidiary that constitutes a business, including cases in which the investor retains joint control of, or significant influence over, the investee.

[IFRS 10.25, IFRS 10.26, IFRS 10.B98, IFRS 10.B99, IFRS 10.B99A].

In the Basis for Conclusions, the IASB clarifies that the amendments do not apply where a transaction with a third party leads to a loss of control (even if the retained interest in the former subsidiary becomes an associate or joint venture that is accounted for using the equity method), nor where the investor elects to measure its investments in associates or joint ventures at fair value in accordance with IFRS 9.

[IFRS 10.BC190].

These amendments were to be applied prospectively to transactions occurring in annual periods beginning on or after 1 January 2016, with earlier application permitted. However, in December 2015, the IASB issued a further amendment, *Effective Date of Amendments to IFRS 10 and IAS 28*. This amendment deferred the effective date of the September 2014 amendments indefinitely.

Nevertheless, the IASB has continued to allow early application of the September 2014 amendments, which must be disclosed, as the Board did not wish to prohibit the application of better financial reporting. [IFRS 10.C1C, IFRS 10.BC190N, IFRS 10.BC190O, IAS 28.45C, IAS 28.BC37I, IAS 28.BC37J].

The September 2014 amendments are discussed in sections 3.3.2 and 3.3.2.B above.

This issue has been reconsidered as part of the IASB's equity method project which aims to develop answers to application questions about the equity method, as set out in IAS 28, using the principles derived from that standard where possible.⁴⁵ In September 2024, the IASB issued an Exposure Draft addressing application questions relating to the equity method. The Exposure Draft proposes that an investor, in applying IAS 28, would recognise the full gain or loss on all transactions with its associate together with improvements to the disclosure requirements when an investor recognises the full gain or loss on transactions with its associate.⁴⁶ This is a different position to the September 2014 amendments.

In May 2025⁴⁷, the IASB started to consider the feedback received on the Exposure Draft and decided to proceed with redeliberating the Exposure Draft's proposals. The Board also decided not to describe a project on a fundamental review of the equity method in the Request for Information on the Fourth Agenda Consultation (expected to start later in 2025 or 2026).⁴⁸

Please refer to the IASB's website for the latest information on these issues.⁴⁹ See also Chapter 12.

7.2 Sale or contribution of assets to a joint operation (where the entity has joint control or is a party to the joint operation)

In July 2016, the IFRS IC discussed whether an entity should remeasure its retained interest in the assets and liabilities of a joint operation when the entity loses control of a business, or an asset or group of assets that is not a business. In the transaction discussed, the entity either retains joint control of a joint operation or is a party to a joint operation (with rights to assets and obligations for liabilities) after the transaction.

Because of the similarity between the transaction being discussed by the IFRS IC and a sale or contribution of assets to an associate or joint venture (see section 7.1 above), the IFRS IC decided not to add the issue to its agenda, but instead to recommend that the IASB consider the issue at the same time that it further considers the accounting for the sale or contribution of assets to an associate or a joint venture. The IFRS IC observed that the PIR of IFRS 10 and IFRS 11 would provide the IASB with an opportunity to consider loss of control transactions and a sale or contribution of assets to an associate or joint venture.⁵⁰ That matter was considered as part of Phase 2 of the PIR of IFRS 10, IFRS 11 and IFRS 12 (see section 7.1 above and section 7.5 below). In June 2022, the Board assessed transactions that change the relationship between an investor and an investee as a low priority and concluded this topic could be explored if identified as a priority in the next agenda consultation (i.e., the Fourth Agenda Consultation, expected to start in 2025 or 2026).⁵¹

The IFRS IC agenda decision, and the accounting for such transactions are discussed further in section 3.3.3 above.

7.3 Accounting for NCI puts - Financial Instruments with Characteristics of Equity ('FICE') project

Both the IFRS IC and the IASB have been debating the accounting for NCI puts over a number of years. Many of these issues have now been considered by the FICE project.

In June 2018, the IASB issued Discussion Paper (DP/2018/1) *Financial instruments with Characteristics of Equity*.⁵² However, after considering feedback, the IASB decided not to continue with the proposed classification approach but instead to clarify the classification requirements in IAS 32, including their underlying principles, to address known application issues and to limit changes in classification outcomes to situations where such a change would provide more useful information.⁵³

In December 2020, the IASB added the FICE project to its standard-setting programme and subsequently, in November 2023, issued Exposure Draft (IASB/ED/2023/5) *Financial instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1*.⁵⁴

The proposals relevant to contracts which include an obligation for an entity to purchase its own equity instruments (such as a forward contract to purchase an entity's own shares or an NCI put) include:

- An entity that does not yet have access to the rights and returns associated with ownership of the equity instruments to which the obligation relates, continues to recognise those instruments as equity instruments and removes from a component of parent equity other than issued share capital an amount equal to the initial amount of the financial liability
- On initial recognition and subsequent remeasurement, the financial liability is measured at the present value of the redemption amount (the existing requirement to subsequently remeasure the financial liability in accordance with IFRS 9 is removed)
- On initial and subsequent measurement, an entity disregards the probability and estimated timing of the counterparty's exercise of its redemption right and discounts the redemption amount to its present value assuming that the redemption will occur at the earliest possible redemption date
- An entity recognises gains or losses on remeasurement of the financial liability in profit or loss
- On expiry of the contract, the carrying amount of the financial liability is derecognised and that amount is included in the same component of equity from which it was removed on initial recognition of the financial liability (Note, the cumulative amount in retained earnings arising from remeasurement of the financial liability could be reclassified to another component of equity but is not reversed in profit or loss)

And

- An entity also applies the requirements relating to obligations to purchase its own equity instruments to contracts that will be settled by delivering a variable number of another class of the entity's own equity instruments to the value of the contractual obligation⁵⁵

Therefore, written put options and forward purchase contracts on an entity's own equity instruments continue to be presented gross (i.e., using the present value of the redemption price) rather than net (i.e., as a derivative) if an entity's contractual obligation is to be gross physically settled. If an entity's obligation is to be net settled (in cash or shares) or could be net settled at the election of either party, derivative accounting would apply.⁵⁶ This is considered to help users in assessing the entity's liquidity risk exposure as, for example, the gross cash flow settling the obligation in cash reduces the entity's assets unlike other derivatives where the entity receives assets not own shares.⁵⁷

53 [Exposure Draft - Snapshot Financial Instruments with Characteristics of Equity](#), IASB, November 2023. Available on the IFRS Foundation's website.

54 Exposure Draft ([IASB/ED/2023/5](#)) *Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1*, IASB, November 2023. Available on the IFRS Foundation's website.

55 Exposure Draft ([IASB/ED/2023/5](#)) *Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32*, IASB, November 2023, paras. 23, AG27B and AG27C. Available on the IFRS Foundation's website.

56 Exposure Draft ([IASB/ED/2023/5](#)) *Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32*, IASB, November 2023, para. AG27D. Available on the IFRS Foundation's website.

57 Exposure Draft ([IASB/ED/2023/5](#)) *Basis for Conclusions on Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1*, IASB, November 2023, paras. BC66-BC70. Available on the IFRS Foundation's website.

To enable users of financial statements to understand the accounting for financial instruments, extensive disclosures are also proposed including:

- The amount removed from equity (and the component of equity from which removed) and included in financial liabilities on initial recognition of the obligation as a financial liability
 - The amount of any remeasurement gain or loss recognised in profit or loss during the reporting period
 - The amount of any gain or loss recognised on settlement of the obligation during the reporting period
 - The amount removed from financial liabilities and included in equity if the obligation has expired unexercised in the reporting period
- And
- Any transfers within equity of amounts related to the obligation during the reporting period (and the components of equity that the amounts were transferred from and to)⁵⁸

A summary of respondents' feedback⁵⁹ was discussed in May 2024 and will be considered further during the IASB's redeliberation of the ED's proposals.⁶⁰ The IASB has continued to redeliberate the proposals in 2024 and 2025. At the time of writing, the IASB expects to issue final amendments during 2026. Please refer to the IASB's website for the latest information on these issues.⁶¹

See Chapter 43 for further discussion of the FICE project.

7.4 Mandatory purchase of non-controlling interests

As discussed more fully in section 6.2.4 above, neither IFRS 10 nor IFRS 3 specifically addresses the accounting for a sequence of transactions that begins with an acquirer gaining control over another entity, followed by it acquiring additional ownership interests shortly thereafter. This frequently happens where public offers are made to a group of shareholders and there is a regulatory requirement for an acquirer to make an offer to the non-controlling shareholders of the acquiree. This issue had been considered by the IFRS IC and was escalated to the IASB.

This issue was subsequently considered within the Discussion Paper (DP/2018/1) *Financial Instruments with Characteristics of Equity*. In the IASB's preliminary view, an entity would apply the IASB's preferred approach to the contractual terms of a financial instrument consistently with IAS 32 and IFRS 9. This would result in, for example, the obligations that arise in mandatory tender offers, which have similar consequences to those that arise from written put options, not being considered for the purpose of classification because they are beyond the scope of IAS 32. The DP stated that the IASB will consider whether it should take any action to address the accounting for mandatory tender offers, including potential disclosure requirements, following its analysis of responses to the DP.⁶²

In October 2019, the Staff recommended that the topic of mandatory tender offers was excluded from the scope of the FICE project as "In the staff's view, amending IAS 32 in a way that it scopes in this type of obligation would require a fundamental rewrite of IAS 32. Therefore, the staff would expect this issue to be outside the scope of this project".⁶³

The IASB discussed the effects of applicable laws on contractual terms of financial instruments on classification of financial instruments in September 2021, December 2021 and February 2023.

63 [Staff Paper 5](#): Project: *Financial Instruments with Characteristics of Equity (FICE)*, Paper topic: *Clarifying amendments to IAS 32 Project plan*, IASB meeting, October 2019, para. 48. Available on the IFRS Foundation's website.

In November 2023, the IASB issued Exposure Draft (IASB/ED/2023/5) *Financial instruments with Characteristics of Equity* - Proposed amendments to IAS 32, IFRS 7 and IAS 1. The ED proposes that in classifying a financial instrument (or its component parts) as a financial liability or an equity instrument, an entity:⁶⁴

- Considers only contractual rights and obligations that are enforceable by laws or regulations and are in addition to those created by relevant laws or regulations (such as statutory or regulatory requirements applicable to the instrument)
- And
- Disregards any rights or obligations created by applicable laws or regulations that would arise regardless of whether the right or obligation is included in the contractual arrangement

In the Basis for Conclusions to the ED, the Board explains that: “These contractual rights and obligations are subject to negotiation and agreement between the parties to the contract and, therefore, can be modified by mutual agreement. In contrast, a right or obligation solely created by laws or regulations applies to all similar instruments and cannot be negotiated or modified by the parties to the contract. A change in relevant laws or regulations would affect all instruments subject to those laws or regulations without any action required from the parties to the contract.”⁶⁵

A contractual right or obligation that is not solely created by laws or regulations but is in addition to a right or obligation established by relevant laws or regulations is considered in its entirety in classifying the financial liability or its component parts (rather than being disaggregated into contractual and non-contractual parts).⁶⁶

In certain circumstances, a company might recognise and measure the rights and obligations that it disregarded when classifying a financial instrument as a financial liability or an equity instrument, applying other IFRS accounting standards.⁶⁷ For example, IAS 37 might apply.

However, in July 2025, the Board tentatively decided to withdraw the requirements proposed in the Exposure Draft related to the effects of relevant laws or regulations on the classification of financial instruments.⁶⁸

How we see it

While the ED and its Basis for Conclusions do not explicitly discuss mandatory tender offers, the proposed requirements (if finalised) on the effects of laws or regulations have potential to impact the determination of whether and, if so, at what point a mandatory tender offer gives rise to a contractual obligation to purchase equity, and hence a financial liability is recognised under IFRS accounting standards. The assessment is likely to depend on the precise contractual terms of the offer made and the legal or regulatory requirements that govern the offer.

However, particularly given the Board’s recent tentative decision to withdraw these proposed requirements, we believe there is likely to remain diversity over this assessment and it is not precluded to account by analogy in the same way as if the transaction gave rise to a contractual NCI put. See section 6.2.4 above.

See section 7.3 above, Chapter 10 and Chapter 43 for further discussion of the FICE project.

7.5 PIR of IFRS 10, IFRS 11 and IFRS 12

In June 2022, the IASB concluded its PIR of IFRS 10, IFRS 11 and IFRS 12 with the publication of the Project Report and Feedback Statement.⁶⁹ Feedback from stakeholders and research undertaken as part of the PIR showed that the requirements set out in the standards are working as intended, are meeting their objectives and that application of the requirements has not given rise to unexpected costs.

The feedback received did raise several matters, including matters that were raised to the IFRS IC in the past and not addressed. However, the IASB has determined that none of these matters are a high or medium priority and that no further action is required as a result of the PIR. If stakeholders require further guidance, they are encouraged to submit questions to the IFRS IC, provided these questions meet the submission criteria.

The PIR assessed the following topics as low priority:

- Subsidiaries that are investment entities
- Transactions that change the relationship between an investor and an investee
- Transactions that involve 'corporate wrappers'
- Collaborative arrangements outside the scope of IFRS 11

And

- Additional disclosures about interests in other entities

The second and third of these topics are relevant to this chapter and are discussed further in sections 3.2 to 3.2.2, sections 3.3.2 to 3.3.2.B, section 3.3.3, sections 7, 7.1 and 7.2 above.

The Board concluded that these topics could be explored if identified as priorities in the next agenda consultation (i.e., the Fourth Agenda Consultation, expected to start in 2025 or 2026).

⁶⁹ [Project Report and Feedback Statement](#): *Post-implementation Review: IFRS 10 Consolidated Financial Statements, IFRS 11 Joint Arrangements, IFRS 12 Disclosure of Interests in Other Entities*, IASB, June 2022. Available on the IFRS Foundation's website.

Appendix B - Defined terms

Extract from IFRS 10

Appendix A Defined terms

consolidated financial statements	The financial statements of a group in which the assets, liabilities, equity, income, expenses and cash flows of the parent and its subsidiaries are presented as those of a single economic entity.
group	A parent and its subsidiaries .
non-controlling interest	Equity in a subsidiary not attributable, directly or indirectly, to a parent .
parent	An entity that controls one or more entities.
subsidiary	An entity that is controlled by another entity.

In addition, the following terms are used throughout this chapter:

- 'NCI' to refer to non-controlling interest(s)
- 'NCI put' to refer to a written put option over non-controlling interest(s)
- 'NCI puts and calls' to refer to written put options and purchased call options over non-controlling interest(s)
- 'Present ownership interest' to include existing legal ownership interests together with potential voting rights and other derivatives that, in substance, already provide existing ownership interests in a subsidiary

Overview

IAS 27 *Separate Financial Statements* prescribes the accounting and disclosure requirements for investments in subsidiaries, joint ventures and associates when an entity prepares separate financial statements. Although IAS 27 does not mandate which entities produce separate financial statements it applies when an entity prepares separate financial statements that comply with IFRS accounting standards.

This chapter deals not only with aspects of the preparation of separate financial statements but also with some of the consequences of common control or group transactions in individual or separate financial statements, and in a set of consolidated financial statements prepared for a sub-group as far as transactions with the ultimate parent or with other entities under common control, other than with respect to business combination under common control (see Chapter 11).

What you need to know

- Separate financial statements are those presented by an entity in which the entity could elect, subject to the requirements in IAS 27, to account for its investments in subsidiaries, joint ventures and associates either at cost, in accordance with IFRS 9 *Financial Instruments*, or using the equity method as described in IAS 28 *Investments in Associates and Joint Ventures*.
- The financial statements of an entity that does not have a subsidiary, associate or joint venture are not 'separate financial statements'.
- When an entity has no subsidiaries, but has investments in joint ventures or associates, there could be differences between separate financial statements and individual financial statements.
- Guidance in IFRS accounting standards for the consequences of common control or group transactions in individual or separate financial statements is limited and incomplete. Whilst such intra-group transactions do not affect the consolidated financial statements of the parent, as they are eliminated during consolidation, they can have a significant impact on the separate or individual financial statements of the parent and/or subsidiaries and/or a set of consolidated financial statements prepared for a sub-group.

1 Separate and individual financial statements

Separate financial statements are defined as follows: [IAS 27.4].

Extract from IAS 27

- 4 The following terms are used in this Standard with the meanings specified:
- Consolidated financial statements** are the financial statements of a group in which the assets, liabilities, equity, income, expenses and cash flows of the parent and its subsidiaries are presented as those of a single economic entity.
- Separate financial statements** are those presented by an entity in which the entity could elect, subject to the requirements in this Standard, to account for its investments in subsidiaries, joint ventures and associates either at cost, in accordance with IFRS 9 *Financial Instruments*, or using the equity method as described in IAS 28 *Investments in Associates and Joint Ventures*.

Generally, the IASB takes the view that the needs of users of financial statements are fully met by requiring entities to consolidate subsidiaries and equity account for associates and joint ventures. However, it is recognised that entities with subsidiaries, associates or joint ventures may wish, or may be required by local law, to present financial statements in which their investments are accounted for on another basis, e.g., as equity investments or under the equity method. [IAS 27.2].

The IASB has collected information about the use of IFRS accounting standards around the world that also provides details on whether different jurisdictions have elected to require or permit entities to present financial statements in accordance with IAS 27.¹

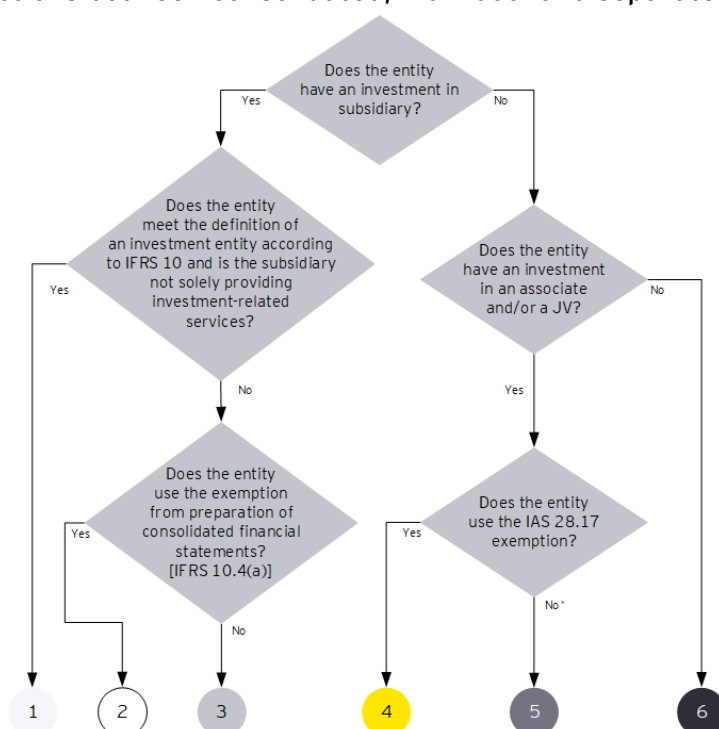

Accordingly, IFRS accounting standards do not require the preparation of separate financial statements. However, when an investor with subsidiaries, associates or joint ventures does prepare separate financial statements purporting to comply with IFRS accounting standards, they must be prepared in accordance with IAS 27. [IAS 27.3].

It follows from the definition of separate financial statements above, that the financial statements of an entity that does not have a subsidiary, associate or joint venture are not 'separate financial statements'. [IAS 27.7].

This chapter also addresses matters that are not exclusive to separate financial statements but relate to any stand-alone financial statements prepared by any entity within a group. We have called these 'individual financial statements', although they may also be referred to (amongst other names) as 'stand-alone', 'solus' or 'single-entity' financial statements. The term 'individual financial statements' for the purpose of this chapter is a term that covers (i) financial statements of entities that do not have investments in associates, joint ventures and subsidiaries, and (ii) financial statements of entities that have only investments in associates and/or joint ventures. When an entity has no investments in associates, joint ventures and subsidiaries in both the current and comparative period, effectively there is no difference between individual and separate financial statements of such an entity.

Figure 1-1 below summarises the interactions between consolidated, individual and separate financial statements. This is further discussed in section 1.1 below.

¹ [Who uses IFRS Accounting Standards?](#), IFRS Foundation's website (accessed 30 September 2023).

Figure 1-1: Interactions between consolidated, individual and separate financial statements**Notes:**

- 1 The entity prepares separate financial statements as its only financial statements. [IAS 27.8A]. In this situation IFRS 10 *Consolidated Financial Statements* would require that investments in subsidiaries, associates and/or joint ventures are accounted for in accordance with IFRS 9. Hence, the cost or equity method would not be available as an accounting policy choice to account for investments in subsidiaries, associates and/or joint ventures in the separate financial statements.
 - 2 If the entity is either not an investment entity, or it is an investment entity and has a subsidiary or subsidiaries that provide(s) investment-related services, the entity prepares consolidated financial statements. If the entity makes use of the exemption from preparing consolidated financial statements, the entity may prepare separate financial statements as its only IFRS financial statements. (See section 1.1 below).
 - 3 If the entity is not an investment entity, or it is an investment entity and has a subsidiary or subsidiaries that provide(s) investment-related services, and the entity has not made use of the exemption from preparing consolidated financial statements, the entity prepares consolidated financial statements. In addition, the entity may prepare separate financial statements.
 - 4 If the entity has an investment in an associate and/or a joint venture and the entity has made use of the exemption from applying the equity method to those investments, the entity may prepare separate financial statements as its only financial statements, in which investments in the associate/joint venture are accounted for at cost or in accordance with IFRS 9.
 - 5 The entity prepares individual financial statements and applies the equity method to its investment in an associate and/or a joint venture. Separate financial statements may be prepared in addition wherein the company may elect a different accounting policy to account for its investment in an associate or a joint venture, such as at cost or in accordance with IFRS 9.
 - 6 When an entity has no investments in subsidiaries, associates or joint ventures, the entity's individual financial statements are identical to the separate financial statements. In certain jurisdictions these individual financial statements may be referred to as separate financial statements due to local Companies Act, or similar, naming conventions. However, as they do not have an investment in either a subsidiary, associate or joint venture, they do not meet the definition of separate financial statements in IAS 27. [IAS 27.7].
- * The entity may, in certain circumstances (e.g., when the investment is held by, or indirectly through, an entity that is a venture capital organisation or mutual fund), elect to measure an investment in an associate or a joint venture at fair value through profit or loss in accordance with IFRS 9. [IAS 28.18]. If the entity elects this policy for all such investments in joint ventures and associates, the financial statements may be referred to as separate financial statements. If the election is not made for one or more investments the financial statements are individual financial statements.

Transactions often take place between a parent entity and its subsidiaries or between subsidiaries within a group that may or may not be carried out at fair value. The objective of IAS 27 is only to prescribe the accounting and disclosure requirements for investments in subsidiaries, joint ventures and associates when an entity prepares separate financial statements. Therefore, there may be uncertainty and ambiguity about how these common control or group transactions should be accounted for. IAS 24 *Related Party Disclosures* requires only that these transactions are disclosed and provides no accounting requirements.

Whilst such transactions do not influence the consolidated financial statements of the ultimate parent (as they are eliminated during consolidation), they can have a significant impact on the individual or separate financial statements of the entities concerned or on the consolidated financial statements prepared for a sub-group.

These issues are discussed in section 4 below.

Differences between the IFRS accounting standards and US GAAP guidance on this topic are not addressed in this chapter as the standards are not converged. Therefore, differences between IFRS accounting standards and US GAAP may exist that are not discussed in this chapter.

1.1 Consolidated financial statements and separate financial statements

A parent is an entity that controls one or more entities. A parent entity, unless exempt, should present consolidated financial statements in which the assets, liabilities, equity, income, expenses and cash flows of the parent and its subsidiaries are presented as those of a single economic entity. [IFRS 10.4, IFRS 10 Appendix A].

Extract from IFRS 10

- 4 An entity that is a parent shall present consolidated financial statements. This IFRS applies to all entities, except as follows:
- (a) a parent need not present consolidated financial statements if it meets all the following conditions:
 - (i) it is a wholly-owned subsidiary or is a partially-owned subsidiary of another entity and all its other owners, including those not otherwise entitled to vote, have been informed about, and do not object to, the parent not presenting consolidated financial statements;
 - (ii) its debt or equity instruments are not traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets);
 - (iii) it did not file, nor is it in the process of filing, its financial statements with a securities commission or other regulatory organisation for the purpose of issuing any class of instruments in a public market; and
 - (iv) its ultimate or any intermediate parent produces financial statements that are available for public use and comply with IFRSs, in which subsidiaries are consolidated or are measured at fair value through profit or loss in accordance with this IFRS.

This exemption is discussed further in Chapter 7. It should be noted that if the entity chooses to prepare consolidated financial statements even if it is exempted from doing so it must comply with all IFRS accounting standards requirements related to consolidated financial statements.

An entity that avails itself of the above exemption may prepare separate financial statements as its only financial statements. [IAS 27.8]. For example, most intermediate holding companies take advantage of this exemption. If such an entity prepares unconsolidated financial statements that are in accordance with IFRS accounting standards, they must comply with the provisions of IAS 27 for such statements and they will then be separate financial statements as defined. The requirements for separate financial statements are dealt with in section 2 below. Certain issues related to timing of issuance of such separate financial statements are also discussed in section 1.1.3. below.

IFRS 10 includes an exception to the consolidation principle for a parent that meets the definition of an investment entity. An investment entity measures its investments in subsidiaries, other than those solely providing services that relate to its investment activities, at fair value through profit or loss in accordance with IFRS 9 instead of consolidating those subsidiaries. The investment entity exception is discussed in Chapter 7. Investment entities measure their investments in those subsidiaries in the same way in their separate financial statements as required in the consolidated financial statements. [IAS 27.11A]. As a result, IAS 27 clarifies that an investment entity that is required, throughout the current period and all comparative periods presented, to apply the exception to consolidation for all its subsidiaries in accordance with IFRS 10.31 presents separate financial statements as its only financial statements. [IAS 27.8A, IFRS 10.31]. An investment entity that prepares separate financial statements as its only financial statements, discloses that fact and presents the disclosures relating to investment entities required by IFRS 12 *Disclosure of Interests in Other Entities* about its interests in subsidiaries. [IAS 27.16A]. The exemption from preparing consolidated financial statements, in criterion (iv) above, is available to a parent entity that is a subsidiary of an investment entity, even when the investment entity does not prepare consolidated financial statements but measures its subsidiaries at fair value through profit or loss. [IFRS 10.BC28A, IFRS 10.BC28B].

The requirements to prepare consolidated and separate financial statements are very often subject to local jurisdictional rules regardless of whether these financial statements are prepared in accordance with local GAAP or IFRS accounting standards. However, IFRS 10 provides specific IFRS requirements which need to be considered when financial statements are prepared on the basis of IFRS accounting standards as issued by the IASB. [IFRS 10.20].

How we see it

If a parent does not prepare IFRS consolidated financial statements due to a concession in local law, the parent could not present separate financial statements in compliance with IFRS accounting standards. This is also further discussed in Chapter 7. See section 1.2 below regarding the interrelationship between IFRS accounting standards and local European law in respect of consolidated and separate financial statements.

IFRS 10 requires a parent to consolidate a subsidiary until the date on which the parent ceases to control the subsidiary. [IFRS 10.20].

How we see it

In our view, consolidated financial statements must be prepared by an entity that was a parent during the reporting period, even if that entity is no longer a parent at the end of the reporting period (e.g., because it disposed of all its subsidiaries).

Entities should consider applicable local regulation requirements governing the preparation of IFRS Financial Statements.

1.1.1 Separate financial statements and interests in associates and joint ventures

IAS 28 must be applied by 'all entities that are investors with joint control of, or significant influence over, an investee'. [IAS 28.2]. IAS 28 requires that an investment in an associate or a joint venture be accounted for in the entity's separate financial statements in accordance with IAS 27.10. [IAS 28.44, IAS 27.10].

An entity that is an investor may present separate financial statements as its only financial statements if it is a parent that is exempt from preparing consolidated financial statements by the scope exemption in IFRS 10.4(a) (see above). [IFRS 10.4(a)]. If it does not have subsidiaries it may still present separate financial statements as its only financial statements if the same criteria as in (i)-(iv) above apply (they are replicated in IAS 28.17) and all its other owners, including those not otherwise entitled to vote, have been informed about, and do not object to, the entity not applying the equity method to its investees. [IAS 28.17].

A parent cannot prepare financial statements in purported compliance with IFRS accounting standards in which subsidiaries are consolidated but associates and joint ventures are not accounted for under IAS 28 but on some other basis (e.g., at cost). Financial statements prepared on such a basis would be neither consolidated financial statements (because of the failure to apply IAS 28) nor separate financial statements (because of the failure to account for subsidiaries on the basis of the direct equity interest).

The conditions for exemption in IAS 28.17 mentioned above are the same as those in IFRS 10. This means that (as illustrated in Figure 1-1 in section 1 above):

- An entity that has subsidiaries and is exempt under IFRS 10 from preparing consolidated accounts is automatically exempt in respect of its associates or joint ventures as well, i.e., it does not account for them under IAS 28.
- An entity that has associates or joint ventures, but no subsidiaries, and does not meet all the exemption criteria in section 1.1 above, is required to apply equity accounting to its associates in its own (non-consolidated) financial statements. Such non-consolidated financial statements include the investment in the associate or joint venture on the basis of the reported results and net assets of the investment. Unless the entity opts to account for all associates or joint ventures using the equity method in its separate financial statements (see section 2.3 below) such non-consolidated financial statements are *not* 'separate financial statements' as defined in IAS 27 (see definition above) and therefore do not have to meet the additional measurement and disclosure requirements required by IAS 27 for separate financial statements that are described in section 3 below to comply with IFRS accounting standards. If such an entity also presents separate financial statements, the Board expects that the entity is likely to account for its investments in associates or joint ventures either at cost or in accordance with IFRS 9. [IAS 27.BC10D].

Although IAS 27 also allows for a policy to use the equity method to account for investments in associates and joint ventures in the separate financial statements, this could be different to some national GAAPs, under which investors that have no subsidiaries (and therefore, do not prepare consolidated financial statements) but have associates or joint ventures, are not permitted to account for their share of the profits and net assets of associates or joint ventures in their statutory financial statements.

How we see it

We believe an entity that has held investments in associates and/or joint ventures during the reporting period is required to prepare individual financial statements at the end of period in which any such investments were sold or otherwise disposed of. This is the case even if they are the only investments of the investor and these investments were sold during the period.

Entities should consider applicable local regulation requirements governing the preparation of IFRS Financial Statements.

1.1.2 Separate financial statements and interests in joint operations

IFRS 11 *Joint Arrangements* differentiates between joint operations and joint ventures. In the separate financial statements, joint ventures are accounted for at cost, in accordance with IFRS 9, or using the equity method as required by IAS 27.10. A joint operator applies paragraphs 20 to 22 of IFRS 11 to account for a joint operation. [IFRS 11.26]. This means that regardless of the type of financial statements prepared, the joint operator in a joint operation recognises in relation to the joint operation its:

- Assets, including its share of any assets held jointly
- Liabilities, including its share of any liabilities incurred jointly
- Revenue from the sale of its share of the output arising from the joint operation
- Share of the revenue from the sale of the output by the joint operation

And

- Expenses, including its share of any expenses incurred jointly [IFRS 11.20]

Similarly, in its individual financial statements, a party that participates in, but does not have joint control of, a joint operation, accounts for its interest as outlined above provided it has rights to the assets and obligations for the liabilities, relating to the joint operation (see Chapter 12). [IFRS 11.23].

In March 2015, the IFRS IC published a number of agenda decisions relating to IFRS 11. The following two are relevant to separate financial statements:²

Frequently asked questions

Question 1-1: How does a joint operator, in its separate financial statements, account for its share of the assets and liabilities of a joint operation when it is structured through a separate vehicle?

The IFRS IC noted that IFRS 11 requires the joint operator to account for its rights and obligations in relation to the joint operation. It also noted that those rights and obligations, in respect of that interest, are the same regardless of whether separate or consolidated financial statements are prepared, by referring to IFRS 11.26. [IFRS 11.26]. Consequently, the same accounting is required in the consolidated financial statements and in the separate financial statements of the joint operator.

The IFRS IC also noted that IFRS 11 requires the joint operator to account for its rights and obligations, which are its share of the assets held by the entity and its share of the liabilities incurred by it. Accordingly, the IFRS IC observed that the joint operator would not additionally (in its separate or consolidated financial statements) account for its shareholding in the separate vehicle, whether at cost or fair value.

² [IFRIC Update](#), March 2015, p.11. Available on the IFRS Foundation's website.

Frequently asked questions

Question 1-2: How does a joint operation that is a separate vehicle account for its share of assets and liabilities in its separate financial statements?

This issue has arisen because the recognition by joint operators in both consolidated and separate financial statements of their share of assets and liabilities held by the joint operation leads to the question of whether those same assets and liabilities should also be recognised in the financial statements of the joint operation itself. The IFRS IC decided not to add the issue to its agenda, because sufficient guidance exists:³

- (a) IFRS 11 applies only to the accounting by the joint operators and not to the accounting by a separate vehicle that is a joint operation.
 - (b) The financial statements of the separate vehicle would therefore be prepared in accordance with applicable Standards.
- And
- (c) Company law often requires a legal entity/separate vehicle to prepare financial statements. Consequently, the reporting entity for the financial statements would include the assets, liabilities, revenues and expenses of that legal entity/separate vehicle. However, when identifying the assets and liabilities of the separate vehicle, it is necessary to understand the joint operators' rights and obligations relating to those assets and liabilities and how those rights and obligations affect those assets and liabilities.

1.1.3 Issuing separate financial statements without consolidated financial statements or financial statements in which investments in associates or joint ventures are equity accounted

IAS 27 does not directly address the issuance requirements for separate financial statements. In some jurisdictions, an entity that prepares consolidated financial statements is prohibited from issuing its separate financial statements without also publishing its consolidated financial statements.

How we see it

In our view, an entity that prepares consolidated financial statements can issue its separate financial statements compliant with IAS 27 without also issuing its consolidated financial statements, provided that certain criteria are met as discussed below.

The same conditions should be applied by an entity having no subsidiaries that prepares financial statements in which investments in associates or joint ventures are equity accounted for but issues its separate financial statements (in which the investments in associates and joint ventures are not equity accounted) without also issuing its financial statements in which investments in associates or joint ventures are equity accounted.

Separate financial statements of a parent entity can also be considered compliant with IAS 27 when the exemption to present consolidated financial statements criteria in IFRS 10.4(a) are met. [IFRS 10.4(a)].

An entity would have to meet the following criteria to issue separate financial statements without also issuing consolidated financial statements:

- (a) The separate financial statements identify the consolidated financial statements prepared under IFRS 10 to which they relate. [IAS 27.17]. In other words, they must draw attention to the fact that the entity also prepares consolidated financial statements and disclose the address where the consolidated financial statements are available, for example, by providing contact details of a person or an e-mail address from which a hard copy of the document can be obtained or a website address where the consolidated financial statements can be found and downloaded.
- And
- (b) The consolidated financial statements have been prepared and approved no later than the date on which the separate financial statements have been approved. Thus, it is not possible to issue the separate financial statements before the consolidated financial statements have been finalised.

³ [IFRIC Update](#), March 2015, p.11. Available on the IFRS Foundation's website.

IAS 27 requires a parent to identify the consolidated financial statements prepared by the parent where the parent is not exempt from preparing consolidated financial statements. [IAS 27.17]. Therefore, if the parent, or ultimate or intermediate parent, has not issued consolidated financial statements prepared in accordance with IFRS accounting standards at the date the separate financial statements are issued, this requirement cannot be met and therefore the separate financial statements cannot be considered to be in compliance with IAS 27. This will also be the case if the consolidated financial statements are prepared, but are not in accordance with IFRS accounting standards (e.g., prepared in accordance with local GAAP).

Frequently asked questions

Question 1-3: Can separate financial statements be issued before the respective consolidated financial statements?

The matter of whether separate financial statements can be issued before the respective consolidated financial statements was explicitly considered by the IFRS IC in March 2006. The IFRS IC concluded that separate financial statements issued before consolidated financial statements could not comply with IFRS accounting standards as issued by the IASB, because “separate financial statements should identify the financial statements prepared in accordance with paragraph 9 of IAS 27 to which they relate (the consolidated financial statements), unless one of the exemptions provided by paragraph 10 is applicable”.⁴ [IAS 27.9, IAS 27.10]. Although IAS 27 has changed since the IFRS IC considered that issue, the current version of IAS 27 still requires separate financial statements to identify financial statements prepared in accordance with IFRS 10, IFRS 11 or IAS 28. [IAS 27.17]. It therefore implies that consolidated financial statements should be available before or at the same date as separate financial statements. However, the situation may be different if local requirements set specific rules relating to the timing of publication of financial statements. This is for example, the case for an entity that is incorporated in the European Union (EU), as described in section 1.2 below.

Whilst the conclusion reached by the IFRS IC is applicable to a parent that prepares consolidated financial statements, there are mixed views about whether it is applicable by analogy to an entity that is exempted from consolidation in accordance with IFRS 10.4(a), or from applying the equity method in accordance with IAS 28.17 and hence, whether these entities may present separate financial statements as their only financial statements (e.g., intermediate holding companies). [IFRS 10.4(a), IAS 28.17]. Some argue that such intermediate holding companies that use the exemption cannot issue their separate financial statements before the IFRS consolidated financial statements of the parent are issued and available for use as they are required to disclose where such consolidated financial statements are obtainable. [IAS 27.16]. Others believe that the parent’s consolidated financial statements must be periodically produced and be available for public use. Due to the lack of clear guidance, the determination of an acceptable approach may need to consider specific facts and circumstances such as local regulatory requirements and the timing between the issuance of the intermediate parent’s separate financial statements and its parent’s consolidated financial statements.

1.2 Entities incorporated in the EU and consolidated and separate financial statements

The EU Regulation on International Accounting Standards requires IFRS accounting standards to be applied by certain entities in their consolidated financial statements. As a result of the EU endorsement mechanism, IFRS accounting standards as adopted by the EU may differ in some respects from the body of Standards and Interpretations issued by the IASB (see Chapter 1). In some circumstances a difference between IFRS accounting standards and IFRS accounting standards as adopted by the European Union may affect separate financial statements.

⁴ [IFRIC Update](#), March 2006, p.7. Available on the IFRS Foundation’s website.

The IFRS IC concluded that separate financial statements issued before consolidated financial statements cannot comply with IFRS accounting standards as issued by the IASB (see Question 1-3 in section 1.1.3 above). However, in January 2007 the European Commission stated that “the Commission Services are of the opinion that, if a company chooses or is required to prepare its annual accounts in accordance with IFRS accounting standards as adopted by the EU, it can prepare and file them independently from the preparation and filing of its consolidated accounts - and thus in advance, where the national law transposing the Directives requires or permits separate publication”.⁵ In other words, under ‘IFRS accounting standards as adopted by the EU’ it may be possible to issue separate financial statements before the consolidated financial statements are issued. The details about differences between scope of consolidation under IFRS 10 and European Union national legislation are described in Chapter 7.

5 Agenda paper for the meeting of the Accounting Regulatory Committee on 2nd February 2007 (document ARC/08/2007), Subject: Relationship between the IAS Regulation and the 4th and 7th Company Law Directives - Can a company preparing both individual and consolidated accounts in accordance with adopted IFRS issue the individual accounts before the consolidated accounts?, European Commission: Internal Market and Services DG: Free movement of capital, company law and corporate governance: Accounting/PB D(2006), 15 January 2007, para. 3.1.

2 Requirements of separate financial statements

In separate financial statements, investments in subsidiaries, associates and joint ventures are accounted for either:

- At cost (see section 2.1 below)
- In accordance with IFRS 9 (see section 2.2 below)

Or

- Using the equity method as described in IAS 28 (see section 2.3 below)

The above applies to all situations except when such investments are classified as held for sale (or included in a disposal group that is classified as held for sale) in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*. When this is the case, investments in subsidiaries, associates and joint ventures that are accounted for at cost, or using the equity method in the separate financial statements, are measured in accordance with IFRS 5, [IAS 27.10], i.e., at the lower of carrying amount and fair value less costs to sell (see Chapter 5). Investments that are accounted for in accordance with IFRS 9 in the separate financial statements and which are classified as held for sale continue to be measured in accordance with IFRS 9 (see Chapter 5).

Each 'category' of investment must be accounted for consistently. [IAS 27.10].

'Category' is not defined in IFRS accounting standards but is used in a number of Standards. For example, IFRS 7 *Financial Instruments: Disclosures* uses 'category' to refer to groupings of financial assets and financial liabilities that are measured in different ways - for example, financial assets measured at fair value through profit or loss is one category of financial asset and financial assets measured at amortised cost is another category of financial asset. While acknowledging this in the Basis for Conclusions of the Annual Improvements 2014 - 2016 Cycle issued in 2016, the IASB clarified that paragraph 10 of IAS 27 should not be read to mean that, in all circumstances, all investments in associates are one 'category' of investment, and that all investments in joint ventures are one 'category' of investment. Accordingly, determining multiple categories for each class of investments is not precluded under IFRS accounting standards in all circumstances.

Furthermore, while the Annual Improvements 2014-2016 cycle and the related Basis for Conclusions refer to investments in associates and joint ventures, rather than investments in subsidiaries, the same logic could be extended to investments in subsidiaries, given that the accounting treatment of all these investments in the separate financial statements of the parent entity is defined in the same paragraph 10 of IAS 27.

When an entity applies the concept of category more granularly, the determination of categories should be based on clear and objective criteria that results in information that is relevant and reliable. An entity could consider, for instance, the guidance in IFRS 7 above or its business model as in the case of investment entities (as discussed below). However, we believe that in identifying categories more granularly an entity shall not consider in isolation only a few criteria such as an investments geography or type of products sold. Judgement is exercised to define criteria to identify categories more granularly.

In applying a consistent policy to each category of investment, we believe IAS 27 would consider the categorisation of investments in subsidiaries, separate to associates and joint ventures; therefore, categorisation and the measurement of similar categories does not need to be consistent between classes of investments.

How we see it

While 'category' is not defined, we believe that investments in subsidiaries, associates, and joint ventures can be further divided into more granular categories, only if a category can be defined clearly and objectively and results in information that is relevant and reliable.

Judgement is exercised to define criteria to identify categories more granularly and should be consistently applied.

When an investment in an associate or joint venture is accounted for in accordance with IFRS 9 in the consolidated financial statements, it must also be accounted for in the same way in the separate financial statements. [IAS 27.11]. The circumstances in which IFRS 9 is applied to account for investments in associates and joint ventures in consolidated financial statements are discussed in Chapter 12 and Chapter 13, respectively.

A parent that meets the definition of an investment entity is required to measure its investments in particular subsidiaries at fair value through profit or loss in accordance with IFRS 9 in its consolidated financial statements, [IFRS 10.31], and is required to account for them in the same way in the separate financial statements. [IAS 27.11A]. When an investment entity parent has shares in subsidiaries that only provide investment related services (and therefore are not subject to mandatory fair value measurement), that parent effectively has shares in two categories of subsidiaries. It therefore, has an accounting policy choice to account for those subsidiaries that only provide investment related services at cost, in accordance with IFRS 9, or using the equity method in its separate financial statements.

When an entity becomes an investment entity, the difference between the previous carrying value of the investment in a subsidiary and its fair value at the date of change in status of the parent is recognised as a gain or loss in profit or loss. When a parent ceases to be an investment entity, it should follow IAS 27.10 and account for the investment in a subsidiary either at cost (the then fair value of the subsidiary at the date of the change in the status becomes the deemed cost), continue to account for the investment in accordance with IFRS 9, or apply the equity method. [IAS 27.10, IAS 27.11B].

IAS 27 contains specific requirements related to the treatment of dividends from investments in subsidiaries, joint ventures or associates. Such dividends are recognised in profit or loss unless the entity elects to use equity method, in which case the dividend is recognised as a reduction of the carrying amount of the investment. [IAS 27.12]. IAS 36 *Impairment of Assets* includes specific triggers for impairment reviews on receipt of such dividends. These are discussed in section 2.4.1 below.

2.1 Cost method

There is no general definition or description of 'cost' in IAS 27. How the term applies in practice is described in section 2.1.1 below.

IAS 27 addresses the cost of investment in a new holding company that becomes the parent of an existing parent in a one-for-one share exchange. This is discussed further in sections 2.1.1.E and 2.1.1.F below.

IAS 27 also indicates that when an entity ceases to be an investment entity and its accounting policy is to account for investments in subsidiaries, associates or joint ventures at cost, the fair value as at the date of the change in status shall be used as the deemed cost. [IAS 27.11B].

IFRS 1 *First-time Adoption of International Financial Reporting Standards* allows use of a 'deemed cost' as a transitional exemption for those applying IFRS accounting standards for the first time in separate financial statements (see section 2.1.2 below).

2.1.1 Cost of investment

IAS 27 does not define what is meant by 'cost' except in the specific circumstances of certain types of group reorganisations, described below, and when an entity ceases to be an investment entity and accounts for investments in subsidiaries at cost as indicated above.

'Consideration given' is likewise not defined.

As discussed further in Chapter 3, IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* states that, in the absence of specific requirements in IFRS accounting standards, management should first refer to the requirements and guidance in IFRS accounting standards that deal with similar and related issues.

The glossary to IFRS accounting standards defines cost as "the amount of cash or cash equivalents paid or the fair value of the other consideration given to acquire an asset at the time of its acquisition or construction".

How we see it

When considering what is meant by 'cost' in IAS 27 we believe that in applying IAS 8 the key sources of guidance in IFRS accounting standards are:

- 'Consideration transferred' in the context of a business combination, as referred to in paragraph 37 of IFRS 3 *Business Combinations*
- 'Cost' as applied in relation to acquisitions of property, plant and equipment in accordance with IAS 16 *Property, Plant and Equipment*, intangible assets in accordance with IAS 38 *Intangible Assets* and investment property in accordance with IAS 40 *Investment Property*
- And
- 'Cost' in the context of determination of the cost of an investment in an associate as discussed in the agenda decision issued by the IFRS IC in July 2009

Applying the requirements of IFRS 3, the 'consideration transferred' in a business combination comprises the sum of the acquisition-date fair values of assets transferred by the acquirer, liabilities incurred by the acquirer to the former owners of the acquiree, and equity interests issued by the acquirer. [IFRS 3.37]. This includes any liability (or asset) for contingent consideration, which is measured and recognised at fair value at the acquisition date. Subsequent changes in the measurement of the changes in the liability (or asset) are recognised in profit or loss (see Chapter 10).

'Cost' as applied in relation to acquisitions of property, plant and equipment is the amount of cash or cash equivalents paid, or the fair value of the other consideration given, to acquire an asset at the time of its acquisition or construction or, where applicable, the amount attributed to that asset when initially recognised in accordance with the specific requirements of other IFRS accounting standards, e.g., IFRS 2 *Share-based Payment*. [IAS 16.6].

The IFRS IC and IASB have discussed the topic *Variable payments for the separate acquisition of PPE and intangible assets* for a few years, attempting to clarify how the initial recognition of the variable payments, such as contingent consideration, and subsequent changes in the value of those payments should be recognised. The scope of the past deliberations did not specifically include the cost of an investment in a subsidiary, associate, or joint venture. However, as they considered general principles about the recognition of variable payments, we believe they can also be considered relevant in determining the cost of such investments.

There was diversity of views about whether the liability for contingent consideration relating to the separate acquisition of property, plant and equipment and intangible assets falls within the scope of IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* or within the scope of IAS 39 *Financial Instruments: Recognition and Measurement* (this is still relevant after IFRS 9 adoption as well). This diversity of views affects the initial recognition and subsequent accounting for changes in the value of the contingent consideration. The issue was discussed by the IFRS IC in the past however it was considered too broad to be addressed and was referred to the IASB.⁶

A critical step in analysing the accounting for variable or contingent consideration in a transaction to acquire an investment in the scope of IAS 27 is to fully understand the contractual arrangements, understanding the nature of the contingent or variable payments. This includes developing a full understanding of whether those contingent payments are linked to the initial value of the asset, or to its future performance, whether the contingency or variability is within or outside of the purchaser's control and whether the variable payment is a payment for some other goods or services from the seller. In some cases, the contract may establish an obligation for the contingent payment at the outset, whilst in others it might be determined that the arrangement is an executory contract, and the liability to make the contingent payments is only recognised later once either party fulfils its obligations under the contract.

The two key issues with regards to the accounting for variable consideration in an asset purchase are 1) whether and when to recognise a liability for that variable consideration, and 2) whether subsequent changes to the estimate of variable or contingent consideration should be accounted for as part of the cost of the acquired asset (see Chapter 19).

Looking at the first question of when a liability to make variable or contingent payments would be recognised, if the arrangement is not considered to be an executory contract, one consideration is whether those payments are dependent on the entity's future activity, or not. IAS 32.25 stipulates that where the contingency is outside the control of both the issuer and the holder, a contingent obligation to deliver cash meets the definition of a financial liability (see Chapter 43). Therefore, if the obligation to make the variable payment does not depend on the acquiring entity's future activity, it would seem appropriate to recognise a financial liability in respect of the contingent amounts. [IAS 32.25]. However, it is acknowledged that whilst this view was tentatively agreed during the course of the IFRS IC discussions on the topic, ultimately, this was not clarified or confirmed as part of the final agenda decision. Furthermore, the final agenda decision notes that there are questions about the accounting for variable payments subsequent to the purchase of the asset, and in making that statement the IFRS IC did not distinguish between the different types of variable payments.

⁶ [IFRIC Update](#), March 2016, p.5. Available on the IFRS Foundation's website.

How we see it

In light of the discussions held by the IFRS IC and the absence of clear guidance in the final agenda decision, entities will need to develop and apply an accounting policy in respect of whether and when the obligation to make contingent payments is recognised as a liability. In doing so, entities will need to apply the hierarchy in IAS 8. The policy selected should result in information that is relevant and reliable in the particular circumstances and must be consistently applied to similar transactions. Different payments may have different types of variability. Therefore, it might be appropriate for an entity to have different policies for dissimilar transactions.

If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

As described above, there is no explicit guidance on the treatment of variable or contingent consideration in the acquisition of an asset and there is diversity in practice for these types of arrangements. Therefore, examples of some accounting policies an entity may want to consider regarding initial recognition of the asset include the following:

- The cost of the asset on initial recognition includes the fair value of all variable or contingent consideration at the date of acquisition. A corresponding liability is recognised for the same amount.
- The cost of the asset on initial recognition excludes any variable or contingent payments. Accordingly, no liability is recognised for those contingent or variable amounts.

The second question that needs to be addressed is how the entity accounts for subsequent payments and changes to the estimate of variable or contingent consideration. Depending on the facts and circumstances of the arrangement an entity may determine that:

- 1) Variability arises from exchange rates, time value of money, or embedded derivatives - Changes in the carrying amount of a recognised liability that arise from exchange rates are accounted for in accordance with IAS 21 *The Effects of Changes in Foreign Exchange Rates* and IFRIC 22 *Foreign Currency Transactions and Advance Consideration*, while the time value of money and embedded derivatives are accounted for in accordance with IFRS 9;
- 2) Variability is directly linked to the quality or quantity of the asset(s) received - In these cases the initial recognition of the asset and liability were based on an accounting estimate that is subsequently updated in accordance with IAS 8.37; or
- 3) The variability in the arrangement does not fall under (1) or (2) above and an accounting policy needs to be developed to address it.

In the latter case, an entity will need to apply the requirements of IAS 8 to develop an accounting policy that it should apply consistently to all similar transactions. The accounting policy developed will need to address whether the change in the estimate of variable or contingent consideration should be capitalised as part of the cost of the asset or expensed. This determination is usually based on the reason for the contingent payment and entities should consider the substance of the arrangement in determining the appropriate treatment.

How we see it

Until this matter is resolved by the IASB, where the accounting for the variability or contingency is not prescribed in another standard, an entity should adopt and apply a consistent accounting policy in relation to whether subsequent payments or changes to the measurement of a recognised liability to make contingent or variable payments are included as part of the cost of the investment or expensed as incurred, in accordance with the hierarchy in IAS 8.

An entity should exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in the particular circumstances.

If information about the selected accounting policy is expected to be material to users of the financial statements, that accounting policy information should be disclosed.

Similar challenges to the above arise when the seller in a business combination contractually agrees to indemnify the acquirer for the outcome of a contingency or uncertainty related to all or part of a specific asset or liability (see Chapter 10). Such indemnification agreements often relate to uncertain tax positions or litigations. Whilst there is guidance about how to deal with the resulting indemnification assets in the consolidated financial statements of the acquirer, there is no comparable guidance about the accounting of such indemnification agreements in the separate financial statements of the acquirer.

How we see it

We believe that as these indemnification assets have some similarities to contingent consideration, an entity can apply the guidance explained in the box above by analogy in developing its accounting policy for indemnification agreements.

Contingent consideration is discussed in relation to intangible assets, property, plant and equipment and investment property in Chapter 18, Chapter 19 and Chapter 20 respectively.

Frequently asked questions

Question 2-1: How are transaction costs relating to the acquisition of an investment in a subsidiary, associate or joint venture treated in the separate financial statements?

In July 2009, the IFRS IC discussed the determination of the initial carrying amount of an equity method investment, which under IAS 28 is at cost, and noted that IFRS accounting standards consistently require assets not measured at fair value through profit or loss to be measured on initial recognition at cost. Generally stated, 'cost' includes the purchase price and other costs directly attributable to the acquisition or issuance of the asset such as professional fees for legal services, transfer taxes and other transaction costs.⁷

How we see it

Given that IAS 27 does not separately define 'cost', we believe it is appropriate to apply a general meaning of 'cost' in determining the cost of investments in subsidiaries, associates or joint ventures in separate financial statements based on the IFRS IC discussion in July 2009. Consequently, we believe that the cost of investment in a subsidiary in the separate financial statements includes any transaction costs incurred even though such costs are expensed in the consolidated financial statements.

2.1.1.A Investments acquired for own shares or other equity instruments

This section relates to the acquisition of an investment in exchange for own shares and other equity instruments. Guidance on the acquisition of an investment in exchange for an owned investment is dealt in section 4.4.1.B below. Transfers of assets in group restructuring arrangements may fall in the scope of IFRS 2 (see Chapter 30); further guidance is also included in section 4.4.1 below in this Chapter.

In some jurisdictions, local law may permit investments acquired for an issue of shares to be recorded at a notional value (for example, the nominal value of the shares issued). In our view, this is not an appropriate measure of 'cost' under IFRS accounting standards.

How we see it

In our view, an investment in a subsidiary, associate or joint venture acquired in exchange for an issue of shares or other equity instruments is recorded at the fair value of the consideration given (being the fair value of equity instruments issued) or the assets received, if that could be more reliably measured, together with directly attributable transaction costs.

A transaction in which an investment in a subsidiary, associate or joint venture is acquired in exchange for an issue of shares or other equity instruments is not specifically addressed under IFRS accounting standards, since it falls outside the scope of both IFRS 9 and IFRS 2 (see Chapter 30).

2.1.1.B Investments acquired in common control transactions

An investment in a subsidiary, associate or joint venture could also be acquired in a common control transaction. Section 4.4.1 below discusses transactions between entities under common control involving non-monetary assets, while section 4.4 below discusses the concept of substance that can be relevant when analysing similar transactions.

⁷ [IFRIC Update](#), July 2009, p.3. Available on the IFRS Foundation's website.

How we see it

When an investment in a subsidiary, associate or joint venture is acquired in a common control transaction, in our view, the cost is generally measured at the fair value of the consideration given (be it cash, other assets or additional shares) plus, where applicable, any costs directly attributable to the acquisition. However, when the purchase consideration does not correspond to the fair value of the investment acquired, in our view, the acquirer has an accounting policy choice to account for the investment at the fair value of consideration given or can impute an equity contribution or dividend distribution and in effect account for the investment at its fair value.

Illustration 2-1 below illustrates the determination of the cost of an investment in a subsidiary in separate financial statements as described above.

Illustration 2-1: Cost of a subsidiary in separate financial statements when the pooling of interest method is applied in consolidated financial statements

Parent has a 100% direct interest in Sub 1 and Sub 2. As part of a group reorganisation, the parent transfers its direct interest in Sub 2 to Sub 1 in exchange for consideration of:

Scenario 1 - CU200 (equal to the fair value of Sub 2).

Scenario 2 - CU150.

The carrying amount of the investment in Sub 2 in the separate financial statements of Parent is CU50. The carrying amount of Sub 2's net assets in the separate financial statements of Sub 2 is CU110.

Sub 1 accounts for the acquisition of Sub 2 using the pooling of interest method in its consolidated financial statements.

In Scenario 1, the cost of an investment in a subsidiary that is acquired as part of a group reorganisation is the fair value of the consideration given (be it cash, other assets, or additional shares), plus, where applicable, any costs directly attributable to the acquisition. Therefore, the cost to Sub 1 is CU200. The cost is not the carrying amount of the investment in Sub 2 in the separate financial statements of Parent (i.e., CU50), nor the carrying amount of Sub 2's net assets in the separate financial statements of Sub 2 (i.e., CU110).

In Scenario 2, the conclusion in Scenario 1 applies even if the fair value of the consideration given is less than the fair value of the acquiree. Therefore, the cost of investment is CU150. However, the acquirer may choose to recognise an equity element (equity contribution). In this case, the cost of investment is CU200 with CU50 recognised as an equity contribution.

Frequently asked questions

Question 2-2: How does a new intermediate parent established within a group determine the cost of its investments in subsidiaries when it accounts for those investments at cost in accordance with IAS 27.10(a)?

In July and September 2011, the IFRS IC discussed group reorganisations in separate financial statements in response to a request asking for clarification on how entities that are established as new intermediate parents within a group determine the cost of their investments in subsidiaries when they account for those investments at cost in accordance with IAS 27.10(a). In the agenda decision issued, the IFRS IC noted that the normal basis for determining the cost of an investment in a subsidiary under IAS 27.10(a) has to be applied to reorganisations that result in the new intermediate parent having more than one direct subsidiary.⁸ [IAS 27.10(a)].

Some have read this to mean that 'the normal basis for determining the cost of investment' in a common control transaction is not restricted to using the fair value of the consideration given, but that another basis for determining cost may be appropriate.

How we see it

One situation when we believe that it would be acceptable not to use the fair value of the consideration given is for a common control transaction in which an investment in a subsidiary constituting a business is acquired in a share-for-share exchange. In that circumstance, we believe that it is also acceptable to measure the cost based on the carrying amount of the investment in the subsidiary in the transferor entity's separate financial statements immediately prior to the transaction, rather than at the fair value of the shares given as consideration. This approach is conceptually based on the pooling of interest approach that is allowed for business combinations under common control (see Chapter 11).

⁸ [IFRIC Update](#), September 2011, p.3. Available on the IFRS Foundation's website.

Common control transactions are discussed further in section 4 below. There are specific measurement requirements applicable to certain arrangements involving the formation of a new parent or intermediate parent, which are described in sections 2.1.1.E and 2.1.1.F below.

2.1.1.C Cost of investment in subsidiary, associate or joint venture acquired in stages

It may be that an investment in a subsidiary, associate or joint venture is acquired in stages and that, up to the date on which control, significant influence or joint control is first achieved, the initial investment was accounted for at fair value under IFRS 9. This raises the question of what the carrying amount should be in the separate financial statements when the cost method is applied.

Frequently asked questions

Question 2-3: How does an entity account for an acquired additional interest in the investee (that is not an associate, joint venture, or subsidiary of the entity) which results in the entity obtaining control of the investee i.e., the investee becomes a subsidiary of the entity?

In January 2019, the IFRS IC discussed the following fact pattern: the entity holds an initial investment in another entity (investee) that is an investment in an equity instrument as defined in paragraph 11 of IAS 32 *Financial Instruments: Presentation*; the investee is not an associate, joint venture or subsidiary of the entity and, accordingly, the entity applies IFRS 9 in accounting for its initial investment (initial interest). Subsequently the entity acquires an additional interest in the investee (additional interest), which results in the entity obtaining control of the investee, i.e., the investee becomes a subsidiary of the entity.

The IFRS IC observed that IAS 27 does not define 'cost', nor does it specify how an entity determines the cost of an investment acquired in stages and concluded that a reasonable reading of the requirements in IFRS accounting standards could result in the application of either one of the following two approaches:

- **Approach 1 *Fair value as deemed cost approach***

Under this approach, the transaction is viewed as if the entity is exchanging its initial interest (plus consideration paid for the additional interest) for a controlling interest in the investee (exchange view). As a result, the cost of investment will be determined as the fair value of the initial interest at the date of obtaining control of the subsidiary, plus any consideration paid for the additional interest.

- **Approach 2 *Accumulated cost approach***

Under this approach, the transaction is viewed as if the entity is purchasing the additional interest while retaining the initial interest (non-exchange view). As a result, the cost of investment will be determined as the consideration paid for the initial interest (original consideration), plus any consideration paid for the additional interest.

In the exchange view the step acquisition transaction is considered a significant economic event - this is because an entity obtains control. The parallel can be drawn, for example, to a business combination achieved in stages, [IFRS 3.BC384], or an entity that ceases to be an investment entity. [IFRS 10.BC271]. In these situations, the fair value of the existing investment is deemed to be the consideration paid at the date of the transaction or event.

Alternatively, the accumulated cost approach considers both the initial acquisition of an interest that is neither an interest in a subsidiary, an associate or a joint venture, and the acquisition of the controlling stake to be separate transactions.

The application of either one of the two approaches is an accounting policy choice and hence it should be applied consistently to all step acquisition transactions. The selected approach is disclosed in accordance with requirements of paragraphs 117-124 of IAS 1 *Presentation of Financial Statements*. [IAS 1.117-124].

Although both approaches are acceptable, the IFRS IC decided to report to the Board that, in their view, the fair value as deemed cost approach would provide more useful information to users of financial statements than the accumulated cost approach.⁹

The IFRS IC also considered how an entity should account for any difference between the fair value of the initial interest at the date of obtaining control and its original consideration when applying the accumulated cost approach. The IFRS IC concluded that the difference meets the definitions of income or expense in the *Conceptual Framework for Financial Reporting*. Accordingly, the IFRS IC concluded that, the entity recognises this difference in profit or loss, regardless of whether, before obtaining control, the investment had been measured at fair value through profit and loss or fair value through other comprehensive income, in accordance with IAS 1.88. [IAS 1.88].

⁹ [IFRIC Update](#), January 2019, p.8. Available on the IFRS Foundation's website.

The two approaches are further explained in the following Illustration 2-2:

Illustration 2-2: Cost of a subsidiary acquired in stages

Entity A has a 10% interest in Entity B, which it acquired in January 20X2 for CU300. This investment is a financial asset measured at fair value in accordance with IFRS 9, in both the consolidated and separate financial statements of Entity A for the six months ended 30 June 20X2. On 1 July 20X2, Entity A acquires a further 45% interest in Entity B for CU2,160 (its then fair value), giving Entity A control over Entity B. The original 10% interest has a fair value of CU480 at that date. In addition, transaction costs were incurred amounting to CU50.

Approach 1 - Fair value as deemed cost approach

The cost of investment after both transactions is the sum of the fair value of the initial interest at the date of obtaining control of the subsidiary plus any consideration paid for the additional interest plus transaction costs - CU2,690 (CU480 + CU2,160 + CU50).

Approach 2 - Accumulated cost approach

The cost of investment after both transactions is the sum of the consideration given for each tranche plus transaction costs - CU2,510 (CU300 + CU2,160 + CU50). The reversal of increase in the fair value of CU180 (CU480 - CU300) relating to the initial 10% interest is recognised in profit or loss, regardless of whether the entity accounted for the initial interest at fair value through other comprehensive income or at fair value through profit or loss.

If changes to the carrying amount of the investment had resulted from an impairment charge, this charge may not necessarily be reversed. This is because the investment must still be considered for impairment in the separate financial statements of the investor.

How we see it

Although the January 2019 agenda decision discussed above does not deal with IAS 28, we believe that based on this agenda decision, the fair value as deemed cost approach and the accumulated cost approach could also be applied by analogy to step acquisition transactions in which an existing investment accounted for under IFRS 9 subsequently becomes an associate or a joint venture, to which the equity method is applied.

2.1.1.D Investment in a subsidiary accounted for at cost: partial disposal

An entity that accounts for its investments in subsidiaries at cost in accordance with IAS 27.10 may dispose of parts of its investment in a subsidiary so that following the disposal the entity either maintains control or has joint control or significant influence over the investee. This raises the question of how the carrying amount of the retained interest should be determined in the separate financial statements.

How we see it

When the cost method is applied to all investments in subsidiaries, associates, and joint ventures we believe that no remeasurement of cost should occur on reclassification between types of investments. As a result, the change in the carrying amount of the investment should be proportionate to the part disposed of.

IAS 27 does not define cost (see section 2.1 above) and consequently there is no specific guidance on how to calculate the cost of investments in subsidiaries for derecognition purposes. IFRS 9 also contains no specific guidance for the purpose of derecognition of financial assets. Under IAS 39, which was also silent on this topic, entities chose between three cost allocation methods for available-for-sale securities: the average cost method, the first-in-first-out (FIFO) method, or the specific identification method. Specific identification can be applied if the entity is able to identify the specific items sold and their costs. For example, a specific security may be identified as sold by linking the date, amount and cost of securities bought with the sale transaction, provided that there is no other evidence suggesting that the actual security sold was not the one identified under this method.

How we see it

We believe that, in the absence of specific guidance, entities can elect to apply a FIFO approach, a specific identification method, or the average cost method constituting acceptable accounting policy choices to be applied consistently (see Chapter 47).

If, following the disposal, the entity has neither control, joint control nor significant influence over the investee, a question arises as to how the carrying amount of the retained interest should be determined in the separate financial statements.

Frequently asked questions

Question 2-4: How is a transaction accounted for when an entity disposes of part of its investment in a subsidiary, that was previously accounted for at cost in accordance with IAS 27.10, and following the disposal the entity has neither control, joint control nor significant influence over the investee?

In January 2019, the IFRS IC concluded that IAS 27.9 requires an entity to apply all applicable IFRS accounting standard in preparing its separate financial statements, except when accounting for investments in subsidiaries, associates and joint ventures to which IAS 27.10 applies.¹⁰ [IAS 27.9, IAS 27.10]. After the partial disposal transaction, the investee is not a subsidiary, associate, or joint venture of the entity. Accordingly, the entity applies IFRS 9 for the first time in accounting for its retained interest in the investee. The IFRS IC observed that the presentation election in IFRS 9.4.1.4 applies at initial recognition of an investment in an equity instrument, which permits the holder of particular investments in equity instruments to present subsequent changes in fair value in other comprehensive income. [IFRS 9.4.1.4]. Therefore, an investment in an equity instrument within the scope of IFRS 9 is eligible for the election if it is neither held for trading (as defined in Appendix A of IFRS 9) nor contingent consideration recognised by an acquirer in a business combination to which IFRS 3 applies.

Assuming the retained interest is not held for trading in the fact pattern discussed by the IFRS IC:

(a) The retained interest is eligible for the presentation election in IFRS 9.4.1.4

And

(b) The entity would make this presentation election when it first applies IFRS 9 to the retained interest (i.e., at the date of losing control of the investee)¹¹

Any difference between the cost of the retained interest and its fair value on the date the entity loses control of the investee meets the definitions of income or expense in the *Conceptual Framework for Financial Reporting*. Accordingly, the IFRS IC concluded that, applying IAS 1.88, the entity recognises this difference in profit or loss. [IAS 1.88]. This is the case regardless of whether the entity presents subsequent changes in fair value of the retained interest in profit or loss or other comprehensive income. The IFRS IC also noted that its conclusion is consistent with the requirements in IAS 28.22(b) and IAS 27.11B, which deal with similar and related issues. [IAS 28.22(b), IAS 27.11B].

The application of the IFRS IC's conclusion is explained in the following Illustration 2-3:

Illustration 2-3: Partial disposal of a subsidiary accounted for at cost when an investor retains an interest that is neither a subsidiary, associate nor joint venture

Entity A has a 60% interest in Entity B, which it acquired for CU2,700 in 20X0. This investment is measured at cost of CU2,700 in the separate financial statements of Entity A at 30 June 20X3. On 1 July 20X3, Entity A sells a 50% interest in Entity B for CU3,000 (its then fair value) and retains a 10% interest in Entity B. The fair value of the 10% interest is CU600 at that date. As the retained interest is not held for trading, the entity elects to account for the retained interest at fair value through other comprehensive income. The total gain from the partial disposal to be recognised in profit or loss amounts to CU900 (CU3,000 + CU600 - CU2,700).

2.1.1.E Formation of a new parent

IAS 27 has the following specific guidance when a new parent is formed above an existing parent: [IAS 27.13]

Extract from IAS 27

- 13 When a parent reorganises the structure of its group by establishing a new entity as its parent in a manner that satisfies the following criteria:
- (a) the new parent obtains control of the original parent by issuing equity instruments in exchange for existing equity instruments of the original parent;
 - (b) the assets and liabilities of the new group and the original group are the same immediately before and after the reorganisation; and
 - (c) the owners of the original parent before the reorganisation have the same absolute and relative interests in the net assets of the original group and the new group immediately before and after the reorganisation,
- and the new parent accounts for its investment in the original parent in accordance with paragraph 10(a) in its separate financial statements, the new parent shall measure cost at the carrying amount of its share of the equity items shown in the separate financial statements of the original parent at the date of the reorganisation.

The same guidance is also applicable if the entity that puts a new parent between it and the shareholders is not itself a parent, i.e., it has no subsidiaries. In such cases, references in the three conditions to 'original parent' and 'original group' are to the 'original entity'. [IAS 27.14].

The types of reorganisation to which these requirements apply involves an existing entity and its shareholders agreeing to create a new parent between them without changing either the composition of the group or their own absolute and relative interests. This is not a general rule that applies to all common control transactions. Transfers of subsidiaries from the ownership of one entity to another within a group are not within the scope. The IASB deliberately excluded extending the amendment to other types of reorganisations or to common control transactions more generally because of its plans, now superseded as described below, to address this in its project on common control transactions. [IAS 27.BC27].

The formation of a new parent - calculating the cost and measuring equity is further discussed in section 2.1.1.F below.

The IASB in December 2012 identified business combinations under common control as a priority research project. In June 2014, the Board tentatively decided that the research project should consider business combinations under common control and group restructurings.¹² The Discussion Paper *Business Combinations under Common Control* was issued for public comment in November 2020.¹³ The Discussion Paper does not address how a receiving company should report in its separate financial statements an investment in a subsidiary received in a business combination under common control as this topic is addressed by IAS 27.¹⁴ However, if the combination involves the transfer of an unincorporated business, the possible reporting requirements developed in this project would also apply in separate financial statements prepared by the receiving company. In April 2024, the IASB published a project summary that explained the reasons behind its decision in November 2023 not to develop requirements for reporting business combinations under common control; namely, the IASB acknowledged that information needed by investors varied among jurisdictions, making it difficult to develop requirements that would meet the information needs of users globally. Furthermore, the IASB acknowledged that diversity in reporting on business combinations under common control would continue and observed that investors said that they can work with this diversity.

This implies that entities - in the absence of authoritative guidance issued by the IASB - will continue to account for such common control transactions in accordance with their accounting policies (see section 4.4 below and Chapter 11).

¹² [IASB Update](#), June 2014, p.9. Available on the IFRS Foundation's website.

¹³ Discussion Paper [DP/2020/2: Business Combinations under Common Control](#), IASB, November 2020. Available on the IFRS Foundation's website.

¹⁴ Discussion Paper [DP/2020/2: Business Combinations under Common Control](#), IASB, November 2020, 1.23, p.19. Available on the IFRS Foundation's website.

As well as the establishment of a new ultimate parent of a group, arrangements that could meet the criteria in IAS 27.13, [IAS 27.13], mentioned above include the following:

- (a) Reorganisations in which the new parent does not acquire all classes of the equity instruments issued by the original parent.

For example, the original parent may have preference shares that are classified as equity in addition to ordinary shares; the new parent does not have to acquire the preference shares for the transaction to be within scope. [IAS 27.BC24(a)].

- (b) A new parent obtains control of the original parent without acquiring all the ordinary shares of the original parent. [IAS 27.BC24(a)]. However, the absolute and relative holdings must be the same immediately before and after the transaction. [IAS 27.13(c)].

The requirements will apply, for example, if a controlling group of shareholders insert a new entity between themselves and the original parent that holds all their original shares, and the new parent is formed in a manner that does not change the relative ownership interests of the owners of the group and does not change the equity, assets, and liabilities of the group as before.

This is further explained in the following Illustration 2-4:

Illustration 2-4: Formation of new parent that does not acquire all the original parent's ordinary shares

Shareholders A and B each hold 50% of the equity instruments of Original Parent. A and B transfer their shares to New Parent in a share-for-share exchange so that both now hold 50% of the shares in New Parent. The absolute and relative interests of A and B and those of the other shareholders in Original Parent are unchanged, so the arrangement is a reorganisation to which the cost method for reorganisations applies.

- (c) The establishment of an intermediate parent within a group. [IAS 27.BC24(b)].

The principle is exactly the same as inserting a new parent company over the top of a group. 'Original Parent' will be an intermediate company within a group, owned by another group company. If the transaction is within scope, the intermediate parent will acquire Original Parent from its parent (the Owner) in a share for share swap. The group structure before and after the transaction can be summarised as follows:

If the composition of the underlying group changes, perhaps because the intermediate parent acquires only part of that group or because it acquires another subsidiary as part of the reorganisation, then the arrangement will not be within scope as the assets and liabilities of the group immediately after the reorganisation would not be 'the same' as those immediately before the reorganisation. [IAS 27.13(b)].

However, there may be arrangements when, to establish an intermediate parent, shares must be issued for an amount of cash, the value of which is typically driven by various legal aspects. Consequently, the assets and liabilities of the new group differ from the assets and liabilities of the original group (or subgroup) by the amount of cash received on the initial issue of shares by the intermediate parent. In those cases, the issuance of shares of the intermediate parent in exchange for cash was merely done to allow the entity to be incorporated under the local jurisdiction.

How we see it

We believe that the arrangements described above, in which shares have to be issued for an amount of cash, are within the scope of the exception, provided that the amount of cash is truly '*de minimis*'; that is, not sufficient to form a substantive part of the group reorganisation transaction such that the assets and liabilities of the group immediately before and after the reorganisation may still be considered 'the same'.

Frequently asked questions

Question 2-5: How is the cost of an investment in a subsidiary determined if the new intermediate parent has more than one direct subsidiary?

The formation of a new parent was also considered by the IFRS IC in 2011. The IFRS IC noted “that the normal basis for determining the cost of an investment in a subsidiary under ... paragraph 10(a) of IAS 27 ... has to be applied to reorganisations that result in the new intermediate parent having more than one direct subsidiary. ... Paragraphs 13 and 14 of IAS 27 ... apply only when the assets and liabilities of the new group and the original group (or original entity) are the same before and after the reorganisation”. The IFRS IC observed that reorganisations that result in the new intermediate parent having more than one direct subsidiary do not meet the conditions in IAS 27 and therefore the exemptions for group reorganisations in IAS 27 do not apply. They also cannot be applied by analogy because this guidance is an exception to the normal basis for determining the cost of investment in a subsidiary.¹⁵ [IAS 27.10(a), IAS 27.13, IAS 27.14].

For example, if, in the group structure presented above, the Intermediate Parent had been inserted between the Original Parent and its subsidiaries, paragraphs 13 and 14 of IAS 27 would not apply as there are several subsidiaries acquired by the Intermediate Parent. In this case, there has been no ‘parent’ that has been established by the Intermediate Parent as its new parent. [IAS 27.13, IAS 27.14].

2.1.1.F Formation of a new parent: calculating the cost and measuring equity

IAS 27 states that the new parent measures cost at the carrying amount of its share of the ‘equity items’ shown in the separate financial statements of the original parent at the date of the reorganisation. [IAS 27.13]. It does not define ‘equity items’ but the term appears to mean the total equity in the original parent, i.e., its issued capital and reserves attributable to owners. This will be the equity as recorded in the IFRS separate financial statements, so it will exclude shares that are classified as liabilities and include, for example, the equity component of a convertible loan instrument.

It is important to stress that the new parent does not record its investment at the consideration given (the shares that it has issued) nor at the assets received (the fair value of the investments it has acquired or the book cost of those investments). Instead, it must look to the total of the equity in the original parent, which is the acquired entity. Even then, it does not record the investment at the amount of original parent’s investments but at the amount of its equity; that is to say, its net assets.

The requirements do not apply to the measurement of any other assets or liabilities in the separate financial statements of either the original parent or the new parent, or in the consolidated financial statements. [IAS 27.BC25].

It is possible for the original parent to have negative equity because its liabilities exceed its assets. IAS 27 does not discuss this, but we consider that in these circumstances the investment should be recorded at zero. There is no basis for recording an investment as if it were a liability.

The above applies only when the new parent issues equity instruments but it does not address the measurement of the equity of the new parent. IFRS accounting standards has no general requirements for accounting for the issue of own equity instruments. Rather, consistent with the position taken by the *Conceptual Framework* that equity is a residual rather than an item ‘in its own right’, the amount of an equity instrument is normally measured by reference to the item (expense or asset) in consideration for which the equity is issued, as determined in accordance with IFRS accounting standards applicable to that other item. The new parent will record the increase in equity at the carrying amount of the investments it has acquired (i.e., at cost), regardless of the amount and face value of the equity instruments issued.

The amount at which the new parent’s issued share capital is recorded will depend on the relevant law in the jurisdiction applicable to the new parent. The shares may be recorded at fair value, which is the fair value of the investments acquired, or at an amount calculated on some other basis. Local law may allow a company to record its issued share capital at a nominal amount, e.g., the nominal (face) value of the shares. In some jurisdictions, intermediate holding companies that acquire an asset from a parent (the ‘transferor’) for shares at a premium are required by law to record the share capital issued (its nominal value and share premium) at the carrying value in the transferor’s books of the asset transferred; if the nominal value exceeds this book amount, the shares are recorded at their total nominal value.

Once the share capital has been recorded, there will usually need to be an adjustment to equity so that in total the equity is equal to the carrying amount (i.e., cost) of the investments acquired. This adjustment

¹⁵ [IFRIC Update](#), September 2011, p.3. Available on the IFRS Foundation’s website.

may increase or decrease the acquirer's equity (compared to share capital value) as it depends on the carrying amounts of the investment in the owner, original parent's equity and the number and value of the shares issued as consideration, as shown in the following Illustration 2-5: [IAS 27.13]

Illustration 2-5: Formation of a new parent, statutory share capital and adjustments to equity

Intermediate Parent A acquires the investments in Original Parent from Parent; the structure after the arrangement is as presented above in section 2.1.1.E. Parent carries its investment in Original Parent at CU200, but it has a fair value of CU750. Original Parent's equity in its separate financial statements is CU650. Intermediate Parent A issues shares with a nominal value of CU100 to Parent.

In accordance with IAS 27.13, Intermediate Parent records its investment in Original Parent at CU650. Depending on local law, it may record its share capital (including share premium, where appropriate) at:

- (i) CU750, being the fair value of the consideration received for the shares. It records a negative adjustment of CU100 elsewhere in equity.
 - (ii) CU100, being the nominal value of the shares issued. It records a credit adjustment of CU550 elsewhere in equity.
- Or
- (iii) CU200, being the carrying value of the investment in Parent. It records a credit adjustment of CU450 elsewhere in equity.

2.1.1.G Reverse acquisitions in the separate financial statements

For the purposes of consolidated financial statements, IFRS 3 takes the view that the acquirer is usually the entity that issues its equity interests to acquire the other entity, but recognises that in some business combinations, known as 'reverse acquisitions', the issuing entity is the acquiree (see Chapter 10).

Under IFRS 3, a reverse acquisition occurs when the entity that issues securities (the legal acquirer) is identified as the acquiree for accounting purposes based on the guidance in IFRS 3 (see Chapter 10). Perhaps more accurately, the legal acquiree must be identified as the acquirer for accounting purposes. Similar circumstances may arise when the legal acquirer obtains control over an unincorporated business (see Chapter 10).

Existing IFRS accounting standards do not contain any guidance on accounting for reverse acquisitions in the separate financial statements, where the reverse acquisition is accounted for in the consolidated financial statements. The application guidance in IFRS 3 only deals with reverse acquisition accounting in the consolidated financial statements (see Chapter 10); the consequences on the accounting in the separate financial statements, if any, of the legal parent/accounting acquiree are not addressed. However, the previous version of IFRS 3 indicated that reverse acquisition accounting applies only in the consolidated financial statements, and that in the legal parent's separate financial statements, the investment in the legal subsidiary is accounted for in accordance with the requirements in IAS 27.

[IFRS 3(2007).B8].

How we see it

In our view, applying the current IFRS 3 and IAS 27 standards, reverse acquisition accounting only applies in the consolidated financial statements.

This is explained in the following Illustration 2-6:

Illustration 2-6: Reverse acquisition - legal parent's statement of financial position in separate financial statements

Entity A, the entity issuing equity instruments and therefore the legal parent, is acquired in a reverse acquisition by Entity B, the legal subsidiary, on 30 September 20X3. The accounting for any income tax effects is ignored.

Statements of financial position of Entity A and Entity B immediately before the business combination are:

	Entity A	Entity B
	CU	CU
Current assets	500	700
Non-current assets	1,300	3,000
Total assets	1,800	3,700
Current liabilities	300	600
Non-current liabilities	400	1,100
Total liabilities	700	1,700
Owner's equity		
Issued equity		
100 ordinary shares	300	
60 ordinary shares		600
Retained earnings	800	1,400
Total shareholders' equity	1,100	2,000

Other information

- On 30 September 20X3, Entity A issues 2.5 shares in exchange for each ordinary share of Entity B. All of Entity B's shareholders exchange their shares in Entity B. Therefore, Entity A issues 150 ordinary shares in exchange for all 60 ordinary shares of Entity B.
- The fair value of each ordinary share of Entity B at 30 September 20X3 is CU40. The quoted market price of Entity A's ordinary shares at that date is CU16.
- The fair values of Entity A's identifiable assets and liabilities at 30 September 20X3 are the same as their carrying amounts, except that the fair value of Entity A's non-current assets at 30 September 20X3 is CU1,500.

Using the facts above, the statement of financial position of Entity A, the legal parent, in its separate financial statements immediately following the business combination will be as follows:

	Entity A
	CU
Current assets	500
Non-current assets	1,300
Investment in subsidiary (Entity B)	2,400
Total assets	4,200
Current liabilities	300
Non-current liabilities	400
Total liabilities	700
Owner's equity	
Issued equity	
250 ordinary shares	2,700
Retained earnings	800
	3,500

The investment in the subsidiary is included at its cost of CU2,400, being the fair value of the shares issued by Entity A (150 × CU16). It can be seen that the issued equity is different from that in the consolidated financial statements and its non-current assets remain at their carrying amounts before the business combination (see Illustration 14-4 in Chapter 10).

2.1.2 Deemed cost on transition to IFRS accounting standards

IFRS 1 allows a first-time adopter an exemption with regard to its investments in subsidiaries, joint ventures, and associates in its separate financial statements. [IFRS 1.D15]. If the first-time adopter elects to apply the cost method, it can either measure the investment in its separate opening IFRS statement of financial position at cost determined in accordance with IAS 27 or at deemed cost. Deemed cost is either:

- (i) Fair value (determined in accordance with IFRS 13 *Fair Value Measurement*) at the entity's date of transition to IFRS accounting standards in its separate financial statements
- Or
- (ii) Previous GAAP carrying amount as at the entity's date of transition to IFRS accounting standards in its separate financial statements

As with the other asset measurement exemptions, the first-time adopter may choose either (i) or (ii) above to measure each individual investment in subsidiaries, joint ventures, or associates that it elects to measure using a deemed cost. [IFRS 1.D15].

2.2 IFRS 9 method

Under IFRS 9, the equity investments in subsidiaries, joint ventures or associates would likely be classified as financial assets measured at fair value through profit or loss or, as financial assets measured at fair value through other comprehensive income (OCI), if an entity elects at initial recognition to present subsequent changes in their fair value in OCI. In the former case, subsequent changes in the fair value of the investments will be recognised in profit or loss. In the latter case, subsequent changes in the fair value of the investments will be recognised in OCI and will never be reclassified to profit or loss. The classification requirements of IFRS 9 are discussed in Chapter 44, and the measurement principles of IFRS 9 on initial and subsequent measurement are discussed in detail in Chapters 45 and 46.

One issue that has been discussed by the IASB that is relevant in determining the fair value of investments in subsidiaries, joint ventures and associates is the unit of account for such investments (see further details in Chapter 15). The Board, for the time being, have decided not to finalise discussions on unit of account for such investments.¹⁶

2.3 Equity method

IAS 27 allows entities to use the equity method as described in IAS 28 to account for investments in subsidiaries, joint ventures, and associates in their separate financial statements. [IAS 27.4]. When the equity method is used, dividends from those investments are recognised as a reduction from the carrying value of the investment. [IAS 27.12]. The application of the equity method under IAS 28 is discussed in Chapter 12. Some jurisdictions require the use of the equity method to account for investments in subsidiaries, associates, and joint ventures in the separate financial statements.

In the Basis for Conclusions to IAS 27, the IASB indicates that in general, the application of the equity method to investments in subsidiaries, joint ventures, and associates in the separate financial statements of an entity is expected to result in the same net assets and profit or loss attributable to the owners as in the entity's consolidated financial statements. However, there may be situations when this may not be the case, including: [IAS 27.BC10G]

- Impairment testing requirements in IAS 28.
For an investment in a subsidiary accounted for in the separate financial statements using the equity method, goodwill that forms part of the carrying amount of the investment in the subsidiary is not tested for impairment separately. Instead, the entire carrying amount of the investment in the subsidiary is tested for impairment in accordance with IAS 36 as a single asset. However, in the consolidated financial statements of the entity, because goodwill is recognised separately, it is tested for impairment by applying the requirements in IAS 36 for testing goodwill for impairment.
- Subsidiary that has a net liability position.
IAS 28 requires an investor to discontinue recognising its share of further losses when its cumulative share of losses of the investee equals or exceeds its interest in the investee, unless the investor has incurred legal or constructive obligations or made payments on behalf of the investee, in which case a liability is recognised, whereas there is no such requirement in relation to the consolidated financial statements.

¹⁶ [IFRS Project report and Feedback Statement: Post-implementation Review of IFRS 13 Fair Value Measurement](#), IASB, December 2018. Available on the IFRS Foundation's website.

- Capitalisation of borrowing costs incurred by a parent in relation to the assets of a subsidiary.
IAS 23 *Borrowing Costs* notes that, in some circumstances, it may be appropriate to include all borrowings of the parent and its subsidiaries when computing a weighted average of the borrowing costs. When a parent borrows funds and its subsidiary uses them for the purpose of obtaining a qualifying asset, in the consolidated financial statements of the parent the borrowing costs incurred by the parent are considered to be directly attributable to the acquisition of the subsidiary's qualifying asset. However, this would not be appropriate in the separate financial statements of the parent when the parent's investment in the subsidiary is a financial asset which is not a qualifying asset.

In the above situations, there will not be alignment of the net assets and profit or loss of an investment in a subsidiary between the consolidated and separate financial statements.

2.3.1 First-time adoption of IFRS accounting standards

IFRS 1 allows a first-time adopter that accounts for an investment in a subsidiary, joint venture or associate using the equity method in the separate financial statements (see Chapter 6) to apply the exemption for past business combinations to the acquisition of the investment. [IFRS 1.D15A]. The exemption for past business combinations is discussed in Chapter 6. The first-time adopter can also apply certain exemptions to the assets and liabilities of subsidiaries, associates, and joint ventures when it becomes a first-time adopter for its separate financial statements earlier than its consolidated financial statements and later than its parent or subsidiary. [IFRS 1.D15A]. These exemptions are discussed in Chapter 6.

2.4 Dividends and other distributions

IAS 27 contains a general principle for dividends received from subsidiaries, joint ventures, or associates. This is supplemented by specific indicators of impairment in IAS 36 that apply when a parent entity receives the dividend. The general principle and the specific impairment indicators are discussed in section 2.4.1 below.

IFRIC 17 *Distributions of Non-cash Assets to Owners* considers in particular the treatment by the entity making the distribution. Details about the requirements of that Interpretation are discussed in section 2.4.2 below.

2.4.1 Dividends from subsidiaries, joint ventures, or associates

The following guidance is included in IAS 27 in relation to recognition of dividends from subsidiaries, joint ventures, or associates: [IAS 27.12]

Extract from IAS 27

- | | |
|----|---|
| 12 | Dividends from a subsidiary, a joint venture or an associate are recognised in the separate financial statements of an entity when the entity's right to receive the dividend is established. The dividend is recognised in profit or loss unless the entity elects to use the equity method, in which case the dividend is recognised as a reduction from the carrying amount of the investment. |
|----|---|

Dividends are recognised only when they are declared (i.e., the dividends are appropriately authorised and no longer at the discretion of the entity). IFRIC 17 expands on this point: the relevant authority may be the shareholders, if the jurisdiction requires such approval, or management or the board of directors, if the jurisdiction does not require further approval. [IFRIC 17.10]. If the declaration is made after the reporting period but before the financial statements are authorised for issue, the dividends are not recognised as a liability at the end of the reporting period because no obligation exists at that time. Such dividends are disclosed in the notes in accordance with IAS 1. [IAS 1.137, IAS 10.13]. A parent cannot record income, or a reduction of the equity accounted investment and recognise an asset until the dividend is a liability of its subsidiary, joint venture or associate, the paying company.

Once dividends are recognised in income, the investor must determine whether or not the investment has been impaired as a result. IAS 36 requires the entity to assess at each reporting date whether there are any 'indications of impairment'. Only if indications of impairment are present will the impairment test itself have to be carried out. [IAS 36.8, IAS 36.9].

The list of indicators in IAS 36 includes the recognition of a dividend from a subsidiary, joint venture, or associate when there is evidence that:

- (i) The dividend exceeds the total comprehensive income of the subsidiary, joint venture, or associate in the period the dividend is declared
- Or
- (ii) The carrying amount of the investment in the separate financial statements exceeds the carrying amounts in the consolidated financial statements of the investee's net assets, including associated goodwill [IAS 36.12(h)]

2.4.1.A The dividend exceeds the total comprehensive income

There are circumstances in which recognition of a dividend will trigger the first indicator, even if the dividend is payable entirely from the profit for the period.

First, the indicator states that the test is by reference to the total comprehensive income in the period in which the declaration is made. Dividends are usually declared after the end of the period to which they relate; an entity whose accounting period ends on 31 December 20X2 will not normally declare a dividend in respect of its earnings in that period until its financial statements have been drawn up, i.e., some months into the next period ended 31 December 20X3. We assume that it is expected that the impairment review itself will take place at the end of the period, in line with the general requirements of IAS 36 referred to above, in which case the dividends received in the period will be compared to the income of the subsidiary for that period. This means that there may be a mismatch, for example, dividends declared on the basis of 20X2 profits will be compared to total comprehensive income in 20X3.

Second, the test is by reference to total comprehensive income, not profit or loss for the period. Total comprehensive income reflects the change in equity during a period resulting from transactions and other events, other than those changes resulting from transactions with owners in their capacity as owners. Total comprehensive income takes into account the components of 'other comprehensive income' that are not reflected in profit or loss that include:

- (a) Changes in revaluation surpluses of property, plant and equipment or intangible assets (see Chapters 19 and 18, respectively)
- (b) Remeasurements of defined benefit plans (see Chapter 31)
- (c) Gains and losses arising from translating the financial statements of a foreign operation (see Chapter 16)
- (d) Fair value changes from financial instruments measured at fair value through other comprehensive income (see Chapter 46)

And

- (e) The effective portion of gains and losses on hedging instruments in a cash flow hedge (see Chapter 49) [IAS 1.7]

This means that all losses on remeasurement that are allowed by IFRS accounting standards to bypass profit or loss and can be taken directly to other components of equity are taken into account in determining whether a dividend is an indicator of impairment. If a subsidiary, joint venture, or associate pays a dividend from its profit for the year that exceeds its total comprehensive income because there have been actuarial losses on the pension scheme or a loss on remeasuring its hedging derivatives, then receipt of that dividend is an indicator of impairment to the parent.

The opposite should also be true: a dividend that exceeds profit for the period but does not exceed total comprehensive income (if, for example, the entity has a revaluation surplus on its property) is not an indicator of impairment. However, IAS 36 makes clear that its list of indicators is not exhaustive and if there are other indicators of impairment then the entity must carry out an impairment test in accordance with IAS 36. [IAS 36.13].

It must be stressed that this test is solely to see whether a dividend triggers an impairment review. It has no effect on the amount of dividend that the subsidiary, joint venture, or associate may pay, which is governed by local law.

2.4.1.B The carrying amount exceeds the consolidated net assets

An impairment is indicated if, after paying the dividend, the carrying amount of the investment in the separate financial statements exceeds the carrying amount of the investee's net assets, including associated goodwill, in the consolidated financial statements.

It will often be clear when dividends are paid out of profits for the period by subsidiaries, joint ventures, or associates, whether the consolidated net assets of the investee in question have declined below the carrying amount of the investment. However, this could require the preparation of consolidated financial statements by an intermediate parent which would otherwise be exempt from the preparation of consolidated financial statements.

Similar issues to those described above may arise, when, for example, the subsidiary, joint venture, or associate may have made losses or taken some sort of remeasurement to other comprehensive income in the period in which the dividend is paid. However, it is the net assets in the consolidated financial statements that are relevant, not those in the subsidiary's, joint venture's or associate's own financial statements, which may be different if the parent acquired the subsidiary.

Testing assets for impairment is described in Chapter 20. There are particular problems to consider in assessing the investments in subsidiaries, joint ventures, and associates for impairment. These are discussed in Chapter 21.

2.4.1.C Returns of capital

Returns of capital are not usually considered to be dividends and hence they are not directly addressed by IAS 27. They are an example of a 'distribution', the broader term applied when an entity gives away its assets to its members.

How we see it

Returns of capital are not always accounted for as a reduction of the carrying value of the investment in the separate financial statements. It is a matter of judgement and depends on the facts and circumstances. Returns of capital frequently cannot be easily distinguished from dividends.

For example, depending on local law, entities may be able to:

- Make repayments that directly reduce their share capital
- Or
- Create reserves by transferring amounts from share capital into retained earnings and, at the same time or later, pay dividends from that reserve

Returns of capital can be accounted for in the same way as dividends, i.e., by applying the impairment testing process described above. However, the effect on an entity that makes an investment (whether on initial acquisition of a subsidiary or on a subsequent injection of capital) and immediately receives it back (whether as a dividend or return of capital) generally will be that of a return of capital that reduces the carrying value of the parent's investment. In these circumstances there will be an impairment that is equal to the dividend that has been received (provided that the consideration paid as investment was at fair value). If there is a delay between the investment and the dividend or return of capital, then the impairment (if any) will be a matter of judgement based on the criteria discussed above. Judgement should be applied in determining whether a distribution from an investee is dividend income (i.e., a return on capital) or a return of capital that 'clearly represents a recovery of part of the cost of the investment'. [IFRS 9.B5.7.1].

2.4.2 Distributions of non-cash assets to owners (IFRIC 17)

Entities sometimes make distributions of assets other than cash, e.g., items of property, plant and equipment, businesses as defined in IFRS 3, ownership interests in another entity or disposal groups as defined in IFRS 5. [IFRIC 17.1, IFRIC 17.2]. IFRIC 17 has the effect that gains or losses relating to some non-cash distributions to shareholders will be accounted for in profit or loss. [IFRIC 17.1]. The Interpretation addresses only the accounting by the entity that makes a non-cash asset distribution, not the accounting by recipients.

2.4.2.A Scope

IFRIC 17 is relevant for the following transactions: [IFRIC 17.3, IFRIC 17.4, IFRIC 17.5]

Extract from IFRIC 17

- | | |
|---|---|
| 3 | This Interpretation applies to the following types of non-reciprocal distributions of assets by an entity to its owners acting in their capacity as owners: |
| | (a) distributions of non-cash assets (e.g. items of property, plant and equipment, businesses as defined in IFRS 3, ownership interests in another entity or disposal groups as defined in IFRS 5); and |
| | (b) distributions that give owners a choice of receiving either non-cash assets or a cash alternative. |
| 4 | This Interpretation applies only to distributions in which all owners of the same class of equity instruments are treated equally. |
| 5 | This Interpretation does not apply to a distribution of a non-cash asset that is ultimately controlled by the same party or parties before and after the distribution. This exclusion applies to the separate, individual and consolidated financial statements of an entity that makes the distribution. |

The IFRS IC did not want the Interpretation to apply to exchange transactions with shareholders, which can include an element of distribution, e.g., a sale to one of the shareholders of an asset having a fair value that is higher than the sales price. [IFRIC 17.BC5]. Therefore, it applies only to non-reciprocal distributions in which all owners of the same class of equity instruments are treated equally. [IFRIC 17.4].

The Interpretation will not apply to distributions made by subsidiaries but only to distributions made by parent entities or individual entities that are not themselves parents. In order to avoid ambiguity regarding 'common control' and to ensure that demergers achieved by way of distribution are dealt with, the Interpretation emphasises that 'common control' is used in the same sense as in IFRS 3. A distribution to a group of individual shareholders will only be out of scope if those shareholders, as a result of contractual arrangements, have ultimate collective power over the entity making the distribution as a result of contractual arrangements. [IFRIC 17.6].

Although the Interpretation does not apply to distributions if the assets are ultimately controlled by the same party or parties before and after the distribution, whether in the separate, individual, or consolidated financial statements of an entity that makes the distribution, it may be applied by analogy for common control distributions as further discussed in section 4.4.1.D below.

If the non-cash asset distributed is an interest in a subsidiary over which the entity retains control, this is accounted for by recognising a non-controlling interest in the subsidiary in equity in the consolidated financial statements of the entity, as required by IFRS 10.23 (see Chapter 8). [IFRS 10.23, IFRIC 17.7].

2.4.2.B Recognition, measurement, and presentation

A dividend is not a liability until the entity is obliged to pay it to the shareholders. [IFRIC 17.10]. The obligation arises when payment is no longer at the discretion of the entity, which will depend on the requirements of local law. In some jurisdictions, the UK or Italy for example, shareholder approval is required before there is a liability to pay. In other jurisdictions, declaration by management or the board of directors may suffice.

The liability is measured at the fair value of the assets to be distributed. [IFRIC 17.11]. If an entity gives its owners a choice of receiving either a non-cash asset or a cash alternative, the entity estimates the dividend payable by considering both the fair value of each alternative and the associated probability of owners selecting each alternative. [IFRIC 17.12]. IFRIC 17 does not specify any method of assessing probability nor its effect on measurement.

IFRS 5's requirements apply also to a non-current asset (or disposal group) that is classified as held for distribution to owners acting in their capacity as owners (held for distribution to owners). [IFRS 5.5A, IFRS 5.12A, IFRS 5.15A]. This means that assets or asset groups within scope of IFRS 5 will be carried at the lower of carrying amount and fair value less costs to distribute. [IFRS 5.15A]. Assets not subject to the measurement provisions of IFRS 5 are measured in accordance with the relevant standard. In practice, most non-cash distributions of assets out of scope of the measurement provisions of IFRS 5 will be of assets held at fair value in accordance with the relevant standard, e.g., financial instruments that under IFRS 9 should be measured at fair value through profit or loss or other comprehensive income, and investment property carried at fair value. [IFRS 5.5]. Accordingly, there should be little difference, if any, between their carrying value and the amount of the distribution.

The liability is adjusted as at the end of any reporting period at which it remains outstanding and at the date of settlement with any adjustment being taken to equity. [IFRIC 17.13]. When the liability is settled, the difference, if any, between its carrying amount and the carrying amount of the assets distributed is accounted for as a separate line item in profit or loss. [IFRIC 17.14, IFRIC 17.15]. IFRIC 17 does not express any preference for particular line items or captions in the statement of profit or loss.

It is rare for entities to distribute physical assets such as property, plant, and equipment to shareholders, although these distributions are common within groups and hence out of scope of IFRIC 17. In practice, the Interpretation will have most effect on demergers by way of distribution, as explained in the following Illustration 2-7:

Illustration 2-7: Non-cash asset distributed to shareholders

Conglomerate Plc has two divisions, electronics, and music, each of which is in a separate subsidiary. On 18 December 20X3 the shareholders approve a non-cash dividend in the form of the electronics division, which means that the dividend is a liability when the annual financial statements are prepared as at 31 December 20X3. The distribution is to be made on 17 January 20X4.

In Conglomerate Plc's separate financial statements at 18 December and 31 December 20X3, the investment in Electronics Ltd, which holds the electronics division, is carried at CU100 million; the division has consolidated net assets of CU210 million. The fair value of the electronics division at 18 December and 31 December 20X3 is CU375 million, so is the amount at which the liability to pay the dividend is recorded in Conglomerate Plc's separate financial statements and in its consolidated financial statements, as follows:

Conglomerate Plc

<i>Separate financial statements</i>			<i>Consolidated financial statements</i>		
	CU	CU		CU	CU
Dr Equity	375		Dr Equity	375	
Cr Liability		375	Cr Liability		375

In Conglomerate PLC's separate financial statements, its investment in Electronics Ltd of CU100 million is classified as held for distribution to owners. In the consolidated financial statements, the net assets of CU210 million are so classified.

If the value of Electronics Ltd had declined between the date of declaration of the dividend and the period end, say to CU360 million (more likely if there had been a longer period between declaration and the period end) then the decline would be reflected in equity and the liability recorded at CU360 million. Exactly the same entry would be made if the value were CU375 million at the period end and CU360 million on the date of settlement (Dr liability CU15 million, Cr equity CU15 million).

The dividend is paid on 17 January 20X4 at which point the fair value of the division is CU360 million. There was no change in the carrying value of the investment in the separate financial statements and of the net assets in the consolidated financial statements between 31 December and distribution date. The difference between the assets distributed and the liability is recognised as a gain in profit or loss.

Conglomerate Plc

<i>Separate financial statements</i>			<i>Consolidated financial statements</i>		
	CU	CU		CU	CU
Dr Liability	360		Dr Liability	360	
Cr Profit or loss		260	Cr Profit or loss		150
Cr Asset held for sale		100	Cr Disposal group		210

IFRIC 17 requires the following disclosures: [IFRIC 17.16, IFRIC 17.17]

Extract from IFRIC 17

- | | |
|----|---|
| 16 | An entity shall disclose the following information, if applicable: <ul style="list-style-type: none"> (a) the carrying amount of the dividend payable at the beginning and end of the period; and (b) the increase or decrease in the carrying amount recognised in the period in accordance with paragraph 13 as result of a change in the fair value of the assets to be distributed. |
| 17 | If, after the end of a reporting period but before the financial statements are authorised for issue, an entity declares a dividend to distribute a non-cash asset, it shall disclose: <ul style="list-style-type: none"> (a) the nature of the asset to be distributed; (b) the carrying amount of the asset to be distributed as of the end of the reporting period; and (c) the fair value of the asset to be distributed as of the end of the reporting period, if it is different from its carrying amount, and the information about the method(s) used to measure that fair value required by paragraphs 93(b), (d), (g) and (i) and 99 of IFRS 13. |

IFRS 13 related disclosures are further discussed in Chapter 15.

3 Disclosure

An entity applies all applicable IFRS accounting standards when providing disclosures in the separate financial statements. [IAS 27.15]. In addition, there are a number of specific disclosure requirements in IAS 27 which are discussed below.

3.1 Separate financial statements prepared by parent electing not to prepare consolidated financial statements

When separate financial statements are prepared for a parent that, in accordance with the exemption discussed in section 1.1 above, elects not to prepare consolidated financial statements, those separate financial statements are to disclose: [IAS 27.16]

- (a) The fact that the financial statements are separate financial statements; that the exemption from consolidation has been used; and the name and the principal place of business (and country of incorporation, if different) of the entity whose consolidated financial statements that comply with IFRS accounting standards have been produced for public use and the address where those consolidated financial statements are obtainable
- (b) A list of significant investments in subsidiaries, joint ventures, and associates, including:
 - (i) The name of those investees
 - (ii) The principal place of business (and country of incorporation, if different) of those investees
And
 - (iii) Its proportion of the ownership interest and, if different, proportion of voting rights held in those investees
And
- (c) A description of the method used to account for the investments listed under (b)

In addition to disclosures required by IAS 27, an entity also must disclose in its separate financial statements qualitative and quantitative information about its interests in unconsolidated structured entities as required by IFRS 12. IFRS 12 does not generally apply to an entity's separate financial statements to which IAS 27 applies but if the entity has interests in unconsolidated structured entities and prepares separate financial statements as its only financial statements, it must apply the requirements in paragraphs 24 to 31 of IFRS 12 when preparing those separate financial statements (see Chapter 14). [IFRS 12.6(b), IFRS 12.24-31].

The unconsolidated structured entity disclosures in IFRS 12 are given only in separate financial statements when the parent has taken advantage of the exemption from preparing consolidated financial statements. When the parent has not taken advantage of the exemption, and also prepares separate financial statements, it gives the disclosures in section 3.3 below in respect of those separate financial statements. [IAS 27.17].

3.2 Separate financial statements prepared by an investment entity

When an investment entity that is a parent (other than a parent electing not to prepare consolidated financial statements) prepares separate financial statements as its only financial statements, it discloses that fact. The investment entity also presents disclosures relating to investment entities required by IFRS 12 (see Chapter 14). [IAS 27.16A].

3.3 Separate financial statements prepared by an entity other than a parent electing not to prepare consolidated financial statements

IAS 27 requires the disclosures below to be given by:

- A parent preparing separate financial statements in addition to consolidated financial statements (i.e., whether or not it is required to prepare consolidated financial statements - the disclosures in section 3.1 above apply only when the parent has actually taken advantage of the exemption, not merely when it is eligible to do so).
And
- An entity (not being a parent) that is an investor in an associate or in a joint venture in respect of any separate financial statements that it prepares, i.e., whether:
 - (i) As its only financial statements (if permitted by IAS 28)
Or
 - (ii) In addition to financial statements in which the results and net assets of associates or joint ventures are included

When an entity is both a parent and an investor in either an associate or a joint venture, it should follow the disclosure requirements governing parents - in other words, it complies with the disclosures in section 3.1 above if electing not to prepare consolidated financial statements and otherwise with the disclosures below.

Separate financial statements prepared by an entity other than a parent electing not to prepare consolidated financial statements must disclose: [IAS 27.17]

- (a) The fact that the statements are separate financial statements and the reasons why those statements are prepared if not required by law
- (b) A list of significant investments in subsidiaries, joint ventures, and associates, including for each such investment its:
 - (i) Name
 - (ii) Principal place of business (and country of incorporation, if different)
And
 - (iii) Proportion of ownership interest and, if different, proportion of voting power held
And
- (c) A description of the method used to account for the investments listed under (b)

The separate financial statements must also identify the financial statements prepared in accordance with the requirements of IFRS 10 (requirement to prepare consolidated financial statements), IFRS 11 or IAS 28 to which they relate. [IAS 27.17]. In other words, they must draw attention to the fact that the entity also prepares consolidated financial statements or, as the case may be, financial statements in which the associates or joint ventures are accounted for using the equity method.

The implication of this disclosure requirement is that an entity which publishes both separate and consolidated financial statements under IFRS accounting standards cannot issue the separate financial statements before the consolidated financial statements have been prepared and approved, since there would not be, at the date of issue of the separate financial statements, any consolidated financial statements 'to which they relate'. This is discussed in section 1.1.3 above.

How we see it

In our view, if the parent has issued consolidated financial statements prepared not in accordance with IFRS accounting standards but with its local GAAP, the parent cannot make reference to the financial statements prepared in accordance with IFRS 10, IFRS 11 or IAS 28, therefore the separate financial statements cannot be considered in compliance with IAS 27.

3.3.1 Entities with no subsidiaries but exempt from applying IAS 28

Entities which have no subsidiaries, but which have investments in associates or joint ventures are permitted by IAS 28 to prepare separate financial statements as their only financial statements if they satisfy the conditions described in section 1.1.1 above; namely, if the entity has an investment in an associate and/or a joint venture and the entity has made use of the exemption from applying the equity method to those investments, the entity may prepare separate financial statements as its only financial statements, in which investments in the associate/joint venture are accounted for at cost or in accordance with IFRS 9.

IAS 27 requires such entities to make the disclosures in (a) to (c) above in section 3.3. In addition, the entity identifies the financial statements prepared in accordance with IAS 28. [IAS 27.17].

4 Common control or group transactions in individual or separate financial statements

4.1 Introduction

Transactions often take place between a parent entity and its subsidiaries or between subsidiaries within a group that may or may not be carried out at fair value.

Whilst such transactions do not affect the consolidated financial statements of the parent as they are eliminated in the course of consolidation, they can have a significant impact on the separate financial statements of the parent, the individual financial statements of an entity that is not a parent, and/or a set of consolidated financial statements prepared for a sub-group. IAS 24 requires only that these transactions are disclosed and provides no accounting requirements.

The IASB generally considers that the needs of users of financial statements are fully met by requiring entities to consolidate subsidiaries and to equity account for associates and joint ventures. Accounting issues within individual or separate financial statements are not a priority and are usually only addressed in IFRS accounting standards when a standard affects consolidated and individual or separate statements in different ways, e.g., accounting for pensions or employee benefits.

How we see it

As there is limited guidance under IFRS accounting standards, we consider that it is helpful to set out some general principles in accounting for these transactions that enhance the consistency of application of IFRS accounting standards whether for the separate financial statements of a parent, the individual financial statements of an entity that is not a parent or the consolidated financial statements of a sub-group.

The considerations provided in this section in certain circumstances also apply to sub-group consolidated financial statements in relation to common control transactions with entities controlled by the ultimate parent or ultimate controlling party or parties, but that are outside the sub-group.

We have considered how to apply these principles to certain common types of arrangement between entities under common control, which are described in more detail in section 4.4 below:

- Sales, exchanges, and contributions of non-monetary assets including sales and exchanges of investments not within the scope of IFRS 9, i.e., investments in subsidiaries, associates, or joint ventures (see section 4.4.1 below)
- Transfers of businesses, including contributions and distribution of businesses (see sections 4.4.2 and 4.4.3 below)
- Incurring costs and settling liabilities without recharge (see section 4.4.4 below)
- Loans that bear interest at non-market rates or are interest free (see section 4.4.5.A below)
- And
- Financial guarantee contracts given by a parent over a subsidiary's borrowings in the financial statements of a subsidiary (see section 4.4.5.B below)

Other arrangements that are subject to specific requirements in particular standards are dealt with in the relevant chapters. These include:

- Financial guarantee contracts over a subsidiary's borrowings in the accounts of the parent (see Chapter 45)
- Put and call options in separate financial statements (see Chapter 8)
- Product warranties in separate financial statements (see Chapter 51)
- Share-based payment plans of a parent (see Chapter 30)
- And
- Employee benefits (see Chapter 31)

How we see it

In determining how to account for transactions between entities under common control, we believe that the following two aspects need to be considered:

- (a) Is the transaction at fair value? Is the price in the transaction the one that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants?
- (b) Is it a contractual arrangement and, if so, is the entity whose financial statements are being considered a party to the contract?

It is necessary to consider whether the transaction is of a type that market participants could or would enter into. It is also important to remember that an arm's length transaction includes the repayment terms that would be expected of independent parties, and this may not be the case in intra-group transactions. The analysis of the design and purpose of the transaction and whether the transaction lacks commercial substance may also be helpful in assessing the features above.

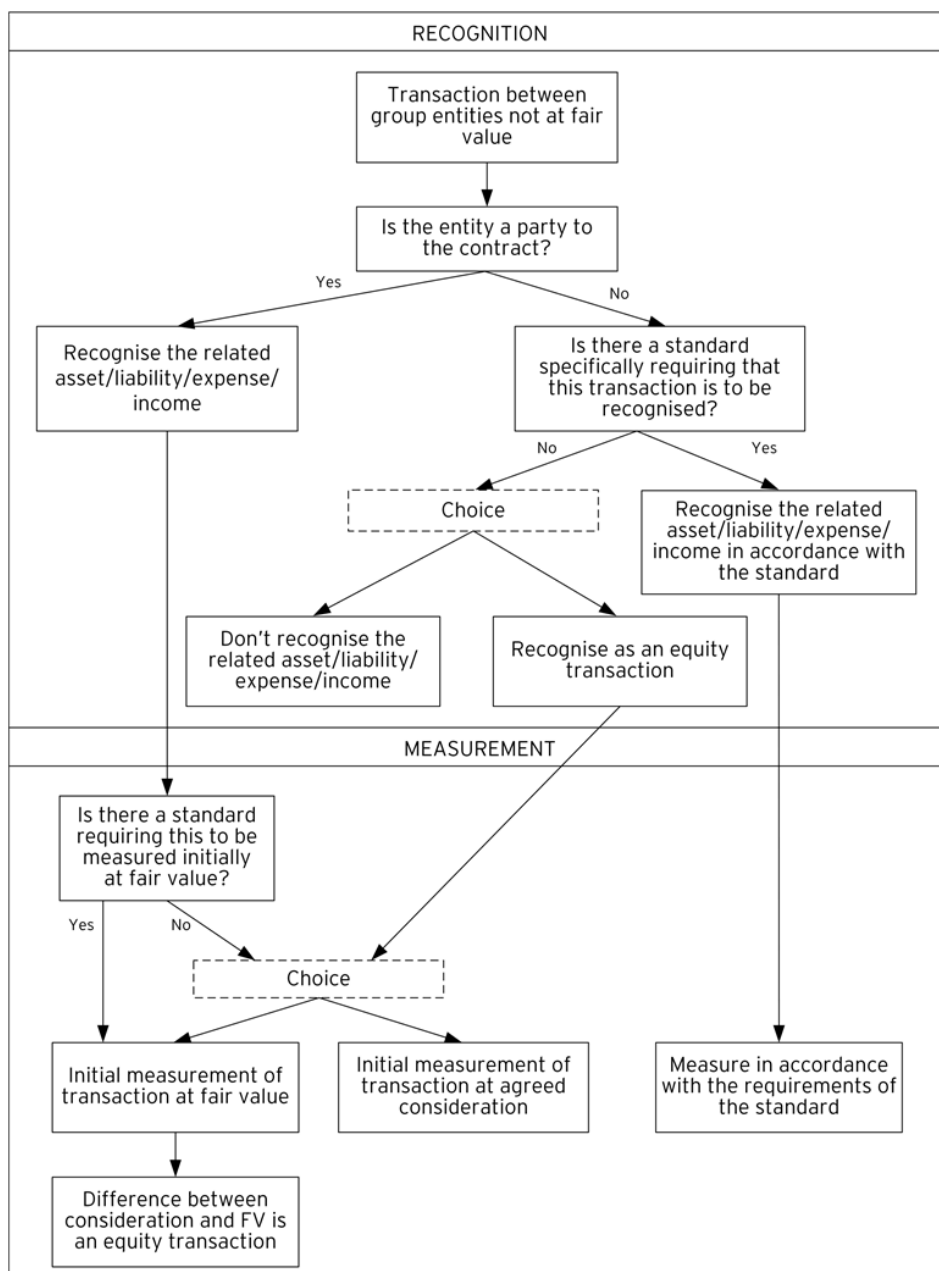

How we see it

If the transaction is at fair value and the entity is a party to the contract, we believe that it should be accounted for in accordance with the terms of the contract and general requirements of IFRS accounting standards related to this type of transaction.

The principles for accounting for transactions between group entities that are not transacted at fair value are presented in the following figure. Detailed comments on the principles are provided further in sections 4.2 and 4.3 below.

Group entities represent entities under common control of the same parent or the same controlling party or parties. The following figure therefore does not apply to transactions of group entities with joint ventures or associates of any of the group entities.

Figure 4-1: The principles for accounting for transactions between group entities that are transacted not at fair value

How we see it

If there is more than one acceptable way of accounting for specific transactions and therefore a choice of accounting policies, we believe the entity applies its chosen policy consistently to similar arrangements and discloses it if it is material. However, not all group entities need adopt the same accounting policy in their individual, separate or sub-group consolidated financial statements. Nor is there a requirement for symmetrical accounting by the entities involved in the transaction.

4.2 Recognition

If an entity is a party to a contract under which it receives a right and incurs an obligation, then on the assumption that there is substance to the transaction, it will be recognised in the financial statements of the entity.

The concept of substance, sometimes also referred to as commercial substance, is currently used for exchange of assets in the scope of other standards. In IAS 16, it refers to transactions that modify the configuration (risk, timing, and amount) of the cash flows before and after the transaction for the entity involved. [IAS 16.24].

An entity may receive a right without incurring an obligation or *vice versa* without being a party to a contract. There are many different types of arrangement that contain this feature, either in whole or in part:

- Some arrangements are not contractual at all, such as capital contributions and distributions, that are in substance gifts made to the receiving entities without consideration.
- Some standards require transactions to which the entity is not a party to be reflected in their financial statements, e.g., IFRS 2 requires an entity to account for a transaction in which it receives goods or services when another entity in the same group has the obligation to settle the share-based payment transaction. The accounting treatment is representing that the subsidiary has received a capital contribution from the parent, which the subsidiary has then spent on employee remuneration or *vice versa*. (see Chapter 30).
- Some are contractual arrangements for the other party, e.g., a parent enters into a contract to engage an auditor for the subsidiary and pays the audit fees without any recharge.

How we see it

If an entity has a relationship to a transaction but is not a party to a contractual relationship, its rights and obligations are not modified, and there is no IFRS accounting standard requiring recognition then, in our view, the entity could choose not to recognise the transaction at all. As further described below, if it chooses to recognise the transaction, then recognition will depend on whether the entity is a parent or a subsidiary and on the specific nature of the transaction.

In some circumstances, i.e., when the transaction has substance, a parent could treat a debit as either an addition to its investment in its subsidiary or as an expense and a credit as a gain to profit or loss. It is not generally possible for the parent to recognise gains in equity as these are usually transactions with subsidiaries, not shareholders. A subsidiary treats the transaction as a credit or debit to income (income or expense) or a debit to asset or credit to liability and an equal and opposite debit or credit to equity (distribution of or contribution to equity).

One example when a subsidiary is required by an IFRS accounting standard to record an expense when it is not a party to a contractual arrangement is a share-based payment. If the employees of a subsidiary are granted options by the parent company over its shares in exchange for services to the subsidiary, the subsidiary must record a cost for that award within its own financial statements, even though it may not legally be a party to it. The parent must also record the share-based payment as an addition to the investment in the subsidiary (see Chapter 30).

Although the entity not party to the contract could have a choice to either record the transaction or not, the other entity within the group that could have entered into the contract on behalf of the entity is required to recognise the transaction. When a group entity is incurring expenses on behalf of another entity, this group entity could be able to capitalise the expenses as part of the cost of the investment (e.g., a parent is incurring expenses of the subsidiary without recharging them), treat them as a distribution (e.g., a sister company is incurring expenses of the entity without recharging them) or to expense them.

The principles apply equally to transactions between a parent and its subsidiaries and those between subsidiaries in a group. If the transaction is between two subsidiaries, and both entities are either required or choose to recognise an equity element in the transaction, one subsidiary recognises a capital contribution from the parent, while the other subsidiary recognises a distribution to the parent. The parent could choose whether or not to recognise the equity transfer in its stand-alone financial statements.

The above treatment could be impacted by the regulations in the jurisdiction that the entity operates in and, therefore, it is useful to understand local practice.

4.3 Measurement

If a standard requires the transaction to be recognised initially at fair value, it must be measured at fair value regardless of the actual consideration. A difference between the fair value and the actual consideration may mean that other goods or services are being provided, e.g., the transaction includes a management fee. This will be accounted for separately on one of the bases described below. If there is still a difference having taken account of all goods or services, it is accounted for as an equity transaction, i.e., as either a contribution to or distribution of equity.

How we see it

In all other cases when there is a difference between the fair value and the actual consideration after having taken account of all goods or services being provided, we believe there is a choice available to the entity to:

- (a) Recognise the transaction at fair value, irrespective of the actual consideration; any difference between fair value and agreed consideration will be a contribution to or a distribution of equity for a subsidiary, or an increase in the investment held or a distribution received by the parent
- Or
- (b) Recognise the transaction at the actual consideration stated in any agreement related to the transaction

The predecessor values accounting (accounting based on the carrying amounts of the transferor) cannot be applied except for specific circumstances described below.

Except for accounting for the acquisition of businesses when the pooling of interest method is considered (see section 4.4.2 below), the transfer of businesses between a parent and its subsidiary (see section 4.4.3 below), and the acquisition of an investment in a subsidiary constituting a business that is acquired in a share-for-share exchange (see section 2.1.1.B above), there is no other basis for the measurement of the transactions between entities under common control other than those stated in (a) and (b) above.

4.3.1 Fair value in intra-group transactions

The requirements for fair value measurement included in IFRS 13 should be applied to common control transactions. However, fair value can be difficult to establish in intra-group transactions.

If there is more than one element to the transaction, this means in principle identifying all the goods and services being provided and accounting for each element at fair value. This is not necessarily straightforward: a bundle of goods and services in an arm's length arrangement will usually be priced at a discount to the price of each of the elements acquired separately and this is reflected in the fair value attributed to the transaction. It can be much harder to allocate fair values in intra-group arrangements when the transaction may not have a commercial equivalent.

As we have already noted, the transaction may be based on the fair value of an asset, but the payment terms are not comparable to those in a transaction between independent parties. The purchase price often remains outstanding on an intercompany account, whereas commercial arrangements always include agreed payment terms. Interest-free loans are common between group companies; these loans may have no formal settlement terms and, while this makes them technically repayable on demand, they too may remain outstanding for prolonged periods.

As a result, there can be a certain amount of estimation when applying fair values to group arrangements.

Some IFRS accounting standards are based on the assumption that one entity may not have the information available to the other party in a transaction, for example:

- A lessee may not know the interest rate implicit in the lease, in which case IFRS 16 *Leases* requires the lessee to substitute it with the lessee's incremental borrowing rate (see Chapter 24).
And
- In exchanges of assets, IAS 16 and IAS 38 note that one party may not have information about the fair value of the asset it is receiving, the fair value of the asset it is giving up or it may be able to determine one of these values more easily than the other (see Chapter 19 and section 4.4.1.B below).

In an intra-group transaction, it will be difficult to assume that one group entity knows the fair value of the transaction, but the other does not. The approximations allowed by these standards will probably not apply. However, if a subsidiary is not wholly-owned, such transactions are undertaken generally at arm's length as non-controlling shareholders are impacted. Therefore, in a situation when such a transaction is not at arm's length, the reasons for and implications of the transaction must be assessed and carefully analysed.

4.4 Application of the principles in practice

The following sections deal with some common transactions that occur between entities under common control. While the scenarios depict transactions between a parent and its subsidiaries they apply similarly to transactions between subsidiaries. Most of the examples in these sections deal with transactions having a non-arm's length element. As for any other transactions undertaken at fair value (at arm's length), respective IFRS accounting standards that are applicable must be taken into account.

Deferred tax has been ignored for the purposes of the examples.

4.4.1 Transactions involving non-monetary assets

The sections below describe a number of examples of transactions between a parent and subsidiary. The principles described also apply when the asset acquired, for a consideration different to fair value, is inventory (IAS 2 *Inventories* - Chapter 23), property, plant, and equipment ('PP&E') (IAS 16 - Chapter 19), an intangible asset (IAS 38 - Chapter 18) or investment property (IAS 40 - Chapter 20). These standards all require assets to be initially recognised at cost.

These principles generally also apply to the acquisition of an investment in a subsidiary, an associate or joint venture when the purchase consideration does not reflect the fair value of the investment, and such investments are accounted for initially at cost in the separate financial statements as discussed in section 2.1 above. Investments acquired in common control transactions are discussed in section 2.1.1.B above.

4.4.1.A Sale of PP&E from the parent to the subsidiary for an amount of cash not representative of the fair value of the asset

The parent and subsidiary are both parties to the transaction and both must recognise it. As the asset is recognised by the acquiring entity at cost, and not necessarily at fair value, a choice exists as to how the cost is determined.

In some jurisdictions, some entities are legally required to conduct such transactions at fair value and in others they may conduct them at the agreed upon amount (actual consideration).

The above choice that exists when accounting for acquisition of the asset for an amount of cash not representative of the fair value of the asset is explained in the following Illustration 4-1:

Illustration 4-1: Sale of PP&E at an undervalue

A parent entity sells PP&E that has a carrying amount of 50 and a fair value of 100 to its subsidiary for cash of 80.

Method (a)				Method (b)			
Recognise the transaction at fair value, regardless of the values in any agreement, with any difference between that amount and fair value recognised as an equity transaction. (Note 1)				Recognise the transaction at the consideration agreed between the parties, being the amount of cash paid.			
Subsidiary							
		CU	CU			CU	CU
Dr	PP&E	100		Dr	PP&E	80	
	Cr Cash		80		Cr Cash		80
	Cr Equity		20				
Parent							
		CU	CU			CU	CU
Dr	Cash	80		Dr	Cash	80	
Dr	Investment	20			Cr PP&E		50
	Cr PP&E		50		Cr Gain (profit or loss)		30
	Cr Gain (profit or loss)		50				

Note 1 This may only be applied when fair value can be measured reliably.

However, what if the asset is sold for more than fair value? What are the implications if, in the above example, the PP&E sold for 80 has a carrying value of 80 but its fair value is 75? There are a number of explanations that may affect the way in which the transaction is accounted for:

- The excess reflects additional services or goods included in the transaction, e.g., future maintenance that will be accounted for separately.
- The excess reflects the fact that the asset's value in use ('VIU') is at least 80. There are instances when PP&E is carried at an amount in excess of fair value because its VIU, or the VIU of the cash-generating unit of which it is a part, is unaffected by falls in fair value. Plant and machinery often have a low resale value; vehicles lose much of their fair value soon after purchase; and falls in property values may not affect the VIU of the head office of a profitable entity (see Chapter 21). Where an entity has an accounting policy to recognise such transactions at consideration paid, there is no reason why the subsidiary cannot record the asset it has acquired for the cash it has paid, which means that it effectively inherits the transferor's carrying value. An impairment test potentially would not reveal any requirement to write down the asset, assuming of course that other factors do not reduce the asset's VIU (e.g., the fact that the asset will after the sale be part of a different cash generating unit).
- The excess over fair value is a distribution by the subsidiary to the parent that will be accounted for in equity. This treatment is a legal requirement in some jurisdictions, which means that the overpayment must meet the legal requirements for dividends, principally that there be sufficient distributable profits to meet the cost.
- The asset is impaired before transfer, i.e., both its fair value and VIU are lower than its carrying amount in which case it must be written down by the transferor before the exchange takes place when Method (b) is applied. If it is still sold for more than its fair value, the excess will be accounted for as a distribution received (by the parent) and a distribution made by the subsidiary (as above).

4.4.1.B The parent exchanges PP&E for a non-monetary asset of the subsidiary

The parent and subsidiary are both parties to the transaction and both must recognise it. The exchange of an asset for another non-monetary asset is accounted for by recognising the received asset at fair value, unless the transaction lacks commercial substance (as defined by IAS 16) or the fair value of neither of the exchanged assets can be measured reliably. [IAS 16.24]. The requirements of IAS 16 are explained in Chapter 19; the treatment required by IAS 38 and IAS 40 is the same.

The mere fact that an exchange transaction takes place between entities under common control does not of itself indicate that the transaction lacks commercial substance. In an exchange transaction between unrelated parties the fair values of the assets are usually the same, but this does not necessarily need to be the case in transactions between entities under common control.

If the fair value of both assets can be measured reliably there may be a difference between the two. IAS 16 requires that, if an entity is able to determine reliably the fair value of either the asset received or the asset given up, then the fair value of the asset given up is used to measure the cost of the asset received unless the fair value of the asset received is more clearly evident. [IAS 16.26]. Therefore, IAS 16 actually requires an entity to base its accounting for the exchange on the asset whose fair value is most clearly evident. [IAS 16.26]. If fair values are different, it is possible that the group entities have entered into a transaction that includes a component of a non-reciprocal transaction. This means that the entity has the policy choice described in section 4.3 above, which in this case means that there are three alternative treatments; it can recognise the transaction as follows:

- Method (a) - an exchange of assets at fair value of the asset received with an equity transaction. Any difference between the fair value of the asset received and the fair value of the asset given up is an equity transaction, while the difference between the carrying value of the asset given up and its fair value is recognised in profit or loss.
 - Method (b) - an exchange of assets at fair value of the asset received without recognising an equity element. The asset received is recognised at its fair value and any resulting difference to the carrying value of the asset given up is recognised in profit or loss.
- Or
- Method (c) - apply a 'cost' method based on IAS 16 (the fair value of the asset given up is used to measure the cost of the asset received) under which each entity records the asset at the fair value of the asset it has given up. This could result in one of the parties recording the asset it has received at an amount in excess of its fair value, which may be an indicator of impairment of the asset. It would be consistent with the principles outlined in section 4.3 above to treat the write down as an equity transaction, i.e., an addition to the carrying value of the subsidiary by the parent and a distribution by the subsidiary.

Illustration 4-2: Exchange of assets with dissimilar values

A parent entity transfers an item of PP&E to its subsidiary in exchange for an item of PP&E of the subsidiary, with the following values:

Subsidiary		Parent	
	CU		CU
Carrying Value	20	Carrying Value	50
Fair Value	80	Fair Value	100

The fair value of both assets can be measured reliably.

The accounting for the transaction by the parent and the subsidiary under each of the methods is as follows:

Method (a)					
Subsidiary			Parent		
	CU	CU		CU	CU
Dr PP&E	100		Dr PP&E	80	
Cr PP&E		20	Dr Investment	20	
Cr Gain (profit or loss)		60	Cr PP&E		50
Cr Equity		20	Cr Gain (profit or loss)		50

Method (b)					
Subsidiary			Parent		
	CU	CU		CU	CU
Dr PP&E	100		Dr PP&E	80	
Cr PP&E		20	Cr PP&E		50
Cr Gain (profit or loss)		80	Cr Gain (profit or loss)		30

Method (c)					
Subsidiary			Parent		
		CU			CU
Dr	PP&E	80	Dr	PP&E (100 - 20)	80
	Cr PP&E		Dr	Investment	20
	Cr Gain (profit or loss)	60		Cr PP&E	50
				Cr Gain (profit or loss)	50

If the fair value of only one of the exchanged assets can be measured reliably, IAS 16 allows both parties to recognise the asset they have received at the fair value of the asset that can be measured reliably.

[IAS 16.26]. Underlying this requirement is a presumption that the fair value of both assets is the same, but one cannot assume this about common control transactions.

If the fair value of neither of the exchanged assets can be measured reliably, or the transaction does not have commercial substance, both the parent and subsidiary recognise the received asset at the carrying amount of the asset they have given up.

4.4.1.C Acquisition and sale of assets for shares

These transactions include the transfer of inventory, property plant and equipment, intangible assets, investment property and investments in subsidiaries, associates, and joint ventures by one entity in return for shares of the other entity. These transactions are usually between a parent and subsidiary and the subsidiary is the transferee that issues shares to the parent in exchange for the assets received. In some cases, local regulations require that the fair value of the assets transferred is not lower than the nominal amount of shares issued.

(a) Accounting treatment by the subsidiary

Transactions that include the transfer of inventory, property plant and equipment, intangible assets, and investment property are within the scope of IFRS 2, as goods have been received in exchange for shares. The assets are recognised at their fair value, unless the fair value cannot be estimated reliably, and an increase in equity of the same amount is recognised. If the fair value of the assets cannot be estimated reliably, the fair value of the shares is used instead. [IFRS 2.10].

Transactions in which an investment in a subsidiary, associate or joint venture is acquired in exchange for shares are not specifically addressed under IFRS accounting standards, since they fall outside the scope of both IFRS 9 and IFRS 2. Similar transactions that do not occur under common control are discussed in section 2.1.1.A above.

How we see it

We believe that it is appropriate, by analogy with IFRS accounting standards on related areas (such as IFRS 2, IFRS 3, or the guidance in IAS 16 on exchange of assets), to account for transactions in which an investment in a subsidiary, associate or joint venture is acquired in exchange for shares, at the fair value of (i) the consideration given (being fair value of equity instruments issued) or (ii) the assets received, if that is more easily measured, together with directly attributable transaction costs. In selecting the accounting policy choice an entity considers applicable local regulation requirements.

As discussed in section 2.1.1.B above, when the purchase consideration does not correspond to the fair value of the investment acquired, in our view, the acquirer has an accounting policy choice to account for the investment at fair value of the consideration given or may impute an equity contribution or dividend distribution and in effect account for the investment at its fair value.

Alternatively, if the investment in a subsidiary constitutes a business and is acquired in a share-for-share exchange, it is also acceptable to measure the cost, as explained in section 2.1.1.B above, based on the carrying amount of the investment in the subsidiary in the transferor entity's separate financial statements, rather than at the fair value of the shares given as consideration. This approach is conceptually based on the pooling of interest approach that is allowed for business combinations under common control (see Chapter 11).

(b) Accounting treatment by the parent

The parent has disposed of an asset in exchange for an increased investment in a subsidiary. Based on what has been said in section 2.1.1 above, the cost of investment should be recorded at the fair value of the consideration given i.e., the fair value of the asset sold. Such a transaction has also the nature of an exchange of assets and, by analogy to IAS 16.24, the investment should be measured at fair value unless the exchange transaction lacks commercial substance or the fair value of neither the investment received, nor the asset given up is reliably measurable. If the investment cannot be measured at fair value, it is measured at the carrying value of the asset given up. [IAS 16.24].

It may be that the asset's fair value is lower than its carrying value, but it is not impaired, because its VIU is sufficient to support its carrying value (see section 4.4.1.A above and Chapter 21). In these circumstances, the parent is not prevented from treating the difference between the fair value of the asset disposed and the carrying value as an addition to the investment in the subsidiary solely because the fair value is lower. In substance, the entity is exchanging an asset with an investment as if the transaction has no commercial substance. If the asset is impaired, then this is recognised before reclassification, unless the reorganisation affects, and increases, the VIU. Significant judgement is exercised to understand how, and if, the reorganisation affects the future cash flows on which the VIU calculation is based.

If the fair value is higher than the carrying value and the investment is accounted for at fair value as discussed above, the transferring entity recognises a gain. In certain circumstances, it may not be appropriate to account for the transaction at fair value due to lack of commercial substance. For example, exchanging the asset for an investment in the shares of a subsidiary that holds nothing, but the asset given as consideration may not give rise to a gain on transfer.

4.4.1.D Contribution and distribution of assets

These transactions include transfers of inventory, property, plant and equipment, intangible assets, investment property and investments in subsidiaries, associates, and joint ventures from one entity to another for no consideration. These arrangements are not contractual but are equity transactions: either specie capital contributions (an asset is gifted by a parent to a subsidiary) or non-cash distributions (an asset is given by a subsidiary to its parent). IFRIC 17 explicitly excludes intra-group non-cash distributions from its scope (see section 2.4.2 above). [IFRIC 17.5].

The relevant standards (IAS 2, IAS 16, IAS 38, and IAS 40) refer to assets being recognised at cost. Similarly, investments in subsidiaries, associates and joint ventures may be recognised at cost under IAS 27 as discussed in section 2.1 above.

How we see it

We believe that following the principles described in section 4.3 above, (and having considered applicable local regulations) the entity receiving the asset has a choice: to recognise it at zero, or at fair value. It is in practice more common for an entity that has received an asset in what is purely an equity transaction to recognise it at fair value. An entity must consistently apply its chosen accounting policy.

The entity that gives away the asset must reflect the transaction. A parent that makes a specie capital contribution to its subsidiary will recognise an increased investment in that subsidiary (in principle at fair value, recognising a gain or loss based on the difference from the carrying amount of the asset) provided the increase does not result in the impairment of the investment, or an expense (based on the carrying amount of the asset given away). A subsidiary that makes a distribution in specie to its parent can account for the transaction by derecognising the distributed asset at its carrying value against retained earnings.

However, the subsidiary could also account for the distribution at fair value, if the fair value can be established reliably. This would potentially result in recognising a gain in profit or loss for the difference between the fair value of the asset and its carrying value. There would also be a charge to equity for the distribution, recognised and measured at the fair value of the asset. Although such in specie distribution from the subsidiary to its parent is not in scope of IFRIC 17, the provisions of IFRIC 17 can be applied by analogy.

4.4.1.E Transfers between subsidiaries

As noted in section 4.2 above, similar principles apply when the arrangement is between two subsidiaries rather than a subsidiary and parent. To illustrate this, assume that the transaction in Illustration 4-1 in section 4.4.1.A above takes place between two subsidiaries rather than parent and subsidiary.

Illustration 4-3: Transactions between subsidiaries

The facts are as in Illustration 4-1 above except that Subsidiary A sells PP&E that has a carrying amount of CU50 and a fair value of CU100 to its fellow-subsidiary B for cash of CU80. As before, it is assumed that fair value can be measured reliably.

Method (a)				Method (b)			
Recognise the transaction at fair value, regardless of the values in any agreement, with any difference between that amount and fair value recognised as an equity transaction.				Recognise the transaction at the consideration agreed between the parties, being the amount of cash paid.			
Subsidiary A							
		CU	CU			CU	CU
Dr	Cash	80		Dr	Cash	80	
Dr	Equity (Note 1)	20			Cr PP&E		50
	Cr PP&E		50		Cr Gain (profit or loss)		30
	Cr Gain (profit or loss)		50				
Subsidiary B							
		CU	CU			CU	CU
Dr	PP&E	100		Dr	PP&E	80	
	Cr Cash		80		Cr Cash		80
	Cr Equity (Note 1)		20				
Note 1	From subsidiary A's perspective there is an equity element to the transaction representing the difference between the fair value of the asset and the contractual consideration. This reflects the amount by which the transaction has reduced A's fair value and has been shown as a distribution by A to its parent. From subsidiary B's perspective, the equity element is a capital contribution from the parent.						
Parent (Note 2)							
		CU	CU				
Dr	Investment in B	20		No entries made			
	Cr Investment in A		20				
Note 2	Parent can choose to reallocate the equity element of the transaction between its two subsidiaries so as to reflect the changes in value.						

In some circumstances, the transfer of an asset from one subsidiary to another may affect the value of the transferor's assets to such an extent as to be an indicator of impairment in respect of the parent's investment in its shares. This could happen if the parent acquired the subsidiary for an amount that includes goodwill and the assets generating part or all of that goodwill have been transferred to another subsidiary. As a result, the carrying value of the shares in the parent may exceed the fair value or VIU of the remaining assets. This is discussed further in Chapter 21.

4.4.2 Acquiring and selling businesses - transfers between subsidiaries

One group entity may sell, and another may purchase, the net assets of a business rather than the shares in the entity. The acquisition may be for cash or shares and both entities must record the transaction in their individual or separate financial statements. There can also be transfers for no consideration. As this chapter only addresses transactions between entities under common control, any arrangement described in this section from the perspective of the transferee will be as common control transactions out of scope of IFRS 3. The common control exemption is discussed in Chapter 10.

If the arrangement is a business combination for the acquiring entity it will also not be within scope of IFRS 2. [IFRS 2.5].

The transferor must recognise the transfer of a business under common control. If the consideration received does not represent fair value of the business transferred or there is the transfer without any consideration, the principles described in section 4.4.2.C below are applied to decide whether any equity element is recognised.

4.4.2.A Has a business been acquired?

IFRS 3 defines a business as “an integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing goods or services to customers, generating investment income (such as dividends or interest) or generating other income from ordinary activities”. [IFRS 3 Appendix A]. See Chapter 9 for descriptions of the features of a business.

4.4.2.B If a business has been acquired, how should it be accounted for?

How we see it

As described in Chapter 11, we believe that, given that the IASB decided in November 2023 not to develop requirements for reporting business combinations under common control, entities should apply either:

(a) The pooling of interest method

Or

(b) The acquisition method (as in IFRS 3)

In our view, when the acquisition method of accounting is selected to reflect, in the separate financial statements, the acquisition of the business under common control, the transaction must have substance from the perspective of the reporting entity. This is because the method results in a reassessment of the value of the net assets of one or more of the entities involved and/or the recognition of goodwill.

Chapter 11 discusses the factors that will give substance to a transaction and although this is written primarily in the context of the acquisition of an entity by another entity, it applies equally to the acquisition of a business by an entity or a legal merger of two subsidiaries.

4.4.2.C Purchase and sale of a business for equity or cash not representative of the fair value of the business

How we see it

In our view, the principles of accounting in the separate financial statements, if a business has been acquired or sold under common control when the consideration in equity or cash is not representative of the fair value of the business, are no different to those described in section 4.4.1.A above. The entity may:

- Recognise the transaction at fair value, regardless of the values in any agreement, with any difference between that amount and fair value recognised as an equity transaction.

Or

- Recognise the transaction at the consideration agreed between the parties, being the amount of cash paid or fair value of shares issued.

From the perspective of the acquirer of the business, the above choice matters only when the acquisition method is applied in accounting for the business acquired. Depending on which approach is applied, goodwill on the acquisition may be different (or there can even be a gain on bargain purchase recognised). This is discussed further in Chapter 11. When the pooling of interest method is applied, the difference between the consideration paid and carrying value of net assets received is always recognised in equity no matter whether the consideration agreed between the parties represents the fair value of the business. If no consideration is payable for the transfer of the business, this could affect the assessment as to whether the transaction has substance to enable the acquisition method to be applied.

From the perspective of the seller of the business, the choice will impact any gain or loss recognised on the disposal. Recognising the transaction on the basis of the consideration agreed will result in a gain or loss based on the difference between the consideration received and the carrying value of the business disposed. Recognising the transaction at fair value including an equity element imputed will result in the gain or loss being the difference between the fair value of the business and its carrying value. If no consideration is received for the transfer of the business, the transaction may be considered to be more in the nature of a distribution in specie, the accounting for which is discussed in section 4.4.1.D above.

4.4.2.D If the net assets are not a business, how should the transactions be accounted for?

Even though one entity acquires the net assets of another, this is not necessarily a business combination. IFRS 3 rules out of scope acquisitions of assets or net assets that are not businesses, noting that:

"This IFRS does not apply to ... the acquisition of an asset or a group of assets that does not constitute a *business*. In such cases the acquirer shall identify and recognise the individual identifiable assets acquired (including those assets that meet the definition of, and recognition criteria for, *intangible assets* in IAS 38 *Intangible Assets*) and liabilities assumed. The cost of the group shall be allocated to the individual identifiable assets and liabilities on the basis of their relative *fair values* at the date of purchase. Such a transaction or event does not give rise to goodwill." [IFRS 3.2(b)].

How we see it

In our view, if the net assets, rather than a business, have been acquired or sold under common control and the consideration in equity or cash is not representative of the fair value of the net assets the principles for accounting in the separate financial statements are no different to those described in sections 4.4.1.A, 4.4.1.C and 4.4.1.D above. The entity may:

- Recognise the transaction at fair value, regardless of the values in any agreement, with any difference between that amount and fair value recognised as an equity transaction, provided that the fair value can be reliably measured.
- Or
- Recognise the transaction at the consideration agreed between the parties, being the amount of cash paid or fair value of shares issued.

4.4.3 Transfers of businesses between parent and subsidiary

As an acquisition of a business by a subsidiary from its parent in exchange for cash, other assets or equity instruments may meet the definition of a business combination, the guidance provided in section 4.4.2 above is applicable. Therefore, this section mainly deals with the transfer of a business from a subsidiary to its parent.

A feature that all transfers of businesses to parent entities have in common, whatever the legal form that they take, is that it is difficult to categorise them as business combinations. There is no acquirer whose actions result in it obtaining control of an acquired business; the parent already controlled the business that has been transferred to it.

A transfer without any consideration is comparable to a distribution by a subsidiary to its parent. The transfer can be a dividend but there are other legal arrangements that have a similar effect including reorganisations sanctioned by a court process or transfers after liquidation of the transferor entity. Some jurisdictions allow a legal merger between a parent and subsidiary to form a single entity. The general issues related to distributions of business are addressed in section 4.4.3.A below, while the special concerns raised by legal mergers are addressed in section 4.4.3.B below.

4.4.3.A Distributions of businesses without consideration - subsidiary transferring business to the parent

When a subsidiary transfers a business to the parent, from the parent perspective, two views exist. One view is that the transfer is a distribution and the model on which to base the accounting is that of receiving a dividend (distribution approach). This approach is permitted when the subsidiary is measured at cost or at fair value applying IFRS 9. Another view is that the parent has exchanged the investment in shares for the underlying assets and this is essentially a change from an equity interest to a direct investment in the net assets and results (exchange of investment for net assets approach). Neither analogy is perfect, although both have their supporters.

How we see it

We believe that in all circumstances, the following two major features will impact the accounting by the parent for the business transferred by the subsidiary:

- Whether the transfer is accounted for at fair value or at 'book value'
- And
- Whether the subsidiary transfers the entirety of its business or only part of it

The transaction could be accounted for at fair value using similar principles to IFRS 3, since a business is being received. Fair value can be used in both circumstances when the parent has set up or acquired the subsidiary.

Book value in turn may depend on whether the subsidiary has been acquired by the parent, in which case the relevant book values would be those reflected in the consolidated financial statements of the parent, rather than those in the subsidiary's financial statements.

The two perspectives are accounted for by the parent as follows:

- (i) Distribution approach - the parent effectively has received a distribution that it accounts for in its statement of profit or loss at the fair value of the business received. It reflects the assets acquired and liabilities assumed at their fair value, including goodwill, which will be measured as at the date of the transfer. The existing investment is written off to the statement of profit or loss when the subsidiary transfers the entirety of its business, or tested for impairment when only part of its business is transferred.
- (ii) Exchange of investment for net assets approach - the parent has exchanged its investment or part of its investment for the underlying assets and liabilities of the subsidiary and accounts for them at book values. The parent recognises the assets and liabilities transferred in its financial statements. The carrying values that are reported in the consolidated financial statements become the cost of these assets and liabilities for the parent. When the transfer represents the entirety of the subsidiary's business and underlying net assets, the parent's investment in the subsidiary is written off as the transaction results, in substance, in the redemption of shares in the subsidiary in exchange for the underlying assets and liabilities. When only part of the subsidiary's business is transferred, the parent tests for impairment the carrying amount of the investment in the subsidiary. This accounting gives rise to a 'catch-up' adjustment; being the difference between the carrying amounts of the net assets of the subsidiary (including, where appropriate, any goodwill) recognised directly by the parent and the reduction (if any) in the cost of the investment in the subsidiary.

How we see it

In our view, the distribution approach can be applied in all circumstances and is the only appropriate method when the parent carries its investment in shares at fair value applying IFRS 9.

The two linked questions when using the exchange of investment for net assets approach are the treatment of any 'catch-up adjustment' and whether or not to reflect goodwill (or an 'excess' - negative goodwill) relating to the acquisition of the subsidiary in the parent's financial statements. The recognition of goodwill will depend primarily on whether the subsidiary has historically been acquired by the parent (the only circumstances in which this approach allows goodwill in the parent's financial statements after the transfer).

These alternative treatments are summarised in the following table:

<i>Subsidiary set up or acquired</i>	Basis of accounting	Goodwill recognised	Effect on statement of profit or loss
Subsidiary set up by parent	Fair value.	Goodwill or negative goodwill at date of transfer.	Dividend recognised at fair value of the business. Investment written off or tested for impairment. (Note 4)
	Book value from consolidated accounts.	No goodwill or negative goodwill. (Note 1)	Catch up adjustment recognised fully in equity or as income, except that the element relating to a transaction recorded directly in equity may be recognised in equity. (Note 2) Investment written off or tested for impairment.
Subsidiary acquired by parent	Fair value.	Goodwill or negative goodwill at date of transfer.	Dividend recognised at fair value of the business. Investment written off or tested for impairment. (Note 4)
	Book value from consolidated accounts. (Note 3)	Goodwill as at date of original acquisition. (Note 3)	Catch up adjustment recognised fully in equity or as income, except that the element relating to a transaction recorded directly in equity may be recognised in equity. (Note 2) Investment written off or tested for impairment.

Notes

- (1) If the parent established the subsidiary itself and its investment reflects only share capital it has injected, an excess of the carrying value over the net assets received will not be recognised as goodwill. This generally arises because of losses incurred by the transferred subsidiary.
If the subsidiary's net assets exceed the carrying value of the investment, then this will be due to profits or other comprehensive income retained in equity.
- (2) The catch-up adjustment is not an equity transaction so all of it can be recognised in income. However, to the extent that it has arisen from a transaction that had occurred directly in equity, such as a revaluation, an entity can make a policy choice to recognise this element in equity. In this case the remaining amount is recognised in income. The entity can also take a view that although the transfer of business is a current period transaction, the differences relate to a prior period and hence should be recognised in equity.
- (3) Because this was originally an acquisition, the values in the consolidated financial statements (and not the subsidiary's underlying records) become 'cost' for the parent. The assets and liabilities will reflect fair value adjustments made at the time of the business combination. Goodwill or negative goodwill will be the amount as at the date of the original acquisition.
- (4) When the investment in the subsidiary is measured at fair value, the parent recognises the fair value of the received net assets and a reduction in the fair value of the investment in the subsidiary in accordance with IFRS 9.

In the separate financial statements, regardless of which approach or variety of approaches are used, comparative information should not be restated to include the net assets distributed by the subsidiary. The financial position and results of operations distributed by the subsidiary are reflected in the separate financial statements only from the date on which the distribution occurred.

How we see it

If the business of the acquired subsidiary is transferred to the parent company as a distribution shortly after acquisition of that subsidiary, we believe that the accounting shall follow IAS 27 in relation to the dividend payment by the subsidiary. It can be accounted for effectively as a return of capital. The parent eliminates its investment in the subsidiary or part of its investment (based on the relative fair value of the business transferred compared to the value of the subsidiary), recognising instead the assets and liabilities of the business acquired at their fair value including the goodwill that has arisen on the business combination. The effect is to reflect the substance of the arrangement which is that the parent acquired a business. Comparative information is not restated in this case.

4.4.3.B Legal merger of parent and subsidiary

A legal merger can occur for numerous reasons, including facilitating a listing or structuring to transfer the borrowings obtained to acquire an entity to be repaid by the entity itself or to achieve tax benefits. Legal mergers are also referred to as 'hive up' or 'hive down' transactions. Legal mergers always affect the individual or separate financial statements of the entities involved. As legal mergers are not specifically discussed in IFRS accounting standards, different views and approaches are encountered in practice.

In many jurisdictions it is possible to affect a 'legal merger' of a parent and its subsidiary whereby the two separate entities become a single entity without any issue of shares or other consideration. This is usually the case when there is a legal merger of a parent with its 100% owned subsidiary. Depending on the jurisdiction, different scenarios may take place.

It is not uncommon for a new entity to be formed as a vehicle used in the acquisition of an entity from a third party in a separate transaction. Subsequently both entities legally merge.

How we see it

Judgement is required to make an assessment as to whether a legal merger occurs 'close to' the date of acquisition, including considering the substance of the transaction and the reasons for doing the merger. If, for example, a new entity is formed concurrently with (or near the date of) the acquisition of a subsidiary, and there is a legal merger of the new entity and the subsidiary, these transactions may, in certain circumstances, be viewed as a single transaction in which a subsidiary is acquired. Facts and circumstances that would, on balance, lead to application of the single transaction perspective are further discussed in Chapter 10.

Even though the substance of the legal merger may be the same, whether the survivor is the parent or subsidiary affects the accounting. The below discussion assumes that both the parent and subsidiary contain businesses. Examples of when these transactions involve entities that do not contain a business are discussed with reference to SPAC transactions. See Chapter 10.

In January 2024, the IFRS IC published an agenda decision about how a parent entity that prepares separate financial statements applying IAS 27 accounts for a merger with its subsidiary in its separate financial statements.¹⁷ The IFRS IC noted that in the fact pattern discussed, there is little evidence of diversity in practice as parent entities generally do not apply the requirements in IFRS 3 that apply to the accounting for a business combination and therefore, the IFRS IC did not propose to add a standard-setting project to the work plan.

(a) *The parent is the surviving entity*

The parent's consolidated financial statements

The legal merger of the parent and its subsidiary on its own does not affect the consolidated financial statements of the group. When non-controlling interests (NCI) are acquired in conjunction with the legal merger transaction, the transaction with the NCI holders is accounted for as a separate equity transaction (i.e., transactions with owners in their capacity as owners). [IFRS 10.23].

How we see it

Even if there is no consolidated group after the legal merger, in our view, according to IFRS 10 consolidated financial statements are still required (including comparative financial statements) in the reporting period in which the legal merger occurs. In such a case, individual financial statements are the continuation of the consolidated group - in subsequent reporting periods, the amounts are carried forward from the consolidated financial statements (and shown as the comparatives in the individual financial statements).

In the reporting period in which the legal merger occurs the parent is also permitted, but not required, to present separate financial statements under IFRS accounting standards.

Separate financial statements

How we see it

When the parent is the surviving entity following the legal merger, then in the parent's separate financial statements we believe two approaches are available if the investment in the subsidiary was previously measured at cost:

- The legal merger is in substance the distribution of the business from subsidiary to the parent.
Or
- The legal merger is in substance the redemption of shares in the subsidiary, in exchange for the underlying assets of the subsidiary.

¹⁷ [IFRIC Update](#), November 2023, Addendum to IFRIC Update-Committee's agenda decisions. Available on the IFRS Foundation's website.

An entity chooses its policy and applies it consistently. Under both approaches, any amounts that were previously recognised in the parent's separate financial statements continue to be recognised at the same amount, except for the investment in the subsidiary that is merged into the parent.

The approaches to consider are as follows:

- (i) The legal merger is in substance the distribution of the business from subsidiary to the parent (distribution approach).

One way to apply the distribution approach, consistently with distributions of businesses without consideration, is to recognise the assets acquired and the liabilities assumed at their fair value, including goodwill (see section 4.4.3.A above). Another way, which is based on the principles that are used for a business combination that occurs in stages, implies that the investment in the subsidiary is first remeasured to fair value as at the date of the legal merger, with any resulting gain or loss recognised in profit or loss. The investment in the subsidiary is then derecognised and the acquired assets (including investments in subsidiaries, associates, or joint ventures held by the merged subsidiary) and assumed liabilities are recognised at fair value. Any difference gives rise to goodwill or income (bargain purchase, which is recognised in profit or loss).

- (ii) The legal merger is in substance the redemption of shares in the subsidiary, in exchange for the underlying assets of the subsidiary.

Consistently with the exchange of investment for net assets approach (see section 4.4.3.A above), giving up the shares for the underlying assets is essentially a change in perspective of the parent of its investment, from a 'direct equity interest' to 'the reported results and net assets'. Hence, the values recognised in the consolidated financial statements become the cost of these assets for the parent. The acquired assets (including investments in subsidiaries, associates, or joint ventures held by the merged subsidiary) and assumed liabilities are recognised at the carrying amounts in the consolidated financial statements as at the date of the legal merger. This includes any associated goodwill, intangible assets, or other adjustments arising from measurement at fair value upon acquisition that were recognised when the subsidiary was originally acquired, less the subsequent related amortisation, depreciation and impairment losses, as applicable. As the parent recognises assets and liabilities of the merged subsidiary, these may also include investments in subsidiaries that are eliminated in preparing the parent's consolidated financial statements. In applying the redemption of shares method, the parent needs to determine the carrying amount of these subsidiaries to be able to recognise values consistent with those in its consolidated financial statements.

How we see it

We believe that, when applying the exchange of investment for net assets approach, the difference between:

- (1) The amounts assigned to the assets and liabilities in the parent's separate financial statements after the legal merger

And

- (2) The carrying amount of the investment in the merged subsidiary before the legal merger, is recognised in one of the following (accounting policy choice):

- Profit or loss
- Directly in equity

Or

- Allocated to the appropriate component in the separate financial statements in the current period (e.g., current period profit or loss, current period other comprehensive income, or directly to equity) of the parent based on the component in which they were recognised in the financial statements of the merged subsidiary

If the investment in the subsidiary was measured at fair value in the separate financial statements of the parent, then only the distribution approach is applicable, because there is a direct swap of the investment with the underlying business. The parent would already have reflected the results of transactions that the subsidiary entered into since making its investment - depending on the designation either in other comprehensive income or in profit or loss. Because the underlying investment in the subsidiary is derecognised, this may trigger the reclassification within equity of any amounts previously recognised in other comprehensive income.

In the separate financial statements, regardless of which approach or variety of approaches is used, comparative information should not be restated to include the merged subsidiary. The financial position and results of operations of the merged subsidiary are reflected in the separate financial statements only from the date on which the merger occurred.

(b) *The subsidiary is the surviving entity*

How we see it

If the subsidiary is the surviving entity following the legal merger then in the subsidiary's separate financial statements, we believe two approaches are available if the investment in the subsidiary was previously measured at cost:

- The economic approach
- Or
- The legal approach

Some argue that the legal form of a merger is more important in the context of the individual or separate financial statements of the subsidiary as these have a different purpose, being the financial statements of a legal entity. Others contend that as the legal mergers are not regulated in IFRS accounting standards the accounting policy selected should reflect the economic substance of transactions, and not merely the legal form. This results in two possible approaches, the economic approach, and the legal approach. The economic approach is on balance the approach that usually provides the more faithful representation of the transaction. The legal approach may however be appropriate when facts and circumstances indicate that the needs of the users of the general-purpose financial statements after the legal merger are best served by using the financial statements of the surviving subsidiary as the predecessor financial statements. This need must outweigh the needs of users who previously relied upon the general-purpose financial statements of the parent (as such information may no longer be available, for example, when, following the merger, there is no group). Consideration is given as to whether either set of users can otherwise obtain the information needed using, for example, special-purpose financial statements.

(i) *The economic approach*

The legal merger between the parent and subsidiary is considered to have no substance. The amounts recognised after the legal merger are the amounts that were previously recognised in the consolidated financial statements, including goodwill and intangible assets recognised upon acquisition of that subsidiary. The consolidated financial statements after the legal merger also reflect any amounts in the consolidated financial statements (pre-merger) related to subsidiaries, associates, and joint ventures held by the surviving subsidiary. If the surviving subsidiary prepares separate financial statements after the legal merger, the subsidiary recognises the amounts that were previously recognised in the consolidated financial statements of the parent, as a contribution from the parent in equity. When the subsidiary holds investments in other subsidiaries, their cost should be adjusted in order to obtain amounts consistent with those recognised in the consolidated financial statements.

(ii) *The legal approach*

The financial statements after the legal merger reflect the legal form of the transaction from the perspective of the subsidiary. There are two methods (as described below) with respect to recognising the identifiable assets acquired of the parent or liabilities assumed from the parent; regardless of which is used, amounts recognised previously in the consolidated financial statements with respect to the parent's acquisition of the surviving subsidiary (e.g., goodwill, intangible assets, fair value purchase price adjustments) are not recognised by the subsidiary. The surviving subsidiary does not recognise any change in the basis of subsidiaries, associates, and joint ventures that it held before the legal merger unless its ownership following the merger increased.

Fair value method

If a merged parent meets the definition of a business, the transaction is accounted for as an acquisition, with the consideration being a 'contribution' from the parent recognised in equity at fair value. Principles in IFRS 3 apply then by analogy.

The subsidiary recognises:

- (1) The fair value of the parent as a business as a contribution to equity
- (2) The identifiable assets acquired, and liabilities assumed from the parent at fair value
- And
- (3) The difference between (2) and (1) as goodwill or gain on a bargain purchase.

Book value method

Under this method the subsidiary accounts for the transaction as a contribution from the parent at book values. The subsidiary recognises the identifiable assets acquired or liabilities assumed from the parent at the historical carrying amounts and the difference between that amount and the value of any shares issued to affect the transaction, is recognised in equity. The historical carrying amounts may be the carrying amounts previously recognised in the parent's separate financial statements, the amounts in the ultimate parent's consolidated financial statements, or in a sub-level consolidation (prior to the merger).

Whatever variation of the legal approach is applied, the subsidiary may not recognise amounts that were previously recognised in the consolidated financial statements that related to the operations of the subsidiary, because there is no basis in IFRS accounting standards for the subsidiary to recognise fair value adjustments to its internally generated assets or goodwill that were recognised by its parent when it was first acquired. Therefore, the carrying amount of the assets (including investments in subsidiaries, associates, and joint ventures) and liabilities held by the subsidiary are the same both before and after a legal merger (there is no revaluation to fair value). There is also no push-down accounting of any goodwill or fair value adjustments recognised in the consolidated financial statements related to the assets and liabilities of the subsidiary that were recognised when the parent acquired the subsidiary.

How we see it

In the separate financial statements, regardless of which approaches, or variety of approaches are used to account for the merger, comparative information should not be restated to include the merged parent. The financial position and results of operations of the merged parent are reflected in the separate financial statements only from the date on which the merger occurred.

4.4.4 Incurring expenses and settling liabilities without recharges

How we see it

Entities may incur costs that provide a benefit to fellow group entities, for example, audit, management, or advertising fees, and do not recharge the costs. If such costs are not recharged to the beneficiary, then the beneficiary is not party to the transaction and does not directly incur an obligation to settle a liability. We believe that the beneficiary may elect to recognise the cost, in which case it will charge profit or loss and credit equity with equivalent amounts. Alternatively, it may elect to do nothing provided the transaction is not within scope of IFRS 2. If the cost is incurred by a parent and the beneficiary is its subsidiary the parent could also elect to increase the investment in the subsidiary rather than to recognise the cost as an expense.

There is no policy choice if the expense relates to a share-based payment, in which case IFRS 2 mandates that expenses incurred for a subsidiary be added to the carrying amount of the investment in the parent and be recognised by the subsidiary (see Chapter 30).

Many groups recharge expenses indirectly, by making management charges, and in these circumstances, it would be inappropriate to recognise the transaction in any entity other than the one that makes the payment.

A parent or other group entity may settle a liability on behalf of a subsidiary. If this is not recharged, the liability will have been extinguished in the entity's accounts. This raises the question of whether the gain should be taken to profit or loss or to equity. IFRS 15 *Revenue from Contracts with Customers* defines income as increases in economic benefits during the accounting period in the form of inflows or enhancements of assets or decreases of liabilities that result in an increase in equity, other than those relating to contributions from equity participants. [IFRS 15 Appendix A]. Except in unusual circumstances, the forgiveness of debt will be a contribution from owners and therefore ought to be taken to equity.

It will usually be appropriate for a parent to add the payment to the investment in the subsidiary as a capital contribution unless a parent concludes that it is more appropriate to expense such forgiveness of debt. If a parent increases the investment in the subsidiary, it may trigger an impairment test. If one subsidiary settles a liability of its fellow subsidiary, both entities can choose to recognise an equity element in the transaction; one subsidiary recognises a capital contribution from the parent, while the other subsidiary recognises a distribution to the parent.

4.4.5 Financial instruments within the scope of IFRS 9

IFRS 9 (except for certain trade receivables) requires the initial recognition of financial assets and financial liabilities to be at fair value, [IFRS 9.5.1.1], so management has no policy choice. Financial instruments arising from group transactions are initially recognised at their fair value, with any difference between the fair value and the terms of the agreement recognised as an equity transaction. The measurement of financial instruments that are received in a transferred business are addressed in sections 4.4.3.A and 4.4.3.B above.

4.4.5.A Interest-free or non-market interest rate loans

Parents may lend money to subsidiaries on an interest-free or low-interest basis and *vice versa*. A feature of some intra-group payables is that they have no specified repayment terms and are therefore, repayable on demand. The fair value of a financial liability with a demand feature is not less than the amount payable on demand, discounted from the first date that the amount could be required to be paid. This means that an intra-group loan payable on demand has a fair value that is the same as the cash consideration given.

Loans are recognised at fair value on initial recognition based on the market rate of interest for similar loans at the date of issue (see Chapter 45). [IFRS 9.B5.1.1]. The party making the loan has a receivable recorded at fair value and must, on initial recognition, account for the difference between the fair value and the loan amount. Also, the party receiving such a loan accounts for a liability at fair value on initial recognition and must deal with the difference between the fair value of such liability and the loan amount.

If the party making the non-market loan is a parent, it adds this to the carrying value of its investment. The subsidiary will initially record a capital contribution in equity. Subsequently, the parent will recognise interest income and the subsidiary interest expense using the effective interest method so that the loan is stated at the amount receivable/repayable at the redemption date. When the loan is repaid, the overall effect in parent's financial statements is of a capital contribution made to the subsidiary as it has increased its investment and recognised income to the same extent (assuming, of course, no impairment). By contrast, the subsidiary has initially recognised a gain in equity that has been reversed as interest has been charged.

If the subsidiary makes the non-market loan to its parent, the difference between the loan amount and its fair value is treated as a distribution by the subsidiary to the parent, while the parent reflects a gain. Again, interest is recognised so that the loan is stated at the amount receivable and payable at the redemption date. For the subsidiary's financial statements, this has the effect of reversing the initial gain or loss taken to equity. Note that the effects in the parent's financial statements are not symmetrical to those when it makes a loan at below market rates. The parent does not need to deduct the benefit it has received from the subsidiary from the carrying value of its investment, but would recognise income from a distribution.

The following Illustration shows the accounting for a variety of intra-group loan arrangements.

Illustration 4-4: Interest-free and below market rate loans within groups

Entity S is a wholly-owned subsidiary of Entity P. In each of the following scenarios one of the entities provides an interest free or below market rate loan to the other entity.

1) P provides an interest free loan in the amount of CU100,000 to S. The loan is repayable on demand.

On initial recognition the receivable is measured at its fair value, which in this case is equal to the cash consideration given. The loan is classified as a current liability in the financial statements of the subsidiary. The classification in the financial statements of the parent depends upon management intention. If the parent had no intention of demanding repayment in the near term, the parent would classify the receivable as non-current in accordance with IAS 1.66.

If S makes an interest-free loan to parent, the accounting is the mirror image of that for the parent.

2) P provides an interest free loan in the amount of CU100,000 to S. The loan is repayable when funds are available.

Generally, a loan that is repayable when funds are available will be classified as a liability. The classification of such a loan, or a part of it, as current or non-current and the measurement at origination date will depend on the subsidiary's right to defer settlement at reporting date. The guidance in IAS 1 on classification of liabilities as current or non-current has changed due to the amendments to that Standard effective for annual periods beginning on or after 1 January 2024 (see Chapter 3); these amendments clarify that management intention does not play a role in the classification of liabilities. If no funds are available to repay the loan of the subsidiary at the reporting date and there is no realistic prospect of funds becoming available for at least twelve months after the reporting date, then at that date the subsidiary has a substantive right to defer. This analysis should be revised at each reporting date. Note that there are differing considerations for classification and measurement, with expectation being disregarded for the former. If the loan is expected to be repaid in three years, measurement of the loan would be the same as in scenario 3.

If S makes an interest-free loan to parent, the accounting is the mirror image of that for the parent.

3) P provides an interest free loan in the amount of CU100,000 to S. The loan is repayable in full after 3 years. The fair value of the loan (based on current market rates of 10%) is CU75,131.

At origination, the difference between the loan amount and its fair value (present value using current market rates for similar instruments) is treated as an equity contribution to the subsidiary, which represents a further investment by the parent in the subsidiary.

Journal entries at origination:

Parent		CU	CU
Dr	Loan receivable from subsidiary	75,131	
Dr	Investment in subsidiary	24,869	
	Cr Cash		100,000
Subsidiary		CU	CU
Dr	Cash	100,000	
	Cr Loan payable to parent		75,131
	Cr Equity - capital contribution		24,869

Journal entries during the periods to repayment:

Parent		CU	CU
Dr	Loan receivable from subsidiary (Note 1)	7,513	
	Cr Profit or loss - notional interest		7,513
Subsidiary		CU	CU
Dr	Profit or loss - notional interest	7,513	
	Cr Loan payable to parent		7,513

Note 1 Amounts represent Year 1 assuming no payments before maturity. Years 2 and 3 amounts would be CU8,264 and CU9,092 respectively i.e., accreted at 10%. At the end of year 3, the recorded balance of the loan will be CU100,000.

If S makes an interest-free loan to the parent, the accounting is the mirror image of that of the parent.

- 4) *S provides a below market rate loan in the amount of CU100,000 to P. The loan bears interest at 4% and is repayable in full after 3 years (i.e., CU112,000 at the end of year 3). The fair value of the loan (based on current market rates of 10%) is CU84,147.*

At origination, the difference between the loan amount and its fair value is treated as a distribution from the subsidiary to the parent. If parent provides a below market rate loan of CU100,000 to S, the accounting is the mirror image of that of the subsidiary; however, the difference between the loan amount and its fair value is treated as an equity contribution to the subsidiary, which represents a further investment by the parent in the subsidiary.

Journal entries at origination:

Parent		CU	CU
Dr	Cash	100,000	
	Cr Loan payable to subsidiary		84,147
	Cr Profit or loss - distribution from subsidiary		15,853
Subsidiary		CU	CU
Dr	Loan receivable from parent	84,147	
Dr	Retained earnings - distribution	15,853	
	Cr Cash		100,000

Journal entries during the periods to repayment:

Parent		CU	CU
Dr	Profit or loss - notional interest	8,415	
	Cr Loan payable to subsidiary		8,415
Subsidiary		CU	CU
Dr	Loan receivable from parent (Note 1)	8,415	
	Cr Profit or loss - notional interest		8,415

Note 1 Amounts represent Year 1 assuming no payments before maturity. Years 2 and 3 amounts would be CU9,256 and CU10,182, respectively i.e., accreted at 10% such that at the end of year 3 the recorded balance of the loan will be CU112,000 being the principal of the loan (CU100,000) plus the interest payable in cash (CU12,000).

4.4.5.B Financial guarantee contracts: parent guarantee issued on behalf of subsidiary

Financial guarantees given by an entity that are within the scope of IFRS 9 must be recognised initially at fair value as there is no exemption from the measurement requirements of IFRS 9 for guarantees issued between parents and their subsidiaries, between entities under common control nor by a parent or subsidiary on behalf of a subsidiary or a parent (See Chapter 41). [IFRS 9.5.1.1].

If a parent or other group entity gives a guarantee on behalf of an entity, this must be recognised in its separate or individual financial statements. Whether or not the guarantee is provided at stand-alone arm's length terms or on off-market terms (for example for no charge) will need to be considered. When the guarantee is provided on off-market terms, it is normally appropriate for a parent that gives a guarantee to treat the off-market terms component as a debit that arises on recognising the guarantee as an additional investment in its subsidiary. This is described in Chapter 45.

The situation is different for the subsidiary (or borrower) whose obligations are guaranteed under the contract.

Appendix A of IFRS 13 defines a unit of account for purposes of fair value measurement as "the level at which an asset or a liability is aggregated or disaggregated in an IFRS for recognition purposes".

Guarantees that are part of the contractual terms of a financial instrument are described in Chapter 47.

Therefore, in situations where the guarantee would be transferred along with the subsidiary's liability, the fair value of that liability to the subsidiary both at inception and for purposes of subsequent measurement includes the guarantee; this implies that there will be no separate recognition of the financial guarantee unless it is provided to the lender separate and apart from the original borrowing, such that it does not form part of the overall terms of the loan (i.e., would not transfer with the loan if it were assigned by the lender to a third party).

Facts and circumstances must be carefully analysed before concluding that guarantees will be reflected separately in the financial statements of the entities that benefit from the guarantees. Financial guarantee contracts are generally described in Chapter 41.

Illustration 4-5: Financial guarantee contracts

A group consists of two entities, H plc (the parent) and S Ltd (H's wholly-owned subsidiary). Entity H has a stronger credit rating than S Ltd. S Ltd is looking to borrow CU100, repayable in five years. A bank has indicated it will charge interest of 7.5% per annum. However, the bank has offered to lend to S Ltd at a rate of 7.0% per annum if H plc provides a guarantee of S Ltd's debt to the bank and this is accepted by S Ltd. No charge was made by H plc to S Ltd in respect of the guarantee. The fair value of the guarantee is calculated at CU2, which is the difference between the present value of the contractual payments discounted at 7.0% and 7.5%. If the bank were to assign the loan to S Ltd to a third party, the assignee would become party to both the contractual terms of the borrowing with S Ltd as well as the guarantee from H plc.

H plc will record the guarantee at its fair value of CU2.

S Ltd will record its loan at fair value including the value of the guarantee provided by the parent. It will simply record the liability at CU100 but will not recognise separately the guarantee provided by the parent.

If the guarantee was separate, S Ltd would record the liability at its fair value without the guarantee of CU98 with the difference of CU2 recorded as a capital contribution.

4.5 Disclosures

When there have been significant transactions between entities under common control that are not on arm's length terms, it will be necessary for the entity to disclose its accounting policy for recognising and measuring such transactions.

IAS 24 applies whether or not a price has been charged, so gifts of assets or services and asset swaps are within scope. Details and terms of the transactions must be disclosed (see Chapter 34).

Appendix B - Index of Frequently asked questions

Question 1-1:	How does a joint operator, in its separate financial statements, account for its share of the assets and liabilities of a joint operation when it is structured through a separate vehicle?	654
Question 1-2:	How does a joint operation that is a separate vehicle account for its share of assets and liabilities in its separate financial statements?	655
Question 1-3:	Can separate financial statements be issued before the respective consolidated financial statements?	656
Question 2-1:	How are transaction costs relating to the acquisition of an investment in a subsidiary, associate or joint venture treated in the separate financial statements?	662
Question 2-2:	How does a new intermediate parent established within a group determine the cost of its investments in subsidiaries when it accounts for those investments at cost in accordance with IAS 27.10(a)?	663
Question 2-3:	How does an entity account for an acquired additional interest in the investee (that is not an associate, joint venture, or subsidiary of the entity) which results in the entity obtaining control of the investee i.e., the investee becomes a subsidiary of the entity?	664
Question 2-4:	How is a transaction accounted for when an entity disposes of part of its investment in a subsidiary, that was previously accounted for at cost in accordance with IAS 27.10, and following the disposal the entity has neither control, joint control nor significant influence over the investee?	666
Question 2-5:	How is the cost of an investment in a subsidiary determined if the new intermediate parent has more than one direct subsidiary?	669

Appendix C - Defined terms

Extract from IAS 27

- 4 The following terms are used in this Standard with the meanings specified:
- Consolidated financial statements* are the financial statements of a group in which the assets, liabilities, equity, income, expenses and cash flows of the parent and its subsidiaries are presented as those of a single economic entity.
- Separate financial statements* are those presented by an entity in which the entity could elect, subject to the requirements in this Standard, to account for its investments in subsidiaries, joint ventures and associates either at cost, in accordance with IFRS 9 *Financial Instruments*, or using the equity method as described in IAS 28 *Investments in Associates and Joint Ventures*.

Chapter 10 Business combinations

Contents

Overview	710
1 Introduction	711
1.1 IFRS 3 (as revised in 2008) and subsequent amendments	711
1.2 Future developments	713
1.2.1 Business combinations - Disclosures, Goodwill and Impairment project	713
1.2.2 Financial Instruments with Characteristics of Equity ('FICE') project	713
2 Scope of IFRS 3	714
2.1 Mutual entities	714
2.2 Arrangements out of scope of IFRS 3	714
2.2.1 Formation of a joint arrangement	714
2.2.2 Acquisition of an asset or a group of assets that does not constitute a business	715
2.2.2.A Special Purpose acquisition companies (SPACs) transactions	716
2.2.3 Business combinations under common control	717
3 Identifying a business combination	718
3.1 Definition of a business combination	718
3.2 Definition of a business	718
3.2.1 Inputs, processes and outputs	719
3.2.2 Assessment of whether acquired set of activities and assets constitutes a business	719
3.2.3 Concentration test	720
3.2.4 Assessing whether an acquired process is substantive	721
3.2.5 'Capable of' from the viewpoint of a market participant	722
3.2.6 Identifying business combinations	723
3.2.7 Development stage entities	725
4 Acquisition method of accounting	726
4.1 Identifying the acquirer	726
4.1.1 New entity formed to effect a business combination	727
4.1.2 Stapling arrangements	731
4.1.3 Determining the accounting acquirer in SPAC transactions	731
4.2 Determining the acquisition date	732
5 Recognition and measurement of identifiable assets acquired, liabilities assumed and non-controlling interests	733
5.1 General principles	733
5.2 Recognising identifiable assets acquired and liabilities assumed	734
5.3 Acquisition-date fair values of identifiable assets acquired and liabilities assumed	734

5.4	Classifying or designating identifiable assets acquired and liabilities assumed	735
5.4.1	Exception to the classifying or designating principle	735
5.5	Recognising and measuring particular assets acquired and liabilities assumed	736
5.5.1	Operating leases in which the acquiree is the lessor	736
5.5.2	Intangible assets	736
5.5.2.A	Examples of identifiable intangible assets	737
5.5.2.B	Customer relationship intangible assets	739
5.5.2.C	Combining an intangible asset with a related contract, identifiable asset or liability	740
5.5.2.D	In-process research or development project expenditure	741
5.5.2.E	Emissions schemes	742
5.5.2.F	Determining the fair values of intangible assets	742
5.5.3	Reacquired rights	744
5.5.4	Assembled workforce and other items that are not identifiable	745
5.5.4.A	Assembled workforce	745
5.5.4.B	Items not qualifying as assets	745
5.5.5	Assets with uncertain cash flows (valuation allowances)	746
5.5.6	Assets that the acquirer does not intend to use or intends to use in a way that is different from other market participants	746
5.5.7	Investments in equity-accounted entities	747
5.5.8	Assets and liabilities related to contracts with customers	747
5.6	Exceptions to the recognition and/or measurement principles	748
5.6.1	Liabilities and contingent liabilities that would be in the scope of IAS 37 or IFRIC 21 if they were incurred separately	749
5.6.1.A	Initial recognition and measurement	749
5.6.1.B	Subsequent measurement and accounting	749
5.6.2	Income taxes	750
5.6.3	Employee benefits	751
5.6.4	Indemnification assets	751
5.6.4.A	Acquirer's obligation to transfer proceeds from realisation of acquired contingent asset ('Reverse indemnification liabilities')	751
5.6.5	Reacquired rights	752
5.6.6	Assets held for sale	753
5.6.7	Share-based payment transactions	753
5.6.8	Leases in which the acquiree is the lessee	753
5.6.9	Insurance contracts within the scope of IFRS 17	754
6	Recognising and measuring goodwill or a gain from a bargain purchase	755
6.1	Subsequent accounting for goodwill	756
7	Consideration transferred	757
7.1	Contingent consideration	758
7.1.1	Initial recognition and measurement	759
7.1.2	Classification of a contingent consideration obligation	761
7.1.3	Subsequent measurement and accounting	762
7.2	Replacement share-based payment awards	762
7.3	Acquisition-related costs	763

7.4	Business combinations achieved without the transfer of consideration	763
7.4.1	Business combinations by contract alone	764
7.5	Combinations involving mutual entities	764
8	Recognising and measuring non-controlling interests	766
8.1	Measuring qualifying non-controlling interests at acquisition-date fair value	767
8.2	Measuring qualifying non-controlling interests at the proportionate share in the recognised amount of the acquiree's identifiable net assets	767
8.3	Implications of method chosen for measuring non-controlling interests	767
8.4	Measuring share-based payment and other components of non-controlling interests	770
8.5	Call and put options over non-controlling interests	771
9	Business combinations achieved in stages ('step acquisitions')	772
9.1	Accounting for previously held interests in a joint operation	777
10	Bargain purchase transactions	778
11	Assessing what is part of the exchange for the acquiree	781
11.1	Effective settlement of pre-existing relationships	782
11.2	Remuneration for future services of employees or former owners of the acquiree	785
11.2.1	Arrangements for contingent payments to employee selling shareholders	785
11.2.2	Share-based payment awards exchanged for awards held by the acquiree's employees	787
11.3	Reimbursement for paying the acquirer's acquisition-related costs	788
11.4	Restructuring plans	788
11.5	Acquisition of non-controlling interest in connection with a business combination	789
12	Measurement period	792
12.1	Adjustments made during measurement period to provisional amounts	793
12.2	Adjustments made after the end of the measurement period	794
13	Subsequent measurement and accounting	795
14	Reverse acquisitions	796
14.1	Measuring the consideration transferred	796
14.2	Measuring goodwill	798
14.3	Preparation and presentation of consolidated financial statements	798
14.4	Non-controlling interest	800
14.5	Earnings per share	801
14.6	Cash consideration	802
14.7	Share-based payments	804
14.8	Acquisitions involving a non-trading shell company	804
14.8.1	Special purpose acquisition companies (SPAC)	806
14.9	Reverse acquisitions and acquirers that are not legal entities	807
15	Push down accounting	808
16	Disclosures	809
16.1	Nature and financial effect of business combinations	809
16.1.1	Business combinations during the current reporting period	809
16.1.2	Business combinations effected after the end of the reporting period	811
16.2	Financial effects of adjustments recognised in the current reporting period	811
16.3	Other necessary information	812

16.4	Disclosures in the interim financial statements	812
16.5	Illustrative disclosures	813

Appendix C - Defined terms		818

Overview

This chapter discusses principles and requirements that an acquirer applies in accounting for a business combination under IFRS 3 *Business Combinations*. These principles and requirements determine how the acquirer:

- Recognises and measures in its financial statements the identifiable assets acquired, the liabilities assumed and any non-controlling interest in the acquiree
- Recognises and measures the goodwill acquired in the business combination or a gain from a bargain purchase
- Determines what information to disclose to enable users of the financial statements to evaluate the nature and financial effects of the business combination

The guidance discussed in this chapter covers business combinations primarily effected by unrelated parties and accounted for under the acquisition method. Business combinations involving entities under common control are discussed in Chapter 11. Accounting for business combinations resulting from the formation of a joint arrangement in the financial statements of the joint arrangement itself is discussed in Chapter 12.

This chapter also provides some guidance on accounting for the acquisition of assets or group of assets that do not constitute a business even if they are housed in a separate legal entity (see section 2.2.2 below).

What you need to know

- IFRS 3 requires an entity to determine whether a transaction or event is a business combination (see section 3.1 and 3.2.6 below).
- To assess whether a transaction is the acquisition of a business, an entity may apply first a quantitative concentration test. The entity is not required to apply the test but may elect to do so separately for each transaction or other event (see section 3.2.3 below).
- If the concentration test is met, the set of activities and assets is not a business and no further assessment is required. Otherwise, or if the entity elects not to apply the test, the entity performs the qualitative analysis of whether an acquired set of assets and activities includes at a minimum, an input and a substantive process (see section 3.2.4 below) that together significantly contribute to the ability to create outputs.
- A business combination is accounted for by applying the acquisition method that involves identifying an acquirer (see section 4.1 below), determining the acquisition date (see section 4.2 below), recognising and measuring the identifiable assets acquired, the liabilities assumed, and any non-controlling interest in the acquiree (see section 5 below) and recognising and measuring goodwill or a gain from a bargain purchase (see section 6 below).
- If the assets acquired and liabilities assumed do not constitute a business, the transaction is accounted for as an acquisition of a group of assets, i.e., the cost of the group is allocated to the individual identifiable assets and liabilities on the basis of their relative fair values at the date of purchase and goodwill is not recognised (see section 2.2.2 below).

1 Introduction

A business combination is defined by the IASB ('the Board') as a "transaction or other event in which an **acquirer** obtains control of one or more **businesses**". [IFRS 3 Appendix A].

Over the years, business combinations have been defined in different ways. Whatever definition has been applied, it includes circumstances in which an entity obtains control of an integrated set of activities and assets that constitute a business.

In accounting terms there have traditionally been two distinctly different forms of reporting the effects of a business combination; the purchase method of accounting (typically known as the acquisition method) and the pooling of interests method (or merger accounting).

The two methods of accounting look at business combinations through quite different eyes. An acquisition was seen as the absorption of the target by the acquirer; there is continuity only of the acquiring entity, in the sense that only the post-acquisition results of the target are reported as earnings of the acquiring entity and the comparative figures remain those of the acquiring entity. In contrast, a pooling of interests or merger is seen as the pooling together of two formerly distinct shareholder groups; in order to present continuity of both entities there is retrospective restatement to show the enlarged entity as if the two entities had always been together, by combining the results of both entities pre- and post-combination and also by restatement of the comparatives. The acquisition method has become the established method of accounting for business combinations under IFRS Accounting standards. Nevertheless, the pooling of interests method is still sometimes used for business combinations involving entities under common control when the transactions have been scoped out of the relevant standard dealing with business combinations (see Chapter 11).

The other main issues facing preparers have been in relation to the application of the acquisition method of accounting for a business combination. Broadly speaking, the acquiring entity has to determine the fair values of the identifiable assets and liabilities of the target. When the acquisition-date fair value of the assets acquired and liabilities assumed in the business combination (subject to certain limited recognition and measurement exceptions) are less than the overall consideration given, the difference is accounted for as goodwill. Goodwill is an asset that is not amortised, but is subject to an impairment test by applying the guidance in IAS 36 *Impairment of Assets*. When the consideration given is less than the fair value of the identifiable net assets acquired, known as a 'bargain purchase', the issue is whether and when such a credit is taken to the income statement.

FASB differences

Differences between IFRS accounting standards and US GAAP guidance on this topic are not addressed in this chapter. Therefore, differences between IFRS accounting standards and US GAAP may exist which are not discussed in this publication.

1.1 IFRS 3 (as revised in 2008) and subsequent amendments

This chapter discusses IFRS 3 as revised in 2008 and amended subsequently and its associated Basis for Conclusions and Illustrative Examples.

The specific requirements of IAS 38 *Intangible Assets* relating to intangible assets acquired as part of a business combination accounted for under IFRS 3 are dealt with as part of the discussion of IFRS 3 in this chapter; the other requirements of IAS 38 are covered in Chapter 18. Impairment of goodwill is addressed in Chapter 21.

In May 2011, the IASB issued a series of IFRS accounting standards that deal broadly with consolidated financial statements. IFRS 10 *Consolidated Financial Statements* is a single standard addressing consolidation. The requirements of IFRS 10 are discussed in Chapter 7 and Chapter 8 which address, respectively, its consolidation requirements and consolidation procedures. Some consequential amendments were made to IFRS 3, principally to reflect that the guidance on 'control' within IFRS 10 is used to identify the acquirer in a business combination.

IFRS 13 *Fair Value Measurement* changed the definition of 'fair value' to an explicit exit value, but it did not change when fair value is required or permitted under IFRS accounting standards. Its impact on IFRS 3 is considered in section 5.3 below and Chapter 15 contains a full discussion. Unless otherwise indicated, references to fair value in this chapter are to fair value as defined by IFRS 13.

In October 2012, the IASB amended IFRS 10 to provide an exception to the consolidation requirement for entities that meet the definition of an investment entity. As a result of this amendment, the scope of IFRS 3 was also amended (see section 2.2 below). The investment entities exception is discussed in Chapter 7.

In December 2013, the IASB issued two cycles of Annual Improvements - *Cycles 2010-2012* and *2011-2013* - that had the following impact on IFRS 3:

- Contingent consideration in a business combination that is not classified as equity is subsequently measured at fair value through profit or loss whether or not it falls within the scope of IFRS 9 *Financial Instruments* (see sections 7.1.2 and 7.1.3 below).
- The formation of joint arrangements, both joint operations and joint ventures, is outside the scope of IFRS 3. The amendment has also clarified that the scope exception applies only to the accounting in the financial statements of the joint arrangement itself (see section 2.2.1 below).
- A clarification that the guidance on ancillary services in IAS 40 *Investment Property*, [IAS 40.11, IAS 40.12, IAS 40.13, IAS 40.14], is intended to distinguish an investment property from an owner-occupied property, not whether a transaction is a business combination or an asset acquisition (see section 3.2.6 below).

As a result of the issue of IFRS 15 *Revenue from Contracts with Customers* in May 2014, a consequential amendment was made to IFRS 3 for the requirements for the subsequent measurement of a contingent liability recognised in a business combination (see section 5.6.1.B below).

Some consequential amendments have been made to IFRS 3 as a result of the issue of IFRS 9. These relate principally to the requirements for:

- Classifying or designating identifiable assets acquired and liabilities assumed (see section 5.4 below)
- Business combinations achieved in stages (see section 9 below)
- Contingent consideration classified as an asset or liability (see section 7.1 below)

In January 2016, the IASB issued IFRS 16 *Leases*, which requires lessees to recognise assets and liabilities for most leases under a single accounting model. A number of consequential amendments have been made to IFRS 3 in respect of leases accounted for under IFRS 16. These relate to the requirements for:

- Classifying or designating identifiable assets acquired and liabilities assumed (see section 5.4 below)
- Recognising and measuring particular assets acquired and liabilities assumed (see section 5.5.1 below)
- Exceptions to the recognition and/or measurement principles (see section 5.6.8 below)

In May 2017, the IASB issued IFRS 17 *Insurance Contracts* (which was further amended in June 2020). IFRS 17 replaces IFRS 4 *Insurance Contracts* and is effective for reporting periods beginning on or after 1 January 2023, with early application permitted. IFRS 17 introduced a new exception to measurement principles in IFRS 3 (see section 5.6.9 below).

In December 2017, the IASB issued amendments to IFRS 3 and IFRS 11 *Joint Arrangements* as part of the *Annual Improvements to IFRS Standards 2015-2017 Cycle*. The amendments clarified how a party to a joint operation accounts for a transaction in which it obtains control of a joint operation that constitutes a business (see section 9.1 below).

In October 2018, as a result of the *Post Implementation Review of IFRS 3* (PIR of IFRS 3), the IASB issued narrow-scope amendments to IFRS 3 to address the challenges in applying the definition of a business. In particular, the amendments clarified the minimum requirements for a business (under the amended definition, a business can exist without including all of the inputs and processes needed to create outputs), removed the assessment of whether market participants are capable of replacing any missing elements, narrowed the definitions of a business and outputs by excluding from the definition of outputs returns in the form of lower costs, introduced an optional fair value concentration test and added guidance to help entities assess whether an acquired process is substantive. New illustrative examples were also added to explain the application of the amended requirements (see section 3.2 below).

In May 2020, the IASB issued amendments to IFRS 3 to replace a reference to a previous version of the IASB's Conceptual Framework with a reference to the current version issued in March 2018 (2018 Conceptual Framework) without significantly changing its requirements. The amendments added an exception to the recognition principle of IFRS 3 to avoid the issue of potential 'day 2' gains or losses arising for liabilities and contingent liabilities that would be within the scope of IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* or IFRIC 21 *Levies*, if incurred separately. The exception requires entities to apply the criteria in IAS 37 or IFRIC 21, respectively, instead of the Conceptual Framework, to determine whether a present obligation exists at the acquisition date. In the IASB's view, the obligations recognised as liabilities applying the amended IFRS 3 are the same as those recognised under IFRS 3 before the amendment. The amendments also added a new paragraph to IFRS 3 to clarify that contingent assets do not qualify for recognition at the acquisition date. This addition has only reconfirmed the IASB's original conclusion that criteria for a recognition of an acquired asset at the acquisition date might not be met if it is uncertain whether an asset exists.

1.2 Future developments

1.2.1 Business combinations - Disclosures, Goodwill and Impairment project

In March 2024, the IASB issued an Exposure Draft *Business Combinations-Disclosures, Goodwill and Impairment* (proposed amendments to IFRS 3 and IAS 36) (the ED).¹ The IASB is proposing amendments to IFRS 3 and IAS 36.

The proposed amendments to IFRS 3 add new disclosure requirements that would result in an entity disclosing:

- For a strategic business combination, information about the performance of business combinations, specifically, information about the entity's acquisition-date key objectives and targets and the extent to which those key objectives and targets are met in subsequent periods; and
- Quantitative information about synergies expected to arise as a result of a business combination.

To address stakeholders concerns that some of that information is commercially sensitive and that disclosing that information could expose an entity to litigation risk, the Board has:

- Included a proposed exemption from disclosing some of this information in specific circumstances
- Proposed that an entity be required to disclose information about the performance of business combinations for only one subset of business combinations - strategic business combinations.

A strategic business combination would be one for which failure to meet any one of an entity's acquisition-date key objectives would put the entity at serious risk of failing to achieve its overall business strategy. The IASB is proposing that entities identify a strategic business combination using a set of thresholds in IFRS 3 - a business combination that met any one of these thresholds would be considered a strategic business combination.

The IASB has also proposed some other minor amendments to the disclosure requirements in IFRS 3.

The proposed changes to IFRS 3, if confirmed, would affect any entity that enters into a business combination after the beginning of the first annual reporting period in which the proposals become effective.

For the proposed amendments to IAS 36, as part of this project, see Chapter 21.

At the time of writing, the IASB is redeliberating the proposals and expects to finalise the project in 2026.

1.2.2 Financial Instruments with Characteristics of Equity ('FICE') project

The IFRS IC and the IASB have been debating the accounting for NCI puts over a number of years. Many of these issues have now been considered by the FICE project.

In November 2023, the IASB issued Exposure Draft (IASB/ED/2023/5) *Financial instruments with Characteristics of Equity* - Proposed amendments to IAS 32, IFRS 7 and IAS 1.

See Chapter 43, Chapter 8 and section 8.5 below for further discussion of the FICE project.

¹ Exposure Draft, [ED/2024/1](#) *Business Combinations-Disclosures, Goodwill and Impairment*, IASB, March 2024. Available on the IFRS Foundation's website.

2 Scope of IFRS 3

Extract from IFRS 3

Scope

- 2 This IFRS applies to a transaction or other event that meets the definition of a business combination. This IFRS does not apply to:
- (a) the accounting for the formation of a joint arrangement in the financial statements of the joint arrangement itself.
 - (b) the acquisition of an asset or a group of assets that does not constitute a business. In such cases the acquirer shall identify and recognise the individual identifiable assets acquired (including those assets that meet the definition of, and recognition criteria for, *intangible assets* in IAS 38 *Intangible Assets*) and liabilities assumed. The cost of the group shall be allocated to the individual identifiable assets and liabilities on the basis of their relative *fair values* at the date of purchase. Such a transaction or event does not give rise to goodwill.
 - (c) a combination of entities or businesses under common control (paragraphs B1-B4 provide related application guidance).
- 2A The requirements of this Standard do not apply to the acquisition by an investment entity, as defined in IFRS 10 *Consolidated Financial Statements*, of an investment in a subsidiary that is required to be measured at fair value through profit or loss.

Entities are required to apply the provisions of IFRS 3 to transactions or other events that meet the definition of a business combination (see section 3.1 below). [IFRS 3.2, IFRS 3.2A].

2.1 Mutual entities

The acquisition method of accounting applies to combinations involving only mutual entities (e.g., mutual insurance companies, credit unions and cooperatives) and combinations in which separate entities are brought together by contract alone (e.g., dual listed corporations and stapled entity structures). [IFRS 3.BC58]. The IASB considers that the attributes of mutual entities are not sufficiently different from those of investor-owned entities to justify a different method of accounting for business combinations between two mutual entities. It also considers that such combinations are economically similar to business combinations involving two investor-owned entities and similar reporting is required. [IFRS 3.BC71, IFRS 3.BC72]. Similarly, the IASB has concluded that the acquisition method “can and should” be applied for combinations achieved by contract alone. [IFRS 3.BC79]. Additional guidance is given in IFRS 3 for applying the acquisition method to such business combinations (see sections 7.4 and 7.5 below).

2.2 Arrangements out of scope of IFRS 3

The standard does not apply to:

- (a) The accounting for the formation of a joint arrangement in the financial statements of the joint arrangement itself (see Chapter 12 below for details)
 - (b) The acquisition of an asset or a group of assets that does not constitute a business (see section 2.2.2 below for details)
 - (c) A combination of entities or businesses under common control (see Chapter 11)
- Or
- (d) The acquisition by an investment entity, as defined in IFRS 10 (see Chapter 7), of an investment in subsidiary that is required to be measured at fair value through profit or loss [IFRS 3.2, IFRS 3.2A]

2.2.1 Formation of a joint arrangement

The scope exception in IFRS 3 for the formation of a joint arrangement relates only to the accounting in the financial statements of the joint arrangement, i.e., the joint venture or joint operation (see Chapter 12), and not to the accounting for the joint venturer’s or joint operator’s interest in the joint arrangement.

[IFRS 3.BC61B, IFRS 3.BC61C, IFRS 3.BC61D].

By contrast, a particular type of arrangement in which the owners of multiple businesses agree to combine their businesses into a new entity (sometimes referred to as a roll-up transaction) does not include a contractual agreement requiring unanimous consent to decisions about the relevant activities. Majority consent on such decisions is not sufficient to create a joint arrangement. Therefore, such arrangements are accounted for by the acquisition method. [IFRS 3.BC60].

2.2.2 Acquisition of an asset or a group of assets that does not constitute a business

Although the acquisition of an asset or a group of assets is not within the scope of IFRS 3, in such cases the acquirer has to identify and recognise the individual identifiable assets acquired (including intangible assets) and liabilities assumed. The cost of the group is allocated to the individual identifiable assets and liabilities on the basis of their relative fair values at the date of purchase. These transactions or events do not give rise to goodwill. [IFRS 3.2]. Thus, using existing book values or values in the acquisition agreement will not always be appropriate.

The cost of the group of assets is the sum of all consideration given and any non-controlling interest recognised. If the non-controlling interest has a present ownership interest and is entitled to a proportionate share of net assets upon liquidation, the acquirer has a choice to recognise the non-controlling interest at its proportionate share of net assets or its proportionate share of the consolidated book values of the net assets including or excluding transaction costs or its fair value. In all other cases, the non-controlling interest is recognised at fair value, unless another measurement basis is required in accordance with IFRS accounting standards. An example could be the acquisition of an incorporated entity that holds a single property, where this is assessed not to be a business (see Chapter 8).

It may be difficult to determine whether or not an acquired asset or a group of assets constitutes a business (see section 3.2 below), yet this decision can have a considerable impact on an entity's reported results and the presentation of its financial statements. Accounting for a business combination under IFRS 3 differs from accounting for an asset(s) acquisition in a number of important respects:

- Goodwill or a gain on bargain purchase only arise on business combinations.
- Assets acquired and liabilities assumed are generally accounted for at fair value in a business combination, while they are generally assigned a carrying amount based on their relative fair values in an asset acquisition.
- Directly attributable acquisition-related costs are expensed if they relate to a business combination, but are generally capitalised as part of the cost of the asset in an asset acquisition.
- While deferred tax assets and liabilities must be recognised if the transaction is a business combination, they are not recognised under IAS 12 *Income Taxes* if it is an asset acquisition (see Chapter 29).
- Where the consideration is in the form of shares, IFRS 2 *Share-based Payment* does not apply in a business combination, but will apply in an acquisition of assets within the scope of IFRS 2.
- Another difference may arise where the transaction involves contingent consideration. While IFRS 3 provides guidance on the accounting for contingent consideration in the acquisition of a business (see section 7.1 below), IAS 16 *Property, Plant and Equipment* and IAS 38 provide no clear guidance on accounting for contingent consideration in an asset(s) acquisition (see Chapter 18 and Chapter 19).
- Disclosures are much more onerous for business combinations than for asset acquisitions.

The accounting differences above will not only affect the accounting as at the acquisition date, but will also have an impact on future depreciation, possible impairment and other costs.

Frequently asked questions

Question 2-1: How does an entity account for the acquisition of a group of assets that does not constitute a business?

In November 2017, the IFRS IC issued an agenda decision that clarified how an entity accounts for the acquisition of a group of assets that does not constitute a business. More specifically, the submitter of the request asked for clarity on how to allocate the transaction price to the identifiable assets acquired and liabilities assumed when:

- (a) The sum of the individual fair values of the identifiable assets and liabilities is different from the transaction price.
And
- (b) The group includes identifiable assets and liabilities initially measured both at cost and at an amount other than cost.

The IFRS IC concluded that a reasonable reading of the requirements in IFRS 3.2(b) on the acquisition of a group of assets that does not constitute a business results in one of the following two approaches:

- (a) Under the first approach, an entity accounts for the acquisition of the group as follows:
 - (i) It identifies the individual identifiable assets acquired and liabilities assumed that it recognises at the date of the acquisition.
 - (ii) It determines the individual transaction price for each identifiable asset and liability by allocating the cost of the group based on the relative fair values of those assets and liabilities at the date of the acquisition.
And then
 - (iii) It applies the initial measurement requirements in applicable IFRS accounting standards to each identifiable asset acquired and liability assumed. The entity accounts for any difference between the amount at which the asset or liability is initially measured and its individual transaction price applying the relevant requirements.
- (b) Under the second approach, for any identifiable asset or liability initially measured at an amount other than cost, an entity initially measures that asset or liability at the amount specified in the applicable standard. The entity deducts from the transaction price of the group the amounts allocated to the assets and liabilities initially measured at an amount other than cost, and then allocates the residual transaction price to the remaining identifiable assets and liabilities based on their relative fair values at the date of the acquisition.

The IFRS IC also concluded that an entity is required to apply its reading of the requirements consistently to all such acquisitions and an entity would also disclose the selected approach applying paragraphs 117-124 of IAS 1 *Presentation of Financial Statements* if that disclosure would assist users of financial statements in understanding how those transactions are reflected in reported financial performance and financial position.²

2.2.2.A Special Purpose acquisition companies (SPACs) transactions

Acquisition by a SPAC offers private companies a way to go public without having to conduct a traditional initial public offering (IPO). A SPAC is an entity that raises capital from investors in an IPO for the sole business purpose of the future business acquisition of a target which typically has not been identified at the time of the SPAC's IPO.

The SPAC typically has a limited period of time to complete an acquisition (e.g., 18 to 24 months). If no successful acquisition has occurred by the end of that period, the SPAC is liquidated, unless public shareholders accept an extension. If the SPAC is liquidated, the IPO proceeds received from public shareholders are returned and the sponsors' contribution is lost.

Once a SPAC identifies a target, it solicits shareholder approval to consummate its acquisition of the target. Public shareholders usually have the right to redeem their shares if they do not wish to invest in the proposed target. Therefore, after an acquisition has been approved, some (e.g., dissenting shareholders) or all public shareholders may require a refund of their investment.

² [IFRIC Update](#), November 2017, available on the IFRS Foundation's website.

The sellers of the target may receive cash or equity in the SPAC (or other successor entity) or a combination of the two. In most cases, the sellers of the target will retain some ownership in the combined entity. After the acquisition, the combined entity is a publicly traded entity, and is usually governed by a board of directors that includes the SPAC sponsors, or their representatives, in addition to directors chosen by the sellers. The sponsors may retain the management of the target to manage the combined entity, or the sponsors may actively participate in managing the combined entity.

The determination of the accounting acquirer in SPAC transactions is particularly important, as it will impact the accounting and financial statement presentation, which can differ significantly depending on which party is determined to be the accounting acquirer. The determination of the accounting acquirer in SPAC transactions is further discussed in section 4.1.3 below.

If a SPAC is determined to be the accounting acquirer, the transaction in which control over the target is acquired, is accounted for as a business combination in accordance with IFRS 3 (i.e., applying the acquisition method).

If the target is determined to be the accounting acquirer, and the SPAC (i.e., the accounting acquiree) does not constitute a business under IFRS 3, the transaction cannot be accounted for as a business combination or 'reverse acquisition' of a SPAC by the target. IFRS 3 has no clear guidance on how to account for such transactions. Instead, we believe the transaction is accounted for as the continuation of the pre-acquisition financial statements of the target.

In October 2022, the Board ratified the IFRS IC's agenda decision on the accounting for warrants when the target is both the accounting and legal acquirer. For the accounting discussion and the conclusion reached, please refer to Chapter 30.

As a SPAC life cycle involves the IPO of the SPAC and the additional complexity of a subsequent acquisition of the target, there are potentially many other financial reporting issues, including those related to the accounting for financial instruments and share-based payment transactions before and after the acquisition. Please refer to *Applying IFRS: Accounting for SPACs, January 2023*³ for further discussion.

2.2.3 Business combinations under common control

IFRS accounting standards do not specify how to account for business combinations involving companies controlled by the same party.

The IASB undertook a research project to consider whether to develop reporting requirements for a receiving entity reporting a business combination under common control (BCUCC) and published a Discussion Paper (DP) in 2020.⁴ The DP summarised the IASB's preliminary views on how a receiving entity should report a BCUCC, including potential measurement methods to apply and also explored potential disclosure requirements. However, in November 2023, the IASB considered the project's direction and decided to discontinue further work developing guidance for BCUCCs.

The application guidance in Appendix B to IFRS 3 gives some guidance on accounting for business combinations involving entities or businesses under common control that are excluded from the requirements of the standard. [IFRS 3.B1, IFRS 3.B2, IFRS 3.B3, IFRS 3.B4]. These arrangements are discussed further in Chapter 11.

³ [Applying IFRS: Accounting for SPACs](#), Updated January 2023, EY Global,

⁴ Discussion Paper [DP/2020/2, Business Combinations under Common Control](#), IASB, November 2020. Available on the IFRS Foundation's website.

3 Identifying a business combination

Extract from IFRS 3

Identifying a business combination

- 3 An entity shall determine whether a transaction or other event is a business combination by applying the definition in this IFRS, which requires that the assets acquired and liabilities assumed constitute a business. If the assets acquired are not a business, the reporting entity shall account for the transaction or other event as an asset acquisition. Paragraphs B5-B12D provide guidance on identifying a business combination and the definition of a business.

IFRS 3 requires an entity to determine whether a transaction or event is a *business combination*; the definition requires that the assets acquired and liabilities assumed constitute a *business*. If the assets acquired and liabilities assumed do not constitute a business, the transaction is accounted for as an asset acquisition (see section 2.2.2 above). [IFRS 3.3].

3.1 Definition of a business combination

IFRS 3 defines a business combination as a “transaction or other event in which an **acquirer** obtains control of one or more **businesses**”. [IFRS 3 Appendix A].

IFRS 3 notes that an acquirer might obtain control of an acquiree (i.e., the business or businesses over which the acquirer obtains control) in a variety of ways, for example:

- (a) Transferring cash, cash equivalents or other assets (including net assets that constitute a business)
- (b) Incurring liabilities
- (c) Issuing equity interests
- (d) Providing more than one type of consideration

Or

- (e) Without transferring consideration - including by contract alone (see section 7.4 below) [IFRS 3.B5]

A business combination may be structured in a variety of ways for legal, taxation or other reasons, which include but are not limited to:

- (a) One or more businesses become subsidiaries of an acquirer or the net assets of one or more businesses are legally merged into the acquirer.
- (b) One combining entity transfers its net assets, or its owners transfer their equity interests, to another combining entity or its owners.
- (c) All of the combining entities transfer their net assets, or the owners of those entities transfer their equity interests, to a newly formed entity (sometimes referred to as a roll-up or put-together transaction).

Or

- (d) A group of former owners of one of the combining entities obtains control of the combined entity.

[IFRS 3.B6].

3.2 Definition of a business

IFRS 3 defines a business as “An integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing goods or services to customers, generating investment income (such as dividends or interest) or generating other income from ordinary activities”. [IFRS 3 Appendix A].

3.2.1 Inputs, processes and outputs

The application guidance to IFRS 3 describes the components of a business as inputs and processes applied to those inputs that have the ability to contribute to the creation of outputs. The three elements are described as follows:

- *Input*
Any economic resource that creates outputs or has the ability to contribute to the creation of outputs when one or more processes are applied to it. Examples include non-current assets (including intangible assets or rights to use non-current assets), intellectual property, the ability to obtain access to necessary materials or rights and employees.
- *Process*
Any system, standard, protocol, convention or rule is a process if, when applied to an input or inputs, it either creates or has the ability to contribute to the creation of outputs. Examples include strategic management processes, operational processes and resource management processes. These processes typically are documented, but the intellectual capacity of an organised workforce having the necessary skills and experience following rules and conventions may provide the necessary processes that are capable of being applied to inputs to create outputs. Accounting, billing, payroll and other administrative systems typically are not processes used to create outputs so their presence or exclusion generally will not affect whether an acquired set of activities and assets is considered a business.
- *Output*
The result of inputs and processes applied to those inputs that provide goods or services to customers, generate investment income (such as dividends or interest) or generate other income from ordinary activities. [IFRS 3.B7].

Although businesses usually have outputs, outputs need not be present at the acquisition date for an integrated set of activities and assets to be identified as a business. [IFRS 3.B8]. The nature of the elements of a business varies by industry and by the structure of an entity's operations (activities), including the entity's stage of development. Established businesses often have many different types of inputs, processes and outputs, whereas new businesses often have few inputs and processes and sometimes only a single output (product). Nearly all businesses also have liabilities, but a business need not have liabilities. Furthermore, an acquired set of activities and assets that is not a business as defined, might have liabilities. [IFRS 3.B9].

3.2.2 Assessment of whether acquired set of activities and assets constitutes a business

To assess whether a transaction is the acquisition of a business, an entity may apply first a quantitative concentration test (also known as a screening test). The entity is not required to apply the test but may elect to do so separately for each transaction or other event.

If the concentration test is met, the set of activities and assets is determined not to be a business and no further assessment is required. Otherwise, or if the entity elects not to apply the test, the entity performs the qualitative analysis of whether an acquired set of assets and activities includes at a minimum, an input and a substantive process that together significantly contribute to the ability to create outputs. [IFRS 3.B7A].

The concentration test is further discussed in section 3.2.3 below and assessment of whether an acquired process is substantive is considered in section 3.2.4 below.

3.2.3 Concentration test

IFRS 3 sets out an optional concentration test designed to simplify the evaluation of whether an acquired set of activities and assets is not a business. An acquired set of activities and assets is not a business if substantially all of the fair value of the gross assets acquired is concentrated in a single identifiable asset or group of similar identifiable assets. IFRS 3 notes that for the purposes of the concentration test:

- (a) Gross assets acquired exclude cash and cash equivalents, deferred tax assets, and goodwill resulting from the effects of deferred tax liabilities.
- (b) The fair value of the gross assets acquired includes any consideration transferred (plus the fair value of any non-controlling interest and the fair value of any previously held interest) in excess of the fair value of net identifiable assets acquired. The fair value of the gross assets acquired may normally be determined as the total obtained by adding the fair value of the consideration transferred (plus the fair value of any non-controlling interest and the fair value of any previously held interest) to the fair value of the liabilities assumed (other than deferred tax liabilities), and then excluding the items identified in subparagraph (a) above. However, if the fair value of the gross assets acquired is more than that total, a more precise calculation may sometimes be needed.
- (c) A single identifiable asset includes any asset or group of assets that would be recognised and measured as a single identifiable asset in a business combination.
- (d) If a tangible asset is attached to, and cannot be physically removed and used separately from, another tangible asset (or from an underlying asset subject to a lease, as defined in IFRS 16), without incurring significant cost, or significant diminution in utility or fair value to either asset (for example, land and buildings), those assets are considered a single identifiable asset.
- (e) When assessing whether assets are similar, an entity considers the nature of each single identifiable asset and the risks associated with managing and creating outputs from the assets (that is, the risk characteristics).
- (f) The following are not considered similar assets:
 - (i) A tangible asset and an intangible asset
 - (ii) Tangible assets in different classes (for example, inventory, manufacturing equipment and automobiles) unless they are considered a single identifiable asset in accordance with the criterion in subparagraph (d) above
 - (iii) Identifiable intangible assets in different classes (for example, brand names, licences and intangible assets under development)
 - (iv) A financial asset and a non-financial asset
 - (v) Financial assets in different classes (for example, accounts receivable and investments in equity instruments)

And

 - (vi) Identifiable assets that are within the same class of asset but have significantly different risk characteristics. [IFRS 3.B7B].

In addition, IFRS 3 clarifies that the requirements above do not modify the guidance on similar assets in IAS 38; nor the meaning of the term 'class' in IAS 16, IAS 38 and IFRS 7 *Financial Instruments: Disclosures*. [IFRS 3.B7C].

Illustration 3-1 and Illustration 3-2 below illustrate application of the guidance on the concentration test to the specific scenarios.

Illustration 3-1: Acquisition of wind farm - concentration test (1)

Greentech A acquires all outstanding shares of Greentech B, which owns 25 windmills of similar types and specifications that each have an in-place lease. The fair value of the consideration paid is equal to the aggregate fair value of the 25 windmills acquired. Each windmill includes the land leased from the local authority and a wind turbine. All windmills are in the same wind farm and are leased out to the small local olive oil producers under the mid-term contracts. The local oil producers are from the same area and are similar in all other respects. No employees, other assets, processes or other activities are transferred.

Greentech A elects to apply the optional concentration test and concludes that:

- (a) Each windmill is considered a single identifiable asset for the following reasons:
 - (i) The wind turbine is attached to and cannot be physically removed and used separately from the leased land plot on which it is located without incurring significant cost.
 - And
 - (ii) The windmill and the in-place lease are considered a single identifiable asset because they would be recognised and measured as a single identifiable asset in a business combination (see IFRS 3.B42).
- (b) The group of 25 windmills is a group of similar identifiable assets because the assets (all windmills) are similar in nature and the risks associated with managing and creating outputs are not significantly different. This is because the types and specifications of windmills and customers are not significantly different.
- And
- (c) Consequently, substantially all of the fair value of the gross assets acquired is concentrated in a group of similar identifiable assets.

Greentech A concludes that the optional concentration test is met and, therefore, the set of activities and assets is not a business and no further assessment is required.

Illustration 3-2: Acquisition of wind and solar farms - concentration test (2)

Assume that in the Illustration 3-1 above, in addition to the wind farm, Greentech B also owns a solar farm located in a foreign country and the aggregate fair value associated with the solar farm is similar to the aggregate fair value associated with the 25 windmills acquired. The fair value of the consideration paid is approximately equal to the aggregate fair value of the wind and solar farms acquired. As in Illustration 3-1 above, no employees, other assets, other processes or other activities are transferred.

Greentech A elects to apply the optional concentration test and concludes that the 25 windmills and the solar farm are not a group of similar identifiable assets because the windmills and the solar farm differ significantly in the risks associated with operating the assets and obtaining and managing customers. In particular, the technology employed in wind and solar energy operations are significantly different and the risks associated with the two classes of customers are also dissimilar because customers operate in different economic environments. In addition, the fair value of the windmills is similar to the aggregate fair value of the solar farm. Consequently, substantially all of the fair value of the gross assets acquired is not concentrated in a single identifiable asset or a group of similar identifiable assets.

Greentech A concludes that the optional concentration test is not met and, therefore, further assessment is required.

The Illustrative Examples to IFRS 3 on application of definition of a business contain further illustrations of the application of the concentration test, including the approach to the determination of the fair value of the gross assets acquired. [IFRS 3.IE73-IE123].

3.2.4 Assessing whether an acquired process is substantive

The existence of a process (or processes) is what distinguishes a business from a set of activities and assets that is not a business. Consequently, the Board decided that to be considered a business, an acquired set of activities and assets must include, at a minimum, an input and a substantive process that together significantly contribute to the ability to create outputs. [IFRS 3.B8].

IFRS 3 also clarifies that an acquired contract is an input and not a substantive process. Nevertheless, an acquired contract, for example, a contract for outsourced property management or outsourced asset management, may give access to an organised workforce. An entity assesses whether an organised workforce accessed through such a contract performs a substantive process that the entity controls, and thus has acquired. Factors considered in making that assessment include the duration of the contract and its renewal terms. [IFRS 3.B12D(a)].

In addition, the Basis for Conclusions on IFRS 3 clarifies that presence of more than an insignificant amount of goodwill is not a relevant indicator that the acquired process is substantive. [IFRS 3.B12D(a)].

IFRS 3 includes guidance to help entities assess whether an acquired process is substantive. That guidance seeks more persuasive evidence when there are no outputs because the existence of outputs already provides some evidence that the acquired set of activities and assets is a business. [IFRS 3.BC21M]. However, if an acquired set of activities and assets has outputs, continuation of revenue does not on its own indicate that both an input and a substantive process have been acquired. [IFRS 3.B8A].

If a set of activities and assets does not have outputs at the acquisition date, an acquired process (or group of processes) is considered substantive only if:

- (a) It is critical to the ability to develop or convert an acquired input or inputs into outputs.
And
- (b) The inputs acquired include both an organised workforce that has the necessary skills, knowledge, or experience to perform that process (or group of processes) and other inputs that the organised workforce could develop or convert into outputs. Those other inputs could include:
 - (i) Intellectual property that could be used to develop a good or service (e.g., technology)
 - (ii) Other economic resources that could be developed to create outputs (e.g., in-process research and development projects)
 Or
 - (iii) Rights to obtain access to necessary materials or rights that enable the creation of future outputs (e.g., real estate and mineral interests) [IFRS 3.B12B]

If a set of activities and assets has outputs at the acquisition date, an acquired process (or group of processes) is considered substantive if, when applied to an acquired input or inputs, it:

- (a) Is critical to the ability to continue producing outputs, and the inputs acquired include an organised workforce with the necessary skills, knowledge, or experience to perform that process (or group of processes)
- Or
- (b) Significantly contributes to the ability to continue producing outputs and:
 - (i) Is considered unique or scarce
 - Or
 - (ii) Cannot be replaced without significant cost, effort, or delay in the ability to continue producing outputs [IFRS 3.B12C]

Difficulties in replacing an acquired organised workforce may indicate that the acquired organised workforce performs a process that is critical to the ability to create outputs. [IFRS 3.B12D(b)].

IFRS 3 also clarifies that a process (or group of processes) is not critical if, for example, it is ancillary or minor within the context of all the processes required to create outputs. [IFRS 3.B12D(c)].

3.2.5 'Capable of' from the viewpoint of a market participant

IFRS 3 clarifies that an acquired set of activities and assets does not need to include all of the inputs or processes necessary to operate that set of activities and assets as a business, i.e., it does not need to be self-sustaining. [IFRS 3.B8]. The definition of a business in IFRS 3 requires that inputs, and processes applied to those inputs, have the 'ability to contribute to the creation of outputs' rather than the 'ability to create outputs'. [IFRS 3.BC21F]. Determining whether a set of activities and assets is a business is based on whether the integrated set is capable of being conducted and managed as a business by a market participant.

Therefore, it is not a relevant consideration whether a vendor operated a transferred set as a business or whether a buyer intends to operate it as a business. [IFRS 3.B11]. The acquired set is a business, even if an acquirer stops all the operations of the acquiree and disposes of assets acquired as a scrap, if any other market participant would be able to operate the acquired set as a business. Under IFRS 3, a market participant would be able to operate an acquired set as a business, if it includes at a minimum, an input and a substantive process that together significantly contribute to the ability to create outputs. However, if an acquirer obtains control of an input or set of inputs without any processes, the acquired input(s) would not be considered a business, even if a market participant had all the processes necessary to operate the input(s) as a business. It is not a relevant consideration whether market participants would be capable of replacing any missing inputs or processes, for example by integrating the acquired activities and assets. [IFRS 3.BC21H, IFRS 3.BC21I].

3.2.6 Identifying business combinations

Significant judgement is required in determining whether an acquired set of activities and assets constitute a business. The following are examples from extractive industries and real estate that illustrate the issues.

Illustration 3-3: Extractive industries - definition of a business (1)

E&P Co A (an oil and gas exploration and production company) acquires a mineral interest from E&P Co B, on which it intends to perform exploration activities to determine if reserves exist. The mineral interest is an unproven property and there have been no exploration activities performed on the property. E&P Co A elects not to apply the optional concentration test.

Inputs - mineral interest

Processes - none

Output - none

Conclusion

In this scenario, we do not believe E&P Co A acquired a business. While E&P Co A acquired an input (mineral interest), it did not acquire any processes. Whether or not a market participant has the necessary processes in place to operate the input as a business is not relevant to the determination of whether the acquired set is a business because no processes, whether substantive or not, were acquired from E&P Co B.

E&P Co A elected not to apply the optional concentration test. However, we do not believe the conclusion would be different, if it had elected to do so. The transferred set includes only a mineral interest that would be recognised and measured as a single identifiable intangible asset in a business combination; consequently, there are no other assets or processes to which a significant portion of the fair value of the gross assets acquired would be assigned. Therefore, the fair value of the gross assets acquired is concentrated in a single identifiable asset.

Illustration 3-4: Extractive industries - definition of a business (2)

E&P Co A acquires a property similar to that in Illustration 3-3 above, except that oil and gas production activities are in place and the acquired set also includes a SCADA system. The target's employees are not part of the transferred set. E&P Co A will take over the operations by using its own employees.

Inputs - oil and gas reserves and SCADA system

Processes - operational processes associated with oil and gas production embodied in the SCADA system

Output - revenues from oil and gas production

Conclusion

In this scenario, we believe that E&P Co A has acquired a business. The acquired set includes both inputs and processes and has outputs. Although the employees are not being transferred to the acquirer, for a set that has outputs, transfer of the organised workforce is not necessary to conclude that it constitutes a business. An acquired process is substantive if, when applied to an acquired input or inputs, it significantly contributes to the ability to continue producing outputs and cannot be replaced without significant cost, effort, or delay in the ability to continue producing outputs. We believe that the SCADA systems that consist of physical equipment, including pumps, meters and other assets used to facilitate gathering, processing, storing, and transporting of oil and gas serve as a substantive process because they significantly contribute to the ability to continue producing outputs and cannot be replaced without significant cost, effort, or delay in the ability to continue producing outputs.

E&P Co A elected not to apply the optional concentration test. However, we do not believe that conclusion would be different if it had elected to do so. This is because, while the acquired set includes only oil and gas reserves and the SCADA system, they generally would not be considered either as a single identifiable asset or group of similar identifiable assets, and we expect that a significant portion of the fair value of the consideration would be assigned to both the value of the transferred oil and gas reserves and the value of assets comprising the SCADA system, which would normally include the operational processes associated with oil and gas production embodied in the SCADA system.

In the real estate industry, IAS 40 notes that when ancillary services (i.e., processes) are provided and they are insignificant to the overall arrangement, this will not prevent the classification of the asset as investment property. [IAS 40.11]. (See Chapter 20). The guidance on ancillary services, [IAS 40.11, IAS 40.12, IAS 40.13, IAS 40.14], is intended to distinguish an investment property from an owner-occupied property, not whether a transaction is a business combination or an asset acquisition. Entities acquiring investment properties must assess whether the property is a business applying the requirements of IFRS 3. [IAS 40.14A]. See also Chapter 20.

Therefore, evaluating whether it is a real estate business where certain processes are transferred involves assessing those processes in the light of the guidance in IFRS 3.

Illustration 3-5: Real estate - definition of a business (1)

Company A acquires land and a vacant building from Company B. No processes, other assets or employees (for example, leases and other contracts, maintenance or security personnel, or a leasing office) are acquired in the transaction. Company A elects not to apply the optional concentration test.

Inputs - land and vacant building constructed on that land

Processes - none

Output - none

Conclusion

In this scenario, we do not believe Company A has acquired a business. While Company A acquired inputs (land and a vacant building), it did not acquire any processes. Whether or not a market participant has the necessary processes in place to operate the inputs as a business is irrelevant to the determination of whether the acquired set is a business, because no processes, whether substantive or not, were acquired from Company B. Company A elected not to apply the optional concentration test. However, we do not believe the conclusion would be different if it elected to do so. The transferred set includes only land and a vacant building, and the vacant building is attached to and cannot be physically removed and used separately from the land without significant diminution in its utility and fair value. Thus, the land and the building are considered a single identifiable asset for the purposes of the concentration test. In addition, there are no other assets or processes to which a significant portion of the fair value of the gross assets acquired would be assigned. Therefore, the fair value of the gross assets acquired is concentrated in a single identifiable asset acquired. However, irrespective of the determination whether a business is acquired or not, the classification of the acquired property as an investment property would depend on whether the property meets the definition of investment property in IAS 40. For example, if Company A intends to lease out the property without the provision of significant ancillary services, it would classify the property as an investment property. Alternatively, if Company A intends to operate the property as an owner-managed hotel, it would classify the property as property, plant and equipment. Refer to Chapter 20 for further discussion.

Illustration 3-6: Real estate - definition of a business (2)

Company A acquires an operating hotel, the hotel's employees, the franchise agreement, inventory, a reservations system and all 'back office' operations. Company A elects not to apply the optional concentration test.

Inputs - non-current assets, franchise agreement, inventory, a reservations system and employees

Processes - undocumented operational and resource management processes associated with operating the hotel

Output - revenues from operating the hotel

Conclusion

In this scenario, we believe Company A has acquired a business. The acquired set has outputs and includes both inputs and processes. In addition, the organised workforce has necessary skills, knowledge, or experience to perform processes (i.e., operational and resource management processes associated with operating the acquired hotel) that are substantive because they are critical to the ability to continue producing outputs when applied to the acquired inputs (i.e., non-current assets and franchise agreement).

Company A elected not to apply the optional concentration test. However, we do not believe that, generally, the conclusion would be different, if it had elected to do so. The acquired set includes non-current assets, inventory, a reservations system and a franchise agreement that are not considered similar assets for the purposes of the concentration test and might have significant individual fair values. In addition, when an operating hotel is acquired in its entirety, it may be the case that a not insignificant portion of the fair value of consideration paid is attributed to the intellectual capacity of the organised workforce acquired, provided skills, knowledge and experience they have, are valued by market participants.

However, as indicated in Illustration 3-5 above, the classification of the acquired property as an investment property would depend on whether the property meets the definition of investment property in IAS 40. For example, if Company A intends to close the hotel and lease out the property to the third party without the provision of significant ancillary services, it would classify the property as an investment property.

Alternatively, if Company A intends to continue operating the acquired hotel it would classify the property as property, plant and equipment. Refer to Chapter 20 for further discussion.

The Illustrative Examples to IFRS 3 provide further illustrations of the application of principles of IFRS 3 to specific scenarios.

3.2.7 Development stage entities

Development stage entities may qualify as businesses, and their acquisitions accounted for as business combinations because outputs are not required at the acquisition date. The IASB concluded that if the set has no outputs, to qualify as a business the set must include not only a process that is critical to the ability to develop or convert the acquired input or inputs into outputs, but also both an organised workforce that has the necessary skills, knowledge or experience to perform that process, and other inputs that the acquired organised workforce could develop or convert into outputs. [IFRS 3.B12B]. The IASB observed that many entities in the development stage will meet this criterion because technology, intellectual property, or other assets are being developed into a good or service. [IFRS 3.BC21Q].

The application of this guidance may be particularly relevant to transactions in the life sciences industry. This is illustrated in the following Illustrations.

Illustration 3-7: Life sciences - definition of a business (1)

Biotech A acquires all of the outstanding shares in Biotech B, which is a development stage company with a licence for a product candidate. Due to a loss of funding, Biotech B has no employees and no other assets. Neither clinical trials nor development are currently being performed. When additional funding is obtained, Biotech A plans to commence phase I clinical trials for the product candidate. Biotech A elects not to apply the optional concentration test.

Input - licence for a product candidate

Processes - none

Outputs - none

Conclusion

In this scenario, Biotech A has not acquired a business. While Biotech B has an input (licence), it lacks processes to apply to the licence in order to create outputs. Furthermore, Biotech B has no employees or any other inputs.

Biotech A elected not to apply the optional concentration test. However, we do not believe the conclusion would be different if it elected to do so. The transferred set includes only a licence for a product candidate that is a single identifiable asset because it would be recognised and measured as a single identifiable intangible asset in a business combination. There are no other assets or processes to which a significant portion of the fair value of the gross assets acquired would be assigned. Therefore, the fair value of the gross assets acquired is concentrated in a single identifiable asset acquired.

Illustration 3-8: Life sciences - definition of a business (2)

Biotech C acquires all of the outstanding shares in Biotech D, a development stage company that has a licence for a product candidate. Phase III clinical trials are currently being performed by Biotech D employees (one of whom founded Biotech D and discovered the product candidate). Biotech D's administrative and accounting functions are performed by a contract employee. Biotech C elects not to apply the optional concentration test.

Inputs - licence for a product candidate and employees

Processes - operational and management processes associated with the performance and supervision of the clinical trials

Output - none

Conclusion

In this scenario, Biotech C has acquired a business because it has acquired not only a process that is critical to the ability to develop acquired inputs into outputs, but also both an organised workforce that has the necessary skills, knowledge or experience to perform that process and other inputs that the acquired organised workforce could develop into output. Biotech D undertakes a Phase III clinical trials process that is critical to develop the acquired input into output (i.e., a commercially developed product that will be sold or licensed) and has both sufficiently qualified and experienced employees, including a scientist who discovered the product candidate and obtained a licence for the product candidate.

Biotech C elected not to apply the optional concentration test. However, we do not believe the conclusion would be different if it had elected to do so. This is because, while the acquired set includes only a single identifiable asset, a licence for a product candidate, we expect that a significant portion of the fair value of the consideration would have been assigned to the value of the intellectual capacity of the employees transferred in the acquisition, provided skills, knowledge and experience they have, are valued by market participants.

4 Acquisition method of accounting

Extract from IFRS 3

- 4 An entity shall account for each business combination by applying the acquisition method.**
- 5 Applying the acquisition method requires:
- (a) identifying the acquirer;
 - (b) determining the *acquisition date*;
 - (c) recognising and measuring the identifiable assets acquired, the liabilities assumed and any non-controlling interest in the acquiree; and
 - (d) recognising and measuring goodwill or a gain from a bargain purchase.

IFRS 3 requires a business combination to be accounted for by applying the acquisition method. [IFRS 3.4]. Applying the acquisition method involves the following steps:

- (a) Identifying an acquirer (see section 4.1 below)
- (b) Determining the acquisition date (see section 4.2 below)
- (c) Recognising and measuring the identifiable assets acquired, the liabilities assumed, and any non-controlling interest in the acquiree (see section 5 below)
- (d) Recognising and measuring goodwill or a gain from a bargain purchase (see section 6 below) [IFRS 3.5]

4.1 Identifying the acquirer

The first step in applying the acquisition method is identifying the acquirer. IFRS 3 requires one of the combining entities to be identified as the acquirer. [IFRS 3.6]. For this purpose, the guidance in IFRS 10 is used, i.e., the acquirer is the entity that obtains control of the acquiree. [IFRS 3.7, IFRS 3.B13]. An investor controls an investee when it is exposed, or has rights, to variable returns from its involvement with the investee and has the ability to affect those returns through its power over the investee. [IFRS 10.6]. This is discussed further in Chapter 7.

If IFRS 10 does not clearly indicate which of the combining entities is the acquirer, additional guidance in IFRS 3 includes other factors to take into account. [IFRS 3.7, IFRS 3.B13].

The other factors require significant judgement, particularly when the business combination may be a 'reverse acquisition' or when the combination occurred by contract alone.

In a business combination effected primarily by transferring cash or other assets, or by incurring liabilities, the acquirer is usually the entity that transfers the cash or other assets or incurs the liabilities. [IFRS 3.B14].

In a business combination effected primarily by exchanging equity interests, the acquirer is usually the entity that issues its equity interests, but in some business combinations, so-called 'reverse acquisitions', the issuing entity is the acquiree. Application guidance on the accounting for reverse acquisitions is provided in Appendix B to IFRS 3 (see section 14 below). In identifying the acquirer, IFRS 3 requires that other facts and circumstances are also considered, including:

- The relative voting rights in the combined entity after the business combination. The acquirer is usually the combining entity whose owners as a group retain or receive the largest portion of the voting rights in the combined entity, after taking account of any unusual or special voting arrangements and options, warrants or convertible securities.
- The existence of a large minority voting interest in the combined entity if no other owner or organised group of owners has a significant voting interest. The acquirer is usually the combining entity whose single owner or organised group of owners holds the largest minority voting interest in the combined entity.
- The composition of the governing body of the combined entity. The acquirer is usually the combining entity whose owners have the ability to elect, appoint or remove a majority of the members of the governing body of the combined entity.
- The composition of the senior management of the combined entity. The acquirer is usually the combining entity whose (former) management dominates the management of the combined entity.
- The terms of the exchange of equity interests. The acquirer is usually the combining entity that pays a premium over the pre-combination fair value of the equity interests of the other combining entity or entities. [IFRS 3.B15].

The acquirer is usually the combining entity whose relative size is significantly greater than that of the other combining entity or entities, measured by, for example, assets, revenues or profit. [IFRS 3.B16].

If the business combination involves more than two entities, determining the acquirer includes considering, among other things, which of the combining entities initiated the combination, as well as the relative size of the combining entities. [IFRS 3.B17].

Frequently asked questions

Question 4-1: Must an acquirer always be a legal entity?

The acquirer is not necessarily a legal entity. In September 2011, the IFRS IC concluded that an acquirer that is a reporting entity but not a legal entity, can be the acquirer in a reverse acquisition⁵ (see section 14.9 below).

The conclusion above would also apply to acquisitions where the legal and accounting acquirer are the same. Therefore, for example, a combined rather than consolidated group might be identified as the acquirer, provided that the combined financial statements are compliant with IFRS accounting standards (see Chapter 7).

4.1.1 New entity formed to effect a business combination

A new entity formed to effect a business combination is not necessarily the acquirer. This will depend among others on whether it has issued equity interests or paid cash. If it has issued equity interests, one of the combining entities is identified as the acquirer by applying the guidance described above. [IFRS 3.B18].

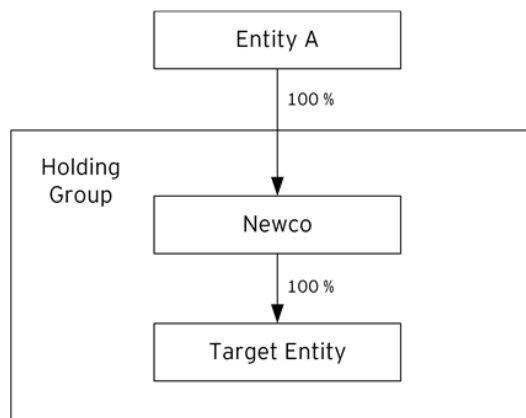

If a new entity transfers cash or other assets, or incurs liabilities as consideration, it may be the acquirer. IFRS 3 does not specify in what circumstances this may be the case but it is clear that 'control' is the fundamental concept when identifying an acquirer. Generally, a new entity that was formed to effect a business combination other than through the issue of shares will be identified as an acquirer if this new entity is an extension of the party (or parties) that ultimately gains control of the combining entities. The determination of whether such a new entity is an extension of the selling party (or parties) or the party (or parties) that ultimately gains control over the combining entities, requires a thorough analysis of all the facts and circumstances. This analysis requires an assessment of the purpose and design of the transaction. Sometimes, even if the transaction results in a change of control, the underlying substance of the transaction may be for a purpose other than a party or parties to gain control of an entity. In such a situation, even if a new entity transfers cash or other assets and/or incurs liabilities as consideration, it may be appropriate to conclude that this new entity is not an extension of the party (or parties) ultimately gaining control and, therefore cannot be identified as an acquirer (see Illustration 4-3 below). However, when the purpose and design of the transaction indicate that its underlying substance is to gain control over the business by the new ultimate controlling party (or parties), then this new entity is an extension of such party (or parties) and, therefore, would likely be identified as an acquirer. An example of the latter is a situation where the newly formed entity ('Newco') is used by a group of investors or another entity to acquire a controlling interest in a target entity in an arm's length transaction.

⁵ [IFRIC Update](#), September 2011, available on the IFRS Foundation's website.

Illustration 4-1: Business combination effected by a Newco for cash consideration (1)

Entity A intends to acquire the voting shares (and therefore obtain control) of Target Entity. Entity A incorporates Newco and uses this entity to effect the business combination. Entity A provides a loan at commercial interest rates to Newco. The loan funds are used by Newco to acquire 100% of the voting shares of Target Entity in an arm's length transaction.

The group structure post-transaction is as follows:

Under its local regulations, Newco is required to prepare consolidated financial statements for the Holding Group (the reporting entity) that are compliant with IFRS accounting standards. In most situations like this, Newco would be exempt from preparing consolidated financial statements - see Chapter 7.

The acquirer is the entity that obtains control of the acquiree. Whenever a new entity is formed to effect a business combination other than through the issue of shares, it is appropriate to consider whether Newco is an extension of one of the transacting parties. If it is an extension of the transacting party (or parties) that ultimately gain control of the other combining entities, Newco is the acquirer.

In this situation, Entity A has obtained control of Target Entity in an arm's length transaction, using Newco to effect the acquisition. The transaction has resulted in a change in control of Target Entity and Newco is in effect an extension of Entity A, acting at its direction to obtain control on behalf of Entity A. Accordingly, Newco would be identified as the acquirer at the Holding Group level.

It is not appropriate to conclude that Target Entity must be the acquirer and argue that Newco does not have any substance to it, as this ignores the fact that there is a third party involved and that this party is, in substance, the ultimate controlling party in the transaction.

If, rather than Entity A establishing Newco, a group of investors had established it as the acquiring vehicle through which they obtained control of Target Entity then, we believe, Newco would also be regarded as the acquirer since it is an extension of the group of investors.

Another specific situation in which a Newco might be identified as the acquirer is illustrated in Illustration 4-2 below, where a parent uses a Newco to facilitate a public flotation of shares in a group of subsidiary companies. Although a Newco incorporated by the existing parent of the subsidiaries concerned would not generally be identified as the acquirer, in this particular situation the critical distinguishing factor is that the acquisition of the subsidiaries was conditional on an IPO of Newco. This means that there has been a substantial change in the ownership of the subsidiaries by virtue of the IPO and indicates that the purpose and design of the transaction is to achieve a change in control over the transferred business. Refer to Chapter 11 for further discussion.

The IFRS IC discussed similar fact patterns⁶ but has subsequently observed that accounting for arrangements involving the creation of a Newco is too broad to be addressed through an interpretation or an annual improvement. The IFRS IC concluded that it would be better considered within the context of a broader project on accounting for common control transactions.⁷ However, the IASB has subsequently decided not to explore developing guidance for business combinations under common control. See chapter 11 for further information.

⁶ [IFRIC Update](#), July 2011, available on the IFRS Foundation's website.

⁷ [IFRIC Update](#), September 2011, available on the IFRS Foundation's website.

Illustration 4-2: Business combination effected by a Newco for cash consideration: spin-off transaction (2)

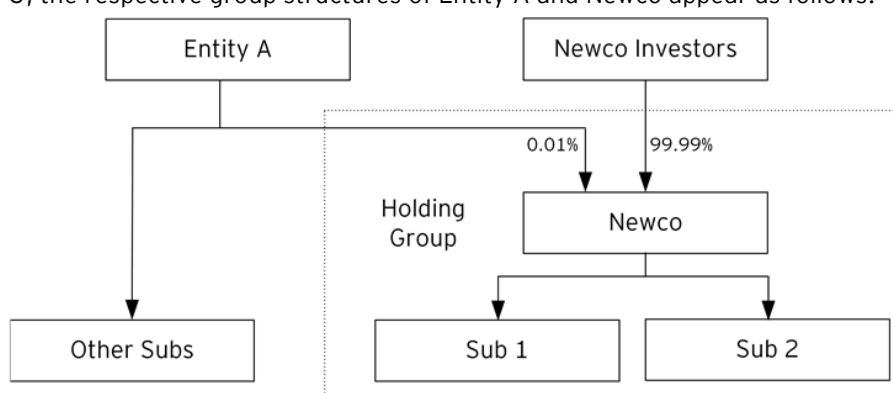

Entity A proposes to spin off two of its existing businesses (currently housed in two separate entities, Sub 1 and Sub 2) as part of an IPO. The existing group structure is as follows:

To facilitate the spin off, Entity A incorporates a new company (Newco) with nominal equity and appoints independent directors to the Board of Newco.

Newco signs an agreement to acquire Sub 1 and Sub 2 from Entity A, conditional on the IPO proceeding. Newco issues a prospectus offering to issue shares for cash to provide Newco with funds to acquire Sub 1 and Sub 2. The IPO proceeds and Newco acquires Sub 1 and Sub 2 for cash. Entity A's nominal equity leaves virtually 100% ownership in Newco with the new investors.

Following the IPO, the respective group structures of Entity A and Newco appear as follows:

In this case, we believe it would likely be appropriate to identify Newco as the acquirer. The Newco investors have obtained control and virtually 100% ownership of Sub 1 and Sub 2 in an arm's length transaction, using Newco to effect the acquisition. The transaction has resulted in a change in control of Sub 1 and Sub 2 (i.e., Entity A losing control and Newco investors, via Newco, obtaining control). Newco could in effect be considered as an extension of the Newco investors since:

- The acquisition of Sub 1 and Sub 2 was conditional on the IPO proceeding so that the IPO is an integral part of the transaction as a whole, evidencing that Newco is an extension of new investors to acquire control of Sub 1 and Sub 2.
- And
- There is a substantial change in the ownership of Sub 1 and Sub 2 by virtue of the IPO (i.e., Entity A only retains a negligible ownership interest in Newco).

Accordingly, Newco might be identified as the acquirer at the Holding Group level.

How we see it

Whether a Newco formed to facilitate an IPO is capable of being identified as an acquirer depends on the facts and circumstances and ultimately requires judgement. If, for example, Entity A incorporates Newco and arranges for it to acquire Sub 1 and Sub 2 prior to the IPO proceeding, Newco could be viewed as an extension of Entity A or possibly an extension of Sub 1 or Sub 2. This is because the IPO and the reorganisation are not always seen as being part of one integral transaction, and therefore the transaction would be a combination of entities under common control (see Chapter 11). In that situation, Newco would not be the acquirer.

In Illustration 4-2 above, virtually 100% of the interest is sold, which is clear evidence of both a change in control and a significant change in ownership. However, if, for example, the existing ownership was 51% and this was diluted to 46% due to the IPO, although there has been a loss of control by Entity A, we do not believe that there has been a significant change in ownership to justify the Newco being identified as the acquirer.

Illustration 4-3 below illustrates a situation where, despite the fact that the transaction results in a change of control, the purpose and design indicate that the substance of the transaction was to achieve something other than gaining control. Assessing the purpose and design of a transaction requires careful consideration of all facts and circumstances.

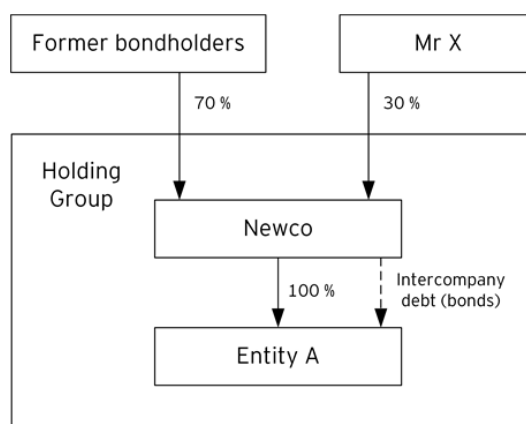

Illustration 4-3: Newco formed to facilitate a debt-to-equity swap transaction

Entity A was wholly owned by a single shareholder Mr X and had issued bonds, ownership of which is widely dispersed. Five years before the maturity of the bonds, Entity A initiated and negotiated with bondholders to swap their bonds for an equity interest in Entity A, in order to facilitate Entity A's future market expansion strategy. Mainly due to tax reasons, the transaction was structured as follows: Mr X formed Newco with *de minimis* share capital, appointed to its Board of Directors the same individuals that comprise the Board of Directors of Entity A, and contributed his interest in Entity A for nil consideration. The bondholders then swapped their bonds for new shares issued by Newco. As result of the transaction, Mr X owns 30% of Entity A's shares indirectly through Newco, and the former bondholders hold 70%. Neither Mr X, nor any individual former bondholder, nor any organised sub-group of former bondholders, controls Newco. No changes were made or are expected to be made to the Board of Directors of Entity A or Newco, on which the former bondholders are not represented. While under the local legislation, Newco is required to present its IFRS financial statements to the regulator, the shareholders of Newco (i.e., Mr X and former bondholders) will continue to use Entity A's financial statements to evaluate its performance and financial position. The shareholding and debt structures before after the transaction are as follows:

Before transaction:

After transaction:

In this transaction, Mr X loses control over Entity A and the former bondholders as a group obtain the majority of shares in Newco and indirectly therefore in Entity A. In order to assess whether the purpose and design of the transaction is to obtain ultimate control over Entity A by the former bondholders as a group, and hence whether it is appropriate to consider Newco as an extension of the former bondholders, the following facts and circumstances are identified:

- The debt-to-equity swap was initiated by Entity A to facilitate its future market expansion strategy.
- The Newco was formed mainly for tax reasons.
- There was no concerted effort by the bondholders to form Newco to acquire control over Entity A.
- There was no new cash involved in this transaction.
- There is no existing or planned Board representation of the former bondholders at Newco or Entity A level. This suggests that the intention of the bondholders was not to change control over Entity A through Newco.
- Financial statements of Entity A will continue to be used to provide the shareholders of Newco (Mr X and former bondholders) with information about the financial performance and financial position of Entity A.
- Neither Mr X, nor any individual bondholder, or any organised sub-group of bondholders, controls Newco after the transaction.

When assessing all these facts and circumstances, the purpose and design of this transaction appears to reflect a facilitation of a debt-to-equity swap rather than an intended change in control over Entity A, even though the change of control happened as well. Therefore, in this specific example, it is appropriate to consider Newco as an extension of Entity A rather than as extension of the former bondholders and, therefore, not to identify Newco as the acquirer.

4.1.2 Stapling arrangements

In 2014, the IFRS IC considered whether an acquirer identified for the purpose of IFRS 3 is a parent for the purpose of IFRS 10 in circumstances in which a business combination is achieved by contract alone, such as a stapling arrangement, with no combining entity obtaining control of the other combining entities. When considering this issue, the IFRS IC thought that the guidance outlined in IFRS 3.B15(a), i.e., that the acquirer is usually the combining entity whose owners as a group receive the largest portion of the voting rights in the combined entity, would be relevant to identifying which of the combining entities is the acquirer in the stapling transaction considered.⁸

4.1.3 Determining the accounting acquirer in SPAC transactions

Although a SPAC legally acquires a target, the accounting for the transaction depends on which entity is considered the acquirer for accounting purposes (i.e., the accounting acquirer). IFRS 3 and IFRS 10 requirements are applied to determine whether the SPAC or its target (or one of its targets) is identified as an accounting acquirer.

Generally, a new entity that has been formed to effect a business combination other than through the issue of shares, will be identified as an acquirer if it is an extension of the party (or parties) that ultimately gains control of the combining entities. This determination requires a thorough analysis of all the facts and circumstances, including an assessment of the purpose and design of the transaction. When the purpose and design of the transaction indicate that its underlying substance is to gain control over the business by the new ultimate controlling party (or parties), then this new entity is an extension of such a party (or parties) and, therefore, would likely be identified as the acquirer. An example could be a situation when the Newco is used by a group of investors or another entity to acquire a controlling interest in a target entity in an arm's length transaction.

As noted in section 4.1 above, in a business combination effected primarily by transferring cash or other assets, or by incurring liabilities, the acquirer is usually the entity that transfers the cash or other assets or incurs the liabilities. In a business combination effected primarily by exchanging equity interests, the acquirer is usually the entity that issues its equity interests, except for a situation where the issuing entity is the accounting acquiree. For example, a private operating entity may arrange the acquisition of all its existing shares by a public entity in exchange for additional shares issued by the public entity. While the public entity might first appear to be the accounting acquirer by issuing additional shares to acquire the controlling interest in a private entity, it is necessary to consider other facts and circumstances in order to determine the accounting acquirer in a business combination effected by exchanging equity interests under IFRS 3. This may result in a conclusion that the private entity is the accounting acquirer and the public entity is the accounting acquiree. Therefore, when a SPAC acquires a business for cash-only consideration, the SPAC is usually the accounting acquirer. However, if the consideration is equity or a mix of cash and equity, determining the accounting acquirer requires considering the guidance in IFRS 3.B14 to B18. Application of this guidance including facts and circumstances that an entity needs to consider while identifying the accounting acquirer is discussed in detail in section 4.1 above.

Since SPAC acquisitions often involve redemptions by selling shareholders that may affect the relative voting rights, as well as complex equity structures (e.g., voting shares, non-voting shares, warrants, convertible instruments), these transactions require a careful analysis of the combined entity's post-combination voting structure. If consideration paid for the target includes shares in the SPAC, the former owners of the target may hold the largest portion of voting rights in the combined entity, which would indicate that the target is the accounting acquirer.

The determination of the accounting acquirer in a SPAC acquisition requires careful analysis and significant judgement. Some of the factors an entity is required to consider as stated above and in section 4.1 may suggest that the SPAC is the accounting acquirer, while others may suggest that the target is the accounting acquirer.

⁸ [IFRIC Update](#), May 2014, available on the IFRS Foundation's website.

4.2 Determining the acquisition date

The next step in applying the acquisition method is determining the acquisition date, which is 'the date on which the acquirer obtains control of the acquiree'. [IFRS 3.8, IFRS 3 Appendix A]. This is generally the 'closing date', i.e., the date on which the acquirer legally transfers the consideration, acquires the assets and assumes the liabilities of the acquiree. [IFRS 3.9]. However, although the standard refers to the 'closing date', this does not necessarily mean that the transaction has to be closed or finalised at law before the acquirer obtains control over the acquiree.

The acquirer might obtain control on a date that is either earlier or later than the closing date. If a written agreement provides that the acquirer obtains control of the acquiree on a date before the closing date, the acquisition date might precede the closing date. [IFRS 3.9]. This does not mean that the acquisition date can be artificially backdated or otherwise altered, for example, by the inclusion of terms in the agreement indicating that the acquisition is effective as at an earlier date, with the acquirer being entitled to profits arising after that date, even if the purchase price is based on the net asset position of the acquiree at that date.

The Basis for Conclusions accepts that, for convenience, an entity might wish to designate an acquisition date at the beginning or end of a month, the date on which it closes its books, rather than the actual acquisition date during the month. Unless events between the 'convenience' date and the actual acquisition date result in material changes in the amounts recognised, that entity's practice would comply with the requirements of IFRS 3. [IFRS 3.BC110].

The date control is obtained will be dependent on a number of factors, including whether the acquisition arises from a public offer or a private deal, is subject to approval by other parties, or is effected by the issue of shares.

However, in all cases, whether control has been obtained by a certain date is a matter of fact, and all pertinent facts and circumstances surrounding a business combination need to be considered in assessing when the acquirer has obtained control. To evaluate whether control has been obtained, the acquirer applies the guidance in IFRS 10 (see Chapter 7).

For an acquisition by way of a public offer, the date of acquisition could be:

- When the offer has become unconditional because sufficient irrevocable acceptances have been received
- Or
- The date that the offer closes

Since the nature of public offers can be different depending on the jurisdiction they are in, it is always necessary to consider the impact of the nature and terms of the offer and any other relevant laws or regulations in determining the date of acquisition.

In a private deal, the date would generally be when an unconditional offer has been accepted by the vendors, the acquirer obtains substantive voting rights in the investee and all other criteria of control in IFRS 10 are met.

Thus, when an offer is conditional on the approval of the acquiring entity's shareholders, until that approval has been received, it is unlikely that control will have been obtained. When the offer is conditional upon receiving some form of regulatory approval, then it will depend on the nature of that approval. If it is a substantive hurdle, such as obtaining the approval of a competition authority, it is unlikely that control is obtained prior to that approval. However, when the approval is merely a formality, or 'rubber-stamping' exercise, then this would not preclude control having been obtained at an earlier date, provided that at that earlier date, the acquirer effectively obtains power to direct the relevant activities of the acquiree.

When the acquisition is effected by the issue of shares, the date of control will generally be when the exchange of shares takes place.

Application of the IFRS 10 criteria for control may also result in the determination of the acquisition date as the date when acquirer obtains substantive voting rights via options held over the acquiree's shares (see Chapter 7).

5 Recognition and measurement of identifiable assets acquired, liabilities assumed and non-controlling interests

Extract from IFRS 3

- 10 As of the acquisition date, the acquirer shall recognise, separately from goodwill, the identifiable assets acquired, the liabilities assumed and any non-controlling interest in the acquiree. Recognition of identifiable assets acquired and liabilities assumed is subject to the conditions specified in paragraphs 11 and 12.
- 11 To qualify for recognition as part of applying the acquisition method, the identifiable assets acquired and liabilities assumed must meet the definitions of assets and liabilities in the *Conceptual Framework for Financial Reporting* at the acquisition date. For example, costs the acquirer expects but is not obliged to incur in the future to effect its plan to exit an activity of an acquiree or to terminate the employment of or relocate an acquiree's employees are not liabilities at the acquisition date. Therefore, the acquirer does not recognise those costs as part of applying the acquisition method. Instead, the acquirer recognises those costs in its post-combination financial statements in accordance with other IFRSs.
- 12 In addition, to qualify for recognition as part of applying the acquisition method, the identifiable assets acquired and liabilities assumed must be part of what the acquirer and the acquiree (or its former owners) exchanged in the business combination transaction rather than the result of separate transactions. The acquirer shall apply the guidance in paragraphs 51-53 to determine which assets acquired or liabilities assumed are part of the exchange for the acquiree and which, if any, are the result of separate transactions to be accounted for in accordance with their nature and the applicable IFRSs.
- 18 **The acquirer shall measure the identifiable assets acquired and the liabilities assumed at their acquisition-date fair values.**
- 21 This IFRS provides limited exceptions to its recognition and measurement principles. Paragraphs 22-31 specify both the particular items for which exceptions are provided and the nature of those exceptions. The acquirer shall account for those items by applying the requirements in paragraphs 22-31, which will result in some items being:
- (a) recognised either by applying recognition conditions in addition to those in paragraphs 11 and 12 or by applying the requirements of other IFRSs, with results that differ from applying the recognition principle and conditions.
 - (b) measured at an amount other than their acquisition-date fair values.

[IFRS 3.10, IFRS 3.11, IFRS 3.12, IFRS 3.18, IFRS 3.21].

The next step in applying the acquisition method involves recognising and measuring the identifiable assets acquired, the liabilities assumed and any non-controlling interest in the acquiree.

5.1 General principles

The identifiable assets acquired and liabilities assumed of the acquiree are recognised as at the acquisition date and measured at fair value as at that date, with certain limited exceptions. [IFRS 3.10, IFRS 3.14, IFRS 3.18, IFRS 3.20].

Any non-controlling interest in the acquiree is recognised at the acquisition date. Non-controlling interests that are present ownership interests and entitle their holders to a proportionate share of the entity's net assets in the event of liquidation can be measured on one of two bases:

- At fair value at that date
- Or
- At the non-controlling interest's proportionate share of the acquiree's net identifiable assets [IFRS 3.19]

All other components of non-controlling interests are measured at their acquisition-date fair values, unless another measurement basis is required by other IFRS accounting standards. [IFRS 3.10, IFRS 3.19]. See section 8 below.

5.2 Recognising identifiable assets acquired and liabilities assumed

To qualify for recognition, an item acquired or assumed must be:

- (a) An asset or liability at the acquisition date

And

- (b) Part of the business acquired (the acquiree) rather than the result of a separate transaction

[IFRS 3.BC112]

The first condition requires the identifiable assets acquired and liabilities assumed to meet the definitions of assets and liabilities in the *Conceptual Framework for Financial Reporting (Conceptual Framework)*, issued in 2018. [IFRS 3.11].

Applying the definitions in the *Conceptual Framework* means that costs that the acquirer expects but is not obliged to incur in the future cannot be provided for. For example, the entity's plans to reorganise the acquiree's activities (e.g., plans to exit from an activity, or terminate the employment of or relocate employees) are not liabilities at the acquisition date. These costs will be recognised by the acquirer in its post-combination financial statements in accordance with other IFRS accounting standards. [IFRS 3.11]. Liabilities for restructuring or exit activities can only be recognised if they meet the definition of a liability at the acquisition date. [IFRS 3.BC132]. Although the standard no longer contains explicit requirements relating to restructuring plans, the Basis for Conclusions clearly indicates that the requirements for recognising liabilities associated with restructuring or exit activities remain the same. [IFRS 3.BC137]. This is discussed further in section 11.4 below.

The first condition for recognition makes no reference to probability of the inflow or outflow of economic benefits. Thus, identifiable assets and liabilities are recognised regardless of the degree of probability that there will be inflows or outflows of economic benefits. [IFRS 3.BC126]. The first condition for recognition makes no reference to reliability of measurement either.

The second condition requires the identifiable assets acquired and liabilities assumed must be part of the exchange for the acquiree, rather than the result of separate transactions. [IFRS 3.12]. Explicit guidance is given in the standard for making such an assessment as discussed in section 11 below. An acquirer may recognise some assets and liabilities that had not previously been recognised in the acquiree's financial statements, e.g., intangible assets, such as internally-generated brand names, patents or customer relationships. [IFRS 3.13].

Guidance on recognising intangible assets and lessor's operating leases, as well as items for which IFRS 3 provides limited exceptions to the recognition principles and conditions are discussed in sections 5.5 and 5.6 below.

5.3 Acquisition-date fair values of identifiable assets acquired and liabilities assumed

The general principle is that the identifiable assets acquired and liabilities assumed are measured at their acquisition-date fair values. In this chapter, reference to fair value means fair value as measured by IFRS 13.

IFRS 13 provides guidance on how to measure fair value, but it does not change when fair value is required or permitted under IFRS accounting standards. IFRS 13 is discussed in detail in Chapter 15. IFRS 3 allows some assets and liabilities to be measured at other than fair value on initial recognition, as described in section 5.6 below.

IFRS 13 defines 'fair value' as "the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date" under current market conditions. It is explicitly an exit price. [IFRS 13.9].

When IFRS 3 requires an identifiable asset acquired or liability assumed to be measured at its fair value at the acquisition date, although an entity applies the IFRS 13 measurement requirements, it does not need to disclose information about those acquisition-date fair value measurements under IFRS 13. However, the IFRS 13 disclosure requirements would apply to any fair value measurement after initial recognition, for example the fair value measurement of contingent consideration classified as a financial liability (see Chapter 15). [IFRS 13.91].

IFRS 3 specifies which assets and liabilities are not measured at fair value, including income taxes and employee benefits. [IFRS 3.20]. These are discussed in section 5.6 below.

5.4 Classifying or designating identifiable assets acquired and liabilities assumed

The acquirer must classify or designate the identifiable assets and liabilities assumed on the basis of its own contractual terms, economic conditions, operating and accounting policies and other relevant conditions as at the acquisition date. [IFRS 3.15].

Examples of classifications or designations made by the acquirer on the basis of conditions at the acquisition date include but are not limited to:

- (a) Classifying financial assets and liabilities as measured at fair value through profit or loss or at amortised cost, or as a financial asset measured at fair value through other comprehensive income, in accordance with IFRS 9
 - (b) Designating a derivative instrument as a hedging instrument in accordance with IFRS 9
- And
- (c) Assessing whether an embedded derivative is separated from the host contract in accordance with IFRS 9 (which is a matter of 'classification' as IFRS 3 uses that term) [IFRS 3.16]

The requirements for the classification of financial assets and liabilities under IFRS 9 are discussed in Chapter 44. Although IFRS 9 prohibits reclassifications of financial liabilities and allows reclassifications of financial assets when, and only when, an entity changes its business model for managing financial assets as described in Chapter 44, these do not apply in the circumstances of a business combination. The acquirer has to make its own classification at the acquisition date. If it has not had to consider the classification of such assets or liabilities before, it could choose to adopt the classification applied by the acquiree or adopt a different classification if appropriate. However, if it already has an accounting policy for like transactions, the classification must be consistent with that existing policy.

As discussed in Chapter 49, there are a number of conditions that need to be met for hedge relationships to qualify for hedge accounting, in particular formal designation and documentation, and an ongoing assessment of the designated hedge. If an acquiree has derivative or other financial instruments that have been used as hedging instruments in a hedge relationship, IFRS 3 requires the acquirer to make its own designation about the hedging relationship that satisfy the conditions for hedge accounting, based on the conditions as they exist at the acquisition date. If the hedging relationship is being accounted for as a cash flow hedge by the acquiree, the acquirer does not inherit the acquiree's existing cash flow hedge reserve, as this clearly represents cumulative pre-acquisition gains and losses. This has implications for the assessment of hedge effectiveness and the measurement of ineffectiveness because, so far as the acquirer is concerned, it has started a new hedge relationship with a hedging instrument that is likely to have a non-zero fair value. This may mean that although the acquiree can continue to account for the relationship as a cash flow hedge, the acquirer is unable to account for it as a cash flow hedge in its financial statements.

In the situations discussed above, the effect of applying the principle in IFRS 3 only affects the post-business combination accounting for the financial instruments concerned. The financial instruments that are recognised as at the acquisition date, and their measurement at their fair value at that date, do not change.

However, the requirement for the acquirer to assess whether an embedded derivative is separated from the host contract based on acquisition date conditions could result in additional assets or liabilities being recognised (and measured at their acquisition-date fair values) that differ from those recognised by the acquiree. This is discussed further in Chapter 42.

5.4.1 Exception to the classifying or designating principle

The standard provides an exception to the principle in IFRS 3.15 regarding classification under IFRS 16 of leases in which the acquiree is the lessor. That is, contracts within the scope of the exception are classified on the basis of the contractual terms and other factors at the inception of the contract or at the date of modification. This could be the acquisition date if the terms of the contract have been modified in a manner that would change its classification. [IFRS 3.17].

Thus, if an acquiree is a lessor under a lease contract that has been classified appropriately as an operating lease under IFRS 16, the acquirer would continue to account for the lease as an operating lease in the absence of any modification to the terms of the contract. Only if, prior to, or as at, the acquisition date, the terms of the lease were modified in such a way that it would be reclassified as a finance lease under IFRS 16 (see Chapter 24), would the acquirer derecognise the underlying asset and recognise instead a financial asset (net investment in a lease).

IFRS 3 as updated by IFRS 17, which is effective for annual periods beginning on or after 1 January 2023, removes the second classification exception⁹ and requires that an acquirer will measure a group of acquired insurance contracts and any assets for insurance acquisition cash flows as defined in IFRS 17, as a liability or asset in accordance with the provisions of IFRS 17.39 and IFRS 17.B93-B95F, at the acquisition date.

5.5 Recognising and measuring particular assets acquired and liabilities assumed

IFRS 3 gives some application guidance on recognising and measuring particular assets acquired and liabilities assumed in a business combination, as discussed below.

5.5.1 Operating leases in which the acquiree is the lessor

If the acquiree is a lessor in an operating lease, i.e., it has an item of property, plant and equipment that is leased to another party, there is no requirement for the acquirer to recognise intangible assets or liabilities if the terms of the lease are favourable or unfavourable relative to market terms and prices. Instead, off-market terms are reflected in the acquisition-date fair value of the asset (such as a building or a patent) subject to the lease. [IFRS 3.B42]. The IASB sought to avoid any inconsistency with the fair value model in IAS 40, which requires the fair value of investment property to take into account rental income from current leases. [IFRS 3.BC146].

The requirement to reflect the off-market terms in the fair value of the asset subject to an operating lease in which the acquiree is the lessor applies to any type of asset, to the extent market participants would take them into consideration when pricing the asset, and is not restricted to investment properties accounted for under the fair value model in IAS 40. Based on the requirements of IAS 16 and IAS 38, an entity would be required to adjust the depreciation or amortisation method of the leased asset so as to reflect the timing of the cash flows attributable to the underlying leases. [IFRS 3.BC148].

5.5.2 Intangible assets

Identifiable intangible assets may have to be recognised by an acquirer although they have not previously been recognised by the acquiree. [IFRS 3.B31]. IFRS 3 and IAS 38 give guidance on the recognition of intangible assets acquired in a business combination.

IFRS 3 and IAS 38 both define an 'intangible asset' as "An **identifiable** non-monetary asset without physical substance". [IFRS 3 Appendix A, IAS 38.8]. The definition requires an intangible asset to be 'identifiable' to distinguish it from goodwill. [IAS 38.11]. Both standards regard an asset as identifiable if it:

- Is separable, i.e., capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged, either individually or together with a related contract, identifiable asset or liability, regardless of whether the entity intends to do so (the 'separability' criterion)
- Or
- Arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations (the 'contractual-legal' criterion) [IFRS 3 Appendix A, IAS 38.12]

IFRS 3 provides the following application guidance.

Separability

An intangible asset is separable even if the acquirer has no intention of selling, licensing or otherwise exchanging it. An acquired intangible asset is separable if there is evidence of exchange transactions for that type of asset or an asset of a similar type, even if those transactions are infrequent and regardless of whether the acquirer is involved in them. For example, customer and subscriber lists are frequently licensed and thus separable. Even if an acquiree believes its customer lists have characteristics that distinguish them from others, this would not generally prevent the acquired customer list from being considered separable. However, if confidentiality terms or other agreements prohibit an entity from selling, leasing or otherwise exchanging information about its customers, then the customer list would not be separable. [IFRS 3.B33].

⁹ IFRS 17 *Insurance Contracts*, Appendix D Amendments to other IFRS Standards, IFRS 3 *Business Combinations*, May 2017.

An intangible asset may be separable from goodwill in combination with a related contract, identifiable asset or liability. Two examples are given by IFRS 3:

- Market participants exchange deposit liabilities and related depositor relationship intangible assets in observable exchange transactions. Therefore, the acquirer recognises the depositor relationship intangible asset separately from goodwill.
- And
- An acquiree owns a registered trademark and documented but unpatented technical expertise used to manufacture the trademarked product. When it sells the trademark, the owner must also transfer everything else necessary for the new owner to produce a product or service indistinguishable from that produced by the former owner. Because the unpatented technical expertise must be separated from the acquiree or combined entity and sold if the related trademark is sold, it meets the separability criterion. [IFRS 3.B34].

Contractual-legal

An intangible asset that meets the contractual-legal criterion is identifiable, and hence accounted for separately from goodwill, even if the asset is not transferable or separable from the acquiree or from other rights and obligations. For example:

- An acquiree owns and operates a nuclear power plant. The licence to operate the power plant is a separate intangible asset, even if the acquirer cannot sell or transfer it separately from the power plant itself. IFRS 3 goes on to say that an acquirer may recognise the operating licence and the power plant as a single asset for financial reporting purposes if their useful lives are similar.
- An acquiree owns a technology patent that it has licensed to others for their exclusive use outside the domestic market, for which it has received a specified percentage of future foreign revenue. Both the technology patent and the related licence agreement meet the contractual-legal criterion for separate recognition even if it would not be practical to sell or exchange them separately from one another. [IFRS 3.B32].

Accordingly, under IFRS 3, intangible assets are recognised separately from goodwill if they are identifiable, i.e., they either are separable or arise from contractual or other legal rights. [IFRS 3.B31]. They must be assigned an acquisition-date fair value.

5.5.2.A Examples of identifiable intangible assets

We have considered above a number of different types of identifiable intangible assets that are recognised separately from goodwill, such as customer and subscriber lists, depositor relationships, registered trademarks, unpatented technical expertise, licences and technology patents.

IAS 38 also explicitly requires an acquirer to recognise as a separate intangible asset in-process research and development of the acquiree, in accordance with IFRS 3, if the project meets the definition of an intangible asset. [IAS 38.34]. IFRS 3 itself only refers to this in its Basis for Conclusions. [IFRS 3.BC149-BC156]. This is discussed in section 5.5.2.D below.

IFRS 3's Illustrative Examples list items acquired in a business combination that are identifiable intangible assets, noting that the examples are not intended to be all-inclusive. [IFRS 3.IE16-IE44]. The assets listed are designated as being 'contractual', or 'non-contractual', in which case they do not arise from contractual or other legal rights but are separable. It emphasises that assets do not have to be separable to meet the contractual-legal criterion.

The table below summarises the items included in the Illustrative Examples. See the Illustrative Examples for further explanations.

Intangible assets arising from contractual or other legal rights (regardless of being separable)	Other intangible assets that are separable
Marketing-related	
<ul style="list-style-type: none"> ▪ Trademarks, trade names, service marks, collective marks and certification marks ▪ Trade dress (unique colour, shape or package design) ▪ Newspaper mastheads ▪ Internet domain names ▪ Non-competition agreements 	

Customer-related

- Order or production backlog
- Customer contracts and the related customer relationships
- Customer lists
- Non-contractual customer relationships

Artistic-related

- Plays, operas and ballets
- Books, magazines, newspapers and other literary works
- Musical works such as compositions, song lyrics and advertising jingles
- Pictures and photographs
- Video and audio-visual material, including motion pictures or films, music videos and television programmes

Contract-based

- Licensing, royalty and standstill agreements
- Advertising, construction, management, service or supply contracts
- Construction permits
- Franchise agreements
- Operating and broadcast rights
- Servicing contracts such as mortgage servicing contracts
- Employment contracts
- Use rights such as drilling, water, air, mineral, timber-cutting and route authorities

Technology-based

- Patented technology
- Computer software and mask works
- Trade secrets, such as secret formulas, processes or recipes
- Unpatented technology
- Databases, including title plants

Some items have been designated as being ‘contractual’ due to legal protection, for example, trademarks and trade secrets. The guidance explains that even without that legal protection, they would still normally meet the separability criterion.

Customer relationships established through contracts are deemed identifiable as they meet the contractual-legal criterion. However, there need not be a current contract or any outstanding orders at the date of acquisition for customer relationships to meet the identifiability criteria. Customer relationships can also be recognised as intangible assets if they arise outside a contract but in this case, they must be separable to be recognised. This is discussed further in section 5.5.2.B below.

IFRS 3’s Illustrative Examples clarify that for contracts with terms that are favourable or unfavourable relative to the market terms, the acquirer recognises either a liability assumed or an asset acquired in a business combination. For example, if the terms of a customer contract are unfavourable in comparison to market terms, the acquirer recognises a corresponding liability. [IFRS 3.IE34]. Conversely, for supply contracts acquired in a business combination that are beneficial from the perspective of the acquiree because the pricing of those contracts is favourable in comparison to market terms, the acquirer recognises a contract-based intangible asset. However, this guidance is not applicable to lease contracts within the scope of IFRS 16. For such contracts, off-market terms are either reflected in the acquisition-date fair value of the asset (such as a building or a patent) subject to the lease if the acquiree is the lessor (see section 5.5.1 above) or captured in the acquisition-date carrying amount of the right-of-use asset if the acquiree is the lessee (see section 5.6.8 below).

5.5.2.B Customer relationship intangible assets

Further guidance on customer relationships acquired in a business combination is provided in IFRS 3's Illustrative Examples, which form the basis of the example below. These demonstrate how an entity interprets the contractual-legal and separability criteria in the context of acquired customer relationships. [IFRS 3.IE30].

Illustration 5-1: Customer relationship intangible assets

(i) Supply agreement

Acquirer Company (AC) acquires Target Company (TC) in a business combination. TC has a five-year agreement to supply goods to Customer. Both TC and AC believe that Customer will renew the agreement at the end of the current contract. The agreement is not separable.

The agreement, whether cancellable or not, meets the contractual-legal criterion. Because TC establishes its relationship with Customer through a contract, both the agreement itself and also TC's customer relationship with Customer meet the contractual-legal criterion.

(ii) Sporting goods and electronics

AC acquires TC in a business combination. TC manufactures goods in two distinct lines of business: sporting goods and electronics. Customer purchases both sporting goods and electronics from TC. TC has a contract with Customer to be its exclusive provider of sporting goods but has no contract for the supply of electronics to Customer. Both TC and AC believe that only one overall customer relationship exists between TC and Customer.

The contract to be Customer's exclusive supplier of sporting goods, whether cancellable or not, meets the contractual-legal criterion. In addition, as TC establishes its relationship with Customer through a contract, the customer relationship with Customer meets the contractual-legal criterion. Because TC has only one customer relationship with Customer, the fair value of that relationship incorporates assumptions about TC's relationship with Customer related to both sporting goods and electronics. However, if AC determines that it has two separate customer relationships with Customer, for sporting goods and for electronics, AC would need to assess whether the customer relationship for electronics is separable before it could be recognised as an intangible asset.

(iii) Order backlog and recurring customers

AC acquires TC in a business combination. TC does business with its customers solely through purchase and sales orders. At the acquisition date, TC has a backlog of customer purchase orders from 60% of its customers, all of whom are recurring customers. The other 40% of TC's customers are also recurring customers. However, as at the acquisition date, TC has no open purchase orders or other contracts with those customers.

Regardless of whether they are cancellable or not, the purchase orders from 60% of TC's customers meet the contractual-legal criterion. Additionally, because TC has established its relationship with 60% of its customers through contracts, not only the purchase orders but also TC's customer relationships meet the contractual-legal criterion. Because TC has a practice of establishing contracts with the remaining 40% of its customers, its relationship with those customers also arises through contractual rights and therefore meets the contractual-legal criterion even though TC does not have contracts with those customers at the acquisition date.

(iv) Motor insurance contracts

AC acquires TC, an insurer, in a business combination. TC has a portfolio of one-year motor insurance contracts that are cancellable by policyholders.

Because TC establishes its relationships with policyholders through insurance contracts, the customer relationship with policyholders meets the contractual-legal criterion.

Sometimes the acquirer may be a customer of the acquiree immediately before the business combination. While a separate customer relationship intangible asset would generally be recognised by the acquirer for the existing relationships between the acquiree and its third-party customers, no separate intangible asset will be recognised for the pre-existing relationship, either contractual or not, between the acquiree and the acquirer. Instead, this relationship will be implicitly considered in the determination of a gain or loss on effective settlement of the pre-existing relationship as illustrated in Illustration 11-2 in section 11.1 below. This is different from any reacquired rights, for which the acquirer would recognise a separate asset (see section 5.5.3 below).

One of the most difficult areas of interpretation is whether an arrangement is contractual or not. Contractual customer relationships are always recognised separately from goodwill, but non-contractual customer relationships are recognised only if they are separable. Consequently, determining whether a relationship is contractual is critical to identifying and measuring customer relationship intangible assets and different conclusions could result in substantially different accounting outcomes.

Paragraph IE28 in the Illustrative Examples explains that a customer relationship is deemed to exist if the entity has information about the customer and regular contact with it and the customer can make direct contact with the entity. A customer relationship “may also arise through means other than contracts, such as through regular contact by sales or service representatives”. However, the argument is taken a stage further. Regardless of whether any contracts are in place at the acquisition date, “customer relationships meet the contractual-legal criterion for recognition if an entity has a practice of establishing contracts with its customers”. [IFRS 3.IE28]. An example of what is meant by this is given in Illustration 5-1 above. In the third illustration, ‘Order backlog and recurring customers’, it states “Because TC has a practice of establishing contracts with the remaining 40% of its customers, its relationship with those customers also arises through contractual rights and therefore meets the contractual-legal criterion even though TC does not have contracts with those customers at the acquisition date”.

In 2008 the IFRS IC considered the circumstances in which non-contractual customer relationships arise. The staff’s survey of IFRS IC members indicated that there were diverse practices regarding which customer relationships have a contractual basis and which do not. In addition, valuation experts seemed to be taking different views.¹⁰

The IFRS IC noted that the IFRS Glossary of Terms defined the term ‘contract’. Whilst the manner in which a relationship is established is relevant to confirming the existence of a customer relationship, it is not the primary basis for determining whether an intangible asset is recognised by the acquirer. What might be more relevant is whether the entity has a practice of establishing contracts with its customers or whether relationships arise through other means, such as through regular contact by sales and service representatives (i.e., the matters identified in IFRS 3.IE28). The existence of contractual relationships and information about a customer’s prior purchases would be important inputs in valuing a customer relationship intangible asset, but it does not determine whether it is recognised.¹¹ Therefore, a customer base (e.g., customers of a fast food franchise or movie theatres) is an example of a non-contractual customer relationship that would not be recognised in a business combination.

The IFRS IC referred the issue to the IASB but to date no further guidance has been developed. Therefore, divergent treatments will remain in practice, depending on how entities interpret ‘contractual’ and ‘non-contractual’ customer-related intangible assets in a particular business combination.

5.5.2.C Combining an intangible asset with a related contract, identifiable asset or liability

IAS 38 states that an intangible asset acquired in a business combination might be separable, but only together with a related contract, identifiable asset, or liability. In such cases, the acquirer recognises the intangible assets separately from goodwill, but together with the related item. [IAS 38.36].

Similarly, the acquirer may recognise a group of complementary intangible assets as a single asset provided the individual assets have similar useful lives. For example, “the terms ‘brand’ and ‘brand name’ are often used as synonyms for trademarks and other marks. However, the former are general marketing terms that are typically used to refer to a group of complementary assets such as a trademark (or service mark) and its related trade name, formulas, recipes and technological expertise.” [IAS 38.37].

It is not clear whether an intangible asset that is only separable in combination with a tangible asset, is recognised together as a single asset for financial reporting purposes in all circumstances. IFRS 3 gives an example of a licence to operate a nuclear power plant, and says that the fair value of the operating licence and the fair value of the power plant may be recognised as a single asset for financial reporting purposes, if the useful lives of those assets are similar (see section 5.5.2 above), yet the requirements in IAS 38 only refer to similar useful lives in the context of a group of complementary intangible assets.

In practice entities account for intangible assets separately from the related tangible asset if the useful lives are different. The Rank Group Plc considers that its casino and gaming licences have indefinite useful lives and accounts for them separately from the buildings with which they are acquired, as disclosed in its accounting policy.

¹⁰ [IFRIC Update](#), September 2008, available on the IFRS Foundation’s website.

¹¹ [IFRIC Update](#), March 2009, available on the IFRS Foundation’s website.

Practical example 5-1: The Rank Group Plc (2021)

United Kingdom

Annual Report 2024 [extract]**Notes to the financial statements [extract]****1 General information and accounting policies [extract]****Summary of significant accounting policies [extract]****1.13 Intangible assets [extract]****(b) Casino and other gaming licences and concessions**

The Group capitalises acquired casino and other gaming licences and concessions. Management believes that casino and other gaming licences have indefinite lives as there is no foreseeable limit to the period over which the licences are expected to generate net cash inflows and each licence holds a value outside the property in which it resides. Each licence is reviewed annually for impairment.

Guidance on determining useful lives of intangible assets is discussed in Chapter 18.

5.5.2.D In-process research or development project expenditure

IFRS 3 itself only refers to in-process research and development in its Basis for Conclusions, where it is made clear that the acquirer recognises all tangible and intangible research and development assets acquired in a business combination. [IFRS 3.BC149-BC156].

IAS 38's general recognition conditions require it to be probable that expected future economic benefits will flow to the entity and that the costs can be measured reliably before an intangible asset can be recognised. [IAS 38.21].

IAS 38 states that "an acquiree's in-process research and development project meets the definition of an intangible asset when it meets the definition of an asset, and is identifiable, i.e., is separable or arises from contractual or other legal rights." [IAS 38.34].

In-process research and development projects, whether or not recognised by the acquiree, are protected by legal rights and are clearly separable as on occasion they are bought and sold by entities without there being a business acquisition. Both of the standard's general recognition criteria, probability of benefits and reliable measurement, are always considered to be satisfied for in-process research and development projects acquired in a business combination. The fair value of an intangible asset reflects expectations about the probability of these benefits, despite uncertainty about the timing or the amount of the inflow. There will be sufficient information to measure the fair value of the asset reliably if it is separable or arises from contractual or other legal rights. If there is a range of possible outcomes with different probabilities, this uncertainty is taken into account in the measurement of the asset's fair value. [IAS 38.33, IAS 38.34, IAS 38.35].

Therefore, recognising in-process research and development as an asset on acquisition applies different criteria to those that are required for internal projects. The research costs of internal projects may under no circumstances be capitalised. [IAS 38.54]. Before capitalising development expenditure, entities must meet a series of exacting requirements. They must demonstrate the technical feasibility of the intangible assets, their intention and ability to complete the assets and use them or sell them and must be able to measure reliably the attributable expenditure. [IAS 38.57]. The probable future economic benefits must be assessed using the principles in IAS 36 which means that they have to be calculated as the net present value of the cash flows generated by the asset or, if it can only generate cash flows in conjunction with other assets, of the cash-generating unit of which it is a part. [IAS 38.60]. This process is described further in Chapter 18.

What this means is that entities will be required to recognise on acquisition some research and development expenditure that they would not have been able to recognise if it had been an internal project. The IASB is aware of this inconsistency, but concluded that this did not provide a basis for subsuming in-process research and development within goodwill. [IAS 38.BC82].

Although the amount attributed to the project is accounted for as an asset, IAS 38 goes on to require that any subsequent expenditure incurred after the acquisition of the project is accounted for in accordance with IAS 38.54 to 62. [IAS 38.42]. These requirements are discussed in Chapter 18.

In summary, this means that the subsequent expenditure is:

- Recognised as an expense when incurred if it is research expenditure
- Recognised as an expense when incurred if it is development expenditure that does not satisfy the criteria for recognition as an intangible asset in IAS 38.57
- Added to the carrying amount of the acquired in-process research or development project if it is development expenditure that satisfies the recognition criteria in IAS 38.57 [IAS 38.43]

The inference is that the in-process research and development expenditure recognised as an asset on acquisition that never progresses to the stage of satisfying the recognition criteria for an internal project will ultimately be impaired, although it may be that this impairment will not arise until the entity is satisfied that the project will not continue. However, since it is an intangible asset not yet available for use, such an evaluation cannot be significantly delayed as it will need to be tested for impairment annually by comparing its carrying amount with its recoverable amount, as discussed in Chapter 21. [IAS 36.10].

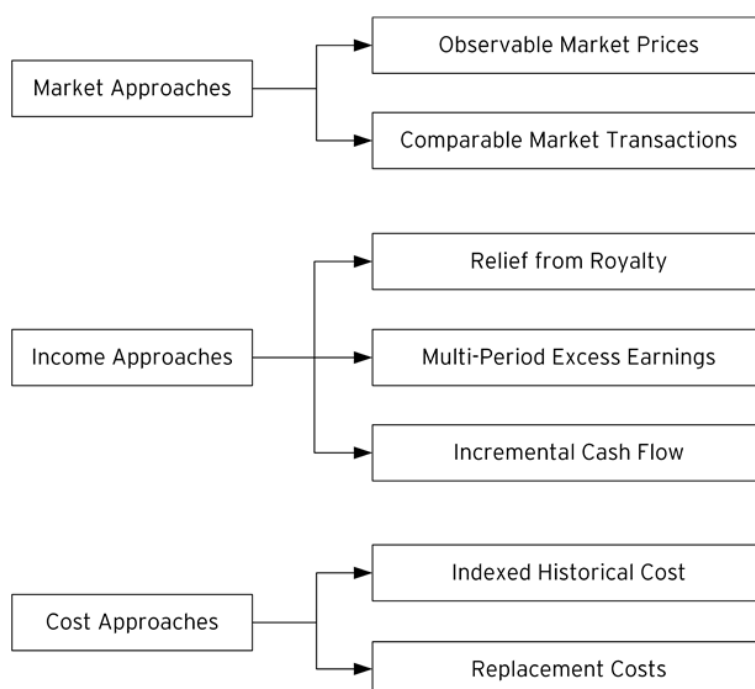

5.5.2.E Emissions schemes

Refer to Chapter 18 for the accounting when an entity that is acquired in a business combination participates in emissions scheme.

5.5.2.F Determining the fair values of intangible assets

IAS 38 states that the fair value of an intangible asset will reflect market participants' expectations at the acquisition date about the probability that the expected future economic benefits embodied in the asset will flow to the entity. [IAS 38.33]. Like IFRS 3, IAS 38 incorporates IFRS 13's definition of fair value (see section 5.3 above and Chapter 15). [IAS 38.8].

There are three broad approaches to valuing intangible assets that correspond to the valuation approaches referred to in IFRS 13. [IFRS 13.62]. These are the market, income and cost approaches (further discussed in Chapter 15). The diagram below shows these valuation approaches, together with some of the primary methods used to measure the fair value of intangible assets that fall under each approach, shown in the boxes on the right.

IFRS 13 does not limit the types of valuation techniques an entity can use to measure fair value. Instead the standard indicates that entities are required to use valuation techniques that are appropriate in the circumstances and for which sufficient data is available, which may result in the use of multiple valuation techniques. Regardless of the technique(s) used, a fair value measurement maximises the use of relevant observable inputs and minimises the use of the unobservable inputs. [IFRS 13.61]. The resulting fair value measurement must also reflect an exit price, i.e., the price to sell an asset. [IFRS 13.2].

In practice, the ability to use a market-based approach is very limited as intangible assets are generally unique and are not typically traded. For example, there are generally no observable transactions for unique rights such as brands, newspaper mastheads, music and film publishing rights, patents or trademarks noted in IAS 38.78, i.e., a number of the intangible assets that IFRS 3 and IAS 38 require an acquirer to recognise in a business combination (see Chapter 18).

The premise of the cost approach is that an investor would pay no more for an intangible asset than the cost to recreate it. The cost approach reflects the amount that would be required currently to replace the service capacity of an asset (i.e., current replacement cost). It is based on what a market participant buyer would pay to acquire or construct a substitute asset of comparable utility, adjusted for obsolescence. Obsolescence includes physical deterioration, technological (functional) and economic obsolescence so it is not the same as depreciation under IAS 16. [IFRS 13.B8, IFRS 13.B9]. This approach is most often used for unique intangible assets constructed by the entity, e.g., internally-developed software.

Income-based approaches are much more commonly used. These involve identifying the expected cash flows or economic benefits to be derived from the ownership of the particular intangible asset, and calculating the fair value of an intangible asset at the present value of those cash flows. These are discussed further below.

For each asset, there may be several methodologies that can be applied. The methods used will depend on the circumstances, as the assets could result in additional revenue, cost savings, or replacement time. A discounted cash flow method may be used, for example, in determining the value of cost-savings that will be achieved as a result of having a supply contract with advantageous terms in relation to current market rates.

Two income-based methods that are commonly used to value intangible assets are:

- The Multi-Period Excess Earnings Method ('MEEM')

And

- The Relief from Royalty method

The MEEM is a residual cash flow methodology that is often used in valuing the primary intangible asset acquired. The key issue in using this method is how to isolate the income/cash flow that is related to the intangible asset being valued.

As its name suggests, the value of an intangible asset determined under the MEEM is estimated through the sum of the discounted future excess earnings attributable to the intangible asset. The excess earnings is the difference between the after-tax operating cash flow attributable to the intangible asset and the required cost of invested capital on all other assets used in order to generate those cash flows. These contributory assets include property, plant and equipment, other identifiable intangible assets and net working capital. The allowance made for the cost of such capital is based on the value of such assets and a required rate of return reflecting the risks of the particular assets. As noted in section 5.5.4.A below, although it cannot be recognised as a separate identifiable asset, an assembled workforce may have to be valued for the purpose of calculating a 'contributory asset charge' in determining the fair value of an intangible asset under the MEEM.

The Relief from Royalty method is often used to calculate the value of a trademark or trade name. This approach is based on the concept that if an entity owns a trademark, it does not have to pay for the use of it and therefore is relieved from paying a royalty. The amount of that theoretical payment is used as a surrogate for income attributable to the trademark. The valuation is arrived at by computing the present value of the after-tax royalty savings, calculated by applying an appropriate royalty rate to the projected revenue, using an appropriate discount rate. The legal protection expenses relating to the trademark and an allowance for tax at the appropriate rate are deducted. The Relief from Royalty method was applied by Carlsberg A/S in its 2022 financial statements.

Practical example 5-2: CARLSBERG A/S (2022)**Denmark****CARLSBERG GROUP ANNUAL REPORT 2022 [extract]****CONSOLIDATED FINANCIAL STATEMENTS [extract]****Notes [extract]****SECTION 5 DISCONTINUED OPERATIONS, ACQUISITIONS, DISPOSALS AND ASSOCIATES [extract]****SECTION 5.3 ACQUISITIONS AND DISPOSALS [extract]****ACCOUNTING ESTIMATES AND JUDGEMENTS [extract]****Brands [extract]**

Brands are measured using the relief from royalty method, under which the expected future cash flows are based on key assumptions about expected useful life, royalty rate, growth rate and the theoretical tax effect. A post-tax discount rate is used that reflects the risk-free interest rate with the addition of a risk premium associated with the particular brand. The model and assumptions applied are consistent with those used in impairment testing, and are described in further detail in section 2.2.3.

It may be that the value of an intangible asset will reflect not only the present value of the future post-tax cash flows as indicated above, but also the value of any tax benefits (sometimes called 'tax amortisation benefits') that might generally be available to the owner if the asset had been bought separately, i.e., not as part of a business combination. Whether such tax benefits are included will depend on the nature of the intangible asset and the relevant tax jurisdiction. If tax amortisation benefits are included, an asset that has been purchased as part of a business combination could not actually be tax-deductible by the entity, either wholly or in part. This therefore raises a potential impairment issue that is discussed in Chapter 21.

In the Practical example below, Allied Electronics Corporation Limited discloses in its annual financial statements the use of the Relief from Royalty method for valuation of trade names and the MEEM to value customer relationships acquired in business combinations.

Practical example 5-3: Allied Electronics Corporation Limited (2021)**South Africa****ANNUAL FINANCIAL STATEMENTS [extract]****NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]****31 CRITICAL JUDGEMENTS AND ESTIMATES MADE BY MANAGEMENT [extract]****31.1 CRITICAL ESTIMATES MADE BY MANAGEMENT [extract]****Purchase price allocation of acquisitions**

The following valuation techniques were used in measuring the fair value of material assets acquired in business combinations:

- Relief-from-royalty method (trade names)
- Multi-period excess earnings method (customer relationships)

Because fair value is an exit price, the acquirer's intention in relation to intangible assets, e.g., where the acquirer does not intend to use an intangible asset of the acquiree, is not taken into account in attributing fair value. This is explicitly addressed in IFRS 3 and IFRS 13 and discussed in section 5.5.6 below and in Chapter 15.

5.5.3 Reacquired rights

A reacquired right, that is, a right previously granted to the acquiree to use one or more of the acquirer's recognised or unrecognised assets, must be recognised separately from goodwill. Reacquired rights include a right to use the acquirer's trade name under a franchise agreement or a right to use the acquirer's technology under a technology licensing agreement. [IFRS 3.B35].

A reacquired right is not treated as the settlement of a pre-existing relationship. Reacquisition of, for example, a franchise right does not terminate the right. The difference is that the acquirer, rather than the acquiree by itself, now controls the franchise right. The IASB also rejected subsuming reacquired rights into goodwill, noting that they meet both contractual-legal and separability criteria and therefore qualify as identifiable intangible assets. [IFRS 3.BC182, IFRS 3.BC183, IFRS 3.BC184].

Guidance on the valuation of such reacquired rights, and their subsequent accounting, is discussed in section 5.6.5 below.

Although the reacquired right itself is not treated as a termination of a pre-existing relationship, contract terms that are favourable or unfavourable relative to current market transactions are accounted for as the settlement of a pre-existing relationship. The acquirer has to recognise a settlement gain or loss.

[IFRS 3.B36]. Guidance on the measurement of any settlement gain or loss is discussed in section 11.1 below.

5.5.4 Assembled workforce and other items that are not identifiable

The acquirer subsumes into goodwill the value of any acquired intangible asset that is not identifiable as at the acquisition date.

5.5.4.A Assembled workforce

A particular example of an intangible asset subsumed into goodwill is an assembled workforce. IFRS 3 regards this as being an existing collection of employees that permits the acquirer to continue to operate an acquired business from the acquisition date without having to hire and train a workforce. [IFRS 3.B37].

Although individual employees might have employment contracts with the employer, the collection of employees, as a whole, does not have such a contract. In addition, an assembled workforce is not separable; it cannot be sold, transferred, licensed, rented or otherwise exchanged without causing disruption to the acquirer's business. Therefore, it is not an identifiable intangible asset recognised separately from goodwill. [IFRS 3.BC178].

Nor does the assembled workforce represent the intellectual capital of the skilled workforce, which is the (often specialised) knowledge and experience that employees of an acquiree bring to their jobs. [IFRS 3.B37]. Prohibiting an acquirer from recognising an assembled workforce as an intangible asset does not apply to intellectual property and the value of intellectual capital may well be reflected in the fair value of other intangible assets. For example, a process or methodology such as a software program would be documented and generally would be the property of the entity; the employer usually 'owns' the intellectual capital of an employee. The ability of the entity to continue to operate is unlikely to be affected significantly by changing programmers, even replacing the particular programmer who created the program. The intellectual property is part of the fair value of that program and is an identifiable intangible asset if it is separable from the entity. [IFRS 3.BC180].

5.5.4.B Items not qualifying as assets

The acquirer subsumes into goodwill any value attributed to items that do not qualify as assets at the acquisition date.

Potential contracts with new customers

Potential contracts that the acquiree is negotiating with prospective new customers at the acquisition date might be valuable to the acquirer. The acquirer does not recognise them separately from goodwill because those potential contracts are not themselves assets at the acquisition date. Nor does the acquirer subsequently reclassify the value of those contracts from goodwill for events that occur after the acquisition date. The acquirer is required, of course, to assess the facts and circumstances surrounding events occurring shortly after the acquisition to determine whether there was a separately recognisable intangible asset at the acquisition date. [IFRS 3.B38].

Contingent assets

IFRS 3 includes an explicit statement clarifying that contingent assets do not qualify for recognition at the acquisition date. [IFRS 3.23A]. IFRS 3 states that an acquired identifiable asset qualifies for recognition as at the acquisition date only if it meets the definition of an asset in the *Conceptual Framework*. [IFRS 3.11]. The *Conceptual Framework* specifies criteria for recognising assets and liabilities and says that these criteria might not be met if it is uncertain whether an asset exists. [CF 5.14]. In the Basis for Conclusions, the IASB noted that in case of contingent assets it is uncertain whether an asset exists at the acquisition date, and it is expected that some future event will confirm whether the entity has an asset. Therefore, the IASB concluded that an asset must only be recognised if the entity has an unconditional right at the acquisition date. However, an asset would not be recognised, even if it is virtually certain that it will become unconditional or non-contingent after that date. [IFRS 3.BC276]. Accounting for contingent assets under IAS 37 is discussed in Chapter 27.

Future contract renewals

In measuring the fair value of an intangible asset, the acquirer considers assumptions that market participants would use when pricing the intangible asset, such as expectations of future contract renewals. It is not necessary for the renewals themselves to meet the identifiability criteria. [IFRS 3.B40]. Any value attributable to the expected future renewal of the contract is reflected in the value of, for example, the customer relationship, rather than being subsumed within goodwill.

However, any potential contract renewals that market participants would consider in determining the fair value of reacquired rights would be subsumed within goodwill. Refer to the discussion in section 5.6.5 below.

5.5.5 Assets with uncertain cash flows (valuation allowances)

Under IFRS 3, the acquirer must not recognise a separate provision or valuation allowance for assets that are initially recognised at fair value. Because receivables, including loans, are recognised and measured at fair value at the acquisition date, any uncertainty about collections and future cash flows is included in the fair value measure (see Chapter 45). [IFRS 3.B41]. Therefore, although an acquiree may have assets, typically financial assets such as receivables and loans, against which it has recognised a provision or valuation allowance for expected credit losses or uncollectible amounts, an acquirer cannot 'carry over' any such valuation allowances nor create its own allowances in respect of those financial assets.

Subsequent measurement of financial instruments under IFRS 9 is dealt with in Chapter 46. Chapter 47 deals specifically with the interaction between the initial measurement of debt instruments acquired in a business combination and the impairment model of IFRS 9.

5.5.6 Assets that the acquirer does not intend to use or intends to use in a way that is different from other market participants

An acquirer may intend not to use an acquired asset, for example, a brand name or research and development intangible asset or it may intend to use the asset in a way that is different from the way in which other market participants would use it. IFRS 3 requires the acquirer to recognise all such identifiable assets and measure them at their fair value determined in accordance with their highest and best use by market participants (see Chapter 15). This requirement is applicable both on initial recognition and when measuring fair value less costs of disposal for subsequent impairment testing. [IFRS 3.B43]. This means that no immediate impairment loss is reflected if the acquirer does not intend to use the intangible asset to generate its own cash flows, but market participants would.

However, if the entity is not intending to use the intangible asset to generate cash flows, it is unlikely that it could be regarded as having an indefinite life for the purposes of IAS 38, and therefore is amortised over its expected useful life.

Illustration 5-2: Acquirer's intention not to use an intangible asset

Entity A acquires a competitor, Entity B. One of the identifiable intangible assets of Entity B is the trade name of one of Entity B's branded products. As Entity A has a similar product, it does not intend to use that trade name post-acquisition. Entity A will discontinue sales of Entity B's product, thereby eliminating competition and enhancing the value of its own branded product. The cash flows relating to the acquired trade name are therefore expected to be nil. Can Entity A attribute a fair value of nil to that trade name?

The fair value of the asset is determined in accordance with its use by market participants. Entity A's future intentions about the asset are reflected in determining the fair value, if that is what other market participants would do.

- There are other market participants that would continue to sell the product.
- Entity A could probably have sold the trade name after acquisition but has chosen not to do so.
- Even if all other market participants would, like Entity A, not sell the product in order to enhance the value of their own products, the trade name is still likely to have some value.

Accordingly, a fair value is attributed to that trade name.

As Entity A is not intending to use the trade name to generate cash flows but to use it defensively by preventing others from using it, the trade name is amortised over the period it is expected to contribute directly or indirectly to the entity's future cash flows.

5.5.7 Investments in equity-accounted entities

An acquiree may hold an investment in an associate, accounted for under the equity method (see Chapter 12). There are no recognition or measurement differences between an investment that is an associate or a trade investment because the acquirer has not acquired the underlying assets and liabilities of the associate. Accordingly, the fair value of the associate is determined on the basis of the value of the investment, rather than the underlying fair values of the identifiable assets and liabilities of the associate. The impact of having listed prices for investments in associates when measuring fair value is discussed further in Chapter 15. Any goodwill relating to the associate is subsumed within the carrying amount for the associate rather than within the goodwill arising on the overall business combination. Nevertheless, although this fair value is effectively the 'cost' of an investment in an associate to which equity accounting is applied, the underlying fair values of the various identifiable assets and liabilities also need to be determined to apply equity accounting (see Chapter 12).

This also applies if an acquiree holds an investment in a joint venture that is accounted for under the equity method according to IFRS 11 (see Chapter 13).

5.5.8 Assets and liabilities related to contracts with customers

As part of a business combination, an acquirer may assume liabilities or acquire assets recognised by the acquiree in accordance with IFRS 15, for example, contract assets, receivables or contract liabilities.

Under IFRS 15, if a customer pays consideration, or an entity has a right to an amount of consideration that is unconditional (i.e., a receivable), before the entity transfers a good or service to the customer, the entity presents a contract liability. [IFRS 15.106]. An acquirer recognises a contract liability (e.g., deferred revenue) related to a contract with a customer that it has assumed if the acquiree has received consideration (or the amount is due) from the customer. To determine whether to recognise a contract liability, however, an acquirer may also need to consider the definition of a performance obligation in IFRS 15. That is, at the acquisition date, the acquirer would identify the remaining promised goods and services in a contract with a customer and evaluate whether the goods and services it must transfer to a customer in the future are an assumed performance obligation for which the acquired entity has received consideration (or the amount is due). This is important because the consideration received (or the amount due) may relate to a satisfied or partially satisfied performance obligation for which no (or not all) revenue was recognised pre-combination (e.g., due to variable consideration being constrained). Since it was not party to the acquiree's performance pre-combination, an acquirer may need to consider how that affects its financial statements. For example, whether any consideration received that relates to the acquiree's pre-combination performance is presented as revenue or other income.

Chapter 28 provides additional guidance on identifying performance obligations in a contract with a customer. If a contract liability for an assumed performance obligation is recognised, the acquirer derecognises the contract liability and recognises revenue as it provides those goods or services after the acquisition date.

In accordance with the requirements in IFRS 3, at the date of acquisition, an assumed contract liability is measured at its fair value, which reflects the acquiree's obligation to transfer some (if advance covers only a portion of consideration for the remaining promised goods and services) or all (if advance covers full consideration for the remaining promised goods and services) of the remaining promised goods and services in a contract with a customer, as at the acquisition date.

The fair value is measured in accordance with the requirements in IFRS 13 and may require significant judgement. One method that might be used in practice to measure fair value of the contract liability is a cost build-up approach. That approach is based on a market participant's estimate of the costs that will be incurred to fulfil the obligation plus a 'normal' profit margin for the level of effort or assumption of risk by the acquirer after the acquisition date. The normal profit margin also is from the perspective of a market participant and will not include any profit related to selling or other efforts completed prior to the acquisition date.

Illustration 5-3: Contract liability of an acquiree

Target is an electronics company that sells contracts to service all types of electronic equipment for an annual fee of CU120,000 paid in advance. Acquirer purchases Target in a business combination. At the acquisition date, Target has one service contract outstanding with 6 months remaining and for which a contract liability of CU60,000 was recorded in Target's pre-acquisition financial statements.

To fulfil the contract over its remaining 6-month term, Acquirer estimates that a market participant would incur costs of CU45,000, and expect a profit margin for that fulfilment effort of 20% (i.e., CU9,000), and thus would expect to receive CU54,000 for the fulfilment of the remaining performance obligation.

Accordingly, Acquirer will recognise a contract liability of CU54,000 in respect of the acquired customer contract.

The acquirer does not recognise a contract liability or a contract asset for the contract with customer that is an executory contract (see Chapter 27) at the acquisition date and where no consideration is received from the customer and no amount is due. However, for executory contracts with customers with terms that are favourable or unfavourable relative to the market terms, the acquirer recognises either a liability assumed or an asset acquired in a business combination (see section 5.5.2.A above).

In addition to the contract liability, an acquirer may also assume refund liabilities of the acquiree. Under IFRS 15, an entity recognises a refund liability if the entity receives consideration from a customer and expects to refund some or all of that consideration to the customer, including refund liabilities relating to a sale with a right of return. [IFRS 15.55]. A refund liability, therefore, is different from a contract liability and might be recognised even if at the acquisition date no contract liability is recognised. Under IFRS 3, refund liabilities are also measured at their fair value at the acquisition date with fair value determined in accordance with the requirements of IFRS 13. The requirements in IFRS 13 for measuring the fair value of liabilities are discussed in more detail in Chapter 15.

If an entity performs by transferring goods or services to a customer before the customer pays consideration or before payment is due, the entity presents a contract as a contract asset, excluding amounts presented as receivable. [IFRS 15.107]. Contract assets represent entity's rights to consideration in exchange for goods or services that the entity has transferred to a customer when that right is conditioned on something other than the passage of time (e.g., the entity's future performance). [IFRS 15 Appendix A]. A receivable is an unconditional right to receive consideration from the customer (see also Chapter 28). [IFRS 15.105].

The value of acquired contracts with customers may be recognised in multiple assets and liabilities (e.g., receivables, contract assets, right of return assets, intangible assets, contract liabilities, refund liabilities).

Under IFRS 3 at the date of acquisition, all acquired assets related to the contract with customers are measured at their fair value at that date determined under IFRS 13. The IFRS 13 requirements for measuring the fair value of assets are discussed in more detail in Chapter 15.

When measuring the fair value of acquired contracts with customers, an acquirer must verify that all of the components of value have been considered (i.e., an acquirer is required to verify that none of the components of value have been omitted or double counted). An acquirer also must verify that all of the components are appropriately reflected in the fair value measurement. After the date of acquisition, an acquirer applies IFRS 15 to account for any of the acquiree's assets, liabilities, income and expenses that fall within that standard's scope. [IFRS 3.54]. Because IFRS 15 does not measure revenue (or any assets or liabilities within its scope) on a fair value basis, so-called 'day 2' measurement differences may arise post-combination. Neither IFRS 3 nor IFRS 15 specify how to account for such differences and, therefore, the acquirer may need to develop an accounting policy in accordance with IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*.

5.6 Exceptions to the recognition and/or measurement principles

There are a number of exceptions to the principles in IFRS 3 that all assets acquired and liabilities assumed are recognised and measured at fair value. For the particular items discussed below, this will result in some items being:

- Recognised either by applying additional recognition conditions or by applying the requirements of other IFRS accounting standards, with results that differ from applying the recognition principle and conditions
- And/Or
- Measured at an amount other than their acquisition-date fair values [IFRS 3.21]

5.6.1 Liabilities and contingent liabilities that would be in the scope of IAS 37 or IFRIC 21 if they were incurred separately

IFRS 3 includes an exception to the recognition principle that applies to liabilities and contingent liabilities assumed in a business combination that would be within the scope of IAS 37 or IFRIC 21 if they were incurred separately, rather than assumed in a business combination. [IFRS 3.21A].

The *Conceptual Framework* defines a liability as "a present obligation of the entity to transfer an economic resource as a result of past events". [CF 4.26]. However, the exception requires an acquirer to apply specific guidance in IAS 37 (instead of the definitions in the *Conceptual Framework*) to determine whether, at the acquisition date, a present obligation exists as a result of past events. For levies that would be within the scope of IFRIC 21, the exception requires an acquirer to apply IFRIC 21 to determine whether the obligating event that gives rise to a liability to pay the levy had occurred by the acquisition date. [IFRS 3.21B].

The board decided to add this exemption to the recognition principle of IFRS 3 to avoid the issue of potential 'day 2' gains or losses arising for liabilities and contingent liabilities that would be within the scope of IAS 37 or IFRIC 21, if incurred separately. Those 'day 2' gains or losses could have been incurred if an acquirer first recognised those liabilities or contingent liabilities at the time of the business combination according to the definition of the *Conceptual Framework* and then measured them according to the principles of IAS 37 or IFRIC 21 and derecognised them immediately afterwards. [IFRS 3.BC264C, IFRS 3.BC264D]. The exception refers to IFRIC 21 as well as IAS 37 because, although IFRIC 21 is an interpretation of IAS 37, it also applies to levies whose timing and amount are certain and so are outside the scope of IAS 37. [IFRS 3.BC264D].

Following this guidance in IFRS 3, the acquirer recognises, as at the acquisition date, a contingent liability assumed in a business combination if it is a present obligation that arises from past events and its fair value can be measured reliably. That is, contrary to paragraphs 14(b), 23, 27, 29 and 30 of IAS 37, the acquirer recognises a contingent liability assumed in a business combination at the acquisition date even if it is not probable that an outflow of resources embodying economic benefits will be required to settle the obligation (see section 5.2 above)

5.6.1.A Initial recognition and measurement

Under IAS 37, contingent liabilities are not recognised as liabilities; instead, they are disclosed in financial statements. However, under IFRS 3 contrary to the requirements of IAS 37, the acquirer recognises a contingent liability as a liability in the statement of financial position at its fair value if there is a present obligation arising from a past event that can be reliably measured, even if it is not probable that an outflow of resources will be required to settle the obligation. [IFRS 3.23]. If a contingent liability only represents a possible obligation arising from a past event, whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity, no liability is recognised under IFRS 3. [IFRS 3.BC275]. No liability is recognised if the acquisition-date fair value of a contingent liability cannot be measured reliably.

5.6.1.B Subsequent measurement and accounting

IFRS 3 requires that after initial recognition and until the liability is settled, cancelled or expires, the acquirer measures a contingent liability that is recognised in a business combination at the higher of:

- (a) The amount that would be recognised in accordance with IAS 37
- And
- (b) The amount initially recognised less, if appropriate, the cumulative amount of income recognised in accordance with the principles of IFRS 15

This requirement does not apply to contracts accounted for in accordance with IFRS 9. [IFRS 3.56]

The implications of part (a) of the requirement are clear. If the acquiree has to recognise a provision in respect of the former contingent liability, and the best estimate of this liability is higher than the original fair value attributed by the acquirer, then the greater liability will now be recognised by the acquirer with the difference taken to the income statement. It would now be a provision measured and recognised in accordance with IAS 37. What is less clear is part (b) of the requirement.

How we see it

The reference to “the cumulative amount of income recognised in accordance with the principles of IFRS 15” in IFRS 3.56 might relate to the recognition of income in respect of those contingent liabilities of the acquiree that have been recognised at fair value at date of acquisition. The requirement would appear to mean that, unless the recognition of income in accordance with the principles of IFRS 15 is appropriate, the amount of the liability cannot be reduced below its originally attributed fair value until the liability is settled, cancelled or expires.

Despite the fact that the requirement for subsequent measurement discussed above was originally introduced for consistency with IAS 39 *Financial Instruments: Recognition and Measurement*, which was replaced by IFRS 9, [IFRS 3.BC245], IFRS 3 makes it clear that this requirement does not apply to contracts accounted for in accordance with IFRS 9. [IFRS 3.56]. This would appear to mean that contracts that are excluded from the scope of IFRS 9, but are accounted for by applying IAS 37, will fall within the requirements of IFRS 3 outlined above.

5.6.2 Income taxes

In developing IFRIC 23 *Uncertainty over Income Tax Treatments*, the IFRS IC considered whether the Interpretation should address the accounting for tax assets and liabilities acquired or assumed in a business combination when there is uncertainty over income tax treatments. It noted that IFRS 3 applies to all assets acquired and liabilities assumed in a business combination and concluded that on this basis the Interpretation should not explicitly address tax assets and liabilities acquired or assumed in a business combination. [IFRIC 23.BC23].

Nonetheless, IFRS 3 requires an entity to account for deferred tax assets and liabilities that arise as part of a business combination (see also Chapter 29) by applying IAS 12. [IFRS 3.24]. Accordingly, the Interpretation applies to such assets and liabilities when there is uncertainty over income tax treatments that affect deferred tax. [IFRIC 23.BC24].

How we see it

Unlike the specific guidance for deferred tax assets and liabilities, IFRS 3 suggests that current tax is measured at fair value, which differs from the subsequent measurement required by IFRIC 23. Entities must consider whether the application of IFRS 3 fair value requirements to current tax assets and liabilities (which may result in possible ‘day 2’ gains and losses) takes precedence over the requirements of IFRIC 23 for the measurement of current tax assets and liabilities. We believe either approach is acceptable, provided that it is applied consistently (see also Chapter 29).

As mentioned above, IFRS 3 requires the acquirer to recognise and measure, in accordance with IAS 12, a deferred tax asset or liability, arising from the assets acquired and liabilities assumed in a business combination. [IFRS 3.24]. The acquirer is also required to account for the potential tax effects of temporary differences and carry-forwards of an acquiree that exist at the acquisition date or arise as a result of the acquisition in accordance with IAS 12. [IFRS 3.25].

IAS 12 requires that:

- Acquired deferred tax benefits recognised within the measurement period (see section 12 below) reduce the goodwill related to that acquisition if they result from new information obtained about facts and circumstances existing at the acquisition date. If the carrying amount of goodwill is zero, any remaining deferred tax benefits are recognised in profit or loss.
- And
- All other acquired tax benefits realised are recognised in profit or loss, unless IAS 12 requires recognition outside profit or loss. [IAS 12.68].

It will therefore be necessary to assess carefully the reasons for changes in the assessment of deferred tax made during the measurement period to determine whether it relates to facts and circumstances at the acquisition date or if it is a change in facts and circumstances since acquisition date. As an anti-abuse clause, if the deferred tax benefits acquired in a business combination are not recognised at the acquisition date but are recognised after the acquisition date with a corresponding gain in profit or loss, IAS 12.81(k) requires a description of the event or change in circumstances that caused the deferred tax benefits to be recognised.

IAS 12 also requires that tax benefits arising from the excess of tax-deductible goodwill over goodwill for financial reporting purposes is accounted for at the acquisition date as a deferred tax asset in the same way as other temporary differences. [IAS 12.32A].

The requirements of IAS 12 relating to the deferred tax consequences of business combinations are discussed further in Chapter 29.

5.6.3 Employee benefits

IFRS 3 requires the acquirer to recognise and measure a liability (or asset, if any) related to the acquiree's employee benefit arrangements in accordance with IAS 19 *Employee Benefits* (see Chapter 31), rather than at their acquisition-date fair values. [IFRS 3.26, IFRS 3.BC296-BC300].

5.6.4 Indemnification assets

The seller in a business combination may contractually indemnify the acquirer for the outcome of the contingency or uncertainty related to all or part of a specific asset or liability. These usually relate to uncertainties as to the outcome of pre-acquisition contingencies, e.g., uncertain tax positions, environmental liabilities, or legal matters. The amount of the indemnity may be capped or the seller may guarantee that the acquirer's liability will not exceed a specified amount.

IFRS 3 considers that the acquirer has obtained an indemnification asset. [IFRS 3.27].

From the acquirer's perspective, the indemnification is an acquired asset recognised at its acquisition-date fair value. However, IFRS 3 makes an exception to the general principles in order to avoid recognition or measurement anomalies for indemnifications related to items for which liabilities are either not recognised or are not required to be measured at fair value (e.g., uncertain tax positions related to recognised deferred tax assets and liabilities). [IFRS 3.BC302, IFRS 3.BC303]. Accordingly, under IFRS 3 the acquirer measures an indemnification asset on the same basis as the indemnified item, subject to the need for a valuation allowance for uncollectible amounts, if necessary.

- If the indemnification relates to an asset or a liability that is measured at fair value, the acquirer will recognise the indemnification asset at its fair value. The effects of uncertainty about future cash flows (i.e., the collectability of the asset) are included in the fair value measure and a separate valuation allowance is not necessary (see section 5.5.5 above). [IFRS 3.27].
- The indemnification may relate to an asset or liability that is not measured at fair value. A common example is an indemnification pertaining to a deferred tax liability that is measured in accordance with IAS 12, rather than at its fair value (see section 5.6.2 above). If the indemnified item is recognised as a liability but is measured on a basis other than fair value, the indemnification asset is recognised and measured using consistent assumptions, subject to management's assessment of collectability and any contractual limitations on the indemnified amount. [IFRS 3.27, IFRS 3.28].
- If the indemnified item is not recognised as a liability at the date of acquisition, the indemnification asset is not recognised. An indemnification could relate to a contingent liability that is not recognised at the acquisition date because its fair value is not reliably measurable, [IFRS 3.28], or it is only a possible obligation at that date (see section 5.6.1 above).

Thereafter, the indemnification asset continues to be measured using the same assumptions as the indemnified liability or asset. [IFRS 3.57]. Thus, where the change in the value of the related indemnified liability or asset is recognised in profit or loss, this will be offset by any corresponding change in the value recognised for the indemnification asset. The acquirer derecognises the indemnification asset only when it collects the asset, sells it or otherwise loses the right to it. [IFRS 3.57].

5.6.4.A Acquirer's obligation to transfer proceeds from realisation of acquired contingent asset ('Reverse indemnification liabilities')

A business combination sometimes includes an agreement under which the acquirer is required to transfer to the seller all or part of the proceeds the acquirer subsequently receives from the realisation of a contingent asset of the acquiree that existed at acquisition date.

The acquirer is required to analyse whether it is acting as an agent for the seller in relation to that particular contingent asset. If so, the obligation, and the realisation of the contingent asset, must be accounted for separately from the business combination.

However, if the acquirer is not acting as an agent for the seller, the question arises as to how the acquirer is required to account for such an obligation. IFRS 3 does not provide specific guidance in that respect.

IFRS 3 defines a contingent consideration as “an obligation of the **acquirer** to transfer additional assets ... to the former owners of an **acquiree** as part of the exchange for control of the acquiree if specified future events occur or conditions are met”. [IFRS 3 Appendix A]. Future realisation of the contingent asset therefore could be treated as a specified future event giving rise to the contingency. Under this ‘contingent consideration liability’ approach, at the acquisition date, an acquirer recognises a contingent consideration liability measured at its fair value at that date (see section 7.1 below).

However, since IFRS 3 prohibits the recognition of a contingent asset acquired in a business combination, there seems to be an accounting anomaly when the ‘contingent consideration liability’ approach is applied, as such application of IFRS 3 would lead to recognition of an obligation that economically does not exist at the acquisition date, because the respective future outflow of economic resources will only occur when the referenced contingent asset is realised, and a corresponding inflow of economic resources occurs. As result, the amount of goodwill would be initially overstated with subsequent recognition of the gain in a post-combination profit or loss, not containing any economic substance, since it was agreed by the seller and the acquirer in advance that all economic benefits or losses associated with the realization of the particular contingent asset would be transferred to the seller. Such ‘artificial’ gain would be recognised subsequently irrespective of whether or not the related contingent asset is subsequently recognised, or it expires.

The alternative approach that allows elimination of such a recognition and measurement anomaly, assumes that the agreement effectively indemnifies the acquirer from transfer of economic resources if a particular contingent asset acquired in a business combination does not realise subsequently (hereinafter - ‘reverse indemnification liability’ approach). The ‘reverse indemnification liability’ approach is based on application by analogy of the indemnification asset guidance in IFRS 3, which was introduced by the IASB to avoid a similar anomaly when it revised IFRS 3 in 2008. In the Basis for Conclusions to IFRS 3, the IASB clarifies that under the indemnification asset guidance, the acquirer does not apply the recognition principle in determining whether or when to recognise an indemnification asset. Instead, the acquirer recognises the asset when it recognises the related liability. [IFRS 3.BC303]. Accordingly, under the ‘reverse indemnification liability’ approach, no liability is recognised until the related asset is recognised, that is, when its realisation is virtually certain.

How we see it

We believe that accounting for such obligation by using the ‘reverse indemnification liability’ approach would better reflect the substance of the agreement. The application of the ‘reverse indemnification liability’ approach is illustrated in Illustration 5-4 below.

Illustration 5-4: Reverse indemnification liability

Entity A acquires Entity B from Seller C for a cash consideration. The net assets of Entity B include a contingent asset related to a court case, which, per IFRS 3, is not recognised by the acquirer as part of the net assets acquired. Entity A and Seller C agreed that, in the event the contingent asset is subsequently realised, the related cash received is transferred to Seller C. Assume that Entity A is not identified in this case as an agent that collects and transfers the contingent asset on behalf of Seller C.

Based on the fact that there is a direct link between the obligation of the entity to transfer certain amount of consideration to Seller C and realisation of the particular contingent asset not recognised at the acquisition date, Entity A treats that obligation as ‘reverse indemnification liability’. Accordingly, no liability is recognised at the acquisition date. Entity A will recognise the liability in the post-combination periods, only if the related contingent asset is realised.

5.6.5 Reacquired rights

Reacquired rights (see section 5.5.3 above) are valued on the basis of the remaining contractual term of the related contract, regardless of whether market participants would consider potential contractual renewals when measuring their fair value. [IFRS 3.29].

If the terms of the contract giving rise to the reacquired right are favourable or unfavourable relative to current market transactions for the same or similar items, this is accounted for as the settlement of a pre-existing relationship and the acquirer has to recognise a settlement gain or loss. [IFRS 3.B36]. Guidance on the measurement of any settlement gain or loss is discussed in section 11.1 below. An example of accounting for the settlement gain or loss on the acquisition of reacquired rights is illustrated in Illustration 11-5 in section 11.1 below.

After acquisition, the intangible asset is amortised over the remaining contractual period of the contract, without including any renewal periods. [IFRS 3.55, IFRS 3.BC308]. As the reacquired right is no longer a contract with a third party it might be thought that the acquirer could assume indefinite renewals of its contractual term, effectively making the reacquired right an intangible asset with an indefinite life. However, the IASB considers that a right reacquired from an acquiree has, in substance, a finite life. [IFRS 3.BC308].

If the acquirer subsequently sells a reacquired right to a third party, the carrying amount of the intangible asset is included in determining the gain or loss on the sale. [IFRS 3.55, IFRS 3.BC310].

5.6.6 Assets held for sale

Non-current assets or disposal groups classified as held for sale at the acquisition date in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* are measured at fair value less costs to sell (see Chapter 5). [IFRS 3.31]. This avoids the need to recognise a loss for the selling costs immediately after a business combination (a so-called 'day 2' loss).

5.6.7 Share-based payment transactions

Liabilities or equity instruments related to the acquiree's share-based payments are measured in accordance with IFRS 2 (referred to as the 'market-based measure'), rather than at fair value, as are replacement schemes where the acquirer replaces the acquiree's share-based payments with its own. [IFRS 3.30, IFRS 13.6]. The measurement rules of IFRS 2 are not based on the fair value of the award at a particular date; measuring share-based payment awards at their acquisition-date fair values would cause difficulties with the subsequent accounting in accordance with IFRS 2. [IFRS 3.BC311].

Additional guidance given in IFRS 3 for accounting for the replacement of share-based payment awards (i.e., vested or unvested share-based payment transactions) in a business combination is discussed in sections 7.2 and 11.2 below and in Chapter 30. Any equity-settled share-based payment transactions of the acquiree that the acquirer does not exchange for its own share-based payment transactions will result in a non-controlling interest in the acquiree being recognised, as discussed in section 8.4 below.

5.6.8 Leases in which the acquiree is the lessee

IFRS 3 requires the acquirer to measure the acquired lease liability as if the lease contract were a new lease at the acquisition date. That is, the acquirer applies IFRS 16's initial measurement provisions to the initial measurement of the lease liability, using the present value of the remaining lease payments at the acquisition date. The acquirer follows the requirements for determining the lease term, lease payments and discount rate as discussed in Chapter 24.

IFRS 3 also requires the acquirer to measure the right-of-use asset at an amount equal to the recognised liability, adjusted to reflect the favourable or unfavourable terms of the lease, relative to market terms. Because the off-market nature of the lease is captured in the right-of-use asset, the acquirer does not separately recognise an intangible asset or liability for favourable or unfavourable lease terms relative to market terms.

It might appear unclear as to how this guidance is applied to fully or partially prepaid leases acquired in a business combination. Assume, for example, that at the date of acquisition, the lessee had a fully prepaid lease. From the acquiree's perspective, the lease technically might be at market (i.e., prepayment reflects the market price for a prepaid lease), so theoretically, under IFRS 3 no assets or liabilities related to that lease will be recognised by the acquirer at the acquisition date. Nevertheless, the prepaid right to use obtained by the acquirer has a value. The question is whether such right is presented as a separate intangible asset or as an adjustment to the carrying value of the right-of-use asset.

How we see it

We believe that from the perspective of a market participant, an acquired fully or partially prepaid lease in a business combination is not 'at market' since the acquirer obtains the right to use the underlying asset without assuming an obligation to pay the market price for that right. Therefore, the fair value of such right is considered in determining any off-market adjustment to the right-of-use asset at the acquisition date.

Illustration 5-5: Fully prepaid leases acquired in a business combination

Entity A acquires a 100% interest in Entity B for cash. At the acquisition date, Entity B recognised in its statement of financial position a right-of-use asset equal to the unamortised prepayment for the fully prepaid lease for the remaining five years of the lease term; an amount of CU120.

If Entity B were to enter the new prepaid lease for the remaining five years at the date of acquisition it would have to pay CU110 in advance for the whole period of the lease. The difference between the market price of the new prepaid lease of CU110 and the assumed contractual obligation for future lease payments of nil represents the favourable terms of the lease from the perspective of the acquirer.

Consequently, at the date of acquisition, Entity A recognises a right-of-use asset of CU110 and does not recognise any lease liability.

Under IFRS 3, the acquirer is not required to recognise right-of-use assets and lease liabilities for leases with lease terms which end within 12 months of the acquisition date and leases for low-value assets acquired in a business combination. As indicated in the Basis for Conclusions for IFRS 16, the IASB considered whether to require an acquirer to recognise assets and liabilities relating to off-market terms for short-term leases and leases of low-value assets. However, the IASB observed that the effect of off-market terms would rarely be material for short-term leases and leases of low-value assets and so decided not to require this. [IFRS 16.BC298].

5.6.9 Insurance contracts within the scope of IFRS 17

IFRS 17 introduces a new exception to measurement principles in IFRS 3. Under IFRS 3, as amended by IFRS 17, the acquirer in a business combination measures a group of contracts within the scope of IFRS 17 as a liability or asset in accordance with IFRS 17.39 and IFRS 17.B93 to B95, at the acquisition date.¹² For further discussion see Chapter 51.

12 IFRS 17 *Insurance Contracts*, Appendix D Amendments to other IFRS Standards, IFRS 3 *Business Combinations*, May 2017.

6 Recognising and measuring goodwill or a gain from a bargain purchase

Extract from IFRS 3

- 32 The acquirer shall recognise goodwill as of the acquisition date measured as the excess of (a) over (b) below:
- (a) the aggregate of:
 - (i) the consideration transferred measured in accordance with this IFRS, which generally requires acquisition-date fair value (see paragraph 37);
 - (ii) the amount of any non-controlling interest in the acquiree measured in accordance with this IFRS; and
 - (iii) in a business combination achieved in stages (see paragraphs 41 and 42), the acquisition-date fair value of the acquirer's previously held equity interest in the acquiree.
 - (b) the net of the acquisition-date amounts of the identifiable assets acquired and the liabilities assumed measured in accordance with this IFRS.
- 33 In a business combination in which the acquirer and the acquiree (or its former owners) exchange only equity interests, the acquisition-date fair value of the acquiree's equity interests may be more reliably measurable than the acquisition-date fair value of the acquirer's equity interests. If so, the acquirer shall determine the amount of goodwill by using the acquisition-date fair value of the acquiree's equity interests instead of the acquisition-date fair value of the equity interests transferred. To determine the amount of goodwill in a business combination in which no consideration is transferred, the acquirer shall use the acquisition-date fair value of the acquirer's interest in the acquiree in place of the acquisition-date fair value of the consideration transferred (paragraph 32(a)(i)). Paragraphs B46-B49 provide related application guidance.

[IFRS 3.32, IFRS 3.33].

The final step in applying the acquisition method is recognising and measuring goodwill or a gain from a bargain purchase.

IFRS 3 defines 'goodwill' in terms of its nature, rather than in terms of its measurement. It is defined as "An asset representing the future economic benefits arising from other assets acquired in a **business combination** that are not individually identified and separately recognised." [IFRS 3 Appendix A].

However, having concluded that the direct measurement of goodwill is not possible, the standard requires that goodwill is measured as a residual. [IFRS 3.BC328].

Goodwill at the acquisition date is computed as the excess of (a) over (b) below:

- (a) The aggregate of:
 - (i) The consideration transferred (generally measured at acquisition-date fair value)
 - (ii) The amount of any non-controlling interest in the acquiree
 And
 - (iii) The acquisition-date fair value of the acquirer's previously held equity interest in the acquiree
- (b) The net of the acquisition-date fair values (or other amounts recognised in accordance with the requirements of the standard) of the identifiable assets acquired and the liabilities assumed [IFRS 3.32]

Having concluded that goodwill is measured as a residual, the IASB, in deliberating IFRS 3, considered the following two components to comprise 'core goodwill':

- The fair value of the going concern element of the acquiree's existing business. This represents the ability of the established business to earn a higher rate of return on an assembled collection of net assets than would be expected if those net assets had to be acquired separately. The value stems from the synergies of the net assets of the business, as well as from other benefits, such as factors related to market imperfections, including the ability to earn monopoly profits and barriers to market entry (by potential competitors, whether through legal restrictions or costs of entry).
- The fair value of the expected synergies and other benefits from combining the acquirer's and acquiree's net assets and businesses. These are unique to each combination, and different combinations would produce different synergies and, hence, different values. [IFRS 3.BC313, IFRS 3.BC316].

However, in practice the amount of goodwill recognised in a business combination will probably not be limited to 'core goodwill'. Items that do not qualify for separate recognition (see section 5.5.4 above) and items that are not measured at fair value, e.g., deferred tax assets and liabilities, will also affect the amount of goodwill recognised (see section 5.6.2 above).

Even though goodwill is measured as a residual, after identifying and measuring all the items in (a) and (b), the acquirer should have an understanding of the factors that make up the goodwill recognised. IFRS 3 requires the disclosure of qualitative description of those factors (see section 16.1.1 below).

Where (b) exceeds (a), IFRS 3 regards this as giving rise to a gain on a bargain purchase. [IFRS 3.34]. Bargain purchase transactions are discussed further in section 10 below.

The measurement of (b) has been discussed in section 5 above. The items included within (a) are discussed in sections 7, 8 and 9 below.

6.1 Subsequent accounting for goodwill

The main issue relating to the goodwill acquired in a business combination is how it is subsequently accounted for. The requirements of IFRS 3 in this respect are straightforward; the acquirer measures goodwill acquired in a business combination at the amount recognised at the acquisition date less any accumulated impairment losses. [IFRS 3.B63].

Goodwill is not amortised. Instead, the acquirer tests it for impairment annually, or more frequently if events or changes in circumstances indicate that it might be impaired, in accordance with IAS 36. The requirements of IAS 36 relating specifically to the impairment of goodwill are dealt with in Chapter 21, including specific considerations related to testing for impairment of goodwill acquired during the current reporting period, if at the end of that reporting period, the initial accounting for a business combination is incomplete (see Chapter 21).

In March 2024, the IASB issued an Exposure Draft *Business Combinations-Disclosures, Goodwill and Impairment* (proposed amendments to IFRS 3 and IAS 36). As part of the project, the IASB considered reintroducing amortisation of goodwill. On balance, considering extensive evidence collected, the IASB concluded it had no compelling case to justify reintroducing amortisation of goodwill and so decided to retain the impairment only model for the subsequent accounting for goodwill.

7 Consideration transferred

Extract from IFRS 3

- 37 The consideration transferred in a business combination shall be measured at fair value, which shall be calculated as the sum of the acquisition-date fair values of the assets transferred by the acquirer, the liabilities incurred by the acquirer to former owners of the acquiree and the equity interests issued by the acquirer. (However, any portion of the acquirer's share-based payment awards exchanged for awards held by the acquiree's employees that is included in consideration transferred in the business combination shall be measured in accordance with paragraph 30 rather than at fair value.) Examples of potential forms of consideration include cash, other assets, a business or a subsidiary of the acquirer, *contingent consideration*, ordinary or preference equity instruments, options, warrants and member interests of *mutual entities*.
Contingent consideration
- 39 The consideration the acquirer transfers in exchange for the acquiree includes any asset or liability resulting from a contingent consideration arrangement (see paragraph 37). The acquirer shall recognise the acquisition-date fair value of contingent consideration as part of the consideration transferred in exchange for the acquiree.
- 40 The acquirer shall classify an obligation to pay contingent consideration that meets the definition of a financial instrument as a financial liability or as equity on the basis of the definitions of an equity instrument and a financial liability in paragraph 11 of IAS 32 *Financial Instruments: Presentation*. The acquirer shall classify as an asset a right to the return of previously transferred consideration if specified conditions are met. Paragraph 58 provides guidance on the subsequent accounting for contingent consideration.

[IFRS 3.37, IFRS 3.39, IFRS 3.40].

The consideration transferred in a business combination comprises the sum of the acquisition-date fair values of assets transferred by the acquirer, liabilities incurred by the acquirer to the former owners of the acquiree and equity interests issued by the acquirer. The consideration may take many forms, including cash, other assets, a business or subsidiary of the acquirer, and securities of the acquirer (e.g., ordinary shares, preferred shares, options, warrants, and debt instruments). The consideration transferred also includes the fair value of any contingent consideration and may also include some or all of any acquirer's share-based payment awards exchanged for awards held by the acquiree's employees measured in accordance with IFRS 2 rather than at fair value. These are discussed further in sections 7.1 and 7.2 below. [IFRS 3.37].

The consideration transferred could include assets or liabilities whose carrying amounts differ from their fair values. These are remeasured to fair value at the acquisition date and any resulting gains or losses are recognised in profit or loss. If the transferred assets or liabilities remain within the combined entity after the acquisition date because they were transferred to the acquiree rather than to its former owners, the acquirer retains control of them. They are retained at their existing carrying amounts and no gain or loss is recognised. [IFRS 3.38].

When the assets given as consideration or the liabilities incurred by the acquirer are financial assets or financial liabilities as defined by IAS 32 (see Chapter 43), the guidance in IFRS 13 on determining the fair values of such financial instruments is followed (see Chapter 15).

These assets and liabilities might be denominated in a foreign currency, in which case the entity may have hedged the foreign exchange risk. IFRS 9 (or IAS 39, if an entity when it first applied IFRS 9 chose as its accounting policy to continue to apply the hedge requirements in IAS 39 instead of the hedge requirements in IFRS 9) allows an entity to apply hedge accounting when hedging the movements in foreign currency exchange rates for a firm commitment to acquire a business in a business combination. [IFRS 9.B6.3.1, IAS 39.AG98].

Frequently asked questions

Question 7-1: Would gains or losses arising from hedging the movements in foreign currency exchange rates, under IAS 39 (or IFRS 9), for a firm commitment to acquire a business result in an adjustment to the amount that is recognised for goodwill?

In January 2011, the IFRS IC considered the treatment of gains or losses arising from hedging this risk under IAS 39 and in particular whether they would result in an adjustment to the amount that is recognised for goodwill. When a basis adjustment is made to a hedged item, it is done after other applicable IFRS accounting standards have been applied. Accordingly, the IFRS IC noted that “such a basis adjustment is made to goodwill (or the gain from a bargain purchase) after the application of the guidance in IFRS 3”.¹³ That conclusion applies under IFRS 9 as well.

When equity interests are issued by the acquirer as consideration, the guidance in IFRS 13 on determining the fair value of an entity’s own equity is followed (see Chapter 15). [IFRS 13.34]. IFRS 3 clarifies that they are measured at their fair values at the acquisition date, rather than at an earlier agreement date (or on the basis of the market price of the securities for a short period before or after that date). [IFRS 3.BC337-BC342].

Although a valid conceptual argument could be made for the use of the agreement date, it was observed that the parties to a business combination are likely to take into account expected changes between the agreement date and the acquisition date in the fair value of the acquirer and the market price of the acquirer’s securities issued as consideration. While an acquirer and a target entity both consider the fair value of the target on the agreement date in negotiating the amount of consideration to be paid, the distorting effects are mitigated if acquirers and targets generally consider their best estimates of the fair values on the acquisition dates. In addition, measuring the equity securities on the acquisition date avoids the complexities of dealing with situations in which the number of shares or other consideration transferred can change between the agreement date and the acquisition date. [IFRS 3.BC342].

Measuring the fair value of an entity’s own equity issued on or close to the agreement date would not result in a consistent measure of the consideration transferred. The fair values of all other forms of consideration transferred are measured at the acquisition date as are the fair values of the assets acquired and liabilities assumed. [IFRS 3.BC338-BC342].

The acquisition-date fair value of the acquiree’s equity interests may be more reliably measurable than that of the acquirer’s equity interests. In that case, IFRS 3 requires goodwill to be calculated using the fair value of the acquiree’s equity interests rather than the fair value of the equity interests transferred. [IFRS 3.33].

IFRS 3 gives additional guidance if no consideration is transferred by the acquirer. This is discussed in section 7.4 below.

7.1 Contingent consideration

Contingent consideration generally arises where the acquirer agrees to transfer additional consideration to the former owners of the acquired business after the acquisition date if certain specified events occur or conditions are met in the future, although it can also result in the return of previously transferred consideration. [IFRS 3 Appendix A].

When entering into a business combination, the parties to the arrangement don’t always agree on the exact value of the business, particularly if there are uncertainties as to the success or worth of particular assets or the outcome of uncertain events. They therefore often agree to an interim value for the purposes of completing the deal, with additional future payments to be made by the acquirer. That is, they share the economic risks relating to the uncertainties about the future of the business. These future payments may be in cash or shares or other assets and may be contingent upon the achievement of specified events, and/or may be linked to future financial performance over a specified period of time. Examples of such additional payments contingent on future events include:

- Earnings above an agreed target over an agreed period
- Components of earnings (e.g., revenue) above an agreed target over an agreed period
- Approval of a patent/licence
- Successful completion of specified contract negotiations
- Cash flows arising from specified assets over an agreed period
- Remaining an employee of the entity for an agreed period of time

¹³ [IFRIC Update](#), January 2011, available on the IFRS Foundation’s website.

An arrangement can have a combination of any of the above factors.

How we see it

A business combination may include an agreement under which the acquirer is required to transfer to the seller all or part of the proceeds the acquirer eventually receives from the realisation of a contingent asset that existed at acquisition date. We believe that accounting for such an obligation as part of the contingent consideration does not necessarily reflect the substance of the agreement; rather it would be better depicted by applying 'reverse indemnification liability' accounting. (See section 5.6.4.A above).

While additional payments contingent on future events may be negotiated as part of gaining control of another entity, the accounting may not necessarily always reflect this, particularly if these payments are made to those who remain as employees of the business after it is acquired. In the latter case, depending on the exact terms of the arrangement, the payment made may be accounted for as remuneration for services provided subsequent to the acquisition, rather than as part of the consideration paid for the business. These payments are also often referred to as 'earn-outs'. The guidance in IFRS 3 for determining whether the arrangements involving employees are accounted for as contingent consideration or remuneration is discussed further in section 11.2 below.

The IASB clarified in June 2009 that pre-existing contingent consideration from a prior business combination of an acquiree does not meet the definition of contingent consideration in the acquirer's business combination. It is one of the identifiable liabilities assumed in the subsequent acquisition.¹⁴

Usually, it makes no difference whether the pre-existing contingent consideration is treated as contingent consideration or as an identifiable liability, as they are both financial liabilities to be accounted for under IFRS 9. As discussed further below, they are initially recognised and measured at fair value at the date of acquisition, with any subsequent remeasurements recognised in profit or loss in accordance with IFRS 9.

7.1.1 Initial recognition and measurement

Contingent consideration is recognised at its fair value as part of the consideration transferred in exchange for the acquiree. [IFRS 3.39].

IFRS 13 has specific requirements with respect to measuring fair value for liabilities. An entity has to determine the price it would need to pay to transfer the liability to a market participant at the measurement date. An entity must assume that the market participant would fulfil the obligation (i.e., it would not be settled or extinguished). [IFRS 13.34(a)]. The specific requirements are discussed in detail in Chapter 15. In light of these requirements, it is likely that the fair value of contingent consideration will need to be measured "from the perspective of a market participant that holds the identical item as an asset at the measurement date". [IFRS 13.37]. That is, the entity measures the fair value of the liability by reference to the fair value of the corresponding asset held by the counterparty.

The initial measurement of the fair value of contingent consideration is based on an assessment of the facts and circumstances that exist at the acquisition date. Although the fair value of some contingent payments may be difficult to measure, it is argued that "to delay recognition of, or otherwise ignore, assets or liabilities that are difficult to measure would cause financial reporting to be incomplete and thus diminish its usefulness in making economic decisions". [IFRS 3.BC347]. Information used in negotiations between buyer and seller will often be helpful in estimating the fair value of the contingent consideration. [IFRS 3.BC348].

An estimate of zero for the fair value of contingent consideration would not be reliable. [IFRS 3.BC349]. Equally, it would be inappropriate to assume an estimate of 100% for the acquisition-date fair value of the obligation to make the payments under the contingent consideration arrangement.

The fair value of contingent consideration will be measured in accordance with IFRS 13 which does not limit the valuation techniques an entity can use.

¹⁴ [IASB Staff Paper 13C](#), Project: *Annual Improvements Process*, Topic: *Contingent consideration of an Acquiree ("pre-existing contingent consideration")*, IASB Meeting, June 2009, page 3. Available on the IFRS Foundation's website.

In most instances, contingent consideration will be valued using an income approach, typically using either a probability-weighted discounted cash flow method (otherwise referred to as a scenario-based method or SBM) or an option pricing method (OPM) to capture the uncertainty in the future payments. These methodologies are discussed in detail in the Appraisal Foundation's *Valuations in Financial Reporting Valuation Advisory 4: Valuation of Contingent Consideration* (Contingent Consideration Advisory)¹⁵ that was issued in February 2019. The Contingent Consideration Advisory provides best practices on the methodology to use based on the nature of the contingent pay-out and the application of each methodology. Although the Contingent Consideration Advisory is not authoritative GAAP, there is little other specific guidance on how to determine the fair value of contingent consideration. We understand that the valuation techniques described in the Contingent Consideration Advisory are generally recognised by the valuation community as acceptable methods for measuring the fair value of contingent consideration. The application of the probability-weighted discounted cash flow method is shown in the following Illustration.

Illustration 7-1: Contingent consideration - applying the probability-weighted discounted cash flow method to determine fair value

Entity G acquires Entity H and as part of the arrangement, Entity G agrees to pay an additional amount of consideration to the seller in the future, as follows:

- If the 12-months' earnings in two years' time (also referred to as the trailing 12 months) are CU1 million or less - nothing will be paid.
- If the trailing 12 months' earnings in two years' time are between CU1 million and CU2 million - 2 × 12-months' earnings will be paid.
- If the trailing 12 months' earnings in two years' time are greater than CU2 million - 3 × 12-months' earnings will be paid.

At the date of acquisition, the possible twelve-month earnings of Entity H in two years' time are determined to be, as follows:

- CU0.8 million - 40%
- CU1.5 million - 40%
- CU2.5 million - 20%

The probability-weighted pay-out is:

$$(40\% \times \text{CU}0) + (40\% \times \text{CU}1.5 \text{ million} \times 2) + (20\% \times \text{CU}2.5 \text{ million} \times 3) = \text{CU}2.7 \text{ million}$$

This CU2.7 million is then discounted at the date of acquisition to determine its fair value.

Since the liability must be measured at fair value, selecting the discount rate to be applied also requires significant judgement to assess the underlying risks associated with the outcomes and the risks of payment. The entity's own credit risk will need to be taken into account when measuring fair value, which could include adjusting the discount rate. In addition, IFRS 13 indicates that in those situations where the identical item is held by another party as an asset, the fair value of the liability is determined from the perspective of a market participant that holds this asset. This guidance applies even if the corresponding asset is not traded or recognised for financial reporting purposes. As such, when determining the fair value of a contingent consideration liability, entities consider market participants' assumptions related to the item when held as an asset. The IASB and the FASB indicated that "in an efficient market, the price of a liability held by another party as an asset must equal the price for the corresponding asset. If those prices differed, the market participant transferee (i.e., the party taking on the obligation) would be able to earn a profit by financing the purchase of the asset with the proceeds received by taking on the liability. In such cases, the price for the liability and the price for the asset would adjust until the arbitrage opportunity was eliminated." [IFRS 13.BC89].

IFRS 3 also recognises that, in some situations, the agreement may give the acquirer the right to the return of previously transferred consideration if specified future events occur or conditions are met. Such a right falls within the definition of 'contingent consideration' and is accounted for as such by recognising an asset at its acquisition-date fair value. [IFRS 3.39, IFRS 3.40, IFRS 3 Appendix A].

15 *Valuations in Financial Reporting Valuation Advisory 4: Valuation of Contingent Consideration*, The Appraisal Foundation, February 2019, available on The Appraisal Foundation's website, www.appraisalfoundation.org (accessed 30 September 2023).

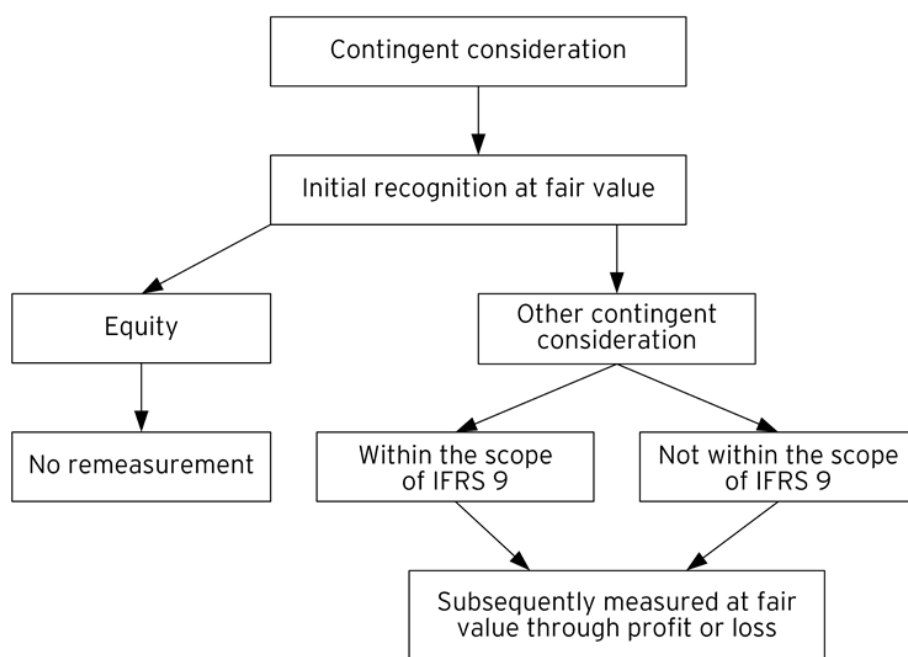

7.1.2 Classification of a contingent consideration obligation

Most contingent consideration obligations are financial instruments, and many are derivative instruments. Some arrangements oblige the acquirer to deliver equity securities if specified future events occur, rather than, say, making additional cash payments.

The classification of a contingent consideration obligation that meets the definition of a financial instrument as either a financial liability or equity is based on the definitions in IAS 32 (see Chapter 43). [IFRS 3.40].

These requirements, and the impact of subsequent measurement and accounting (which is discussed further in section 7.1.3 below), are summarised in the diagram below.

Classification of contingent consideration

Contingent consideration will often meet the definition of a financial liability. This includes those arrangements where the acquirer is obliged to deliver equity securities because IAS 32 defines a financial liability to include “a contract that will or may be settled in the entity’s own equity instruments” and is:

- “A non-derivative for which the entity is or may be obliged to deliver a variable number of the entity’s own equity instruments”
- Or
- “A derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity’s own equity instruments” [IAS 32.11]

Most contingent consideration arrangements that are settled by delivering equity shares will involve a variable number of shares, e.g., an arrangement obliges the acquirer to issue between zero and 1 million additional equity shares on a sliding scale based on the acquiree’s post-combination earnings. This arrangement will be classified as a financial liability. Only in situations where the arrangement involves issuing, say, zero or 1 million shares depending on a specified event or target being achieved would the arrangement be classified as equity.

How we see it

When the arrangement involves a number of different discrete targets that are independent of one another, which if met will result in additional equity shares being issued as further consideration, we believe that the classification of the obligation to provide such financial instruments in respect of each target is assessed separately in determining whether equity classification is appropriate.

However, if the targets are interdependent, the classification of the obligation to provide such additional equity shares is based on the overall arrangement, and as a variable number of shares is likely to be delivered, the arrangement would be classified as a financial liability.

Illustration 7-2: Share-settled contingent consideration - financial liability or equity?

Entity P acquires a 100% interest in Entity S on 1 January 20X1. As part of the consideration arrangements, additional consideration will be payable based on Entity S meeting certain profit targets over the 3 years ended 31 December 20X3, as follows:

Profit target	Additional consideration
Year ended 31 December 20X1 - CU1m+	100,000 shares
Year ended 31 December 20X2 - CU1.25m+	150,000 shares
Year ended 31 December 20X3 - CU1.5m+	200,000 shares

Each target is non-cumulative. If the target for a particular year is met, the additional consideration will be payable, irrespective of whether the targets for the other years are met or not. If a target for a particular year is not met, no shares will be issued in respect of that year.

In this scenario, as each of the targets are independent of one another, this arrangement can be regarded as being three distinct contingent consideration arrangements that are assessed separately. As either zero or the requisite number of shares will be issued if each target is met, the obligation in respect of each arrangement is classified as equity.

If the targets were dependent on each other, for example, if they were based on an average for the 3-year period, a specified percentage increase on the previous year's profits, or the later targets were forfeited if the earlier targets were not met, the classification would be assessed on the overall arrangement. As this would mean that a variable number of shares may be delivered, the obligation under such an arrangement would be classified as a financial liability.

For those contingent consideration arrangements where the agreement gives the acquirer the right to the return of previously transferred consideration if specified future events occur or conditions are met, IFRS 3 requires that such a right is classified as an asset. [IFRS 3.40].

7.1.3 Subsequent measurement and accounting

The IASB has concluded that subsequent changes in the fair value of a contingent consideration obligation generally do not affect the fair value of the consideration transferred for the acquiree. Subsequent changes in value relate to post-combination events and changes in circumstances of the combined entity and do not affect the measurement of the consideration transferred or goodwill. [IFRS 3.BC357].

Accordingly, IFRS 3 requires that changes in the fair value of contingent consideration resulting from events after the acquisition date such as meeting an earnings target, reaching a specified share price, or meeting a milestone on a research and development project are accounted for as follows:

- Contingent consideration classified as equity is not subsequently remeasured (consistent with the accounting for equity instruments generally), and its subsequent settlement is accounted for within equity.
- Other contingent consideration that either is within the scope of IFRS 9 or within the scope of other standards (e.g., a consideration payable that is a non-financial liability) is remeasured at fair value at each reporting date and changes in fair value are recognised in profit or loss. [IFRS 3.58].

The IASB also decided that any gain or loss resulting from changes in the fair value of a contingent consideration arrangement classified as a liability, that are recognised in profit or loss will include changes in own credit risk. [IFRS 3.BC360].

If the changes are the result of additional information about the facts and circumstances that existed at the acquisition date, they are measurement period adjustments and are accounted for as discussed in section 12 below. [IFRS 3.58].

Classification of fair value remeasurements of a contingent consideration liability under the requirements of IFRS 18 *Presentation and Disclosure in Financial Statements* is discussed in Chapter 4.

7.2 Replacement share-based payment awards

Acquirers often exchange share-based payment awards (i.e., replacement awards) for awards held by employees of the acquiree. These exchanges frequently occur because the acquirer wants to avoid the effect of having non-controlling interests in the acquiree, the acquirer's shares are often more liquid than the shares of the acquired business after the acquisition, and/or to motivate former employees of the acquiree toward the overall performance of the combined, post-acquisition business.

If the acquirer replaces any acquiree awards, the consideration transferred will include some or all of any replacement share-based payment awards. However, arrangements that remunerate employees or former owners for future services are excluded from consideration transferred (see section 11.2 below).

Replacement awards are modifications of share-based payment awards in accordance with IFRS 2. [IFRS 3.B56-B62]. Discussion of this guidance, including illustrative examples is dealt with in Chapter 30.

The acquirer is required to include some or all replacement awards (i.e., vested or unvested share-based payment transactions) as part of the consideration transferred, irrespective of whether it is obliged to replace acquiree's awards or does so voluntarily. There is only one situation in which none of the market-based measure of the awards is included in the consideration transferred: if acquiree awards would expire as a consequence of the business combination and the acquirer replaces those when it was not obliged to do so. In that case, all of the market-based measure of the awards is recognised as remuneration cost in the post-combination financial statements. [IFRS 3.B56].

Any equity-settled share-based payment transactions of the acquiree that the acquirer does not exchange for its own share-based payment transactions will result in non-controlling interest in the acquiree being recognised and measured at their market-based measure as discussed in section 8.4 below. [IFRS 3.B62A, IFRS 3.B62B].

7.3 Acquisition-related costs

IFRS 3 requires acquisition-related costs to be accounted for as expenses in the periods in which the costs are incurred and the related services are received with the exception of the costs of registering and issuing debt and equity securities that are recognised in accordance with IAS 32 and IFRS 9, i.e., as a reduction of the proceeds of the debt or equity securities issued. [IFRS 3.53]. In addition, IFRS 3 requires that a transaction that reimburses the acquiree or its former owners for paying the acquirer's acquisition-related costs is not included in applying the acquisition method (see section 11.3 below). This is in order to mitigate concerns about potential abuse, e.g., a buyer might ask a seller to make payments to third parties on its behalf, but the consideration paid for the business is sufficient to reimburse the seller for making such payments. [IFRS 3.51, IFRS 3.52, IFRS 3.53, IFRS 3.BC370].

An acquirer's costs incurred in connection with a business combination include:

- Direct costs of the transaction, such as costs for the services of lawyers, investment bankers, accountants, and other third parties and issuance costs of debt or equity instruments used to effect the business combination
- Indirect costs of the transaction, such as recurring internal costs, e.g., the cost of maintaining an acquisition department

Acquisition-related costs, whether for services performed by external parties or internal staff of the acquirer, are not part of the fair value exchange between the buyer and seller for the acquired business. Accordingly, they are not part of the consideration transferred for the acquiree. Rather, they are separate transactions in which the buyer makes payments in exchange for the services received, to be accounted for separately. It might be necessary to recognise expenses and a liability for such costs before the deal is closed, if recognition criteria for a liability is met at the earlier date, even if fees are payable only upon successful completion of the business combination.

7.4 Business combinations achieved without the transfer of consideration

An acquirer sometimes obtains control of an acquiree without transferring consideration. The standard emphasises that the acquisition method applies to a business combination achieved without the transfer of consideration. [IFRS 3.43]. IFRS 3 indicates that such circumstances include:

- (a) The acquiree repurchases a sufficient number of its own shares for an existing investor (the acquirer) to obtain control.
- (b) Minority veto rights lapse that previously kept the acquirer from controlling an acquiree in which the acquirer held the majority voting rights.
- (c) The acquirer and the acquiree agree to combine their businesses by contract alone. In that case, the acquirer transfers no consideration in exchange for control of an acquiree and holds no equity interests in the acquiree, either on the acquisition date or previously. Examples of business combinations achieved by contract alone include bringing two businesses together in a stapling arrangement or forming a dual listed corporation. [IFRS 3.43].

In computing the amount of goodwill in a business combination, IFRS 3 normally requires the acquirer to aggregate:

- The consideration transferred
 - The amount of any non-controlling interest in the acquiree
- And
- The acquisition-date fair value of the acquirer's previously held equity interest in the acquiree [IFRS 3.32]

However, when the consideration transferred is nil, IFRS 3 requires the entity to use the acquisition-date fair value of the acquirer's interest in the acquiree instead. [IFRS 3.33, IFRS 3.B46].

How we see it

In the first two circumstances described in (a) and (b) above, the acquirer has a previously held equity interest in the acquiree. To also include the acquisition-date fair value of the previously-held interest would result in double-counting of the value of the acquirer's interest in the acquiree. The acquisition-date fair value of the acquirer's interest in the acquiree must only be included once in the computation of goodwill. These two circumstances would also be examples of business combinations achieved in stages (see section 9 below).

The fair value of the acquirer's interest in the acquiree is measured in accordance with IFRS 13.

7.4.1 Business combinations by contract alone

In a business combination achieved by contract alone ((c) above), IFRS 3 requires that the acquirer attributes to the owners of the acquiree the amount of the acquiree's net assets recognised under the standard (see section 2.1 above). In other words, the equity interests in the acquiree held by parties other than the acquirer are a non-controlling interest in the acquirer's consolidated financial statements, even if it results in all of the equity interests in the acquiree being attributed to the non-controlling interest.

[IFRS 3.44].

This might suggest that no goodwill is recognised in a business combination achieved by contract alone as the second item in part (a) will be equal to part (b) of the goodwill computation set out in section 6 above.

How we see it

We believe that the requirement to attribute the equity interests in the acquiree to the non-controlling interest discussed above is emphasising the presentation within equity in the consolidated financial statements. Thus, when the option of measuring non-controlling interests in an acquiree at its acquisition-date fair value is chosen, goodwill is recognised. If the option of measuring the non-controlling interest at its proportionate share of the value of net identifiable assets acquired is chosen, no goodwill is recognised (except to the extent any is recognised as a result of there being other equity instruments that are required to be measured at their acquisition-date fair value or other measurement basis required by IFRS accounting standards).

The options available for the measurement of the non-controlling interests at the date of acquisition are discussed in section 8 below.

7.5 Combinations involving mutual entities

Combinations involving mutual entities are within the scope of IFRS 3. A mutual entity is defined by IFRS 3 as "An entity, other than an investor-owned entity, that provides dividends, lower costs or other economic benefits directly to its **owners**, members or participants. For example, a mutual insurance company, a credit union and a co-operative entity are all mutual entities." [IFRS 3 Appendix A].

The standard notes that the fair value of the equity or member interests in the acquiree (or the fair value of the acquiree) may be more reliably measurable than the fair value of the member interests transferred by the acquirer. In that situation, the acquirer determines the amount of goodwill by using the acquisition-date fair value of the acquiree's equity interests as the equivalent to the consideration transferred in the goodwill computation set out in section 7.4 above, instead of the acquirer's equity interests transferred as consideration. [IFRS 3.B47].

IFRS 3 clarifies that the acquirer in a combination of mutual entities recognises the acquiree's net assets as a direct addition to capital or equity, not as an addition to retained earnings, which is consistent with the way other types of entity apply the acquisition method. [IFRS 3.B47].

IFRS 3 recognises that mutual entities, although similar in many ways to other businesses, have distinct characteristics that arise primarily because their members are both customers and owners. Members of mutual entities generally expect to receive benefits for their membership, often in the form of reduced fees charged for goods and services or patronage dividends. Patronage dividends are distributions paid to members (or investors) in mutual entities and the portion allocated to each member is often based on the amount of business the member did with the mutual entity during the year. [IFRS 3.B48]. The fair value of a mutual entity includes the assumptions that market participants would make about future member benefits. If, for example, a present value technique is used to measure the fair value of the mutual entity, the cash flow inputs will be based on the expected cash flows of the mutual entity, which are likely to reflect reductions for member benefits, such as reduced fees charged for goods and services. [IFRS 3.B49].

8 Recognising and measuring non-controlling interests

Extract from IFRS 3

- 19 For each business combination, the acquirer shall measure at the acquisition date components of non-controlling interests in the acquiree that are present ownership interests and entitle their holders to a proportionate share of the entity's net assets in the event of liquidation at either:
- (a) fair value; or
 - (b) the present ownership instruments' proportionate share in the recognised amounts of the acquiree's identifiable net assets.
- All other components of non-controlling interests shall be measured at their acquisition-date fair values, unless another measurement basis is required by IFRSs.

IFRS 3 requires any non-controlling interest in an acquiree to be recognised, [IFRS 3.10], but provides a choice of two measurement methods. This choice only applies to those components of non-controlling interests that are present ownership interests and entitle their holders to a proportionate share of the entity's net assets in the event of a liquidation ('qualifying non-controlling interests').

These measurement methods are:

- Option 1, to measure such components of non-controlling interests at acquisition-date fair value (consistent with the measurement principle for other components of the business combination)
- Option 2, to measure such components of non-controlling interests at their proportionate share of the value of net identifiable assets acquired (described in section 5.1 above)

This choice is not available for all other components of non-controlling interests. These are measured at their fair values, unless another measurement basis is required by IFRS accounting standards. [IFRS 3.19].

IFRS 3 defines non-controlling interest as "The equity in a subsidiary not attributable, directly or indirectly, to a parent". [IFRS 3 Appendix A]. This is the same as that in IFRS 10. As discussed in Chapter 8, this definition includes not only equity shares in the subsidiary held by other parties, but also other elements of 'equity' in the subsidiary. These could relate to, say, other equity instruments such as options or warrants, the equity element of convertible debt instruments, and the 'equity' related to share-based payment awards held by parties other than the parent.

The application to particular instruments is set out in the table below.

Instruments issued by the acquiree	Measurement required by IFRS 3
Ordinary shares	Proportionate share of net assets OR fair value
Preference shares entitled to a <i>pro rata</i> share of net assets upon liquidation	Proportionate share of net assets OR fair value
Preference shares <i>not</i> entitled to a <i>pro rata</i> share of net assets upon liquidation	Fair value
Equity component of convertible debt and other compound financial instruments [°]	Fair value
Share warrants [°]	Fair value
Options over own shares [°]	Fair value
Options under share-based payment transactions [°]	IFRS 2 'market-based measure'

[°] In practice, because these instruments are generally not entitled to a share of net assets as at the acquisition date, their proportionate share of net assets is nil.

An illustration of the consequences of applying these requirements is given in section 8.4 below.

The choice of method is made for each business combination on a transaction-by-transaction basis, rather than being a policy choice. Each option, combined with the accounting in IFRS 10 for changes in ownership interest of a subsidiary (see Chapter 8), could have a significant effect on the amount recognised for goodwill.

8.1 Measuring qualifying non-controlling interests at acquisition-date fair value

An acquirer will sometimes be able to measure the fair value of a non-controlling interest on the basis of a quoted price in an active market for the equity shares it does not hold. If a quoted price in an active market is unavailable, the acquirer will need to measure the fair value of the non-controlling interest by using other valuation techniques. [IFRS 3.B44].

The fair value of the acquirer's interest in the acquiree and the non-controlling interest on a per-share basis might differ. This generally would happen because the consideration transferred by the acquirer includes a control premium, or conversely, a discount for lack of control (also referred to as a non-controlling interest discount) is included in the per-share value of the non-controlling interest, if market participants would take into account such a premium or discount when pricing the non-controlling interest. [IFRS 3.B45]. In this case, it would not seem appropriate to extrapolate the fair value of an acquirer's interest (i.e., the amount that the acquirer paid per share) to determine the fair value of the non-controlling interests. If the acquiree's shares are quoted on an active market, IFRS 13 requires the fair value of the non-controlling interest to be determined using the quoted price of the shares at the acquisition date ('PxQ'). [IFRS 13.80].

8.2 Measuring qualifying non-controlling interests at the proportionate share in the recognised amount of the acquiree's identifiable net assets

Under this option, the non-controlling interest is measured at the proportionate share of the value of the identifiable assets acquired and liabilities assumed of the acquiree (see section 5.1 above). The result is that the amount recognised for goodwill is only the acquirer's share. However, if any part of the outstanding non-controlling interest is subsequently acquired, no additional goodwill is recorded as under IFRS 10 this is an equity transaction (see Chapter 8).

8.3 Implications of method chosen for measuring non-controlling interests

The following Illustration shows the impact of the two measurement options on measuring those components of qualifying non-controlling interests.

Illustration 8-1: Initial measurement of non-controlling interests in a business combination (1)

Entity B has 40% of its shares publicly traded on an exchange. Entity A purchases the 60% non-publicly traded shares in one transaction, paying CU630. Based on the trading price of the shares of Entity B at the date of gaining control, a value of CU400 is assigned to the 40% non-controlling interest, indicating that Entity A has paid a control premium of CU30. The fair value of Entity B's identifiable net assets is CU700. For the purposes of this Illustration, Entity B has no other instruments that would be regarded as non-controlling interests.

Option 1 - Non-controlling interest at fair value

Entity A accounts for the acquisition as follows:

Dr	Fair value of identifiable net assets acquired	CU700	
Dr	Goodwill	CU330	
Cr	Cash		CU630
Cr	Non-controlling interest in Entity B		CU400

Option 2 - Certain non-controlling interests are measured at proportionate share of identifiable net assets

Entity A accounts for the acquisition as follows:

Dr	Fair value of identifiable net assets acquired	CU700	
Dr	Goodwill	CU210	
Cr	Cash		CU630
Cr	Non-controlling interest in Entity B (CU700 × 40%)		CU280

The IASB noted that there are likely to be three main differences arising from measuring the non-controlling interest at its proportionate share of the acquiree's net identifiable assets, rather than at fair value. First, the amounts recognised in a business combination for the non-controlling interest and goodwill are likely to be lower (as illustrated in the above example).

Second, if a cash generating unit to which the goodwill has been allocated is subsequently impaired, any resulting impairment of goodwill recognised through income is likely to be lower than it would have been if the non-controlling interest had been measured at fair value. [IFRS 3.BC217]. Chapter 21 discusses testing goodwill for impairment in entities with non-controlling interests. This guidance includes considerations when an entity applies an allocation methodology that recognises the disproportionate sharing of the controlling and non-controlling interests in the goodwill book value, i.e., taking into account the acquirer's control premium, if any.

The third difference arises if the acquirer subsequently purchases some or all of the shares held by the non-controlling shareholders. Under IFRS 10, such a transaction is accounted for as an equity transaction (see Chapter 8). By acquiring the non-controlling interest, usually at fair value (unless there are some special circumstances surrounding the acquisition), the equity of the group is reduced by the non-controlling interest's share of any unrecognised changes in fair value of the net assets of the business, including goodwill. Measuring the non-controlling interest initially as a proportionate share of the acquiree's net identifiable assets, rather than at fair value, means that the reduction in the reported equity attributable to the acquirer is likely to be larger. [IFRS 3.BC218]. If in Illustration 8-1 above, Entity A were subsequently to acquire all of the non-controlling interest for, say, CU500, then assuming that there had been no changes in the carrying amounts for the net identifiable assets and the goodwill, the equity attributable to the parent, Entity A, would be reduced by CU220 (CU500 - CU280) if Option 2 (proportionate share of fair value of identifiable net assets) had been adopted. If Option 1 (full fair value) had been adopted, the reduction would only be CU100 (CU500 - CU400).

In Illustration 8-1 above, the acquiree had no other instruments that would be regarded as non-controlling interests. This will not always be the case. Non-controlling interests may include components of non-controlling interests that are present ownership interests and entitle their holders to a proportionate share of the entity's net assets in the event of a liquidation ('qualifying non-controlling interests') that might be measured at the date of acquisition either at their proportionate share of the value of net identifiable assets acquired or at their acquisition-date fair values and other components that must be measured at their acquisition-date fair value. IFRS 3 does not explicitly state how to measure 'qualifying non-controlling interests' in such cases.

How we see it

We believe that two alternative approaches to the determination of the 'qualifying non-controlling interests' when other non-controlling interests exist, are acceptable:

- The computation of the 'qualifying non-controlling interests' is based solely on the fair value of the identifiable net assets, i.e., no deduction is made in respect of the other component of non-controlling interest.
- Or
- In the computation of the 'qualifying non-controlling interests' the other components of non-controlling interests are deducted from the value of the identifiable net assets based on their acquisition-date fair value (or market-based measure) or based on their liquidation rights.

The impact of the measurement of such non-controlling interests on goodwill is discussed in Illustration 8-2 below.

Illustration 8-2: Initial measurement of non-controlling interests in a business combination (2)

Parent acquires 80% of the ordinary shares of Target, a private entity, for CU950 in cash. The total fair value of the equity instruments issued by Target is CU1,165 and the fair value of its identifiable net assets is CU850. The fair value of the 20% of the ordinary shares owned by non-controlling shareholders is CU190. In addition, the subsidiary has also written gross settled call options over its own shares with a fair value of CU25, which are considered equity instruments under IAS 32.

Option 1 - Non-controlling interest at fair value

The impact of the business combination, and the measurement of non-controlling interests, is as follows:

Dr	Fair value of identifiable net assets acquired	CU850	
Dr	Goodwill ((CU950 + CU215) - CU850)	CU315	
Cr	Cash		CU950
Cr	Non-controlling interest in Target (CU190 + CU25)		CU215

Under this method, goodwill represents the difference between the fair value of Target and the fair value of its identifiable net assets. The non-controlling interests are measured as the fair value of all equity instruments issued by Target that are not owned by Parent (i.e., ordinary shares and gross settled call options).

Option 2 - Certain non-controlling interests are measured at proportionate share of identifiable net assets

The impact of the business combination, and the measurement of non-controlling interests, is as follows:

Dr	Fair value of identifiable net assets acquired	CU850	
Dr	Goodwill ((CU950 + CU195) - CU850)	CU295	
Cr	Cash		CU950
Cr	Non-controlling interest in Target (20% × CU850 + CU25)		CU195

Under this method, goodwill represents the difference between the total of the consideration transferred and the amount of the non-controlling interests, less the fair value of the identifiable assets acquired and liabilities assumed. The non-controlling interests that are present ownership interests and entitle their holders to a proportionate share of the Target's net assets in the event of liquidation (i.e., the ordinary shares) are measured at the non-controlling interest's proportionate share of the identifiable net assets of Target. The non-controlling interests that are not present ownership interests or do not entitle their holders to a proportionate share of the Target's net assets in the event of liquidation (i.e., the gross settled call options) are measured at their fair value.

Reconciliation of goodwill

Goodwill as determined under the two methods can be reconciled as follows:

	CU
Option 2: Goodwill (CU950 - 80% × CU850 + CU25)	295
Goodwill related to the non-controlling interest in ordinary shares (CU190 - 20% × CU850)	20
Option 1: Goodwill ((CU950 + CU215) - CU850)	315

This makes clear that Option 2 effectively ignores the goodwill related to ordinary shares that are held by non-controlling shareholders.

In Illustration 8-2 above, under Option 2, the computation of the non-controlling interests represented by the ordinary shares was based solely on the fair value of the identifiable net assets, i.e., no deduction was made in respect of the other component of non-controlling interest. As noted above an alternative view would be that other components of non-controlling interests are deducted from the value of the identifiable net assets based on their acquisition-date fair value (or market-based measure) or based on their liquidation rights (see Chapter 8). This alternative view is illustrated in Chapter 8.

8.4 Measuring share-based payment and other components of non-controlling interests

The above options for measuring the initial carrying values of non-controlling interests only apply to present ownership interests that entitle their holders to a proportionate share of the entity's net assets in the event of a liquidation. All other components of non-controlling interests must be measured at their fair values, unless another measurement basis is required by IFRS accounting standards. [IFRS 3.19]. For example, a preference share that entitles the holders only to a preferred return of capital and accrued and unpaid dividends (or any other restricted right) in the event of a liquidation does not qualify for the measurement choice in IFRS 3.19 because it does not entitle its holder to a proportionate share of the entity's net assets in the event of liquidation.

The exception to fair values relates to outstanding share-based payment transactions that are not replaced by the acquirer:

- If vested, they are measured at their market-based measure.
- If unvested, they are measured at their market-based measure as if the acquisition date were the grant date. [IFRS 3.B62A].

The market-based measure of unvested share-based payment transactions is allocated to the non-controlling interest on the basis of the ratio of the portion of the vesting period completed to the greater of the total vesting period or the original vesting period of the share-based payment transaction. The balance is allocated to post-combination service. [IFRS 3.B62B].

The above requirements for equity-settled share-based payment transactions of the acquiree are discussed further in Chapter 30.

Illustration 8-3: Measurement of non-controlling interest represented by preference shares and employee share options

Preference shares

TC has issued 100 preference shares, which are classified as equity. The preference shares have a nominal value of CU1 each. The preference shares give their holders a priority right to a preferential dividend over the payment of any dividend to the holders of ordinary shares. On liquidation of TC, the holders of the preference shares are entitled to receive, out of the assets available for distribution, the amount of CU1 per share before any payment is made to the holders of ordinary shares. However, they do not have any further rights on liquidation.

AC acquires all ordinary shares of TC. The acquisition-date fair value of the preference shares is CU120.

The non-controlling interests that relate to TC's preference shares do not entitle their holders to a proportionate share of the entity's net assets in the event of liquidation. They are measured at a fair value of CU120.

If the preference shares have an equal right and ranking to the ordinary shares in the event of liquidation, they have a present ownership interest and could then be measured at their fair value or at their proportionate share of the identifiable net assets recognised by the acquiree. If the fair value of the preference shares is CU160 and the proportionate share of TC's identifiable net assets attributable to the preference shares is CU140, the acquirer can elect to measure the preference shares at either of these amounts.

Employee share options

TC has issued share options to its employees. The share options are classified as equity and are vested at the acquisition date. The share options do not expire on the acquisition date and AC does not replace them. They do not represent a present ownership interest and do not entitle their holders to a proportionate share of TC's net assets in the event of liquidation. The market-based measure of the share options in accordance with IFRS 2 at the acquisition date is CU200. The acquirer measures the non-controlling interests that are related to the share options at their market-based measure of CU200.

8.5 Call and put options over non-controlling interests

In some business combinations when less than 100% of the equity shares are acquired, it may be that the transaction also involves options over some or all of the outstanding shares held by the non-controlling shareholders. The acquirer may have a call option, i.e., a right to acquire the outstanding shares at a future date for cash at a particular price. Alternatively, it may have granted a put option to the other shareholders whereby they have the right to sell their shares to the acquirer at a future date for cash at a particular price. In some cases, there may be a combination of call and put options, the terms of which may be equivalent or may be different.

Those kinds of transactions raise many questions regarding the appropriate accounting treatment such as the appropriate classification of the call and put options and whether the transactions are accounted for as a single arrangement. IFRS 3 gives no guidance as to how such options impact the accounting for a business combination. Those issues are discussed in Chapter 8.

Similarly, IFRS 3 does not explicitly address the accounting for a sequence of transactions that begin with an acquirer gaining control over another entity, followed by acquiring additional ownership interests shortly thereafter. This frequently happens where public offers are made to a group of shareholders and there is a regulatory requirement for an acquirer to make an offer to the non-controlling shareholders of the acquiree. This issue is also discussed in Chapter 8.

The IFRS IC and the IASB have debated the accounting for NCI puts for a number of years. Many of these issues have now been considered as part of the Financial Instruments with Characteristics of Equity (FICE) project. An Exposure Draft *Financial Instruments with Characteristics of Equity*¹⁶ was published in November 2023. See section 1.2.2 above and chapter 43 for further information on the FICE project.

¹⁶ Exposure Draft ([IASB/ED/2023/5](#)) *Financial Instruments with Characteristics of Equity - Proposed amendments to IAS 32, IFRS 7 and IAS 1*, IASB, November 2023. Available on the IFRS Foundation's website.

9 Business combinations achieved in stages ('step acquisitions')

Extract from IFRS 3

- 42 In a business combination achieved in stages, the acquirer shall remeasure its previously held equity interest in the acquiree at its acquisition-date fair value and recognise the resulting gain or loss, if any, in profit or loss or other comprehensive income, as appropriate. In prior reporting periods, the acquirer may have recognised changes in the value of its equity interest in the acquiree in other comprehensive income. If so, the amount that was recognised in other comprehensive income shall be recognised on the same basis as would be required if the acquirer had disposed directly of the previously held equity interest.
- 42A When a party to a joint arrangement (as defined in IFRS 11 *Joint Arrangements*) obtains control of a business that is a joint operation (as defined in IFRS 11), and had rights to the assets and obligations for the liabilities relating to that joint operation immediately before the acquisition date, the transaction is a business combination achieved in stages. The acquirer shall therefore apply the requirements for a business combination achieved in stages, including remeasuring its previously held interest in the joint operation in the manner described in paragraph 42. In doing so, the acquirer shall remeasure its entire previously held interest in the joint operation.

[IFRS 3.42, IFRS 3.42A].

The third item in part (a) of the goodwill computation set out in section 6 above is the acquisition-date fair value of the acquirer's previously held equity interest in the acquiree.

An acquirer sometimes obtains control of an acquiree in which it held an equity interest immediately before the acquisition date. For example, on 31 January 20X2, Entity A holds a 35% non-controlling equity interest in Entity B. On that date, Entity A purchases an additional 40% interest in Entity B, which gives it control of Entity B. IFRS 3 refers to such a transaction as a business combination achieved in stages, sometimes also referred to as a 'step acquisition'. [IFRS 3.41].

If the acquirer holds a non-controlling equity investment in the acquiree immediately before obtaining control, the acquirer remeasures that previously held equity investment at its acquisition-date fair value and recognises any resulting gain or loss in profit or loss or other comprehensive income, as appropriate. [IFRS 3.42].

In effect, the acquirer exchanges its status as an owner of an investment asset in an entity for a controlling financial interest in all of the underlying assets and liabilities of that entity (acquiree) and the right to direct how the acquiree and its management use those assets in its operations. [IFRS 3.BC384].

In addition, any changes in the value of the acquirer's equity interest in the acquiree recognised in other comprehensive income (e.g., the investment was designated as measured at fair value through other comprehensive income without recycling to profit or loss upon derecognition) is recognised on the same basis that would be required if the acquirer had directly disposed of the previously held equity investment. [IFRS 3.42].

The acquirer's non-controlling equity investment in the acquiree, after remeasurement to its acquisition-date fair value, is then included as the third item of part (a) of the goodwill computation set out in section 6 above.

Under IFRS 9 investments in equity instruments that are not held for trading would likely be classified as either:

- Financial assets designated as measured at fair value through profit or loss
- Or
- Financial assets measured at fair value through other comprehensive income (FVOCI) if an entity made an irrevocable election at initial recognition to present subsequent changes in their fair value in other comprehensive income

In the former case no transfer would be necessary as gains or losses from changes in the fair value would be already included in profit or loss in the previous periods. In the latter case, as demonstrated in Illustration 9-1 below, gains or losses from changes in the fair value accumulated in other comprehensive income would never be reclassified to profit or loss but may be transferred to retained earnings on 'deemed disposal' of the investment if an entity initially recognised these changes in a separate component of equity rather than directly within retained earnings.

Illustration 9-1: Business combination achieved in stages - original investment treated as FVOCI without recycling

Investor acquires a 20% ownership interest in Investee (a service company) on 1 January 20X1 for CU3,500,000 in cash, which is the fair value of the investment at that date. Investor has concluded that despite its 20% holding, it does not have significant influence over Investee. At that date, the fair value of Investee's identifiable assets is CU10,000,000, and the carrying amount of those assets is CU8,000,000. Investee has no liabilities or contingent liabilities at that date. The following shows Investee's statement of financial position as at 1 January 20X1 together with the fair values of the identifiable assets:

Investee's statement of financial position as at 1 January 20X1	Carrying amounts	Fair values
	CU'000	CU'000
Cash and receivables	2,000	2,000
Land	6,000	8,000
	<u>8,000</u>	<u>10,000</u>
Issued equity: 1,000,000 ordinary shares	5,000	
Retained earnings	<u>3,000</u>	
	<u>8,000</u>	

During the year ended 31 December 20X1, Investee reports a profit of CU6,000,000 but does not pay any dividends. In addition, the fair value of Investee's land increases by CU3,000,000 to CU11,000,000. However, the amount recognised by Investee in respect of the land remains unchanged at CU6,000,000. The following shows Investee's statement of financial position as at 31 December 20X1 together with the fair values of the identifiable assets:

Investee's statement of financial position as at 31 December 20X1	Carrying amounts	Fair values
	CU'000	CU'000
Cash and receivables	8,000	8,000
Land	6,000	11,000
	<u>14,000</u>	<u>19,000</u>
Issued equity: 1,000,000 ordinary shares	5,000	
Retained earnings	<u>9,000</u>	
	<u>14,000</u>	

On 1 January 20X2, Investor acquires a further 60% ownership interest in Investee for CU22,000,000 cash, thereby obtaining control. Before obtaining control, Investor does not have significant influence over Investee, and accounts for its initial 20% investment at FVOCI. Investee's ordinary shares have a quoted market price at 31 December 20X1 of CU30 per share.

Throughout the period 1 January 20X1 to 1 January 20X2, Investor's issued equity was CU30,000,000. Investor's only asset apart from its investment in Investee is cash.

Accounting for the initial investment before obtaining control

Investor's initial 20% investment in Investee is measured at its fair value at the acquisition date of CU3,500,000. However, Investee's 1,000,000 ordinary shares have a quoted market price at 31 December 20X1 of CU30 per share. Therefore, the carrying amount of Investor's initial 20% investment is remeasured in Investor's financial statements at CU6,000,000 on 31 December 20X1, with the CU2,500,000 increase recognised as a component of other comprehensive income. Therefore, Investor's statement of financial position before the acquisition of the additional 60% ownership interest is as follows:

Investor's statement of financial position as at 31 December 20X1	CU'000
Cash	26,500
Investment in Investee	<u>6,000</u>
	<u>32,500</u>
Issued equity	30,000
Gain on remeasurement of the equity investment designated as FVOCI (without recycling)	<u>2,500</u>
	<u>32,500</u>

Accounting for the business combination

Assuming Investor adopts option 2 for measuring the non-controlling interest in Investee, i.e., at the proportionate share of the value of the net identifiable assets acquired, it recognises the following amount for goodwill in its consolidated financial statements:

	CU'000
Consideration transferred for 60% interest acquired on 1 January 20X2	22,000
Non-controlling interest - proportionate share of fair values of identifiable net assets at that date (20% × CU19,000,000)	3,800
Acquisition-date fair value of initial 20% interest	6,000
	<u>31,800</u>
Acquisition-date fair values of identifiable net assets acquired	19,000
Goodwill	<u>12,800</u>

The existing gain on the equity investment designated as FVOCI (without recycling) of CU2,500,000, according to the Investor's accounting policy, is transferred from the separate component of accumulated Other Comprehensive Income (OCI) to retained earnings at the date of obtaining control on 1 January 20X2. If under the Investor's accounting policy gains or losses upon remeasurement were included directly in retained earnings rather than accumulated in a separate component of accumulated OCI, no transfer would be required.

The following shows Investor's consolidation worksheet immediately after the acquisition of the additional 60% ownership interest in Investee, together with consolidation adjustments and associated explanations:

	Investor	Investee	Consolidation adjustments		Consolidated
			Dr	Cr	
	CU'000	CU'000	CU'000	CU'000	CU'000
Cash and receivables	4,500	8,000			12,500
Investment in Investee	28,000	-		28,000	-
Land		6,000	5,000		11,000 (a)
Goodwill			12,800		12,800 (b)
	<u>32,500</u>	<u>14,000</u>			<u>36,300</u>
Issued equity	30,000	5,000	5,000		30,000 (c)
Gain on remeasurement of the equity investment designated as FVOCI (without recycling)	2,500		2,500		- (d)
Retained earnings		9,000	9,000	2,500	2,500 (d)
Non-controlling interest				3,800	3,800 (a)
	<u>32,500</u>	<u>14,000</u>			<u>36,300</u>

Notes

The above consolidation adjustments result in:

- (a) Investee's identifiable net assets being stated at their full fair values at the date Investor obtains control of Investee, i.e., CU19,000,000, including land of CU11,000,000. The 20% non-controlling interest in Investee is also stated at the non-controlling interest's 20% share of the fair values of Investee's identifiable net assets, i.e., CU3,800,000 (20% × CU19,000,000).
- (b) Goodwill being recognised from the acquisition date based on the computation set out in section 6 above, i.e., CU12,800,000.
- (c) Issued equity of CU30,000,000 comprising the issued equity of Investor of CU30,000,000.
- (d) A retained earnings balance of CU2,500,000 being the amount transferred from accumulated other comprehensive income relating to the previously held investment in Investee on the step acquisition.

If the investor in the above Illustration had accounted for its original investment of 20% as an associate using the equity method under IAS 28 *Investments in Associates and Joint Ventures*, then the accounting would have been as follows:

Illustration 9-2: Business combination achieved in stages - original investment treated as an associate under IAS 28

This example uses the same facts as in Illustration 9-1 above, except that Investor has significant influence over Investee following its initial 20% investment.

Accounting for the initial investment before obtaining control

Investor's initial 20% investment in Investee is included in Investor's consolidated financial statements under the equity method. Accordingly, it is initially recognised at its cost of CU3,500,000 and adjusted thereafter for its share of the profits of Investee after the date of acquisition of CU1,200,000 (being 20% × CU6,000,000). Investor's policy for property, plant and equipment is to use the cost model under IAS 16; therefore, in applying the equity method, it does not include its share of the increased value of the land held by Investee. IAS 28 requires that, on the acquisition of an associate, any difference between the cost of the acquisition and its share of the fair value of the associate's identifiable assets and liabilities is accounted for as goodwill, but is included within the carrying amount of the investment in the associate. Accordingly, Investor has included goodwill of CU1,500,000 arising on its original investment of 20%, being CU3,500,000 less CU2,000,000 (20% × CU10,000,000). Therefore, Investor's consolidated statement of financial position as at 31 December 20X1, before the acquisition of the additional 60% ownership interest, is as follows:

Investor's consolidated statement of financial position as at 31 December 20X1		CU'000
Cash		26,500
Investment in associate		4,700
		<u>31,200</u>
Issued equity		30,000
Retained earnings		1,200
		<u>31,200</u>

In its separate financial statements, Investor includes its investment in the associate at the cost of CU3,500,000.

Accounting for the business combination

Although Investor has previously equity-accounted for its 20% interest in Investee (and calculated goodwill on that acquisition), the computation of goodwill in its consolidated financial statements as a result of obtaining control over Investee is the same as that in Illustration 9-1 above:

	CU'000
Consideration transferred for 60% interest acquired on 1 January 20X2	22,000
Non-controlling interest - share of fair values of identifiable net assets at that date (20% × CU19,000,000)	3,800
Acquisition-date fair value of initial 20% interest	6,000
	<u>31,800</u>
Acquisition-date fair values of identifiable net assets acquired	19,000
Goodwill	<u>12,800</u>

Investor recognises a gain of CU1,300,000 in profit or loss as a result of remeasuring its existing interest from its equity-accounted amount of CU4,700,000 at the date of obtaining control to its acquisition-date fair value of CU6,000,000.

The following shows Investor's consolidation worksheet immediately after the acquisition of the additional 60% ownership interest in Investee, together with consolidation adjustments and associated explanations:

	Investor	Investee	Consolidation adjustments		Consolidated
			Dr	Cr	
	CU'000	CU'000	CU'000	CU'000	CU'000
Cash and receivables	4,500	8,000			12,500
Investment in Investee	26,700	-		26,700	-
Land		6,000	5,000		11,000 (a)
Goodwill			12,800		12,800 (b)
	<u>31,200</u>	<u>14,000</u>			<u>36,300</u>
Issued equity	30,000	5,000	5,000		30,000 (c)
Retained earnings	1,200	9,000	9,000		1,200 (d)
Profit for 20X2				1,300	1,300 (e)
Non-controlling interest				3,800	3,800 (a)
	<u>31,200</u>	<u>14,000</u>			<u>36,300</u>

Notes

The above consolidation adjustments result in:

- (a) Investee's identifiable net assets being stated at their full fair values at the date Investor obtains control of Investee, i.e., CU19,000,000, including land of CU11,000,000. The 20% non-controlling interest in Investee is also stated at the non-controlling interest's 20% share of the fair values of Investee's identifiable net assets, i.e., CU3,800,000 (20% × CU19,000,000).
- (b) Goodwill being recognised from the acquisition date based on the computation set out in section 6 above, i.e., CU12,800,000.
- (c) Issued equity of CU30,000,000 comprising the issued equity of Investor of CU30,000,000.
- (d) A retained earnings balance of CU1,200,000 being Investor's equity-accounted share of Investee while it was an associate.
- (e) Profit of CU1,300,000 being the amount of gain on remeasurement of the previously existing interest in Investee at its acquisition-date fair value (CU6,000,000 - CU4,700,000). As a result, total retained earnings in the statement of financial position are CU2,500,000.

Although the Illustrations above explain the requirements of IFRS 3 when the previously held investment has been accounted for as an equity investment designated as FVOCI (without recycling) or as an associate, the requirements in IFRS 3 for step acquisitions apply to all previously held non-controlling equity investments in the acquiree, including those that were accounted for as joint ventures or joint operations under IFRS 11. Accounting for step-acquisitions of former joint operations that are businesses is discussed in section 9.1 below. IAS 28's requirements also apply to joint ventures. [IAS 28.2].

As a result of obtaining control over a former associate or joint venture, the acquirer accounts for the business combination by applying the other requirements under IFRS 3 as it would in any other business combination. Thus, it needs to recognise the net of the acquisition-date fair values (or other amounts recognised in accordance with the requirements of the standard) of the identifiable assets acquired and the liabilities assumed relating to the former associate or joint venture (see section 5 above), i.e., perform a new purchase price allocation. This will include reassessing the classification and designation of assets and liabilities, including the classification of financial instruments, embedded derivatives and hedge accounting, based on the circumstances that exist at the acquisition date (see section 5.4 above).

Obtaining control over a former associate or joint venture means that the investor 'loses' significant influence or 'joint control' over it. Therefore, any amounts recognised in other comprehensive income relating to the associate or joint venture is recognised by the investor on the same basis that would be required if the associate or joint venture had directly disposed of the related assets or liabilities. For associates and joint ventures, this is discussed further in Chapter 12.

In Illustration 9-2 above, a gain was recognised as a result of the step-acquisition of the former associate. However, a loss may have to be recognised as a result of the step-acquisition.

Illustration 9-3: Business combination achieved in stages - loss arising on step-acquisition

An investor has an equity-accounted interest in a listed associate comprising 1,000 shares with a carrying value of CU1,000. The quoted price of the associate's shares is CU0.90 per share, i.e., CU900 in total. As there is an impairment indicator, the investment is tested for impairment in accordance with IAS 36. However, as the investor determines that the investment's value in use exceeds CU1,000, no impairment loss is recognised.

In the following period, the investor acquires all of the other outstanding shares in the associate. Up to the date of obtaining control, the investor has recognised a further share of profits of the associate, such that the equity-accounted interest in the associate is now CU1,050. At the date of obtaining control, the fair value of the shares has increased to CU0.93. The existing shares are remeasured to fair value at that date and a loss of CU120 (CU1,050 less CU930) is recognised in profit or loss.

9.1 Accounting for previously held interests in a joint operation

A party to a joint operation (i.e., either a joint operator or a party that does not share joint control) may obtain control of a joint operation that is a business (as defined in IFRS 3). The IASB views a transaction where control is gained as a significant change in the nature of, and the economic circumstances surrounding, the interest in the joint operation. Therefore, when a party to a joint operation obtains control of a joint operation that is a business, it must remeasure to fair value the entire interest it previously held in that joint operation. In other words, such a transaction must be accounted for as a business combination achieved in stages. [IFRS 3.42A].

Chapter 13 discusses how a party that participates in (but does not have joint control over) a joint operation, accounts for obtaining joint control over that joint operation that is a business (as defined in IFRS 3).

10 Bargain purchase transactions

Extract from IFRS 3

Bargain purchases

- 34 Occasionally, an acquirer will make a bargain purchase, which is a business combination in which the amount in paragraph 32(b) exceeds the aggregate of the amounts specified in paragraph 32(a). If that excess remains after applying the requirements in paragraph 36, the acquirer shall recognise the resulting gain in profit or loss on the acquisition date. The gain shall be attributed to the acquirer.
- 35 A bargain purchase might happen, for example, in a business combination that is a forced sale in which the seller is acting under compulsion. However, the recognition or measurement exceptions for particular items discussed in paragraphs 22-31 may also result in recognising a gain (or change the amount of a recognised gain) on a bargain purchase.
- 36 Before recognising a gain on a bargain purchase, the acquirer shall reassess whether it has correctly identified all of the assets acquired and all of the liabilities assumed and shall recognise any additional assets or liabilities that are identified in that review. The acquirer shall then review the procedures used to measure the amounts this IFRS requires to be recognised at the acquisition date for all of the following:
- (a) the identifiable assets acquired and liabilities assumed;
 - (b) the non-controlling interest in the acquiree, if any;
 - (c) for a business combination achieved in stages, the acquirer's previously held equity interest in the acquiree; and
 - (d) the consideration transferred.
- The objective of the review is to ensure that the measurements appropriately reflect consideration of all available information as of the acquisition date.

IFRS 3 regards a bargain purchase as being a business combination in which:

- The net of the acquisition-date fair values (or other amounts recognised in accordance with the requirements of the standard) of the identifiable assets acquired and the liabilities assumed, exceeds
- The aggregate of:
 - The consideration transferred (generally measured at acquisition-date fair value)
 - The amount of any non-controlling interest in the acquiree
 And
 - The acquisition-date fair value of the acquirer's previously held equity interest in the acquiree [IFRS 3.34]

The IASB considers bargain purchases anomalous transactions - business entities and their owners generally do not knowingly and willingly sell assets or businesses at prices below their fair values. [IFRS 3.BC371]. Nevertheless, occasionally, an acquirer will make a bargain purchase, for example, in a forced sale in which the seller is acting under compulsion. [IFRS 3.35]. These may occur in a forced liquidation or distress sale (e.g., after the death of a founder or key manager) in which owners need to sell a business quickly. The IASB observed that an economic gain is inherent in a bargain purchase and concluded that, in concept, the acquirer recognises that gain at the acquisition date. However, there may not be clear evidence that a bargain purchase has taken place, and because of this there remained the potential for inappropriate gain recognition resulting from measurement bias or undetected measurement errors. [IFRS 3.BC372, IFRS 3.BC373, IFRS 3.BC374, IFRS 3.BC375].

Therefore, before recognising a gain on a bargain purchase, the acquirer is required to reassess all components of the computation to ensure that the measurements are based on all available information as at the acquisition date. This means ensuring that it has correctly identified all of the assets acquired and all of the liabilities assumed and does not have to recognise any additional assets or liabilities. Having done so, the acquirer must review the procedures used to measure all of the following:

- The identifiable assets acquired and liabilities assumed
- The non-controlling interest in the acquiree, if any
- For a business combination achieved in stages, the acquirer's previously held equity interest in the acquiree
- The consideration transferred [IFRS 3.36]

If an excess remains, the acquirer recognises a gain in profit or loss on the acquisition date. All of the gain is attributed to the acquirer. [IFRS 3.34].

The computation means that a gain on a bargain purchase and goodwill cannot both be recognised for the same business combination. [IFRS 3.BC376, IFRS 3.BC377].

IFRS 3 acknowledges that the requirements to measure particular assets acquired or liabilities assumed in accordance with other IFRS accounting standards, rather than their fair value, may result in recognising a gain (or change the amount of a recognised gain) on acquisition. [IFRS 3.35, IFRS 3.BC379].

The computation of a gain on a bargain purchase is shown in the following Illustration, which is based on one included within the Illustrative Examples accompanying IFRS 3. [IFRS 3.IE45-IE49].

Illustration 10-1: Gain on a bargain purchase (1)

Entity A acquires 80% of the equity interests of Entity B, a private entity, in exchange for cash of CU150m. Because the former owners of Entity B needed to dispose of their investments in Entity B by a pre-determined date, they did not have sufficient time to market Entity B to multiple potential buyers. The management of Entity A initially measures the separately recognisable identifiable assets acquired and the liabilities assumed as at the acquisition date in accordance with the requirements of IFRS 3. The identifiable assets are measured at CU250m and the liabilities assumed are measured at CU50m. Entity A engages an independent consultant, who determines that the fair value of the 20% non-controlling interest in Entity B is CU42m.

Entity B's identifiable net assets of CU200m (being CU250m - CU50m) exceed the fair value of the consideration transferred plus the fair value of the non-controlling interest in Entity B. Therefore, Entity A reviews the procedures it used to identify and measure the assets acquired and liabilities assumed and to measure the fair value of both the non-controlling interest in Entity B and the consideration transferred. After that review, Entity A decides that the procedures and resulting measures were appropriate. Entity A measures the gain on its purchase of the 80% interest as follows:

	CU million	CU million
Fair value of the identifiable net assets acquired (CU250m - CU50m)		200
Less:		
Fair value of the consideration transferred for Entity A's 80% interest	150	
Fair value of non-controlling interest in Entity B	<u>42</u>	
		<u>(192)</u>
Gain on bargain purchase of 80% interest in Entity B		8

Entity A records its acquisition of Entity B in its consolidated financial statements as follows:

	CU million	CU million
Dr Identifiable assets acquired	250	
Cr Cash		150
Cr Liabilities assumed		50
Cr Gain on bargain purchase		8
Cr Equity - non-controlling interest in Entity B		42

If Entity A chooses to measure the non-controlling interest in Entity B on the basis of its proportionate interest in the identifiable net assets of the acquiree, the gain on the purchase of the 80% interest is as follows:

	CU million	CU million
Fair value of the identifiable net assets acquired (CU250m - CU50m)		200
Less:		
Fair value of the consideration transferred for Entity A's 80% interest	150	
Non-controlling interest in Entity B (20% × CU200m)	<u>40</u>	
		<u>(190)</u>
Gain on bargain purchase of 80% interest in Entity B		10

On that basis, Entity A records its acquisition of Entity B in its consolidated financial statements as follows:

	CU million	CU million
Dr Identifiable net assets acquired	250	
Cr Cash		150
Cr Liabilities assumed		50
Cr Gain on bargain purchase		10
Cr Equity - non-controlling interest in Entity B		40

It can be seen from the above example that the amount of the gain recognised is affected by the way in which the non-controlling interest is measured. Indeed, it might be that if the non-controlling interest is measured at its acquisition-date fair value, goodwill is recognised rather than a gain as shown below.

Illustration 10-2: Gain on a bargain purchase (2)

This example uses the same facts as in Illustration 10-1 above, except that the independent consultant determines that the fair value of the 20% non-controlling interest in Entity B is CU52m.

In this situation, the fair value of the consideration transferred plus the fair value of the non-controlling interest in Entity B exceeds the recognised amount of the identifiable net assets acquired, giving rise to goodwill on the acquisition as follows:

	CU million
Fair value of the consideration transferred for Entity A's 80% interest	150
Fair value of non-controlling interest in Entity B	52
	<hr/> 202
Less: Fair value of the identifiable net assets acquired (CU250m - CU50m)	(200)
Goodwill on acquisition of 80% interest in Entity B	<hr/> 2 <hr/>

Therefore, although Entity A in the above example might have made a 'bargain purchase', the requirements of IFRS 3 lead to no gain being recognised.

11 Assessing what is part of the exchange for the acquiree

Extract from IFRS 3

Determining what is part of the business combination transaction

- 51 The acquirer and the acquiree may have a pre-existing relationship or other arrangement before negotiations for the business combination began, or they may enter into an arrangement during the negotiations that is separate from the business combination. In either situation, the acquirer shall identify any amounts that are not part of what the acquirer and the acquiree (or its former owners) exchanged in the business combination, ie amounts that are not part of the exchange for the acquiree. The acquirer shall recognise as part of applying the acquisition method only the consideration transferred for the acquiree and the assets acquired and liabilities assumed in the exchange for the acquiree. Separate transactions shall be accounted for in accordance with the relevant IFRSs.
- 52 A transaction entered into by or on behalf of the acquirer or primarily for the benefit of the acquirer or the combined entity, rather than primarily for the benefit of the acquiree (or its former owners) before the combination, is likely to be a separate transaction. The following are examples of separate transactions that are not to be included in applying the acquisition method:
- (a) a transaction that in effect settles pre-existing relationships between the acquirer and acquiree;
 - (b) a transaction that remunerates employees or former owners of the acquiree for future services; and
 - (c) a transaction that reimburses the acquiree or its former owners for paying the acquirer's acquisition-related costs.
- Paragraphs B50-B62 provide related application guidance.

Acquisition-related costs

- 53 Acquisition-related costs are costs the acquirer incurs to effect a business combination. Those costs include finder's fees; advisory, legal, accounting, valuation and other professional or consulting fees; general administrative costs, including the costs of maintaining an internal acquisitions department; and costs of registering and issuing debt and equity securities. The acquirer shall account for acquisition-related costs as expenses in the periods in which the costs are incurred and the services are received, with one exception. The costs to issue debt or equity securities shall be recognised in accordance with IAS 32 and IFRS 9.

[IFRS 3.51, IFRS 3.52, IFRS 3.53].

To be included in the accounting for the business combination, the identifiable assets acquired and liabilities assumed must be part of the exchange for the acquiree, rather than as a result of separate transactions.

[IFRS 3.12].

IFRS 3 recognises that the acquirer and the acquiree may have a pre-existing relationship or other arrangement before the negotiations for the business combination, or they may enter into an arrangement during the negotiations that is separate from the business combination. In either situation, the acquirer is required to identify any amounts that are separate from the business combination and thus are not part of the exchange for the acquiree. [IFRS 3.51]. This requires the acquirer to evaluate the substance of transactions between the parties.

There are three types of transactions that IFRS 3 regards as separate transactions that are not considered part of the exchange for the acquiree:

- A transaction that effectively settles pre-existing relationships between the acquirer and acquiree, e.g., a lawsuit, supply contract, franchising or licensing arrangement (see section 11.1 below)
- A transaction that remunerates employees or former owners of the acquiree for future services (see section 11.2 below)
- A transaction that reimburses the acquiree or its former owners for paying the acquirer's acquisition-related costs (see section 11.3 below) [IFRS 3.52]

The acquirer is required to consider the following factors to determine whether a transaction is part of the exchange for the acquiree or whether it is separate. The standard stresses that these factors are neither mutually exclusive nor individually conclusive. [IFRS 3.B50].

- *The reasons for the transaction*

Understanding the reasons why the parties to the combination, the acquirer and the acquiree and their owners, directors and managers - and their agents - entered into a particular transaction or arrangement may provide insight into whether it is part of the consideration transferred and the assets acquired or liabilities assumed. If a transaction is arranged primarily for the benefit of the acquirer or the combined entity rather than for the benefit of the acquiree or its former owners before the combination, that portion of the transaction price paid (and any related assets or liabilities) is less likely to be part of the exchange for the acquiree. The acquirer would account for that portion separately from the business combination.

- *Who initiated the transaction*

A transaction or other event that is initiated by the acquirer may be entered into for the purpose of providing future economic benefits to the acquirer or combined entity with little or no benefit received by the acquiree or its former owners before the combination. A transaction or arrangement initiated by the acquiree or its former owners is less likely to be for the benefit of the acquirer or the combined entity and more likely to be part of the business combination transaction.

- *The timing of the transaction*

A transaction between the acquirer and the acquiree during the negotiations of the terms of a business combination may have been entered into in contemplation of the business combination to provide future economic benefits to the acquirer or the combined entity. If so, the acquiree or its former owners before the business combination are likely to receive little or no benefit from the transaction except for benefits they receive as part of the combined entity.

One particular area that may be negotiated between acquirer and acquiree could be a restructuring plan relating to the activities of the acquiree. This is discussed in section 11.4 below.

11.1 Effective settlement of pre-existing relationships

The acquirer and acquiree may have a relationship that existed before they contemplated the business combination, referred to as a 'pre-existing relationship'. This may be contractual, e.g., vendor and customer or licensor and licensee, or non-contractual, e.g., plaintiff and defendant. [IFRS 3.B51].

The purpose of this guidance is to ensure that a transaction that in effect settles a pre-existing relationship between the acquirer and the acquiree is excluded from the accounting for the business combination. If a potential acquiree has an asset, for example, a receivable for an unresolved claim against the potential acquirer, the acquiree's owners could agree to settle that claim as part of an agreement to sell the acquiree to the acquirer. If the acquirer makes a lump sum payment to the seller-owner for the business, part of that payment is to settle the claim. In effect, the acquiree relinquished its claim against the acquirer by transferring its receivable as a dividend to the acquiree's owner. Thus, at the acquisition date the acquiree has no receivable to be acquired as part of the combination, and the acquirer accounts separately for its settlement payment. [IFRS 3.BC122].

The acquirer recognises a gain or a loss on effective settlement of a pre-existing relationship, measured on the following bases:

- For a pre-existing non-contractual relationship, such as a lawsuit, the gain or loss is measured at its fair value
 - For a pre-existing contractual relationship, such as a supply contract, the gain or loss is measured as the lesser of:
 - (a) The amount by which the contract is favourable or unfavourable from the perspective of the acquirer when compared with terms for current market transactions for the same or similar terms (A contract that is unfavourable in terms of current market terms is not necessarily an onerous contract in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it.)
 - And
 - (b) The amount of any settlement provisions in the contract available to the counterparty to whom the contract is unfavourable
- If (b) is less than (a), the difference is included as part of the business combination accounting.

The amount of gain or loss will depend in part on whether the acquirer had previously recognised a related asset or liability, and the reported gain or loss therefore may differ from the amount calculated by applying the above requirements. [IFRS 3.B52].

If there is an 'at market' component to the settlement (i.e., part of the payment reflects the price any market participant would pay to settle the relationship), this is accounted for as part of goodwill and not as a separate intangible asset.¹⁷

The requirements for non-contractual relationships are shown in the following Illustration.

Illustration 11-1: Settlement of pre-existing non-contractual relationship

On 1 January 20X7, Entity A acquires a 100% interest in Entity B for CU250m in cash.

At the beginning of 20X5, a dispute arose over the interpretation of a contract for the development and implementation by Entity A of an e-business platform for Entity C, which at the end of 20X4 was merged with Entity B. The contract, signed in 20X0 and for which work was completed in December 20X3, provided for payment of part of the contract price by allocating to Entity A 5% of the profit from the platform for five years from the system's installation, i.e., from January 20X4 to January 20X9. At the end of 20X4 the merged Entity ceased to use the platform developed by Entity A, as Entity B had its own platform. Entity A, however, believes that 5% of certain profits is payable by Entity B for the period January 20X5 to January 20X9 regardless of the system used by Entity B. Several legal hearings took place in 20X5 and 20X6. However, at the date of acquisition the dispute is still unresolved. Entity B recognised a provision amounting to CU12m reflecting the best estimate of the expenditure required to settle the present obligation at 1 January 20X7. No assets are recognised by Entity A with respect to the dispute prior to the date of acquisition.

The acquisition by Entity A of Entity B includes the effective settlement of the dispute between Entity A and Entity B which is accounted for as a separate transaction from the business combination. On 1 January 20X7, Entity A recognises a gain on effective settlement of the dispute at its fair value, which is not necessarily equal to the amount of the provision reported by Entity B. The amount of consideration transferred for the acquisition of Entity B is increased accordingly. Assuming the fair value of the dispute at 1 January 20X7 is CU15m, Entity A will recognise a gain on effective settlement of CU15m, and the consideration transferred for the purposes of determining goodwill will be CU265m (CU250m + CU15m).

The requirements for contractual relationships relating to a supply contract are shown in the following Illustration. [IFRS 3.IE54, IFRS 3.IE55, IFRS 3.IE56, IFRS 3.IE57].

Illustration 11-2: Settlement of pre-existing contractual relationship - Supply contract

Entity A purchases electronic components from Entity B under a five-year supply contract at fixed rates. Currently, the fixed rates are higher than the rates at which Entity A could purchase similar electronic components from another supplier. The supply contract allows Entity A to terminate the contract before the end of the initial five-year term, but only by paying a CU6m penalty. With three years remaining under the supply contract, Entity A pays CU50m to acquire Entity B, which is the fair value of Entity B based on what other market participants would be willing to pay.

Included in the total fair value of Entity B is CU8m related to the fair value of the supply contract with Entity A. The CU8m represents a CU3m component that is 'at market' because the pricing is comparable to pricing for current market transactions for the same or similar items (selling effort, customer relationships and so on) and a CU5 million component for pricing that is unfavourable to Entity A because it exceeds the price of current market transactions for similar items. Entity B has no other identifiable assets or liabilities related to the supply contract, and Entity A has not recognised any assets or liabilities related to the supply contract before the business combination.

In this example, Entity A calculates a loss of CU5m (the lesser of the CU6m stated settlement amount and the amount by which the contract is unfavourable to the acquirer) separately from the business combination. The CU3m 'at-market' component of the contract is part of goodwill. This means that in the business combination, the acquirer does not recognise any pre-existing relationship between the acquiree and the acquirer as a separate intangible asset acquired.

¹⁷ [IFRIC Update](#), November 2010, available on the IFRS Foundation's website.

Whether Entity A had previously recognised an amount in its financial statements related to a pre-existing relationship will affect the amount recognised as a gain or loss for the effective settlement of the relationship. Suppose that Entity A had recognised a CU6m liability for the supply contract before the business combination. In that situation, Entity A recognises a CU1m settlement gain on the contract in profit or loss at the acquisition date (the CU5m measured loss on the contract less the CU6m loss previously recognised). In other words, Entity A has in effect settled a recognised liability of CU6m for CU5m, resulting in a gain of CU1m. [IFRS 3.1E57].

A lease contract entered into between the parties to a business combination before the transaction, also represents a pre-existing contractual relationship between the acquirer and the acquiree that is treated as effectively settled at the acquisition date.

Illustration 11-3: Settlement of pre-existing contractual relationship - Lease contract (acquirer as a lessor in an operating lease)

Entity A leases a building to Entity B under a five-year lease. Currently, market lease rates for similar leases are less than the contractual lease rate, resulting in a lease that is favourable to Entity A. The fair value of the off-market lease provisions is CU2m. The lease contract permits Entity B to terminate the lease for a payment of CU3m. Entity A as a lessor classifies the lease as an operating lease. With three years remaining under the lease contract, Entity A pays CU25m to acquire Entity B.

In this example, Entity A recognises a CU2m gain on settlement of the lease (the lesser of the CU2m amount by which the lease is favourable to Entity A and the CU3m stated settlement provision amount available to Entity B) and the consideration transferred in the business combination is CU27m.

Another example of settlement of a pre-existing contractual relationship, which is recognised separately from the business combination, is when the acquirer has a loan payable to or receivable from the acquiree.

Illustration 11-4: Settlement of pre-existing contractual relationship - Loan agreement

Entity A acquires a 100% interest in Entity B for CU500m in cash.

Before the acquisition, Entity B granted a fixed interest rate loan to Entity A. At the date of acquisition, Entity A has recognised a financial liability in respect of the loan amounting to CU50m. The fair value of that financial liability is CU45m. The fair value of the identifiable net assets and liabilities of Entity B as at the date of acquisition is CU460m, including CU45m in respect of the fixed rate loan to Entity A.

The amount of consideration transferred for the acquisition of Entity B is decreased by the fair value of the financial liability and the financial liability is then derecognised. As such, the consideration transferred for the purposes of determining goodwill is CU455m (CU500m - CU45m). The amount by which the loan agreement is favourable to the acquirer is recognised as a gain in the consolidated profit or loss. The net identifiable assets and liabilities of Entity B exclude the receivable due from Entity A.

Entity A accounts for the acquisition of Entity B and settlement of the financial liability as follows:

		CU million	CU million
Dr	Net identifiable assets and liabilities acquired (CU460m - CU45m)	415	
Dr	Loan due to Entity B	50	
Dr	Goodwill (CU455m - CU415m)	40	
Cr	Gain on derecognition of loan due to Entity B (CU50m - CU45m)		5
Cr	Cash - consideration for business combination (CU500m - CU45m)		455
Cr	Cash - effective settlement of loan due to Entity B		45

A pre-existing relationship may be a contract that the acquirer recognises as a reacquired right. As indicated in section 5.6.5 above, if the contract includes terms that are favourable or unfavourable when compared with pricing for current market transactions for the same or similar items, the acquirer recognises, separately from the business combination, a gain or loss for the effective settlement of the contract, measured in accordance with the requirements described above. [IFRS 3.B53].

Illustration 11-5: Settlement of pre-existing contractual relationship - Reacquired technology licensing agreement

Entity A acquires a 100% interest in Entity B for CU350m in cash.

Before the acquisition, Entity A sold Entity B an exclusive right to use Entity A's technology in a specified territory. Entity B also pays a revenue-based royalty on a monthly basis. The terms of the technology licensing agreement state that if Entity A terminates the arrangement without cause, Entity A is required to pay a penalty of CU30m. Neither Entity A nor Entity B has recognised any assets or liabilities related to the licence agreement.

The fair value of the licence agreement is CU120m, which includes CU20m for the future royalties which are below current market rates. Therefore, the licence agreement is unfavourable to Entity A and favourable to Entity B. The fair value of the identifiable net assets and liabilities of Entity B at the date of the business combination is CU320m, including the fair value of the licence agreement of CU120m.

The reacquired licence right is recognised at CU100m, being the licence's fair value at current market rates (CU120m - CU20m). Entity A recognises a loss on settlement of the agreement at the lower of:

- CU20m, which is the amount by which the royalty is unfavourable to Entity A compared to market terms.
- CU30m, which is the amount that Entity A would have to pay to terminate the right at the date of acquisition.

A loss is therefore recognised of CU20m. The amount of consideration transferred for the acquisition of Entity B is decreased accordingly to CU330m (CU350m - CU20m).

Entity A accounts for the acquisition of Entity B and the reacquired technology licensing agreement as follows:

		CU million	CU million
Dr	Net identifiable assets and liabilities acquired (CU320m - CU20m)	300	
Dr	Goodwill (CU330m - CU300m)	30	
Dr	Loss on settlement of technology licensing agreement	20	
Cr	Cash - consideration for business combination (CU350m - CU20m)		330
Cr	Cash - effective settlement of technology licensing agreement		20

11.2 Remuneration for future services of employees or former owners of the acquiree

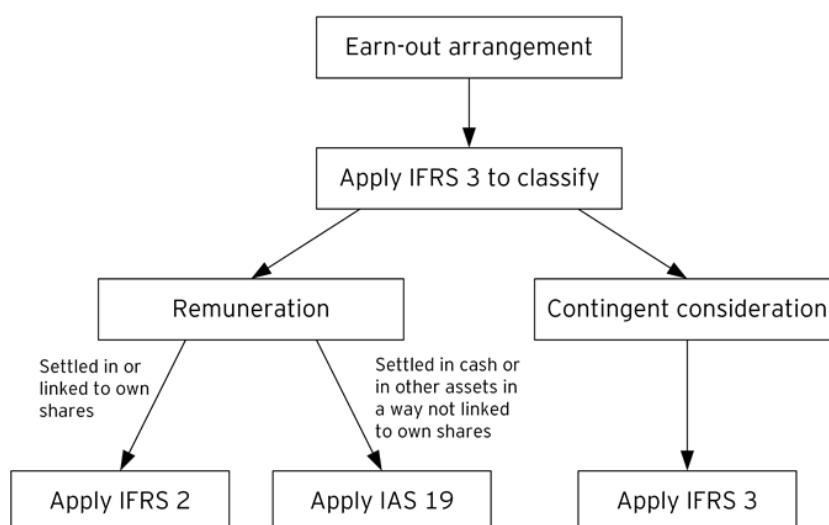

A transaction that remunerates employees or former owners of the acquiree for future services is excluded from the business combination accounting and accounted for separately. [IFRS 3.52].

11.2.1 Arrangements for contingent payments to employee selling shareholders

Whether arrangements for contingent payments to employee selling shareholders are contingent consideration to be included in the measure of the consideration transferred (see section 7.1 above) or are separate transactions to be accounted for as remuneration, will depend on the nature of the arrangements.

Such payments are also often referred to as 'earn-outs'. The approach to accounting for earn-out arrangements is summarised in the diagram below:

Approach to accounting for earn-outs

Understanding the reasons why the acquisition agreement includes a provision for contingent payments, who initiated the arrangement and when the parties entered into the arrangement may be helpful in assessing the nature of the arrangement. [IFRS 3.B54]. If it is not clear whether the arrangement for payments to employees or selling shareholders is part of the exchange for the acquiree or is a transaction separate from the business combination, there are a number of indicators in IFRS 3. [IFRS 3.B55]. These are summarised in the table below:

Indicators to consider when classifying payments as remuneration or contingent consideration

Lead to conclusion as remuneration	Indicators to consider when assessing terms of additional payments to selling shareholders that remain employees	Lead to conclusion as contingent consideration
Payments forfeited on termination	Continuing employment	Payments are not affected by termination
Coincides with or exceeds payment period	Duration of required employment	Shorter than the payment period
Not reasonable compared to other key employees of the group	Level of other elements of remuneration	Reasonable compared to the other key employees of the group
Other non-employee selling shareholders receive lower additional payments (on a per share basis)	Incremental payments to other non-employee selling shareholders	Other non-employee selling shareholders receive similar additional payments (on a per share basis)
Selling shareholders remaining as employees owned substantially all shares (in substance profit-sharing)	Number of shares owned when all selling shareholders receive same level of additional consideration (on a per share basis)	Selling shareholders remaining as employees owned only a small portion of shares
Formula for additional payment consistent with other profit-sharing arrangements rather than the valuation approach	Linkage of payments to valuation of business	Initial consideration at lower end of range of business valuation, and formula for additional payment linked to the valuation approach
Formula is based on performance, such as percentage of earnings	Formula for additional payments	Formula is based on a valuation formula, such as multiple of earnings, indicating it is connected to a business valuation

Although these points are generally indicators, continuing employment is an exception. It is categorically stated that "a contingent consideration arrangement in which the payments are automatically forfeited if employment terminates is remuneration for post-combination services". [IFRS 3.B55(a)]. In January 2013, the

IFRS IC clarified that this conclusion assumes that the service condition is substantive.¹⁸ That conclusion was reaffirmed by the IFRS IC in April 2024.¹⁹ With this exception, no other single indicator is likely to be conclusive as to the accounting treatment.

The guidance in IFRS 3 expands the points in the table above, but also notes that:

- The relevant terms of continuing employment may be included in an employment agreement, acquisition agreement or some other document. [IFRS 3.B55(a)].
- Other pre-acquisition ownership interests may be relevant, e.g., those held by parties related to selling shareholders such as family members, who continue as key employees. [IFRS 3.B55(e)].

When some or all of the arrangement is accounted for as contingent consideration, the requirements in IFRS 3 discussed in section 7.1 above are applied. If some or all of the arrangement is post-combination remuneration, it is accounted for under IFRS 2 if it represents a share-based payment transaction (see Chapter 30) or otherwise under IAS 19 (see Chapter 31).

The requirements for contingent payments to employees are shown in the following Illustration. [IFRS 3.IE58, IFRS 3.IE59, IFRS 3.IE60].

Illustration 11-6: Contingent payments to employees

Entity B appointed a candidate as its new CEO under a ten-year contract. The contract requires Entity B to pay the candidate CU5m if Entity B is acquired before the contract expires. Entity A acquires Entity B eight years later. The CEO was still employed at the acquisition date and will receive the additional payment under the existing contract.

In this example, Entity B entered into the employment agreement before the negotiations of the combination began, and the purpose of the agreement was to obtain the services of the CEO. Thus, there is no evidence that the agreement was arranged primarily to benefit Entity A or the combined entity. Therefore, the liability to pay CU5m is accounted for as part of the acquisition of Entity B.

In other circumstances, Entity B might enter into a similar agreement with the CEO at the suggestion of Entity A during the negotiations for the business combination. If so, the primary purpose of the agreement might be to provide severance pay to the CEO, and the agreement may primarily benefit Entity A or the combined entity rather than Entity B or its former owners. In that situation, Entity A accounts for the liability to pay the CEO in its post-combination financial statements separately from the acquisition of Entity B.

Not all arrangements relate to judgements about whether an arrangement is remuneration or contingent consideration and other agreements and relationships with selling shareholders may have to be considered. The terms of other arrangements and the income tax treatment of contingent payments may indicate that contingent payments are attributable to something other than consideration for the acquiree. These can include agreements not to compete, executory contracts, consulting contracts and property lease agreements. For example, the acquirer might enter into a property lease arrangement with a significant selling shareholder. If the lease payments specified in the lease contract are significantly below market, some or all of the contingent payments to the lessor (the selling shareholder) required by a separate arrangement for contingent payments might be, in substance, payments for the use of the leased property that the acquirer is required to recognise separately in its post-combination financial statements. In contrast, if the lease contract specifies lease payments that are consistent with market terms for the leased property, the arrangement for contingent payments to the selling shareholder may be contingent consideration in the business combination.

11.2.2 Share-based payment awards exchanged for awards held by the acquiree's employees

The acquirer may exchange share-based payment awards (i.e., replacement awards) for awards held by employees of the acquiree.

If the acquirer replaces any acquiree awards, the consideration transferred will include some or all of any replacement awards. Any amount not included in the consideration transferred is treated as a post-combination remuneration expense.

IFRS 3 includes application guidance dealing with replacement awards. [IFRS 3.B56-B62]. Replacement awards are modifications of share-based payment awards in accordance with IFRS 2. Discussion of this guidance, including illustrative examples that reflect the substance of the Illustrative Examples that accompany IFRS 3, [IFRS 3.IE61-IE71], is dealt with in Chapter 30.

18 [IFRIC Update](#), January 2013, available on the IFRS Foundation's website.

19 [Agenda Decision](#), April 2024, available on the IFRS Foundation's website.

11.3 Reimbursement for paying the acquirer's acquisition-related costs

The third example of a separate transaction is included to mitigate concerns about potential abuse. IFRS 3 requires the acquirer to expense its acquisition-related costs - they are not included as part of the consideration transferred for the acquiree. This means that they are not reflected in the computation of goodwill. As a result, acquirers might modify transactions to avoid recognising those costs as expenses. They might disguise reimbursements, e.g., a buyer might ask a seller to make payments to third parties on its behalf; the seller might agree to make those payments if the total amount to be paid to it is sufficient to reimburse it for payments made on the buyer's behalf. [IFRS 3.BC370].

The same would apply if the acquirer asks the acquiree to pay some or all of the acquisition-related costs on its behalf and the acquiree has paid those costs before the acquisition date, so that at the acquisition date the acquiree does not record a liability for them. [IFRS 3.BC120]. This transaction has been entered into on behalf of the acquirer, or primarily for the benefit of the acquirer.

11.4 Restructuring plans

One particular area that could be negotiated between the acquirer and the acquiree or its former owners is a restructuring plan relating to the acquiree's activities.

How we see it

In our view, a restructuring plan that is implemented by or at the request of the acquirer is not a liability of the acquiree as at the date of acquisition and cannot be part of the accounting for the business combination under the acquisition method, regardless of whether the combination is contingent on the plan being implemented.

IFRS 3 states that costs the acquirer expects but is not obliged to incur in the future to effect its plan to exit an activity of an acquiree or to terminate the employment of or relocate an acquiree's employees are not liabilities at the acquisition date. Therefore, the acquirer does not recognise those costs as part of applying the acquisition method. [IFRS 3.11]. Furthermore, as discussed in section 5.2 above, an acquirer recognises liabilities for restructuring or exit activities acquired in a business combination only if they meet the definition of a liability at the acquisition date. [IFRS 3.BC132].

A restructuring plan that is decided upon or put in place between the date the negotiations for the business combination started and the date the business combination is completed is only likely to be accounted for as a pre-combination transaction of the acquiree if there is no evidence that the acquirer initiated the restructuring and the plan makes commercial sense, even if the business combination does not proceed.

If a plan initiated by the acquirer is implemented without an explicit link to the business combination, this may indicate that control has already passed to the acquirer at this earlier date.

This is discussed further in the following Illustration:

Illustration 11-7: Recognition or otherwise of a restructuring liability as part of a business combination

The acquirer and the acquiree (or the owners of the acquiree) enter into an arrangement before the acquisition that requires the acquiree to restructure its workforce or activities. They intend to develop the main features of a plan that involves terminating or reducing the acquiree's activities and to announce the plan's main features to those affected by it so as to raise a valid expectation that the plan will be implemented. The combination is contingent on the plan being implemented.

Does such a restructuring plan that the acquiree puts in place simultaneously with the business combination, and which will become effective upon the change in control, but which was implemented by or at the request of the acquirer qualify for inclusion as part of the liabilities assumed in accounting for the business combination?

Paragraph B50 of the Application Guidance to IFRS 3 gives some guidance on determining what is part of the business combination and requires the acquirer to consider the following factors:

- *The reason:*

A restructuring plan implemented at the request of the acquirer is presumably arranged primarily for the benefit of the acquirer or the combined entity because of the possible redundancy expected to arise from the combination of activities of the acquirer with activities of the acquiree, e.g., capacity redundancy leading to closure of the acquiree's facilities.

- *Who initiated:*

If such a plan is the result of a request by the acquirer, it means that the acquirer is expecting future economic benefits from the restructuring.

- *The timing:*

The restructuring plan is usually discussed during the negotiations; therefore, it is contemplated from the perspective of the future combined entity.

Accordingly, a restructuring plan that is implemented as a result of an arrangement between the acquirer and the acquiree is not a liability of the acquiree at the date of acquisition and cannot be part of the accounting for the business combination under the acquisition method.

Does the answer differ if the combination is not contingent on the plan being implemented?

The answer applies regardless of whether the combination is contingent on the plan being implemented. A plan initiated by the acquirer will most likely not make commercial sense from the acquiree's perspective absent the business combination. For example, retrenchments of staff might only be necessary if the entities are combined. In that case, IFRS 3.B50 indicates that this is an arrangement to be accounted for separately, rather than as part of the business combination exchange. This arrangement may also indicate that control of the acquiree has already passed to the acquirer, otherwise it would be difficult to understand why the acquiree would enter into an arrangement that makes little or no commercial sense.

11.5 Acquisition of non-controlling interest in connection with a business combination

In some situations, a business combination will result in the indirect acquisition of a non-controlling interest i.e., the acquiree is the owner of a non-controlling interest in an acquirer's existing subsidiary.

How we see it

In such situations, we believe that the transaction consists of the following two elements that require separate accounting:

- The acquisition of a business under IFRS 3
- And
- The acquisition of a non-controlling interest under IFRS 10

We believe that the fair value of the consideration transferred is allocated to each element on a relative fair value basis.

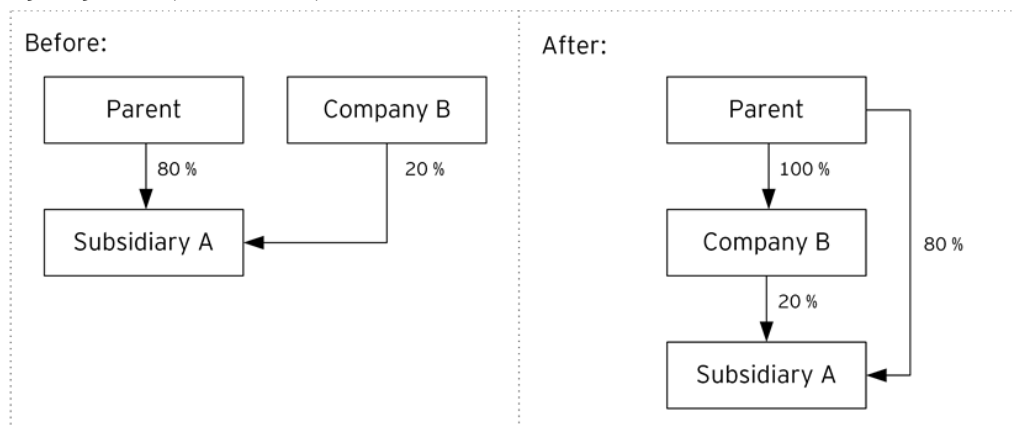

Because the acquirer retains control of its existing subsidiary, the indirect acquisition of the non-controlling interest is accounted for as an equity transaction. That is, any difference between the fair value of the allocated consideration transferred and the carrying amount of the non-controlling interest is recognised as an adjustment to equity in the acquirer's consolidated financial statements.

Illustration 11-8 below demonstrates this concept. Transactions with a non-controlling interest holder are further discussed in Chapter 8.

Illustration 11-8: Indirect acquisition of non-controlling interest in connection with a business combination

Parent owns an 80% controlling interest in Subsidiary A. Company B holds the remaining 20% non-controlling interest in Subsidiary A. Parent pays CU600 million in cash to acquire all of the shares of Company B and therefore gains control over Company B, while still retaining control of Subsidiary A.

The following diagram depicts the corporate structure before and after the transaction:

Relevant fair value and book value information (in CU millions) is as follows:

	CU million
Fair value of non-controlling interest in Subsidiary A	120
Carrying amount of non-controlling interest in Parent's financial statements	80
Fair value of Company B (inclusive of goodwill but excluding the fair value of Company B's investment in Subsidiary A)	480
Fair value of Company B's identifiable net assets acquired (excluding goodwill and its investment in Subsidiary A)	460

In calculating the allocation on a relative fair value basis of the fair value of the consideration transferred for the acquisition of a business under IFRS 3 and the acquisition of a non-controlling interest under IFRS 10, the Parent allocates CU480m (calculated as $(\text{CU}480\text{m} \div \text{CU}600\text{m}) \times \text{CU}600\text{m}$) to the acquisition of Company B and 120m (calculated as $(\text{CU}120\text{m} \div \text{CU}600\text{m}) \times \text{CU}600\text{m}$) to the acquisition of the non-controlling interest in Subsidiary A.

Accounting for the business combination

Under IFRS 3, Parent calculates goodwill relating to the acquisition of Company B as follows (amounts in CU millions):

	CU million
Consideration transferred	480
Less: Fair value of Company B's net identifiable assets acquired (excluding goodwill)	(460)
Goodwill	20

Accounting for the acquisition of non-controlling interest

Under IFRS 10, the increase in Parent's ownership interest in Subsidiary A from 80% to 100% is accounted for as an equity transaction. As a result, the carrying amounts of the controlling and non-controlling interests are adjusted to reflect the changes in their relative interests in Subsidiary A. Any difference between the fair value of the consideration transferred and the carrying amount of the non-controlling interest is recognised directly in equity and attributed to Parent. Parent calculates the adjustment to recognise in equity the difference between the fair value and carrying amount of the non-controlling interest as follows (amounts in CU millions):

	CU million
Consideration transferred for acquisition of non-controlling interest	120
Less: Carrying value of non-controlling interest	(80)
Adjustment to controlling interest (Parent's) retained earnings	40

Consolidation Entry

Parent records the following journal entry to account for the transaction (in CU millions):

		CU million	CU million
Dr	Net assets acquired	460	
Dr	Goodwill	20	
Dr	Non-controlling interest	80	
Dr	Retained earnings of Parent	40	
Cr	Cash		600

12 Measurement period

Extract from IFRS 3

45 If the initial accounting for a business combination is incomplete by the end of the reporting period in which the combination occurs, the acquirer shall report in its financial statements provisional amounts for the items for which the accounting is incomplete. During the measurement period, the acquirer shall retrospectively adjust the provisional amounts recognised at the acquisition date to reflect new information obtained about facts and circumstances that existed as of the acquisition date and, if known, would have affected the measurement of the amounts recognised as of that date. During the measurement period, the acquirer shall also recognise additional assets or liabilities if new information is obtained about facts and circumstances that existed as of the acquisition date and, if known, would have resulted in the recognition of those assets and liabilities as of that date. The measurement period ends as soon as the acquirer receives the information it was seeking about facts and circumstances that existed as of the acquisition date or learns that more information is not obtainable. However, the measurement period shall not exceed one year from the acquisition date.

IFRS 3 contains a 'measurement period' which provides the acquirer with a reasonable period of time to obtain the information necessary to identify and measure all of the various components of the business combination as at the acquisition date in accordance with the standard, i.e.:

- The identifiable assets acquired, liabilities assumed and any non-controlling interest in the acquiree
- The consideration transferred for the acquiree (or the other amount used in measuring goodwill)
- In a business combination achieved in stages, the equity interest in the acquiree previously held by the acquirer
- The resulting goodwill or gain on a bargain purchase [IFRS 3.46]

For most business combinations, the main area where information will need to be obtained is in relation to the acquiree, i.e., the identifiable assets acquired and the liabilities assumed, particularly as these may include items that the acquiree had not previously recognised as assets and liabilities in its financial statements and, in most cases, need to be measured at their acquisition-date fair values (see section 5 above). Information may also need to be obtained in determining the fair value of any contingent consideration arrangements (see section 7.1 above).

The measurement period ends as soon as the acquirer receives the information it was seeking about facts and circumstances that existed as at the acquisition date or learns that it cannot obtain more information. The measurement period cannot exceed one year from the acquisition date. [IFRS 3.45]. The Basis for Conclusions notes that in placing this constraint it was "concluded that allowing a measurement period longer than one year would not be especially helpful; obtaining reliable information about circumstances and conditions that existed more than a year ago is likely to become more difficult as time passes. Of course, the outcome of some contingencies and similar matters may not be known within a year. But the objective of the measurement period is to provide time to obtain the information necessary to measure the fair value of the item as at the acquisition date. Determining the ultimate settlement amount of a contingency or other item is not necessary. Uncertainties about the timing and amount of future cash flows are part of the measure of the fair value of an asset or liability." [IFRS 3.BC392].

Under IFRS 3, if the initial accounting is incomplete at the end of the reporting period in which the combination occurs, the acquirer will include provisional amounts. [IFRS 3.45]. IFRS 3 specifies particular disclosures about those items (see section 16.2 below). [IFRS 3.BC393]. In addition, in such circumstances, impairment testing at the end of the reporting period, of goodwill acquired during that reporting period requires specific considerations, which are discussed in Chapter 21.

How we see it

Although IFRS 3.45 refers to the initial accounting being 'incomplete by the end of the reporting period' and the acquirer reporting 'provisional amounts for the items for which the accounting is incomplete', it is clear from the Illustrative Examples accompanying IFRS 3 that this means that the initial accounting is incomplete at the date at which the financial statements for that period are authorised for issue (see Illustration 12-1 in section 12.1 below). Thus, any items that are finalised up to that date must be reflected in the initial accounting.

12.1 Adjustments made during measurement period to provisional amounts

During the measurement period, the acquirer retrospectively adjusts the provisional amounts recognised at the acquisition date to reflect new information obtained about facts and circumstances at the acquisition date that, if known, would have affected the measurement of the amounts recognised.

Similarly, the acquirer recognises additional assets or liabilities if new information is obtained about facts and circumstances at the acquisition date and, if known, would have resulted in the recognition of those assets and liabilities as at that date. [IFRS 3.45].

IFRS 3 requires the acquirer to consider all pertinent factors to distinguish information that retrospectively adjusts the provisional amounts from information arising from events that occurred after the acquisition date. Factors to be considered include the date when additional information is obtained and whether the acquirer can identify a reason for a change to provisional amounts. Clearly, information obtained shortly after the acquisition date is more likely to reflect circumstances that existed at the acquisition date than information obtained several months later. If the acquirer sells an asset to a third party shortly after the acquisition date for an amount that is significantly different to its provisional fair value, this is likely to indicate an 'error' in the provisional amount unless there is an intervening event that changes its fair value. [IFRS 3.47].

Adjustments to provisional amounts that are made during the measurement period are recognised as if the accounting for the business combination had been completed at the acquisition date. This may be in a prior period, so the acquirer revises its comparative information as needed. This may mean making changes to depreciation, amortisation or other income effects. [IFRS 3.49]. These requirements are shown in the following Illustration, which is based on one included within the Illustrative Examples accompanying IFRS 3. [IFRS 3.IE50, IFRS 3.IE51, IFRS 3.IE52, IFRS 3.IE53]. The deferred tax implications are ignored.

Illustration 12-1: Adjustments made during measurement period to provisional amounts

Entity A acquired Entity B on 30 September 20X1. Entity A sought an independent valuation for an item of property, plant and equipment acquired in the combination. However, the valuation was not complete by the time Entity A authorised its financial statements for issue for the year ended 31 December 20X1. In its 20X1 annual financial statements, Entity A recognised a provisional fair value for the asset of CU30,000. At the acquisition date, the item of property, plant and equipment had a remaining useful life of five years.

Five months after the acquisition date (and after the date on which the financial statements were issued), Entity A received the independent valuation, which estimated the asset's acquisition-date fair value at CU40,000.

In its financial statements for the year ended 31 December 20X2, Entity A retrospectively adjusts the 20X1 prior year information as follows:

- (a) The carrying amount of property, plant and equipment as at 31 December 20X1 is increased by CU9,500. That adjustment is measured as the fair value adjustment at the acquisition date of CU10,000 less the additional depreciation that would have been recognised if the asset's fair value at the acquisition date had been recognised from that date (CU500 for three months' depreciation).
- (b) The carrying amount of goodwill as at 31 December 20X1 is decreased by CU10,000.
- (c) Depreciation expense for 20X1 is increased by CU500.

Entity A disclosed in its 20X1 financial statements that the initial accounting for the business combination had not been completed because the independent valuation for the item of property, plant and equipment had not yet been received.

In its 20X2 financial statements, Entity A will disclose the amounts and explanations of the adjustments to the provisional values recognised during the current reporting period. Therefore, Entity A will disclose that the 20X1 comparative information is adjusted retrospectively to increase the fair value of the item of property, plant and equipment at the acquisition date by CU10,000, resulting in an increase to property, plant and equipment of CU9,500, offset by a decrease in goodwill of CU10,000 and an increase in depreciation expense of CU500.

The example below illustrates that adjustments during the measurement period are also made when information is received about the existence of an asset as at the acquisition date:

Illustration 12-2: Identification of an asset during measurement period

Entity C acquired Entity D on 30 November 20X1. Entity C engaged an independent appraiser to assist with the identification and determination of fair values to be assigned to the acquiree's assets and liabilities. However, the appraisal was not finalised by the time Entity C authorised its financial statements for issue for the year ended 31 December 20X1, and therefore the amounts recognised in its 20X1 annual financial statements were on a provisional basis.

Six months after the acquisition date, Entity C received the independent appraiser's final report, in which it was identified by the independent appraiser that the acquiree had an intangible asset with a fair value at the date of acquisition of CU20,000. As this had not been identified at the time when Entity C was preparing its 20X1 annual financial statements, no value had been included for that asset.

In its financial statements for the year ended 31 December 20X2, Entity C retrospectively adjusts the prior year information to reflect the recognition of this intangible asset.

Although a change in the provisional amount recognised for an identifiable asset will usually mean a corresponding decrease or increase in goodwill, new information obtained could affect another identifiable asset or liability. For example, if the acquirer assumed a liability to pay damages relating to an accident in one of the acquiree's facilities, part or all of which was covered by the acquiree's liability insurance policy, new information during the measurement period about the fair value of the liability would affect goodwill. This adjustment to goodwill would be offset, in whole or in part, by a corresponding adjustment resulting from a change to the provisional amount recognised for the claim receivable from the insurer. [IFRS 3.48]. Similarly, if there is a non-controlling interest in the acquiree, and this is measured based on the proportionate share of the identifiable net assets of the acquiree (see section 8.2 above), any adjustments to those assets that had initially been determined on a provisional basis will be offset by the proportionate share attributable to the non-controlling interest.

12.2 Adjustments made after the end of the measurement period

After the end of the measurement period, the acquirer can only revise the accounting for a business combination to correct an error in accordance with IAS 8. [IFRS 3.50]. This would probably be the case only if the original accounting was based on a misinterpretation of the facts which were available at the time; it would not apply simply because new information had come to light which changed the acquiring management's view of the value of the item in question.

Adjustments after the end of the measurement period are not made for the effect of changes in estimates. In accordance with IAS 8, the effect of a change in estimate is recognised in current and future periods (see Chapter 3).

13 Subsequent measurement and accounting

Extract from IFRS 3

- 54 In general, an acquirer shall subsequently measure and account for assets acquired, liabilities assumed or incurred and equity instruments issued in a business combination in accordance with other applicable IFRSs for those items, depending on their nature. However, this IFRS provides guidance on subsequently measuring and accounting for the following assets acquired, liabilities assumed or incurred and equity instruments issued in a business combination:
- (a) reacquired rights;
 - (b) contingent liabilities recognised as of the acquisition date;
 - (c) indemnification assets; and
 - (d) contingent consideration.

Paragraph B63 provides related application guidance.

Assets acquired, liabilities assumed or incurred and equity instruments issued in a business combination are usually accounted for in accordance with the applicable IFRS accounting standards. However, there is specific guidance on subsequent measurement of, and accounting for, the following:

- Reacquired rights (see section 5.6.5 above)
- Contingent liabilities recognised as at the acquisition date (see section 5.6.1.B above)
- Indemnification assets (see section 5.6.4 above)
- Contingent consideration (see section 7.1.3 above) [IFRS 3.54]

Other IFRS accounting standards provide guidance on subsequent measurement and accounting: [IFRS 3.B63]

- IAS 38 prescribes the accounting for identifiable intangible assets acquired in a business combination (see Chapter 18), although accounting for some intangible assets is not prescribed by IAS 38 but by other IFRS accounting standards (see Chapter 18). [IFRS 3.B39]. Goodwill is measured at the amount recognised at the acquisition date less any accumulated impairment losses, measured in accordance with IAS 36 (see Chapter 21).
- IFRS 17 provides guidance on the initial and subsequent measurement of a group of contracts within the scope of IFRS 17 acquired in a business combination (see Chapter 51).
- IAS 12 prescribes the subsequent accounting for deferred tax assets (including unrecognised deferred tax assets) and liabilities acquired in a business combination (see Chapter 29).
- IFRS 2 provides guidance on subsequent measurement and accounting for the portion of replacement share-based payment awards issued by an acquirer that are attributable to employees' future services (see Chapter 30).
- IFRS 10 provides guidance on accounting for changes in a parent's ownership interest in a subsidiary after control is obtained (see Chapter 8).

14 Reverse acquisitions

Extract from IFRS 3

B19 A reverse acquisition occurs when the entity that issues securities (the legal acquirer) is identified as the acquiree for accounting purposes on the basis of the guidance in paragraphs B13-B18. The entity whose equity interests are acquired (the legal acquiree) must be the acquirer for accounting purposes for the transaction to be considered a reverse acquisition. For example, reverse acquisitions sometimes occur when a private operating entity wants to become a public entity but does not want to register its equity shares. To accomplish that, the private entity will arrange for a public entity to acquire its equity interests in exchange for the equity interests of the public entity. In this example, the public entity is the **legal acquirer** because it issued its equity interests, and the private entity is the **legal acquiree** because its equity interests were acquired. However, application of the guidance in paragraphs B13-B18 results in identifying:

- (a) the public entity as the **acquiree** for accounting purposes (the accounting acquiree); and
- (b) the private entity as the **acquirer** for accounting purposes (the accounting acquirer).

The accounting acquiree must meet the definition of a business for the transaction to be accounted for as a reverse acquisition, and all of the recognition and measurement principles in this IFRS, including the requirement to recognise goodwill, apply.

The standard takes the view that the acquirer is usually the entity that issues its equity interests, but recognises that in some business combinations, so-called 'reverse acquisitions', the issuing entity is the acquiree.

Under IFRS 3, a reverse acquisition occurs when the entity that issues securities (the legal acquirer) is identified as the acquiree for accounting purposes based on the guidance in the standard as discussed in section 4.1 above. Perhaps more accurately, the legal acquiree must be identified as the acquirer for accounting purposes.

Reverse acquisitions sometimes occur when a private operating entity wants to become a public entity but does not want to register its equity shares. The private entity will arrange for a public entity to acquire its equity interests in exchange for the equity interests of the public entity. Although the public entity is the legal acquirer because it issued its equity interests, and the private entity is the legal acquiree because its equity interests were acquired, application of the guidance results in identifying: [IFRS 3.B19]

- The public entity as the acquiree for accounting purposes (the accounting acquiree)
- And
- The private entity as the acquirer for accounting purposes (the accounting acquirer)

If the transaction is accounted for as a reverse acquisition, all of the recognition and measurement principles in IFRS 3, including the requirement to recognise goodwill, apply. The standard also notes that the legal acquirer must meet the definition of a business (see section 3.2 above) for the transaction to be accounted for as a reverse acquisition, [IFRS 3.B19], but does not say how to account for the transaction when the accounting acquiree is not a business. It clearly cannot be accounted for as an acquisition of the legal acquiree by the legal acquirer under the standard either, if the legal acquirer has not been identified as the accounting acquirer based on the guidance in the standard. This is discussed further in section 14.8 below.

14.1 Measuring the consideration transferred

The first item included in the computation of goodwill in a reverse acquisition is the consideration transferred by the accounting acquirer, i.e., the legal acquiree/subsidiary. In a reverse acquisition, the accounting acquirer usually issues no consideration for the acquiree; equity shares are issued to the owners of the accounting acquirer by the accounting acquiree. The fair value of the consideration transferred by the accounting acquirer is based on the number of equity interests the legal subsidiary would have had to issue to give the owners of the legal parent the same percentage equity interest in the combined entity that results from the reverse acquisition. The fair value of the number of equity interests calculated in that way is used as the fair value of consideration transferred. [IFRS 3.B20].

These requirements are shown in the following Illustration, which is based on one included within the Illustrative Examples accompanying IFRS 3. [IFRS 3.IE1-IE5].

Illustration 14-1: Reverse acquisition - calculating the fair value of the consideration transferred

Entity A, the entity issuing equity instruments and therefore the legal parent, is acquired in a reverse acquisition by Entity B, the legal subsidiary, on 30 September 20X2. The accounting for any income tax effects is ignored.

Statements of financial position of Entity A and Entity B immediately before the business combination are:

	Entity A	Entity B
	CU	CU
Current assets	500	700
Non-current assets	1,300	3,000
Total assets	1,800	3,700
Current liabilities	300	600
Non-current liabilities	400	1,100
Total liabilities	700	1,700
Owner's equity		
Issued equity		
100 ordinary shares	300	-
60 ordinary shares	-	600
Retained earnings	800	1,400
Total shareholders' equity	1,100	2,000

Other information

- On 30 September 20X2, Entity A issues 2.5 shares in exchange for each ordinary share of Entity B. All of Entity B's shareholders exchange their shares in Entity B. Therefore, Entity A issues 150 ordinary shares in exchange for all 60 ordinary shares of Entity B.
- The fair value of each ordinary share of Entity B at 30 September 20X2 is CU40. The quoted market price of Entity A's ordinary shares at that date is CU16.
- The fair values of Entity A's identifiable assets and liabilities at 30 September 20X2 are the same as their carrying amounts, except that the fair value of Entity A's non-current assets at 30 September 20X2 is CU1,500.

Calculating the fair value of the consideration transferred

As a result of Entity A (legal parent/accounting acquiree) issuing 150 ordinary shares, Entity B's shareholders own 60% of the issued shares of the combined entity (i.e., 150 of 250 issued shares). The remaining 40% are owned by Entity A's shareholders. If the business combination had taken the form of Entity B issuing additional ordinary shares to Entity A's shareholders in exchange for their ordinary shares in Entity A, Entity B would have had to issue 40 shares for the ratio of ownership interest in the combined entity to be the same. Entity B's shareholders would then own 60 out of the 100 issued shares of Entity B - 60% of the combined entity.

As a result, the fair value of the consideration effectively transferred by Entity B and the group's interest in Entity A is CU1,600 (i.e., 40 shares each with a fair value of CU40).

The fair value of the consideration effectively transferred is calculated based on the most reliable measure. In this example, the quoted market price of Entity A's shares provides a more reliable basis for measuring the consideration effectively transferred than the estimated fair value of the shares in Entity B, and the consideration is measured using the market price of Entity A's shares - 100 shares with a fair value per share of CU16, i.e., CU1,600.

The final paragraph in the above example is based on the requirements of IFRS 3.33, i.e., "In a business combination in which the acquirer and the acquiree (or its former owners) exchange only equity interests, the acquisition-date fair value of the acquiree's equity interests may be more reliably measurable than the acquisition-date fair value of the acquirer's equity interests. If so, the acquirer determines the amount of goodwill by using the acquisition-date fair value of the acquiree's equity interests instead of the acquisition-date fair value of the equity interests transferred." [IFRS 3.33]. In the above example, this did not result in a difference as the value of the consideration measured under both approaches was the same. However, the example above indicates that there is a quoted market price for Entity A's shares which is a more reliable basis than the fair value of Entity B's shares. Therefore, if the quoted market price of Entity A's shares had been, say, CU14 per share, the fair value of the consideration effectively transferred would have been measured at CU1,400.

14.2 Measuring goodwill

As there is no non-controlling interest in the accounting acquiree, and assuming that the accounting acquirer had no previously held equity interest in the accounting acquiree, goodwill is measured as the excess of (a) over (b) below:

- (a) The consideration effectively transferred (generally measured at acquisition-date fair value) by the accounting acquirer, i.e., the legal subsidiary.
- (b) The net of the acquisition-date fair values (or other amounts recognised in accordance with the requirements of the standard) of the identifiable assets acquired and the liabilities assumed of the accounting acquiree, i.e., the legal parent.

Illustration 14-2: Reverse acquisition - measuring goodwill (1)

Using the facts in Illustration 14-1 in section 14.1 above, this results in goodwill of CU300, measured as follows:

	CU	CU
Consideration effectively transferred by Entity B		1,600
Net recognised values of Entity A's identifiable assets and liabilities:		
Current assets	500	
Non-current assets	1,500	
Current liabilities	(300)	
Non-current liabilities	(400)	
		<u>1,300</u>
Goodwill		<u>300</u>

Illustration 14-3: Reverse acquisition - measuring goodwill (2)

If Illustration 14-2 above had been based on the same facts as Illustration 14-1 in section 14.1 above, except that the quoted market price of Entity A's shares had been CU14 per share, the fair value of the consideration effectively transferred is CU1,400, resulting in goodwill of CU100.

14.3 Preparation and presentation of consolidated financial statements

Although the accounting for the reverse acquisition reflects the legal subsidiary as being the accounting acquirer, the consolidated financial statements are issued in the name of the legal parent/accounting acquiree. In some cases, a reverse acquisition may be immediately followed by a legal merger between the legal parent and subsidiary. This is considered further in Chapter 9. Consequently, the financial statements have to be described in the notes as a continuation of the financial statements of the legal subsidiary/accounting acquirer, with one adjustment, which is to adjust retrospectively the accounting acquirer's legal capital to reflect the legal capital of the accounting acquiree. Comparative information presented in those consolidated financial statements is therefore that of the legal subsidiary/accounting acquirer, not that originally presented in the previous financial statements of the legal parent/accounting acquiree as adjusted to reflect the legal capital of the legal parent/accounting acquiree. [IFRS 3.B21].

The consolidated financial statements reflect:

- (a) The assets and liabilities of the legal subsidiary/accounting acquirer recognised and measured at their pre-combination carrying amounts, i.e., not at their acquisition-date fair values.
- (b) The assets and liabilities of the legal parent/accounting acquiree recognised and measured in accordance with IFRS 3, i.e., generally at their acquisition-date fair values.
- (c) The retained earnings and other equity balances of the legal subsidiary/accounting acquirer before the business combination, i.e., not those of the legal parent/accounting acquiree.
- (d) The amount recognised as issued equity instruments in the consolidated financial statements determined by adding the issued equity of the legal subsidiary/accounting acquirer outstanding immediately before the business combination to the fair value of the legal parent/accounting acquiree. However, the equity structure (i.e., the number and type of equity instruments issued) reflects the equity structure of the legal parent/accounting acquiree, including the equity instruments issued by the legal parent to effect the combination. Accordingly, the equity structure of the legal subsidiary/accounting acquirer is restated using the exchange ratio established in the acquisition agreement to reflect the number of shares of the legal parent/accounting acquiree issued in the reverse acquisition.
- (e) The non-controlling interest's proportionate share of the legal subsidiary's/accounting acquirer's pre-combination carrying amounts of retained earnings and other equity interests (as discussed in section 14.4 below). [IFRS 3.B22].
- (f) The income statement for the current period reflects that of the legal subsidiary/accounting acquirer for the full period together with the post-acquisition results of the legal parent/accounting acquiree based on the attributed fair values.

How we see it

It is unclear why the application guidance in (d) above refers to using 'the fair value of the legal parent/accounting acquiree', when, as discussed previously in section 14.1 above, the guidance for determining 'the fair value of the consideration effectively transferred' uses a different method of arriving at the value of the consideration given. The amount recognised as issued equity must reflect whichever value has been determined for the consideration effectively transferred.

Continuing with Illustration 14-1 in section 14.1 above, the consolidated statement of financial position immediately after the business combination will be as follows:

Illustration 14-4: Reverse acquisition - consolidated statement of financial position immediately after the business combination

Using the facts in Illustration 14-1 in section 14.1 above, the consolidated statement of financial position immediately after the date of the business combination is as follows (the intermediate columns for Entity B (legal subsidiary/accounting acquirer) and Entity A (legal parent/accounting acquiree) are included to show the workings):

	Entity B	Entity A	Consolidated
	Book values	Fair values	
	CU	CU	CU
Current assets	700	500	1,200
Non-current assets	3,000	1,500	4,500
Goodwill	-	300	300
Total assets	3,700	2,300	6,000
Current liabilities	600	300	900
Non-current liabilities	1,100	400	1,500
Total liabilities	1,700	700	2,400
Owner's equity			
Issued equity			
250 ordinary shares	600	1,600	2,200
Retained earnings	1,400	-	1,400
Total shareholders' equity	2,000	1,600	3,600

The amount recognised as issued equity interests in the consolidated financial statements (CU2,200) is determined by adding the issued equity of the legal subsidiary/accounting acquirer immediately before the business combination (CU600) and the fair value of the consideration effectively transferred (CU1,600). However, the equity structure appearing in the consolidated financial statements (i.e., the number and type of equity interests issued) must reflect the equity structure of the legal parent/accounting acquiree, including the equity interests issued by the legal parent/accounting acquiree to effect the combination. As noted above, we believe that the amount recognised as issued equity must reflect whichever value has been determined for the consideration effectively transferred.

The application guidance in IFRS 3 only deals with reverse acquisition accounting in the consolidated financial statements; no mention is made as to the accounting in the separate financial statements of the legal parent/accounting acquiree. However, the previous version of IFRS 3 indicated that reverse acquisition accounting applies only in the consolidated financial statements, and that in the legal parent's separate financial statements, the investment in the legal subsidiary is accounted for in accordance with certain superseded requirements in IAS 27. (See Chapter 9 for further discussion). [IFRS 3(2007).B8].

14.4 Non-controlling interest

In a reverse acquisition, some of the owners of the legal subsidiary/accounting acquirer might not exchange their equity instruments for equity instruments of the legal parent/accounting acquiree. Those owners are required to be treated as a non-controlling interest in the consolidated financial statements after the reverse acquisition. This is because the owners of the legal subsidiary that do not exchange their equity instruments for equity instruments of the legal parent have an interest only in the results and net assets of the legal subsidiary, and not in the results and net assets of the combined entity. Conversely, even though the legal parent is the acquiree for accounting purposes, the owners of the legal parent have an interest in the results and net assets of the combined entity. [IFRS 3.B23].

As indicated in section 14.3 above, the assets and liabilities of the legal subsidiary/accounting acquirer are recognised and measured in the consolidated financial statements at their pre-combination carrying amounts. Therefore, in a reverse acquisition the non-controlling interest reflects the non-controlling shareholders' proportionate interest in the pre-combination carrying amounts of the legal subsidiary's net assets even if the non-controlling interests in other acquisitions are measured at fair value at the acquisition date. [IFRS 3.B24].

These requirements are shown in the following Illustration, which is based on one included within the Illustrative Examples accompanying IFRS 3. [IFRS 3.IE11-IE15].

Illustration 14-5: Reverse acquisition - non-controlling interest

This example uses the same facts as in Illustration 14-1 above, except that only 56 of Entity B's 60 ordinary shares are exchanged. Because Entity A issues 2.5 shares in exchange for each ordinary share of Entity B, Entity A issues only 140 (rather than 150) shares. As a result, Entity B's shareholders own 58.3% of the issued shares of the combined entity (i.e., 140 shares out of 240 issued shares).

As in Illustration 14-1 above, the fair value of the consideration transferred for Entity A, the accounting acquiree, is calculated by assuming that the combination had been effected by Entity B issuing additional ordinary shares to the shareholders of Entity A in exchange for their ordinary shares in Entity A. That is because Entity B is the accounting acquirer, and IFRS 3 requires the acquirer to measure the consideration exchanged for the accounting acquiree (see section 14.1 above).

In calculating the number of shares that Entity B would have had to issue, the non-controlling interest is excluded from the calculation. The majority shareholders own 56 shares of Entity B. For that to represent a 58.3% ownership interest, Entity B would have had to issue an additional 40 shares. The majority shareholders would then own 56 out of the 96 issued shares of Entity B and therefore 58.3% of the combined entity.

As a result, the fair value of the consideration transferred for Entity A, the accounting acquiree, is CU1,600 (i.e., 40 shares, each with a fair value of CU40). That is the same amount as when all 60 of Entity B's shareholders tender all 60 of its ordinary shares for exchange (see Illustration 14-1 above). The recognised amount of the group's interest in Entity A, the accounting acquiree, does not change if some of Entity B's shareholders do not participate in the exchange.

The non-controlling interest is represented by the 4 shares of the total 60 shares of Entity B that are not exchanged for shares of Entity A. Therefore, the non-controlling interest is 6.7%. The non-controlling interest reflects the proportionate interest of the non-controlling shareholders in the pre-combination carrying amounts of the net assets of Entity B, the legal subsidiary. Therefore, the consolidated statement of financial position is adjusted to show a non-controlling interest of 6.7% of the pre-combination carrying amounts of Entity B's net assets (i.e., CU134 or 6.7% of CU2,000).

The consolidated statement of financial position as at 30 September 20X2 (the date of the business combination) reflecting the non-controlling interest is as follows (the intermediate columns for Entity B (legal subsidiary/accounting acquirer), non-controlling interest and Entity A (legal parent/accounting acquiree) are included to show the workings):

	Entity B Book values	Non- controlling interest	Entity A Fair values	Consolidated
	CU	CU	CU	CU
Current assets	700	-	500	1,200
Non-current assets	3,000	-	1,500	4,500
Goodwill	-	-	300	300
Total assets	3,700	-	2,300	6,000
Current liabilities	600	-	300	900
Non-current liabilities	1,100	-	400	1,500
	1,700	-	700	2,400
Owner's equity				
Issued equity				
240 ordinary shares	600	(40)	1,600	2,160
Retained earnings	1,400	(94)	-	1,306
Non-controlling interest	-	134	-	134
	2,000	-	1,600	3,600

The non-controlling interest of CU134 has two components. The first component is the reclassification of the non-controlling interest's share of the accounting acquirer's retained earnings immediately before the acquisition ($\text{CU}1,400 \times 6.7\%$ or CU93.80). The second component represents the reclassification of the non-controlling interest's share of the accounting acquirer's issued equity ($\text{CU}600 \times 6.7\%$ or CU40.20).

14.5 Earnings per share

The equity structure, i.e., the number and type of equity instruments issued, in the consolidated financial statements following a reverse acquisition reflects the equity structure of the legal parent/accounting acquiree, including the equity instruments issued by the legal parent to effect the business combination. [IFRS 3.B25].

When the legal parent is required by IAS 33 *Earnings per Share* to disclose earnings per share information (see Chapter 33), then for the purpose of calculating the weighted average number of ordinary shares outstanding (the denominator of the earnings per share calculation) during the period in which the reverse acquisition occurs:

- The number of ordinary shares outstanding from the beginning of that period to the acquisition date is computed on the basis of the weighted average number of ordinary shares of the legal subsidiary/accounting acquirer outstanding during the period multiplied by the exchange ratio established in the acquisition agreement.
And
- The number of ordinary shares outstanding from the acquisition date to the end of that period is the actual number of ordinary shares of the legal parent/accounting acquiree outstanding during that period. [IFRS 3.B26].

The basic earnings per share disclosed for each comparative period before the acquisition date is calculated by dividing:

- The profit or loss of the legal subsidiary/accounting acquirer attributable to ordinary shareholders in each of those periods
By
- The legal subsidiary/accounting acquirer's historical weighted average number of ordinary shares outstanding multiplied by the exchange ratio established in the acquisition agreement [IFRS 3.B27]

These requirements are shown in the following Illustration, which is based on one included within the Illustrative Examples accompanying IFRS 3. [IFRS 3.IE9, IFRS 3.IE10].

Illustration 14-6: Reverse acquisition - earnings per share

This example uses the same facts as in Illustration 14-1 in section 14.1 above. Assume that Entity B's earnings for the annual period ended 31 December 20X1 were CU600, and that the consolidated earnings for the annual period ending 31 December 20X2 were CU800. Assume also that there was no change in the number of ordinary shares issued by Entity B (legal subsidiary/accounting acquirer) during the annual period ended 31 December 20X1 and during the period from 1 January 20X2 to the date of the reverse acquisition (30 September 20X2), nor by Entity A (legal parent, accounting acquiree) after that date.

Earnings per share for the annual period ended 31 December 20X2 is calculated as follows:

Number of shares deemed to be outstanding for the period from 1 January 20X2 to the acquisition date (i.e., the number of ordinary shares issued by Entity A (legal parent, accounting acquiree) in the reverse acquisition, or more accurately, the weighted average number of ordinary shares of Entity B (legal subsidiary/accounting acquirer) outstanding during the period multiplied by the exchange ratio established in the acquisition agreement (i.e., 60×2.5)	150
Number of shares of Entity A (legal parent/accounting acquiree) outstanding from the acquisition date to 31 December 20X2	250
Weighted average number of shares outstanding ($150 \times 9/12$) + ($250 \times 3/12$)	175
Earnings per share ($\text{CU}800 \div 175$)	CU4.57

The restated earnings per share for the annual period ending 31 December 20X1 is CU4.00 - being $\text{CU}600 \div 150$, i.e., the earnings of Entity B (legal subsidiary, accounting acquirer) for that period divided by the number of ordinary shares Entity A issued in the reverse acquisition (or more accurately, by the weighted average number of ordinary shares of Entity B (legal subsidiary/accounting acquirer) outstanding during the period multiplied by the exchange ratio established in the acquisition agreement, i.e., 60×2.5). Any earnings per share information for that period previously disclosed by either Entity A or Entity B is irrelevant.

14.6 Cash consideration

In some circumstances the combination may be effected whereby some of the consideration given by the legal acquirer (Entity A) to acquire the shares in the legal acquiree (Entity B) is cash.

Normally, the entity transferring cash consideration would be considered the acquirer. [IFRS 3.B14]. This is because, if a substantial part of the consideration is cash, the legal acquiree's shareholders will receive insufficient shares to dominate the voting of the legal acquirer and thus will not be able to dictate the selection of the board and management of the legal acquirer. However, despite the form of the consideration, the key determinant in identifying an acquirer is whether it has control over the other entity (see section 4.1 above).

Therefore, if there is evidence demonstrating that the legal acquiree, Entity B, has obtained control over Entity A by being exposed, or having rights, to variable returns from its involvement with Entity A and having the ability to affect those returns through its power over Entity A, Entity B is then the acquirer and the combination is accounted for as a reverse acquisition.

In that case, how is any cash paid accounted for?

One approach might be to treat the payment as a pre-acquisition transaction with a resulting reduction in the consideration and in net assets acquired (with no net impact on goodwill). However, we do not believe this is appropriate. Any consideration, whether cash or shares, transferred by Entity A cannot form part of the consideration transferred by the acquirer as Entity A is the accounting acquiree. As discussed in section 14.3 above, although the consolidated financial statements following a reverse acquisition are issued under the name of the legal parent (Entity A), they are described in the notes as a continuation of the financial statements of the legal subsidiary (Entity B).

How we see it

Since the consolidated financial statements are a continuation of Entity B's financial statements, in our view the cash consideration paid from Entity A (the accounting acquiree) to the shareholders of Entity B (the accounting acquirer) is accounted for as a distribution from the consolidated group to the shareholders of the accounting parent as at the combination date.

When a cash payment is made to effect the combination, the requirements of IFRS 3 need to be applied with care as shown in the following Illustration.

Illustration 14-7: Reverse acquisition effected with cash consideration

Entity A has 100,000 ordinary shares in issue, with a market price of CU2.00 per share, giving a market capitalisation of CU200,000. It acquires all of the shares in Entity B for a consideration of CU500,000 satisfied by the issue of 200,000 shares (with a value of CU400,000) and a cash payment of CU100,000 to Entity B's shareholders. Entity B has 200,000 shares in issue, with an estimated fair value of CU2.50 per share. After the combination Entity B's shareholders control the voting of Entity A and, as a result, have been able to appoint Entity B's directors and key executives to replace their Entity A counterparts. Accordingly, Entity B is considered to have obtained control over Entity A. Therefore, Entity B is identified as the accounting acquirer. The combination must be accounted for as a reverse acquisition, i.e., an acquisition of Entity A (legal parent/accounting acquiree) by Entity B (legal subsidiary/accounting acquirer).

How is the consideration transferred by the accounting acquirer (Entity B) for its interest in the accounting acquiree (Entity A) determined?

Applying the requirements of IFRS 3.B20 (discussed in section 14.1 above) to the transaction might erroneously lead to the following conclusion. Entity A has had to issue 200,000 shares to Entity B's shareholders, resulting in Entity B's shareholders having 66.67% ($200,000 \div 300,000$) of the equity and Entity A's shareholders 33.33% ($100,000 \div 300,000$). If Entity B's share price is used to determine the fair value of the consideration transferred, then under IFRS 3.B20, Entity B would have had to issue 100,000 shares to Entity A's shareholders to result in the same % shareholdings ($200,000 \div 300,000 = 66.67\%$). This would apparently give a value of the consideration transferred of $100,000 @ CU2.50 = CU250,000$. This does not seem correct, for the reasons discussed below.

If there had been no cash consideration at all, Entity A would have issued 250,000 shares to Entity B's shareholders, resulting in Entity B's shareholders having 71.43% ($250,000 \div 350,000$) of the equity and Entity A's shareholders 28.57% ($100,000 \div 350,000$). If Entity B's share price is used to determine the value of the consideration transferred, then under IFRS 3.B20, Entity B would have had to issue 80,000 shares to Entity A's shareholders to result in the same % shareholdings ($200,000 \div 280,000 = 71.43\%$). This would give a value for the consideration transferred of $80,000 @ CU2.50 = CU200,000$. If it was thought that the fair value of Entity A's shares was more reliably measurable, IFRS 3.33 would require the consideration to be measured using the market price of Entity A's shares. As Entity B has effectively acquired 100% of Entity A, the value of the consideration transferred would be CU200,000 (the same as under the revised IFRS 3.B20 calculation above).

In our view, the proper analysis of the IFRS 3.B20 calculation in this case is that of the 100,000 shares that Entity B is deemed to have issued, only 80,000 of them are to acquire Entity A's shares, resulting in consideration transferred of CU200,000. The extra 20,000 shares are to compensate Entity A's shareholders for the fact that Entity B's shareholders have received a cash distribution of CU100,000, and is effectively a stock distribution to Entity A's shareholders of CU50,000 ($20,000 @ CU2.50$), being their share (33.33%) of a total distribution of CU150,000. However, since the equity structure (i.e., the number and type of shares) appearing in the consolidated financial statements reflects that of the legal parent, Entity A, this 'stock distribution' will not actually be apparent. The only distribution that will be shown as a movement in equity is the CU100,000 cash paid to Entity B's shareholders.

14.7 Share-based payments

In a reverse acquisition, the legal acquirer (Entity A) may have an existing share-based payment plan at the date of acquisition. How does the entity account for awards held by the employees of the accounting acquiree?

How we see it

We believe that when, at the date of reverse acquisition, the accounting acquiree has an existing share-based payment plan held by its employees, the accounting acquirer A allocates the acquisition-date fair value of awards made by the accounting acquiree to the portion attributable to the vesting period prior to the reverse acquisition, and to the portion that vests after the reverse acquisition. The former is recognised as part of the consideration transferred by the accounting acquirer for the business combination, and the latter is treated as post-combination expense.

Under IFRS 3, accounting for a reverse acquisition takes place from the perspective of the accounting acquirer, not the legal acquirer. Therefore, the accounting for the share-based payment plan of Entity A is based on what would have happened if Entity B rather than Entity A had issued such equity instruments. As indicated in section 14.1 above, in a reverse acquisition, the acquisition-date fair value of the consideration transferred by the accounting acquirer for its interest in the accounting acquiree is based on the number of equity interests the legal subsidiary would have had to issue to give the owners of the legal parent the same percentage equity interest in the combined entity that results from the reverse acquisition. The fair value of the number of equity interests calculated in that way can be used as the fair value of consideration transferred in exchange for the acquiree. Therefore, although the legal form of awards made by the accounting acquiree (Entity A) does not change, from an accounting perspective, it is as if these awards have been exchanged for a share-based payment award of the accounting acquirer (Entity B).

As a result, absent any legal modification to the share-based payment awards in Entity A, the acquisition-date fair value of the legal parent/accounting acquiree's (Entity A's) share-based payments awards are included as part of the consideration transferred by the accounting acquirer (Entity B), based on the same principles as those described in IFRS 3.B56 to B62 (see section 7.2 above and Chapter 30). [IFRS 3.B56-B62]. That is, the portion of the fair value attributed to the vesting period prior to the reverse acquisition is recognised as part of the consideration paid for the business combination and the portion that vests after the reverse acquisition is treated as post-combination expense.

14.8 Acquisitions involving a non-trading shell company

The requirements for reverse acquisitions in IFRS 3, and the guidance provided by the standard, discussed above are based on the premise that the legal parent/accounting acquiree has a business which has been acquired by the legal subsidiary/accounting acquirer. In some situations, this may not be the case, for example when a private entity arranges to have itself 'acquired' by a non-trading public entity as a means of obtaining a stock exchange listing or when a target is determined to be an accounting acquirer in a transaction with a SPAC that does not constitute a business (see our publication *Applying IFRS: Accounting for SPACs*).

As indicated in section 14 above, the standard notes that the legal parent/accounting acquiree must meet the definition of a business (see section 3.2 above) for the transaction to be accounted for as a reverse acquisition, [IFRS 3.B19], but does not say how to account for the transaction when the accounting acquiree is not a business.

In 2013, the IFRS IC²⁰ has clarified that in a reverse acquisition involving an entity that does not constitute a business (i.e., an asset acquisition or the provision of a service), IFRS 2 rather than IFRS 3 is likely to apply.

20 [IFRIC Update](#), March 2013, available on the IFRS Foundation's website.

The issue that was considered by the IFRS IC involved the former shareholders of a non-listed operating entity becoming the majority shareholders of the combined entity by exchanging their shares for new shares of a listed non-operating entity. The IFRS IC concluded that it is appropriate to apply the IFRS 3 guidance for reverse acquisitions by analogy, and the accounting acquirer is deemed to have issued shares to obtain control of the acquiree. The transaction is not a business combination, but a share-based payment transaction which is accounted for in accordance with IFRS 2 (i.e., an asset acquisition or provision of service). The IFRS IC concluded that any difference in the fair value of the shares deemed to have been issued by the accounting acquirer and the fair value of the accounting acquiree's identifiable net assets represents a service received by the accounting acquirer for obtaining a stock exchange listing.

How we see it

In our view, when an accounting acquiree is not a business, a transaction is accounted for in the consolidated financial statements of the legal parent as a continuation of the financial statements of the private entity (the legal subsidiary), together with a deemed issue of shares by the private entity (the legal subsidiary) and a re-capitalisation of the equity of the private entity (the legal subsidiary).

Under IFRS 2, for equity-settled share-based payments, an entity measures the goods or services received, and the corresponding increase in equity, directly at the fair value of the goods or services received. If the entity cannot estimate reliably the fair value of the goods and services received, the entity measures the amounts, indirectly, by reference to the fair value of the equity instruments issued. [IFRS 2.10]. For transactions with non-employees, IFRS 2 presumes that the fair value of the goods and services received is more readily determinable. [IFRS 2.13]. This would suggest that the increase in equity is based on the cash and the fair value of the listing status. As it is unlikely that a fair value of the listing status can be reliably estimated, the increase in equity will be measured by reference to the fair value of the shares that are deemed to have been issued.

Even if a fair value could be attributed to the listing status, if the total identifiable consideration received is less than the fair value of the equity given as consideration, the transaction is measured based on the fair value of the shares that are deemed to be issued. [IFRS 2.13A]. This issue was considered by the IFRS IC between September 2012 and March 2013 and the IFRS IC conclusions in the final agenda decision published in March 2013 accord with the analysis given above.

Frequently asked questions

Question 14-1: Is it appropriate to apply the IFRS 3 guidance for reverse acquisitions by analogy to a transaction in which the former shareholders of a non-listed operating entity become the majority shareholders of the combined entity, by exchanging their shares for new shares of a listed non-trading company?

In March 2013, the IFRS IC concluded that for a transaction in which the former shareholders of a non-listed operating entity become the majority shareholders of the combined entity by exchanging their shares for new shares of a listed non-trading company, it is appropriate to apply the IFRS 3 guidance for reverse acquisitions by analogy. This results in the non-listed operating entity being identified as the accounting acquirer, and the listed non-trading entity being identified as the accounting acquiree. The accounting acquirer is deemed to have issued shares to obtain control of the acquiree. If the listed non-trading entity is not a business, the transaction is not a business combination, but a share-based payment transaction which is accounted for in accordance with IFRS 2. Any difference in the fair value of the shares deemed to have been issued by the accounting acquirer and the fair value of the accounting acquiree's identifiable net assets represents a service received by the accounting acquirer. The IFRS IC concluded that regardless of the level of monetary or non-monetary assets owned by the non-listed operating entity the entire difference is considered to be payment for the service of obtaining a stock exchange listing for its shares and no amount is considered a cost of raising capital.²¹

²¹ [IFRIC Update](#), March 2013, available on the IFRS Foundation's website.

The application of these conclusions is shown in the Illustration below.

Illustration 14-8: Acquisition of a non-trading shell company

Entity A is a non-trading public company with 10,000 ordinary shares in issue. On 1 January 20X2, Entity A issues 190,000 ordinary shares in exchange for all of the ordinary share capital of Entity B, a private trading company, with 9,500 ordinary shares in issue.

At the date of the transaction, Entity A has CU85,000 of cash and the quoted market price of Entity A's ordinary shares is CU12.

The fair value of Entity B has been determined by an independent professional valuer as being CU2,185,000, giving a value per share of CU230.

Following the transaction, apart from one non-executive director, all of the directors of Entity A resign and four new directors from Entity B are appointed to the Board of Entity A.

As a result of Entity A issuing 190,000 ordinary shares, Entity B's shareholders own 95% of the issued share capital of the combined entity (i.e., 190,000 of the 200,000 issued shares), with the remaining 5% held by Entity A's existing shareholders.

How is this transaction accounted for in the consolidated financial statements of Entity A?

As the shareholders of Entity A only retain a 5% interest in the combined entity after the transaction, and the Board is dominated by appointees from Entity B, this cannot be accounted for as an acquisition of Entity B by Entity A. Also, as Entity A is a non-trading cash shell company, and therefore not comprising a business (see section 3.2 above), it cannot be accounted for as a reverse acquisition of Entity A by Entity B.

The consolidated financial statements reflect the substance of the transaction which is that Entity B is the continuing entity. Entity B is deemed to have issued shares in exchange for the CU85,000 cash held by Entity A together with the listing status of Entity A.

However, the listing status does not qualify for recognition as an intangible asset, and therefore is expensed in profit or loss. As the existing shareholders of Entity A have a 5% interest in the combined entity, Entity B would have had to issue 500 shares for the ratio of ownership interest in the combined entity to be the same. Based on the fair value of an Entity B share of CU230, the accounting for the transaction is:

Dr	Cash received	CU85,000	
Dr	Listing expense (income statement)	CU30,000	
	Cr	Issued equity* (500 × CU230)	CU115,000

As Entity B is a private entity, it may be that a more reliable basis for determining the fair value of the deemed shares issued would have been to use the quoted market price of Entity A's shares at the date of the transaction. On this basis, the issued equity would have been CU120,000 (10,000 × CU12), giving rise to a listing expense of CU35,000.

In summary, the accounting for this transaction is similar in many respects to that which would have been the case if the transaction had been accounted for as a reverse acquisition; the main difference being that no goodwill arises on the transaction, and that any amount that would have been so recognised is accounted for as a listing expense. Indeed, if the transaction had been accounted for as a reverse acquisition, the overall effect may have been the same if an impairment loss on the 'goodwill' had been recognised.

* Refer to Chapter 30 on the accounting considerations for financial instruments, including cash, acquired in the acquisition applying IAS 32.

14.8.1 Special purpose acquisition companies (SPAC)

For the discussion on the accounting when a target that is a legal acquiree is determined to be an accounting acquirer in a transaction with a SPAC that does not constitute a business, please refer to section 14.8 above. For further discussion please see our publication *Applying IFRS: Accounting for SPACs*.

14.9 Reverse acquisitions and acquirers that are not legal entities

Sometimes reverse acquisitions involve a combination of a non-trading listed entity with a business that is not housed in a separate legal entity before the transaction. For instance, a larger legal entity may wish to carve-out an internal division or branch through an IPO. In September 2011, the IFRS IC considered whether a business that is not a legal entity could be the acquirer in a reverse acquisition. It noted that the issue is not widespread but nevertheless provided some guidance in its agenda decision.

Frequently asked questions

Question 14-2: Could a business that is not a legal entity be identified as an acquirer in a reverse acquisition?

The IFRS IC concluded that an acquirer that is a reporting entity, but not a legal entity, can be considered the acquirer in a reverse acquisition. The IFRS IC observed that IFRS accounting standards and the 1989 *Conceptual Framework* do not require a 'reporting entity' to be a legal entity. Therefore, as long as the business that is not a legal entity obtains control of the acquiree and, in accordance with Appendix A of IFRS 3, the acquiree is "the business or businesses that the **acquirer** obtains control of in a **business combination**" then "...the entity whose equity interests are acquired (the legal acquiree) must be the acquirer for accounting purposes for the transaction to be considered a reverse acquisition." [IFRS 3.7, IFRS 3 Appendix A, IFRS 3.B19].²²

The 2018 *Conceptual Framework* (effective for annual periods beginning on or after 1 January 2020) does not alter the analysis above, as it states explicitly that a reporting entity is not necessarily a legal entity. [CF 3.10].

²² [IFRIC Update](#), September 2011, available on the IFRS Foundation's website.

15 Push down accounting

The term 'push down accounting' relates to the practice adopted in some jurisdictions of incorporating, or 'pushing down', the fair value adjustments which have been made by the acquirer into the financial statements of the acquiree, including the goodwill arising on the acquisition. It is argued that the acquisition, being an independently bargained transaction, provides better evidence of the values of the assets and liabilities of the acquiree than those previously contained within its financial statements, and therefore represents an improved basis of accounting. There are, however, contrary views, which hold that the transaction in question was one to which the reporting entity was not a party, and there is no reason why an adjustment is made to the entity's own accounting records.

Push down accounting may be useful as it removes the need to make consolidation adjustments in each subsequent year, based on parallel accounting records. However, eligibility of applying 'push down accounting' in financial statements prepared in accordance with IFRS accounting standards is questionable.

How we see it

In our view, if the acquiree is preparing its financial statements in accordance with IFRS accounting standards, it cannot apply push down accounting and reflect the fair value adjustments made by the acquirer and the goodwill that arose on its acquisition.

All of the requirements of IFRS accounting standards must be applied when an entity prepares its financial statements. IFRS accounting standards require assets and liabilities to be recognised initially at cost or fair value, depending on the nature of the assets and liabilities. The acquisition of an entity by another party is not a transaction undertaken by that entity itself; hence it cannot be a transaction to determine cost.

Application of push down accounting would result in the recognition and measurement of assets and liabilities that are prohibited by some standards (such as internally generated intangibles and goodwill) and the recognition and measurement of assets and liabilities at amounts that are not permitted under IFRS accounting standards. While some IFRS accounting standards include an option or requirement to revalue particular assets, this is undertaken as part of a process of determining accounting policies rather than as one-off revaluations. For example:

- IAS 2 *Inventories* requires that inventories are measured at the lower of cost and net realisable value (see Chapter 23).
- IAS 16 requires that items of property, plant and equipment are initially measured at cost. Subsequently, property, plant and equipment can be measured at cost or at revalued amount. However, revaluations must be applied consistently and must be performed on a regular basis. Therefore, a one-off revaluation is not permitted (see Chapter 19).
- IAS 38 requires that intangible assets are initially measured at cost. Subsequently, they can be revalued only in rare circumstances where there is an active market. In addition, IAS 38 specifically prohibits the recognition of internally generated goodwill. Therefore, a one-off revaluation is not permitted (see Chapter 18).

16 Disclosures

Extract from IFRS 3

Disclosures

- 59 The acquirer shall disclose information that enables users of its financial statements to evaluate the nature and financial effect of a business combination that occurs either:
- (a) during the current reporting period; or
 - (b) after the end of the reporting period but before the financial statements are authorised for issue.
- 60 To meet the objective in paragraph 59, the acquirer shall disclose the information specified in paragraphs B64-B66.
- 61 The acquirer shall disclose information that enables users of its financial statements to evaluate the financial effects of adjustments recognised in the current reporting period that relate to business combinations that occurred in the period or previous reporting periods.
- 62 To meet the objective in paragraph 61, the acquirer shall disclose the information specified in paragraph B67.
- 63 If the specific disclosures required by this and other IFRSs do not meet the objectives set out in paragraphs 59 and 61, the acquirer shall disclose whatever additional information is necessary to meet those objectives.

[IFRS 3.59, IFRS 3.60, IFRS 3.61, IFRS 3.62, IFRS 3.63].

The disclosure requirements of IFRS 3 are set out below. Note that, although IFRS 13 provides guidance on how to measure fair value, IFRS 13 disclosures are not required for items that are recognised at fair value only at initial recognition. [IFRS 13.91(a)]. For example, the information about the fair value measurement of a non-controlling interest in an acquiree if measured at fair value at the acquisition date is disclosed in accordance with the requirements of IFRS 3. [IFRS 3.B64(o)(i)].

16.1 Nature and financial effect of business combinations

The first disclosure objective is that the acquirer discloses information that enables users of its financial statements to evaluate the nature and financial effect of a business combination that occurs either:

- During the current reporting period
- Or
- After the end of the reporting period but before the financial statements are authorised for issue [IFRS 3.59]

Information that is required to be disclosed by the acquirer to meet the above objective is specified in the application guidance of the standard. [IFRS 3.60].

16.1.1 Business combinations during the current reporting period

To meet the above objective, the acquirer is required to disclose the following information for each business combination that occurs during the reporting period: [IFRS 3.B64]

- (a) The name and a description of the acquiree.
- (b) The acquisition date.
- (c) The percentage of voting equity interests acquired.
- (d) The primary reasons for the business combination and a description of how the acquirer obtained control of the acquiree.
- (e) A qualitative description of the factors that make up the goodwill recognised, such as expected synergies from combining operations of the acquiree and the acquirer, intangible assets that do not qualify for separate recognition or other factors.

- (f) The acquisition-date fair value of the total consideration transferred and the acquisition-date fair value of each major class of consideration, such as:
 - (i) Cash
 - (ii) Other tangible or intangible assets, including a business or subsidiary of the acquirer
 - (iii) Liabilities incurred, for example, a liability for contingent consideration
 - (iv) Equity interests of the acquirer, including the number of instruments or interests issued or issuable and the method of measuring the fair value of those instruments or interests
- (g) For contingent consideration arrangements and indemnification assets:
 - (i) The amount recognised as of the acquisition date
 - (ii) A description of the arrangement and the basis for determining the amount of the payment
 - (iii) An estimate of the range of outcomes (undiscounted) or, if a range cannot be estimated, that fact and the reasons why a range cannot be estimated. If the maximum amount of the payment is unlimited, the acquirer discloses that fact.
- (h) For acquired receivables:
 - (i) The fair value of the receivables
 - (ii) The gross contractual amounts receivable
 - (iii) The best estimate at the acquisition date of the contractual cash flows not expected to be collected

The disclosures are to be provided by major class of receivable, such as loans, direct finance leases and any other class of receivables.
- (i) The amounts recognised as of the acquisition date for each major class of assets acquired and liabilities assumed.
- (j) For each contingent liability recognised in accordance with IFRS 3.23 of the standard (see section 5.6.1 above), the information required in IAS 37.85 (see Chapter 27). If a contingent liability is not recognised because its fair value cannot be measured reliably, the acquirer discloses:
 - (i) The information required by IAS 37.86 (see Chapter 27)
 - (ii) The reasons why the liability cannot be measured reliably
- (k) The total amount of goodwill that is expected to be deductible for tax purposes.
- (l) For transactions that are recognised separately from the acquisition of assets and assumption of liabilities in the business combination in accordance with IFRS 3.51 (see section 11 above):
 - (i) A description of each transaction
 - (ii) How the acquirer accounted for each transaction
 - (iii) The amounts recognised for each transaction and the line item in the financial statements in which each amount is recognised
 - (iv) If the transaction is the effective settlement of a pre-existing relationship, the method used to determine the settlement amount
- (m) The disclosure of separately recognised transactions required by (l) above includes the amount of acquisition-related costs and, separately, the amount of those costs recognised as an expense and the line item or items in the statement of comprehensive income in which those expenses are recognised. The amount of any issue costs not recognised as an expense and how they were recognised are also to be disclosed.
- (n) In a bargain purchase (see section 10 above):
 - (i) The amount of any gain recognised and the line item in the statement of comprehensive income in which the gain is recognised
 - (ii) A description of the reasons why the transaction resulted in a gain
- (o) For each business combination in which the acquirer holds less than 100% of the equity interests in the acquiree at the acquisition date (i.e., there is a non-controlling interest - see section 8 above):
 - (i) The amount of the non-controlling interest in the acquiree recognised at the acquisition date and the measurement basis for that amount
 - (ii) For each non-controlling interest in an acquiree measured at fair value, the valuation techniques and significant inputs used to measure that value

- (p) In a business combination achieved in stages (see section 9 above):
 - (i) The acquisition-date fair value of the equity interest in the acquiree held by the acquirer immediately before the acquisition date
 - (ii) The amount of any gain or loss recognised as a result of remeasuring to fair value the equity interest in the acquiree held by the acquirer before the business combination and the line item in the statement of comprehensive income in which that gain or loss is recognised
- (q) The following information:
 - (i) The amounts of revenue and profit or loss of the acquiree since the acquisition date included in the consolidated statement of comprehensive income for the reporting period
 - (ii) The revenue and profit or loss of the combined entity for the current reporting period as though the acquisition date for all business combinations that occurred during the year had been as of the beginning of the annual reporting period

If disclosure of any of the information required by this subparagraph is impracticable, the acquirer discloses that fact and explain why the disclosure is impracticable. IFRS 3 uses the term 'impracticable' with the same meaning as in IAS 8 (see Chapter 3).

Although it is not explicitly stated in IFRS 3.B64, it is evident that the above information is required for each material business combination. This is due to the fact that the standard states that for individually immaterial business combinations occurring during the reporting period that are material collectively, the acquirer has to disclose, in aggregate, the information required by items (e) to (q) above. [IFRS 3.B65].

16.1.2 Business combinations effected after the end of the reporting period

If the acquisition date of a business combination is after the end of the reporting period but before the financial statements are authorised for issue, the acquirer is required to disclose the information set out in section 16.1.1 above for that business combination, unless the initial accounting for the business combination is incomplete at the time the financial statements are authorised for issue. In that situation, the acquirer describes which disclosures could not be made and the reasons why they cannot be made. [IFRS 3.B66].

16.2 Financial effects of adjustments recognised in the current reporting period

The second objective is that the acquirer discloses information that enables users of its financial statements to evaluate the financial effects of adjustments recognised in the current reporting period that relate to business combinations that occurred in the period or previous reporting periods. [IFRS 3.61].

Information that is required to be disclosed by the acquirer to meet the above objective is specified in the application guidance of the standard. [IFRS 3.62].

To meet the above objective, the acquirer is required to disclose the following information for each material business combination or in the aggregate for individually immaterial business combinations that are material collectively: [IFRS 3.B67]

- (a) If the initial accounting for a business combination is incomplete (see section 12 above) for particular assets, liabilities, non-controlling interests or items of consideration and the amounts recognised in the financial statements for the business combination thus have been determined only provisionally:
 - (i) The reasons why the initial accounting for the business combination is incomplete
 - (ii) The assets, liabilities, equity interests or items of consideration for which the initial accounting is incomplete
 - (iii) The nature and amount of any measurement period adjustments recognised during the reporting period in accordance with IFRS 3.49 (see section 12.1 above)
- (b) For each reporting period after the acquisition date until the entity collects, sells or otherwise loses the right to a contingent consideration asset, or until the entity settles a contingent consideration liability or the liability is cancelled or expires (see section 7.1 above):
 - (i) Any changes in the recognised amounts, including any differences arising upon settlement
 - (ii) Any changes in the range of outcomes (undiscounted) and the reasons for those changes
 - (iii) The valuation techniques and key model inputs used to measure contingent consideration
- (c) For contingent liabilities recognised in a business combination, the acquirer discloses the information required by IAS 37.84 and IAS 37.85 for each class of provision (see Chapter 27).

- (d) A reconciliation of the carrying amount of goodwill at the beginning and end of the reporting period showing separately:
 - (i) The gross amount and accumulated impairment losses at the beginning of the reporting period
 - (ii) Additional goodwill recognised during the reporting period, except goodwill included in a disposal group that, on acquisition, meets the criteria for classified as held for sale in accordance with IFRS 5 (see Chapter 5)
 - (iii) Adjustments resulting from the subsequent recognition of deferred tax assets during the reporting period in accordance with IFRS 3.67 (there is in fact no such adjustment to disclose as any adjustment is recognised in profit or loss (see section 5.6.2 above))
 - (iv) Goodwill included in a disposal group classified as held for sale in accordance with IFRS 5 and goodwill derecognised during the reporting period without having previously been included in a disposal group classified as held for sale
 - (v) Impairment losses recognised during the reporting period in accordance with IAS 36. (IAS 36 requires disclosure of information about the recoverable amount and impairment of goodwill in addition to this requirement (see Chapter 21))
 - (vi) Net exchange rate differences arising during the reporting period in accordance with IAS 21 *The Effects of Changes in Foreign Exchange Rates* (see Chapter 16)
 - (vii) Any other changes in the carrying amount during the reporting period
 - (viii) The gross amount and accumulated impairment losses at the end of the reporting period
- (e) The amount and an explanation of any gain or loss recognised in the current reporting period that both:
 - (i) Relates to the identifiable assets acquired or liabilities assumed in a business combination that was effected in the current or previous reporting period

And

 - (ii) Is of such a size, nature or incidence that disclosure is relevant to understanding the combined entity's financial statements

16.3 Other necessary information

IFRS 3 includes a catch-all disclosure requirement, that if in any situation the information required to be disclosed set out above, or by other IFRS accounting standards, does not satisfy the objectives of IFRS 3, the acquirer discloses whatever additional information is necessary to meet those objectives. [IFRS 3.63].

In addition, IAS 7 *Statement of Cash Flows* requires disclosures in respect of obtaining control of subsidiaries and other businesses (see Chapter 36). [IAS 7.39, IAS 7.40, IAS 7.41, IAS 7.42].

16.4 Disclosures in the interim financial statements

The disclosures under IFRS 3 are explicitly required in the interim financial statements for business combinations occurring during the interim period, even if those interim financial statements are condensed (see Chapter 37). [IAS 34.16A(i)].

16.5 Illustrative disclosures

An illustration of some of the disclosure requirements of IFRS 3 is given in the Illustrative Examples accompanying the standard. The example, which is reproduced below, assumes that the acquirer, AC, is a listed entity and that the acquiree, TC, is an unlisted entity. The illustration presents the disclosures in a tabular format that refers to the specific disclosure requirements illustrated. (The references to IFRS 3.B64 correspond to the equivalent item in section 16.1.1 above and those to IFRS 3.B67 correspond to the equivalent item in section 16.2 above.) A footnote might present many of the disclosures illustrated in a simple narrative format. [IFRS 3.IE72].

Extract from IFRS 3

Disclosure requirements

Illustrating the consequences of applying the disclosure requirements in paragraphs 59-63 and B64-B67 of IFRS 3.

IE72 The following example illustrates some of the disclosure requirements of IFRS 3; it is not based on an actual transaction. The example assumes that AC is a listed entity and that TC is an unlisted entity. The illustration presents the disclosures in a tabular format that refers to the specific disclosure requirements illustrated. An actual footnote might present many of the disclosures illustrated in a simple narrative format.

Footnote X: Acquisitions

Paragraph reference

B64(a)-(d) On 30 June 20X0 AC acquired 15 per cent of the outstanding ordinary shares of TC. On 30 June 20X2 AC acquired 60 per cent of the outstanding ordinary shares of TC and obtained control of TC. TC is a provider of data networking products and services in Canada and Mexico. As a result of the acquisition, AC is expected to be the leading provider of data networking products and services in those markets. It also expects to reduce costs through economies of scale.

B64(e) The goodwill of CU2,500 arising from the acquisition consists largely of the synergies and economies of scale expected from combining the operations of AC and TC.

B64(k) None of the goodwill recognised is expected to be deductible for income tax purposes. The following table summarises the consideration paid for TC and the amounts of the assets acquired and liabilities assumed recognised at the acquisition date, as well as the fair value at the acquisition date of the non-controlling interest in TC.

At 30 June 20X2

	Consideration	CU
B64(f)(i)	Cash	5,000
B64(f)(iv)	Equity instruments (100,000 ordinary shares of AC)	4,000
B64(f)(iii); B64(g)(i)	Contingent consideration arrangement	1,000
B64(f)	Total consideration transferred	10,000
B64(p)(i)	Fair value of AC's equity interest in TC held before the business combination	2,000
		12,000
B64(m)	Acquisition-related costs (included in selling, general and administrative expenses in AC's statement of comprehensive income for the year ended 31 December 20X2)	1,250
B64(i)	Recognised amounts of identifiable assets acquired and liabilities assumed	
	Financial assets	3,500
	Inventory	1,000
	Property, plant and equipment	10,000
	Identifiable intangible assets	3,300
	Financial liabilities	(4,000)
	Contingent liability	(1,000)

	Total identifiable net assets	12,800
B64(o)(i)	Non-controlling interest in TC	(3,300)
	Goodwill	2,500
		<u>12,000</u>
B64(f)(iv)	The fair value of the 100,000 ordinary shares issued as part of the consideration paid for TC (CU4,000) was measured using the closing market price of AC's ordinary shares on the acquisition date.	
B64(f)(iii)	The contingent consideration arrangement requires AC to pay the former owners of TC 5 per cent of the revenues of XC, an unconsolidated equity investment owned by TC, in excess of CU7,500 for 20X3, up to a maximum amount of CU2,500 (undiscounted). The potential undiscounted amount of all future payments that AC could be required to make under the contingent consideration arrangement is between CU0 and CU2,500. The fair value of the contingent consideration arrangement of CU1,000 was estimated by applying the income approach. The fair value measurement is based on significant inputs that are not observable in the market, which IFRS 13 <i>Fair Value Measurement</i> refers to as Level 3 inputs. Key assumptions include a discount rate range of 20-25 per cent and assumed probability-adjusted revenues in XC of CU10,000-20,000. As of 31 December 20X2, neither the amount recognised for the contingent consideration arrangement, nor the range of outcomes or the assumptions used to develop the estimates had changed.	
B64(g)		
B67(b)		
B64(h)		
B67(a)	The fair value of the acquired identifiable intangible assets of CU3,300 is provisional pending receipt of the final valuations for those assets.	
B64(j)	A contingent liability of CU1,000 has been recognised for expected warranty claims on products sold by TC during the last three years. We expect that the majority of this expenditure will be incurred in 20X3 and that all will be incurred by the end of 20X4. The potential undiscounted amount of all future payments that AC could be required to make under the warranty arrangements is estimated to be between CU500 and CU1,500. As of 31 December 20X2, there has been no change since 30 June 20X2 in the amount recognised for the liability or any change in the range of outcomes or assumptions used to develop the estimates.	
B67(c)		
IAS 37.84, 85		
B64(o)		
	The fair value of the non-controlling interest in TC, an unlisted company, was estimated by applying a market approach and an income approach. The fair value measurements are based on significant inputs that are not observable in the market and thus represent a fair value measurement categorised within Level 3 of the fair value hierarchy as described in IFRS 13. Key assumptions include the following:	
	(a) a discount rate range of 20-25 per cent;	
	(b) a terminal value based on a range of terminal EBITDA multiples between 3 and 5 times (or, if appropriate, based on long term sustainable growth rates ranging from 3 to 6 per cent);	
	(c) financial multiples of companies deemed to be similar to TC; and	
	(d) adjustments because of the lack of control or lack of marketability that market participants would consider when measuring the fair value of the non-controlling interest in TC.	
B64(p)(ii)	AC recognised a gain of CU500 as a result of measuring at fair value its 15 per cent equity interest in TC held before the business combination. The gain is included in other income in AC's statement of comprehensive income for the year ending 31 December 20X2.	
B64(q)(i)	The revenue included in the consolidated statement of comprehensive income since 30 June 20X2 contributed by TC was CU4,090. TC also contributed profit of CU1,710 over the same period.	
B64(q)(ii)	Had TC been consolidated from 1 January 20X2 the consolidated statement of comprehensive income would have included revenue of CU27,670 and profit of CU12,870.

Question 2-1:	How does an entity account for the acquisition of a group of assets that does not constitute a business?	716
Question 4-1:	Must an acquirer always be a legal entity?	727
Question 7-1:	Would gains or losses arising from hedging the movements in foreign currency exchange rates, under IAS 39 (or IFRS 9), for a firm commitment to acquire a business result in an adjustment to the amount that is recognised for goodwill?	758
Question 14-1:	Is it appropriate to apply the IFRS 3 guidance for reverse acquisitions by analogy to a transaction in which the former shareholders of a non-listed operating entity become the majority shareholders of the combined entity, by exchanging their shares for new shares of a listed non-trading company?	805
Question 14-2:	Could a business that is not a legal entity be identified as an acquirer in a reverse acquisition?	807

Appendix C - Defined terms

Extract from IFRS 3

Appendix A Defined terms

Acquiree	The business or businesses that the acquirer obtains control of in a business combination .
Acquirer	The entity that obtains control of the acquiree .
acquisition date	The date on which the acquirer obtains control of the acquiree .
business	An integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing goods or services to customers, generating investment income (such as dividends or interest) or generating other income from ordinary activities.
business combination	A transaction or other event in which an acquirer obtains control of one or more businesses . Transactions sometimes referred to as 'true mergers' or 'mergers of equals' are also business combinations as that term is used in this IFRS.
contingent consideration	Usually, an obligation of the acquirer to transfer additional assets or equity interests to the former owners of an acquiree as part of the exchange for control of the acquiree if specified future events occur or conditions are met. However, <i>contingent consideration</i> also may give the acquirer the right to the return of previously transferred consideration if specified conditions are met.
equity interests	For the purposes of this IFRS, <i>equity interests</i> is used broadly to mean ownership interests of investor-owned entities and owner, member or participant interests of mutual entities .
fair value	<i>Fair value</i> is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13.)
goodwill	An asset representing the future economic benefits arising from other assets acquired in a business combination that are not individually identified and separately recognised.
identifiable	An asset is <i>identifiable</i> if it either: (a) is separable, ie capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged, either individually or together with a related contract, identifiable asset or liability, regardless of whether the entity intends to do so; or (b) arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations.
intangible asset	An identifiable non-monetary asset without physical substance.
mutual entity	An entity, other than an investor-owned entity, that provides dividends, lower costs or other economic benefits directly to its owners , members or participants. For example, a mutual insurance company, a credit union and a co-operative entity are all mutual entities.
non-controlling interest	The equity in a subsidiary not attributable, directly or indirectly, to a parent.
owners	For the purposes of this IFRS, <i>owners</i> is used broadly to include holders of equity interests of investor-owned entities and owners or members of, or participants in, mutual entities .

Overview

The accounting requirements for business combinations are set out in IFRS 3 *Business Combinations* and are covered in Chapter 10. However, IFRS 3 excludes business combinations under common control (BCUCC) from its scope. IFRS accounting standards do not specify how a receiving entity accounts for such transactions and for some other types of group reorganisations, including certain transactions involving a newly formed entity (Newco). Due to the lack of specifically applicable requirements, entities need to develop their own accounting policy in accordance with IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*¹, which has resulted in diversity in practice. The IASB undertook a research project to consider how to fill this 'gap' in IFRS accounting standards and published a Discussion Paper (DP) for public consultation in November 2020.² The DP summarised the IASB's preliminary views on how a receiving entity should report a BCUCC, including potential measurement methods to apply, and also explored potential disclosure requirements. However, in November 2023, the IASB considered the project's direction and decided to discontinue further work developing guidance for BCUCCs.³ It is, therefore, expected that diversity in practice will continue.

This chapter addresses common control transactions that involve the transfer of control over one or more businesses (whether incorporated or not) and focuses on the perspective of the receiving entity. It discusses when the scope exclusion for business combinations under common control applies and the appropriate accounting treatment in the absence of specific requirements.

This chapter also provides accounting considerations for transactions under common control (or common ownership) involving a Newco, which, depending on the facts and circumstances, might not meet the description of a business combination. One of the key questions in this respect is whether a Newco can be identified as the acquirer under IFRS 3 (see section 4 below), which is also discussed in Chapter 10.

Finally, this chapter addresses the accounting by a receiving entity for the acquisition of an investment in an associate or joint venture accounted for using the equity method from an entity under common control. The equity method of accounting is discussed in Chapter 12.

More details on the scope of this chapter can be found in section 1.3 below.

What you need to know

- IFRS accounting standards do not specify how to account for business combinations under common control and certain other types of group reorganisations.
- In our view, a receiving entity accounting for a business combination under common control has an accounting policy choice to apply either the pooling of interests or acquisition method, provided there is substance to the transaction.
- Applying the pooling of interests method to a business combination under common control requires a series of further accounting policy choices.
- Accounting for transactions under common control (or common ownership) involving a Newco requires careful consideration of all facts and circumstances.
- In our view, a receiving entity accounting for the acquisition of an investment in an associate or joint venture accounted for using the equity method from an entity under common control could elect to apply the scope exclusion in IFRS 3 for business combinations under common control by analogy.

1 The consequential amendments resulting from IFRS 18 *Presentation and Disclosure in Financial Statements*, once effective, changes the title of IAS 8 to '*Basis of Preparation of Financial Statements*' to better reflect the amended content of IAS 8. See Chapter 4 for further details on the requirements of IFRS 18.

3 [Business combinations under common control project page](#), available on the IFRS Foundation's website (accessed 24 September 2024).

1 Introduction

1.1 Common control transactions

Transactions between entities under common control (or common control transactions) occur frequently in business. For example, many entities conduct their business activities through subsidiaries and there are often transactions between the entities comprising the group. It is also common for entities under common control, which are not a group for financial reporting purposes, to transact with each other.

Examples of common control transactions include the sale of goods, property and other assets, the provision of services (including those of employees), leasing, transfers under licence agreements, financing transactions and the provision of guarantees.

It cannot always be assumed that common control transactions are undertaken on an arm's length basis or that equal values have been exchanged. Standard-setters internationally have developed standards that require disclosures about related party transactions (which include common control transactions), rather than requiring the transactions to be recognised at an arm's length price. The IASB also adopted this approach in IAS 24 *Related Party Disclosures*, which is a disclosure standard and does not establish recognition or measurement requirements. Entities would need to account for such transactions in accordance with the requirements of any IFRS accounting standard specifically applicable to that transaction. [IAS 8.7].

In January 2018, the IFRS IC confirmed that IFRS accounting standards do not provide a general exception or exemption from applying the requirements in a particular IFRS accounting standard to common control transactions. In its agenda decision, the IFRS IC observed that "unless a Standard specifically excludes common control transactions from its scope, an entity applies the applicable requirements in the Standard to common control transactions".⁴

Nonetheless, IFRS accounting standards do not provide a complete framework and some common control transactions might not be covered by any IFRS accounting standard. Specific requirements might also be absent when common control transactions are excluded from the scope of an IFRS accounting standard that would otherwise apply. There is often more than one acceptable way of accounting for common control transactions, and this gives rise to an accounting policy choice. General guidance on accounting for transactions between a parent and its subsidiaries, or between subsidiaries within a group, is included in Chapter 9.

One specific area where there is a scope exclusion for common control transactions is IFRS 3 (discussed in Chapter 10). That standard addresses business combinations but excludes "a combination of entities or businesses under common control" from its scope. [IFRS 3.2]. The IASB noted that current IFRS accounting standards do not specify how to account for business combinations under common control and carried out a research project with proposals to address this gap, in order to improve the comparability and transparency of accounting for such transactions. In November 2020, the IASB published a Discussion Paper (DP)⁵ setting out its preliminary views. However, following the IASB's consideration of the feedback, the project was discontinued in November 2023.⁶ See section 6 for further discussion.

This chapter deals with the implications of the scope exclusion in IFRS 3 for business combinations under common control and the current absence of guidance in IFRS accounting standards for certain types of group reorganisations. It also discusses the choice of accounting treatments that could be adopted for such transactions.

This chapter does not discuss any potential differences between IFRS and US GAAP, which might exist because US GAAP does have specific guidance on this topic.

1.2 Group reorganisations

Group reorganisations involve restructuring the relationships between entities or businesses within a group (or under common control) and can take many forms. They might be undertaken for various reasons, for example to reorganise activities with an aim to achieve synergies, to simplify a group structure, or to obtain tax efficiency (e.g., by creating a tax grouping in a particular jurisdiction). In some cases, a group reorganisation takes place to split an existing group into two or more separate groups or to create a single new reporting group, possibly as a prelude to a subsequent sale or initial public offering (IPO).

4 [IFRIC Update](#), January 2018, *Committee's agenda decisions: Contributing property, plant and equipment to an associate (IAS 28 Investments in Associates and Joint Ventures)-Agenda Paper 2*. Available on the IFRS Foundation's website.

5 Discussion Paper, [DP 2020/2, Business Combinations under Common Control](#), IASB, November 2020. Available on the IFRS Foundation's website.

6 [Business combinations under common control project page](#), available on the IFRS Foundation's website.

Group reorganisations involve transferring entities or businesses between existing or newly formed entities under common control. From the perspective of the controlling party, the transfer does not affect the entities or businesses that party holds. Such changes often have no impact on the consolidated financial statements of an existing group (except for any potential tax consequences), provided the ownership interests of non-controlling interest holders (NCI) are not affected. This is because the effects of transactions within an existing group are generally eliminated in full (see Chapter 8). Alternatively, some reorganisations involve transferring entities or businesses outside the existing group (e.g., demergers).

Transfers of entities or businesses between existing or newly formed entities under common control might be in exchange for cash, loan consideration or shares. Other transfers might be without any consideration, such as a distribution by a subsidiary to its parent or a contribution by a parent to its subsidiary. There can also be legal arrangements that have a similar effect, including reorganisations sanctioned by a court process or transfers after liquidation of the transferor (i.e., the transferring entity). In addition, some jurisdictions allow a legal merger between a parent and its subsidiary to form a single entity.

From the perspective of the transferee in the reorganisation (i.e., the receiving entity), there could be a business combination that needs to be accounted for. Such a business combination would be excluded from the scope of IFRS 3 if it satisfies the description of a business combination under common control. However, the transaction would not represent a business combination as defined in IFRS 3, where the assets acquired and liabilities assumed do not constitute a business (i.e., an asset acquisition), or where neither of the combining entities can be identified as the acquirer (e.g., in some situations where a newly formed entity is involved - see section 4.1 below). The accounting by the receiving entity in a group reorganisation is often not covered in existing IFRS accounting standards.

The transferor in the reorganisation will need to account for its part of the transaction in its own financial statements. The relevant requirements for transferors are discussed in other chapters, as set out in section 1.3 below.

1.3 Scope of this chapter

This chapter deals with common control transactions that involve the transfer of control over one or more businesses (as defined in IFRS 3) and focuses on the perspective of the receiving entity. That receiving entity might or might not be identified as the acquirer if IFRS 3 were applied to the transaction (see Chapter 10). If the entity or net assets being transferred do not meet the definition of a business (see Chapter 10), the transaction represents an asset acquisition. The accounting for acquisitions of (net) assets under common control is discussed in Chapter 9.

This chapter addresses:

- The scope exclusion in IFRS 3 for business combinations under common control (see section 2 below)
- The accounting for business combinations (involving entities or businesses) under common control excluded from the scope of IFRS 3 (see section 3 below)
- The accounting for transactions under common control (or sometimes common ownership) involving a newly formed entity (see section 4 below)
- The accounting for transfers of investments in associates or joint ventures from entities under common control (see section 5 below)

And

- The discontinuance of, and feedback received on the IASB's project on business combinations under common control (see section 6 below)

Although the discussion in sections 3 and 4 below (particularly the examples contained therein) generally refers to 'consolidated financial statements' and transfers of 'entities', the accounting might be equally applicable to the separate or individual financial statements of an entity that receives the net assets of a business (rather than the shares in the entity holding that business) in a common control transaction. In contrast, if the receiving entity obtains control over a business housed in a separate legal entity, it would recognise an investment in a subsidiary in accordance with IAS 27 *Separate Financial Statements* in its separate financial statements (and individual financial statements are not applicable). This is consistent with business combinations that are in the scope of IFRS 3. That IFRS accounting standard specifies only to which transactions it applies, but not to which financial statements it applies (e.g., consolidated, separate, individual).

This chapter, however, does not specifically deal with the accounting by the receiving entity for common control transactions in separate or individual financial statements, which is covered in Chapter 9. Chapter 9 discusses distributions of businesses from a subsidiary to a parent and Chapter 9 discusses the accounting for legal mergers between a parent and its subsidiary.

An acquisition of a business by a subsidiary from its parent or a fellow subsidiary might meet the definition of a business combination under common control and, accordingly, be dealt with in this chapter. There is further discussion of the accounting for business combinations under common control in separate and individual financial statements in Chapter 9.

Although no control is obtained by the receiving entity, this chapter does address the transfer of an investment in an associate or joint venture from an entity under common control (see section 5 below). The issue is whether the scope exclusion in IFRS 3 for business combinations under common control can be applied by analogy to this scenario.

The transferor that loses control over an entity or business in a common control transaction will also need to account for the transaction in its own financial statements. In doing so, it will need to consider the requirements of other relevant IFRS accounting standards, in particular, the requirements of IFRS 10 *Consolidated Financial Statements* relating to disposals of, or loss of control over, subsidiaries (see Chapter 8) and the requirements of IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* relating to disposal groups held for sale and discontinued operations (see Chapter 5). The discussion in Chapter 8 and in Chapter 9 relating to demergers (e.g., the spin-off of a subsidiary or business) might also be relevant, as well as the discussion in Chapter 21 on impairment considerations relating to investments in subsidiaries.

Finally, any transaction between entities under common control is a related party transaction under IAS 24, the requirements of which are dealt with in Chapter 35.

1.3.1 First-time adoption considerations

The requirements of IFRS 1 *First-time Adoption of International Financial Reporting Standards* are applied when the reporting entity is a first-time adopter (see Chapter 6). It could be the case that, in connection with a common control transaction or a proposed transaction (such as an IPO), the reporting entity prepares individual and/or consolidated financial statements with an unreserved statement of compliance with IFRS accounting standards for the first time. This chapter does not discuss the general requirements of IFRS 1 that are relevant for all first-time adopters. These are addressed in Chapter 6.

How we see it

Care should be taken in identifying whether and how IFRS 1 is applied by entities involved in transactions under common control. In many cases, there might be no accounting impact. However, in other cases there might be an accounting impact to reflect.

For example, where a newly incorporated company (Newco) acquires another entity that is an existing IFRS reporter in a transaction under common control, Newco will be regarded as a continuation of that entity (see Illustration 4-1 at section 4.2.1 below). There would be no change to the recognised assets and liabilities of the acquired entity in Newco's financial statements (if required to be prepared) as that entity had already adopted IFRS accounting standards and Newco is a continuation of that entity. Nevertheless, if that entity had not already adopted IFRS accounting standards, Newco would apply IFRS 1 in its first IFRS financial statements (since it is a continuation of an entity that is a first-time adopter). See Chapter 6.

Application of IFRS 1 could also be relevant where an entity acquires another entity in a business combination under common control and prepares IFRS consolidated financial statements for the first time. In such cases, particular care is needed with the application of IFRS 1.D16 and IFRS 1.D17 (discussed in Chapter 6) where the entity is part of a group reporting under IFRS accounting standards.

2 The IFRS 3 scope exclusion

Extract from IFRS 3

- 2 This IFRS applies to a transaction or other event that meets the definition of a business combination. This IFRS does not apply to:
- (a) the accounting for the formation of a joint arrangement in the financial statements of the joint arrangement itself.
 - (b) the acquisition of an asset or a group of assets that does not constitute a *business*. In such cases the acquirer shall identify and recognise the individual identifiable assets acquired (including those assets that meet the definition of, and recognition criteria for, *intangible assets* in IAS 38 *Intangible Assets*) and liabilities assumed. The cost of the group shall be allocated to the individual identifiable assets and liabilities on the basis of their relative *fair values* at the date of purchase. Such a transaction or event does not give rise to goodwill.
 - (c) a combination of entities or businesses under common control (paragraphs B1-B4 provide related application guidance).

[IFRS 3.2].

IFRS 3 establishes principles and requirements for how the acquirer accounts for a business combination, which is defined as: “A transaction or other event in which an **acquirer** obtains control of one or more **businesses**.” [IFRS 3.1, IFRS 3 Appendix A]. Identifying a business combination, including the definition of a business, is discussed generally in Chapter 10.

However, IFRS 3 excludes from its scope “a combination of entities or businesses under common control ...”. [IFRS 3.2(c)]. Appendix B of IFRS 3 provides further guidance to determine when a business combination is regarded as a business combination under common control. This application guidance is discussed in section 2.1 below.

If the transaction is not a business combination in the first place, because the assets acquired and liabilities assumed do not constitute a business as defined in IFRS 3, it is accounted for as an asset acquisition.

[IFRS 3.2(b), IFRS 3.3]. The accounting for acquisitions of (net) assets under common control is discussed in Chapter 9. In addition, a transaction might not be a business combination as defined in IFRS 3 because, applying that IFRS accounting standard, no acquirer can be identified. This is considered in more detail in section 4.1 below.

2.1 Business combinations under common control

Extract from IFRS 3

- B1 This IFRS does not apply to a business combination of entities or businesses under common control. A business combination involving entities or businesses under common control is a business combination in which all of the combining entities or businesses are ultimately controlled by the same party or parties both before and after the business combination, and that control is not transitory.
- B4 The extent of non-controlling interests in each of the combining entities before and after the business combination is not relevant to determining whether the combination involves entities under common control. Similarly, the fact that one of the combining entities is a subsidiary that has been excluded from the consolidated financial statements is not relevant to determining whether a combination involves entities under common control.

[IFRS 3.B1, IFRS 3.B4].

For the purpose of the scope exclusion, IFRS 3 describes a business combination under common control as “a business combination in which all of the combining entities or businesses are ultimately controlled by the same party or parties both before and after the business combination, and that control is not transitory”. [IFRS 3.B1]. This will include transactions such as transfers of subsidiaries or businesses between entities within a group, provided the transaction meets the definition of a business combination in IFRS 3 (see section 2 above).

The extent of NCI in each of the combining entities before and after the business combination is not relevant to determining whether common control exists. [IFRS 3.B4]. This is because a partially-owned subsidiary is nevertheless under the control of the parent entity. Therefore, transactions involving partially-owned subsidiaries are also outside the scope of IFRS 3. Similarly, the fact that one of the combining entities is a subsidiary that has been excluded from the consolidated financial statements of the group in accordance with IFRS 10 is not relevant to determining whether common control exists. [IFRS 3.B4]. This is because the parent entity controls the subsidiary regardless of that fact.

2.1.1 Common control by an individual or group of individuals

Extract from IFRS 3

- | | |
|----|--|
| B2 | A group of individuals shall be regarded as controlling an entity when, as a result of contractual arrangements, they collectively have the power to govern its financial and operating policies so as to obtain benefits from its activities. Therefore, a business combination is outside the scope of this IFRS when the same group of individuals has, as a result of contractual arrangements, ultimate collective power to govern the financial and operating policies of each of the combining entities so as to obtain benefits from their activities, and that ultimate collective power is not transitory. |
| B3 | An entity may be controlled by an individual or by a group of individuals acting together under a contractual arrangement, and that individual or group of individuals may not be subject to the financial reporting requirements of IFRSs. Therefore, it is not necessary for combining entities to be included as part of the same consolidated financial statements for a business combination to be regarded as one involving entities under common control. |

[IFRS 3.B2, IFRS 3.B3].

The scope exclusion is not restricted to transactions between entities within a group. An entity can be controlled by an individual or a group of individuals acting together under a contractual arrangement. That individual or group of individuals might not be subject to the financial reporting requirements of IFRS accounting standards. It is not necessary for combining entities to be included as part of the same consolidated financial statements for a business combination to be regarded as one involving entities under common control. [IFRS 3.B3]. Thus, if a transaction involves entities controlled by the same individual, even if it results in a new reporting group, the acquisition method would not always be applied.

A group of individuals controls an entity when, as a result of contractual arrangements, they collectively have the power to govern its financial and operating policies so as to obtain benefits from its activities. Therefore, a business combination is outside the scope of IFRS 3 if the same group of individuals has ultimate collective power to control each of the combining entities and that ultimate collective power is not transitory. [IFRS 3.B2].

The mere existence of common ownership is not sufficient. For the scope exclusion to apply to a group of individuals, there has to be a 'contractual arrangement' between them such that they have control over the entities involved in the transaction. IFRS 3 does not indicate what form such an arrangement must take. However, in describing a 'joint arrangement', IFRS 11 *Joint Arrangements* explains that "Contractual arrangements can be evidenced in several ways" and that "An enforceable contractual arrangement is often, but not always, in writing, usually in the form of a contract or documented discussions between the parties." [IFRS 11.B2]. This also implies that it is possible for a contractual arrangement to be in non-written form. If it is not written, great care needs to be taken with all of the facts and circumstances to determine whether it is appropriate to exclude a business combination from the scope of IFRS 3.

How we see it

Although not explicitly stated in IFRS 3, we believe that a contractual arrangement between a group of individuals does not necessarily need to be in written form. However, for an unwritten arrangement to exist, there must be clear evidence of that arrangement and this will depend on the facts and circumstances of each case.

One particular situation where there might be such an unwritten arrangement, is where the individuals involved are members of the same family. In such situations, whether common control exists between family members very much depends on the specific facts and circumstances and requires judgement.

A starting point could be the definition in IAS 24 of 'close members of the family of a person' as "those family members who may be expected to influence, or be influenced by, that person in their dealings with the entity and include:

- (a) that person's children and spouse or domestic partner;
- (b) children of that person's spouse or domestic partner; and
- (c) dependants of that person or that person's spouse or domestic partner." [IAS 24.9].

How we see it

Whether common control exists between family members depends on the specific facts and circumstances, as often there will not be a written agreement between family members. In our view, the influence that normally arises within relationships between 'close members of the family' (as defined in IAS 24) means that it is possible that an unwritten arrangement exists. If family members are not 'close members of the family', we believe that there is a presumption that common control does not exist and clear evidence that those non-close family members act collectively, rather than independently, must exist to overcome this presumption.

If the individuals concerned are 'close members of the family' as defined in IAS 24 (and further discussed in Chapter 35), then it is possible that they will act collectively, and the scope exclusion in IFRS 3 might apply. This could be the case where one family member effectively controls the voting of a dependent family member (e.g., scenario (a) in Illustration 2-1 below). It is also possible that a highly influential parent is able to ensure that adult family members act collectively (e.g., scenario (b) in Illustration 2-1 below). In this case, there would need to be clear evidence that the family influence has resulted in a pattern of collective family decisions. However, common control is unlikely to exist where the family members are adult siblings (e.g., scenario (c) in Illustration 2-1 below), as such individuals are more likely to act independently.

In all such situations involving family members, whenever there is sufficient evidence that the family members (irrespective of the family relationship) have acted independently, then the scope exclusion in IFRS 3 for business combinations under common control does not apply.

Illustration 2-1: Common control involving individuals

Entity A has three shareholders, Mr X, Mr Y and Mr Z. Mr X and Mr Y are family members who each hold a 30% interest in Entity A. Mr X and Mr Y also each hold a 30% interest in Entity B. There is no written contractual arrangement between Mr X and Mr Y requiring them to act collectively as shareholders in Entity A and Entity B. Both Entity A and Entity B are businesses as defined in IFRS 3.

If Entity A acquires 100% of Entity B, is this a business combination under common control and therefore outside the scope of IFRS 3 when the nature of the family relationship is:

- (a) Mr X is the father and Mr Y is his young dependent son?
- (b) Mr X is a patriarchal father and - because of his highly influential standing - his adult son Mr Y has traditionally followed his father's decisions?
- (c) Mr X and Mr Y are adult siblings?

Whether common control exists between family members very much depends on the specific facts and circumstances. If so, the business combination would be outside the scope of IFRS 3.

Scenario (a)

The business combination might be outside the scope of IFRS 3. The father, Mr X, might effectively control the voting of his dependent son, Mr Y, by acting on his behalf and thus vote the entire 60% combined holding collectively. However, if there is evidence that Mr X and Mr Y are acting independently (e.g., by voting differently at shareholder or board meetings), the scope exclusion would not apply since these close family members have not been acting collectively to control the entities.

Scenario (b)

The business combination might be outside the scope of IFRS 3. A highly influential parent might be able to ensure that adult family members act collectively. However, there would need to be clear evidence that the family influence has resulted in a pattern of collective family decisions. If there is any evidence that Mr X and Mr Y are acting independently (e.g., by voting differently at shareholder or board meetings), the scope exclusion would not apply since the parent and adult family member have not been acting collectively to control the entities.

Scenario (c)

Common control is unlikely to exist, and therefore the business combination would be in scope of IFRS 3. In this scenario where Mr X and Mr Y are adult siblings (and not considered close family members otherwise), it is less likely that an unwritten arrangement will exist. Where family members are not 'close', they are less likely to have influence over each other and more likely to act independently. Accordingly, in our view, there is a presumption that common control does not exist between non-close family members. Sufficient evidence that they act collectively, rather than independently, would be needed to overcome this presumption.

If in Illustration 2-1 above, Mr X and Mr Y had been unrelated, then, in the absence of a written agreement, consideration would need to be given to all facts and circumstances to determine whether it is appropriate to exclude the transaction from the scope of IFRS 3. As discussed above, in our view, there would need to be very strong evidence of them acting together to control both entities in a collective manner, in order to demonstrate that an unwritten contractual arrangement really exists, and that such control is not transitory. Prior to the acquisition of Entity B by Entity A in Illustration 2-1 above, another question is whether financial statements can be prepared under IFRS accounting standards for a 'reporting entity' that does not comprise a group under IFRS 10 (i.e., combined financial statements comprised of such 'sister' companies). This issue is discussed in Chapter 7.

2.1.2 Transitory control

IFRS 3 requires that common control is 'not transitory' as a condition for the scope exclusion to apply. [IFRS 3.B1, IFRS 3.B2]. In contrast, if common control is only transitory, the business combination is still within the scope of IFRS 3. The 'not transitory' condition was included when IFRS 3 was first issued in 2004 to deal with concerns that business combinations between parties acting at arm's length could be structured through the use of 'grooming' transactions so that, for a brief period immediately before and after the combination, the combining entities or businesses are under common control. In this way, it might have been possible for combinations that would otherwise be accounted for in accordance with IFRS 3 using the purchase method (now called 'acquisition method') to be accounted for using some other method. [IFRS 3(2007).BC28]. Questions have been raised, however, on the meaning of 'transitory control'.

The IFRS IC was asked in 2006 whether a reorganisation involving the formation of a Newco to facilitate the sale of part of an organisation is a business combination within the scope of IFRS 3. Some suggested that, because control of Newco is transitory (i.e., it is subsequently sold), a combination involving that Newco would be within the scope of IFRS 3. The IFRS IC however, observed that IFRS 3.22 (now IFRS 3.B18) states that when an entity is formed to issue equity instruments to effect a business combination, one of the combining entities that existed before the combination must be identified as the acquirer. To be consistent, the IFRS IC noted that the question of whether the entities or businesses are under common control applies to the combining entities that existed before the combination (i.e., excluding the newly formed entity that did not exist before). Accordingly, the IFRS IC decided not to add this topic to its agenda.⁷ Although the issue was considered in the context of the original IFRS 3, the comments remain valid as the relevant requirements in the current version of the standard are substantially unchanged. [IFRS 3.B18].

Therefore, whether or not a Newco is set up within an existing group to facilitate the disposal of businesses is irrelevant as to whether or not common control is transitory. Another question is whether the fact that the reorganisation results in the parent of the existing group losing control over those businesses, means that common control is transitory.

How we see it

In our view, common control is not considered to be 'transitory' just because a reorganisation is undertaken to facilitate the disposal of businesses (e.g., by sale or IPO). Whether common control is transitory or not is assessed by looking at the duration of control over each of the combining businesses in the period before and after the reorganisation. It is not limited to an assessment of the duration of control only after the reorganisation.

⁷ [IFRIC Update](#), March 2006, *IFRIC Agenda Decisions: 'Transitory' Common Control*. Available on the IFRS Foundation's website.

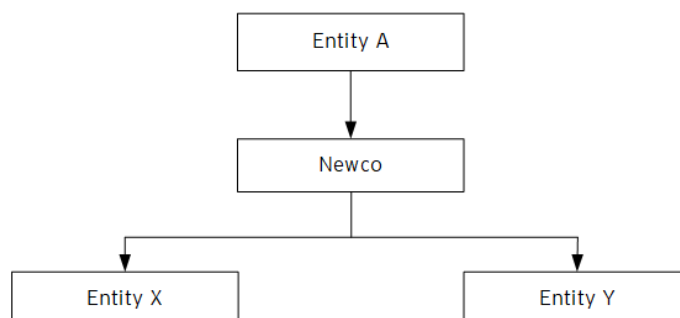

Accordingly, the requirement that common control is not transitory is intended as an anti-avoidance mechanism to prevent business combinations between parties acting at arm's length from being structured through the use of 'grooming' transactions so that, for a brief period immediately before and after the combination, the combining entities or businesses are under common control. Consequently, whether or not common control is transitory is assessed by looking at the duration of control in the period both before and after the reorganisation. Therefore, an intention to sell the businesses or go to an IPO shortly after the reorganisation does not, by itself, preclude the scope exclusion in IFRS 3 from applying. This is also consistent with the ordinary meaning of 'transitory' being something which is fleeting, brief or temporary. However, section 4.1 below discusses certain limited situations in which a Newco that is used to facilitate an external sale or IPO might be considered an acquirer.

Illustration 2-2: The meaning of 'transitory' common control

Entity A currently has two businesses (as defined in IFRS 3) operated through wholly-owned subsidiaries Entity X and Entity Y. The group structure (ignoring other entities within the group) is as follows:

Entity A proposes to combine the two businesses (currently housed in two separate entities, Entity X and Entity Y) into one entity and then spin off the combined entity as part of an IPO. Both businesses have been owned by Entity A for several years. The reorganisation will be structured such that Entity A will first establish a new entity (Newco) and transfer its interests in Entity X and Entity Y to Newco, resulting in the following group structure:

Newco will then be subject to an IPO, with the result that Entity A will lose control.

If Newco were to prepare consolidated financial statements, would the reorganisation undertaken to facilitate the disposal of Entity X and Entity Y be in the scope of IFRS 3? Or would the scope exclusion for business combinations under common control apply?

The question of whether the entities or businesses are under common control applies to the combining entities that existed before the combination, excluding the newly formed entity, i.e., Entity X and Entity Y. These are clearly entities that have been under the common control of Entity A and remain so after the transfer.

If Newco prepares consolidated financial statements without there being an intended IPO, the scope exclusion would apply. However, as the purpose of the transaction was to facilitate the disposal of the businesses by way of an IPO, such that Entity A loses control over Entity X and Entity Y, does this mean that common control is transitory?

In our view, the answer is 'no'. Common control is not considered to be transitory and therefore the reorganisation is excluded from the scope of IFRS 3. This is consistent with the ordinary meaning of transitory. The common control of Entity X and Entity Y was not fleeting in the fact pattern as both entities had been controlled by Entity A for several years. In contrast, if Entity Y had only recently come into the group, this might well indicate that control is transitory.

Although Illustration 2-2 above involves a newly formed entity, the same considerations apply regardless of how the reorganisation has been structured prior to the IPO. For example, Entity X might have acquired Entity Y or the net assets and trade of Entity Y, with Entity X then being subject to an IPO. In such a situation, Entity X would apply the scope exclusion for business combinations under common control.

3 Accounting for business combinations involving entities or businesses under common control

IFRS 3 prescribes a single method of accounting for all business combinations that are within its scope, i.e., the acquisition method. No other methods are described and the standard does not address the appropriate accounting for business combinations under common control excluded from its scope. The 'pooling of interests' method and 'fresh start' method are only referred to in the Basis for Conclusions as possible methods of accounting but were not deemed appropriate for all business combinations. [IFRS 3.BC23].

The discussion in sections 3.1 to 3.3.6 below considers how entities account for business combinations under common control outside the scope of IFRS 3 (described in section 2 above). If the assets acquired and liabilities assumed do not constitute a business, the transaction is accounted for as an asset acquisition. The accounting for acquisitions of (net) assets under common control is discussed in Chapter 9. Transactions under common control involving a Newco, which might or might not be a business combination as defined in IFRS 3, are considered separately in section 4 below.

Legal mergers between a parent and its subsidiary are discussed in Chapter 9.

3.1 Pooling of interests method or acquisition method

Extract from IAS 8

- 10** In the absence of an IFRS that specifically applies to a transaction, other event or condition, management shall use its judgement in developing and applying an accounting policy that results in information that is:
- (a) relevant to the economic decision-making needs of users; and
 - (b) reliable, in that the financial statements:
 - (i) represent faithfully the financial position, financial performance and cash flows of the entity;
 - (ii) reflect the economic substance of transactions, other events and conditions, and not merely the legal form;
 - (iii) are neutral, ie free from bias;
 - (iv) are prudent; and
 - (v) are complete in all material respects.
- 11** In making the judgement described in paragraph 10, management shall refer to, and consider the applicability of, the following sources in descending order:
- (a) the requirements in IFRSs dealing with similar and related issues; and
 - (b) the definitions, recognition criteria and measurement concepts for assets, liabilities, income and expenses in the *Conceptual Framework for Financial Reporting (Conceptual Framework)*.²
- 12** In making the judgement described in paragraph 10, management may also consider the most recent pronouncements of other standard-setting bodies that use a similar conceptual framework to develop accounting standards, other accounting literature and accepted industry practices, to the extent that these do not conflict with the sources in paragraph 11.

² Paragraph 54G explains how this requirement is amended for regulatory account balances.

[IAS 8.10, IAS 8.11, IAS 8.12].

IFRS 3 scopes out business combinations under common control and is not prescriptive otherwise as to the method of accounting for such transactions. Entities must therefore develop an accounting policy that results in relevant and reliable information by applying the hierarchy in IAS 8.10-12 (discussed in Chapter 3). [IAS 8.10, IAS 8.11, IAS 8.12].

Applying that hierarchy, entities could refer to IFRS 3 as an IFRS accounting standard that deals with a similar and related issue and apply the acquisition method by analogy. Entities could also consider the most recent pronouncements of other standard-setting bodies having a similar framework to IFRS accounting standards, other accounting literature and accepted industry practices, to the extent that these do not conflict with any IFRS accounting standard or the *Conceptual Framework for Financial Reporting*. Several standard-setting bodies have issued guidance and some allow or require a pooling of interests-type method (also referred to as 'predecessor accounting', 'merger accounting' or 'carry over accounting' in some jurisdictions) to account for business combinations under common control.

How we see it

We believe that a receiving entity accounting for a business combination under common control must apply either:

(a) The acquisition method set out in IFRS 3 (see section 3.2 below)

Or

(b) The pooling of interests method (see section 3.3 below)

However, in our view, this accounting policy choice is only available if the transaction has substance for the combining parties. If there is no substance to the transaction, the pooling of interests method is the only method that can be applied to that transaction. If there is substance to the transaction, whichever accounting policy is adopted must be applied consistently to similar categories of transactions as required by IAS 8. An entity needs to exercise judgement in developing and consistently applying an accounting policy that results in information that is relevant and reliable in the particular circumstances.

We do not consider that the ‘fresh start’ method, whereby all assets and liabilities of all combining businesses are restated to fair value, is an appropriate method of accounting for business combinations under common control.

We believe that the accounting policy choice above is only available if the transaction has substance, because the acquisition method results in measuring the net identifiable assets of one or more of the businesses involved at their acquisition-date fair values (with some limited exceptions - see Chapter 10) and/or the recognition of goodwill (or gain on a bargain purchase). IFRS accounting standards contain limited circumstances when net assets are restated to fair value and prohibit the recognition of internally generated goodwill. A common control transaction must not be used to circumvent these limitations. Careful consideration is required of all facts and circumstances, before it is concluded that a transaction has substance.

If substance exists, we believe that a receiving entity is allowed to determine a policy for how categories of BCUCC transactions will be accounted, provided the policy results in relevant and reliable information. For example, some entities might conclude that two BCUCC both have substance but that use of the acquisition method provides more relevant information to the users of the financial statements where the BCUCC is made on terms equivalent to those prevailing in arm’s length transactions and the receiving company is a publicly traded subsidiary with non-controlling interests. By contrast, some entities might determine that the use of pooling for BCUCC involving wholly-owned subsidiaries provides more relevant and reliable information in the circumstances (even if the transaction is determined to have substance).

How we see it

Evaluating whether a business combination under common control has substance will involve consideration of multiple factors, including (but not necessarily limited to):

- The purpose of the transaction
 - The involvement of outside parties in the transaction, such as NCI or other third parties
 - Whether or not the transaction is conducted at fair value
 - The existing activities of the entities involved in the transaction
- And
- Whether or not it is bringing entities together into a reporting entity that did not exist before

The concept of ‘reporting entity’ is clarified in the *Conceptual Framework for Financial Reporting*. A reporting entity is described as “an entity that is required, or chooses, to prepare financial statements.” This can be a single entity or a portion of an entity or comprise more than one entity. A reporting entity is not necessarily a legal entity. [CF 3.10]. Further discussion is included in Chapter 2 and Chapter 7.

Illustration 3-1: Accounting for business combinations under common control - use of acquisition method? (1)

Entity A currently has two businesses (as defined in IFRS 3) operated through wholly-owned subsidiaries Entity B and Entity C. The group structure (ignoring other entities within the group) is as follows:

Entity A proposes to combine the two complementary businesses (currently housed in two separate entities, Entity B and Entity C) into one entity, in anticipation of spinning off the combined entity by way of an IPO. Both businesses have been owned by Entity A for several years. The reorganisation will be structured such that Entity C will acquire the shares of Entity B from Entity A for cash at their fair value of CU1,000. The carrying amount of the net assets of Entity B is CU200 (both in the individual financial statements of Entity B and in the consolidated financial statements of Entity A). The net of the acquisition-date fair values of the identifiable assets acquired and liabilities assumed of Entity B (measured in accordance with IFRS 3) is CU600.

How would this transaction (to facilitate a subsequent spin-off) be accounted for in the consolidated financial statements of both Entity C and Entity A?

As far as Entity C is concerned, there is a business combination that needs to be accounted for. That business combination is however excluded from the scope of IFRS 3, as it is under common control and that control is not transitory. In this fact pattern, there is substance to the transaction. There is a business purpose to the transaction; it has been conducted at fair value; both Entity B and Entity C have existing activities; and they have been brought together into a reporting entity that did not exist before (assuming no general purpose combined financial statements were prepared before - see Chapter 7). Accordingly, Entity C can apply either the acquisition method as set out in IFRS 3 or the pooling of interests method in its consolidated financial statements. The selected accounting policy must be applied consistently to similar transactions.

If Entity C selects the acquisition method, it will need to identify whether Entity C or Entity B is the acquirer (see section 3.2 below). Assuming that Entity C is identified as the acquirer, in summary, this will mean that the net identifiable assets of Entity B will be initially reflected at their acquisition-date fair values (CU600), together with goodwill of CU400 (CU1,000 less CU600), in the consolidated statement of financial position. Only the post-acquisition results of Entity B will be reflected in the consolidated statement of comprehensive income.

As far as Entity A is concerned (i.e., from the perspective of the controlling party), there has been no change in the reporting entity - all that has happened is that Entity B, rather than being directly held and controlled by Entity A, is now indirectly held and controlled through Entity C (i.e., no change in control). Accordingly, there is no business combination and the effects resulting from the intragroup transaction are eliminated in full. Thus, the carrying amounts for Entity B's net assets included in the consolidated financial statements of Entity A do not change. There are also no NCI affected. The transaction therefore has no impact on the consolidated financial statements of Entity A (except for any potential tax consequences).

In Illustration 3-1 above, Entity C had to account for its business combination with Entity B, as it was preparing consolidated financial statements. In some situations, Entity C would not need to account for the business combination at all, as it might be exempt as an intermediate parent company from preparing consolidated financial statements (see Chapter 7). If in Illustration 3-1 above, Entity C had acquired the business of Entity B, rather than the shares, then the same accounting policy choice would have to be made for the business combination in Entity C's financial statements, even if they are not consolidated financial statements.

However, in other types of reorganisations, careful consideration of the factors above might indicate that there is no substance to the transaction. This is shown in Illustration 3-2 below.

Illustration 3-2: Accounting for business combinations under common control - use of acquisition method? (2)

Entity A engages in different business activities in two geographical areas through four wholly-owned subsidiaries (all owned for several years). Each subsidiary individually meets the definition of a business in IFRS 3. Traditionally, the legal structure followed the geographical areas of operations. To align with its management structure, which is organised by business segment, Entity A proposes to reorganise its legal structure. This two-step process involves (i) Entity B distributing its shares in Entity D to Entity A, and (ii) Entity D acquiring the shares in Entity E. The transaction price for (ii) reflects the carrying amount of Entity E's net assets as included in the consolidated financial statements of Entity A. The group structure before and after this reorganisation is as follows:

Before

After

How would this transaction (to align the group's legal and management structure) be accounted for in the consolidated financial statements of both Entity A and Entity D?

As far as Entity A is concerned, neither its own acquisition of the shares in Entity D (by way of distribution from Entity B) nor the transfer of shares in Entity E from Entity C to Entity D represents a business combination. As described in Illustration 3-1 above, from the perspective of the controlling party, there is no change of control. Because there is also no NCI affected, the reorganisation has no impact on the consolidated financial statements of Entity A (except for any potential tax consequences).

In contrast, in the consolidated financial statements of Entity D, there is a business combination that needs to be accounted for. That business combination is however excluded from the scope of IFRS 3, as it is under common control and that control is not transitory. In this fact pattern, the transaction is bringing entities together into a reporting entity that did not exist before (assuming no general purpose combined financial statements were prepared before; see Chapter 7) and both Entity D and Entity E have existing activities. Nevertheless, there is no substance to the transaction. There is no clear business purpose to the transaction; the restructuring is purely internal, with no external parties being involved; and the transaction is not conducted at fair value. Consequently, Entity D cannot apply the acquisition method in its consolidated financial statements. This reorganisation will be accounted for using the pooling of interests method.

In Illustration 3-2 above, Entity D had to account for its business combination with Entity E, as it was preparing consolidated financial statements. In some situations, Entity D would not need to account for the business combination at all, as it might be exempt as an intermediate parent company from preparing consolidated financial statements (see Chapter 7). If in Illustration 3-2 above, Entity D had acquired the business of Entity E, rather than the shares, then the business combination would similarly have to be accounted for using the pooling of interests method in Entity D's financial statements, even if they are not consolidated financial statements.

3.2 Application of the acquisition method under IFRS 3

The application of the acquisition method is set out in IFRS 3 and discussed generally in Chapter 10. This method involves the following steps:

- Identifying the acquirer (see Chapter 10)
- Determining the acquisition date (see Chapter 10)
- Recognising and measuring the identifiable assets acquired, the liabilities assumed, and any NCI in the acquiree (see Chapter 10)

And

- Recognising and measuring goodwill or a gain on a bargain purchase (see Chapter 10) [IFRS 3.5]

It could be that in some cases the identification of the acquirer means that the business combination under common control needs to be accounted for as a reverse acquisition (see Chapter 10). Careful consideration is required where the transaction involves a Newco, as it is often a high hurdle for a Newco to be identified as the acquirer under IFRS 3 (see section 4.1 below).

Goodwill at the acquisition date is computed as the excess of (a) over (b) below:

(a) The aggregate of:

- (i) The consideration transferred (generally measured at acquisition-date fair value)
- (ii) The amount of any NCI in the acquiree

And

- (iii) The acquisition-date fair value of the acquirer's previously held equity interest in the acquiree

(b) The net of the acquisition-date fair values (or other amounts measured in accordance with IFRS 3) of the identifiable assets acquired and the liabilities assumed [IFRS 3.32]

Where (b) exceeds (a) above, IFRS 3 regards this as giving rise to a gain on a bargain purchase. [IFRS 3.34].

The requirements of IFRS 3 in relation to the acquisition method have clearly been developed for dealing with business combinations between parties transacting on an arm's length basis. The consideration transferred in a business combination at arm's length will generally be measured at the acquisition-date fair values of the assets transferred, liabilities incurred and/or equity interests issued by the acquirer (see Chapter 10). The fair value of that consideration normally reflects the value of the acquired business. For business combinations under common control, however, this might not be the case. The transaction might not be at arm's length and the fair value of the consideration transferred might not reflect the value of the acquired business.

Where a higher value is given up than received, economically, the difference represents a distribution from the receiving entity's equity. Conversely, where a higher value is received than given up, the difference represents a contribution to the receiving entity's equity. Nevertheless, IFRS accounting standards neither require nor prohibit the recognition by the acquirer of a non-arm's length element in a business combination under common control.

How we see it

If a business combination under common control is not at arm's length, this might suggest that there is no substance to the transaction, in which case application of the acquisition method would not be appropriate (see section 3.1 above). If, however, the acquisition method is appropriate, in our view, the receiving entity can either:

- (a) Recognise the transaction at the consideration transferred as agreed between the parties (measured at the acquisition-date fair value in accordance with IFRS 3)

Or

- (b) Recognise the transaction at the fair value of the acquired business (with the difference between the fair value of the consideration transferred and the fair value of the acquired business as a contribution to or distribution from equity)

Whichever accounting policy is adopted, it must be applied consistently.

This accounting policy choice is considered in Illustration 3-3 below. As the example does not include any NCI in the acquiree, nor any previously held interest in the acquiree by the acquirer, the computation of goodwill or a gain on a bargain purchase only involves the comparison between the consideration transferred and the net of the acquisition-date fair values of the identifiable assets acquired and liabilities assumed.

Illustration 3-3: Acquisition method - cash consideration less than the fair value of acquired business

Assume the same facts as in Illustration 3-1 above, except that Entity C, rather than acquiring Entity B from Entity A for cash at its fair value of CU1,000, only pays cash of CU700. Assuming there is still substance to the transaction, how would this be reflected by Entity C (if identified as the acquirer) when applying the acquisition method for its acquisition of Entity B?

As discussed above, in our view, there are two acceptable ways of accounting for the transaction:

- (a) The transaction is recognised at the consideration transferred as agreed between Entity A and Entity C, being the acquisition-date fair value of the cash given as consideration, i.e., CU700. Accordingly, goodwill of only CU100 (CU700 less CU600) is recognised.
- (b) The transaction is recognised at the fair value of the acquired business (CU1,000), with a deemed capital contribution from Entity A for the excess over the acquisition-date fair value of the cash given as consideration, i.e., CU300 (CU1,000 less CU700), reflected in Entity C's equity. Accordingly, goodwill of CU400 (CU1,000 less CU600) is recognised.

Whichever method is adopted, it must be applied on a consistent basis.

If Entity C only paid cash of CU500, assuming there is still substance to the transaction, then the impact under (a) and (b) above would be as follows:

- (a) Since the consideration transferred is only CU500, no goodwill is recognised. However, a gain on a bargain purchase of CU100 (being the excess of the acquisition-date fair value of the net identifiable assets of Entity B of CU600 over the consideration transferred of CU500) is recognised immediately in profit or loss.
- (b) As before, goodwill of CU400 is recognised, but a capital contribution of CU500 (CU1,000 less CU500) would be reflected in equity.

In Illustration 3-1 and Illustration 3-3 above, the consideration transferred by Entity C was in cash. However, what if Entity C issued shares to Entity A to effect this business combination under common control?

If an acquirer issues equity interests to effect a business combination, IFRS 3 requires the consideration transferred to be measured at the acquisition-date fair value of these equity interests issued. [IFRS 3.37]. As discussed in Chapter 10, in a business combination in which the acquirer and the acquiree (or its former owners) exchange only equity interests, the acquisition-date fair value of the acquiree's equity interests might be more reliably measurable than that of the acquirer's equity interests. In that case, IFRS 3 requires goodwill to be calculated using the fair value of the acquiree's equity interests rather than the fair value of the equity interests transferred. [IFRS 3.33].

IFRS 3 does not include detailed guidance on measuring the fair value of equity interests issued as consideration. In such circumstances, IFRS 13 *Fair Value Measurement* is relevant because it applies when another IFRS accounting standard requires or permits fair value measurements. [IFRS 13.5]. Fair value is defined as follows: [IFRS 13.9]

Extract from IFRS 13

- 9** This IFRS defines fair value as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.

IFRS 13 requires that entities maximise the use of relevant observable inputs and minimise the use of unobservable inputs to meet the objective of a fair value measurement. [IFRS 13.36]. If either the acquirer's or acquiree's shares are quoted, this would indicate which fair value is more reliably measurable. However, in arrangements between entities under common control, a quoted price for either the acquirer's or the acquiree's shares might not always be available. IFRS 13 is discussed in detail in Chapter 15.

In Illustration 3-3 above, if Entity C issued shares to Entity A to acquire Entity B, and there is no quoted price for either Entity B's or Entity C's shares, then the fair value of the consideration transferred would need to be based on whichever shares are considered to be more reliably measurable. If this were Entity C's shares and their fair value was only CU700, then Entity C would similarly have an accounting policy choice between (a) and (b) above. This choice exists regardless of whether Entity C transfers cash or equity interests as consideration. However, if Entity B's shares are considered to be more reliably measurable, both approaches would result in a similar outcome. This is because the consideration transferred by Entity C would then be based on the fair value of Entity B, i.e., CU1,000. Thus, goodwill of CU400 would be recognised, with the CU1,000 consideration transferred reflected in equity.

3.3 Application of the pooling of interests method

We believe that if an entity does not adopt an accounting policy of using the acquisition method under IFRS 3, or if the transaction has no substance, the pooling of interests method must be applied when accounting for business combinations under common control (see section 3.1 above).

3.3.1 General requirements

IFRS 3 makes no reference to the pooling of interests method, except in the context of rejecting it as a method of accounting for business combinations generally. Various local standard-setters have issued guidance, and some allow or require a pooling of interests-type method (sometimes known as 'predecessor accounting', 'merger accounting' or 'carry over accounting') to account for business combinations under common control. The pooling of interests method is generally considered to involve the following:⁸

- The assets and liabilities of the combining parties are reflected at their carrying amounts.
No adjustments are made to reflect fair values, or recognise any new assets or liabilities, at the date of the combination that would otherwise be done under the acquisition method. The only adjustments made are to align accounting policies.
- No 'new' goodwill is recognised as a result of the combination.
The only goodwill that is recognised is any existing goodwill relating to either of the combining parties. Any difference between the consideration transferred and the acquired net assets is reflected within equity.
- The income statement reflects the results of the combining parties.

Different practices exist as to where in equity any difference between the consideration transferred and acquired net assets is presented (e.g., in retained earnings or a separate merger reserve). IFRS accounting standards generally do not prescribe presentation within equity. Also, this is often influenced by legal or regulatory requirements in an entity's jurisdiction.

Apart from the second bullet point above, the application of the pooling of interests method, in the context of accounting for business combinations under common control under IFRS accounting standards, does raise particular issues as discussed in sections 3.3.2 to 3.3.6 below.

3.3.2 Carrying amounts of assets and liabilities

In general, no adjustments would be expected to be required to conform accounting policies of the entities involved in a business combination under common control. This is because in preparing the consolidated financial statements of the ultimate parent under IFRS accounting standards, uniform accounting policies would have been adopted by all members of the group. [IFRS 10.19, IFRS 10.B87]. However, it might be necessary to make adjustments where the combining entities or businesses used different accounting policies when preparing their own financial statements or were not part of the same group before.

The main issue relating to the use of predecessor carrying amounts, when the receiving entity applies the pooling of interests method for business combinations under common control, is whether the carrying amounts of the assets acquired and liabilities assumed are based on:

- (a) The carrying amounts recognised by the controlling party (e.g., those reported in the consolidated financial statements of the parent)
- Or
- (b) The carrying amounts recognised by the transferred business (e.g., those reported in the financial statements of the acquiree)

A difference between (a) and (b) above might result from fair value adjustments and/or goodwill that have/has arisen on the past acquisition of the transferred business by that controlling party.

The carrying amounts of the receiving entity's assets and liabilities remain the same as those in its existing financial statements prior to the business combination under common control.

⁸ For example, see FASB ASC 805-50, *Business Combinations - Related Issues*; and the Financial Reporting Council's FRS 102 Section 19, *Business Combinations and Goodwill*, paras. 29-32 (which refers to merger accounting).

How we see it

In our view, when applying the pooling of interests method for business combinations under common control, the receiving entity generally would use the carrying amounts as recognised by the controlling party for the transferred business (i.e., those in (a) above).

Usually, the carrying amounts as recognised in the ultimate parent's IFRS consolidated financial statements are used. However, there could be cases where the facts and circumstances mean that the carrying amounts as recognised in the IFRS consolidated financial statements of an intermediate parent provide relevant information.

In certain circumstances, it might be acceptable to use the carrying amounts as recognised by the transferred business (i.e., those in (b) above). Factors to consider include:

- The timing of the transaction
- Whether the transaction is in preparation for an external sale
- The identity and nature of the users of the financial statements
- Whether an accounting policy was already set for similar and related transactions
- Difficulties in identifying consolidated book values for the transferred business under IFRS accounting standards

An entity needs to exercise judgement in determining the basis for the carrying amounts of the transferred business that results in information that is relevant and reliable in the particular circumstances.

We believe that the receiving entity generally would use the carrying amounts in (a) above because those carrying amounts might be more recent (and therefore relevant) and reflect the perspective of that party that effectively directs the transaction. Generally, the consolidated book values under IFRS accounting standards of the ultimate parent are used. However, there can be cases where the consolidated book values under IFRS accounting standards of another parent in the group provide relevant information to the users of the financial statements. For example, it might be that the ultimate parent does not prepare IFRS consolidated financial statements including the transferred business whereas an intermediate parent does so. Even where both the ultimate parent and an intermediate parent prepare IFRS consolidated financial statements including the transferred business and the receiving entity, the carrying amounts in the lower-level consolidation might provide more relevant information, having regard to the factors listed below. For example, significant non-controlling interests or creditors in the intermediate parent's subgroup might rely primarily on the IFRS consolidated financial statements of the intermediate parent.

When evaluating if the carrying amounts in (b) above can be used, the following factors need to be considered:

- The timing of the business combination under common control in comparison to when the transferred business was previously acquired by the controlling party, if applicable. Generally, the carrying amounts in (a) above are deemed more relevant as they were reassessed more recently. However, the longer the period since the previous acquisition by the controlling party, the less relevant this factor might be. Where an intragroup transfer follows shortly after a third-party acquisition, use of the carrying amounts in (a) is appropriate because these represent the book values to the controlling party's group using the acquisition method. Use of the carrying amounts in (b) would give a different answer purely due to the structuring rather than reflecting the substance of the transaction.
- Whether the transaction is a 'grooming' transaction in preparation for a spin-off, sale or similar external transaction. Generally, the carrying amounts in (a) above will be more relevant in such a situation (for the reasons explained above). However, it could be argued that in a grooming transaction leading to an external trade sale (with different owners), the new owners are indifferent as to whether the carrying amounts in (a) or (b) are used, particularly if the transferred business had been acquired by its previous owners some considerable time before.
- The identity and nature of the users of the financial statements. If a broad group of users of the financial statements of the receiving entity after the transaction are parties that previously relied upon the financial statements of, or including, the transferred business before the transaction (e.g., if there are significant NCI and/or creditors), using the amounts in (b) above might provide more relevant information.
- Whether an accounting policy was already set within the group for similar and related common control transactions (e.g., whether the accounting policy for this transaction is consistent with the accounting policy applied to legal mergers between a parent and a subsidiary - see Chapter 9).

- Difficulties in identifying reliable book values under IFRS accounting standards for the transferred business. It will be more difficult and costly to use the carrying amounts in (a) if the controlling party has not previously prepared IFRS consolidated financial statements. In addition, it might be that allocations of goodwill and intangible assets which are reported in the IFRS consolidated financial statements need to be made when determining the consolidated book values relating to the transferred business. In such circumstances, it might be more straightforward to determine the carrying amounts in accordance with IFRS accounting standards for the transferred business particularly if these already exist.

Determining the appropriate basis of the IFRS carrying amounts of the transferred business requires judgement to ensure the information presented is relevant and reliable in the particular circumstances. It will generally be appropriate to disclose the basis used in the material accounting policy information and, where relevant, to disclose key judgements made. [IAS 1.117, IAS 1.122].

The rationale for using the carrying amounts as recognised by the controlling party is explained further in Illustration 3-4 below.

Illustration 3-4: Pooling of interests method - carrying amounts of assets acquired and liabilities assumed

Entity A currently has two businesses (as defined in IFRS 3) operated through wholly-owned subsidiaries Entity B and Entity C. The group structure (ignoring other entities within the group) is as follows:

Both entities have been owned by Entity A for a number of years.

On 1 October 20X2, Entity A restructures the group by transferring its investment in Entity C to Entity B, such that Entity C becomes a subsidiary of Entity B. The accounting policy adopted for business combinations under common control excluded from IFRS 3 is to apply the pooling of interests method.

In Entity B's consolidated financial statements for the year ending 31 December 20X2, which carrying amounts would be reflected in respect of the assets and liabilities of Entity C?

Entity B generally would use the carrying amounts reported in Entity A's consolidated financial statements, rather than the carrying amounts reported in Entity C's own financial statements.

Accordingly, they will be based on their fair values as at the date Entity C became part of the Entity A group and adjusted for subsequently in accordance with the applicable IFRS accounting standards. Any goodwill relating to Entity C that was recognised in Entity A's consolidated financial statements, will also be recognised in Entity B's consolidated financial statements. Any difference between the equity of Entity C and those carrying amounts are adjusted against equity. The carrying amounts of the net assets of Entity B will remain as before.

The rationale for applying this approach is that the transaction is essentially a transfer of the assets and liabilities of Entity C from the consolidated financial statements of Entity A to the financial statements of Entity B. From a group perspective of Entity B's shareholder, nothing has changed except the location of those assets and liabilities. Entity B has effectively taken on the group's ownership. Therefore, the carrying amounts used in the consolidated financial statements are the appropriate and most relevant values to apply to the assets and liabilities of Entity C, as they represent the carrying amounts to the Entity A group.

The transferring entity might prepare IFRS financial statements which consolidate the transferred business up to the date of loss of control. The transferred business might qualify as a disposal group held for sale in the transferring entity's consolidated financial statements prior to the date of loss of control as a consequence of the expected sale to another entity in the same common control group. In accordance with IFRS 5, the transferring entity would cease depreciation of non-current assets and the disposal group would be measured at the lower of cost and fair value less costs of disposal. A similar situation could arise in the transferring entity's individual IFRS financial statements if the transferred business is an unincorporated business.

However, in the ultimate parent's case, its consolidated financial statements would not reflect IFRS 5 adjustments since it has not lost control of the transferred business.

When the receiving entity accounts for the transferred business under the pooling method using the transferring entity's book values, the question arises as to whether the carrying amounts recorded by the receiving entity in its IFRS financial statements need to reflect IFRS 5 adjustments made in relation to the transferred business.

How we see it

In our view, the carrying amounts for the transferred business used by the receiving entity need to exclude the IFRS 5 adjustments that are reflected in the transferring entity's IFRS financial statements. This is because the transferred business remains under common control, so there is no disposal to the wider group.

The same approach applies where the receiving entity uses the carrying amounts for the transferred business that are reflected in the IFRS consolidated financial statements of an intermediate parent that consolidates the transferring but not the receiving entity.

When applying the pooling of interests method to business combinations under common control, the receiving entity would apply the approach outlined above regardless of the legal form of the transaction. Therefore, if in Illustration 3-4 above, Entity B had acquired the business of Entity C, rather than the shares, or the entities had been merged into one legal entity whereby Entity B was the continuing entity, then the same treatment would apply in Entity B's financial statements, even if they are not consolidated financial statements.

3.3.3 Restatement of financial information for periods prior to the date of the combination

Another issue is whether the receiving entity would restate financial information for periods prior to the date of the business combination when applying the pooling of interests method. That is, from which date would the transaction be accounted for and how would comparative information for the prior period(s) be presented?

The pooling of interests method is generally considered to involve the combining parties being presented as if they had always been combined. To this effect, the receiving entity accounts for the transaction from the beginning of the period in which the combination occurs (irrespective of its actual date) and restates comparatives to include all combining parties. However, in applying the IAS 8 hierarchy (see section 3.1 above), an entity would need to consider whether the pooling of interests method is consistent with IFRS 10 specifically. That standard indicates that an entity only includes the income and expenses of a subsidiary in the consolidated financial statements from the date the entity gains control. [IFRS 10.20, IFRS 10.B88].

Extract from IFRS 10

Measurement

B88 An entity includes the income and expenses of a subsidiary in the consolidated financial statements from the date it gains control until the date when the entity ceases to control the subsidiary. Income and expenses of the subsidiary are based on the amounts of the assets and liabilities recognised in the consolidated financial statements at the acquisition date. For example, depreciation expense recognised in the consolidated statement of comprehensive income after the acquisition date is based on the fair values of the related depreciable assets recognised in the consolidated financial statements at the acquisition date.

The IFRS IC discussed the presentation of comparatives when applying the pooling of interests method to business combinations under common control, prior to the issuance of IFRS 10, under the regime of IAS 27 *Consolidated and Separate Financial Statements* (now superseded). However, as resolving the issue would require interpreting the interaction of multiple IFRS accounting standards and the IASB had added a project on business combinations under common control to its research agenda, the IFRS IC decided not to add the issue to its agenda.⁹ There was no substantial change in IFRS 10 from superseded IAS 27 regarding the measurement of income and expenses of a subsidiary in the consolidated financial statements.¹⁰

⁹ [IFRIC Update](#), January 2010, *Agenda decisions: IAS 27 Consolidated and Separate Financial Statements - Presentation of comparatives when applying the 'pooling of interests' method*. Available on the IFRS Foundation's website.

¹⁰ Paragraph B88 of IFRS 10 essentially retains the wording of the superseded IAS 27.26, which was as follows: "The income and expenses of a subsidiary are included in the consolidated financial statements from the acquisition date as defined in IFRS 3. Income and expenses of the subsidiary shall be based on the values of the assets and liabilities recognised in the parent's consolidated financial statements at the acquisition date..."

One view is that the concept of pooling does not conflict with the requirements of IFRS 10, on the basis that the combined entity is considered a continuation from the perspective of the controlling party. In business combinations under common control, ultimately, there has been no change in control, because the controlling party already had control over the combined resources - it has merely changed the location of its resources. Accordingly, the receiving entity restates the periods prior to the combination to reflect that there has been no change in ultimate control. IFRS 10.B88 restricts when the pooling of interests method is applied (i.e., not until the combining parties have actually come under direct control), not how it is applied.

Another view is that the requirements of IFRS 10 are inconsistent with the concept of pooling, on the basis that the combined entity did not exist before, from the perspective of the combining parties. Therefore, the consolidated financial statements of the receiving entity cannot include financial information of a subsidiary prior to the date it obtains control, in accordance with IFRS 10.B88. The fact that the business combination is outside of the scope of IFRS 3 is irrelevant when considering the requirements of IFRS 10. Accordingly, the pooling of interests method does not involve restatement of periods prior to the combination and affects only the values assigned to the assets and liabilities of the transferred business when the receiving entity obtains control (see section 3.3.2 above).

How we see it

In our view, when applying the pooling of interests method for business combinations under common control, the receiving entity has an accounting policy choice between:

- View 1 - Restatement of periods prior to the business combination under common control, to the extent that the combining parties were under common control of the same controlling party (retrospective approach)
- View 2 - No restatement of periods prior to the business combination under common control (prospective approach)

An entity must consistently apply its chosen accounting policy.

Under View 1 above, the financial information in the consolidated financial statements is restated for periods prior to the business combination under common control, to reflect the combination as if it had occurred from the beginning of the earliest period presented, regardless of the actual date of the combination. However, financial information for periods prior to the business combination is restated only for the period that the combining parties were under common control of the same controlling party (or parties).

Under View 2 above, the financial information in the consolidated financial statements is not restated for periods prior to the business combination under common control. The receiving entity accounts for the combination prospectively from the date on which it occurred.

These views are illustrated in Illustration 3-5 and Illustration 3-6 below.

Illustration 3-5: Pooling of interests method - restatement of financial information for periods prior to the date of the combination (1)

Assume the same facts as in Illustration 3-4 above.

Entity B obtains control over Entity C on 1 October 20X2.

In preparing its consolidated financial statements for the year ending 31 December 20X2 (including comparatives for one year), from which date would Entity B include financial information for Entity C when applying the pooling of interests method?

Entity B has a choice of two views for its accounting policy, which must be applied consistently:

View 1 - Restatement of periods prior to the business combination under common control, to the extent that the combining parties were under common control of the same controlling party

Entity B and Entity C have been owned by Entity A for a number of years (i.e., common control already existed at the start of the first comparative period presented). Entity B therefore restates the financial information in its consolidated financial statements for 20X2 (both the current year pre-combination results and the 20X1 comparatives) to include financial information for Entity C as from 1 January 20X1.

View 2 - No restatement of periods prior to the business combination under common control

Entity B does not restate the financial information in its consolidated financial statements for 20X2 (neither the current year pre-combination results nor the 20X1 comparatives). No financial information is included for Entity C prior to 1 October 20X2.

In Illustration 3-5 above, Entity C had been part of the Entity A group for a number of years. What if this had not been the case? Entity B still has a choice of two views, to restate or not to restate. If it chooses restatement, then financial information in the consolidated financial statements for periods prior to the combination is restated only for the period that the entities were under common control of the same controlling party (or parties). If the controlling party has not always controlled these combined resources, then application of the pooling of interests method reflects that fact. That is, an entity cannot restate the comparative financial information for a period that common control by the same controlling party (or parties) did not exist.

Illustration 3-6: Pooling of interests method - restatement of financial information for periods prior to the date of the combination (2)

Assume the same facts as in Illustration 3-4 above, except that in this situation Entity A had acquired Entity C on 1 July 20X1. That is, (non-transitory) common control exists at the time of Entity B's acquisition of Entity C, but Entity B and Entity C were not under common control during the entire comparative period.

In preparing its consolidated financial statements for the year ending 31 December 20X2 (including comparatives for one year), from which date would Entity B include financial information for Entity C when applying the pooling of interests method?

View 1 - Restatement of periods prior to the business combination under common control, to the extent that the combining parties were under common control of the same controlling party

If Entity B applies View 1 as its accounting policy, it restates the financial information in its consolidated financial statements for 20X2 (both the current year pre-combination results and the 20X1 comparatives). However, Entity B includes financial information for Entity C only as from 1 July 20X1 (i.e., when both entities were first under common control of Entity A).

View 2 - No restatement of periods prior to the business combination under common control

If Entity B applies View 2 as its accounting policy, the change in fact pattern has no impact as Entity B does not restate the financial information in its consolidated financial statements for 20X2 (neither the current year pre-combination results nor the 20X1 comparatives). No financial information is included for Entity C prior to 1 October 20X2.

3.3.4 Equity reserves and history of assets and liabilities carried over

The concept of pooling generally is based on the premise of a continuation of the combining parties. Consistently, the pre-combination equity composition and history associated with the assets and liabilities would be carried forward upon the combination occurring and might affect the post-combination accounting. For instance, certain equity reserves might be transferred within equity or reclassified to profit or loss when specific conditions are met. Examples of equity reserves that are reclassified to profit or loss on the occurrence of specific circumstances (including a loss of control of a subsidiary) include fair value reserves of financial assets (other than investments in equity instruments) at FVOCI, hedging reserves, and foreign currency translation reserves. Carrying forward the history also means that if a hedging relationship was previously established in an entity that is transferred to another entity in a business combination under common control, that hedging relationship continues to be reflected in the consolidated financial statements of the receiving entity provided all the conditions of hedging are still met post-transfer. Similarly, previous impairment losses recognised for assets might possibly reverse post-combination.

If the receiving entity in a business combination under common control adopts View 1 in section 3.3.3 above, pooling is applied in full and the history of the combining parties (since they were under common control of the same controlling party or parties) is continued as described above.

If the receiving entity adopts View 2 in section 3.3.3 above, it would need to decide whether or not to retain the pre-combination equity reserves and history of assets and liabilities of the transferred business.

How we see it

In our view, when applying the pooling of interests method for business combinations under common control and electing not to restate periods prior to the transaction, the receiving entity has a further accounting policy choice between:

- View 2a - No restatement of periods prior to the business combination under common control, but retention of equity reserves and history
- View 2b - No restatement of periods prior to the business combination under common control, with reset of equity balances and history

An entity must consistently apply its chosen accounting policy.

View 2a above considers the absence of restatement as only a presentation issue, but to all intents and purposes the concept of pooling is applied in full. While the financial information for periods prior to the business combination is not restated, the transferred business continues within the combined entity as if pooling had been applied since the combining parties were under common control of the same controlling party (or parties). The pre-combination equity reserves and history of assets and liabilities of the transferred business are carried over as at the date of transaction and are reflected in the post-combination financial statements of the receiving entity.

View 2b above considers the absence of restatement as more than only a presentation issue. Rather, the business combination is viewed as an initial recognition event at that date, using the measurement principle of pooling. While the financial information for periods prior to the business combination is not restated, the transaction gives rise to an initial recognition of the assets and liabilities of the transferred business at their predecessor carrying amounts. This means that they essentially have a new deemed cost and their history is not retained (so, for example, if the deemed cost reflects a prior impairment, that impairment would not be capable of reversal subsequent to the business combination, as the transaction reset the initial cost). Equally, the equity reserves of the transferred business are not carried over but adjusted to another component of equity (e.g., retained earnings). The post-combination financial statements of the receiving entity do not reflect any pre-combination history of the transferred business. Since any cash flow hedge reserves are not retained, this view often has consequences for hedge effectiveness going forward. This is further discussed in Chapter 49.

Overall, View 2a and View 2b above result in the same net asset position at the date of the combination. This is because under both views the assets and liabilities of the transferred business are carried over at their predecessor carrying amounts. However, they will have a different effect on the composition of equity at the date of the combination and the treatment of certain transactions post-combination. This is demonstrated in Illustration 3-7 below.

Illustration 3-7: Pooling of interests method - no restatement of financial information for periods prior to the date of the combination - impact of carrying over equity reserves and history

Assume the same facts as in Illustration 3-4 above, with Entity B adopting *View 2 - No restatement of periods prior to the business combination under common control*.

Entity B then has an accounting policy choice as to whether or not to retain the pre-combination equity reserves and history of assets and liabilities of Entity C.

How does this choice affect the accounting for the post-combination disposal of a foreign operation described below, in Entity B's consolidated financial statements for the year ending 31 December 20X2?

On 1 October 20X2, the date of the combination occurring, Entity C had a foreign currency translation reserve of CU100 (credit) relating to a foreign operation - for example, an equity-accounted associate. On 31 October 20X2, Entity C sold the associate carried at CU500 for CU700. Assume that the foreign exchange rate had remained unchanged during October 20X2.

View 2a - No restatement of periods prior to the business combination under common control, but retention of equity reserves and history

Entity B recognises the foreign currency translation reserve of CU100 at the date of the combination. When the associate (i.e., the underlying foreign operation) is subsequently sold, that CU100 is reclassified from equity to profit or loss for the year. Therefore, a net gain on disposal of CU300 is recognised in the statement of profit or loss (CU700 less CU500 plus CU100), with a CU100 debit entry to OCI.

View 2b - No restatement of periods prior to the business combination under common control, with reset of equity reserves and history

Entity B does not recognise the foreign currency translation reserve at the date of the combination. When the associate is subsequently sold, a net gain on disposal of CU200 is recognised (CU700 less CU500) and no additional amount is reclassified from equity to the profit or loss for the year.

3.3.5 Accounting for transaction costs in a business combination under common control

Transaction costs such as advisory, legal and other professional fees can arise in a pooling transaction. There is no guidance in IFRS accounting standards specifically addressing this issue.

How we see it

In our view, transaction costs that do not qualify as issue costs of a debt or equity instrument are recognised in profit or loss as an expense. This is consistent with how an entity would account for transaction costs incurred in connection with a business combination under IFRS 3 (since they do not form part of the exchange transaction).

3.3.6 Acquisition of NCI as part of a business combination under common control

As discussed in section 2.1 above, the extent of NCI in each of the combining entities before and after the business combination is not relevant to determining whether the combination involves entities under common control for the purposes of the scope exclusion in IFRS 3. [IFRS 3.B4]. Accordingly, the accounting for business combinations under common control is not restricted to combinations involving wholly-owned entities.

It could be that in a business combination under common control involving a partially-owned subsidiary, any NCI in that subsidiary is acquired at the same time as the common control transaction.

Where the receiving entity applies the pooling of interests method, the question arises as to at what date the acquisition of the NCI would be reflected in its consolidated financial statements. This is particularly pertinent where the receiving entity restates financial information for periods prior to the date of the combination under View 1 as set out in section 3.3.3 above.

How we see it

When NCI in the transferred business is acquired simultaneously with a business combination under common control that is accounted for using the pooling of interests method, in our view, there are two separate transactions to be accounted for:

- The reorganisation of entities under common control
- The acquisition of the NCI

Regardless of whether or not the receiving entity elects to restate periods prior to the business combination under common control (see section 3.3.3 above), the acquisition of the NCI is accounted for at the date of acquisition.

The basic principle of accounting for business combinations under common control using the pooling of interests method is that the structure of ownership is discretionary and any reorganisation thereof is without economic substance from the perspective of the controlling party. The receiving entity might reflect that perspective and present the combining parties as if they had always been combined, regardless of the actual date of the combination (see section 3.3.3 above). However, it is inconsistent with the principles of pooling to reflect ownership of a portion or all of a business prior to the date the controlling party (either directly or indirectly) obtained that ownership interest.

The acquisition of the NCI is a transaction with economic substance from the perspective of the controlling party. IFRS 10 states that the change in ownership interest resulting from such a transaction is accounted for as an equity transaction at that date. [IFRS 10.23, IFRS 10.24, IFRS 10.B96]. Also, IFRS accounting standards do not include a principle that transactions with a third party (such as the acquisition of NCI) can be accounted for as of a date earlier than when the transaction is actually consummated.

Accordingly, the receiving entity accounts for the acquisition of NCI at the actual date of acquisition. It is not appropriate to reflect the acquisition of NCI as if it occurred as of any prior date (as can be done for the controlling interest transferred), even if the acquisition occurs simultaneously with a common control transaction. This is consistent with requirements in IFRS accounting standards to present separately income attributable to the owners of the parent (see Chapter 3) and to calculate earnings per share based on profit or loss attributable to ordinary shareholders of the parent (see Chapter 33).

The discussion above is illustrated in Illustration 3-8 below.

Illustration 3-8: Pooling of interests method - acquisition of NCI as part of a business combination under common control

Parent A controls Entity B and Entity C. Both subsidiaries are businesses as defined in IFRS 3. From the group's perspective, there is a 40% NCI in Entity C that is held by an unrelated party, Entity Z. Entity B obtains control of Entity C by issuing additional shares on the same date to:

- Acquire Parent A's 60% interest in Entity C
- And
- Acquire Entity Z's 40% interest in Entity C

The group structure before and after these transactions is as follows:

Before

After

How would Entity B account for the acquisition of Entity Z's 40% interest in Entity C when applying the pooling of interests method in its consolidated financial statements?

Entity B must account for the acquisition of Entity Z's 40% interest in Entity C at the actual date of the transaction, regardless of whether financial information for periods prior to the business combination under common control is restated (see section 3.3.3 above). Thus, if Entity B restates its consolidated financial statements to reflect comparative information for Entity C for the period before the combination, it will include the 40% NCI in Entity C within equity until the actual date of the transaction. The change in ownership interest resulting from the acquisition of Entity Z's 40% interest will be accounted for as an equity transaction at that date.

4 Accounting for transactions under common control (or ownership) involving a Newco

4.1 Introduction

Extract from IFRS 3

- B18** A new entity formed to effect a business combination is not necessarily the acquirer. If a new entity is formed to issue equity interests to effect a business combination, one of the combining entities that existed before the business combination shall be identified as the acquirer by applying the guidance in paragraphs B13-B17. In contrast, a new entity that transfers cash or other assets or incurs liabilities as consideration may be the acquirer.
- B19** A reverse acquisition occurs when the entity that issues securities (the legal acquirer) is identified as the acquiree for accounting purposes on the basis of the guidance in paragraphs B13-B18. The entity whose equity interests are acquired (the legal acquiree) must be the acquirer for accounting purposes for the transaction to be considered a reverse acquisition. For example, reverse acquisitions sometimes occur when a private operating entity wants to become a public entity but does not want to register its equity shares. To accomplish that, the private entity will arrange for a public entity to acquire its equity interests in exchange for the equity interests of the public entity. In this example, the public entity is the **legal acquirer** because it issued its equity interests, and the private entity is the **legal acquiree** because its equity interests were acquired. However, application of the guidance in paragraphs B13-B18 results in identifying:
- (a) the public entity as the **acquiree** for accounting purposes (the accounting acquiree); and
 - (b) the private entity as the **acquirer** for accounting purposes (the accounting acquirer).
- The accounting acquiree must meet the definition of a business for the transaction to be accounted for as a reverse acquisition, and all of the recognition and measurement principles in this IFRS, including the requirement to recognise goodwill, apply.

[IFRS 3.B18, IFRS 3.B19].

The receiving entity in a common control transaction involving the transfer of control over one or more businesses is not always an existing entity but could also be a newly formed entity (or Newco). This raises particular questions since IFRS 3 indicates that a new entity formed to effect a business combination is not necessarily the acquirer. If a new entity issues equity interests to effect a business combination, one of the combining entities that existed before the transaction shall be identified as the acquirer. In contrast, a new entity that transfers cash or other assets or incurs liabilities as consideration could be the acquirer. [IFRS 3.B18].

Whether a Newco can be identified as the acquirer could be relevant to determine if a transaction is a business combination and thus within the scope of IFRS 3 (unless otherwise excluded). The standard defines a business combination as “a transaction or other event in which an **acquirer** obtains control of one or more **businesses**.” [IFRS 3 Appendix A]. This requires one of the combining entities to be identified as the acquirer. IFRS 3 also states that “The accounting acquiree must meet the definition of a business for the transaction to be accounted for as a reverse acquisition”. [IFRS 3.B19]. Since a Newco does not have its own operations, it would not be a business as defined. Accordingly, if a Newco combines with only one business, neither party might be capable of being identified as the acquirer under IFRS 3 and the transaction would not be a business combination.

Whether a Newco can be identified as the acquirer is also relevant in case the acquisition method is applied. When, for example, a Newco combines with two businesses and is identified as the acquirer, acquisition-date fair values would be attributed to the assets acquired and liabilities assumed of both existing businesses, and any goodwill or gain on a bargain purchase relating to those businesses would be recognised. In contrast, if Newco itself is not the acquirer under IFRS 3, one of the existing businesses must be identified as the acquirer and the acquisition method of accounting would be applied only to the other business.

IFRS 3 does not specify in which circumstances a Newco that effects a business combination other than through the issue of shares can be the acquirer, but it is clear that ‘control’ is the fundamental concept when identifying an acquirer. This is discussed further in Chapter 10.

How we see it

The analysis of whether a Newco that effects a business combination other than through the issue of shares can be the acquirer requires careful consideration of all facts and circumstances. In our view, this ultimately depends on whether a Newco can be considered as an extension of the party (or parties) that ultimately gain control over the combining entities.

In common control transactions, however, there is typically no change of ultimate control over the transferred business or businesses. In that situation, we believe that a Newco would not be identified as the acquirer under IFRS 3.

That conclusion might be different when a reorganisation involving a Newco is used to facilitate an external sale or IPO. That is, if the transfer under common control is an integral part of another transaction that ultimately results in a change of control over the transferred business or businesses, the facts and circumstances might be such that a Newco could be regarded as the acquirer under IFRS 3. This situation is shown in Chapter 10, where the transfer of two businesses from a parent to a newly incorporated entity for cash (i.e., under common control) is contingent on the completion of an IPO of that Newco. In this scenario, the parent loses ultimate control over the two businesses and Newco could in effect be considered as an extension of its new shareholders after the IPO. However, if the change of control is only planned, but not an integral part of the transaction, Newco would be viewed as an extension of the parent (or possibly the transferred businesses) and would not be the acquirer.

How we see it

In our view, if a reorganisation involving a Newco is conditional on the completion of another transaction that ultimately results in a change of control over the transferred business or businesses (e.g., by sale or IPO), it would be possible to identify Newco as the acquirer under IFRS 3. However, if the change of control is only planned, but not an integral part of the transaction, Newco would not be identified as the acquirer under IFRS 3.

While the IFRS IC discussed a few similar fact patterns in 2011, it ultimately observed that the accounting for arrangements involving the creation of a newly formed entity and for common control transactions is too broad to be addressed through an interpretation or an annual improvement. The IFRS IC concluded that these matters would be better considered in the context of a broader project on accounting for common control transactions.¹¹ As previously noted in section 1.1 above, the IASB undertook a research project on business combinations under common control but decided to discontinue the project in November 2023. The feedback statement issued by the IASB in April 2024 following the discontinuance of the project is further discussed in section 6 below.

The discussion in sections 4.2, 4.3 and 4.4 below addresses different scenarios involving a Newco. While this chapter mainly deals with transactions under common control, Illustration 4-1, Illustration 4-2 and Illustration 4-4 below also discuss the accounting treatment where the same group of shareholders owns the combining entities before and after the transaction, but without a single shareholder, or sub-group of the shareholders by virtue of a contractual arrangement (see section 2.1.1 above), having control. All of the Illustrations in sections 4.2, 4.3 and 4.4 below assume that all entities are owned 100% by the party or parties at the top of the particular structure.

Sometimes, BCUCCs and other transactions under common control (as discussed in section 4 of this chapter) involve use of an existing shell company for convenience, rather than establishing a Newco to effect a transaction.

How we see it

In our view, where a BCUCC or other transaction under common control is effected through use of an existing shell company for convenience, similar considerations to those discussed in section 4 of this chapter in connection to the use of Newcos apply.

¹¹ [IFRIC Update](#), September 2011, *IFRS Interpretations Committee agenda decisions: IFRS 3 Business Combinations-business combinations involving newly formed entities: factors affecting the identification of the acquirer; and IFRS 3 Business Combinations-business combinations involving newly formed entities: business combinations under common control*. Available on the IFRS Foundation's website.

4.2 Setting up a new top holding company

In Illustration 4-1 and Illustration 4-2 (see section 4.2.1 below), a new holding company has been inserted between shareholders and either an existing group or a series of entities with common ownership (but not necessarily common control). Newco issues shares to effect the transaction and is not identified as the acquirer in either case. However, the accounting consequences might differ depending on whether or not the transaction represents a business combination according to IFRS 3. Transactions such as this might also be effected for consideration other than shares or a combination of shares and other consideration. Arrangements in which Newco transfers cash or other assets or incurs liabilities are discussed in section 4.2.2 below.

4.2.1 Setting up a new top holding company: transactions effected through issuing equity interests

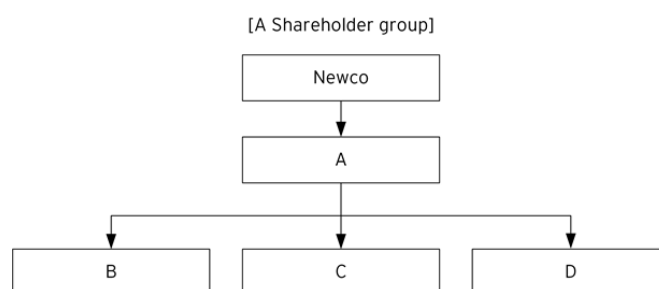

Illustration 4-1: Newco inserted at the top of an existing group

A Newco is incorporated and inserted at the top of an existing group, which is a business as defined in IFRS 3. Newco issues shares to the existing shareholders of Entity A in exchange for the shares already held in that entity. There are no changes to the shareholder group. The group structure before and after this transaction is as follows:

Before

After

How would this reorganisation be accounted for in Newco's consolidated financial statements?

In many situations, this type of transaction will not be 'under common control' since there will be no contractual arrangement between the shareholders (see section 2.1.1 above). However, whether there is common ownership or common control by one individual, or a sub-group of the shareholders, over the combining parties is irrelevant in this specific scenario.

How we see it

The transaction in this specific fact pattern is not a business combination. In our view, Newco cannot elect to apply the acquisition method. Rather, its consolidated financial statements are a continuation of the existing group.

The transaction does not meet the definition of a business combination under IFRS 3, because neither Newco nor Entity A can be identified as the acquirer. Newco cannot be identified as the acquirer as it issues shares to effect the combination. Entity A cannot be identified as the acquirer (in a reverse acquisition) as Newco is not a business as defined. On that basis, the transaction is outside the scope of IFRS 3.

Applying the IAS 8 hierarchy, Newco cannot elect to apply the acquisition method as set out in IFRS 3 since the transaction does not result in any change of economic substance (e.g., in terms of any real alteration to the composition or ownership of the group). Accordingly, Newco's consolidated financial statements reflect that the arrangement is in substance a continuation of Entity A's group (combined with a capital reorganisation to reflect Newco's capital structure) and will reflect pre-combination carrying amounts for Entity A's group. The financial information presented for periods prior to the transaction is that of Entity A's group. Any difference in share capital is reflected as an adjustment to equity.

In Illustration 4-1 above, the transaction does not represent a business combination as none of the combining parties can be identified as the acquirer according to IFRS 3. This is because Newco issues equity interests to obtain control of only one business. In Illustration 4-2 below, whilst Newco still issues shares to effect the transaction, the combination involves more than one business.

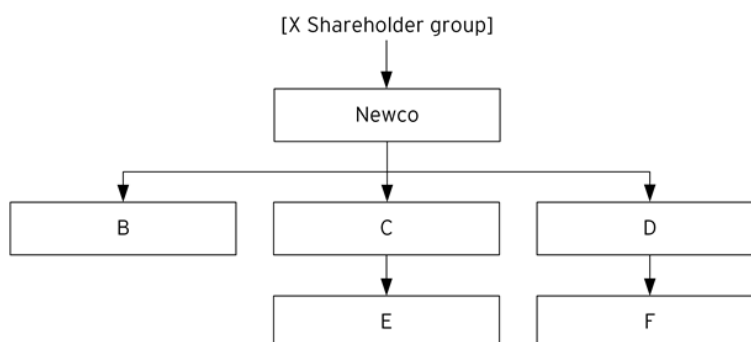

Illustration 4-2: Newco inserted at the top of entities owned by the same shareholders thereby creating a new reporting group

A Newco is incorporated and inserted at the top of a number of entities owned by the same shareholders. Newco issues shares to the existing shareholders of Entities B, C and D in exchange for the shares already held in those entities. Entities B, C and D are businesses as defined in IFRS 3. The group structure before and after this transaction is as follows:

Before

After

How would this reorganisation be accounted for in Newco's consolidated financial statements?

How we see it

The transaction in this fact pattern is a business combination that falls within the scope of IFRS 3 if common control does not exist (or is transitory). If common control does exist (and is not transitory), the transaction is outside the scope of IFRS 3 and Newco can elect to apply the pooling of interests method or acquisition method (provided the transaction has substance) in our view. Applying the acquisition method, Newco cannot be identified as the acquirer in this fact pattern.

Unlike the situation in Illustration 4-1 above, this transaction meets the definition of a business combination under IFRS 3. Entity B and sub-groups C and D (each a business as defined) have been brought together to form a new reporting entity under a new parent entity (Newco). Accordingly, the transaction is within the scope of IFRS 3 unless otherwise excluded. In this context it is relevant whether Entities B, C and D are under common control (that is not 'transitory' - see section 2.1.2 above) or just under common ownership.

If the transaction satisfies the description of a business combination under common control, it is outside the scope of IFRS 3. In practice, this type of transaction might be under common control since the number of shareholders will generally be relatively few. Accordingly, there might well be one individual, or a sub-group of the shareholders with a contractual arrangement (see section 2.1.1 above), who controls Entities B, C and D. The scope exclusion applies as long as that common control is not transitory. In that case, subject to certain conditions (see section 3.1 above), there is an accounting policy choice between the pooling of interests method and acquisition method.

If Entities B, C and D are not under common control (or if common control is transitory), then the business combination is within the scope of IFRS 3 and the acquisition method must be applied.

Pooling of interests method

If the pooling of interests method is used, the assets and liabilities of all combining parties will be reflected at their predecessor carrying amounts. The application of this method is discussed in section 3.3 above.

Acquisition method

If the acquisition method set out in IFRS 3 is used, Newco cannot be the acquirer as it issues shares to effect the combination (and there is no change in control arising). Accordingly, one of the pre-existing entities (i.e., Entity B, Entity C or Entity D) will need to be identified as the acquirer (see Chapter 10). If, for example, Entity B is identified as the acquirer, the consolidated financial statements of Newco are effectively a continuation of Entity B (combined with a capital reorganisation to reflect Newco's capital structure), and will reflect pre-combination carrying amounts for Entity B and acquisition-date fair values of the assets acquired and liabilities assumed, together with any resulting goodwill, for sub-groups C and D. The financial information presented in those financial statements for periods prior to the acquisition date is that of Entity B. Newco cannot be accounted for as acquiree in a reverse acquisition, because it is not a business as defined. The application of the acquisition method is discussed generally in Chapter 10 and for business combinations under common control specifically in section 3.2 above.

4.2.2 Setting up a new top holding company: transactions involving consideration other than equity interests

In Illustration 4-1 and Illustration 4-2 above, a Newco has been inserted between shareholders and either an existing group or a series of entities with common ownership (but not necessarily common control). In neither case could Newco itself be identified as the acquirer under IFRS 3, since it issued equity interests to effect the combination.

How we see it

In the fact patterns described in section 4.2.1 above, we believe that even if Newco transferred cash or other assets, or incurred liabilities, as consideration, it generally cannot be identified as the acquirer under IFRS 3. In that situation, the way in which those transactions are accounted for would not change. The treatment of cash (or other consideration) paid is set out below.

Only in limited circumstances would it be possible to identify Newco as the acquirer under IFRS 3, as discussed in section 4.1 above. This might happen, for example, if the transaction was contingent on completion of an IPO that resulted in a change of control over Newco. In that case, the application of the acquisition method would result in fair values being attributed to the assets acquired and liabilities assumed of the existing businesses, and the recognition of goodwill or a gain on a bargain purchase relating to those businesses.

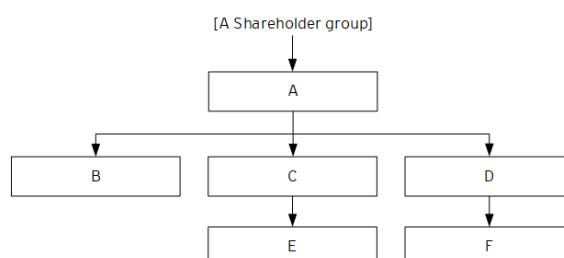

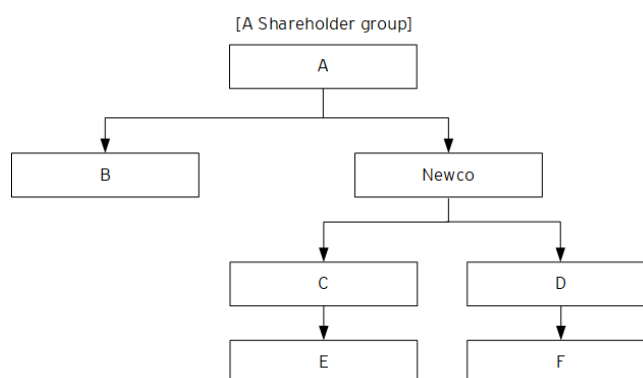

Unless the acquisition method is applied, any cash (or other form of consideration) paid to the shareholders is effectively a distribution and would be accounted for as such in equity. If the acquisition method can be applied, any cash paid to the shareholders in their capacity as owners of the identified acquirer is accounted for as a distribution. Any cash paid to the shareholders as owners of the acquiree(s) forms part of the consideration transferred for the entity or entities acquired. Determining whether cash is paid to shareholders in their capacity as owners of the identified acquirer or as owners of the acquiree(s) might require judgement.

4.3 Inserting a new intermediate parent within an existing group

In Illustration 4-3 below, a new intermediate holding company has been inserted within an existing group, so as to form a new sub-group.

Illustration 4-3: Newco inserted as a new intermediate parent within an existing group

A Newco is incorporated and inserted above a number of entities within an existing group so as to form a new sub-group. Newco issues shares to Parent A in return for the shares in Entities C and D, both businesses as defined in IFRS 3. The group structure before and after this transaction is as follows:

Before**After**

In most situations, Newco will be exempt from preparing consolidated financial statements (see Chapter 7).

However, if Newco does prepare consolidated financial statements, how would this reorganisation be accounted for in its consolidated financial statements?

How we see it

The transaction in this fact pattern will generally satisfy the description of a business combination under common control that is scoped out of IFRS 3. In our view, Newco can elect to apply the pooling of interests method or acquisition method (provided the transaction has substance). Applying the acquisition method, Newco cannot be identified as the acquirer in this fact pattern.

This reorganisation is a business combination (Entities C and D are businesses as defined) and all combining parties are under common control of Parent A. Accordingly, the transaction is excluded from the scope of IFRS 3 as long as that common control is not 'transitory', and in making that assessment Newco is excluded (see section 2.1.2 above). Assuming that the scope exclusion applies, subject to certain restrictions (see section 3.1 above), there is an accounting policy choice between the pooling of interests method and acquisition method (assuming the transaction has substance). If common control is transitory, then the business combination is within the scope of IFRS 3, and the acquisition method must be applied.

Pooling of interests method

If the pooling of interests method is used, the assets and liabilities of all combining parties will be reflected at their predecessor carrying amounts. The application of this method is discussed in section 3.3 above.

Acquisition method

If the acquisition method as set out in IFRS 3 is used, Newco cannot be identified as the acquirer as it issues shares to effect the combination (and there is no change in control arising). Accordingly, one of the pre-existing entities (Entity C or Entity D) will need to be identified as the acquirer (see Chapter 10). If, for example, Entity C is identified as the acquirer, the consolidated financial statements of Newco are effectively a continuation of Entity C, and will reflect pre-combination carrying amounts for sub-group C and acquisition-date fair values of the assets acquired and liabilities assumed, together with any resulting goodwill, for sub-group D. The financial information presented in those financial statements for periods prior to the acquisition date is that of Entity C. Newco cannot be accounted for as acquiree in a reverse acquisition, because it is not a business as defined. The application of the acquisition method is discussed generally in Chapter 10 and for business combinations under common control specifically in section 3.2 above.

How we see it

In Illustration 4-3 above, the reorganisation was effected by Newco issuing shares. We believe that even if Newco transferred cash or other assets, or incurred liabilities, as consideration, then in most situations this will not affect the analysis above and the further consequences would be the same as those described in section 4.2.2 above.

Only in limited circumstances would it be possible to identify Newco as the acquirer under IFRS 3, as discussed in section 4.1 above. This accounting might be appropriate when, for example, the transaction was contingent on completion of an IPO that resulted in a change of control over Newco. In that case, the application of the acquisition method would result in fair values being attributed to the assets acquired and liabilities assumed of both sub-groups C and D, and the recognition of goodwill or a gain on a bargain purchase relating to those businesses.

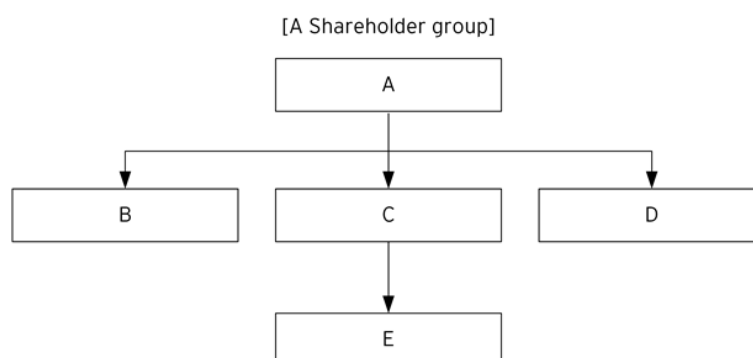

4.4 Transferring businesses outside an existing group using a Newco

Illustration 4-4 below illustrates a scenario where a business is transferred outside an existing group to a Newco owned by the same shareholders.

Illustration 4-4: Newco created to take over a business of an existing group (spin-off)

Entity C, a subsidiary of Parent A, transfers the shares held in its subsidiary, Entity E, to a newly formed entity, Newco. In return, Newco issues shares to the existing shareholders of Parent A. Entity E is a business as defined in IFRS 3. The group structure before and after this transaction is as follows:

Before

After

How would this reorganisation be accounted for in Newco's consolidated financial statements?

In many situations, this type of transaction will not be 'under common control' since there will be no contractual arrangement between the shareholders (see section 2.1.1 above). However, whether there is common ownership or common control by one individual, or a sub-group of the shareholders, over the combining parties is irrelevant in this specific scenario.

How we see it

The transaction in this specific fact pattern is not a business combination. In our view, Newco cannot elect to apply the acquisition method. Rather, its consolidated financial statements are a continuation of the transferred business.

The transaction does not meet the definition of a business combination under IFRS 3, because neither Newco nor Entity E can be identified as the acquirer. Newco cannot be identified as the acquirer as it issues shares to effect the combination. Entity E cannot be identified as the acquirer (in a reverse acquisition) as Newco is not a business as defined. On that basis, the transaction is outside the scope of IFRS 3.

Applying the IAS 8 hierarchy, Newco cannot elect to apply the acquisition method as set out in IFRS 3 since the transaction does not result in any change of economic substance for Newco and Entity E (e.g., in terms of any real alteration to the composition or ownership of Entity E). Accordingly, the consolidated financial statements of Newco reflect that the arrangement is in substance a continuation of Entity E and will reflect the pre-combination book values of Entity E (combined with a capital reorganisation to reflect Newco's capital structure). The financial information presented for periods prior to the transaction is that of Entity E. Any difference in share capital is reflected as an adjustment to equity.

Apart from any necessary change in share capital, the accounting treatment set out in Illustration 4-4 above is the same as would have been applied if the business was transferred by distributing the shares in Entity E directly to Parent A's shareholders, without the use of a Newco. In that case, there would be no question that there had been a business combination at all. Entity E would not reflect any changes in its financial statements. The only impact for Entity E would be that, rather than only having one shareholder (Entity C), it now has a number of shareholders.

How we see it

In Illustration 4-4 above, the reorganisation was effected by Newco issuing shares. We believe that even if Newco transferred cash or other assets, or incurred liabilities, as consideration, then in most situations this will not affect the analysis above. The only difference is that any consideration transferred to the shareholders is effectively a distribution and would be accounted for as such (see section 4.2.2 above).

Only in limited circumstances would it be possible to identify Newco as the acquirer under IFRS 3, as discussed in section 4.1 above. This accounting might be appropriate when, for example, the transaction was contingent on completion of an IPO that resulted in a change of control over Newco. In that case, the application of the acquisition method would result in fair values being attributed to the assets acquired and liabilities assumed of Entity E, and the recognition of goodwill or a gain on a bargain purchase relating to that business.

For Entity A, this transaction is a spin-off (or demerger) of Entity E, and therefore the discussion in Chapter 8 and in Chapter 9 would be relevant.

5 Accounting for transfers of investments in associates or joint ventures from entities under common control

Extract from IAS 28

- 26 Many of the procedures that are appropriate for the application of the equity method are similar to the consolidation procedures described in IFRS 10. Furthermore, the concepts underlying the procedures used in accounting for the acquisition of a subsidiary are also adopted in accounting for the acquisition of an investment in an associate or a joint venture.
- 32 An investment is accounted for using the equity method from the date on which it becomes an associate or a joint venture. On acquisition of the investment, any difference between the cost of the investment and the entity's share of the net fair value of the investee's identifiable assets and liabilities is accounted for as follows:
- (a) Goodwill relating to an associate or a joint venture is included in the carrying amount of the investment. Amortisation of that goodwill is not permitted.
 - (b) Any excess of the entity's share of the net fair value of the investee's identifiable assets and liabilities over the cost of the investment is included as income in the determination of the entity's share of the associate or joint venture's profit or loss in the period in which the investment is acquired.
- Appropriate adjustments to the entity's share of the associate's or joint venture's profit or loss after acquisition are made in order to account, for example, for depreciation of the depreciable assets based on their fair values at the acquisition date. Similarly, appropriate adjustments to the entity's share of the associate's or joint venture's profit or loss after acquisition are made for impairment losses such as for goodwill or property, plant and equipment.

[IAS 28.26, IAS 28.32].

Although this chapter principally addresses common control transactions in which the receiving entity obtains control over a business, a reorganisation might also involve the transfer of investments in associates or joint ventures between entities under common control (e.g., within an existing group). Investments in associates and joint ventures are generally accounted for using the equity method as set out in IAS 28 *Investments in Associates and Joint Ventures* (see Chapter 12). IAS 28 states that "the concepts underlying the procedures used in accounting for the acquisition of a subsidiary are also adopted in accounting for the acquisition of an investment in an associate or a joint venture". [IAS 28.26].

Consequently, the question arises whether the scope exclusion for business combinations under common control in IFRS 3 can be extended to the acquisition of an investment in an associate or joint venture from an entity under common control (i.e., where significant influence or joint control is obtained, rather than control).

This question is relevant when the investment in an associate or joint venture is acquired in a separate common control transaction, rather than as part of a larger business combination under common control. That is, if an investment in an associate or joint venture is being transferred as part of a business combination under common control (i.e., where the investment is one of the identifiable assets of the acquired business), the entire transaction is excluded from the scope of IFRS 3, and the receiving entity would need to develop an accounting policy as discussed in section 3.1 above.

In October 2012, the IFRS IC was asked whether it is appropriate to apply the scope exclusion for business combinations under common control in IFRS 3 by analogy to the acquisition of an interest in an associate or joint venture from an entity under common control. On the one hand, it was noted that IAS 28.32 has guidance on such acquisitions and does not distinguish between acquisitions under common control and acquisitions not under common control. IAS 8.10 requires management to use its judgement in developing and applying an accounting policy only in the absence of an IFRS accounting standard that specifically applies to a transaction. On the other hand, it was noted that IAS 28.26 refers to adopting "the concepts underlying the procedures used in accounting for the acquisition of a subsidiary" and that IFRS 3.2(c) excludes business combinations under common control from its scope. The IFRS IC observed "that some might read these paragraphs as contradicting the guidance in paragraph 32 of IAS 28, and so potentially leading to a lack of clarity". Ultimately, the IFRS IC noted that accounting for the acquisition of an interest in an associate or joint venture under common control would be better considered within the context of broader projects on accounting for business combinations under common control and the equity method. Consequently, it decided in May 2013 not to take the issue onto its agenda.¹²

¹² [IFRIC Update](#), May 2013, *Interpretations Committee agenda decisions: IAS 28 Investments in Associates and Joint Ventures and IFRS 3 Business Combinations-Associates and common control*. Available on the IFRS Foundation's website.

In June 2017, the IFRS IC reconsidered this topic and tentatively decided that the requirements in IFRS accounting standards provide an adequate basis to account for the acquisition of an interest in an associate or joint venture from an entity under common control. The IFRS IC observed that IAS 28 does not include a scope exception for acquisitions under common control and, accordingly, applies to the transaction. IAS 28.26 should not be used as a basis to apply the scope exclusion for business combinations under common control in IFRS 3.2(c) by analogy. The IFRS IC also observed that in accounting for the acquisition of the interest, an entity would assess whether the transaction includes a transaction with owners in their capacity as owners - if so, the entity determines the cost of the investment taking into account that transaction with owners.¹³ However, the tentative agenda decision was eventually not finalised, as that might have been premature pending developments in the IASB's research project on business combinations under common control (see section 6 below).¹⁴ The IASB decided to discontinue the business combinations under common control project in November 2023 and the IASB's tentative decisions on its equity method project did not address the accounting for the acquisition of an interest in an associate or a joint venture from an entity under common control.¹⁵ In September 2024, the IASB issued an exposure draft¹⁶ addressing application issues relating to the equity method of accounting.

How we see it

Based on the discussions of the IFRS IC described above, we believe there are two possible approaches to account for the acquisition of an investment in an associate or joint venture from an entity under common control, when applying the equity method. As IAS 28 is currently not clear, in our view, the receiving entity has an accounting policy choice between:

- Approach 1 - Apply the requirements in IAS 28.32
- Approach 2 - Apply by analogy the scope exclusion for business combinations under common control in IFRS 3 and use the predecessor carrying amount

An entity must consistently apply the chosen accounting policy.

Under Approach 1 above, the 'normal' requirements in IAS 28 are applied as there is no scope exclusion for the acquisition of an interest in an associate or joint venture from an entity under common control. The receiving entity/investor compares the cost of the investment against its share of the net fair value of the investee's assets and liabilities on the date of acquisition, to identify any goodwill or gain on a bargain purchase. Goodwill is included in the carrying amount of the investment. Any gain on a bargain purchase is recognised in profit or loss. [IAS 28.32]. If the common control transaction is not at arm's length, we believe that the receiving entity has an accounting policy choice to impute an equity contribution or distribution when it determines the cost of the investment.

How we see it

If Approach 1 above is applied and the common control transaction is not at arm's length, we believe that the receiving entity has an accounting policy choice whether or not to impute an equity contribution or distribution when it determines the cost of the investment in an associate or joint venture. Whichever accounting policy is adopted, it must be applied consistently.

Under Approach 2 above, the scope exclusion for business combinations under common control in IFRS 3 is applied by analogy to the acquisition of an interest in an associate or joint venture from an entity under common control. This is on the basis that IAS 28 indicates that the concepts applied to accounting for acquisitions of investments in associates or joint ventures are similar to those applied to acquisitions of subsidiaries. As such, the receiving entity/investor could recognise the investment in the associate or joint venture at its predecessor equity-accounted carrying amount on the date of acquisition. Any difference between this amount and the consideration given is accounted for as an equity contribution or distribution.

16 Exposure Draft [IASB/ED/2024/7](#) Equity Method of Accounting - IAS 28 Investments in Associates and Joint Ventures, IASB, September 2024. Available on the IFRS Foundation's website.

The two approaches are illustrated in Illustration 5-1 below.

Illustration 5-1: Transfer of an associate within an existing group

Entity B and Entity C are under common control of Entity A. Entity C holds an investment in Associate D, which it sells to Entity B for cash. The transaction can be illustrated as follows:

Before

After

In Entity C's financial statements, the equity-accounted carrying amount of its 20% interest in Associate D is CU100. The net fair value of the identifiable assets and liabilities of Associate D is CU800 (based on 100%). Entity B gives consideration of CU190 to Entity C for the 20% interest in Associate D, which is the fair value of the 20% interest. The consolidated financial statements of Entity A will not be impacted (except for any potential tax consequences), because from the group's perspective there has been no change.

How would Entity B account for this transaction in its own financial statements when applying the equity method to investments in associates?

As discussed above, in our view, there are two approaches that Entity B can apply in accounting for this common control transaction. Whichever approach is adopted, it must be applied consistently.

Approach 1 - Apply the requirements in IAS 28.32

Under this approach, IAS 28 applies as it does to any other acquisition of an investment in an associate (see Chapter 12). Accordingly, the receiving entity calculates its share of the net fair value of the investee's identifiable assets and liabilities applying IAS 28.32.

Entity B recognises an investment in an associate with a cost of CU190 (fair value of consideration given). This amount comprises Entity B's share of the net fair value of Associate D's identifiable assets and liabilities of CU160 ($20\% \times \text{CU}800$) and goodwill of CU30 (CU190 less CU160).

Approach 2 - Apply by analogy the scope exclusion for business combinations under common control in IFRS 3 and use the predecessor carrying amount

Under this approach, the scope exclusion in IFRS 3.2(c) is applied by analogy to the acquisition of an interest in an associate from an entity under common control. This is because IAS 28.26 indicates that the concepts underlying the procedures used in accounting for the acquisition of a subsidiary are also adopted in accounting for the acquisition of an investment in an associate. Similarly, the receiving entity could elect to account for such transactions on a carry-over basis as its accounting policy.

Entity B recognises an investment in an associate based on the equity-accounted carrying amount in Entity C's financial statements as at the acquisition date, which is CU100. Entity B does not reassess the fair values of Associate D's identifiable assets and liabilities. Rather, Entity B continues to recognise any adjustments that Entity C recognised in accordance with IAS 28.32 due to differences in fair values at the date Entity C acquired its interest in Associate D.

Entity B recognises the excess of the consideration paid (CU190) over the carrying amount (CU100) of CU90 as a distribution from equity.

Although Illustration 5-1 above discusses the acquisition of an investment in an associate from an entity under common control, the same accounting policy choice would also apply to transfers of joint ventures between entities under common control.

6 Recent developments

6.1 Business Combinations under Common Control ('BCUCC') research project

In November 2020, the IASB published a Discussion Paper (DP) named *Business Combinations under Common Control* for public consultation.¹⁷ The DP set out the IASB's preliminary views on possible reporting requirements for the receiving entity, with the objective to reduce diversity in practice and improve the transparency of reporting business combinations under common control (and certain other group reorganisations).

The IASB's preliminary view in the DP was that its proposals should cover reporting by the receiving entity for all transfers of a business under common control, even if the transfer is:

- Preceded by an acquisition from an external party or followed by a sale of one or more of the combining businesses to an external party

Or

- Conditional on a sale of the combining businesses to an external party, such as in an IPO

The project, therefore, addressed both business combinations under common control that are explicitly scoped out of IFRS 3, and other transactions that involve the transfer of a business under common control but which do not meet the definition of a business combination in IFRS 3. For simplicity, the DP used the term 'business combinations under common control' (BCUCC) to refer to all transactions within the scope of the project.

The scope of the project, however, did not address transfers of investments in associates and joint ventures, transfers of entities with no business or transfers of assets that are not a business.¹⁸

The DP summarised the IASB's preliminary views on how a receiving entity should report a BCUCC and explored which measurement method to apply, how the acquisition method and a 'book-value method' should apply and disclosure requirements.

The IASB considered stakeholder feedback on the DP throughout 2022 and 2023. However, in November 2023, the IASB reconsidered the project direction. The Board decided not to develop requirements for reporting BCUCCs nor to explore disclosure-only requirements and, consequently, decided to discontinue the project.¹⁹

In April 2024, the IASB published the Project Summary.²⁰ This explains that:

- The IASB acknowledged that, without requirements for reporting BCUCCs, diversity could persist in how receiving entities report BCUCCs
- Feedback received had suggested that:
 - (a) Users of financial statements are not significantly affected by diversity in how receiving entities report BCUCCs
 - (b) Users' information needs vary among jurisdictions making it difficult to develop requirements that would meet needs globally
 - (c) Stakeholders' views were split as to whether the IASB should develop requirements for reporting BCUCCs and, if so, what those requirements should be

And

- Overall, the IASB's research findings suggested that any improvements to financial reporting that might result from developing requirements for reporting BCUCCs are likely to be outweighed by the costs of developing and implementing such changes

How we see it

To ensure that users of financial statements understand the impact of a BCUCC, we encourage entities to consider the reporting requirements in IFRS accounting standards to ensure the faithful representation of the effects of a BCUCC, including clear disclosure of material accounting policies.

Appendix B - Defined terms

Extract from IFRS accounting standards - Definitions	
acquiree	The business or businesses that the acquirer obtains control of in a business combination . [IFRS 3 Appendix A].
acquirer	The entity that obtains control of the acquiree . [IFRS 3 Appendix A].
acquisition date	The date on which the acquirer obtains control of the acquiree . [IFRS 3 Appendix A].
business	An integrated set of activities and assets that is capable of being conducted and managed for the purpose of providing goods or services to customers, generating investment income (such as dividends or interest) or generating other income from ordinary activities. [IFRS 3 Appendix A].
business combination	A transaction or other event in which an acquirer obtains control of one or more businesses . Transactions sometimes referred to as 'true mergers' or 'mergers of equals' are also business combinations as that term is used in this IFRS. [IFRS 3 Appendix A].
close members of the family of a person	<i>Close members of the family of a person</i> are those family members who may be expected to influence, or be influenced by, that person in their dealings with the entity and include: <ul style="list-style-type: none"> (a) that person's children and spouse or domestic partner; (b) children of that person's spouse or domestic partner; and (c) dependants of that person or that person's spouse or domestic partner. [IAS 24.9].
fair value	<i>Fair value</i> is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (See IFRS 13.) [IFRS 3 Appendix A].

In addition, references in this chapter to a 'receiving entity' mean the transferee in the reorganisation. In the context of section 6 above, this term has the definition set out in the DP.²²

Overview	863
1 Introduction	864
1.1 Objective of IAS 28	864
1.2 Scope of IAS 28	864
1.3 Definitions	864
1.4 Key differences between IAS 28 and ASC 323	865
2 Significant influence	866
2.1 Lack of significant influence	866
2.2 Holdings of less than 20% of the voting power	867
2.3 Assessing significant influence when an investor has both a direct holding and an indirect holding through an associate or joint venture	867
2.4 Potential voting rights	868
2.5 Fund managers	869
2.6 Severe long-term restrictions impairing ability to transfer funds to the investor	869
3 Exemptions from applying the equity method	870
3.1 Parents exempt from preparing consolidated financial statements	870
3.2 Subsidiaries meeting certain criteria	870
3.3 Investments in associates or joint ventures held by venture capital organisations and similar organisations	871
3.3.1 Investment entities exception	871
3.3.2 Application of IFRS 9 to exempt investments in associates or joint ventures	871
3.3.2.A Entities with a mixture of activities	872
3.3.2.B Establishment of a venture capital organisation or similar financial institution	872
3.4 Partial use of fair value measurement of associates	873
4 Classification as held for sale (IFRS 5)	876
5 Overview of the equity method	877
5.1 Comparison between equity accounting and consolidation	878

6	Initial accounting for an associate or joint venture	880
6.1	Date of commencement of equity accounting	880
6.2	Initial carrying amount of an associate or joint venture	880
6.2.1	Measurement period on acquisition of an associate or joint venture	881
6.2.2	Initial carrying amount of an associate or joint venture following loss of control of an entity	881
6.2.2.A	Initial accounting for the investment in an associate or joint venture using the IFRS 10 approach and the IAS 28 approach	882
6.2.2.B	Loss of control scenarios in which the retained investment is an associate or joint venture	882
6.2.3	Step acquisition of an associate or joint venture (financial instrument becoming an associate or joint venture)	884
6.2.3.A	Applying an accumulated cost approach	885
6.2.3.B	Applying a fair value as deemed cost approach	888
6.2.4	Step increase in an existing associate or joint venture without a change in status of the investee	889
6.2.5	Existing associate that becomes a joint venture, or vice versa	890
6.2.6	Common control transactions involving sales of associates	891
6.3	Share of the investee	891
6.3.1	Accounting for potential voting rights	891
6.3.2	Cumulative preference shares held by parties other than the investor	891
6.3.3	Several classes of equity and substantive profit sharing arrangements	892
6.3.4	Where the reporting entity is a group (indirect interests)	892
6.3.5	Where the investee is a group: non-controlling interests in an associate's or joint venture's consolidated financial statements	893
7	Transactions between the reporting entity and its associates or joint ventures	894
7.1	Elimination of 'upstream' and 'downstream' transactions	894
7.1.1	Elimination of 'downstream' unrealised profits in excess of the investment	896

	Appendix C - Defined terms	936

Overview

This chapter addresses the requirements of IAS 28 *Investments in Associates and Joint Ventures*. IAS 28 requires that investments in entities over which an investor has significant influence are classified as associates and are generally accounted for using the equity method of accounting. Joint arrangements that are classified as joint ventures are also generally accounted for using the equity method as described in IAS 28. The classification of joint arrangements as either joint ventures or joint operations is required by IFRS 11 *Joint Arrangements* and is discussed in Chapter 13. The term joint venture is often used colloquially with different meanings, but references to 'joint venture' in this chapter have the meaning as defined in IAS 28.

The equity method of accounting involves a modified form of consolidation of the results and assets of investees in the investor's financial statements. The essence of the equity method of accounting is that, rather than full scale consolidation on a line-by-line basis, it requires incorporation of the investor's share (adjusted for basis differences, like fair value adjustments arising on initial acquisition of the interest in the associate or joint venture) of the investee's:

- Net assets, in one line in the investor's consolidated statement of financial position
- Profit or loss, in one line in the investor's consolidated statement of profit or loss
- Other comprehensive income (OCI), in one line in the investor's consolidated statement of other comprehensive income

Since its issuance, IAS 28 has been subject to several amendments. The equity method of accounting is the subject of a standard-setting project of the International Accounting Standards Board (IASB), as discussed in section 13 below.

What you need to know

- An investor has significant influence over an associate when it has the power to participate in the financial and operating policy decisions of the investee but does not have control or joint control of those policies.
- In the investor's consolidated financial statements, associates and joint ventures are accounted for using the equity method, unless one of the exemptions in IAS 28 applies.
- Under the equity method, an associate or joint venture is first recognised at its cost, including any directly attributable expenditures.
- The carrying amount is increased or decreased to recognise the investor's share of the profit or loss of the associate or joint venture after the date of acquisition, adjusted for basis differences.
- Generally, equity method losses are recognised until the investor's interest in the associate or joint venture is reduced to zero.
- The equity method is discontinued when the investment ceases to be an associate or joint venture.
- In the investor's separate financial statements, there is an accounting policy choice for the measurement of associates and joint ventures between cost, in accordance with IFRS 9 *Financial Instruments* or using the equity method.

1 Introduction

1.1 Objective of IAS 28

The objective of the standard is to prescribe the accounting for investments in associates and to set out the requirements for the application of the equity method when accounting for investments in associates and joint ventures. [IAS 28.1].

IAS 27 *Separate Financial Statements* allows an entity, in its separate financial statements, to account for its investments in subsidiaries, joint ventures and associates using the equity method of accounting as described in IAS 28. [IAS 27.10]. This is discussed further in Chapter 9.

1.2 Scope of IAS 28

The standard is applied by all entities that are investors with joint control of a joint venture, or significant influence over an associate. [IAS 28.2]. Although there are no exemptions from the standard itself, there are exemptions from applying the equity method by certain types of entities as discussed in section 3 below.

1.3 Definitions

The following terms are used in IAS 28 with the meanings specified: [IAS 28.3]

Extract from IAS 28

3 The following terms are used in this Standard with the meanings specified:

An associate is an entity over which the investor has significant influence.

Consolidated financial statements are the financial statements of a group in which assets, liabilities, equity, income, expenses and cash flows of the parent and its subsidiaries are presented as those of a single economic entity.

The **equity method** is a method of accounting whereby the investment is initially recognised at cost and adjusted thereafter for the post-acquisition change in the investor's share of the investee's net assets. The investor's profit or loss includes its share of the investee's profit or loss and the investor's other comprehensive income includes its share of the investee's other comprehensive income.

A **joint arrangement** is an arrangement of which two or more parties have joint control.

Joint control is the contractually agreed sharing of control of an arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control.

A **joint venture** is a joint arrangement whereby the parties that have joint control of the arrangement have rights to the net assets of the arrangement.

A **joint venturer** is a party to a joint venture that has joint control of that joint venture.

Significant influence is the power to participate in the financial and operating policy decisions of the investee but is not control or joint control of those policies.

IAS 28 also notes that the following terms are defined in IAS 27.4 and in Appendix A of IFRS 10 *Consolidated Financial Statements* and are used in IAS 28, with the meanings specified in the IFRS accounting standard in which they are defined:

- Control of an investee
- Group
- Parent
- Separate financial statements
- And
- Subsidiary [IAS 28.4]

1.4 Key differences between IAS 28 and ASC 323

IAS 28 is not converged with its US GAAP equivalent, ASC 323 *Investments - Equity Method and Joint Ventures*. However, they are similar, as summarised below, and therefore key differences are highlighted in this section. This is not an exhaustive list of differences. Further detail can be found in the US GAAP/IFRS accounting differences identifier tool.¹

- An equity investment that gives an investor significant influence over an investee is considered an equity method investment under both US GAAP and IFRS accounting standards.
- An investor is generally presumed to have significant influence when it holds 20% or more of the voting interest in an investee.
- The equity method of accounting for such investments generally is consistent under US GAAP and IFRS accounting standards.

FASB differences

The key differences between the IFRS accounting standards and US GAAP guidance on this topic are as follows:

- When determining significant influence under IAS 28, potential voting rights are considered if currently exercisable. Under US GAAP, potential voting rights are generally not considered.
- Under IAS 28, the equity method is applied when an investor has significant influence, regardless of the legal form of the investee. Under US GAAP, the equity method is also applied when an investor holds more than 3-5% of a limited partnership or similar entity, unless the limited partner has virtually no influence over the investee, or the investor meets the criteria to apply proportional amortisation and elects that approach.
- Investments in associates held by venture capital organisations, mutual funds, unit trusts and similar entities are exempt from using the equity method under IAS 28 and the investor can elect to measure its investments in these associates at fair value. Under US GAAP (via ASC 825-10 *Financial Instruments*), all entities have the option to account for equity method investments at fair value. Therefore, the scope of entities that can apply a fair value measurement model is different.
- Uniform accounting policies between the investor and investee are required when applying IAS 28. Conforming accounting policies between investor and investee is generally not permitted under US GAAP.

¹ [US GAAP/IFRS accounting differences identifier tool](#), EY, December 2024, available on ey.com.

2 Significant influence

An investor has significant influence over an associate when it has the power to participate in the financial and operating policy decisions of the investee but does not have control or joint control of those policies. [IAS 28.3].

Under IAS 28, a holding of 20% or more of the voting power of the investee (held directly or indirectly, through subsidiaries, see section 2.3 below) is presumed to give rise to significant influence, unless it can be clearly demonstrated that this is not the case. Conversely, a holding of less than 20% of the voting power is presumed not to give rise to significant influence, unless it can be clearly demonstrated that there is in fact significant influence. The existence of a substantial or majority interest of another investor in the investee does not necessarily preclude the investor from having significant influence. [IAS 28.5].

How we see it

In our view, an entity considers both ordinary shares and other categories of shares in determining its voting rights, because IAS 28 focuses on 'voting power'.

Extract from IAS 28

- 6 The existence of significant influence by an entity is usually evidenced in one or more of the following ways:
- (a) representation on the board of directors or equivalent governing body of the investee;
 - (b) participation in policy-making processes, including participation in decisions about dividends or other distributions;
 - (c) material transactions between the entity and its investee;
 - (d) interchange of managerial personnel; or
 - (e) provision of essential technical information.

[IAS 28.6].

Significant influence might also exist over another entity through potential voting rights (see section 2.4 below). [IAS 28.7].

An entity loses significant influence over an associate when it loses the power to participate in the financial and operating policy decisions of that associate. The loss of significant influence can occur with or without a change in absolute or relative ownership levels. It could result from a contractual arrangement. It could also occur, for example, when an associate becomes subject to the control of a government, court, administrator or regulator. [IAS 28.9]. An entity reassesses whether it has the ability to exercise significant influence when facts and circumstances change. The accounting for loss of significant influence over an associate is discussed in section 9 below.

2.1 Lack of significant influence

Indicators that the presumption of significant influence has been overcome include the following²:

- The investor has tried and failed to obtain representation on the investee's board of directors.
 - The investee, other shareholders or regulatory authorities are opposing the investor's attempts to exercise significant influence.
 - The investor and investee sign an agreement under which the investor surrenders significant rights as a shareholder, such as a standstill agreement.
 - The investor is unable to obtain timely or adequate financial information required to apply the equity method.
- Or
- A group of shareholders that holds the majority ownership of the investee operates without regard to the views of the investor.

² Similar considerations to those included in US GAAP, ASC 323-10-15-6.

How we see it

Determining whether the presumption of significant influence has been overcome requires considerable judgement. In our experience, many regulators take a keen interest in these decisions.

IFRS 12 *Disclosure of Interests in Other Entities* requires that an entity must disclose significant judgements and assumptions made in determining that it does not have significant influence even though it holds 20% or more of the voting rights of another entity. [IFRS 12.9(d)]. This is discussed further in Chapter 14.

2.2 Holdings of less than 20% of the voting power

Although there is a presumption that an investor that holds less than 20% of the voting power in an investee does not have significant influence, [IAS 28.5], careful judgement is needed to assess whether significant influence exists if one of the indicators in IAS 28.6(a) to (e) are present (see section 2 above).

For example, an investor might still be able to exercise significant influence in the following circumstances:

- The investor's voting power is much larger than that of any other shareholder of the investee.
- The corporate governance arrangements could be such that the investor is able to appoint members to the board, supervisory board or significant committees of the investee. The investor will need to apply judgement to the facts and circumstances to determine whether representation on the respective boards or committees is enough to provide significant influence.

Or

- The investor has the power to veto significant financial and operating decisions.

How we see it

Determining whether the indicators above result in an investor having significant influence despite a holding of less than 20% of the voting power requires considerable judgement.

IFRS 12 requires that an entity must disclose significant judgements and assumptions made in determining that it does have significant influence when it holds less than 20% of the voting rights of another entity. [IFRS 12.9(e)]. This is discussed further in Chapter 14.

Practical example 2-1 below shows Aveng Limited's disclosure of significant influence when it has voting rights of less than 20%.

Practical example 2-1:	Aveng Limited (2021)	South Africa
Audited consolidated annual financial statements 2021 [extract] Notes to the consolidated financial statements [extract] 3. SIGNIFICANT ACCOUNTING JUDGEMENTS AND ESTIMATES [extract] 3.1 Judgements and estimation assumptions [extract] 3.1.3 Equity-accounted investments [extract]		
<p>Equity-accounted entities are entities in which the Group holds less than 20% of the voting power, but the Group has determined that it has significant influence in entities where it holds less than 20% of the voting power. The Group's significant influence is due to the Group having a representation on the board of directors in each of these entities and the Group's participation in decisions over the relevant activities of the entities.</p>		
...		

2.3 Assessing significant influence when an investor has both a direct holding and an indirect holding through an associate or joint venture

Extract from IAS 28

- 5 If an entity holds, directly or indirectly (eg through subsidiaries), 20 per cent or more of the voting power of the investee, it is presumed that the entity has significant influence, unless it can be clearly demonstrated that this is not the case. Conversely, if the entity holds, directly or indirectly (eg through subsidiaries), less than 20 per cent of the voting power of the investee, it is presumed that the entity does not have significant influence, unless such influence can be clearly demonstrated. A substantial or majority ownership by another investor does not necessarily preclude an entity from having significant influence.

[IAS 28.5].

The reference to investments held 'directly or indirectly (e.g., through subsidiaries)' is not explicitly clear whether investments held through an associate are considered when making the assessment of significant influence over an entity. Further, IAS 28.27 is clear that when assessing an investor's share of an associate or joint venture for the purposes of applying equity accounting, holdings of the group's other associates or joint ventures are ignored for this purpose.

This raises a question of how to account for a direct interest in a subsidiary of an associate or joint venture (that does not on its own give the investor significant influence or control). Considered alone, the direct interest would be a financial asset accounted for under IFRS 9, but considered in the context of the investment in the associate or joint venture would be accounted for under IAS 28.

How we see it

As with any assessment of whether an investor has significant influence over another entity, the determination in this case requires judgement. Accounting for the direct interest depends on facts and circumstances. If the investor can demonstrate significant influence over the subsidiary of its associate or joint venture ("the investee"), the direct interest is accounted for under IAS 28. If not, it is a financial asset.

If the investor concludes that it has significant influence over the investee, applying IAS 28.27, its share of the investee is limited to the direct interest since holdings of associates and joint ventures are ignored in determining the investor's share in an associate or joint venture. The indirect interest in the investee is accounted for via equity accounting for the associate or joint venture.

Illustration 2-1: Investor holding a direct and indirect interest in an investee

Company A owns 30% of Company B and has significant influence over it. B has a 90% subsidiary, Company C, in which A also has a direct 8% interest. A's direct and indirect equity interests provide it with certain rights over C and there are no other relevant agreements providing rights over C. A has subsidiaries and prepares consolidated financial statements. How should A account for its 8% direct interest in C in its consolidated financial statements?

A considers the facts and circumstances of its relationship with C, including the factors in IAS 28.6 (see section 2 above) for the determination of significant influence. If the facts and circumstances indicate that A has significant influence over C, A equity accounts for its 8% interest in C and a further 27% indirect interest is equity accounted through its interest in B. If the facts and circumstances indicate that A does not have significant influence over C, the direct interest is accounted for as a financial asset under IFRS 9 and the 27% interest is accounted for under IAS 28 via A's equity accounting for B.

2.4 Potential voting rights

Extract from IAS 28

- 7 An entity may own share warrants, share call options, debt or equity instruments that are convertible into ordinary shares, or other similar instruments that have the potential, if exercised or converted, to give the entity additional voting power or to reduce another party's voting power over the financial and operating policies of another entity (ie potential voting rights). The existence and effect of potential voting rights that are currently exercisable or convertible, including potential voting rights held by other entities, are considered when assessing whether an entity has significant influence. Potential voting rights are not currently exercisable or convertible when, for example, they cannot be exercised or converted until a future date or until the occurrence of a future event.

[IAS 28.7].

In assessing whether potential voting rights contribute to significant influence, an entity must examine facts and circumstances that affect potential voting rights, including their terms of exercise and any other contractual arrangements, whether considered individually or in combination. However, an entity does not include in the assessment the intention of management and the financial ability to exercise or convert those potential voting rights. [IAS 28.8].

IAS 28 does not include guidance on potential voting rights comparable to that included in IFRS 10 (see Chapter 7). In the amendments introduced to IAS 28 when IFRS 10, IFRS 11 and IFRS 12 were issued, the IASB did not reconsider the definition of significant influence and concluded that it would not be appropriate to address one element of the definition in isolation. Any such consideration would be done as part of a wider review of accounting for associates. [IAS 28.BC16]. Therefore, potential voting rights that are currently exercisable are included in the assessment of significant influence even if they are not 'substantive' in terms of IFRS 10. An example is a currently exercisable call option that is out of the money.

2.5 Fund managers

At its November 2016 meeting, the IFRS IC discussed a request to clarify whether, and how, a fund manager assesses if it has significant influence over a fund that it manages and in which it has a direct investment but does not control.

The IFRS IC observed that a fund manager assesses whether it has control, joint control or significant influence over a fund that it manages by applying the relevant IFRS accounting standard, which in the case of significant influence, is IAS 28. Unlike IFRS 10, IAS 28 does not contemplate whether and how decision-making authority held in the capacity of an agent affects the assessment of significant influence. The IFRS IC decided not to add the issue to its agenda.³ However, IFRS 12.7(b) requires an entity to disclose information about significant judgements and assumptions it has made in determining that it has significant influence over another entity. [IFRS 12.7(b)].

2.6 Severe long-term restrictions impairing ability to transfer funds to the investor

When assessing its ability to exercise significant influence over an entity, an investor considers the effect of severe long-term restrictions on the transfer of funds from the associate to the investor or other restrictions in exercising significant influence. However, such restrictions do not, in isolation, preclude the exercise of significant influence. [IAS 28.BCZ18].

In some jurisdictions, an entity can seek protection from creditors to reorganise its business (e.g., under Chapter 11 of the Bankruptcy Code in the United States). In such situations, an investor (that is not under bankruptcy protection itself) with an interest in such an associate will need to evaluate the facts and circumstances to assess whether it is still able to exercise significant influence over the financial and operating policies of the investee.

³ [IFRIC Update](#), November 2016, available on the IFRS Foundation's website.

3 Exemptions from applying the equity method

Under IAS 28, an entity with joint control of, or significant influence over, an investee accounts for its investment in an associate or a joint venture using the equity method, except when that investment qualifies for exemption in accordance with IAS 28.17 to 19. [IAS 28.16]. These exemptions are discussed in sections 3.1 to 3.4 below.

3.1 Parents exempt from preparing consolidated financial statements

An entity need not apply the equity method to its investment in an associate or a joint venture if the entity is a parent that is exempt from preparing consolidated financial statements by the scope exception in IFRS 10.4(a) (see Chapter 7), which exempts subsidiaries from preparing consolidated financial statements if certain criteria are met. [IAS 28.17].

3.2 Subsidiaries meeting certain criteria

Extract from IAS 28

- 17 An entity need not apply the equity method to its investment in an associate or a joint venture if the entity is a parent that is exempt from preparing consolidated financial statements by the scope exception in paragraph 4(a) of IFRS 10 or if all the following apply:
- (a) The entity is a wholly-owned subsidiary, or is a partially-owned subsidiary of another entity and its other owners, including those not otherwise entitled to vote, have been informed about, and do not object to, the entity not applying the equity method.
 - (b) The entity's debt or equity instruments are not traded in a public market (a domestic or foreign stock exchange or an over-the-counter market, including local and regional markets).
 - (c) The entity did not file, nor is it in the process of filing, its financial statements with a securities commission or other regulatory organisation, for the purpose of issuing any class of instruments in a public market.
 - (d) The ultimate or any intermediate parent of the entity produces financial statements available for public use that comply with IFRSs, in which subsidiaries are consolidated or are measured at fair value through profit or loss in accordance with IFRS 10.

[IAS 28.17].

An entity is exempt from applying the equity method to its investment in an associate or a joint venture if certain criteria are met. [IAS 28.17]. This exemption applies only when the investor in an associate or a joint venture is not also a parent. If it is a parent, it must look to the similar exemption from preparation of consolidated financial statements in IFRS 10, which also contains the conditions (a) to (d) above for a parent to be exempt from preparing consolidated financial statements under IFRS 10. [IFRS 10.4(a)].

This exemption is available only to entities that are themselves either wholly-owned subsidiaries or partially-owned subsidiaries whose non-controlling shareholders do not object to the presentation of financial statements that do not include associates or joint ventures using the equity method. Subsidiaries are not exempt if none of their parent companies prepares consolidated financial statements in accordance with IFRS accounting standards. A typical example is that of an entity that is a subsidiary of a US group that prepares consolidated financial statements in accordance with US GAAP only. In addition, any entity that has publicly traded debt or equity, or is in the process of obtaining a listing for such instruments, will not satisfy the criteria for exemption.

The effect of the above requirements is that a reporting entity that has associates or joint ventures, but no subsidiaries, and does not meet all the criteria in (a)-(d) above, is required to apply equity accounting for its associates or joint ventures in its own (non-consolidated) financial statements (not to be confused with its 'separate financial statements' - see section 11 below).

Many jurisdictions apply a national GAAP that is based on IFRS but requires some form of endorsement process. The question then arises as to whether the exemption in (d) above can be applied when the ultimate or intermediate parent entity produces financial statements available for public use that comply with a national GAAP that is based on IFRS accounting standards.

How we see it

In our view, the exemption in (d), which relies on a parent of the entity producing financial statements available for public use that comply with IFRS accounting standards, can be applied when those financial statements use a national GAAP that is based on IFRS accounting standards if certain criteria are met. These are discussed in Chapter 7.

3.3 Investments in associates or joint ventures held by venture capital organisations and similar organisations

Extract from IAS 28

18 When an investment in an associate or a joint venture is held by, or is held indirectly through, an entity that is a venture capital organisation, or a mutual fund, unit trust and similar entities including investment-linked insurance funds, the entity may elect to measure that investment at fair value through profit or loss in accordance with IFRS 9. An example of an investment-linked insurance fund is a fund held by an entity as the underlying items for a group of insurance contracts with direct participation features. For the purposes of this election, insurance contracts include investment contracts with discretionary participation features. An entity shall make this election separately for each associate or joint venture, at initial recognition of the associate or joint venture. (See IFRS 17 *Insurance Contracts* for terms used in this paragraph that are defined in that Standard.)

[IAS 28.18].

This exemption is related to the fact that fair value measurement provides more useful information for users of the financial statements than application of the equity method. In the Basis for Conclusions to IAS 28, the IASB clarified that this is an exemption from the requirement to measure interests in joint ventures and associates using the equity method, rather than an exception to the scope of IAS 28 for the accounting for joint ventures and associates held by these entities. [IAS 28.BC12, IAS 28.BC13].

This exemption raises the question of exactly which entities comprise “venture capital organisations, or a mutual fund, unit trust and similar entities including investment-linked insurance funds”, since they are not defined in IAS 28. The determination of which entities are eligible for this exemption is discussed in sections 3.3.1 and 3.3.2 below.

IFRS 17 *Insurance Contracts* explains that an investment-linked insurance fund could be, for example, a fund held by an entity as the underlying items for a group of insurance contracts with direct participation features. [IAS 28.18]. For the purposes of the fair value election, insurance contracts include investment contracts with discretionary participation features.

3.3.1 Investment entities exception

IFRS 10 requires entities that meet the definition of an investment entity to measure investments in subsidiaries at fair value through profit or loss in accordance with IFRS 9. The investment entities exception is discussed further in Chapter 7.

The application of the investment entity exception is not an accounting policy choice. If an entity meets the definition of an investment entity, it is required to measure its subsidiaries at fair value through profit or loss. To meet this definition, an investment entity must, as well as meeting other criteria, elect the exemption from applying the equity method in IAS 28 for its investments in associates and joint ventures. [IFRS 10.B85L(b)].

As discussed further in section 8.2.1 below, if an entity that is not itself an investment entity has an interest in an associate or joint venture that is an investment entity, the investor can retain the fair value measurement applied by that investment entity associate or joint venture to the investment entity associate's or joint venture's interests in subsidiaries. [IAS 28.36A].

3.3.2 Application of IFRS 9 to exempt investments in associates or joint ventures

The reason that IAS 28 allows venture capital organisations, mutual funds, unit trusts and similar entities to measure investments in associates and joint ventures at fair value is because these entities often manage their investments based on fair values and so the application of IFRS 9 produces more relevant information. Furthermore, the financial statements would be less useful if changes in the level of ownership in an investment resulted in frequent changes in the method of accounting for the investment. When investments are measured at fair value, the fair value is determined in accordance with IFRS 13 *Fair Value Measurement* (see Chapter 15).

3.3.2.A Entities with a mixture of activities

The exemption clearly applies to venture capital organisations and other similar financial institutions whose main activities consist of managing an investment portfolio comprising investments unrelated to the investor's business. Although, the exemption is not intended to apply to other entities that hold investments in several associates, there are cases in which entities have significant venture capital activities as well as significant other activities. It is clear from IAS 28.18 that the exemption applies to investments that are indirectly held through a venture capital or similar organisation (as well as to those held by the organisations themselves). Therefore, when an entity has a mixture of activities, if it can demonstrate that it runs a venture capital activity rather than merely undertaking, on an *ad hoc* basis, transactions that a venture capital activity would undertake, the exemption applies. [IAS 28.18].

Illustration 3-1: Entity owning a discrete venture capital organisation

Parent P operates a construction business and owns a venture capital organisation (Subsidiary V) that invests in the telecommunications industry. Even though P itself is not a venture capital organisation, V would be able to apply the exemption and account for its investments at fair value under IFRS 9. In the consolidated financial statements of P, the investments held by V could also be accounted for at fair value under IFRS 9, with changes in fair value recognised in profit or loss in the period of change.

Illustration 3-2: Entity with a venture capital organisation segment

Bank A has several separate activities. One segment's business is that of a venture capital organisation. A's share of investees held by the venture capital organisation segment provides it with significant influence, but not control.

Even though A is itself not a venture capital organisation, it would be able to apply the exemption and account for its investments at fair value under IFRS 9, with changes in fair value recognised in profit or loss in the period of change.

3.3.2.B Establishment of a venture capital organisation or similar financial institution

IAS 28.18 says that the election to account for an associate or joint venture held by a venture capital or similar organisation is made 'at initial recognition of the associate or joint venture'. As described at 3.3.2.A above, an entity might conduct a mixture of activities, of which a venture capital or similar organisation is one part. An entity might therefore introduce such an operation and transfer to it existing holdings in associates or joint ventures accounted for using the equity method. This raises a question as to whether the exemption is available on initial transfer of investments to a newly formed venture capital or similar organisation or whether IAS 28.18 is interpreted such that the exemption is available only on initial recognition of the associate or joint venture itself.

Arguments for the exemption to be available to relevant investments on transfer to a newly formed venture capital or similar organisation include:

- IAS 28 does not provide guidance for when a venture capital or similar organisation is established as part of an internal restructuring.
- The election of accounting policy provided by IAS 28.18 becomes available only when a venture capital or similar organisation exists. Prior to this, the entity has made no accounting policy election and so is permitted to do so on initial transfer to the venture capital or similar organisation.
- The exemption in IAS 28 is provided because fair value measurement provides more useful information for users of the financial statements than application of the equity method. [IAS 28.BC12].
- If the exemption were not available, associates and joint ventures held by the group on establishment of the venture capital or similar organisation, and transferred to it, would continue to be equity accounted while the exemption would be available for subsequent investments by the venture capital or similar organisation. This might result in mixed measurement models not accurately reflecting the manner in which investments are managed by the venture capital or similar organisation.

How we see it

In our view, this scenario is not considered in IAS 28. Therefore, it is acceptable to apply the exemption in IAS 28.18 once, on initial transfer of an existing investment in associate or joint venture to a newly established venture capital or similar organisation. It is also acceptable to interpret IAS 28.18 as not permitting such application of the exemption.

For the venture capital or similar organisation to have substance, the group must demonstrate that it runs a venture capital activity rather than merely undertaking, on an ad hoc basis, transactions that a venture capital activity would undertake. In the context of a newly established VCO organisation, this might be supported by evidence that the objective of holding the transferred investments in associates or joint ventures is for capital gain. This might be demonstrated by updates and changes to the entity's:

- Group structure
- Policies, procedures and business plans
- Management structures and remuneration arrangements

3.4 Partial use of fair value measurement of associates

Extract from IAS 28

- 19 When an entity has an investment in an associate, a portion of which is held indirectly through a venture capital organisation, or a mutual fund, unit trust and similar entities including investment-linked insurance funds, the entity may elect to measure that portion of the investment in the associate at fair value through profit or loss in accordance with IFRS 9 regardless of whether the venture capital organisation, or the mutual fund, unit trust and similar entities including investment-linked insurance funds, has significant influence over that portion of the investment. If the entity makes that election, the entity shall apply the equity method to any remaining portion of its investment in an associate that is not held through a venture capital organisation, or a mutual fund, unit trust and similar entities including investment-linked insurance funds.

[IAS 28.19].

In the Basis for Conclusions to IAS 28, the IASB discussed whether the partial use of fair value is allowed only in the case of venture capital organisations (or mutual funds, unit trusts and similar entities including investment-linked insurance funds) that have designated their portion of the investment in the associate at fair value through profit or loss in their own financial statements. The IASB noted that several situations might arise in which those entities do not measure their portion of the investment in the associate at fair value through profit or loss. In those situations, however, from the group's perspective, the appropriate determination of the business purpose would lead to the measurement of this portion of the investment in the associate at fair value through profit or loss in the consolidated financial statements. Consequently, the IASB decided that an entity can measure a portion of an investment in an associate held by a venture capital organisation (or a mutual fund, unit trust and similar entities including investment-linked insurance funds) at fair value through profit or loss regardless of whether this portion of the investment is measured at fair value through profit or loss in those entities' financial statements. [IAS 28.BC22].

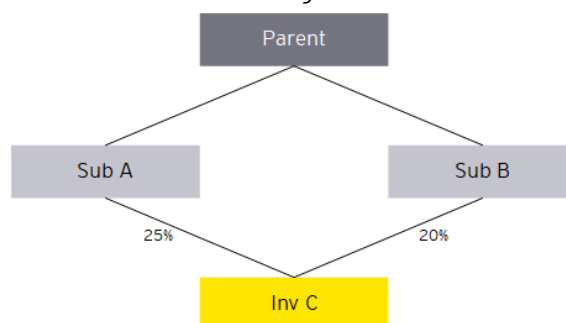

Illustration 3-3 below (which is based on four scenarios considered by the IFRS IC at its meeting in May 2009⁴) illustrates this partial use exemption.

⁴ [IASB Staff Paper 3](#), Project: IAS 28 Investments in Associates, Paper topic: *Venture capital consolidations and partial use of fair value through profit or loss*, IFRIC Meeting, May 2009. Available on the IFRS Foundation's website.

Illustration 3-3: Venture capital consolidations and partial use of fair value through profit or loss

A parent entity has two wholly-owned subsidiaries (A and B), each of which has an ownership interest in the same associate, Entity C. A is a venture capital business that holds its interest via an investment-linked fund. B is a holding company. Neither of the investments held by A and B is held for trading.

Scenario 1: both investments in the associate result in significant influence on a stand-alone basis

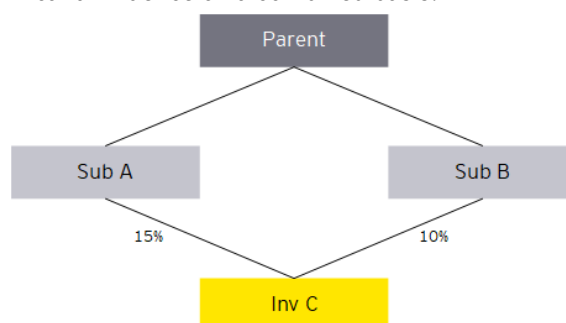

A accounts for its 25% share in the associate at fair value through profit or loss in accordance with IFRS 9 (see Chapter 46).

B accounts for its 20% share in the associate using the equity method in accordance with IAS 28 (see section 5 below).

The parent entity must equity account for its 20% interest held by B. Under the partial use of fair value exemption, the parent entity can elect to measure the 25% interest held by A at fair value through profit or loss.

Scenario 2: neither of the investments in the associate results in significant influence on a stand-alone basis but do provide the parent with significant influence on a combined basis.

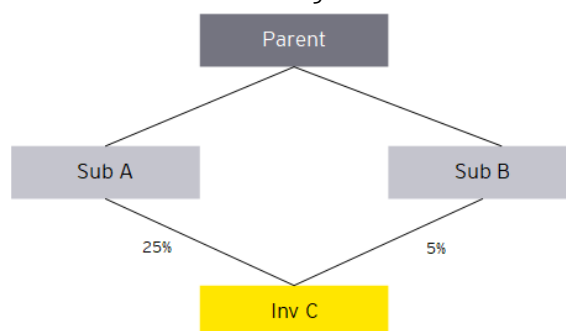

A accounts for its 15% share in the associate at fair value through profit or loss in accordance with IFRS 9 (see Chapter 46).

B designated its 10% share in the associate as at fair value through OCI in accordance with IFRS 9 (see Chapter 46).

The parent entity must equity account for its 10% interest held by B, even though B would not have significant influence on a stand-alone basis. Under the partial use of fair value exemption, the parent entity can elect to measure the 15% interest held by A at fair value through profit or loss.

Scenario 3: one of the investments in the associate results in significant influence on a stand-alone basis and the other investment in the associate does not result in significant influence on a stand-alone basis

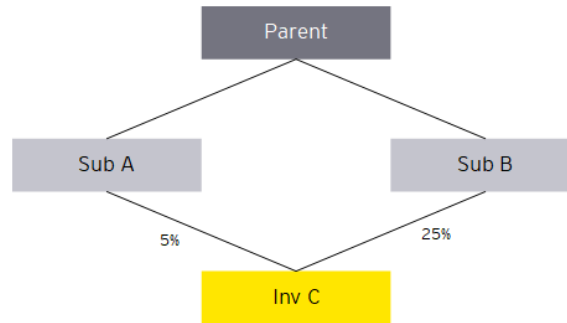

A accounts for its 25% share in the associate at fair value through profit or loss in accordance with IFRS 9 (see Chapter 46).

B designated its 5% share in the associate as at fair value through OCI in accordance with IFRS 9 (see Chapter 46).

The parent entity must equity account for its 5% interest held by B, even though B would not have significant influence on a stand-alone basis. Under the partial use of fair value exemption, the parent entity can elect to measure the 25% interest held by A at fair value through profit or loss.

Scenario 4: same as scenario 3, but with the ownership interests switched between the subsidiaries

A accounts for its 5% share in the associate at fair value through profit or loss in accordance with IFRS 9 (see Chapter 46).

B accounts for its 25% share in the associate using the equity method in accordance with IAS 28 (see section 5 below).

The parent entity must equity account for its 25% interest held by B. Under the partial use of fair value exemption, the parent entity can elect to measure the 5% interest held by A at fair value through profit or loss.

4 Classification as held for sale (IFRS 5)

IAS 28 requires that an entity applies IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* to an investment, or a portion of an investment, in an associate or a joint venture that meets the criteria to be classified as held for sale. [IAS 28.20]. The detailed requirements for classification as held for sale are discussed in Chapter 5. In this situation, the investor discontinues the use of the equity method from the date that the investment (or the portion of it) is classified as held for sale. Instead, the associate or joint venture is measured at the lower of its carrying amount and fair value less cost to sell. [IFRS 5.15]. The measurement requirements of IFRS 5 are discussed in Chapter 5.

How we see it

In our view, once an investment (or a portion thereof) is classified as held for sale, dividends (or the related portion thereof) are recognised in profit or loss, because the investment (or portion thereof) is no longer being accounted for under the equity method. However, receiving dividends usually reduces the fair value of the investment, which could result in an offsetting loss recognised in the IFRS 5 measurement.

Any retained portion of an investment in an associate or a joint venture that has not been classified as held for sale is accounted for using the equity method until disposal of the portion that is classified as held for sale takes place. After the disposal takes place, an entity accounts for any retained interest in the associate or joint venture in accordance with IFRS 9 unless the retained interest continues to be an associate or a joint venture, in which case the entity uses the equity method. [IAS 28.20].

As explained in the Basis for Conclusions to IAS 28, the IASB concluded that if a portion of an interest in an associate or joint venture fulfilled the criteria for classification as held for sale, it is only that portion that is accounted for under IFRS 5. An entity uses the equity method for the retained interest until the portion classified as held for sale is finally sold. This is because, even if the entity has the intention of selling a portion of an interest in an associate or joint venture, until it does so, it still has significant influence over, or joint control of, that investee. [IAS 28.BC26, IAS 28.BC27].

When an investment, or a portion of an investment, in an associate or a joint venture previously classified as held for sale no longer meets the criteria to be so classified, it is accounted for using the equity method retrospectively, from the date of its classification as held for sale. Financial statements for the periods since classification as held for sale are amended accordingly. [IAS 28.21].

5 Overview of the equity method

IAS 28 defines the equity method as “a method of accounting whereby the investment is initially recognised at cost and adjusted thereafter for the post-acquisition change in the investor's share of the investee's net assets. The investor's profit or loss includes its share of the investee's profit or loss and the investor's other comprehensive income includes its share of the investee's other comprehensive income.” [IAS 28.3].

Extract from IAS 28

- 10 Under the equity method, on initial recognition the investment in an associate or a joint venture is recognised at cost, and the carrying amount is increased or decreased to recognise the investor's share of the profit or loss of the investee after the date of acquisition. The investor's share of the investee's profit or loss is recognised in the investor's profit or loss. Distributions received from an investee reduce the carrying amount of the investment. Adjustments to the carrying amount may also be necessary for changes in the investor's proportionate interest in the investee arising from changes in the investee's other comprehensive income. Such changes include those arising from the revaluation of property, plant and equipment and from foreign exchange translation differences. The investor's share of those changes is recognised in the investor's other comprehensive income (see IAS 1 *Presentation of Financial Statements*).
- 32 An investment is accounted for using the equity method from the date on which it becomes an associate or a joint venture. On acquisition of the investment, any difference between the cost of the investment and the entity's share of the net fair value of the investee's identifiable assets and liabilities is accounted for as follows:
- (a) Goodwill relating to an associate or a joint venture is included in the carrying amount of the investment. Amortisation of that goodwill is not permitted.
 - (b) Any excess of the entity's share of the net fair value of the investee's identifiable assets and liabilities over the cost of the investment is included as income in the determination of the entity's share of the associate or joint venture's profit or loss in the period in which the investment is acquired.
- Appropriate adjustments to the entity's share of the associate's or joint venture's profit or loss after acquisition are made in order to account, for example, for depreciation of the depreciable assets based on their fair values at the acquisition date. Similarly, appropriate adjustments to the entity's share of the associate's or joint venture's profit or loss after acquisition are made for impairment losses such as for goodwill or property, plant and equipment.

[IAS 28.10, IAS 28.32].

IAS 28 explains that equity accounting is necessary because recognising income simply based on distributions received might not be an adequate measure of the income earned by an investor on an investment in an associate or a joint venture, since distributions received might bear little relation to the performance of the associate or joint venture. Through its significant influence over the associate, or joint control of the joint venture, the investor has an interest in the associate's or joint venture's performance and, as a result, the return on its investment. The investor accounts for this interest by extending the scope of its financial statements to include its share of profits or losses of such an investee. As a result, application of the equity method provides more informative reporting of the net assets and profit or loss of the investor. [IAS 28.11].

The investor's profit or loss and other comprehensive income are also adjusted for differences between the carrying amount of assets and liabilities in the associate's or joint venture's books and that in the investor's books, for example resulting from fair value adjustments on acquisition of the associate or joint venture. These are sometimes referred to as basis differences. [IAS 28.32]. Basis differences are important, because when an investor records its equity method earnings, the entity reflects not only its portion of earnings of the associate or joint venture, but also any effects of the basis differences related to identified assets or assumed liabilities, for example, by recognising additional depreciation on a property that had a fair value greater than its carrying amount in the associate's or joint venture's books at the date of acquisition.

Illustration 5-1: Application of the equity method

On the first day of its financial year, Entity A acquires a 35% interest in Entity B, over which it can exercise significant influence. A paid CU475,000 for its interest in B. The book value of B's net identifiable assets at acquisition date was CU900,000, and the fair value CU1.1m. The difference of CU200,000 relates to an item of property, plant and equipment (PP&E) with a remaining useful life of 10 years. During the year, B made a profit of CU80,000 and paid a dividend of CU120,000. B also owned an investment in securities classified as at fair value through OCI that increased in value by CU20,000 during the year. For the purposes of the example, any deferred tax implications have been ignored.

A accounts for its investment in B under the equity method as follows:

	CU	CU
Acquisition date of investment in B		
Share in book value of B's net identifiable assets: 35% of CU900,000	315,000	
Share in fair valuation of B's net identifiable assets: 35% of (CU1.1m - CU900,000)*	70,000	
Goodwill on investment in B: CU475,000 - CU315,000 - CU70,000*	90,000	
Cost of investment		475,000
Profit during the year		
Share in the profit reported by B: 35% of CU80,000	28,000	
Adjustment to reflect effect of fair valuation* 35% of ((CU1.1m - CU900,000) ÷ 10 years)	(7,000)	
Share of profit in B recognised in income by A (equity method income)		21,000
Revaluation of asset at fair value through OCI		
Share in revaluation recognised in OCI by A: 35% of CU20,000		7,000
Dividend received by A during the year		
35% of CU120,000 (debit cash, credit investment)		(42,000)
End of the financial year		
Share in book value of B's net assets: CU315,000 + 35% (CU80,000 - CU120,000 + CU20,000)	308,000	
Share in fair valuation of B's net identifiable assets: CU70,000 - CU7,000*	63,000	
Goodwill on investment in B*	90,000	
Closing balance of A's investment in B		461,000

* These line items are often referred to as 'basis differences' and are combined with the ones immediately above.

5.1 Comparison between equity accounting and consolidation

For some time, there has been a debate about whether the equity method of accounting is primarily a method of consolidation or a method of valuing an investment, as IAS 28 does not provide specific guidance either way.

An investor that controls a subsidiary has control over the assets and liabilities of that subsidiary. While an investor that has significant influence over an associate or joint control of a joint venture controls its holding in the shares of the associate or joint venture, it does not control the assets and liabilities of that associate or joint venture. Therefore, the investor does not account for the assets and the liabilities of the associate or joint venture, but accounts only for its investment in the associate or joint venture as a whole.

Extract from IAS 28

- 26 Many of the procedures that are appropriate for the application of the equity method are similar to the consolidation procedures described in IFRS 10. Furthermore, the concepts underlying the procedures used in accounting for the acquisition of a subsidiary are also adopted in accounting for the acquisition of an investment in an associate or a joint venture.

[IAS 28.26].

However, although the equity method generally adopts consolidation principles (see Chapter 8), it also has features of a valuation methodology. For example, the IASB noted that IAS 28.20 (now IAS 28.26) explains “only the methodology used to account for investments in associates. This should not be taken to imply that the principles for business combinations and consolidations can be applied by analogy to accounting for investments in associates and joint ventures.” [IFRS 9.BC22.42].

The similarities between equity accounting and consolidation include:

- Appropriate adjustments to the entity’s share of the associate’s or joint venture’s profits or losses after acquisition are made to account, for example, for depreciation of the depreciable assets based on their fair values at the acquisition date.
- Goodwill relating to an associate or a joint venture is recognised in the carrying amount of the investment.
- Goodwill is not amortised.
- Any excess of the investor’s share of the net fair value of the associate’s identifiable assets and liabilities over the cost of the investment is included as income in the determination of the entity’s share of the associate’s or joint venture’s profit or loss in the period in which the investment is acquired (that is, any excess is recognised as a bargain purchase gain).
- Unrealised profits on ‘upstream’ and ‘downstream’ transactions are eliminated, although, unlike consolidation, only until realised in transactions with third parties (see section 7.1 below).
- Uniform accounting policies are applied for like transactions.

However, there are also several differences between equity accounting and consolidation, including:

- The investor ceases to recognise its share of losses of an associate or joint venture once the investment has been reduced to zero.
- The treatment of loans and borrowings (including preference shares classified as debt by the investee) between the reporting entity and its associates or joint ventures (see section 7.3 below).
- The investor cannot capitalise its own borrowing costs in respect of an associate’s or joint venture’s assets under construction (an equity accounted investment is not a qualifying asset under IAS 23 *Borrowing Costs* regardless of the associate’s or joint venture’s activities or assets). [IAS 23.BC22].
- The investor considers whether there is any additional impairment loss with respect to its net investment.

As there is no clear principle underlying the application of the equity method, different views on how to account for certain transactions for which the standard has no clear guidance might be taken, depending on which principle (i.e., consolidation or valuation of an investment) is deemed to take precedence. We address these issues in the following sections.

6 Initial accounting for an associate or joint venture

6.1 Date of commencement of equity accounting

An investor begins equity accounting for an associate or a joint venture from the date on which it obtains significant influence over the associate or joint control over the joint venture (and is not otherwise exempt from equity accounting for it). [IAS 28.32]. In most situations, this is when the investor acquires the investment in the associate or joint venture. Determining whether an entity has significant influence is discussed in section 2 above.

6.2 Initial carrying amount of an associate or joint venture

Under the equity method, an investment is initially recognised at cost. [IAS 28.3, IAS 28.10]. However, 'cost' for this purpose is not defined.

Frequently asked questions

Question 6-1: Is directly attributable expenditure included in the initial carrying amount of an investment under the equity method?

In July 2009, the IFRS IC discussed the lack of a definition of cost in IAS 28. The IFRS IC issued an agenda decision⁵ clarifying that the cost of an investment in an associate at initial recognition comprises its purchase price and any directly attributable expenditures necessary to obtain it. Therefore, any acquisition-related costs are not expensed (as is the case in a business combination under IFRS 3 *Business Combinations*) but are included as part of the cost of the associate.

The glossary to IFRS accounting standards defines cost as being the "amount of cash or cash equivalents paid or the fair value of the other consideration given to acquire an asset at the time of its acquisition or construction ...".

'Consideration given' is likewise not defined, but guidance exists in IFRS accounting standards:

- 'Consideration transferred' in the context of a business combination, as referred to in IFRS 3.37. [IFRS 3.37].
- 'Cost' as applied in relation to acquisitions of PP&E in accordance with IAS 16 *Property, Plant and Equipment*, intangible assets in accordance with IAS 38 *Intangible Assets* and investment property in accordance with IAS 40 *Investment Property*.

Applying the requirements of IFRS 3 *Business Combinations*, the 'consideration transferred' in a business combination comprises the sum of the acquisition-date fair values of assets transferred by the acquirer, liabilities incurred by the acquirer to the former owners of the acquiree, and equity interests issued by the acquirer. This includes any liability (or asset) for contingent consideration, which is measured and recognised at fair value at the acquisition date. Subsequent changes in the measurement of the liability (or asset) are recognised in profit or loss (see Chapter 10).

How we see it

In our view, the guidance in IFRS 3 referred to above can be applied to contingent consideration arrangements for the purchase of an associate or a joint venture, i.e., the initial carrying amount of an associate or joint venture includes the fair value of any contingent consideration arrangement. Consequently, subsequent changes in the contingent consideration would be accounted for under IFRS 9.

Further guidance on accounting for contingent consideration when determining the cost of an asset can be found in Chapter 18 and Chapter 19.

The considerations regarding applying the cost requirements of other standards have previously been discussed by the IFRS IC, and the discussions are summarised in Chapter 9.

The IFRS IC agenda decision did not provide any specific guidance in relation to a step acquisition of an associate or a joint venture. This is discussed further in section 6.2.3 below.

⁵ Agenda decision, July 2009. Potential effect of IFRS 3 *Business Combinations* (as revised in 2008) and IAS 27 *Consolidated and Separate Financial Statements* (as amended in 2008) on equity method accounting.

6.2.1 Measurement period on acquisition of an associate or joint venture

IAS 28 does not provide guidance when the accounting as required by IAS 28.32 is incomplete by the end of the reporting period in which the acquisition of the investment occurs.

How we see it

We believe that when the initial accounting for the acquisition of an associate or joint venture is incomplete at the reporting date, an entity could use by analogy the guidance in IFRS 3 regarding provisional accounting in the measurement period (see Chapter 10).

Hence, the entity estimates and discloses provisional amounts for the items for which the accounting is incomplete. Those provisional amounts are adjusted retrospectively in the following reporting period to reflect new information obtained about facts and circumstances that existed at the acquisition date that, if known, would have affected the amounts recognised at that date. This is because the concepts underlying the procedures used in accounting for the acquisition of a subsidiary are also adopted in accounting for the acquisition of an investment in an associate or a joint venture. [IAS 28.26].

6.2.2 Initial carrying amount of an associate or joint venture following loss of control of an entity

A parent might lose control of its subsidiary as a result of a transaction with a third party or a downstream transaction (i.e., a transaction with its associate or joint venture, see section 7.5 below).

If a parent loses control of a subsidiary that constitutes a business in a transaction that is not a downstream transaction and the retained interest is an investment in an associate or joint venture, then it applies IFRS 10.25.

Under IFRS 10, when an entity loses control of a subsidiary and retains an interest in an associate or joint venture, the retained interest is remeasured at its fair value and included in the calculation of the gain or loss on disposal of the subsidiary. This fair value becomes the cost on initial recognition of the associate or joint venture. [IFRS 10.25]. The gain or loss on disposal is recognised in full and not restricted as would be the case in certain downstream transactions as explained below.

Under IAS 28, the investor that sells or contributes assets to its equity-accounted associate or joint venture is required to restrict any gain arising on its own assets to the gain attributable to the other party to the associate or joint venture. [IAS 28.28]. This results in an adjustment to the carrying amount of the investment in the associate or joint venture.

In certain scenarios in which a parent loses control of a subsidiary in a downstream transaction (see examples in Figure 6-1 below), there is a conflict between the above requirements of IFRS 10 and IAS 28.

In September 2014, the IASB issued *Sale or Contribution of Assets between an Investor and its Associate or Joint Venture* (amendments to IFRS 10 and IAS 28) to address the conflict between IFRS 10 and IAS 28.⁶ The amendments state that:

- Partial gain or loss recognition for transactions between an investor and its associate or joint venture applies only to a gain or loss resulting from the sale or contribution of assets that do not constitute a business as defined in IFRS 3.
- The gain or loss resulting from the sale or contribution of assets that constitute a business as defined in IFRS 3 to an associate or joint venture is recognised in full. [IAS 28.31A].

In addition, the amendments address when an entity sells or contributes assets in two or more transactions. When determining whether assets that are sold or contributed constitute a business as defined in IFRS 3, an entity considers whether the sale or contribution of those assets is part of multiple arrangements that are accounted for as a single transaction in accordance with the requirements in IFRS 10.B97. [IAS 28.31B].

In December 2015, the IASB deferred the effective date of these amendments indefinitely due to feedback that the recognition of a partial gain or loss when a transaction involves assets that do not constitute a business, even if these assets are housed in a subsidiary, is inconsistent with the initial measurement requirements of IAS 28.32(b): “Any excess of the entity’s share of the net fair value of the investee’s identifiable assets and liabilities over the cost of the investment is included as income in the determination of the entity’s share of the associate or joint venture’s profit or loss in the period in which the investment is acquired”. This issue is in the scope of the equity method project (see section 13 below). However, entities can apply the amendments before the effective date.

⁶ *Sale or Contribution of Assets between an Investor and its Associate or Joint Venture (amendments to IFRS 10 and IAS 28)*, IASB, September 2014.

How we see it

Until the amendments to IAS 28 become mandatorily effective, we believe that entities have an accounting policy choice to apply either IFRS 10 or IAS 28 to the contribution of an interest in a subsidiary that constitutes a business. Once selected, the entity must apply the policy consistently.

6.2.2.A Initial accounting for the investment in an associate or joint venture using the IFRS 10 approach and the IAS 28 approach

When the IFRS 10 approach is applied to a loss of control transaction, an investor accounts for a retained equity method investment as if it had acquired the retained investment at fair value at the date that control is lost. [IFRS 10.25, IAS 28.32]. Therefore, the accounting is the same as for the initial acquisition of an investment in an associate according to IAS 28.32 (see section 5 above). The investor applying the equity method also needs to consider the requirements in IAS 28.32 regarding initial investment in an associate or joint venture. On initial recognition, the concepts underlying the procedures used in accounting for the acquisition of a subsidiary are also adopted in accounting for the acquisition of an investment in an associate or joint venture and fair values are applied to measure all the identifiable assets and liabilities in calculating any goodwill or bargain purchase that exists. [IAS 28.26, IAS 28.32]. Accordingly, to apply the equity method from the date control is lost, an investor remeasures all the identifiable assets and liabilities underlying the investment at their fair values (or other measurement basis required by IFRS 3 at that date), i.e., the investor performs a new purchase price allocation.

Illustration 6-1 below demonstrates the accounting under the IFRS 10 approach. Although it shows the loss of control of a business with a retained interest in an associate, the accounting would be the same if the retained interest were a joint venture.

Illustration 6-1: Accounting for retained interest in an associate following loss of control of a subsidiary that is a business due to sale of shares to third party

Entity A owns 100% of the shares of Entity B. B meets the definition of a business. On its reporting date, A sells 60% of the shares in B to Entity C for CU1.3m. As a result of the sale, A loses control over B. A retains a 40% equity interest in B and determines that it has significant influence over B.

At the date of disposal, the carrying amount of the net identifiable assets of B in A's consolidated financial statements is CU1.2m and the fair value of A's retained interest of 40% of the shares of B is CU800,000.

Upon A's sale of 60% of the shares of B, it deconsolidates B and accounts for its investment in B as an associate using the equity method of accounting, as follows:

Dr	Cash	CU1,300,000	
Dr	Associate	CU800,000	
	Cr	Net assets of subsidiary	CU1,200,000
	Cr	Gain on disposal	CU900,000

When the IAS 28 approach is applied to a loss of control transaction, the retained equity method investment is adjusted to restrict any gain arising on the investor's own assets to the gain attributable to the other party to the associate or joint venture. Therefore, the investment is not initially measured at its fair value. For an illustration of the IAS 28 approach, see section 7.5.2 below.

6.2.2.B Loss of control scenarios in which the retained investment is an associate or joint venture

As discussed in more detail in Chapter 8, examples of situations that result in the loss of control of a subsidiary and the interest retained is an associate or joint venture accounted for using the equity method, include:

- Scenario 1 - a 'downstream' sale or contribution of the investment in the subsidiary (which is a business) to an existing associate or joint venture.
- Scenario 2 - a 'downstream' sale or contribution of the investment in the subsidiary (which is not a business) to an existing associate or joint venture.
- Scenario 3 - a direct sale or dilution of the investment in the subsidiary (which is a business) for cash in a transaction involving a third party with a retained interest in an associate or joint venture.
- Scenario 4 - a direct sale or dilution of the investment in the subsidiary (which is not a business) for cash in a transaction involving a third party with a retained interest in an associate or joint venture.

The contribution of non-monetary assets to an associate or joint venture, which could include the contribution of a subsidiary, is discussed at 7.5 below.

In certain of these scenarios noted below there is a conflict between the requirements of IFRS 10.25 and those of IAS 28.28. This conflict is described at section 6.2.2 above.

How we see it

In our view, the context of which is discussed more fully in Chapter 8, the following accounting policy determinations are needed:

- (a) Do the requirements of IFRS 10.25 apply to:
 - A loss of control of a subsidiary that is a business ('narrow view')
 Or
 - A loss of control of a subsidiary (whether a business or not) ('wide view')?
- (b) Where there is a conflict between the requirements of IFRS 10.25 ('IFRS 10 approach') and IAS 28.28 ('IAS 28 approach'), which accounting standard takes precedence?
- (c) Where the transaction falls within the scope of neither IFRS 10.25 nor IAS 28.28, what accounting policy is applied?

Scenarios 1 and 3 fall within the scope of IFRS 10.25, whether a 'wide view' or 'narrow view' is taken at (a) above. However, Scenarios 2 and 4 will fall within the scope of IFRS 10 only if a 'wide view' is taken. Only Scenarios 1 and 2 fall within the scope of IAS 28.28. This is because this requirement in IAS 28 applies only to 'downstream' transactions with an associate or joint venture accounted for using the equity method and not to all transactions where the retained interest in the former subsidiary is an associate or joint venture accounted for using the equity method.

Figure 6-1 below summarises how the above policy determinations apply to the four scenarios where the September 2014 amendments are not applied. Application of the September 2014 amendments is discussed at 6.2.2 above.

Figure 6-1: Loss of control transactions where the retained interest in the former subsidiary is an associate or joint venture accounted for using the equity method

	Subsidiary meets the definition of a business	Subsidiary does not meet the definition of a business
Sale or contribution of investment in former subsidiary in downstream transaction with existing associate or joint venture	Scenario 1 <ul style="list-style-type: none"> ▪ Both IFRS 10.25 (as the subsidiary is a business) and IAS 28.28 (as this is a 'downstream' transaction) apply to this scenario, so a conflict arises. ▪ An entity would need to develop an accounting policy to resolve the conflict, which would result in either applying full gain recognition (IFRS 10 approach) or partial gain recognition (IAS 28 approach). 	Scenario 2 <ul style="list-style-type: none"> ▪ IAS 28.28 (as this is a 'downstream' transaction) applies to this scenario. Therefore, partial gain recognition applies. ▪ However, if a 'wide view' is taken on the scope of IFRS 10.25, a conflict arises. An entity would then need to develop an accounting policy to resolve the conflict, which would result in either applying full gain recognition (IFRS 10 approach) or partial gain recognition (IAS 28 approach).
Sale or dilution of investment in former subsidiary for cash in transaction with third party	Scenario 3 <ul style="list-style-type: none"> ▪ IAS 28.28 does not apply (as this is not a 'downstream' transaction). ▪ IFRS 10.25 applies (as the subsidiary is a business). ▪ Therefore, an entity applies full gain recognition (IFRS 10 approach) to the transaction. 	Scenario 4 <ul style="list-style-type: none"> ▪ IAS 28.28 does not apply (as this is not a 'downstream transaction'). ▪ IFRS 10.25 only applies if a 'wide view' is taken. ▪ Therefore, if a 'wide view' over the scope of IFRS 10.25 applies, an entity applies full gain recognition (IFRS 10 approach) to the transaction. ▪ If a 'narrow view' over the scope of IFRS 10.25 applies, an entity must develop and apply an appropriate accounting policy that provides relevant and reliable information in accordance with IAS 8.

How we see it

Where it is determined that a loss of control transaction falls within the scope of neither IFRS 10.25 nor IAS 28.28 (which might be the case for Scenario 4 if a 'narrow view' of the scope of IFRS 10.25 is taken), management will need to use judgement in developing and applying an appropriate accounting policy that results in relevant and reliable information, which must be consistently applied.

Please see further discussion of matters relating to developing an appropriate accounting policy in Chapter 8.

6.2.3 Step acquisition of an associate or joint venture (financial instrument becoming an associate or joint venture)

An entity might gain significant influence or joint control over an existing investment upon acquisition of a further interest or due to a change in circumstances. IAS 28 is unclear on how an investor accounts for an existing investment that is accounted for under IFRS 9 and that subsequently becomes an associate or a joint venture, to be accounted for under the equity method.

How we see it

In our view, when accounting for the step acquisition of an associate or a joint venture, an investor applies either:

- (a) An 'accumulated cost' approach
- Or
- (b) A 'fair value as deemed cost' approach

Once selected, the investor must apply the selected policy consistently.

The rationale for each of these approaches is discussed in more detail below.

As discussed in section 6.2 above, the IFRS IC, in July 2009, clarified that the initial cost of an equity accounted investment comprises the purchase price and directly attributable expenditures necessary to obtain it. Although the implications for the step acquisition of an associate are not explicitly addressed, it appeared that, since the IFRS IC considered that the initial recognition of the associate is based on its cost, the accounting reflects an 'accumulated cost' approach.

However, in July 2010, the IFRS IC received a request to address the accounting for an investment in an associate when the investment was purchased in stages and classified as available-for-sale (AFS) in terms of IAS 39 *Financial Instruments: Recognition and Measurement* until it became an associate.⁷ The Staff Paper recommended that "the fair value of an investment classified as AFS prior to the investor obtaining significant influence over that investment should be the deemed cost of that pre-existing interest at the date the investor obtains significant influence over the associate. The accumulated changes in fair value accounted for in OCI should be reclassified to profit or loss at that date." The Staff Paper further recommended that a clarification of IAS 28 to that effect be included within the Annual Improvements project.⁸ Thus, the Staff was recommending a 'fair value as deemed cost' approach. However, due to the acknowledged diversity in practice in accounting for associates purchased in stages, the IFRS IC did not reach a conclusion and to date there has been no amendment to IAS 28.⁹

In January 2019, the IFRS IC issued an agenda decision regarding the step acquisition of an investment in a subsidiary accounted for at cost in the separate financial statements of the parent. In the request, the initial interest was an equity instrument of another entity and was measured at fair value in accordance with IFRS 9. The IFRS IC concluded that a reasonable reading of the requirements in IFRS accounting standards could result in the application of either one of the two approaches to determine 'cost': the 'fair value as deemed cost' approach or the 'accumulated cost' approach. These approaches are discussed in more detail below. The IFRS IC concluded that, when the accumulated cost approach is applied, any difference between the fair value of the initial interest at the date of obtaining control of the subsidiary and its original consideration meets the definitions of income or expenses in the *Conceptual Framework for Financial Reporting*. Accordingly, applying paragraph 88 of IAS 1 *Presentation of Financial Statements*, the

⁸ [IASB Staff Paper 16](#), Project: *Annual Improvements Project - 2009-2011 cycle*, Paper topic: IAS 28 - Investments in Associates - *Purchase in stages - fair value as deemed cost*, IFRS IC Meeting, July 2010, paras. 24 and 29. Available on the IFRS Foundation's website.

⁹ [IFRIC Update](#), July 2010, available on the IFRS Foundation's website.

entity recognises this difference in profit or loss, regardless of whether, before obtaining control, the entity had presented subsequent changes in fair value of the initial interest in profit or loss or in OCI.¹⁰

How we see it

The January 2019 agenda decision related specifically to investments in subsidiaries in the separate financial statements of the parent. However, we believe it is also relevant to step acquisitions of equity accounted associates and joint ventures, because IAS 28.3 also requires investments in associates and joint ventures to be measured at cost.

The scope of the equity method project (see section 13 below), includes measuring the cost of an investment when an investor obtains significant influence and has a previously held interest in the investee. Readers should monitor developments.¹¹

6.2.3.A Applying an accumulated cost approach

When an accumulated cost approach is applied to account for a step acquisition of an associate or a joint venture, this involves the determination of:

- (a) The cost of the investment
- (b) Whether or not any catch-up adjustment is required when first applying equity accounting (i.e., an adjustment for the share of investee's profits and other equity movements as if the previously held interest had been equity accounted)
- (c) The date(s) at which the goodwill implicit in the investment (or gain on bargain purchase) is measured

Not all of these aspects of the accounting for a step acquisition of an associate or a joint venture were addressed by the IFRS IC agenda decisions in 2009 and 2019.

How we see it

In our view, there are four possible accumulated cost approaches that can be applied to a step acquisition of an associate or a joint venture. Once selected, the investor must apply the selected policy consistently.

In all accumulated cost approaches, cost is the sum of the consideration given for each tranche together with any directly attributable costs. However, because of the answers to (b) and (c) above, the four accumulated cost approaches are as follows:

	Catch-up equity accounting adjustment for previously held interest	Determination of goodwill/gain on bargain purchase
Approach 1	None	Difference between sum of the consideration and share of fair value of net identifiable assets at date investment becomes an associate or joint venture
Approach 2	None	Difference between the cost of each tranche and the share of fair value of net identifiable assets acquired in each tranche
Approach 3	For profits (less dividends), and changes in OCI	
Approach 4	For profits (less dividends), changes in OCI and unrecognised changes in fair value of net identifiable assets	

The basis for using the above accumulated cost approaches can be set out as follows. The explanations below assume that the step acquisition has occurred in two tranches; the second acquisition resulting in the entity obtaining significant influence. When an entity purchases multiple tranches prior to obtaining significant influence, references below to the 'first tranche' apply to all tranches prior to obtaining significant influence.

¹⁰ [IFRIC Update](#), January 2019, available on the IFRS Foundation's website.

¹¹ [IASB Update](#), April 2022, available on the IFRS Foundation's website.

Approach 1

IAS 28.32 (see section 5 above) states that an investment is accounted for using the equity method “from the date on which it becomes an associate or a joint venture.” Recognising any catch-up adjustments can be interpreted as a form of equity accounting for a period prior to gaining significant influence, which contradicts this principle of IAS 28.

IAS 28.32 also states that any notional goodwill or gain on a bargain purchase is determined “on acquisition of the investment”. However, it does not specify on which date the fair values of the net identifiable assets are determined. It can be interpreted to mean only at the date that the investment becomes an associate or a joint venture. This is also consistent with the approach in IFRS 3, whereby the underlying fair values of net identifiable assets are determined at one time only, rather than determining them several times for individual transactions leading to the change in the economic event.

Approach 2

No catch-up adjustment is recognised, for the same reasons as noted in Approach 1.

IAS 28.32 is interpreted to mean that the fair values of the associate’s or joint venture’s net identifiable assets are determined at a date that corresponds to the date at which consideration was given. Therefore, the fair values are determined for each tranche. This might require the fair values to be determined for previous periods when no such exercise was performed at the date of the original purchase.

Approach 3

A catch-up adjustment is recognised to reflect the application of the equity method as described in IAS 28.10 (see section 5 above), with respect to the first tranche (i.e., the share of the associate’s results that would have been recognised by the investor if the first tranche of 10% had always been equity accounted). However, the application of that paragraph restricts the adjustment to only the share of profits (less dividends) and OCI relating to the first tranche. That is, there is no catch-up adjustment made for changes in the fair value of the net identifiable assets not recognised by the investee (except for any adjustments necessary to give effect to uniform accounting policies).

The determination of goodwill is the same as for Approach 2.

Approach 4

This approach is based on the underlying philosophy of equity accounting, which is to reflect the investor’s share of the underlying net identifiable assets plus goodwill inherent in the purchase price. Therefore, when the investment was acquired in tranches, IAS 28.32 is interpreted to mean that a catch-up adjustment in respect of the first tranche is necessary, in order to apply equity accounting from the date the investment becomes an associate or a joint venture. The catch-up adjustment reflects not only the post-acquisition share of profits and OCI relating to the first tranche (i.e., the share of the associate’s or joint venture’s results that would have been recognised by the investor if the first tranche of 10% had always been equity accounted), but also the share of the unrecognised fair value adjustments based on the fair values of the net identifiable assets at the date of becoming an associate or a joint venture. The determination of goodwill is the same as for Approach 2.

Example of cost accumulation approaches

The above four accumulated cost approaches are shown in Illustration 6-2 below. Although, the example illustrates the step acquisition of an associate, the accounting would be the same if the transaction had resulted in the step acquisition of a joint venture.

Illustration 6-2: Accounting for existing financial instruments on the step acquisition of an associate (cost-based approach)

An investor acquired a 10% interest in an investee for CU100 on 1 January 20X1, which increased to a fair value of CU150 as of 31 December 20X3. Until 31 December 20X3, the investor accounted for its initial 10% interest at fair value in accordance with IFRS 9 and recognised the difference between the fair value of CU150 and the cost of the first tranche of CU100 of CU50 and the dividends received for its 10% interest of CU20 ($\text{CU}200 \times 10\%$) in profit or loss.

Three years later, on 1 January 20X4, the investor acquired an additional 15% interest in the investee for CU225. The investor now holds a 25% interest and has the ability to exercise significant influence. For the purposes of the example, directly attributable transaction costs and any deferred tax implications have been ignored.

The financial information relating to the investee can be summarised as follows:

	1 January 20X1	Movements in period of 10% ownership				1 January 20X4
		Profit	Dividends	Increase in fair value of land	Increase in fair value of goodwill	
	CU	CU	CU	CU	CU	CU
Book value of investee's assets	600	500	(200)			900
Investor's fair value adjustment to net identifiable assets (land*)	200			100		300
Investor's goodwill	200				100	300
Fair value of investee	1,000					1,500
Consideration paid	100					225

* For simplicity, the example includes fair value adjustments only on a non-depreciable asset.

The accounting for this step acquisition under each of the accumulated cost approaches is as follows (all amounts in CU):

	Catch-up equity accounting adjustment	Initial equity accounted amount	Goodwill in initial amount of associate
Approach 1	0	$100 + 225 = 325$	Consideration less share of fair value of net identifiable assets at time investment becomes an associate $325 - (25\% \times 1200) = 25$
Approach 2	0	$100 + 225 = 325$	Cost less share of fair value of net identifiable assets at each tranche: $100 - (10\% \times 800) = 20$ + $225 - (15\% \times 1200) = 45$ Total = 65
Approach 3	10% of profits (less dividends) $10\% \times (500 - 200) = 30$	$325 + 30 = 355$	
Approach 4	10% of profits (less dividends) and changes in unrecognised fair value of net identifiable assets $10\% \times (500 - 200 + 100) = 40$	$325 + 40 = 365$	

The result in both the separate and consolidated financial statements is as follows:

Cost of investment

In all four accumulated cost approaches, the difference of CU50, between the fair value of the original 10% of CU150 and the cost of the first tranche of CU100, is reversed against profit or loss on 1 January 20X4 (the date of the transaction) to bring the asset back to its original cost of CU100.

Catch-up adjustment

For the accumulated cost approaches 3 and 4, the 'catch-up' equity accounting adjustment relating to the first tranche is recognised against the appropriate balance within equity - that is, retained earnings, or other equity reserve, depending on the nature of the 'catch up'. For example, an adjustment relating to the investee's profits would be recognised against retained earnings and an adjustment relating to the investee's OCI, for example, foreign currency translation, would be recognised against the relevant equity reserve.

The combined journal entry at 1 January 20X4 under each of the four approaches is as follows:

	Approach 1	Approach 2	Approach 3	Approach 4
Associate	Dr 325 <i>(of which equity method goodwill is 25)</i>	Dr 325 <i>(of which equity method goodwill is 65)</i>	Dr 355 <i>(of which equity method goodwill is 65)</i>	Dr 365 <i>(of which equity method goodwill is 65)</i>
Cash (Credit)	Cr 225	Cr 225	Cr 225	Cr 225
Investment (IFRS 9) (Credit)	Cr 150	Cr 150	Cr 150	Cr 150
Profit or loss	Dr 50 <i>(reversing prior fair value increases)</i>	Dr 50 <i>(reversing prior fair value increases)</i>	Dr 50 <i>(reversing prior fair value increases)</i>	Dr 50 <i>(reversing prior fair value increases)</i>
Retained earnings or other equity reserve	<i>No change to prior equity method income or dividend income</i>	<i>No change to prior equity method income or dividend income</i>	Cr 50 <i>(cumulative equity method income)</i> Dr 20 <i>(reversing prior dividend income)</i>	Cr 50 <i>(cumulative equity method income)</i> Cr 10 <i>(unrecognised increase in fair value of net identifiable assets)</i> Dr 20 <i>(reversing prior dividend income)</i>

6.2.3.B Applying a fair value as deemed cost approach

When a fair value as deemed cost approach is applied to accounting for a step acquisition of an associate or a joint venture, the fair value of the previously held interest at the date that significant influence or joint control is obtained is deemed to be the cost for the initial application of equity accounting. Since the investment would already be measured at fair value under IFRS 9, there is no further change to its carrying value.

- If the investment had been accounted for at fair value through OCI under IFRS 9, amounts accumulated in equity are not reclassified to profit or loss at the date that significant influence is obtained, although the cumulative gain or loss can be transferred within equity. [IFRS 9.5.2.1, IFRS 9.5.7.5, IFRS 9.B5.7.1, IFRS 9.B5.7.3].
- If the investment had been accounted for at fair value through profit or loss under IFRS 9, any changes from original cost would already be reflected in profit or loss.

Consistent with the guidance in IFRS 3 for acquisitions achieved in stages, the calculation of goodwill at the date the investor obtains significant influence or joint control is made only at that date, using information available at that date.

The fair value as deemed cost approach is shown in Illustration 6-3 below. Although the example illustrates the step acquisition of an associate, the accounting would be the same if the transaction had resulted in the step acquisition of a joint venture.

Illustration 6-3: Accounting for existing financial instruments on the step acquisition of an associate (fair value (IFRS 3) approach)

Using the same information as in Illustration 6-2 above, under a fair value as deemed cost approach to an acquisition in stages, in the consolidated financial statements of the investor, the fair value of the 10% existing interest would be deemed to be part of the cost for the initial application of equity accounting.

Equity method goodwill is calculated as the difference between the initial equity method investment of CU375 (the fair value of the existing 10% interest of CU150 and the cost of the additional 15% interest of CU225) and CU300 (25% of the fair value of net identifiable assets of CU1,200, at the date significant influence is attained).

The combined journal entry at 1 January 20X4 is as follows:

Dr	Associate	CU375	
	Cr Investment		CU150
	Cr Cash		CU225

Additionally, if the investor measured the original investment at fair value through OCI, any amount in OCI relating to this interest can be reclassified within equity.

The methodology shown in Illustration 6-3 above is consistent with the accounting that is required by IAS 28 in the reverse situation; i.e., when there is a loss of significant influence in an associate (or loss of joint control in a joint venture), resulting in the discontinuance of the equity method (see section 9 below).

6.2.4 Step increase in an existing associate or joint venture without a change in status of the investee

An entity might acquire an additional interest in an existing associate that continues to be an associate accounted for under the equity method. Similarly, an entity might acquire an additional interest in an existing joint venture that continues to be a joint venture accounted for under the equity method. IAS 28 does not explicitly deal with such transactions.

How we see it

When an investor acquires an additional interest in an existing associate that continues to be accounted for under the equity method, we believe that the purchase price paid for the additional interest is added to the existing carrying amount of the associate or the joint venture and the existing interest in the associate or joint venture is not remeasured.

This increase in the investment must still be split notionally between goodwill and the additional interest in the fair value of the net identifiable assets of the associate or joint venture. This split is based on the fair value of the net identifiable assets at the date of the increase in the associate or joint venture. However, no remeasurement is made for previously unrecognised changes in the fair values of net identifiable assets. The treatment is shown in Illustration 6-4 below.

This accounting differs from the treatment required by IFRS 3 when an increased investment in an associate or joint venture results in the investor obtaining control over the investee. IFRS 3 is clear that when an entity acquires an additional interest in an existing associate or joint venture that gives it control, the entity is required to revalue the previously held interest in that investment and any gain or loss is recognised in profit or loss. [IFRS 3.41, IFRS 3.42]. This treatment reflects the significant change in the nature of, and economic circumstances surrounding, that investment, which therefore warrants a change in the classification and measurement of that investment. [IFRS 3.BC384].

By contrast, when an investor increases its ownership interest in an existing associate or joint venture and that investment's classification remains unchanged, there is no significant change in the nature and economic circumstances of the investment. Hence, there is no justification for remeasurement of the existing ownership interest at the time of the increase. Rather the investor applies an accumulated cost approach equivalent to Approach 2 discussed in section 6.2.3.A above; i.e., the purchase price paid for the additional interest is added to the existing carrying amount of the associate or joint venture and the existing interest in the associate or joint venture is not remeasured.

IAS 28.32 (see section 5 above) establishes the requirement that the cost of an investment in an associate or joint venture is allocated between the share of the fair value of net identifiable assets and the goodwill. This requirement is not limited to the initial application of equity accounting but applies to each acquisition of an investment. However, this requirement does not result in any revaluation of the existing share of net assets in a step increase transaction without a change in status.

Rather, the existing ownership interests are accounted for under IAS 28.10 and IAS 28.32, whereby the carrying value is adjusted only for the investor's share of the associate or joint venture's profits or losses and other recognised equity transactions.

Although, Illustration 6-4 below illustrates an increase in ownership of an associate that continues to be an associate, the accounting would be the same if the transaction had been an increase in ownership of a joint venture.

Illustration 6-4: Accounting for an increase in the ownership of an associate

Entity A obtains significant influence over Entity B by acquiring an investment of 25% at a cost of CU3,000. At the date of the acquisition, the fair value of the associate's net identifiable assets is CU10,000, which equals their carrying amounts. Therefore, the difference between the amount paid of CU3,000 and A's share of the fair value of B's net assets of CU2,500 is attributable entirely to goodwill. The investment is accounted for under the equity method in the consolidated financial statements of A.

Two years later, A acquires an additional investment of 20% in B at a cost of CU4,000, increasing its total investment in B to 45%. The investment is still an associate and accounted for using the equity method of accounting.

For the purposes of the example, directly attributable costs have been ignored and it is assumed that no profit or loss arose during the period since the acquisition of the first 25%. Therefore, the carrying amount of the investment immediately prior to the additional investment is CU3,000. However, an asset held by the associate has increased in value by CU5,000 so that the fair value of the associate's net identifiable assets is now CU15,000.

To summarise, amounts are as follows:

	CU
Fair value of net identifiable assets of Entity B at acquisition	10,000
Increase in fair value	5,000
Fair value of net identifiable assets of Entity B two years later	15,000

Because of the additional investment, the equity-accounted amount for the associate increases by CU4,000. The notional goodwill applicable to the second tranche of the acquisition is CU1,000 [CU4,000 - (20% × CU15,000)].

The impact of the additional investment on A's equity-accounted amount for B is summarised as follows:

	% held	Carrying amount	Share of net identifiable assets	Goodwill included in investment
		CU	CU	CU
Existing investment	25	3,000	2,500	500
Additional investment	20	4,000	3,000	1,000
Total investment	45	7,000	5,500	1,500

The accounting for an increase in an associate or a joint venture that becomes a subsidiary is discussed in Chapter 10.

6.2.5 Existing associate that becomes a joint venture, or vice versa

In the situations discussed in section 6.2.4 above, the acquisition of the additional interests did not result in a change in status of the investee, i.e., the associate remained an associate or the joint venture remained a joint venture. However, an associate could become a joint venture, either by the acquisition of an additional interest, or through a contractual agreement that gives the investor joint control. Alternatively, a contractual agreement could end, or part of an interest could be disposed of and a joint venture could become an associate. In all these situations, IAS 28 requires that the entity continues to apply the equity method and does not remeasure the retained interest. [IAS 28.24]. Therefore, the accounting described in Illustration 6-4 above would apply.

6.2.6 Common control transactions involving sales of associates

IFRS 3 and IAS 28 are not clear about how to apply the equity method of accounting when an investor acquires an investment in an associate from an entity that is under common control. Therefore, there is an interpretation of whether, and how, to apply IFRS 3 principles to investments in associates.

How we see it

We believe there are two possible approaches when an investor acquires an investment in an associate from an entity that is under common control: acquisition accounting and pooling of interests. An entity accounts for such transactions using a consistent accounting policy.

These approaches are discussed further in Chapter 11.

6.3 Share of the investee

6.3.1 Accounting for potential voting rights

In applying the equity method and determining the share of the investee's earnings or losses to be recognised, the proportionate share of the associate or joint venture to be accounted for is generally based on the investor's ownership interest in the ordinary shares.

This is also generally the case when the investor holds potential voting rights, or other derivatives containing potential voting rights, in addition to the single investment in the ordinary shares. This is because an entity's interest in an associate or a joint venture is determined solely based on existing ownership interests and does not reflect the possible exercise or conversion of potential voting rights and other derivative instruments. [IAS 28.12].

However, as an exception to this, IAS 28 recognises that: [IAS 28.13]

Extract from IAS 28

- 13 In some circumstances, an entity has, in substance, an existing ownership as a result of a transaction that currently gives it access to the returns associated with an ownership interest. In such circumstances, the proportion allocated to the entity is determined by taking into account the eventual exercise of those potential voting rights and other derivative instruments that currently give the entity access to the returns.

The standard does not provide an example of such circumstances, but the assessment of whether a potential voting right or other derivative instrument gives the holder present access to returns associated with the ownership interest in the shares is discussed in Chapter 8 in the context of options over NCI. Similar considerations apply to the assessment of whether a potential voting right or other derivative instrument gives the holder present access to returns associated with the ownership interest in the shares under IAS 28.

IFRS 9 does not apply to interests in associates and joint ventures that are accounted for using the equity method. When instruments containing potential voting rights in substance currently give access to the returns associated with an ownership interest in an associate or a joint venture, the instruments are not subject to IFRS 9. In all other cases, instruments containing potential voting rights in an associate or a joint venture are accounted for in accordance with IFRS 9. [IAS 28.14]. Once the potential voting rights are exercised and the share in the investee increases, the fair value of such instruments at the exercise date is part of the cost to be recognised in accounting for the step increase (see section 6.2.3 above).

6.3.2 Cumulative preference shares held by parties other than the investor

If an associate or joint venture has outstanding cumulative preference shares that are held by parties other than the investor and that are classified as equity, the investor computes its share of profits or losses after adjusting for the dividends on such shares, whether or not the dividends have been declared. [IAS 28.37].

Although Illustration 6-5 below illustrates cumulative preference shares issued by an associate, the accounting would be the same if the shares were issued by a joint venture.

Illustration 6-5: Cumulative preference shares issued by an associate

An entity holds an investment of 30% in the ordinary shares of an associate that has net assets of CU200,000 and net profit for the year of CU24,500. The associate has issued 5,000 cumulative preference shares with a nominal value of CU10 which entitle its holders to a 9% cumulative preference dividend. The cumulative preference shares are classified by the associate as equity in accordance with the requirements of IAS 32 *Financial Instruments: Presentation*. The associate has not declared dividends on the cumulative preference shares in the past two years.

The investor calculates its share of the associate's net assets and net profit as follows:

	CU
Net assets	200,000
9% Cumulative preference shares	(50,000)
Undeclared dividend on cumulative preference shares 2 years × 9% × CU50,000 =	(9,000)
Net assets value attributable to ordinary shareholders	<u>141,000</u>
Investor's 30% share of the net assets	<u>42,300</u>
Net profit for the year	24,500
Share of profit of holders of cumulative preference shares 9% of CU50,000 =	(4,500)
Net profit attributable to ordinary shareholders	<u>20,000</u>
Investor's 30% share of the net profit	<u>6,000</u>

If the investor also owned all the cumulative preference shares, then it would assess whether those preference shares are accounted for under IFRS 9 or IAS 28 (see section 6.3.1 above). Assuming that the preference shares are accounted for under IAS 28, the investor's share in the net assets of the associate would be CU42,300 + CU50,000 + CU9,000 = CU101,300. Its share in the net profit would be CU6,000 + CU4,500 = CU10,500.

6.3.3 Several classes of equity and substantive profit sharing arrangements

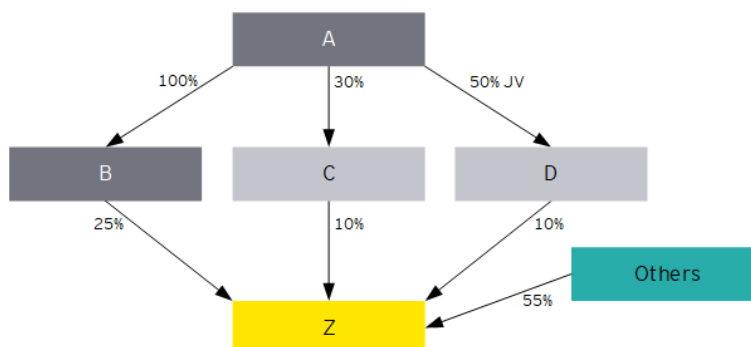

When an associate or joint venture has a complicated equity structure with several classes of equity shares that have varying entitlements to net profits, equity or liquidation preferences, or substantive profit sharing arrangements, the investor needs to assess carefully the rights attaching to each class of equity and the arrangements in determining the appropriate amount to recognise for its share of the investee's profit or losses.

6.3.4 Where the reporting entity is a group (indirect interests)

A group's share in an associate or joint venture is the aggregate of the holdings in that associate or joint venture by the parent and its subsidiaries. The holdings of the group's other associates or joint ventures are ignored for this purpose. [IAS 28.27]. Illustration 6-6 below illustrates the group's share in an associate when investments are also held by other entities in the group.

Illustration 6-6: Share in an associate or a joint venture when the reporting entity is a group

Parent A holds a 100% investment in Subsidiary B, which in turn holds a 25% investment in Associate Z. In addition, A also holds a 30% investment in Associate C and a 50% investment in Joint Venture D, each of which holds a 10% investment in Z.

In its consolidated financial statements, A accounts for a 25% investment in Z under the equity method because:

- The investments in Z held by C and D are not considered
- A consolidates the assets of B, which include a 25% investment in Z

A's indirect interests in Z held via its interests in C and D are accounted for via its accounting for C and D.

6.3.5 Where the investee is a group: non-controlling interests in an associate's or joint venture's consolidated financial statements

When an associate or joint venture itself has subsidiaries, the profits or losses, OCI and net assets considered in applying the equity method are those recognised in the associate's or joint venture's consolidated financial statements, but after any adjustments necessary to give effect to uniform accounting policies (see section 8.2 below). [IAS 28.27].

An associate or joint venture might not own all the shares in some of its subsidiaries, in which case its consolidated financial statements will include non-controlling interests (NCI). Under IFRS 10, any NCI are presented in the consolidated statement of financial position within equity, separately from the equity of the owners of the parent. Profit or loss and each component of OCI are attributed to the owners of the parent and to the NCI. [IFRS 10.22, IFRS 10.B94]. The profit or loss and OCI reported in the associate's or joint venture's consolidated financial statements will include 100% of the amounts relating to the subsidiaries, but the overall profit or loss and total comprehensive income will be split between the amounts attributable to the owners of the parent (i.e., the associate or joint venture) and those attributable to the NCI. The net assets in the consolidated statement of financial position will also include 100% of the amounts relating to the subsidiaries, with any NCI in the net assets presented in the consolidated statement of financial position within equity, separately from the equity of the owners of the parent.

IAS 28 does not explicitly say whether the investor bases the accounting for its share of the associate's or joint venture's profits, OCI and net assets under the equity method on the amounts before or after any NCI in the associate's or joint venture's consolidated accounts. However, the implementation guidance to IAS 1 indicates that the amounts disclosed for 'share of profits of associates' and 'share of other comprehensive income of associates' represent the amounts "attributable to owners of the associates, i.e., it is after tax and non-controlling interests in the associates".¹²

How we see it

Therefore, in our view, when an investee does not wholly own its subsidiaries, since the investor's interest in the associate or joint venture is as an owner of the parent, its share of its associate's or joint venture's profits is based on the amounts that are reported as attributable to the owners of the parent (controlling interest) in the associate's or joint venture's consolidated financial statements, i.e., after any amounts attributable to the NCI.

¹² IAS 1 IG6 XYZ Group - Statement of profit or loss and other comprehensive income for the year ended 31 December 20X7 (illustrating the presentation of profit and loss and other comprehensive income in one statement and the classification of expenses within profit by function).

7 Transactions between the reporting entity and its associates or joint ventures

7.1 Elimination of 'upstream' and 'downstream' transactions

IAS 28 requires certain eliminations of transactions between an investor and its associate.

Extract from IAS 28

- 28 Gains and losses resulting from 'upstream' and 'downstream' transactions between an entity (including its consolidated subsidiaries) and its associate or joint venture are recognised in the entity's financial statements only to the extent of unrelated investors' interests in the associate or joint venture. 'Upstream' transactions are, for example, sales of assets from an associate or a joint venture to the investor. 'Downstream' transactions are, for example, sales or contributions of assets from the investor to its associate or its joint venture. The investor's share in the associate's or joint venture's gains or losses resulting from these transactions is eliminated.

[IAS 28.28].

How we see it

We believe that an appropriate approach for presenting these entries is as follows:

- In the statement of profit or loss and other comprehensive income, the adjustment is taken against either the investor's profit or the share of the associate's or joint venture's profit, whichever is the entity that recorded the profit on the transaction.
- In the statement of financial position, the adjustment is made against the asset which was the subject of the transaction if it is held by the investor, or against the carrying amount of the associate or joint venture if the asset is held by the associate or joint venture.

However, certain of these presentations have drawbacks, discussed in more detail below. The selected accounting policy must be consistently applied and disclosed in the financial statements.

This approach is consistent with the approach required by IAS 28 in dealing with the elimination of unrealised gains and losses arising on contributions of non-monetary assets to an associate or joint venture in exchange for an equity interest in the associate or joint venture (see section 7.5 below).

Illustration 7-1 and Illustration 7-2 below show our suggested approach to this requirement of IAS 28. Although these examples illustrate transactions between the reporting entity and an associate, the accounting would be the same if the transactions occurred between the reporting entity and a joint venture.

Illustration 7-1: Elimination of profit on sale by investor to associate ('downstream transaction')

One month before its reporting date, Entity H sells inventory costing CU750,000 to Associate A for CU1m, all of which remains in A's inventory at the reporting date. H owns 40% of A.

H recorded revenue of CU1m and cost of sales of CU750,000, a profit of CU250,000. However since, at the reporting date, the inventory is still held by A, only 60% of this transaction is regarded by IAS 28 as having taken place (in effect with the other shareholders of A). This is reflected by the elimination accounting entry:

Dr	Revenue	CU400,000	
	Cr	Cost of sales	CU300,000
	Cr	Investment in A	CU100,000

This entry effectively defers recognition of 40% of the profit on sale ($\text{CU}250,000 \times 40\%$) and offsets the deferred profit against the carrying amount of H's investment in A.

After the reporting date, when the inventory is sold to a third party for CU1.2m by A, this deferred profit can be released by H, reflected by the following equity accounting entry:

Dr	Investment in A	CU100,000	
Dr	Cost of sales	CU300,000	
	Cr	Revenue	CU400,000

An alternative approach would be to eliminate the profit on 40% of the sale against the cost of sales. Before the reporting date, this is reflected by the equity accounting entry:

Dr	Cost of sales	CU100,000	
	Cr	Investment in A	CU100,000

After the reporting date, when the inventory is sold to a third party for CU1.2m by A, this deferred profit can be released by H, reflected by the following equity accounting entry:

Dr	Investment in A	CU100,000	
	Cr	Cost of sales	CU100,000

An argument in favour of the alternative approach is that the revenue figures are not adjusted because the sales to associates or joint ventures are disclosed as related party transactions. However, this approach causes volatility in H's reported gross margin, as revenue and the related net margin are not recognised in the same accounting period.

Illustration 7-2: Elimination of profit on sale by associate to reporting entity ('upstream transaction')

This is the mirror image of the transaction in Illustration 7-1 above. Before H's reporting date, A sells inventory costing CU750,000 to H for CU1m.

A recognised a profit of CU250,000 (CU1m - CU750,000), 40% of which (CU100,000) is regarded under IAS 28 as unrealised by H, and is therefore deferred and offset against inventory:

Dr	Equity method earnings in A	CU100,000	
	Cr	Inventory	CU100,000

In the following period, when the inventory is sold to a third party for CU1.2m by H, the entry is reversed:

Dr	Inventory	CU100,000	
	Cr	Equity method earnings in A	CU100,000

Under this approach, at the reporting date, the investment in A will have increased by CU100,000 more than the share of profit of associates as reported in group profit or loss (and in the following period by CU100,000 less). This is because the adjustment to the statement of financial position at the reporting date is to inventory rather than the carrying value of the investment in A, reflecting the fact that A has, indeed, made a profit. It might therefore be necessary to disclose the reasons for this difference in the notes to the financial statements.

A transaction between an investor and its associate or joint venture could indicate a reduction in the net realisable value or an impairment loss of the asset that is the subject of the transaction. IAS 28 requires that when this is the case in a downstream transaction, those losses are recognised in full by the investor. Similarly, when an upstream transaction provides evidence of a reduction in the net realisable value of the assets to be purchased or of an impairment loss of those assets, the investor recognises its share of those losses. [IAS 28.29].

The effect of these requirements is shown in Illustration 7-3 and Illustration 7-4 below. Although these examples illustrate transactions between the reporting entity and a joint venture, the accounting would be the same if the transactions occurred between the reporting entity and an associate.

Illustration 7-3: Sale of asset from venturer to joint venture at a loss

Two entities, A and B, establish Joint Venture C in which A and B each hold 50%. A and B each contribute CU5m in cash to C in exchange for equity shares. C then uses CU8m of its CU10m cash to acquire a property from A recorded in the financial statements of A at CU10m. CU8m is agreed to be the fair value of the property.

The required accounting entry by A is as follows:

	CU m	CU m
Dr Cash ⁽¹⁾	3	
Dr Investment in C ⁽²⁾	5	
Dr Loss on sale ⁽³⁾	2	
Cr Property ⁽⁴⁾		10

(1) CU8m received from C less CU5m contributed to C.

(2) Represented by 50% of C's cash CU2m (CU10m from A and B minus CU8m to A), plus 50% of CU8m (carrying value of the property in books of C).

(3) Loss on sale of property CU2m (CU8m received from C less CU10m carrying value = CU2m) recognised in full because the transaction indicated an impairment of the property. In effect, it is the result that would have been obtained if A had recognised an impairment charge immediately prior to the sale and then recognised no gain or loss on the sale.

(4) Derecognition of A's original property.

Illustration 7-4: Sale of asset from joint venture to venturer at a loss

On 1 January 20X2, two entities A and B establish Joint Venture C in which A and B each hold 50%. A and B each contribute CU5m in cash to C in exchange for equity shares. C then uses CU8m of its CU10m cash to acquire a property from an independent third-party D. Property prices fall during 20X2 and on 31 December 20X2, the property is sold to A for CU7m settled in cash, which is agreed to be its fair value.

The required accounting entry by A for both transactions combined is as follows:

	CU m	CU m
Dr Property ⁽¹⁾	7.0	
Dr Investment in C ⁽²⁾	4.5	
Dr Share of loss of C ⁽³⁾	0.5	
Cr Cash ⁽⁴⁾		12.0

(1) CU7m paid to C.

(2) Represented by 50% of C's cash CU9m (CU10m from A and B minus CU8m to D plus CU7m received from A).

(3) Loss in C's books is CU1m (CU8m cost of property less CU7m proceeds of sale). A recognises its 50% share because the transaction indicates an impairment of the asset, which is recognised by C as an impairment charge immediately prior to the sale.

(4) CU5m cash contributed to C plus CU7m consideration for property.

7.1.1 Elimination of 'downstream' unrealised profits in excess of the investment

Occasionally an investor's share of the unrealised profit on the sale of an asset to an associate or a joint venture exceeds the carrying value of the investment held. In that case, to what extent is any profit in excess of the carrying value of the investment eliminated?

IAS 28 is unclear about the elimination of 'downstream' unrealised gains in excess of the investment. Consequently, the IFRS IC received a request asking for clarification of the accounting treatment when the amount of gains to eliminate in a 'downstream' transaction in accordance with IAS 28.28 exceeds the amount of the entity's interest in the joint venture. The request specifically asked whether:

- The gain from the transaction is eliminated only to the extent that it does not exceed the carrying amount of the entity's interest in the joint venture
- Or
- The remaining gain in excess of the carrying amount of the entity's interest in the joint venture is also eliminated and if so, what it would be eliminated against

The IFRS IC determined that the entity eliminates the gain from a 'downstream' transaction to the extent of the related investor's interest in the joint venture, even if the gain to be eliminated exceeds the carrying amount of the entity's interest in the joint venture, as required by IAS 28.28. Any eliminated gain that is in excess of the carrying amount of the entity's interest in the joint venture is recognised as deferred income.¹³ In July 2013, the IASB tentatively agreed with the views of the IFRS IC and directed the staff to draft amendments to IAS 28.¹⁴ However, in June 2015, the IASB tentatively decided to defer further work on this topic to the equity method project. This is discussed further in section 13 below.

How we see it

We believe that, until the IASB issues an amendment to IAS 28, the investor can either recognise the excess, referred to above, as 'deferred income' or restrict the elimination to the amount required to reduce the investment to zero. The treatment chosen is based on the investor's accounting policy choice for dealing with other situations when IAS 28 is unclear, reflecting whether the investor considers the equity method of accounting to be primarily a method of consolidation (which would be consistent with recognition of the excess as deferred income) or a method of valuing an investment (which would be consistent with restricting the elimination to the amount that reduces the investment to zero). The investor applies a consistent policy to such situations.

7.1.1.A Method of consolidation approach

This approach gives precedence to the requirements in IAS 28.26, which is also consistent with the general requirement to apply IFRS 10 consolidation elimination principles. [IAS 28.26]. Although IAS 28.38 requires an investor to discontinue application of the equity method when an investor's share of losses equals or exceeds its interest in the associate (see section 8.3 below), [IAS 28.38], the elimination does not represent a real 'loss' to the investor but is simply the non-recognition of a gain because of normal consolidation principles. Therefore, IAS 28.38 is subordinate to the requirement to eliminate unrealised profits.

7.1.1.B Method of valuing investment approach

This approach views the requirements of IAS 28.38 as taking precedence over the requirements of IAS 28.28 to eliminate unrealised profits from a transaction between the investor and the associate. The elimination of the full amount of the share of unrealised profit effectively results in the recognition of a 'loss' to the investor. Furthermore, by deferring the 'loss', the investor is effectively recognising a negative investment balance, which is not permitted or required under IAS 28 when the investor does not have any further legal or constructive obligations in relation to the asset or the associate.

7.1.1.C Examples

Although the following Illustrations show transactions between the reporting entity and an associate, the accounting would be the same if the transactions occurred between the reporting entity and a joint venture.

¹³ [IFRIC Update](#), May 2013, available on the IFRS Foundation's website.

¹⁴ [IASB Update](#), July 2013, available on the IFRS Foundation's website.

Illustration 7-5: Elimination of downstream unrealised profits in excess of the investment

An investor has a 40% investment in an associate, which it carries in its statement of financial position at CU800,000. The investor sells a property to the associate in exchange for cash, which results in a profit of CU3m. After the sale, 40% of that profit (i.e., CU1.2m) is unrealised from the investor's perspective.

It is assumed that the requirements for determining when a performance obligation is satisfied in IFRS 15 *Revenue from Contracts with Customers* have been met. Great care needs to be taken when the investor has any continuing involvement with the transferred asset - for example, guaranteeing limited recourse debt funding used to acquire the asset - to ensure that the requirements in IFRS 15 have been satisfied for revenue to be recognised.

The two approaches for determining to what extent a profit in excess of the carrying value of the investment are eliminated are as follows:

Method of consolidation approach - excess of the unrealised profit over the carrying value of the investment recognised as 'deferred income'

The investor eliminates the investor's total share of the unrealised profit against the carrying amount of the investment in the associate until reaching zero, recognising the excess as a 'deferred income' or similar balance, as follows:

Dr	Profit on sale of property ⁽¹⁾	CU1,200,000	
	Cr	Investment in associate	CU800,000
	Cr	'Deferred income'	CU400,000

(1) This adjustment could be presented in the income statement as an adjustment to revenue and cost of sales or to cost of sales only as discussed at Illustration 7-1 above.

This leaves a net profit of CU1.8m recognised in the consolidated financial statements. The investor recognises deferred income as the asset or the investment in the associate is realised (e.g., upon disposal of the investor's investment in the associate, or upon the disposal or depreciation of the asset by the associate).

Method of valuing investment approach - restricts the elimination to the amount required to reduce the investment to zero

If the investor does not have any further legal or constructive obligations in relation to the asset or the associate, no liability exists, and no further profit is deferred. The investor eliminates the unrealised profit to the extent that it reduces the carrying value of the investment to zero, as follows:

Dr	Profit on sale of property ⁽¹⁾	CU800,000	
	Cr	Investment in associate	CU800,000

(1) This adjustment could be presented in the statement of profit or loss and other comprehensive income as an adjustment to revenue and cost of sales or to cost of sales only as discussed at Illustration 7-1 above.

This leaves a net profit of CU2,200,000 recognised in the consolidated financial statements. The investor does not recognise further profits in the associate until they exceed the unrecognised unrealised profits of CU400,000.

7.1.2 Transactions between associates and/or joint ventures

Transactions could take place between associates and/or joint ventures held by the same investor. Although IAS 28.28 refers only to upstream and downstream transactions between an investor and its associate or its joint venture, we consider these to be examples of typical transactions to be eliminated as a result of the requirements of IAS 28.26 which says that "Many of the procedures that are appropriate for the application of the equity method are similar to the consolidation procedures described in IFRS 10". They are not the only transactions requiring elimination as a result of applying the principle in IAS 28.26. Therefore, applying the principles in IAS 28.28 and IFRS 10.B86, the unrealised profit in the investor's financial statements arising from any transaction between the associates (and/or joint ventures) is eliminated to the extent of the related investor's interests in the associates (and/or joint ventures) as appropriate.

How we see it

When transactions take place between associates and/or joint ventures, which are accounted for under the equity method, we believe the investor applies the requirements of IAS 28 and IFRS 10 by analogy and eliminate its share of any unrealised profits or losses. In practice, however, it might be difficult to determine whether such transactions have taken place.

Illustration 7-6: Elimination of profits and losses resulting from transactions between associates and/or joint ventures

Entity H has a 25% interest in Associate A and a 30% interest in Joint Venture B.

During the reporting period, A sold inventory costing CU1m to B for CU1.2m. All of the inventory remains on B's statement of financial position at the end of the reporting period.

H eliminates CU15,000 (i.e., $30\% \times 25\% \times \text{CU}200,000$) as its share of the profit that is unrealised.

7.2 Reciprocal interests

Reciprocal interests (or 'cross-holdings') arise when an associate or joint venture itself holds an investment in the reporting entity. Although the discussion below refers to a reciprocal interest between the reporting entity and an associate, the discussion below would apply equally to a joint venture.

7.2.1 Reciprocal interests in reporting entity accounted for under the equity method by the associate

When the associate's investment in the reporting entity is such that the associate in turn has significant influence over the reporting entity and accounts for that investment under the equity method, a literal interpretation of IAS 28.27 is that an investor records its share of an associate's profits and net assets, including the associate's equity accounted profits and net assets of its investment in the investor. The reciprocal interests can therefore give rise to a measure of double counting of profits and net assets between the investor and its associate.

The elimination of reciprocal interests was discussed by the IFRS IC in August 2002. The IFRS IC agreed not to require publication of an Interpretation on this issue but did state that "like the consolidation procedures applied when a subsidiary is consolidated, the equity method requires reciprocal interests to be eliminated."¹⁵

How we see it

Therefore, we believe that the requirement in IFRS 10.B86 to eliminate intragroup balances, transactions, income and expenses is applied by analogy when reciprocal interests exist.

Neither IFRS 10 nor IAS 28 explains how an entity eliminates the double counting that arises from reciprocal holdings. We believe that a direct holding only (or net approach) is applicable, whereby the profit of the investor is calculated by adding its direct investment in the associate to its trading profits, as shown in Illustration 7-7 below.

This method takes up the investor's share of the associate's profits excluding the equity income arising on the reciprocal shareholdings and eliminates only the effects of an entity's indirect investment in its own shares.

The investor also eliminates the reciprocal interest in calculating earnings per share (EPS), consistent with the treatment of treasury shares. The associate is not part of the group and therefore, the shares held in the investor are not 'treasury shares' as defined. However, applying IAS 28.26, the reciprocal shareholdings are eliminated as they would be if a subsidiary held shares in its parent, under IFRS 10.B86(c).

¹⁵ [IFRIC Update](#), August 2002, p.3, available on the IFRS Foundation's website.

Illustration 7-7: Elimination of equity-accounted reciprocal interests

Entity A has a 40% equity interest in Entity B and conversely, B has a 30% interest in A. The structure of the reciprocal holdings is shown in the diagram below:

**Entity A**

Share in equity of B	40%
Shares in A held by 'outside' shareholders	70%
Trading profit of A (before share in profit of B)	CU60,000
Net assets of A (before share in net assets of B)	CU600,000
Number of shares in issue	100,000

Entity B

Share in equity of A	30%
Shares in B held by 'outside' shareholders	60%
Trading profit of B (before share in profit of A)	CU110,000
Net assets of B (before share in net assets of A)	CU1,100,000
Number of shares in issue	40,000

Income

The profit for the period is calculated by adding the direct interest in the associate's profit:

- Profit of A:
Trading profit of A + 40% × trading profit of B = CU60,000 + 40% × CU110,000 = CU104,000
- Profit of B:
Trading profit of B + 30% × trading profit of A = CU110,000 + 30% × CU60,000 = CU128,000

Statement of financial position

A similar approach can be applied to calculate the net assets of A and B:

- Net assets of A including share in B without eliminations:
CU600,000 + 40% × CU1.1m = CU1.04m
- Net assets of B including share in A without eliminations:
CU1.1m + 30% × CU600,000 = CU1.28m

EPS

It is necessary to adjust the number of shares to eliminate the reciprocal holdings: For A it can be argued that it indirectly owns 40% of B's 30% interest, i.e., A indirectly owns 12% (= 40% × 30%) of its own shares. Those shares are ignored for the purposes of the EPS calculation.

- Number of A shares after elimination of 'treasury shares':
 $100,000 \times (100\% - 12\%) = 88,000$ shares

Similarly, B indirectly owns 30% of A's 40% interest, i.e., B indirectly owns 12% (= 30% × 40%) of its own shares.

- Number of B shares after elimination of 'treasury shares':
 $40,000 \times (100\% - 12\%) = 35,200$ shares

The EPS for the shareholders of A and B is calculated as follows:

- EPS A:
CU104,000 ÷ 88,000 = CU1.18
- EPS B:
CU128,000 ÷ 35,200 = CU3.64

The EPS is equivalent to the hypothetical dividend per share in the case of full distribution of all profits.

Conclusion

The financial statements reflect both the interests of the 'outside' shareholders and the interests that B shareholders have in A. It is worthwhile noting that the combined underlying trading profit of A and B is only CU170,000 (i.e., CU60,000 + CU110,000), whereas their combined reported profit is CU232,000 (i.e., CU104,000 + CU128,000). Similarly, the combined underlying net assets of A and B are only CU1,700,000, whereas the combined reported net assets are CU2,320,000.

7.2.2 Reciprocal interests in reporting entity not accounted for under the equity method by the associate

In some situations, the associate's investment in the reporting entity is such that the associate does not have significant influence over the reporting entity and accounts for that investment under IFRS 9, either as at fair value through OCI or at fair value through profit or loss. Although the associate is not applying the equity method, the reciprocal interest can still result in double counting of profits and net assets between the investor and its associate when the investor accounts for its share of the profits and net assets of the associate. Again, IAS 28.26 states that many of the procedures appropriate for the application of the equity method are similar to the consolidation procedures described in IFRS 10.

How we see it

In our view, the requirement in IFRS 10.B86 to eliminate intragroup balances, transactions, income and expenses is applied by analogy to reciprocal interests in the reporting entity accounted for under IFRS 9. Accordingly, in its equity accounting, the investor eliminates income from the associate's investment in the investor. This elimination includes dividends and changes in fair value recognised either in profit or loss or OCI. The investor also eliminates the reciprocal interest in calculating EPS.

Illustration 7-8: Elimination of reciprocal interests not accounted for under the equity method

Investor A has a 20% interest in an Associate B. B has a 10% interest in A, which does not give rise to significant influence.

Scenario 1

B recognises a profit of CU1,300 for the year, which includes a dividend of CU100 received from A and a gain of CU200 from measuring its investment in A at fair value through profit or loss.

In this scenario, A's equity method share of B's profit is CU200, being 20% of B's profit of CU1,000 after excluding income (dividend of CU100 plus fair value gain of CU200) on its investment in A.

Scenario 2

B recognises a profit of CU1,100 for the year, which includes a dividend of CU100 received from A and recognises CU200 in OCI from measuring its investment in A as a financial asset at fair value through OCI.

In this scenario, A's equity method share of B's profit is CU200, being 20% of B's profit of CU1,000 after excluding income (dividend of CU100) on its investment in A. A's share of B's OCI also excludes the gain of CU200 recognised in OCI arising from its investment in A.

In both scenarios, A also reduces its equity balance and its investment in B by its effective 2% interest in its own shares and uses the reduced number of shares in determining EPS.

7.3 Loans and borrowings between the reporting entity and its associates or joint ventures

The requirement in IAS 28.28 to eliminate partially unrealised profits or losses on transactions with associates or joint ventures is expressed in terms of transactions involving the transfer of assets. The requirement for partial elimination of profits could be read to not apply to items such as interest paid on loans and borrowings between the reporting entity and its associates or joint ventures since such loans and borrowings do not involve the transfer of assets giving rise to gains or losses. Moreover, they are not normally regarded as part of the investor's share of the net assets of the associate or joint venture, but as separate transactions (except in the case of loss-making associates or joint ventures, see section 8.3 below).

How we see it

We believe that loans and borrowings between the reporting entity and its associates or joint ventures generally are not eliminated in the reporting entity's consolidated financial statements when the interest income and expense are recognised by both parties.

However, if the associate or joint venture has capitalised the borrowing costs then the investor would need to eliminate a relevant share of its interest income and realise it as the associate depreciates the qualifying asset. The same principle applies to eliminate a share of capitalised management or advisory fees charged to an associate or joint venture.

7.4 Statement of cash flows

Changes in cash and cash equivalents relating to associates or joint ventures accounted for under the equity method affect the entity's statement of cash flows only to the extent of the cash flows between the group and the investee (for example, to dividends and advances). [IAS 7.37, IAS 7.38]. The same concept applies to associates or joint ventures carried at fair value (see section 3 above).

In the consolidated statement of cash flows, no elimination adjustment is made in respect of the cash flows relating to transactions with associates or joint ventures. This contrasts with the requirement in any consolidated statement of cash flows to eliminate the cash flows between members of the group.

7.5 Contributions of non-monetary assets to an associate or a joint venture

It is fairly common for an entity to create or change its interest in an associate or a joint venture by contributing some of the entity's existing non-monetary assets to that associate or joint venture. This raises several questions as to how such transactions are accounted for, in particular whether they are accounted for at book value or fair value.

IAS 28 requires the contribution of a non-monetary asset to an associate or a joint venture in exchange for an equity interest in the associate or joint venture to be accounted for in accordance with IAS 28.28, except when the contribution lacks commercial substance, as described in IAS 16 (see section 7.5.1 below and Chapter 19). [IAS 28.30]. IAS 28.28 requires gains and losses resulting from transactions between an entity and its associate or joint venture to be recognised only to the extent of unrelated interests in the associate or joint venture. The investor's share in the associate's or joint venture's gains or losses resulting from those transactions is eliminated (see section 7.1 above for a discussion of the requirements relating to these transactions). However, there is a conflict between the requirements of IAS 28 and the requirements in IFRS 10 relating to accounting for the loss of control of a subsidiary, when a subsidiary is contributed by the investor to an associate or joint venture and control of the subsidiary is consequently lost. This conflict is discussed below in section 7.5.3.

If a contribution lacks commercial substance, the gain or loss is regarded as unrealised and is not recognised unless IAS 28.31 (see below) also applies. The unrealised gains and losses are eliminated against the investment accounted for using the equity method and are not presented as deferred gains or losses in the entity's consolidated statement of financial position or in the entity's statement of financial position in which investments are accounted for using the equity method. [IAS 28.30]. When 'unrealised' losses are eliminated in this way, the effect will be to apply what is sometimes referred to as 'asset swap' accounting. In other words, the carrying value of the investment in the associate or joint venture will be the same as the carrying value of the non-monetary assets transferred in exchange for it, subject to any necessary provision for impairment uncovered by the transaction.

If, in addition to receiving an equity interest in an associate or a joint venture, an entity receives monetary or non-monetary assets, the entity recognises in full, in profit or loss, the portion of the gain or loss on the non-monetary contribution relating to the monetary or non-monetary assets received. [IAS 28.31].

If the terms of a transaction provide evidence that the entity's interest in the associate, or the asset that was contributed, might be impaired, a charge is recognised, as discussed in section 7.1 above and in section 7.5.4 below.

7.5.1 'Commercial substance'

IAS 28 requires that a transaction is not treated as realised when it lacks commercial substance as described in IAS 16. [IAS 28.30].

Extract from IAS 16

- 25 An entity determines whether an exchange transaction has commercial substance by considering the extent to which its future cash flows are expected to change as a result of the transaction. An exchange transaction has commercial substance if:
- (a) the configuration (risk, timing and amount) of the cash flows of the asset received differs from the configuration of the cash flows of the asset transferred; or
 - (b) the entity-specific value of the portion of the entity's operations affected by the transaction changes as a result of the exchange; and
 - (c) the difference in (a) or (b) is significant relative to the fair value of the assets exchanged.
- For the purpose of determining whether an exchange transaction has commercial substance, the entity-specific value of the portion of the entity's operations affected by the transaction shall reflect post-tax cash flows. The result of these analyses may be clear without an entity having to perform detailed calculations.

[IAS 16.25].

The Board included the 'commercial substance' test in IAS 16 in order to "help to give users ... assurance that the substance of a transaction in which the acquired asset is measured at fair value (and often, consequentially, a gain on the disposal of the transferred asset is recognised in income) is the same as its legal form." [IAS 16.25, IAS 16.BC21].

The first step when assessing whether a transaction has commercial substance is to determine the cash flows both of the asset given up and of the asset acquired (the latter being the interest in the associate or joint venture). This determination could be sufficient by itself to satisfy (a) above, as it might be obvious that there are significant differences in the configuration of the cash flows. The type of income might have changed. For example, if the entity contributed a non-monetary asset such as a property or intangible asset to the associate or joint venture, the reporting entity might now be receiving a rental or royalty stream from the associate or joint venture, whereas previously the asset contributed to the cash flows of the cash-generating unit of which it was a part.

However, determining the cash flows might not result in a clear-cut conclusion, in which case the entity-specific value will have to be calculated. This is not the same as a value in use calculation under IAS 36 *Impairment of Assets*, in that the entity can use a discount rate based on its own assessment of the risks specific to the operations, not those that reflect current market assessments, [IAS 16.BC22], and post-tax cash flows. [IAS 16.25]. The calculation might not be highly sensitive to the discount rate as the same rate is used to calculate the entity-specific value of both the asset surrendered and the entity's interest in the associate or joint venture.

However, if the entity considers that a high discount rate is appropriate, this will have an impact on whether or not the difference is significant relative to the fair value of the assets exchanged. The transaction will have commercial substance if the entity-specific value of both the asset surrendered and the entity's interest in the associate or joint venture are not only different to one another but also significant compared to the fair values of the assets exchanged. [IAS 16.25].

How we see it

We believe that transactions entered into with genuine commercial purposes in mind are likely to pass the 'commercial substance' tests outlined in IAS 16.25 above. Testing transactions for their commercial substance will require entities to focus on the fair value of the transaction as a whole and not to follow the strict legal form.

7.5.2 Contributions of non-monetary assets - IAS 28 approach

IAS 28 does not give an example of the accounting treatment that it envisages when a gain is treated as 'realised'. We believe that the intended approach is that set out in Illustration 7-9 below. In essence, this approach reflects the fact that the reporting entity:

- (a) Has acquired an interest in an associate or joint venture and therefore the entity's share of the fair value of the net identifiable assets must be accounted for at fair value (see section 5 above)
And
- (b) Is required by IAS 28 to restrict any gain arising from transactions between the reporting entity and its associate or joint venture relating to assets that remain on the books of the associate. Such gains are recognised only to the extent that the gain is attributable to the other investor in the associate or joint venture. This leads to an adjustment of the carrying amount of the investment in the associate or joint venture

In Illustration 7-9 below, we show the accounting by Entity A when the non-monetary assets it has contributed are intangible assets that are not in a subsidiary. See section 7.5.3 below for guidance when the assets contributed are in a subsidiary.

Although Illustration 7-9 below is based on a transaction resulting in the formation of a joint venture, the accounting treatment by Entity A would be the same if it had obtained an interest in an associate.

Illustration 7-9: Contribution of non-monetary assets to form a joint venture

A and B are two major pharmaceutical companies, which agree to form a joint venture (JV Co) as defined in IAS 28. A will own 40% of the joint venture, and B, 60%. The total fair value of the new business of JV Co is CU250m.

A's contribution to the venture is several intangible assets that are not in a subsidiary, with a carrying amount of CU60m. The fair value of the intangible assets contributed by A is CU100m, i.e., equivalent to 40% of the total fair value of JV Co of CU250m.

B contributes a business in a subsidiary, with separable net identifiable assets of CU85m and goodwill of CU15m. The fair value of the separable net identifiable assets is CU120m. The fair value of the business contributed is CU150m (60% of total fair value of JV Co of CU250m). See section 7.5.3 below for guidance on B's accounting.

The book and fair values of the assets/businesses contributed by A and B can therefore be summarised as follows:

	A		B	
(CU million)	Book value	Fair value	Book value	Fair value
Intangible assets	60	100		
Separable net identifiable assets			85	120
Goodwill			15	30
Total	60	100	100	150

IAS 28.32 requires A to recognise the identifiable assets at fair value upon the acquisition of its 40% interest in the new venture. However, as noted above, any gain or loss recognised by A must reflect only the disposal of the assets to the other partners in the venture (i.e., in this case, 60% - the extent to which A's intangible assets are effectively transferred to B through B's 60% interest in the new venture). [IAS 28.30, IAS 28.32].

This gives rise to the following accounting entry.

		CU m	CU m
Dr	Investment in JV Co:		
	▪ Share of net identifiable assets of JV Co ⁽¹⁾	72	
	▪ Goodwill ⁽²⁾	12	
Cr	Intangible assets contributed to JV Co ⁽³⁾		60
Cr	Gain on disposal ⁽⁴⁾		24

- (1) 40% of fair value of separable net identifiable assets (including A's intangible assets) of new entity CU88m (40% of [CU100m + CU120m] as in table above) less elimination of 40% of gain on disposal CU16m (40% of CU40m, being the difference between the book value [CU60m] and fair value [CU100m] of A's intangible assets, as in table above, contributed to JV Co) = CU72m.
- This is equivalent to, and perhaps more easily calculated as, 40% of [book value of A's intangible assets + fair value of B's separable net identifiable assets], i.e., $40\% \times [CU60m + CU120m] = CU72m$.
- Under the equity method, this CU72m together with the CU12m of goodwill (see (2) below) would be included as the equity accounted amount of JV Co.
- (2) Fair value of consideration given CU100m (as in table above) less fair value of 40% share of separable net identifiable assets of JV Co acquired CU88m (see (1) above) = CU12m.
- This is equivalent to, and perhaps more easily calculated as, 40% of the fair value of B's goodwill, i.e., $40\% \times CU30m = CU12m$.
- Under the equity method, as noted at (1) above, this CU12m together with the CU72m relating to the separable net identifiable assets would be included as the equity accounted amount of JV Co.
- (3) Previous carrying amount of intangible assets contributed by A, now deconsolidated.
- (4) Fair value of business acquired CU100m (40% of CU250m) less book value of intangible assets disposed of CU60m (as in table above) = CU40m, less 40% of gain eliminated (CU16m) = CU24m. The CU16m eliminated reduces A's share of JV Co's separable net identifiable assets by CU16m (see (1) above).

It is common when joint ventures are set up in this way for the fair value of the assets contributed not to be exactly in proportion to the fair values of the venturers' agreed relative shares. Cash 'equalisation' payments are then made between the venturers so that the overall financial position of the venturer does correspond to the agreed relative shares in the venture.

How we see it

We believe that an appropriate treatment of cash equalisation payments, in which a proportion of the gain on disposal is eliminated equal to the investor's ownership interest, in the context of a transaction within the scope of IAS 28, is shown in Illustration 7-10 below.

Although the example is based on a transaction resulting in the formation of a joint venture, the accounting treatment by party A would be the same if it had obtained an interest in an associate.

Illustration 7-10: Contribution of non-monetary assets to form a joint venture with cash equalisation payment between venturers/investors

Suppose that the transaction in Illustration 7-9 above was varied so that A has a 36% interest in JV Co. However, as shown by the introductory table in Illustration 7-9 above, A is contributing intangible assets worth 40% of the total fair value of JV Co. Accordingly, B makes good the shortfall by making a cash payment to A - equivalent to 4% of the fair value of JV Co, i.e., CU10m (4% of CU250m).

This would require A to make the following accounting entries.

	CU m	CU m
Dr Investment in JV Co:		
▪ Share of net identifiable assets of JV Co ⁽¹⁾	64.8	
▪ Goodwill ⁽²⁾	10.8	
Dr Cash (equalisation payment from B)	10.0	
Cr Intangible assets contributed to JV Co ⁽³⁾		60.0
Cr Gain on disposal ⁽⁴⁾		25.6

- (1) 36% of fair value of separable net identifiable assets of new entity CU79.2m (36% of [CU100m + CU120m] as in table in Illustration 7-9 above) less elimination of 36% of gain on disposal CU14.4m (36% of CU40m, being the difference between the book value [CU60m] and fair value [CU100m] of A's intangible assets, as in table in Illustration 7-9 above, contributed to JV Co) = CU64.8m.
- This is equivalent to, and perhaps more easily calculated as, 36% of [book value of A's intangible assets + fair value of B's separable net identifiable assets], i.e., $36\% \times [CU60m + CU120m] = CU64.8m$.
- Under the equity method, this CU64.8m together with the CU10.8m of goodwill (see (2) below) would be included as the equity accounted amount of JV Co.

- (2) Fair value of consideration given CU100m (as in table in Illustration 7-9 above), less cash equalisation payment received CU10m = CU90m less fair value of 36% share of separable net identifiable assets of JV Co acquired CU79.2m (see (1) above) = CU10.8m.
This is equivalent to, and perhaps more easily calculated as, 36% of the fair value of B's goodwill, i.e., 36% × CU30m = CU10.8m.
Under the equity method, as noted at (1) above, this CU10.8m together with the CU64.8m relating to the separable net identifiable assets would be included as the equity accounted amount of JV Co.
- (3) Previous carrying amount of intangible assets contributed by A, now deconsolidated.
- (4) Fair value of business acquired CU90m (36% of CU250m) plus cash equalisation payment CU10m = CU100m, less book value of intangible assets disposed of CU60m (as in table in Illustration 7-9 above) = CU40m, less 36% of gain eliminated (CU14.4m) = CU25.6m. The CU14.4m eliminated reduces A's share of JV Co's separable net identifiable assets by CU14.4m (see (1) above).

7.5.3 Conflict between IAS 28 and IFRS 10

In Illustration 7-9 above, we considered the accounting by Entity A when the non-monetary assets it has contributed are intangible assets that are not in a subsidiary. Entity B has contributed an interest in a subsidiary that is a business. The accounting for Entity B is subject to the conflict between IFRS 10 and IAS 28, as described at section 6.2.2 above and in more detail in Chapter 8. Consequently, Entity B has a policy choice between full and partial gain recognition described at section 6.2.2.B above.

In Illustration 7-11 below, we illustrate how Entity B, which has contributed a subsidiary that constitutes a business in return for its interest in the joint venture in the transaction set out in Illustration 7-9 above, would account for the transaction by applying the requirements of IFRS 10. I.e., Entity B has elected to apply IFRS 10 to the loss of control transaction even though it is a downstream transaction. Although, the example is based on a transaction resulting in the formation of a joint venture, the accounting treatment by Entity B would be the same if it had obtained an interest in an associate.

Illustration 7-11: Contribution of subsidiary to form a joint venture - applying IFRS 10

A and B are two major pharmaceutical companies, which agree to form a joint venture (JV Co). A will own 40% of the joint venture, and B 60%. The parties agree that the total value of the new business of JV Co is CU250m.

A's contribution to the venture is several intangible assets, with a carrying amount of CU60m. The fair value of the intangible assets contributed by A is CU100m, i.e., equivalent to 40% of the total fair value of JV Co of CU250m.

B contributes a subsidiary that is a business with separable net identifiable assets of CU85m and goodwill of CU15m. The fair value of the separable net identifiable assets is CU120m. The implicit fair value of the business contributed is CU150m (60% of total fair value of JV Co of CU250m).

The book and fair values of the assets/businesses contributed by A and B can therefore be summarised as follows:

	A		B	
(in CU m)	Book value	Fair value	Book value	Fair value
Intangible assets	60	100		
Separable net identifiable assets			85	120
Goodwill			15	30
Total	60	100	100	150

Applying IFRS 10 to the transaction results in B reflecting the following accounting entry.

		CU m	CU m
Dr	Investment in JV Co:		
	▪ Share of net identifiable assets of JV Co ⁽¹⁾	132	
	▪ Goodwill ⁽²⁾	18	
Cr	Separable net identifiable assets and goodwill contributed to JV Co ⁽³⁾		100
Cr	Gain on disposal ⁽⁴⁾		50

- (1) 60% of fair value of separable net identifiable assets of new entity CU132m (60% of [CU100m + CU120m] as in table above). There is no elimination of 60% of the gain on disposal.
Under the equity method, this CU132m together with the CU18m of goodwill (see (2) below) would be included as the equity accounted amount of JV Co.
- (2) Fair value of consideration given of CU60m (being 40% of CU150m as in table above) plus fair value of retained interest of CU90m (being 60% of CU150m) less fair value of 60% share of separable net identifiable assets of JV Co acquired CU132m (see (1) above).
Under the equity method, as noted at (1) above, this CU18m together with the CU132m relating to the separable net identifiable assets would be included as the equity accounted amount of JV Co.
- (3) Previous carrying amount of net identifiable assets contributed by B as in table above, now deconsolidated. There would be a number of entries to deconsolidate these on a line-by-line basis.
- (4) Fair value of consideration received of CU60m (being 60% of CU100m as in table above) plus fair value of retained interest of CU90m (being 60% of CU150m) less book value of assets disposed of CU100m (see (3) above) = CU50m.

7.5.4 Accounting for the acquisition of a business on formation of a joint venture

IFRS 3 does not apply to business combinations that arise on the formation of a joint venture. [IFRS 3.2(a)]. Therefore, it is not clear under IFRS accounting standards how the acquisition by a joint venture of the former business of a venturer is accounted for in the financial statements of the joint venture itself.

How we see it

We believe that under the GAAP hierarchy in IAS 8 the pooling of interests method is available when accounting for the businesses acquired on the formation of a joint venture. However, there are other acceptable approaches (including the acquisition method) that give a fair presentation in particular circumstances.

When a new company is formed to create a joint venture and both venturers contribute a business, we believe that it would also be acceptable under the GAAP hierarchy in IAS 8.11 (see Chapter 3) to apply the acquisition method to both businesses, as IFRS accounting standards do not prevent entities from doing this and it provides useful information to investors.

The entity makes disclosures that are sufficient for users of the financial statements to understand the transaction fully.

In Illustration 7-9 above, if JV Co were to apply the acquisition method, it could mean that the equity-accounted amounts included in the financial statements of B bear little relation to its share of the net assets of the joint venture as reported in the underlying financial statements of the investee. This would be the case if B accounted for the transaction by applying IAS 28 rather than IFRS 10 (see section 7.5.3 above). For example, B's share of any amortisation charge recorded by JV Co must be based on the carrying amount of B's share of JV Co's intangible assets, not as recorded in JV Co's books (i.e., at fair value) but as recorded in B's books, which will be based on book value for intangible assets contributed by B and at fair value for intangible assets contributed by A. Accordingly it would be necessary for B to keep a 'memorandum' set of books for equity accounting purposes reflecting its share of assets that were originally its own at book value and those originally of A at fair value.

In Illustration 7-9 above, JV Co must account for the intangibles contributed by A at fair value because the transaction represents a share-based payment transaction in terms of IFRS 2 *Share-based Payment*. Therefore, A will need to keep a 'memorandum' record relating to these intangibles, so that it can make the necessary adjustments in its equity accounting to reflect amortisation charges based on its original book values.

Alternatively, if JV Co were to apply the pooling of interests method and therefore reflect assets contributed from both A and B at their book values, A would need to keep a 'memorandum' set of books for equity accounting purposes because its share of assets that were originally those of B are carried at fair value rather than carry-over cost.

7.5.5 Contributions to an associate that is under common control

Frequently asked questions

Question 7-1: How does an entity account for a contribution of PP&E to a newly formed associate in exchange for shares in the associate when the entity and the fellow investors in the associate are entities under common control?

In January 2018, the IFRS IC was asked how an entity accounts for a transaction in which it contributes PP&E to a newly formed associate in exchange for shares in the associate. In the fact pattern described in the request, the entity and the fellow investors in the associate are entities under common control. The investors each contribute items of PP&E to the new entity in exchange for shares in that entity.

The IFRS IC firstly observed that unless a standard specifically excludes common control transactions from its scope, an entity applies the applicable requirements in the standard to common control transactions. In terms of IAS 28.28, the entity recognises gains and losses resulting from the downstream transactions only to the extent of unrelated investors' interests in the associate.

Finally, the IFRS IC observed that if there is initially any indication that the fair value of the PP&E contributed might differ from the fair value of the acquired equity interest, the entity first assesses the reasons for this difference and reviews the procedures and assumptions it has used to determine fair value. The entity recognises a gain or loss on contributing the PP&E and a carrying amount for the investment in the associate that reflects the determination of those amounts based on the fair value of the assets contributed, unless the transaction provides objective evidence that the entity's interest in the associate might be impaired. If this is the case, the entity also considers the impairment requirements in IAS 36. If, having reviewed the procedures and assumptions used to determine fair value, the fair value of the PP&E is more than the fair value of the acquired interest in the associate, this would provide objective evidence that the entity's interest in the associate might be impaired.

The IFRS IC concluded that the principles and requirements in IFRS accounting standards provide an adequate basis for an entity to account for the contribution of non-monetary assets to an associate in the fact pattern described in the request and did not add any items to its agenda.¹⁶

¹⁶ [IFRIC Update](#), January 2018, available on the IFRS Foundation's website.

8 Practical matters applying the equity method

8.1 Non-coterminous accounting periods

In applying the equity method, the investor uses the most recent financial statements of the associate or joint venture. When the reporting dates of the investor and the associate or joint venture are different, IAS 28 requires the associate or joint venture to prepare, for the use of the investor, financial statements as of the same date as those of the investor unless it is impracticable to do so. [IAS 28.33].

When the financial statements of an associate or joint venture used in applying the equity method are prepared as at a different reporting date from that of the investor, adjustments must be made for the effects of significant transactions or events (for example a sale of a significant asset or a major loss on a contract) that occurred between that date and the date of the investor's financial statements. In no circumstances can the difference between the reporting date of the associate or the joint venture and that of the investor be more than three months. [IAS 28.34, IAS 28.BCZ19]. It is not necessary for such a non-coterminous period to end before that of the investor.

How we see it

There are no exemptions from the requirement above despite the fact that it could be quite onerous in practice, for example, because:

- The associate or joint venture might need to produce interim financial statements so that the investor can comply with this requirement.
- Or
- The associate or joint venture could be a listed company in its own right whose financial information is considered price-sensitive, which means that the associate or joint venture might not be able to provide detailed financial information to one investor without providing equivalent information to all other investors at the same time.

The length of the reporting periods and any difference in the reporting dates must be the same from period to period. [IAS 28.34]. The requirement in IAS 28.34 implies that, when an associate or joint venture was previously equity accounted for based on non-coterminous financial statements and is now equity accounted for using coterminous financial statements, it is necessary to restate comparative information so that financial information in respect of the associate or joint venture is included in the investor's financial statements for an equivalent period in each period presented.

How we see it

We believe that other approaches not involving restatement of comparatives would be acceptable, particularly when the comparative information has already reflected the effects of significant transactions or events during the period between the date of the associate's or joint venture's financial statements and the date of the investor's financial statements. When comparatives are not restated, additional disclosures might be needed about the treatment adopted and the impact on the current period of including information for the associate or joint venture for a period different from that of the investor.

8.2 Consistent accounting policies

IAS 28 requires the investor's financial statements to be prepared using uniform accounting policies for like transactions and events in similar circumstances. [IAS 28.35]. If an associate or joint venture uses different accounting policies from those of the investor for like transactions and events in similar circumstances, adjustments must be made to conform the associate's or joint venture's accounting policies to those of the investor when the associate's or joint venture's financial statements are used by the investor in applying the equity method. [IAS 28.36].

In practice, using consistent accounting policies might be easier said than done, since the investor has only significant influence, and not control, over the associate, and therefore might not have access to the relevant underlying information in sufficient detail to make such adjustments with certainty. Restating the financial statements of an associate to IFRS accounting standards could require extensive detailed information that might not be required under the associate's local GAAP (for example, in respect of business combinations, share-based payments, financial instruments and revenue recognition). Although there could be some practical difficulties when the entity has joint control over a joint venture, we would expect this to arise less often, as joint control is likely to give the investor more access to the information required.

8.2.1 Exemption for associates or joint ventures that are investment entities

If an entity that is not itself an investment entity has an interest in an associate or joint venture that is an investment entity, the entity can, when applying the equity method, elect to retain the fair value measurement applied by that investment entity associate or joint venture to the investment entity associate's or joint venture's interests in subsidiaries. This election is made separately for each investment entity associate or joint venture, at the later of the date on which:

- (a) The investment entity associate or joint venture is initially recognised
- (b) The associate or joint venture becomes an investment entity
- (c) The investment entity associate or joint venture first becomes a parent [IAS 28.36A]

8.3 Loss-making associates or joint ventures

An investor in an associate or joint venture recognises its share of the losses of the associate or joint venture until its share of losses equals or exceeds its interest in the associate or joint venture, at which point the investor discontinues recognising its share of further losses. For this purpose, the investor's interest in an associate or joint venture is the carrying amount of the investment in the associate or joint venture under the equity method together with any long-term interests that, in substance, form part of the investor's net investment in the associate or joint venture. For example, an item for which settlement is neither planned nor likely to occur in the foreseeable future is, in substance, an extension of the entity's investment in that associate or joint venture. [IAS 28.38]. The items that form part of the net investment are discussed further in Chapter 16. The IASB argued that this requirement ensures that investors are not able to avoid recognising the loss of an associate or joint venture by restructuring their investment to provide the majority of funding through non-equity investments. [IAS 28.BCZ39, IAS 28.BCZ40].

Such items include:

- Preference shares
- Long-term receivables or loans (unless supported by adequate collateral)

But do not include:

- Trade receivables
- Trade payables
- Any long-term receivables for which adequate collateral exists, such as secured loans [IAS 28.38]

Once the investor's share of losses recognised under the equity method has reduced the investor's investment in ordinary shares to zero, its share of any further losses is applied to reduce the other components of the investor's interest in an associate or joint venture in the reverse order of their seniority (i.e., priority in liquidation). [IAS 28.38].

Once the investor's interest is reduced to zero, additional losses are provided for, and a liability is recognised, only to the extent that the investor has incurred legal or constructive obligations or made payments on behalf of the associate or joint venture. If the associate or joint venture subsequently reports profits, the investor resumes recognising its share of those profits only after its share of the profits equals the share of losses not recognised. [IAS 28.39].

How we see it

Whilst IAS 28.39 does not say so explicitly, we believe that, when profits begin to be recognised again, they are applied to write back the various components of the investor's interest in the associate or joint venture in the reverse order to that in which they were written down (i.e., in order of their priority in a liquidation).

IAS 28 is not explicit about the allocation of losses recognised in the income statement and losses incurred in OCI. Therefore, management will need to develop an appropriate policy. The policy chosen is disclosed and consistently applied.

In addition to the recognition of losses arising from application of the equity method, an investor in an associate or joint venture must consider the additional requirements of IAS 28 in respect of impairment losses (see section 10 below).

Illustration 8-1: Accounting for a loss-making associate

At the beginning of the year Entity H invests CU5m to acquire a 30% equity interest in Associate A. In addition, H lends CU9m to A, but does not provide any guarantees or commit itself to provide further funding. How does H account for the CU20m loss that A made during the year?

H's share in A's loss is $\text{CU}20\text{m} \times 30\% = \text{CU}6\text{m}$. If H's loan to A is considered part of the net investment in A then the carrying amount of the associate is reduced by CU6m, from CU14m (= CU5m + CU9m) to CU8m. That is, the equity interest is reduced to nil and the loan is reduced to CU8m.

Conversely, if the loan is not part of the net investment in A, then H accounts for the loss as follows:

- The equity interest in the associate is reduced from CU5m to zero.
- A loss of CU1m remains unrecognised because H did not provide any guarantees and has no commitments to provide further funding.
- If, in the second year, A were to make a profit of CU10m then H would recognise a profit of only CU2m (= $\text{CU}10\text{m} \times 30\% - \text{CU}1\text{m}$).
- Alternatively, if, in the second year, H were to provide a CU1.5m guarantee to A and A's net profit were nil, then H would need to recognise an immediate loss of CU1m (i.e., the lower of the unrecognised loss of CU1m and the guarantee of CU1.5m) because it now has a legal obligation to pay A's debts.
- As there are several indicators of impairment, the loan from H to A is tested for impairment in accordance with IFRS 9.

8.4 Distributions received in excess of the carrying amount

When an associate or joint venture makes dividend distributions to the investor in excess of the investor's carrying amount, it is not clear how the excess is accounted for.

How we see it

In our view, a liability under IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* is recognised only if the investor is obliged to refund the dividend, has incurred a legal or constructive obligation to or has made payments on behalf of the associate. In the absence of such obligations, it is appropriate that the investor recognises the excess in net profit for the period. When the associate or joint venture subsequently makes profits, the investor starts recognising profits only when they exceed the excess cash distributions recognised in net profit plus any previously unrecognised losses (see section 8.3 above).

8.5 Equity transactions in an associate's or joint venture's financial statements

The financial statements of an associate or joint venture that are used for the purposes of equity accounting by the investor might include items within its statement of changes in equity that are not reflected in the profit or loss or other components of comprehensive income, for example, dividends or other forms of distributions, issues of equity instruments and equity-settled share-based payment transactions. When the associate or joint venture has subsidiaries and consolidated financial statements are prepared, those financial statements might include the effects of changes in the parent's (i.e., the associate's or joint venture's) ownership interest and NCI in a subsidiary that did not arise from a transaction that resulted in loss of control of that subsidiary.

Although the description of the equity method in IAS 28 requires that the investor's share of the profit or loss of the associate or joint venture is recognised in the investor's profit or loss, and the investor's share of changes in items of OCI of the associate or joint venture is recognised in OCI of the investor, [IAS 28.10], no explicit reference is made to other items that the associate or joint venture might have in its statement of changes in equity. The following sections provide guidance in determining an appropriate accounting treatment for certain common transactions.

8.5.1 Dividends or other forms of distributions

Although IAS 28.10 does not explicitly refer to dividends or other forms of distribution that are reflected in the associate's statement of changes in equity, it does state that distributions received from an investee reduce the carrying amount of the investment. Generally, the distributions received will be the equivalent of the investor's share of the distributions made to the owners of the associate reflected in the associate's statement of changes in equity. Thus, they are effectively eliminated as part of applying the equity method. However, this might not always be the case. For example, when an associate declares scrip dividends which are not taken up by the investor, the investor's proportionate interest in the associate is reduced. In this situation, the investor accounts for this as a deemed disposal (see section 9.6 below).

8.5.2 Issues of equity instruments

When an associate or joint venture has issued equity instruments, the effect on its net assets will be reflected in the associate's or joint venture's statement of changes in equity. When the investor has participated in the issue of these equity instruments, it will account for its cost of doing so by increasing the carrying amount of its associate or joint venture. If participation in such a transaction leads to the investor increasing its percentage ownership interest in an existing associate or joint venture without obtaining control, the investor accounts for this as an increase in an associate or joint venture without a change in status (see section 6.2.4 above).

If the investor has not participated in the issue of equity instruments reflected in the associate's or joint venture's statement of changes in equity, for example, shares have been issued to third parties or the investor has not taken up its full allocation of a rights issue by the associate or joint venture, the investor's proportionate interest in the associate or joint venture is reduced.

How we see it

In situations in which the investor has not participated in the issue of equity instruments reflected in the associate's or joint venture's statement of changes in equity, we believe that it accounts for the transaction as a deemed disposal (see section 9.6 below).

8.5.3 Equity-settled share-based payment transactions

Another item arising in an associate's or joint venture's statement of changes in equity is the credit entry relating to any equity-settled share-based payment transactions of the associate or joint venture; the debit entry of such transactions is recognised by the associate or joint venture as an expense within its profit or loss.

As the share-based payment expense is included within the profit or loss of the associate or joint venture, this will be reflected in the share of the associate's or joint venture's profit or loss recognised in the investor's profit or loss. [IAS 28.10]. The credit to equity that is recognised in the associate's or joint venture's statement of changes in equity is not part of comprehensive income and therefore does not automatically get reflected in the investor's financial statements. Therefore, there are two possible approaches for the credit entry:

- Do not reflect the credit entry that arises in the associate's or joint venture's statement of changes in equity
- Or
- Reflect the investor's share of the credit entry as a 'share of other changes in equity of associates or joint ventures' in the investor's statement of changes in equity

The description of the equity method in IAS 28 states that "the carrying amount [of the investment in an associate or a joint venture] is increased or decreased to recognise the investor's share of the profit or loss of the investee after the date of acquisition. ... Adjustments to the carrying amount may also be necessary for changes in the investor's proportionate interest in the investee arising from changes in the investee's other comprehensive income." [IAS 28.10].

How we see it

The credit to shareholders' equity recognised by the associate or joint venture in accordance with IFRS 2 is not part of comprehensive income. IAS 28.10 implies that the investor recognises only its share of the elements of profit or loss and of OCI; therefore, we believe that the investor does not recognise its proportion of the credit to shareholders' equity recognised by the associate or joint venture. That is, we believe the credit entry is ignored, rather than recognised in the investor's equity accounting.

Ignoring the credit entry results in the carrying amount of the equity investment no longer corresponding to the proportionate share of the net assets of the investee (as reported by the investee). However, this approach is consistent with the requirement in IAS 28 for dealing with undeclared dividends on cumulative preference shares held by parties other than the investor (see section 6.3.2 above). [IAS 28.37]. In that situation, the undeclared dividends have not yet been recognised by the investee at all, but the investor still reduces its share of the profit or loss (and therefore its share of net assets).

If the options are exercised, the investor will account for its reduction in its proportionate interest as a deemed disposal (see section 8.5.2 above and section 9.6 below). [IAS 28.10].

The approach of ignoring the credit entry is shown in Illustration 8-2 below. Although the example is based on an equity-settled share-based payment transaction of an associate, the accounting treatment would be the same if it were a joint venture.

Illustration 8-2: Equity-settled share-based payment transactions of associate

Entity A holds a 30% interest in Entity B and accounts for its interest in B as an associate using the equity method. Assume for simplicity that there are no fair value adjustments required related to the assets of B in A's consolidated financial statements and its equity-accounted amount represents an original cost of CU1,500 (30% of B's issued equity of CU5,000) together with A's 30% share of B's retained profits of CU5,000. Also assume that A has CU21,000 in other assets and assume for simplicity that A has no other profit or loss except for its equity method earnings and losses.

B issues share options to its employees which are accounted for by B as an equity-settled share-based payment transaction. The options entitle the employees to subscribe for shares of B, representing an additional 20% interest in the shares of B. If the options are exercised, the employees will pay CU2,400 for the shares. The grant date fair value of the options issued is CU900 and, for the purposes of the example, it is assumed that the options are immediately vested. Accordingly, B has recognised a share-based payment expense of CU900 in profit or loss and a credit to equity of the same amount.

The impact of accounting for this equity-settled share-based payment transaction on B's financial statements and on A's consolidated financial statements is summarised below.

Immediately before the granting of the options

B's financial statements			
	CU		CU
Net assets	10,000	Issued equity	5,000
		Retained earnings	5,000
Total	10,000	Total	10,000

A's consolidated financial statements			
	CU		CU
Investment in B	3,000	Issued equity	10,000
Other net assets	21,000	Retained earnings	14,000
Total	24,000	Total	24,000

Immediately after the granting of the options*

B's financial statements			
	CU		CU
Net assets	10,000	Issued equity	5,000
		Retained earnings	5,000
		Loss for period	(900)
		Share-based payment reserve	900
Total	10,000	Total	10,000

A's consolidated financial statements

	CU		CU
Investment in B	2,730	Issued equity	10,000
Other net assets	21,000	Retained earnings	14,000
		Loss for period	(270)
Total	<u>23,730</u>	Total	<u>23,730</u>

* For the purposes of Illustration, B's expense and the corresponding credit to equity have been shown separately within equity as 'loss for period' and 'share-based payment reserve' respectively. A's 30% share of the expense has similarly been shown separately within equity.

Immediately after exercise of the options[†]**B's financial statements**

	CU		CU
Net assets	10,000	Issued equity	5,000
		Additional equity on exercise of options	2,400
Cash on exercise of options	2,400	Retained earnings	5,000
		Loss for period	(900)
		Share-based payment reserve	900
Total	<u>12,400</u>	Total	<u>12,400</u>

A's consolidated financial statements

	CU		CU
Investment in B	3,100	Issued equity	10,000
Other net assets	21,000	Retained earnings	14,000
		Loss for period	(270)
		Gain on deemed disposal	370
Total	<u>24,100</u>	Total	<u>24,100</u>

† As a result of the employees exercising the options for CU2,400, assume that A's proportionate interest in B has reduced from 30% to 25%. A is considered still to have significant influence over B, which remains an associate of A. This deemed disposal results in A recognising a gain on deemed disposal in its profit or loss for the period. This gain is computed by comparing A's proportionate share of net assets of B before and after the exercise of the options as follows:

	CU	
Net assets attributable to A's 30% interest	2,730	(30% of CU9,100)
Net assets attributable to A's 25% interest	<u>3,100</u>	(25% of CU12,400)
Gain on deemed disposal	370	

In Illustration 8-2 above, there were no basis differences (for example, fair value adjustments arising on initial acquisition of the interest in the associate). If there had been, the calculation of the gain on deemed disposal would be calculated based on the equity method amounts including the basis differences, rather than as the share of the associate's net assets as stated in the associate financial statements, as shown in the Illustration above.

How we see it

When an investor's interest in an associate is diluted through the exercise of share options or similar instruments, we believe the investor proportionately reduces its equity method basis differences for the effect of dilution. Additionally, because of the transaction, the investor adjusts its basis differences in the underlying net assets of the investee, if necessary. Adjustments to the investor's basis differences resulting from dilution will reduce the amount of future amortisation or impairment of the investor's basis differences.

As indicated in Illustration 8-2 above, when the options are exercised, the investor accounts for the reduction in its proportionate interest in the associate or joint venture as a deemed disposal (see section 9.6 below).

8.5.4 Effects of changes in parent/non-controlling interests in subsidiaries

The consolidated financial statements of an associate or a joint venture might include NCI related to its subsidiaries that are not wholly owned. Under IFRS 10, any NCI are presented in the consolidated statement of financial position within equity, separately from the equity of the owners of the parent. Profit or loss and each component of OCI are attributed to the owners of the parent and to the NCI. [IFRS 10.22, IFRS 10.B94]. The profit or loss and OCI reported in the associate's or joint venture's consolidated financial statements include 100% of the amounts relating to the subsidiaries, but the overall profit or loss and total comprehensive income is split between the amounts attributable to the owners of the parent (i.e., the associate or joint venture) and those attributable to the NCI. The net assets in the consolidated statement of financial position also include 100% of the amounts relating to the subsidiaries, with any NCI in the net assets presented in the consolidated statement of financial position within equity, separately from the equity of the owners of the parent. NCI is discussed in more detail in Chapter 8.

The issue of whether the investor's share of the associate's or joint venture's profits, OCI and net assets under the equity method is based on the amounts before or after any NCI in the associate's or joint venture's consolidated accounts is discussed in section 6.3.5 above. As the investor's interest in the associate or joint venture is as an owner of the parent, it is appropriate that the share recognised by an investor is based on the profit or loss, comprehensive income and equity (net assets) that are reported as being attributable to the owners of the parent in the associate's or joint venture's consolidated financial statements, i.e., after any amounts attributable to the NCI.

Under IFRS 10, changes in a parent's ownership interest in a subsidiary that do not result in a loss of control are accounted for as equity transactions. [IFRS 10.23]. In such circumstances, the carrying amounts of the controlling and non-controlling interests are adjusted to reflect the changes in their relative interests in the subsidiary. Any difference between the amount by which the NCI are adjusted and the fair value of the consideration paid or received is recognised directly in equity and attributed to the owners of the parent. [IFRS 10.B96].

How is such an amount attributed to the owners of the parent that is recognised in the associate's or joint venture's statement of changes in equity be reflected by the investor in equity accounting for the associate or joint venture?

How we see it

In our view, the investor may account for its share of the change of interest in the net assets/equity of the associate or joint venture because of the associate's or joint venture's equity transaction by applying either of the approaches set out below:

- (a) Reflect it as part of the share of other changes in equity of associates or joint ventures in the investor's statement of changes in equity
- Or
- (b) Reflect it as a gain or loss within the share of associate's or joint venture's profit or loss included in the investor's profit or loss

Once selected, the investor applies the selected policy consistently.

Approach (a) reflects the view that although IAS 28.10 refers to the investor accounting for its share of the investee's profit or loss and other items of comprehensive income only, this approach is consistent with the equity method as described in IAS 28.10 because it:

- Reflects the post-acquisition change in the net assets of the investee [IAS 28.3]
- Faithfully reflects the investor's share of the associate's transaction as presented in the associate's consolidated financial statements [IAS 28.27]

Under this view, since the transaction does not change the investor's ownership interest in the associate, it is not a deemed disposal (see section 9.6 below) and, therefore, no gain or loss is recognised.

By contrast, Approach (b) reflects the view that:

- The investor reflects the post-acquisition change in the net assets of the investee. [IAS 28.3].
- From the investor's perspective, the transaction is not a transaction "with owners in their capacity as owners", [IFRS 10.23], because the investor does not equity account for the NCI (see section 6.3.5 above). Therefore, whilst the investee must reflect the transaction as an equity transaction, from the investor's point of view the increase in the investment is a gain. This is consistent with the treatment of unrealised profits between a reporting entity and an associate (see section 7.1 above). The NCI's ownership is treated as an 'external' ownership interest to the investor's group. Consequently, any transaction which is, from the investor's perspective, a transaction with an 'external' ownership interest can give rise to a gain or loss.
- The increase in the investee's equity is also not an item of OCI as referred to in IAS 28.10.
- Any increase in the amount of an asset is recognised in profit or loss if not otherwise stated in IFRS accounting standards. IAS 1.88 states that an "entity shall recognise all items of income and expense in a period in profit or loss unless an IFRS requires or permits otherwise."

These approaches are shown in Illustration 8-3 below. Although the example is based on a transaction by an associate, the accounting would be the same if it were a joint venture.

Illustration 8-3: Accounting for the effect of transactions with non-controlling interests recognised through equity by an associate

Entity A holds a 20% interest in Entity B (an associate) that in turn has a 100% ownership interest in Subsidiary C. The net assets of C included in B's consolidated financial statements are CU1,000. For the purposes of the example all other assets and liabilities in B's financial statements and in A's consolidated financial statements are ignored.

B sells 20% of its interest in C to a third party for CU300. B accounts for this transaction as an equity transaction in accordance with IFRS 10, giving rise to a credit in equity of CU100 that is attributable to the owners of B. The credit is the difference between the proceeds of CU300 and the share of net assets of C that are now attributable to the NCI of CU200 (20% of CU1,000).

The financial statements of A and B before the transaction are summarised below:

Before

A's consolidated financial statements			
	CU		CU
Investment in B	200	Equity	200
Total	200	Total	200

B's consolidated financial statements			
	CU		CU
Assets (from C)	1,000	Equity	1,000
Total	1,000	Total	1,000

The financial statements of B after the transaction are summarised below:

After

B's consolidated financial statements			
	CU		CU
Assets (from C)	1,000	Equity	1,000
Cash	300	Equity transaction with NCI	100
		Equity attributable to owners	1,100
		NCI	200
Total	1,300	Total	1,300

As a result of the sale of B's 20% interest in C, B's net assets attributable to the owners of B have increased from CU1,000 to CU1,100. Although A has not participated in the transaction, its share of net assets in B has increased from CU200 to CU220.

A accounts for the increase in net assets arising from this equity transaction using either of the following approaches:

Approach (a) - 'share of other changes in equity' in investor's statement of changes in equity

The change of interest in the net assets/equity of B resulting from B's equity transaction is reflected in A's financial statements as 'share of other changes in equity of associates' in its statement of changes in equity.

Therefore, A reflects its CU20 share of the change in equity and maintains the same classification as the associate i.e., a direct credit to equity.

Approach (b) - gain or loss within share of associate's profit or loss included in investor's profit or loss

The change of interest in the net assets/equity of B resulting from B's equity transaction is reflected in A's financial statements as a 'gain' in profit or loss.

Therefore, A reflects its CU20 share of the change in equity in profit or loss.

9 Discontinuing the use of the equity method

An investor discontinues the use of the equity method on the date that its investment ceases to be either an associate or a joint venture. The subsequent accounting depends upon the nature of the retained investment. If the investment becomes a subsidiary, it will be accounted for in accordance with IFRS 10 and IFRS 3 as discussed in section 9.1 below. If the retained investment is a financial asset, it will be accounted for in accordance with IFRS 9 as discussed in section 9.3 below. [IAS 28.22]. If an investment in an associate becomes an investment in a joint venture, or an investment in a joint venture becomes an investment in an associate, the entity continues to apply the equity method, as discussed in section 9.4 below. [IAS 28.24].

When an investment in an associate or a joint venture (or a portion thereof) meets the criteria to be classified as held for sale, the entity applies IFRS 5 as discussed in section 4 above. [IAS 28.20].

9.1 Investment in associate or joint venture that is a business becoming a subsidiary

If an increased investment in an associate or joint venture that is a business, or a change in circumstances, leads to an investor obtaining control over the investee, the investment becomes a subsidiary. The entity discontinues the use of the equity method and accounts for its investment in accordance with IFRS 3 and IFRS 10. [IAS 28.22]. In this situation, IFRS 3 requires revaluation of the previously held interest in the equity accounted investment at its acquisition-date fair value, with recognition of any gain or loss in profit or loss. [IFRS 3.41, IFRS 3.42]. The accounting for an increase in an associate or joint venture that becomes a subsidiary is discussed further in Chapter 10.

In addition, the entity accounts for all amounts previously recognised in OCI in relation to that investment on the same basis as would have been required if the investee had directly disposed of the related assets or liabilities. [IAS 28.22].

Therefore, if a gain or loss previously recognised in OCI by the investee would be reclassified to profit or loss on the disposal of the related assets or liabilities, the entity reclassifies the gain or loss from equity to profit or loss (as a reclassification adjustment) when the equity method is discontinued. For example, if an associate or a joint venture has cumulative exchange differences relating to a foreign operation and the entity discontinues the use of the equity method, the entity shall reclassify to profit or loss the gain or loss that had previously been recognised in OCI in relation to the foreign operation. [IAS 28.23].

9.2 Investment in associate or joint venture that is not a business becoming a subsidiary

Current accounting standards do not address the accounting treatment for an acquisition in stages from associate or joint venture to subsidiary that is considered an asset acquisition rather than a business combination. This raises questions as to how to measure the previously held interest and the NCI on acquisition. There is more than one acceptable approach for the measurement of both the previously held interest and the NCI on acquisition. These are discussed in detail in Chapter 8.

How we see it

In our view, as described in section 9.1 above, the investor accounts for all amounts previously recognised in OCI related to the investment on the same basis as would have been required if the investee had directly disposed of the related asset or liabilities. That is, certain amounts previously recognised in OCI (such as cumulative translation differences relating to a foreign operation) must be recycled to profit or loss upon disposal of the investment.

9.3 Retained investment in the former associate or joint venture is a financial asset

If an investor disposes of a portion of its investment or there is a change in circumstances, such that it no longer has significant influence or joint control over the investee, it will discontinue the use of the equity method. If the retained interest is a financial asset, the entity measures the retained interest at fair value. The fair value of the retained interest is regarded as its fair value on initial recognition as a financial asset in accordance with IFRS 9.

In such situations, the entity recognises in profit or loss any difference between:

- The fair value of any retained interest and any proceeds from disposing of a part interest in the associate or joint venture
- And
- The carrying amount of the investment at the date the equity method was discontinued

Furthermore, the entity accounts for all amounts previously recognised in OCI in relation to that investment on the same basis as would have been required if the investee had directly disposed of the related assets or liabilities. [IAS 28.22].

Therefore, if a gain or loss previously recognised in OCI by the investee would be reclassified to profit or loss on the disposal of the related assets or liabilities, the entity reclassifies the gain or loss from equity to profit or loss (as a reclassification adjustment) when the equity method is discontinued. For example, if an associate or a joint venture has cumulative exchange differences relating to a foreign operation and the entity discontinues the use of the equity method, the entity reclassifies to profit or loss the gain or loss that had previously been recognised in OCI in relation to the foreign operation. [IAS 28.23].

After the partial disposal of an interest in a joint venture (or an associate) that includes a foreign operation, if the retained interest is a financial asset that itself includes a foreign operation, IAS 21 *The Effects of Changes in Foreign Exchange Rates* requires it to be accounted for as a disposal. [IAS 21.48A]. As a result, the reclassification adjustment from equity to profit or loss is for the full amount that is in OCI and not just a proportionate amount based upon the interest disposed of. The Basis for Conclusions to IAS 21 explains that the loss of significant influence or joint control is a significant economic event that warrants accounting for the transaction as a disposal under IAS 21, [IAS 21.BC33, IAS 21.BC34], and hence the transfer of the full exchange difference rather than just the proportionate share that would be required if this was accounted for as a partial disposal under IAS 21.

The accounting described above applies not only when an investor disposes of an interest in an associate or joint venture, but also when it ceases to have significant influence due to a change in circumstances. For example, when an associate issues shares to third parties, changes to the board of directors might result in the investor no longer having significant influence over the associate. In this scenario, the investor discontinues the use of the equity method.

9.4 Investment in associate becomes a joint venture (or vice versa)

Extract from IAS 28

24 If an investment in an associate becomes an investment in a joint venture or an investment in a joint venture becomes an investment in an associate, the entity continues to apply the equity method and does not remeasure the retained interest.

When the change in status of the investment results from the acquisition of an additional interest in the investee, the increase in the investment is accounted for as discussed in section 6.2.5 above. When the change in status results from the disposal of an interest in the investee, this is accounted for as explained in section 9.5 below. [IAS 28.24].

As discussed in sections 4 and 9 above, if a portion of an interest in an associate or joint venture fulfils the criteria for classification as held for sale, it is only that portion that is accounted for under IFRS 5. An entity maintains the use of the equity method for the retained interest until the portion classified as held for sale is finally sold.

9.5 Partial disposals of interests in associate or joint venture when the equity method continues to be applied

IAS 28 does not explicitly state that an entity recognises a gain or loss when it disposes of a part of its interest in an associate or a joint venture, but the entity continues to apply the equity method. However, as explained below, it is evident that a gain or loss is recognised on the partial disposal.

The standard requires that when an entity's ownership interest in an associate or a joint venture is reduced, but the entity continues to apply the equity method, the entity reclassifies to profit or loss the proportion of the gain or loss that had previously been recognised in OCI relating to that reduction in ownership interest if that gain or loss would be required to be reclassified to profit or loss on the disposal of the related assets or liabilities. [IAS 28.25].

In addition, IAS 21 requires for such partial disposals that the investor reclassifies “to profit or loss only the proportionate share of the cumulative amount of the exchange differences recognised in other comprehensive income”. [IAS 21.48C].

That means that the investor recognises in profit or loss an amount proportionate to the interest disposed, of:

- Foreign exchange differences recognised in OCI under IAS 21
- Accumulated hedging gains and losses recognised in OCI under IFRS 9 (see Chapter 49) (or IAS 39)
- Any other amounts previously recognised in OCI that would have been recognised in profit or loss if the associate had directly disposed of the assets to which they relate

IAS 21 requires that the proportion of the foreign exchange differences are reclassified “when the gain or loss on disposal is recognised”. [IAS 21.48]. In addition, the IFRS IC in the context of deemed disposals (see section 9.6 below), noted that reclassification of amounts to profit or loss from OCI is generally required as part of determining the gain or loss on a disposal. Amounts previously recognised in OCI that are not recycled to profit or loss on disposal (or partial disposal), such as a revaluation reserve on property, plant and equipment that are remeasured to fair value are transferred to retained earnings to reflect the proportion no longer held.

IFRS 10 requires that the partial disposal of a subsidiary when control is retained is accounted for as an equity transaction (see Chapter 8). In contrast, the partial disposal of an equity method investment is not an equity transaction because, an investor accounts only for its own interest.

Illustration 9-1: Partial disposal of an associate when equity method continues to be applied

An investor purchases a 45% investment in the ordinary shares of an investee on 1 January 20X2 and accounts for the investment as an associate. On 30 June 20X2, the investor sells a 15% interest in the investee to a third party for CU250,000, reducing its interest to 30%. The investor retains the ability to exercise significant influence over the investee after the decrease in its interest (the presumption that significant influence exists is not overcome). Therefore, the investor continues to apply the equity method.

At the date of sale, the carrying amount of the associate was CU600,000. In addition, there was a CU120,000 credit included in the cash flow hedge reserve (accumulated other comprehensive income within equity), representing the investor's share of the associate's cash flow hedging activity, and CU240,000 credit in the revaluation reserve (accumulated other comprehensive income within equity), representing the investor's share of the associate's revaluation on property that is measured at fair value.

To proportionately reduce its investment in the associate from a 45% interest to a 30% interest and reclassify a proportionate amount to profit or loss from those amounts recorded in OCI in accordance with IAS 28.25, the investor records the following:

Dr	Cash	CU250,000	
Dr	Cash flow hedge reserve/OCI ⁽¹⁾	CU40,000	
Dr	Revaluation reserve on property ⁽²⁾	CU80,000	
	Cr Associate ⁽³⁾		CU200,000
	Cr Gain on sale (profit or loss) ⁽⁴⁾		CU90,000
	Cr Retained earnings ⁽⁵⁾		CU80,000

(1) 15/45 of 120,000

(2) 15/45 of 240,000

(3) 15/45 of 600,000

(4) CU250,000 minus CU200,000 plus CU40,000 recycled from the cash flow hedge reserve.

(5) In accordance with IAS 16.41, amounts recorded in the revaluation reserve are not recycled to profit or loss on disposal (or partial disposal) of the related PP&E. IAS 16 allows a transfer to retained earnings to reflect the proportion no longer held.

The investor continues to account for its retained 30% interest, which would have a carrying amount of CU400,000, using the equity method. Prospectively from 30 June 20X2, the investor recognises its share of earnings and losses of the associate to reflect that it owns only 30%. In determining its equity method earnings or losses, the investor includes adjustments (e.g., depreciation, amortisation) related to the proportionately reduced purchase price allocation adjustments (basis differences).

9.6 Deemed disposals

An investor's interest in an associate or a joint venture might be reduced other than by an actual disposal. Such a reduction in interest, which is commonly referred to as a deemed disposal, gives rise to a 'dilution' gain or loss. Deemed disposals arise for several reasons, including:

- The investor does not take up its full allocation in a rights issue by the associate or joint venture.
- The associate or joint venture declares scrip dividends which are not taken up by the investor so that its proportional interest is reduced.
- Another party exercises its options or warrants issued by the associate or joint venture.
- The associate or joint venture issues shares to third parties.

In some situations, the dilution might cause the investor to lose the ability to exercise significant influence over the investee. In that case, the investor will account for the transaction as a disposal, with a retained interest in a financial asset measured at fair value in accordance with IFRS 9. This is described in section 9.3 above. However, in other situations, the deemed disposal will give rise to only a partial disposal, such that the investor will continue to equity account for the investee.

As discussed in more detail in section 9.5 above, although IAS 28 does not explicitly state that an entity recognises a gain or loss on partial disposal of its interest in an associate or a joint venture when the entity continues to apply the equity method, it is evident that a gain or loss is recognised on partial disposals.

How we see it

In the absence of further guidance, we believe that gains or losses on deemed disposals of an associate or joint venture are recognised in profit or loss, and this will include amounts reclassified from OCI.

It also is not clear whether any of the notional goodwill component of the carrying amount of the associate or joint venture is considered in the calculation of the gain or loss on the deemed disposal. This is because IAS 28 defines the equity method as "a method of accounting whereby the investment is initially recognised at cost and adjusted thereafter for the post acquisition change in the investor's share of the investee's net assets. ..." [IAS 28.3]. This definition suggests that in calculating the loss on dilution, the investor takes account of only the change in its share of the associate's or joint venture's net assets and does not account for a change in the notional goodwill component.

However, IAS 28.42 specifically states that goodwill included in the carrying amount of an investment in an associate or a joint venture is not separately recognised. [IAS 28.42]. Although the IASB did not explicitly consider accounting for deemed disposals of associates or joint ventures, IAS 28.26 refers to the concepts underlying the procedures used in accounting for the acquisition of a subsidiary in accounting for acquisitions of an investment in an associate or joint venture. Therefore, it is appropriate to consider the notional goodwill component when accounting for deemed disposals of associates or joint ventures in the same way as for deemed disposals of subsidiaries.

How we see it

We believe that it is appropriate to consider the entire carrying amount of the associate or joint venture, i.e., including the notional goodwill, when determining the gain or loss on deemed disposal.

This accounting is shown in Illustration 9-2 below. Although the example is based on a deemed disposal of an associate, the accounting would be the same if it were a joint venture.

Illustration 9-2: Deemed disposal of an associate

At the start of the reporting period, Investor A acquired a 30% interest in Entity B at a cost of CU500,000. A has significant influence over B and accounts for its investment in B under the equity method. B has net identifiable assets of CU1m at the date of acquisition, which have a fair value of CU1.2m. During the year, B recognised a post-tax profit of CU200,000 and paid a dividend of CU18,000. B also recognised foreign exchange losses of CU40,000 in OCI.

B's net assets at the end of the reporting period can be determined as follows:

	CU
Net identifiable assets - opening balance	1,000,000
Profit for year	200,000
Dividends paid	(18,000)
Foreign exchange losses	(40,000)
B's net assets - closing balance	<u>1,142,000</u>

A's interest in B at the end of the reporting period is calculated as follows:

	CU
On acquisition (including goodwill of CU140,000 = CU500,000 - (30% × CU1.2m)):	500,000
Share of profit after tax (30% × CU200,000)	60,000
Elimination of dividend (30% of CU18,000)	(5,400)
A's share of exchange differences (30% × CU40,000)	(12,000)
A's interest in B at the end of the reporting period under the equity method	<u>542,600</u>

Which can also be determined as follows:

	CU
A's share of B's net identifiable assets (30% × CU1.142m)	342,600
Goodwill	140,000
A's share of fair value uplift (30% × CU200,000)*	60,000
A's interest in B at the end of the reporting period	<u>542,600</u>

* This assumes for simplicity that none of the difference in the fair value of the identifiable net assets over their carrying amount upon initial investment related to depreciable assets, such that the CU200,000 did not diminish after the acquisition.

At the start of the next reporting period, B has a rights issue that A does not participate in. The rights issue brings in an additional CU400,000 in cash and dilutes A's interest in B to 25%.

Consequently, B's net assets at this date are:

	CU
B's net assets before the rights issue	1,142,000
Additional cash	400,000
B's net assets after the rights issue	<u>1,542,000</u>

The loss on the deemed disposal, considering the entire carrying amount of the associate, including the notional goodwill is calculated as follows:

	CU	CU
Carrying amount of the investment before the deemed disposal		542,600
Cost of deemed disposal (CU542,600 × (30% - 25%) ÷ 30%)	(90,433)	
Share of the contribution (CU400,000 × 25%)	<u>100,000</u>	
Increase in carrying amount of associate	9,567	9,567
Reclassification of share in currency translation: (CU40,000 × 30% × (25% - 30%) ÷ 30%)	<u>(2,000)</u>	
Gain on deemed disposal	7,567	
Carrying amount of the investment after the deemed disposal		<u>552,167</u>

10 Impairment losses

10.1 General

Determining whether an investment in an associate or joint venture is impaired involves carrying out several separate impairment assessments, as applicable:

- Assets of the associate or joint venture

It is generally not appropriate for the investor simply to multiply the amount of the impairment recognised in the investee's own books by the investor's percentage of ownership when recognising its share of the investee's profit or loss. This is because the investor measures its interest in an associate's or joint venture's identifiable net assets at fair value at the date of acquisition of an associate or a joint venture as discussed in section 6.2 above. Therefore, if the value that the investor attributes to the associate's or joint venture's net assets differs from the carrying amount of those net assets in the associate's or joint venture's own books, the investor adjusts its share of any impairment losses recognised by the associate or joint venture for such basis differences. This is shown in Illustration 10-1 below.

Any goodwill recognised on the statement of financial position of an associate or joint venture needs to be separated into two elements:

- Goodwill that existed at the date the investor acquired its interest in the associate or joint venture
And
- Goodwill that arises on subsequent acquisitions by the associate or joint venture

Goodwill that existed at the date the investor acquired its interest is not an identifiable asset of the associate or joint venture from the perspective of the investor. It is combined with the investor's goodwill on the acquisition of its interest in the associate or joint venture.

Goodwill that arises on subsequent acquisitions by the associate or joint venture is accounted for in the books of the associate or joint venture, including being tested for impairment in accordance with IAS 36. The investor does not make any adjustments to the associate's or joint venture's accounting for that goodwill.

- Investment in the associate or joint venture

After application of the equity method, including recognising the associate's or joint venture's losses (see section 8.3 above) inclusive of any impairments recognised by the associate or joint venture (adjusted for basis differences for those assets), the entity applies the requirements discussed in section 10.2 below to determine whether there is any objective evidence that its net investment in the associate or joint venture is impaired. [IAS 28.40].

- Other interests that are not part of the net investment in the associate or joint venture

The entity applies the impairment requirements in IFRS 9 (see Chapter 47) to its other interests in the associate or joint venture that are in the scope of IFRS 9 and that do not constitute part of the net investment (see section 10.2 below). [IFRS 9.2.1(a)].

How we see it

It is unlikely that any impairment charge recognised in respect of an associate or joint venture will simply be the investor's share of any impairment charge recognised by the associate or joint venture itself, even when the associate or joint venture complies with IFRS accounting standards, considering the factors described above.

Illustration 10-1 below demonstrates the effect on the equity method accounting when an asset of an associate is impaired. Although the example illustrates the accounting in relation to an associate, it would be the same if it were a joint venture.

Illustration 10-1: Impairment of assets of the associate

Investor A acquires a 25% equity interest in Associate B. The cost of the investment was CU95, including transaction costs. To simplify this Illustration, assume that the only assets held by B are PP&E and there is no equity method goodwill. At the acquisition date, the fair value of the PP&E is CU380 and A's share of this is CU95 (25% of CU380). On that date, the book value of the PP&E of B is CU300 and A's share of this is CU75 (25% of CU300). The CU20 difference between A's cost of CU95 and its share of the book value of net assets of B of CU75 relates entirely to the PP&E. Depreciation, transactions between A and B and the effect of income taxes have been ignored to simplify this example.

	B's book value	A's 25% share of B's book value	Fair value of B's net assets	Difference between book value and fair value (basis difference)	A's 25% of basis difference
	CU	CU	CU	CU	CU
PP&E	300	75	380	80	20

Subsequently, B determines that the PP&E is impaired and the recoverable amount of the PP&E at the date of impairment is CU280. Therefore, B recognises an impairment charge of CU20 to reduce the book value of the PP&E to its recoverable amount. A's share of the revised book value of the PP&E is CU70 (25% of CU280).

In the ordinary course of recording its share of B's profits under the equity method, A records its share of the impairment charge CU5 (25% of CU20). That is, the impairment charge recorded by B is included in its profit or loss, which is the basis for A to determine its share of B's profits.

In addition, A assesses the effect of the impairment on the fair value adjustment recorded on acquisition of its investment in B. Because A's share of the fixed assets of CU90 (CU95 less the impairment charge of CU5) exceeds its share of the recoverable amount of the PP&E (CU70), A recognises an additional impairment charge of CU20. Therefore, the total impairment charge recognised by A is CU25 (CU5 that was included in A's share of B's profit plus CU20 additional loss related to the fair value adjustment). While A does not assess individual underlying assets for impairment, when B recognises an impairment, A adjusts the impairment charge to reflect its share in the underlying assets. After recording the impairment charge, A's share in the PP&E of B is as follows:

	B's book value (after impairment)	A's 25% share of B's book value	Recoverable amount of B's net assets	Difference between recoverable amount and book value	A's 25% of difference
	CU	CU	CU	CU	CU
PP&E (after impairment)	280	70	280	-	-
					CU
Cost of original 25% equity method investment					95
A's equity method loss from B (25% of CU20)					(5)
Additional equity method loss for impairment [(CU95 - CU5) - (25% of CU280)]					(20)
A's equity method carrying amount of B					70

10.2 Investment in the associate or joint venture

IAS 28 requires: [IAS 28.43]

Extract from IAS 28

- 43 The recoverable amount of an investment in an associate or a joint venture shall be assessed for each associate or joint venture, unless the associate or joint venture does not generate cash inflows from continuing use that are largely independent of those from other assets of the entity.

After application of the equity method, including recognising its share of the associate's or joint venture's losses (see section 8.3 above), the entity applies the following requirements to determine whether there is any objective evidence that its net investment in the associate or joint venture is impaired. [IAS 28.40]. The entity applies the impairment requirements in IFRS 9 (see Chapter 47) to its other interests in the associate or joint venture that are in the scope of IFRS 9 and that do not constitute part of the net investment. [IFRS 9.2.1(a)].

Extract from IAS 28

- 41A The net investment in an associate or joint venture is impaired and impairment losses are incurred if, and only if, there is objective evidence of impairment as a result of one or more events that occurred after the initial recognition of the net investment (a 'loss event') and that loss event (or events) has an impact on the estimated future cash flows from the net investment that can be reliably estimated. It may not be possible to identify a single, discrete event that caused the impairment. Rather the combined effect of several events may have caused the impairment. Losses expected as a result of future events, no matter how likely, are not recognised. Objective evidence that the net investment is impaired includes observable data that comes to the attention of the entity about the following loss events:
- (a) significant financial difficulty of the associate or joint venture;
 - (b) a breach of contract, such as a default or delinquency in payments by the associate or joint venture;
 - (c) the entity, for economic or legal reasons relating to its associate's or joint venture's financial difficulty, granting to the associate or joint venture a concession that the entity would not otherwise consider;
 - (d) it becoming probable that the associate or joint venture will enter bankruptcy or other financial reorganisation; or
 - (e) the disappearance of an active market for the net investment because of financial difficulties of the associate or joint venture.
- 41B The disappearance of an active market because the associate's or joint venture's equity or financial instruments are no longer publicly traded is not evidence of impairment. A downgrade of an associate's or joint venture's credit rating or a decline in the fair value of the associate or joint venture, is not of itself, evidence of impairment, although it may be evidence of impairment when considered with other available information.
- 41C In addition to the types of events in paragraph 41A, objective evidence of impairment for the net investment in the equity instruments of the associate or joint venture includes information about significant changes with an adverse effect that have taken place in the technological, market, economic or legal environment in which the associate or joint venture operates, and indicates that the cost of the investment in the equity instrument may not be recovered. A significant or prolonged decline in the fair value of an investment in an equity instrument below its cost is also objective evidence of impairment.

[IAS 28.41A, IAS 28.41B, IAS 28.41C].

Goodwill that forms part of the carrying amount of the net investment in an associate or a joint venture is not separately recognised and therefore is not tested for impairment separately. Instead, the entire carrying amount of the investment is tested for impairment in accordance with IAS 36 as a single asset, by comparing its recoverable amount (the higher of value in use and fair value less costs to sell) with its carrying amount whenever indicators of impairment exist, as described in the bullets above. Any impairment loss is not allocated to any asset, including goodwill, that forms part of the carrying amount of the net investment in the associate or joint venture. Accordingly, any reversal of that impairment loss is recognised in accordance with IAS 36 to the extent that the recoverable amount of the net investment subsequently increases. In determining the value in use of the net investment, an entity estimates:

- Its share of the present value of the estimated future cash flows expected to be generated by the associate or joint venture, including the cash flows from the operations of the associate or joint venture and the proceeds from the ultimate disposal of the investment.
- Or
- The present value of the estimated future cash flows expected to arise from dividends to be received from the investment and from its ultimate disposal.

Using appropriate assumptions, both methods give the same result. [IAS 28.42].

In effect, IAS 28 requires the investor to regard its investment in an associate or joint venture as a single cash-generating unit, rather than ‘drilling down’ into the separate cash-generating units determined by the associate or joint venture. The IASB does not explain why it adopted this approach, although it might have been because although an investor has significant influence over an associate, it does not have control and therefore might not have access to the relevant underlying information. Furthermore, IAS 28 requires the investment as a whole to be reviewed for impairment as if it were a financial asset.

10.2.1 Assessing an equity accounted investment for impairment on transition to IFRS accounting standards

A first-time adopter of IFRS accounting standards is required by IFRS 1 *First-time Adoption of International Financial Reporting Standards* to perform an impairment test in accordance with IAS 36 to any goodwill recognised at the date of transition to IFRS accounting standards, regardless of whether there is any indication of impairment, unless a first-time adopter applies IFRS 3 retrospectively to the related past business combinations, see Chapter 6. [IFRS 1.C4(g)(ii)]. IFRS 1 extends the exemption for past business combinations to past acquisitions of investments in associates, interests in joint ventures and interests in joint operations (in which the activity of the joint operation constitutes a business, as defined in IFRS 3). [IFRS 1.C5].

How we see it

We believe that an impairment review for investments in associates or joint ventures whose carrying value includes an element of goodwill must be undertaken at the date of transition on the basis required by IAS 28 as described in section 10.1 above.

10.3 Other interests that are not part of the net investment in the associate or joint venture

The IASB issued an amendment to IAS 28 clarifying that an entity applies IFRS 9 to long-term interests in an associate or joint venture to which the equity method is not applied but that, in substance, form part of the net investment in the associate or joint venture (long-term interests). This clarification is relevant because it implies that the expected credit loss model in IFRS 9 applies to such long-term interests. The IASB also clarified that, in applying IFRS 9, an entity does not take account of any losses of the associate or joint venture, or any impairment losses on the net investment, recognised as adjustments to the net investment in the associate or joint venture that arise from applying IAS 28. [IAS 28.14A].

To illustrate how entities apply the requirements in IAS 28 and IFRS 9 with respect to long-term interests, the Board published an illustrative example, on which Illustration 10-2, below, is based.

Illustration 10-2: Long-term interests in associates and joint ventures

An investor has the following three types of interests in an associate:

(a) O Shares

Ordinary shares representing a 40% ownership interest to which the investor applies the equity method. This interest is the least senior of the three interests, based on their relative priority in liquidation.

(b) P Shares

Non-cumulative preference shares that form part of the net investment in the associate and that the investor measures at fair value through profit or loss applying IFRS 9.

(c) LT Loan

A long-term loan that forms part of the net investment in the associate and that the investor measures at amortised cost applying IFRS 9, with a stated interest rate and an effective interest rate of 5% a year. The associate makes interest-only payments to the investor each year. The LT Loan is the most senior of the three interests.

The LT Loan is not an originated credit-impaired loan. Throughout the years illustrated, there has not been any objective evidence that the net investment in the associate is impaired applying IAS 28, nor does the LT Loan become credit-impaired applying IFRS 9.

The associate does not have any outstanding cumulative preference shares classified as equity, as described in IAS 28.37. Throughout the years illustrated, the associate neither declares nor pays dividends on O Shares or P Shares.

The investor has not incurred any legal or constructive obligations, nor made payments on behalf of the associate, as described in IAS 28.39. Accordingly, the investor does not recognise its share of the associate's losses once the carrying amount of its net investment in the associate is reduced to zero.

The amount of the investor's initial investment in O Shares is CU200, in P Shares is CU100 and in the LT Loan is CU100. On acquisition of the investment, the cost of the investment equals the investor's share of the net fair value of the associate's identifiable assets and liabilities.

This table summarises the carrying amount at the end of each year for P Shares and the LT Loan applying IFRS 9 but before applying IAS 28, and the associate's profit (loss) for each year. The amounts for the LT Loan are shown net of the loss allowance.

At the end of year	P Shares applying IFRS 9 (fair value)	LT Loan applying IFRS 9 (amortised cost)	Profit (Loss) of the Associate
	CU	CU	CU
1	110	90	50
2	90	70	(200)
3	50	50	(500)
4	40	50	(150)
5	60	60	-
6	80	70	500
7	110	90	500

The table below summarises the amounts recognised in the investor's profit or loss. When recognising interest revenue on the LT Loan in each year, the investor does not take account of any adjustments to the carrying amount of the LT Loan that arose from applying IAS 28 (IAS 28.14A). Accordingly, the investor recognises interest revenue on the LT Loan based on the effective interest rate of 5% each year.

Items recognised				
During year	Impairment (losses), including reversals, applying IFRS 9	Gains (losses) of P Shares applying IFRS 9	Share of profit (loss) of the associate recognised applying the equity method	Interest revenue applying IFRS 9
	CU	CU	CU	CU
1	(10)	10	20	5
2	(20)	(20)	(80)	5
3	(20)	(40)	(200)	5
4	-	(10)	(30)	5
5	10	20	(30)	5
6	10	20	200	5
7	20	30	200	5

- (1) In Year 1, the increase in fair value of the P Shares of CU10 is the difference between the CU110 and CU100; the increase in the loss allowance of the LT Loan of (CU10) is the difference between CU90 and CU100; and the investor's share of profit of CU20 is $CU50 \times 40\%$. At the end of Year 1, the carrying amount of the O Shares is CU220, P Shares is CU110 and the LT Loan (net of loss allowance) is CU90.
- (2) In Year 2, the decrease in fair value of the P Shares of (CU20) is the difference between the CU90 and CU110; the increase in the loss allowance of the LT Loan of (CU20) is the difference between CU70 and CU90; and the investor's share of losses of CU80 is $CU200 \times 40\%$. At the end of Year 2, the carrying amount of the O Shares is CU140, P Shares is CU90 and the LT Loan (net of loss allowance) is CU70.
- (3) Applying IAS 28.14A, the investor applies IFRS 9 to the P Shares and the LT Loan before it applies IAS 28.38. Accordingly, in Year 3 the decrease in fair value of the P Shares of (CU40) is the difference between the CU50 and CU90; the increase in the loss allowance of the LT Loan of (CU20) is the difference between CU50 and CU70; and the investor's share of losses of CU200 is $CU500 \times 40\%$. The investor recognises its share of the associate's loss in reverse order of seniority as specified in IAS 28.38 and allocates CU140 to the O Shares, CU50 to the P Shares and CU10 to the LT Loan. At the end of Year 3, the carrying amount of the O Shares is zero, P Shares is zero and the LT Loan (net of loss allowance) is CU40.

- (4) In Year 4, the decrease in fair value of the P Shares of (CU10) is the difference between the CU40 and CU50. Recognition of the change in fair value of CU10 in Year 4 results in the carrying amount of P Shares being negative CU10. Consequently, the investor reverses a portion of CU10 of the associate's losses previously allocated to P Shares. Applying IAS 28.38, the investor limits the recognition of the associate's losses to CU40 because the carrying amount of its net investment in the associate is then zero. At the end of Year 4, the carrying amount of the O Shares is zero, P Shares is zero and the LT Loan (net of loss allowance) is zero. There is also an unrecognised share of the associate's losses of CU30 (the investor's share of the associate's cumulative losses of CU340 - CU320 losses recognised cumulatively + CU10 losses reversed).
- (5) In Year 5, the increase in fair value of the P Shares of CU20 is the difference between the CU60 and CU40; the decrease in the loss allowance of CU10 is the difference between CU60 and CU50. After applying IFRS 9 to the P Shares and the LT Loan, these interests have a positive carrying amount. Consequently, the investor allocates the previously unrecognised share of the associate's losses of CU30 to these interests, being CU20 to the P Shares and CU10 to the LT Loan. At the end of Year 5, the carrying amount of the O Shares is zero, P Shares is zero and the LT Loan (net of loss allowance) is zero.
- (6) In Year 6, the increase in fair value of the P Shares of CU20 is the difference between the CU80 and CU60; the decrease in the loss allowance of CU10 is the difference between CU70 and CU60; and the investor's share of the associate's profit of CU200 is $CU500 \times 40\%$. The investor allocates the associate's profit to each interest in the order of seniority. The investor limits the amount of the associate's profit it allocates to the P Shares and the LT Loan to the amount of equity method losses previously allocated to those interests, which in this example is CU60 for both interests. The balancing CU60 is allocated to the investment in the O Shares. At the end of Year 6, the carrying amount of the O Shares is CU80, P Shares is CU80 and the LT Loan (net of loss allowance) is CU70.
- (7) In Year 7, the increase in fair value of the P Shares of CU30 is the difference between the CU110 and CU80; the decrease in the loss allowance of CU20 is the difference between CU90 and CU70; and the investor's share of the associate's profit of CU200 is $CU500 \times 40\%$, allocated in full to the investment in the O Shares. At the end of Year 7, the carrying amount of the O Shares is CU280, P Shares is CU110 and the LT Loan (net of loss allowance) is CU90.

11 Separate financial statements

IAS 27 allows entities the option to account for investments in subsidiaries, associates and joint ventures using the equity method of accounting.

Separate financial statements are defined in IAS 27 as those presented by an entity in which the entity could elect to account for its investments in subsidiaries, joint ventures and associates either at cost, in accordance with IFRS 9 or using the equity method as described in IAS 28. [IAS 28.4].

An investment in an associate or joint venture is accounted for in the entity's separate financial statements in accordance with IAS 27.10. [IAS 28.44]. IAS 27 requires that, in separate financial statements, investments in subsidiaries, associates or joint ventures are accounted for either:

- At cost
- In accordance with IFRS 9
- Or
- Using the equity method as described in IAS 28

The entity applies the same accounting for each category of investments. Investments accounted for at cost or using the equity method are accounted for in accordance with IFRS 5 when they are classified as held for sale (or included in a disposal group that is classified as held for sale). [IAS 27.10].

If an entity elects, in accordance with IAS 28.18, to measure its investments in associates or joint ventures at fair value through profit or loss in accordance with IFRS 9 (see section 3.3 above) it also accounts for those investments in the same way in its separate financial statements. [IAS 27.11].

IAS 27 requires the investor to recognise all dividends in profit or loss within its separate financial statements once the right to receive payment has been established, unless the equity method is elected, in which case the dividend is recognised as a reduction from the carrying amount of the investment. [IAS 27.12]. The investor then needs to consider whether there are indicators of impairment as set out in IAS 36.12 (see Chapter 9).

The detailed requirements for separate financial statements as set out in IAS 27 are discussed more fully in Chapter 9.

11.1 Impairment of investments in associates or joint ventures in separate financial statements

An issue considered by the IFRS IC and the IASB is how impairments of investments in associates are determined in the separate financial statements of the investor. In January 2013, the IFRS IC issued an agenda decision¹⁷ stating that according to IAS 36.4, IAS 36.5 and IAS 39.2(a) (now IFRS 9.2.1(a)), investments in subsidiaries, joint ventures, and associates that are not accounted for in accordance with IFRS 9 are within the scope of IAS 36 for impairment purposes. Consequently, in its separate financial statements, an entity applies the provisions of IAS 36 to test for impairment its investments in subsidiaries, joint ventures, and associates that are carried at cost or using the equity method. See Chapter 21.

¹⁷ [IFRIC Update](#), January 2013, available on the IFRS Foundation's website.

12 Presentation and disclosures

12.1 Presentation

12.1.1 Statement of financial position

Unless an investment, or a portion of an investment, in an associate or a joint venture is classified as held for sale in accordance with IFRS 5 (see section 4 above), the investment, or any retained interest in the investment not classified as held for sale, is classified as a non-current asset. [IAS 28.15]. The aggregate of investments in associates and joint ventures accounted for using the equity method are presented as a discrete line item in the statement of financial position. [IAS 1.54(e)].

IAS 28 does not explicitly define what is meant by “investment ... in an associate or a joint venture”. However, IAS 28.38 states that “...The interest in an associate or a joint venture is the carrying amount of the investment in the associate or joint venture determined using the equity method together with any long-term interests that, in substance, form part of the entity’s net investment in the associate or joint venture... Such items may include preference shares and long-term receivables or loans but do not include trade receivables, trade payables or any long-term receivables for which adequate collateral exists, such as secured loans. ...” [IAS 28.38]. Some have interpreted this as a requirement to present the investment in ordinary shares and other long-term interests in associates within the same line item. However, when associates are profitable, long-term interests such as loans are normally accounted for under IFRS 9 rather than under the equity method. Therefore, it is generally considered acceptable to present the investment in ordinary shares in associates and joint ventures and other long-term interests in associates and joint ventures in separate line items.

Goodwill relating to an associate or joint venture is included in the carrying amount of the investment, [IAS 28.32], as is illustrated in Practical example 12-1 below.

Practical example 12-1: RWE Aktiengesellschaft (2023)	Germany
Annual Report 2023 [extract] 4 Consolidated financial statements [extract] 4.6. Notes [extract] Consolidation principles [extract]	
<p style="text-align: center;">...</p> <p>For investments accounted for using the equity method, goodwill is not reported separately, but rather included in the value recognised for the investment. In other respects, the consolidation principles described above apply analogously. If impairment losses on the equity value become necessary, we report such under income from investments accounted for using the equity method.</p>	

12.1.2 Profit or loss

In the statement of comprehensive income or separate income statement, the aggregate of the investor’s share of the profit or loss of associates and joint ventures accounted for using the equity method must be shown. [IAS 1.82(c)]. ‘Profit or loss’ in this context is interpreted in the implementation guidance to IAS 1 as meaning the ‘profit attributable to owners’ of the associates and joint ventures, i.e., it is after tax and non-controlling interests in the associates or joint ventures.¹⁸ There is no requirement as to where in the statement of comprehensive income or separate income statement the investor’s share of the profit or loss of associates and joint ventures accounted for using the equity method is shown, and different approaches are therefore seen in practice. As discussed in Chapter 3, some entities present operating income on the face of the statement of comprehensive income. In this case, equity accounted investments might form part of operating activities with their results included in that measure and with non-operating investments excluded from it. Another acceptable alternative is to exclude the results of all associates and joint ventures from operating profit.

¹⁸ IAS 1 IG6 XYZ Group - Statement of profit or loss and other comprehensive income for the year ended 31 December 20X7 (illustrating the presentation of profit and loss and other comprehensive income in one statement and the classification of expenses within profit by function).

Nokia Corporation for example includes its share of the (post-tax) results of associates after operating profit, but before pre-tax profit:

Practical example 12-2: Nokia Corporation (2023)

Finland

Nokia in 2023 [extract]

Financial statements [extract]

Consolidated financial statements [extract]

Consolidated income statement [extract]

EURm	Note	2023	2022	2021
Operating profit	...	1 688	2 318	2 158
Share of results of associates and joint ventures	6.4	(39)	(26)	9
Financial income ⁽¹⁾	2.4	425	178	69
Financial expenses ⁽¹⁾	2.4	(575)	(286)	(310)
Profit before tax		1 499	2 184	1 926
	...			

(1) In 2023, Nokia changed the presentation of net interest income on defined benefit plans within financial income and expenses. The comparative amounts for 2022 and 2021 have been recast accordingly. Refer to Note 2.4. Financial income and expenses for more information.

In contrast, Nestlé S.A. includes its share of the post-tax results of associates below tax expense:

Practical example 12-3: Nestlé S.A. (2023)		Switzerland	
Financial Statements 2023 [extract]			
Consolidated Financial Statements of the Nestlé Group 2023 [extract]			
Consolidated income statement for the year ended December 31, 2023 [extract]			
In millions of CHF			
	Notes	2023	2022

Taxes	13	(2 314)	(2 730)
Income from associates and joint ventures	14	1 120	1 040
Profit for the year		11 509	9 596
...			

12.1.2.A Impairment of associates or joint ventures

It is unclear where impairments of associates or joint ventures are presented in the statement of comprehensive income or separate income statement. IAS 28 requires an impairment test to be performed “after application of the equity method”, [IAS 28.40], which could be read as implying that impairment of an associate or joint venture is not part of the investor’s share of the profit or loss of an associate or joint venture accounted for using the equity method. On the other hand, the guidance on accounting for impairment losses on associates is presented under the heading “Application of the equity method” in IAS 28, which suggests that accounting for impairments of associates is part of the equity method. In practice, both interpretations appear to have gained a degree of acceptance.

RWE Aktiengesellschaft, for example, reports impairment losses on associates within income from investments accounted for using the equity method (see Practical example 12-1 in section 12.1.1 above).

12.1.3 Other items of comprehensive income

The investor’s share of items recognised in OCI by the associate or joint venture is recognised in the investor’s OCI. [IAS 28.10].

IAS 1.82A clarifies that entities must present the share of OCI of associates and joint ventures accounted for using the equity method, separated into the share of items that, in accordance with other IFRS accounting standards:

- Will not be subsequently reclassified to profit or loss
- And
- Will be reclassified subsequently to profit or loss when specific conditions are met [IAS 1.82A]

In this context, OCI is interpreted in the implementation guidance to IAS 1 as meaning the “other comprehensive income attributable to owners” of the associates and joint ventures, i.e., it is after tax and non-controlling interests in the associates or joint ventures.¹⁹

12.1.4 Statement of cash flows

IAS 7 *Statement of Cash Flows* notes that for an equity accounted investment, reporting in the cash flow statement is limited to cash flows between the investor and the investee, such as dividends received. The question arises as to whether dividends received are recognised as operating or investing cash flows. As discussed in Chapter 36, IAS 7 is not prescriptive; however, entities select an accounting policy and apply it consistently.

12.1.5 IFRS 18 *Presentation and Disclosure in Financial Statements*

In April 2024, the IASB issued IFRS 18 to replace IAS 1. IFRS 18 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). See Chapter 4 for further details on IFRS 18.

12.2 Disclosures

The disclosure requirements for associates and joint ventures are dealt with in IFRS 12, together with the disclosure requirements for subsidiaries and unconsolidated structured entities. The disclosure requirements in relation to associates and joint ventures are discussed in Chapter 14.

In May 2024, the IASB issued IFRS 19, a voluntary IFRS accounting standard for use by eligible subsidiaries that prepare financial statements applying IFRS accounting standards. IFRS 19 specifies which disclosure requirements apply to a subsidiary that does not have public accountability and whose parent produces consolidated financial statements that comply with IFRS accounting standards and are available for public use. IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). See Chapter 4 for further details on IFRS 19.

¹⁹ IAS 1 IG6 XYZ Group - *Statement of profit or loss and other comprehensive income for the year ended 31 December 20X7 (illustrating the presentation of profit and loss and other comprehensive income in one statement and the classification of expenses within profit by function).*

13 Future developments

As discussed in section 5.1 above, many procedures appropriate for the application of the equity method are similar to the consolidation procedures described in IFRS 10 (see Chapter 8). Furthermore, IAS 28 explains that the concepts underlying the procedures used in accounting for the acquisition of a subsidiary are also adopted in accounting for the acquisition of an investment in an associate or a joint venture. [IAS 28.26]. This does raise several practical difficulties, and there has been an ongoing debate about whether the equity method of accounting is a consolidation method or a measurement method. Although IAS 28 generally adopts consolidation principles it nevertheless retains features of a valuation methodology.

In September 2024, the IASB published an exposure draft²⁰ addressing application issues relating to the equity method of accounting. The project objectives are:

- To reduce diversity in practice by answering application questions on the equity method of accounting
- To improve the understandability of IAS 28 Investments in Associates and Joint Ventures

The exposure draft addresses application questions in the following areas:

- Initial recognition
- Changes in ownership
- Transactions with associates and joint ventures
- Impairment indicators
- Separate financial statements

The IASB also proposes certain improvements to disclosure requirements for investments in associates and joint ventures. Readers should monitor developments.

Appendix A - Index of Illustrations

Illustration 2-1:	Investor holding a direct and indirect interest in an investee	868
Illustration 3-1:	Entity owning a discrete venture capital organisation	872
Illustration 3-2:	Entity with a venture capital organisation segment	872
Illustration 3-3:	Venture capital consolidations and partial use of fair value through profit or loss	874
Illustration 5-1:	Application of the equity method	878
Illustration 6-1:	Accounting for retained interest in an associate following loss of control of a subsidiary that is a business due to sale of shares to third party	882
Illustration 6-2:	Accounting for existing financial instruments on the step acquisition of an associate (cost-based approach)	886
Illustration 6-3:	Accounting for existing financial instruments on the step acquisition of an associate (fair value (IFRS 3) approach)	889
Illustration 6-4:	Accounting for an increase in the ownership of an associate	890
Illustration 6-5:	Cumulative preference shares issued by an associate	892
Illustration 6-6:	Share in an associate or a joint venture when the reporting entity is a group	893
Illustration 7-1:	Elimination of profit on sale by investor to associate ('downstream transaction')	894
Illustration 7-2:	Elimination of profit on sale by associate to reporting entity ('upstream transaction')	895
Illustration 7-3:	Sale of asset from venturer to joint venture at a loss	896
Illustration 7-4:	Sale of asset from joint venture to venturer at a loss	896
Illustration 7-5:	Elimination of downstream unrealised profits in excess of the investment	898
Illustration 7-6:	Elimination of profits and losses resulting from transactions between associates and/or joint ventures	899
Illustration 7-7:	Elimination of equity-accounted reciprocal interests	900
Illustration 7-8:	Elimination of reciprocal interests not accounted for under the equity method	901
Illustration 7-9:	Contribution of non-monetary assets to form a joint venture	904
Illustration 7-10:	Contribution of non-monetary assets to form a joint venture with cash equalisation payment between venturers/investors	905
Illustration 7-11:	Contribution of subsidiary to form a joint venture - applying IFRS 10	906
Illustration 8-1:	Accounting for a loss-making associate	911
Illustration 8-2:	Equity-settled share-based payment transactions of associate	913
Illustration 8-3:	Accounting for the effect of transactions with non-controlling interests recognised through equity by an associate	916
Illustration 9-1:	Partial disposal of an associate when equity method continues to be applied	920
Illustration 9-2:	Deemed disposal of an associate	921
Illustration 10-1:	Impairment of assets of the associate	924
Illustration 10-2:	Long-term interests in associates and joint ventures	926

Appendix B - Index of Frequently asked questions

Question 6-1:	Is directly attributable expenditure included in the initial carrying amount of an investment under the equity method?	880
Question 7-1:	How does an entity account for a contribution of PP&E to a newly formed associate in exchange for shares in the associate when the entity and the fellow investors in the associate are entities under common control?	908

Appendix C - Defined terms

Extract from IAS 28

- 3 The following terms are used in this Standard with the meanings specified:
- An *associate* is an entity over which the investor has significant influence.
- Consolidated financial statements* are the financial statements of a group in which assets, liabilities, equity, income, expenses and cash flows of the parent and its subsidiaries are presented as those of a single economic entity.
- The *equity method* is a method of accounting whereby the investment is initially recognised at cost and adjusted thereafter for the post-acquisition change in the investor's share of the investee's net assets. The investor's profit or loss includes its share of the investee's profit or loss and the investor's other comprehensive income includes its share of the investee's other comprehensive income.
- A *joint arrangement* is an arrangement of which two or more parties have joint control.
- Joint control* is the contractually agreed sharing of control of an arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control.
- A *joint venture* is a joint arrangement whereby the parties that have joint control of the arrangement have rights to the net assets of the arrangement.
- A *joint venturer* is a party to a joint venture that has joint control of that joint venture.
- Significant influence* is the power to participate in the financial and operating policy decisions of the investee but is not control or joint control of those policies.

Overview

This chapter deals with joint arrangements. An entity might pursue an economic activity with another entity (or entities) and share decision-making relating to those activities. IFRS 11 *Joint Arrangements* applies when the arrangement establishes joint control over an activity between two or more of the parties involved.

IFRS 11 classifies joint arrangements into one of two types: joint operations and joint ventures. Parties that jointly control a joint operation have rights to the assets and obligations for the liabilities of the operation. By contrast, parties that jointly control a joint venture have rights to the net assets of the arrangement.

The accounting for joint operations is set out in IFRS 11 and involves the joint operator recognising the assets it has a right to and the obligations it incurs as a result of the joint operation and its share of the joint operation's assets held and liabilities incurred jointly. It also recognises its share of revenue and expenses.

An investor that jointly controls a joint venture applies the equity method of accounting to its investment as described in IAS 28 *Investments in Associates and Joint Ventures*, which is discussed in Chapter 12.

What you need to know

- A joint arrangement is classified as either a joint operation or a joint venture; this determination might require significant judgement depending on the nature of the arrangement.
- If facts and circumstances change, a joint operator/joint venturer in a joint arrangement reassesses whether it still has joint control of the arrangement and whether the classification of the joint arrangement has changed.
- The equity method of accounting is applied to investments in joint ventures in the consolidated financial statements of the joint venturers.
- A joint venturer has an accounting policy choice for the measurement of joint ventures in its separate financial statements at cost, in accordance with IFRS 9 *Financial Instruments* or using the equity method.
- In both consolidated and separate financial statements, a joint operator recognises its share of assets, liabilities, revenue and expenses, each of which are accounted for by applying the relevant IFRS accounting standard.

1 Introduction

A joint arrangement is an arrangement that has the following characteristics:

- The parties are bound by a contractual arrangement.
- The contractual arrangement gives two or more of those parties joint control of the arrangement. [IFRS 11.5].

A joint arrangement is classified as either a joint operation or a joint venture. [IFRS 11.6]. Joint operators have rights to the assets of the operation and obligations for its liabilities. Joint venturers have rights to the net assets of the arrangement. [IFRS 11 Appendix A, IFRS 11.BC24].

The terms 'joint arrangement', 'joint control', 'joint operation' and 'joint venture' are specifically defined by IFRS 11 (see Appendix C below) and have important accounting consequences. However, these terms are often used loosely in practice and might appear in legal documents and public statements by management with a different meaning from the IFRS 11 terms.

How we see it

No matter the terminology used to describe the arrangement, or its purpose, management needs to evaluate the terms of the arrangement, and the relevant facts and circumstances, to determine whether it is a joint arrangement as defined in IFRS 11.

FASB differences

IFRS 11 is not converged with US GAAP. The characteristics of a joint venture in US GAAP are similar to those in IFRS accounting standard, but certain differences exist. Key differences are highlighted in this section, but this is not an exhaustive list of possible differences. Further detail can be found in the US GAAP/IFRS accounting differences identifier tool.¹

- Joint control is defined in IFRS 11, but not in US GAAP. In contrast to US GAAP, joint control can be established through means other than an equity interest.
- US GAAP does not contain the concept of a joint operation, although proportionate consolidation is permitted to account for interests in unincorporated entities in certain industries. Proportionate consolidation is not permitted by IFRS 11, however, a joint operator recognises its share of assets, liabilities, revenue and expenses (a methodology similar to proportionate consolidation).
- In US GAAP, joint ventures are entities whose operations and activities are jointly controlled by their equity investors and have certain other characteristics. In IFRS accounting standards, joint ventures are separate vehicles and the joint venturers have rights to the vehicle's net assets.
- In IFRS accounting standards, joint venturers cannot have direct rights and obligations with respect to the underlying assets and liabilities of the joint venture, but this is not relevant to the determination of whether an investment is a joint venture under US GAAP.
- Joint venturers generally measure their investment using the equity method of accounting under both IFRS and US GAAP. However, US GAAP provides an accounting policy choice to measure joint ventures at fair value, whereas this election is restricted to certain entities under IFRS accounting standards.

¹ [US GAAP/IFRS accounting differences identifier tool](#), EY, December 2024, available on ey.com.

2 Objective and scope of IFRS 11

2.1 Objective

The objective of IFRS 11 is to establish principles for financial reporting by entities that have an interest in a joint arrangement. [IFRS 11.1]. As a result, the standard defines and provides guidance on:

- What a joint arrangement is and when joint control is present (see sections 3 and 4 below).
- The two types of joint arrangements and how to classify an arrangement (see section 5 below).
- How to account for each type of joint arrangement in the financial statements of a party to a joint arrangement (see sections 6, 7 and 8 below). [IFRS 11.2].

2.2 Scope

IFRS 11 applies to all entities that are a party to a joint arrangement. [IFRS 11.3]. A 'party to a joint arrangement' is defined as "An entity that participates in a joint arrangement, regardless of whether that entity has joint control of the arrangement." [IFRS 11 Appendix A]. Therefore, an entity could be required to apply IFRS 11 to an arrangement even though it does not have joint control of it (see section 6.4 below).

2.2.1 Application by venture capital organisations and similar entities

IFRS 11 applies to all entities that are party to a joint arrangement, including venture capital organisations, mutual funds, unit trusts, investment-linked insurance funds and similar entities (referred to hereafter as 'venture capital organisations'). However, venture capital organisations can choose to measure investments in joint ventures at fair value under the measurement exemption in IAS 28 (see Chapter 12), but remain subject to the disclosure requirements of IFRS 12 *Disclosure of Interests in Other Entities* (see Chapter 14). [IFRS 11.BC15-BC18].

A venture capital organisation that is an 'investment entity' as defined in IFRS 10 *Consolidated Financial Statements* and holds investments in subsidiaries and associates/joint ventures measures its investments in associates/ joint ventures at fair value through profit or loss. [IFRS 10.B85L(b)]. Investment entities are discussed in Chapter 7.

2.2.2 Application to joint arrangements held for sale

As discussed in section 8.2.7 below, an investment in a joint venture (or portion thereof) that is classified as held for sale under IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* is accounted for under IFRS 5. [IAS 28.20]. Similarly, a joint operation that is held for sale under IFRS 5 is accounted for under IFRS 5, see section 8.3.6 below. [IFRS 11.21, IFRS 5.2].

2.2.3 Accounting by a joint operation

The scope of IFRS 11 does not address the accounting by the joint operation itself.

Frequently asked questions

Question 2-1: How does a joint operation that is a separate vehicle account for the assets and liabilities of the joint operation in its financial statements?

In March 2015, the IFRS IC published its agenda decision² on the accounting by a joint operation that is a separate vehicle in its financial statements. Joint operators recognise their share of assets and liabilities held by the joint operation, which leads to the question of whether those same assets and liabilities are also recognised in the financial statements of the joint operation itself. The IFRS IC decided not to add the issue to its agenda, because the following guidance exists:

- IFRS 11 applies only to the accounting by the joint operators and not to the accounting by a separate vehicle that is a joint operation.
- The financial statements of the separate vehicle would therefore be prepared in accordance with applicable IFRS accounting standards. Note that IFRS 3 *Business Combinations* does not apply to “the accounting for the formation of a joint arrangement in the financial statements of the joint arrangement itself.” (see Chapter 10). [IFRS 3.2(a)].
- Company law often requires a legal entity or separate vehicle to prepare financial statements. Consequently, the financial statements would include the assets, liabilities, revenues and expenses of that legal entity or separate vehicle. The determination of which assets and liabilities to recognise and their measurement will depend on rights and obligations of the separate vehicle and specific facts and circumstances.

² [IFRIC Update](#), March 2015, available on the IFRS Foundation’s website.

3 Joint arrangement

IFRS 11 defines a joint arrangement as “An arrangement of which two or more parties have joint control.” *[IFRS 11 Appendix A]*.

The contractual arrangement that binds the parties together is often, but not always, in writing. Unwritten agreements are rare in practice. Laws can also create enforceable arrangements, with or without a contract. *[IFRS 11.B2]*. A joint arrangement can be structured through a separate vehicle (see section 5.1 below). That entity’s articles, charter or by-laws also might include aspects of the contractual arrangement. *[IFRS 11.B3]*.

Contractual arrangements generally specify the following:

- Purpose, activity and duration of the joint arrangement
- Appointment of members of the board of directors (or equivalent governing body)
- Decision-making processes
 - Matters requiring decisions from the parties
 - Voting rights of the parties
- And
- Required level of agreement for those matters
- Capital or other contribution requirements
- Sharing of assets, liabilities, revenues, expenses or profit or loss relating to the joint arrangement *[IFRS 11.B4]*

How we see it

Understanding the terms of the contractual arrangement is crucial in determining whether joint control exists (see section 4 below) and, if so, in deciding whether the joint arrangement is a joint operation or joint venture (see section 5 below).

In addition, a contract to receive goods or services might be entered into by a joint arrangement or on behalf of a joint arrangement. The terms and conditions of the joint arrangement could impact how the contract to receive goods or services is accounted for. See Chapter 24.

3.1 Unit of account

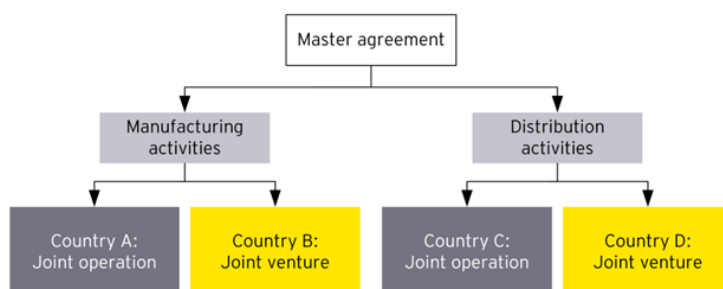

The unit of account of a joint arrangement is the activity that two or more parties have agreed to control jointly. A party to the arrangement assesses its rights to the assets and obligations for the liabilities relating to that activity, regardless of whether the activity is conducted in a separate vehicle. *[IFRS 11.BC20, IFRS 11.BC35]*.

The purpose and design of an arrangement might provide insight into how to identify the unit of account. For example, a framework agreement can establish multiple joint arrangements of different types. *[IFRS 11.18]*. The possibility also exists that, within the same separate vehicle, parties to the arrangement might undertake different activities in which they have different rights to the assets, and obligations for the liabilities, resulting in different types of joint arrangements conducted within the same separate vehicle. The IASB believes such situations would be rare in practice. *[IFRS 11.BC36]*. Scenarios in which the activity is larger than a single entity or separate vehicle are referred to as ‘layered agreements’ in this chapter and are discussed in Illustration 4-9 in section 4.4.2 below.

Illustration 3-1 below describes a case in which a master agreement is accounted for as several distinct joint arrangements, each of which is classified as either a joint operation or a joint venture.

Illustration 3-1: Master agreement for manufacturing and distribution

A single contract between two parties specifies the terms and conditions related to manufacturing and distribution activities and dictates how these activities are carried out in various jurisdictions through several entities. The activities are carried out concurrently and not sequentially (see section 4.1.1 below). In each entity, the parties jointly control the relevant activities.

The parties determine that the master agreement contains several discrete joint arrangements (one for each activity in each jurisdiction, which corresponds to an entity). If the terms and conditions relating to each activity are distinct for each separate vehicle then each entity would be classified as a joint venture or joint operation in accordance with IFRS 11.

In some cases, multiple contractual agreements between parties relate to the same activities, which would need to be analysed together to determine whether a joint arrangement exists and, if so, the type of joint arrangement.

In other cases, there might be a single master agreement between two parties that covers several different activities. Some of these activities might be controlled solely by one of the two parties, while the parties might jointly control other activities.

How we see it

IFRS 11 does not define 'activity'. Therefore, careful analysis is required to determine the unit of account and to assess whether any of the arrangements are jointly controlled.

Illustration 3-2 below illustrates a contract that contains multiple agreements, only some of which are joint arrangements.

Illustration 3-2: Agreements with control and joint control

Assume the same information as in Illustration 3-1 above with the following variation: One party has the ability to direct the manufacturing activities of the entity in Country A and the other party to direct those in Country B. As in Illustration 3-1, in Countries C and D the parties jointly control the relevant activities.

In this case, each party controls its respective entities in Countries A and B and therefore these entities are not joint arrangements. The distribution activities conducted in the entities in Countries C and D are still joint arrangements and each is classified as either a joint operation or a joint venture. See Illustration 5-6 in section 5.5 below for a case when two parties have two joint arrangements and each joint arrangement relates to a specific activity.

4 Joint control

A crucial element in a joint arrangement is joint control.

Joint control is defined as: *[IFRS 11.7, IFRS 11 Appendix A]*

Extract from IFRS 11

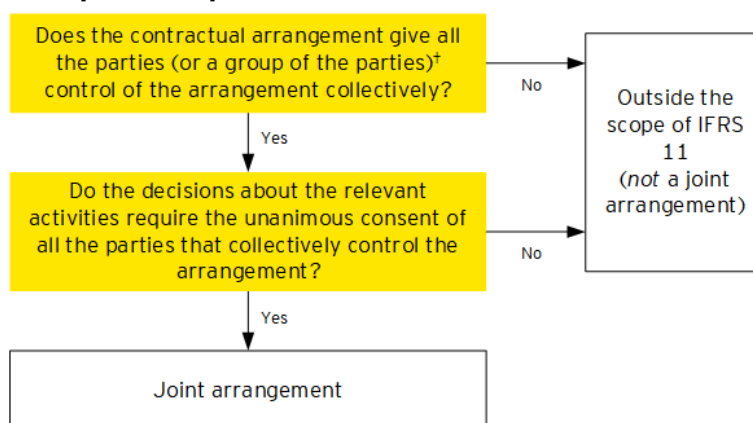

- 7** Joint control is the contractually agreed sharing of control of an arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control.

[IFRS 11.7].

As discussed in section 2.2 above, not all the parties to the joint arrangement need to have joint control of the relevant activities for the arrangement to be classified as a joint arrangement. Therefore, IFRS 11 distinguishes between parties that have joint control of a joint arrangement and those that do not.

[IFRS 11.11]. A joint operator and a joint venturer refer to parties that have joint control of a joint operation and joint venture respectively. *[IFRS 11 Appendix A]*. IFRS 11 does not explicitly define a party that participates in, but does not have joint control of, a joint arrangement. We refer to these parties as 'parties without joint control'. IFRS 11 specifies the accounting for parties without joint control (see sections 6.4 and 7.1 below).

The following flowchart provided in IFRS 11 illustrates how a party to a joint arrangement evaluates whether joint control exists. *[IFRS 11.B10]*.

† The reference to 'a group of the parties' refers to a situation in which there is joint control between two or more parties, but there are other parties to the joint arrangement that do not participate in joint control.

We discuss key aspects of joint control within this chapter, as follows:

- Contractual arrangement - See section 3 above
- Assessing control - See section 4.1 below
- Rights to control collectively - See section 4.2 below
- Unanimous consent - See section 4.3 below
- Other practical issues with assessing joint control - See section 4.4 below

All facts and circumstances are considered when assessing whether all the parties, or a group of the parties, have joint control of an arrangement and judgement is required. *[IFRS 11.12]*.

In some cases, it will be clear that there is no collective control, or no unanimous consent. If neither criterion is met, the activity is not a joint arrangement. For example, an advertising cost-sharing agreement between a retailer and a wholesaler that does not establish joint control over the advertising activities would not meet the definition of a joint arrangement.

How we see it

We believe that it would be rare for a publicly listed entity to be subject to joint control, since it would be unusual to have a contractual agreement among all the shareholders to direct the activities of such an entity.

When it is not clear whether joint control exists, a party to a joint arrangement needs to exercise judgement to determine whether there is joint control. *[IFRS 11.12]*. In such cases, IFRS 12 requires an entity to disclose information about the significant judgements and assumptions made (see Chapter 14). *[IFRS 12.7]*.

When an arrangement is outside the scope of IFRS 11, an entity accounts for its interest in the arrangement in accordance with relevant IFRS accounting standard, such as IFRS 10, IAS 28 or IFRS 9 *Financial Instruments*. [IFRS 11.B11].

4.1 Assessing control

The first step in evaluating joint control is to assess whether the contractual arrangement gives a single party control of the arrangement. [IFRS 11.10]. The IASB believes that the definition of control and the application requirements to assess control in IFRS 10 will assist an entity in determining whether it unilaterally controls an arrangement or whether it jointly controls an arrangement along with other parties. [IFRS 11.BC14]. Therefore, if one of the parties to the arrangement is exposed, or has rights, to variable returns from its involvement in the arrangement and has the ability to affect those returns through its power, it controls the arrangement and joint control is not possible. [IFRS 11.10, IFRS 11.B5].

In assessing control, the following factors within IFRS 10 are considered:

- The purpose and design of the arrangement (see Chapter 7)
- What the relevant activities of the arrangement are and how decisions about those activities are made (see Chapter 7)
- Whether the rights of the party give it the current ability to direct the relevant activities (see Chapter 7)
- Whether the party is exposed, or has rights, to variable returns from its involvement with the arrangement (see Chapter 7)
- Whether the party has the ability to use its power over the investee to affect the amount of its returns (see Chapter 7). [IFRS 10.B3].

4.1.1 Sequential activities

The determination of the relevant activities of an arrangement might be complicated when the arrangement includes different activities that occur at different times. For example, some joint arrangements operate in sequential production phases, such as those in the mining, construction, real estate, and life-sciences industries. These arrangements generally fall into two types of situations:

- Parties have rights to direct different activities
- Or
- Parties collectively direct all of the activities

In the first situation, each party assesses whether it has the rights to direct the activities that most significantly affect returns, and therefore whether it controls the arrangement (see Chapter 7). This assessment is reconsidered if relevant facts or circumstances change. [IFRS 11.13].

Illustrations 4-1 and 4-2 below illustrate the above principles. They are based on an example taken from IFRS 10. [IFRS 10.B13 Example 1].

Illustration 4-1: Directing sequential activities separately

Companies A and B enter into an arrangement, structured through a separate vehicle, to develop and market a medical product. A is responsible for developing and obtaining regulatory approval for the medical product. This includes having the unilateral ability to make all decisions relating to the development of the product and to obtain regulatory approval. Once the regulator has approved the product, B will manufacture and market it and has the unilateral ability to make all decisions about the manufacturing and marketing of the project. All of the activities - developing and obtaining regulatory approval as well as manufacturing and marketing of the medical product - are relevant activities. A and B determine that the activity that most significantly affects returns at the time of the assessment is the developing and obtaining regulatory approval of the medical product.

In Illustration 4-1 above, there is no joint control because the parties to the arrangement do not collectively direct the activity that most significant affects returns of the arrangement. Rather, one party directs each activity. However, if the fact pattern were different such that they collectively directed that activity, then there would be joint control. This is described in Illustration 4-2 below.

Illustration 4-2: Directing sequential activities jointly

Companies A and B enter into an arrangement, structured through a separate vehicle, to develop and market a medical product. A and B are responsible for developing and obtaining regulatory approval for the medical product. The arrangement establishes joint control over the decisions relating to the development of the product and to obtain regulatory approval. Once the regulator has approved the product, B will manufacture and market it and have the unilateral ability to make all decisions about the manufacturing and marketing of the project. All of the activities - developing and obtaining regulatory approval as well as manufacturing and marketing of the medical product - are relevant activities. A and B determine that the activity that most significantly affects returns at the time of the assessment is the developing and obtaining regulatory approval of the medical product.

4.2 Rights to control collectively

Joint control can exist only when the parties collectively control the arrangement. [IFRS 11.B5].

Extract from IFRS 11

- 8 An entity that is a party to an arrangement shall assess whether the contractual arrangement gives all the parties, or a group of the parties, control of the arrangement collectively. All the parties, or a group of the parties, control the arrangement collectively when they must act together to direct the activities that significantly affect the returns of the arrangement (ie the relevant activities).

Acting together to direct the relevant activities is referred to as 'collective control' and is discussed further in the following sections. [IFRS 11.8].

4.2.1 Protective rights, including some veto rights

IFRS 10 defines protective rights as "Rights designed to protect the interest of the party holding those rights without giving that party power over the entity to which those rights relate". [IFRS 10 Appendix A].

Protective rights relate to fundamental changes to the activities of the arrangement or apply in exceptional circumstances. Since power is an essential element of control, protective rights do not give a party control over the arrangement. Holding protective rights cannot prevent another party from having power over an arrangement (see Chapter 7). [IFRS 10.B26, IFRS 10.B27].

Accordingly, when assessing whether a group of the parties collectively control an arrangement, consideration must be given to whether rights held by any of the parties are:

- Protective - in which case, the other parties might collectively control the arrangement, and those parties might have joint control
- Or
- Substantive - in which case, such rights could prevent the other parties from having joint control, and possibly give the holder of those rights control

Illustration 4-3 below illustrates this point with veto rights, which are often protective rights.

Illustration 4-3: Protective rights and joint control

Companies A, B and C enter into a joint arrangement to conduct an activity in Entity Z. The contractual agreement between A and B states that they must agree to direct all the activities of Z. The agreement of C is not required, except that C has the right to veto the issuance of debt or equity instruments by Z. The ability to veto the issuance of equity and debt instruments is considered a protective right because the right is designed to protect C's interest without giving C the ability to direct the activities that most significantly affect Z's returns.

In this fact pattern, A and B have joint control over Z because collectively they have the ability to direct Z and the contractual agreement requires their unanimous consent. Although C is a party to the joint arrangement, C does not have joint control because C holds only a protective right with respect to Z.

An arrangement might be structured such that, rather than giving some parties protective rights, one party has the deciding vote in case of a tie or disagreement (see section 4.3.2 below).

4.2.2 Potential voting rights and joint control

Common examples of potential voting rights include options, forward contracts, and conversion features of a convertible instrument that, if exercised, would change the decision-making rights of the parties to the arrangement.

How we see it

IFRS 11 does not explicitly address how to deal with potential voting rights when assessing whether there is joint control. However, since joint control requires the parties collectively to have 'control' as defined in IFRS 10, a party to a joint arrangement must consider the requirements of IFRS 10 regarding potential voting rights.

To evaluate whether a potential voting right is substantive, and whether joint control exists, it is necessary to understand the purpose and design of the potential voting right and the context in which it was issued or granted. Guidance on how to assess whether a potential voting right is substantive is discussed further in Chapter 7.

If the potential voting right is substantive, then the holder could have joint control together with the other parties, if the terms of the contractual arrangement confer joint control.

4.2.3 Other evidence of joint control

In some cases, it might be difficult to determine whether the rights of a group of the parties give them collective power over an arrangement. In such cases, the parties consider other evidence to indicate whether they have the current ability to direct the relevant activities collectively. IFRS 10 lists several examples of this evidence (see Chapter 7).

How we see it

Whether the parties can obtain the financial information needed to account for the arrangement (e.g., to apply the equity method in the case of a joint venture) and to provide the required disclosures might also be relevant when determining whether the parties have joint control. If the group of the parties cannot obtain information regarding an arrangement (e.g., because management of that arrangement refuses to provide it), this might indicate that the parties do not have collective control (and therefore, no joint control) over that arrangement.

4.2.4 Delegated decision-making

In some cases, one of the parties might be appointed as the operational manager of the arrangement. This commonly occurs in the extractive and real estate industries, for example, when one of the parties has extensive experience in the type of activities conducted. The operational manager is frequently referred to as the 'operator', but since IFRS 11 uses the terms 'joint operation' and 'joint operator' with specific meaning, to avoid confusion we refer to such a party as the 'manager'. The other parties to the arrangement might delegate some or all the decision-making rights to this manager.

To evaluate joint control, a party to the arrangement assesses whether the contractual arrangement gives the manager control of the arrangement (see section 4.1 above). IFRS 10 also describes how to assess whether the manager is acting as a principal or an agent on behalf of all, or a group of, the parties to the arrangement. Careful consideration of the following is required (see Chapter 7):

- The scope of the manager's decision-making authority
- The rights held by others (e.g., protective rights and removal rights)
- The manager's exposure to the variable returns of the arrangement through management fees earned
- The manager's exposure to the variable returns of the arrangement through other interests, for example, a direct investment held by the manager in the joint arrangement [IFRS 10.B60]

See Chapter 39 for discussion of the application of IFRS 11 to entities in the extractive industries where this situation is more common.

Therefore, depending on the facts and circumstances, it is possible that joint control exists even when a manager is appointed if the arrangement requires contractually agreed unanimous consent for decisions about the relevant activities. Accordingly, arrangements in which the manager appears to have power over the relevant activities must be analysed carefully to determine whether joint control exists and, if so, which parties share in the joint control.

4.2.5 Related parties and *de facto* agents

One party to an arrangement might act as a *de facto* agent for another party (see Chapter 7). *De facto* agents can include related parties (as defined in IAS 24 *Related Party Disclosures*). Determining whether joint control is established includes assessing whether any of the parties to the arrangement is acting as a *de facto* agent of another party. Illustration 4-4 below illustrates this point.

Illustration 4-4: *De facto* agents in joint control

A contractual arrangement has three parties: A has 50% of the voting rights and B and C each have 25%. The contractual arrangement between A, B and C specifies that at least 75% of the voting rights are required to make decisions about the relevant activities of the arrangement.

Analysis

A, B and C collectively control the relevant activities of the arrangement. However, there is neither control nor joint control, because more than one combination of parties can reach 75% and therefore direct the relevant activities.

Variation

If the facts and circumstances changed, such that C is a *de facto* agent of B, then A and B would have joint control, because effectively B would direct 50% (in combination with C's 25%) and A would need B to agree to direct the relevant activities.

How we see it

Identifying *de facto* agents can be complex and requires judgement and a careful evaluation of all the facts and circumstances.

4.2.6 Role of a government

In some countries, the government might retain a substantial interest in certain arrangements.

How we see it

When a government entity is party to an arrangement, the arrangement needs to be evaluated carefully to determine whether joint control or control exists.

This is illustrated in Illustration 4-5 below.

Illustration 4-5: Role of a government

A government owns land, which is believed to contain oil reserves. The government enters into a contractual arrangement with an oil company to drill for oil and sell the product, which the oil company does through a separate vehicle. The oil company evaluates the contractual terms of the arrangement closely to determine whether it has joint control, control, or some other type of interest. The ownership percentages in the separate vehicle do not necessarily determine whether there is control by one party or joint control.

In some cases, the contractual terms might give all final decision-making authority over the relevant activities to the government, in which case, the government would have control.

However, in other cases, the decision-making authority might require unanimous consent by the government and the oil company to direct the activities, in which case, they would have joint control.

4.3 Unanimous consent

Extract from IFRS 11

- 9 Once it has been determined that all the parties, or a group of the parties, control the arrangement collectively, joint control exists only when decisions about the relevant activities require the unanimous consent of the parties that control the arrangement collectively.

[IFRS 11.9].

Assessing whether the arrangement is jointly controlled by all of its parties or by a group of the parties, or controlled by one of the parties individually, can require judgement. It is not necessary for every party to the arrangement to have joint control. Only those parties that collectively control the arrangement must agree. [IFRS 11.9, IFRS 11.B6].

In a joint arrangement, no single party controls the arrangement. A party with joint control of an arrangement can prevent any of the other parties, or a group of the parties, from controlling the arrangement. [IFRS 11.10]. In other words, the requirement for unanimous consent means that any party with joint control of the arrangement can prevent any of the other parties, or a group of the parties, from making unilateral decisions (about the relevant activities) without its consent. [IFRS 11.B9].

IFRS 11 provides additional guidance on when unanimous consent exists. For example, a contractual arrangement can establish unanimous consent implicitly when the proportion of the voting rights needed to make decisions about the relevant activities effectively requires a specified combination of the parties to agree. [IFRS 11.B7]. When that minimum proportion of voting rights can be achieved by more than one combination of the parties agreeing, the arrangement is not a joint arrangement unless it specifies which parties (or combination of parties) are required to agree unanimously to decisions about the relevant activities of the arrangement. [IFRS 11.B8]. IFRS 11 provides some examples to illustrate this point. Examples 1 and 2 are summarised in the following table. [IFRS 11.B8 Example 1, IFRS 11.B8 Example 2].

Example 1	Example 2
Minimum voting requirement	Minimum voting requirement
75% vote to direct relevant activities	75% vote to direct relevant activities
Party A - 50%	Party A - 50%
Party B - 30%	Party B - 25%
Party C - 20%	Party C - 25%
Conclusion	Conclusion
<i>Joint control</i> - A and B collectively control the arrangement (since their votes, and only their votes, together meet the requirement). Since there is only one combination of parties that collectively control the arrangement, it is clear that A and B must unanimously agree. C is a 'party without joint control' (see section 4 above).	<i>No joint control</i> - multiple combinations of parties could collectively control the arrangement (i.e., A and B or A and C could vote together to meet the requirement). Since there are multiple combinations, and the contractual agreement does not specify which parties must agree, there is no unanimous consent.

4.3.1 Arrangements involving parties without joint control

Unanimous consent needs to be established by contract. For example, two parties, A and B, each have 35% of the voting rights in an arrangement with the remaining 30% being widely dispersed and decisions about the relevant activities require approval by a majority of the voting rights. In this situation, A and B have joint control of the arrangement only if the contractual arrangement specifies that decisions about the relevant activities of the arrangement require agreement of both A and B. [IFRS 11.B8 Example 3]. The fact that the remaining 30% of the voting rights are widely dispersed does not implicitly create joint control.

4.3.2 Ultimate voting authority (tie-breakers)

Sometimes an arrangement provides all parties with a voting right, but in the case of a deadlock, or disagreement, one party has the deciding vote (i.e., the final decision or override powers). If any single party could direct the relevant activities unilaterally, there would not be joint control. Illustration 4-6 below illustrates this point.

Illustration 4-6: Ultimate decision-making authority - no joint control (1)

Companies G and H enter into an arrangement and set up a joint steering committee. H has ultimate decision-making authority when the joint steering committee cannot reach an agreement. In this case, there would not be joint control because the agreement of G is not needed.

To evaluate whether H has control, it would also need to assess whether it has exposure to variable returns, and the ability to affect those returns through its power, as required by IFRS 10 (see Chapter 7).

Just because one party has a deciding vote does not necessarily mean that it has control, particularly if other parties can act without the agreement of that party. This is illustrated in Illustration 4-7 below.

Illustration 4-7: Ultimate decision-making authority - no joint control (2)

Companies I, J and K enter into an arrangement and set up a joint steering committee. Each party has one vote, and two votes are needed to carry a motion. K has ultimate decision-making authority when the joint steering committee cannot reach an agreement. For example, if no combination of I, J and K can agree with each other, K would have the ultimate decision-making authority.

There is no joint control, since there are multiple combinations of parties that could vote together, and the contractual agreement does not specify which parties must agree. For example, I and J could agree together, without the agreement of K. In addition, K does not control the arrangement, even though it has a deciding vote when the joint steering committee cannot reach an agreement, because I and J can act without the agreement of K.

4.3.3 Arbitration

Contractual arrangements often include terms and conditions relating to the resolution of disputes and might provide for arbitration. The existence of such terms and conditions does not prevent the arrangement from being jointly controlled and, consequently, from being a joint arrangement. [IFRS 11.B10]. A party to a joint arrangement evaluates the facts and circumstances related to the arbitration procedures to determine the implications for joint control. For example, if the arbitration process is neutral to both parties, which might be achieved by using a mutually agreed upon arbitrator, there might be joint control. Alternatively, arbitration procedures that favour one party might indicate that there is no joint control.

4.3.4 Statutory mechanisms

Statutory mechanisms can create legally enforceable rights and obligations (see section 3 above). Therefore, when evaluating whether an arrangement implicitly results in joint control, an entity considers the statutory requirements in the relevant jurisdiction under which the contractual arrangement was established.

4.4 Other practical issues with assessing joint control**4.4.1 Undivided interests or a joint arrangement**

Entities sometimes acquire undivided interests (a share in a commonly-owned asset, such as land or real estate) or enter into joint arrangements with a common economic goal: to share in the benefits and obligations of owning an asset. The appropriate accounting depends on the facts and circumstances and might require judgement.

Undivided interests are common in the extractives industry and are discussed in Chapter 39. They are usually subject to joint control and can, therefore, be accounted for as joint operations. However, some arrangements do not establish joint control but are, instead, based on some form of supermajority voting whereby a qualified majority (e.g., 75%) of the participants can approve decisions. This situation usually arises when the group of participants is too large for joint control to be practical or when the main investor wants to retain a certain level of influence.

Where joint control does not exist, such undivided interests cannot be accounted for as joint operations in the scope of IFRS 11. Instead, the appropriate accounting treatment by the investor depends on the nature of the arrangement.

Illustration 4-8 below illustrates a scenario in which the accounting depends on the nature of the arrangement.

Illustration 4-8: Joint purchase of an aircraft

Five parties jointly buy an aircraft. By contractual agreement, each party has the right to use the aircraft for a certain number of days each year and shares proportionately in the maintenance costs. They share decision-making regarding the maintenance and disposal of the aircraft, which are the relevant activities for that aircraft. Those decisions require agreement of parties holding 75% of the voting rights. There are multiple combinations of how the 75% threshold can be achieved and the contractual agreement does not specify which parties must agree. Therefore, there is no unanimous consent.

Analysis

The agreement is not a joint arrangement, as the contractual agreement does not establish joint control. The appropriate accounting depends on the rights and obligations of each party under the contractual agreement.

4.4.2 Evaluating multiple agreements together

Sometimes it is necessary to evaluate multiple agreements together, to understand the purpose and design of an arrangement, and to determine whether there is joint control. A party might appear to have joint control of a joint arrangement when considering one agreement in isolation, but that party might not have joint control when considered in the full context of its purpose and design. Illustration 4-9 below illustrates this point.

Illustration 4-9: Layered agreements

Companies A, B, C and D enter into Agreement No.1 to undertake oil and gas exploration. Committee No.1 is formed to direct all related activities, including review and approval of annual budgets and operating policies. Committee No.1 consists of six members, of whom D nominates three members. A, B, and C each nominate one of the remaining three members. The decisions of Committee No.1 require the unanimous vote of the members.

A and B enter into Agreement No.2, which establishes Committee No.2 to coordinate cooperation between A and B, with respect to the same oil and gas exploration activity. A and B each appoint one representative to Committee No.2. Committee No.2 has the power to make decisions to be submitted for approval to Committee No.1. Any matter to be decided by Committee No.2 requires the consent of both parties. However, if agreement cannot be reached between A and B, B has the deciding vote. The decisions made in Committee No.2 are binding on A and B and they must vote accordingly in Committee No.1.

In this fact pattern, there are two separate contractual agreements. However, they are evaluated together to determine if there is a joint arrangement, because they relate to the same oil and gas exploration activity. For example, if Agreement No.1 were considered in isolation, it would appear that A, B, C and D all have joint control over the arrangement because its decisions require the unanimous vote of the members.

However, Agreement No.1 is evaluated together with Agreement No.2. Accordingly, only B, C and D have joint control over the joint arrangement. B can effectively direct A how to vote (by virtue of Agreement No.2) in Committee No.2, so A does not have joint control with the other parties. A is effectively a *de facto* agent of B and represents a 'party without joint control' (see section 4.2.5 above).

5 Classification of a joint arrangement: joint operations and joint ventures

A joint arrangement is classified as either a joint operation or a joint venture. [IFRS 11.14, IFRS 11.6].

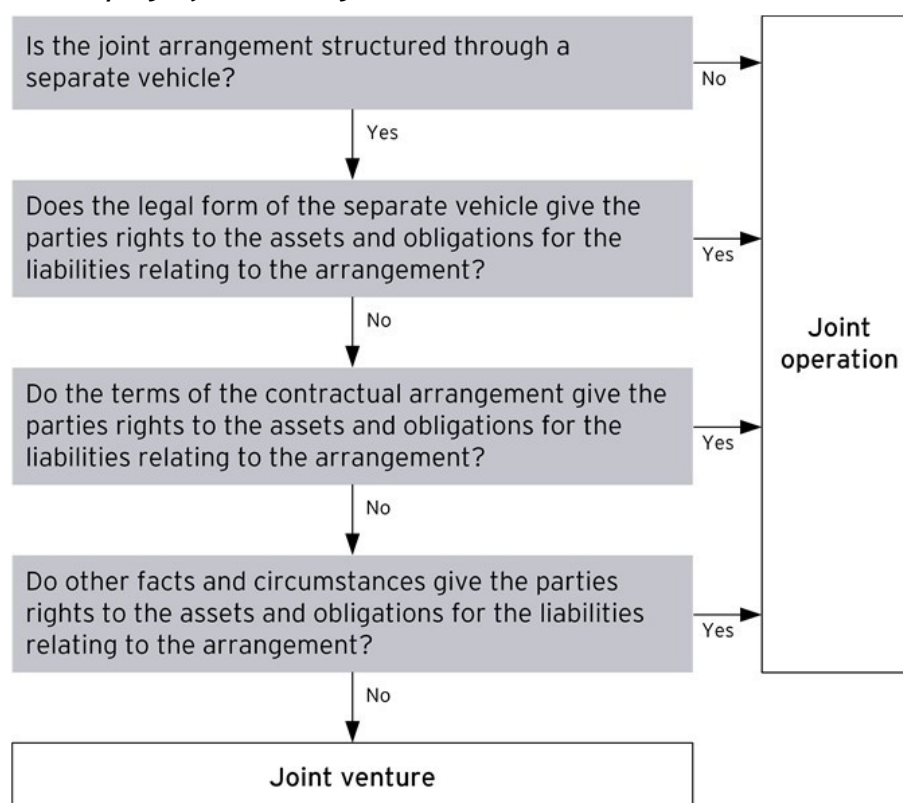

Extract from IFRS 11

- 14** An entity shall determine the type of joint arrangement in which it is involved. The classification of a joint arrangement as a joint operation or a joint venture depends upon the rights and obligations of the parties to the arrangement.

The table below compares the two types of joint arrangements and provides an overview of the accounting for each under IFRS 11.

Type of arrangement	Joint operation	Joint venture
<i>Definition</i>	A joint arrangement whereby the parties that have joint control of the arrangement have rights to the assets, and obligations for the liabilities, relating to the arrangement. [IFRS 11 Appendix A].	A joint arrangement whereby the parties that have joint control of the arrangement have rights to the net assets of the arrangement. [IFRS 11 Appendix A].
<i>Parties with joint control</i>	A joint operator is a party with joint control in a joint operation. [IFRS 11.15].	A joint venturer is a party with joint control in a joint venture. [IFRS 11.16].
<i>Accounting overview</i>	<p>Each party to the arrangement, i.e., joint operators and parties without joint control, accounts for the following in accordance with the applicable IFRS accounting standard:</p> <ul style="list-style-type: none"> ▪ Its assets, including its share of any assets held jointly ▪ Its liabilities, including its share of any liabilities incurred jointly ▪ Its revenue from the sale of its share of the output arising from the joint operation ▪ Its share of revenue from the sale of the output by the joint operation ▪ Its expenses, including its share of any expenses incurred jointly. [IFRS 11.20, IFRS 11.23]. <p>Accounting for joint operations is discussed further at section 6 below.</p>	<p>A joint venturer accounts for its investment in the joint venture applying IAS 28.</p> <p>Parties without joint control account for the investment in accordance with IFRS 9, unless the parties have significant influence, in which case the parties apply IAS 28. [IFRS 11.24, IFRS 11.25].</p> <p>Accounting for joint ventures is discussed further at section 7 below.</p>

The process to classify a joint arrangement is illustrated in the following flowchart, which includes the criteria to be met for the joint arrangement to be a joint venture. [IFRS 11.B21].

Figure 5-1: Classifying a joint arrangement

We discuss key aspects of the classification process within this section as follows:

- Separate vehicle - see section 5.1 below
- Legal form of the separate vehicle - see section 5.2 below
- Contractual terms - see section 5.3 below
- Other facts and circumstances - see section 5.4 below [IFRS 11.17, IFRS 11.B15]

Judgement is required in assessing whether a joint arrangement is a joint operation or a joint venture. An entity evaluates its rights and obligations arising from a joint arrangement in order to classify it. [IFRS 11.17]. IFRS 12 requires an entity to disclose information when it makes significant judgements and assumptions to classify the type of joint arrangement, specifically when the arrangement has been structured through a separate vehicle (see Chapter 14). [IFRS 12.7].

IFRS 11 also includes examples illustrating this evaluation, some within the application guidance and others as illustrative examples accompanying the standard (see section 5.5 below).

How we see it

When classifying a joint arrangement, parties to the joint arrangement would normally reach the same conclusion regarding classification. To reach different conclusions regarding the classification of a joint arrangement would mean that one party has rights to assets and obligations for the liabilities while the other has rights to the net assets, within the same separate vehicle.

The classification of joint arrangements depends upon the parties' rights and obligations arising from the arrangement in the normal course of business. [IFRS 11.B14]. These concepts are discussed in more detail in the context of analysing the contractual terms of the arrangement, and the other facts and circumstances in sections 5.3 and 5.4 below, respectively.

The requirement to classify a joint arrangement based on the normal course of business is consistent with the requirement to consider the purpose and design of an investee in IFRS 10 (see Chapter 7).

How we see it

We believe that the purpose and design of a joint arrangement is an important consideration in determining the appropriate classification.

5.1 Separate vehicle or not

The first factor in classifying a joint arrangement is the assessment of whether a separate vehicle exists. A joint arrangement in which the assets and liabilities relating to the arrangement are held in a separate vehicle can be either a joint venture or a joint operation. [IFRS 11.B19, IFRS 11.B20].

A separate vehicle is defined in IFRS 11 as “A separately identifiable financial structure, including separate legal entities or entities recognised by statute, regardless of whether those entities have a legal personality.” [IFRS 11 Appendix A]. Apart from those entities mentioned in the definition, IFRS 11 does not provide any examples of what might constitute a ‘separate vehicle’, and there is no clear definition of what constitutes a ‘separately identifiable financial structure’. The existence of a separate vehicle does not depend on whether the assets and liabilities within the vehicle meet the definition of a ‘business’ in IFRS 3. [IFRS 11.BC29].

The desired economic substance often drives the selection of a particular legal form of a separate vehicle. However, the choice might be driven by tax, regulatory requirements or other reasons that can alter the intended economic substance, necessitating that the parties use contractual arrangements to modify the effects that the legal form would otherwise have on their rights and obligations. [IFRS 11.BC32].

Many common arrangements, such as partnerships, corporations, trusts and syndicates, are likely to be considered separate vehicles, although local laws are also considered. In some jurisdictions, an oral agreement is considered sufficient to create a contractual partnership, and thus, the hurdle for having a separate vehicle could be quite low.

A contract alone can create a separate vehicle, such as when it creates a deemed separate entity (referred to as a ‘silo’ in IFRS 10) or creates a partnership. A silo exists when specified assets of an arrangement are the only source of payment for specified liabilities of an arrangement, and parties other than those with the specified liability do not have rights or obligations related to the specified assets or to residual cash flows from those assets. That is, a silo exists when, in substance, all the assets, liabilities and equity of that deemed separate entity are ring-fenced from the ‘host’ arrangement. The identification of silos is discussed further in Chapter 7.

The term ‘separate vehicle’ is broader than an ‘entity’ as illustrated in the diagram below. We understand that this was done primarily to address concerns that, in some jurisdictions, separate vehicles created to establish a joint arrangement are not necessarily legal reporting entities.

The IASB concluded that it would be rare that a joint arrangement would give the parties rights to the net assets without having a separate vehicle and therefore no further assessment is required in this scenario; when there is no separate vehicle, the arrangement is a joint operation. [IFRS 11.BC27].

5.2 Legal form of the separate vehicle

Once it is determined that a separate vehicle exists, the second step is to analyse its legal form to determine whether it gives the parties rights to the net assets or rights to the assets and obligations for the liabilities of the arrangement. [IFRS 11.B21]. In other words, does the separate vehicle confer separation between the parties and the separate vehicle?

The legal form of the separate vehicle is relevant as an initial indicator of the parties' rights to the assets, and obligations for the liabilities, relating to the arrangement. When the legal form of the separate vehicle does not confer separation between the parties and the vehicle, the arrangement is a joint operation. [IFRS 11.B24, IFRS 11.BC31].

When separation between the parties and the separate vehicle exists, this is not determinative. The terms agreed by the parties in their contractual arrangement (see section 5.3 below) and other facts and circumstances (see section 5.4 below) can override the assessment of the rights and obligations conferred upon the parties by the legal form of the separate vehicle and the arrangement can still be classified as a joint operation. [IFRS 11.B23].

Local laws can affect the form of the separate vehicle. For example, in many countries, a corporation confers separation between the parties and the separate vehicle and provides the parties with rights to net assets. The liabilities of the corporation are limited to the corporation and creditors do not have recourse to the investors in the corporation for those liabilities. These are indicators that a corporation that is jointly controlled is a joint venture.

By contrast, partnerships that have unlimited liability, which are common in many countries, often do not confer separation between the parties and the separate vehicle. They provide the partners with rights to the assets and obligations for the liabilities, indicating that the arrangement is a joint operation. When creditors of the partnership have direct recourse to the joint arrangement partners, the partners are the primary obligors, which is indicative of a joint operation. However, in a partnership when creditors have recourse to the partners only after the partnership has defaulted, there is separation between the partners and the vehicle. The liability of the partners as secondary obligor is akin to a guarantee. This is an indicator of a joint venture.

In March 2015, the IFRS IC published an agenda decision³ in which it observed that two seemingly similar joint arrangements from an operational perspective might be classified differently because one is structured through a separate vehicle and the other is not. The legal form of the separate vehicle could affect the rights and obligations of the parties to the joint arrangement and thereby affect the economic substance of the rights and obligations of the parties to the joint arrangement. [IFRS 11.B22, IFRS 11.BC43].

5.3 Contractual terms

The next step in classifying a joint arrangement structured through a separate vehicle is to examine the contractual terms of the arrangement. While the legal form of the separate vehicle gives certain rights and obligations to each of the parties, the contractual terms of the joint arrangement can unwind the effects of the legal form and give the parties different rights and obligations.

IFRS 11 includes examples (which are not exhaustive) of common contractual terms found in joint arrangements and indicates whether these are examples of joint operations or joint ventures. These are included in the table below. [IFRS 11.B27].

Joint operation	Joint venture
Terms of the contractual arrangement	
The parties are provided with rights to the assets, and obligations for the liabilities, relating to the arrangement.	The parties are provided with rights to the net assets of the arrangement (i.e., it is the separate vehicle, not the parties, that has rights to the assets and obligations for the liabilities relating to the arrangement).
Rights to assets	
The parties share all interests (e.g., rights, title or ownership) in the assets relating to the arrangement in a specified proportion (e.g., in proportion to the parties' ownership interest in the arrangement or in proportion to the activity carried out through the arrangement that is directly attributed to them).	The assets brought into the arrangement or subsequently acquired by the joint arrangement are the arrangement's assets. The parties have no interests (i.e., no rights, title or ownership) in the assets of the arrangement.

³ [IFRIC Update](#), March 2015, available on the IFRS Foundation's website.

Joint operation	Joint venture
Obligations for liabilities	
The parties share all liabilities, obligations, costs and expenses in a specified proportion (e.g., in proportion to the parties' ownership interest in the arrangement or in proportion to the activity carried out through the arrangement that is directly attributed to them).	The joint arrangement is liable for the debts and obligations of the arrangement. The parties are liable under the arrangement only to the extent of their respective investments in the arrangement, or to their respective obligations to contribute any unpaid or additional capital to the arrangement, or both.
The parties are liable for claims raised by third parties.	Creditors of the joint arrangement do not have rights of recourse against any party with respect to debts or obligations of the arrangement.
Revenues and expenses and profits or losses	
Each party receives an allocation of revenues and expenses based on the relative performance of each party to the joint arrangement. For example, the contractual arrangement might establish that revenues and expenses are allocated based on the capacity that each party uses in a plant operated jointly, which could differ from their ownership interest in the joint arrangement. In other instances, the parties might have agreed to share the profit or loss relating to the arrangement based on a specified proportion such as the parties' ownership interest in the arrangement. This would not prevent the arrangement from being a joint operation if the parties have rights to the assets, and obligations for the liabilities, relating to the arrangement.	Each party has a share in the profit or loss relating to the activities of the arrangement.
Guarantees	
The parties to joint arrangements are often required to provide guarantees to third parties that, for example, receive a service from, or provide financing to, the joint arrangement. The provision of such guarantees, or the commitment by the parties to provide them, does not determine, by itself, that the joint arrangement is a joint operation. The feature that determines whether the joint arrangement is a joint operation or a joint venture is whether the parties have obligations for the liabilities relating to the arrangement (for some of which the parties might or might not have provided a guarantee). See section 5.3.1 below.	
In many cases, the rights and obligations agreed to by the parties in their contractual arrangements are consistent, or do not conflict, with the rights and obligations conferred on the parties by the legal form of the separate vehicle. [IFRS 11.B25]. However, as discussed in section 5.2 above, this is not always the case, [IFRS 11.B26], as shown in Illustration 5-1 below. [IFRS 11.B26 Example 4].	
Illustration 5-1: Modification of legal form by contractual terms	
Companies A and B jointly start a Corporation C, over which they have joint control. The legal form of the separate vehicle (a corporation) preliminarily indicates that C is a joint venture. However, the contractual arrangement states that A and B have rights to the assets of C and are obligated for the liabilities of C in a specified proportion. Effectively, this contractual term unwinds the effects of the legal form (corporation). Therefore, C is a joint operation.	
When the contractual arrangement specifies that the parties have rights to the assets, and obligations for the liabilities, relating to the joint arrangement, they are parties to a joint operation, and do not further consider other facts and circumstances when classifying the joint arrangement. [IFRS 11.B28].	

5.3.1 Guarantees

Parties to joint arrangements might provide guarantees to third parties. For example, a guarantee or commitment that:

- Services provided by the joint arrangement to the third party will be of a certain quality or nature
- It will support the joint arrangement in the event of distress

Or

- It will repay funding received from the third party

IFRS 11 is clear that the issuance of guarantees, or a commitment by the parties to provide guarantees, does not, by itself, determine that the joint arrangement is a joint operation. [IFRS 11.B27]. This is because the guarantee does not give the guarantor a present obligation for the underlying liabilities.

If the issuer of the guarantee must pay or perform under that guarantee, this might indicate that facts and circumstances have changed, or this event might be accompanied by a change in the contractual terms of the arrangement. These changes would trigger a reassessment of whether the arrangement is still subject to joint control and, if so, whether the joint arrangement is a joint operation or a joint venture, as discussed in section 8 below.

When a guarantee meets the definition of a 'financial guarantee' (see Chapter 41), the party issuing the guarantee accounts for the guarantee in accordance with IFRS 9, irrespective of the classification of the joint arrangement.

5.3.2 Contractual terms upon liquidation or dissolution of joint arrangement

In some joint arrangements, the parties contribute assets to the joint arrangement to use in the activity while it continues to operate. However, if the joint arrangement is liquidated or dissolved, the contributed assets revert to the contributing party. The question is whether this contractual term gives the parties rights to the assets. If so, the joint arrangement is classified as a joint operation.

How we see it

All relevant facts and circumstances are considered in reaching a conclusion. In our view, a contractual agreement whereby assets contributed to a joint arrangement revert to the contributing party upon liquidation or dissolution of the joint arrangement, does not necessarily mean that the arrangement is a joint operation because the contributing party does not have rights to the contributed assets in the normal course of business, based on its purpose and design (see section 5 above).

If the party contributing the asset has a currently exercisable call option on that asset, it includes this fact in the analysis. The call option is accounted for in accordance with the relevant IFRS.

5.4 Other facts and circumstances

When the legal form of the separate vehicle and the terms of the contractual arrangement do not specify that the parties have rights to the assets, and obligations for the liabilities, relating to the arrangement, then the parties must consider all other facts and circumstances to assess whether the arrangement is a joint operation or a joint venture. [IFRS 11.B29, IFRS 11.B30]. The 'other facts and circumstances' must be substantive and demonstrate that the parties have rights to the assets and obligations for the liabilities of the separate vehicle to classify the joint arrangement as a joint operation.

In March 2015, the IFRS IC published agenda decisions⁴, incorporated into the discussions in sections 5.4.1 and 5.4.2 below, that provide a helpful overview of the issues that require judgement and guidance to consider. The assessment of 'other facts and circumstances' can be challenging in practice.

⁴ [IFRIC Update](#), March 2015, available on the IFRS Foundation's website.

5.4.1 How and why particular facts and circumstances create rights and obligations

Frequently asked questions

Question 5-1: How does an entity evaluate the other facts and circumstances when classifying a joint arrangement that is structured through a separate vehicle whose legal form causes the separate vehicle to be considered in its own right?

The IFRS IC noted the following regarding a joint arrangement that is structured through a separate vehicle whose legal form causes the separate vehicle to be considered in its own right:⁵

- (a) The assessment of other facts and circumstances is performed when there is no contractual arrangement to reverse or modify the rights and obligations conferred by the legal form of the separate vehicle through which the arrangement has been structured.
- (b) The assessment focuses on whether the other facts and circumstances establish, for each party to the joint arrangement, rights to the assets and obligations for the liabilities relating to the joint arrangement.
- (c) Parties to the joint arrangement have rights to the assets of the joint arrangement through other facts and circumstances when they: *[IFRS 11.B31, IFRS 11.B32, IFRS 11.B33]*
 - (i) Have rights to substantially all of the economic benefits (for example, 'output') of assets of the arrangement
And
 - (ii) Have obligations to acquire those economic benefits and thus assume the risks relating to those economic benefits (for example, the risks relating to the output).
- (d) Parties to the joint arrangement have obligations for liabilities of the joint arrangement through other facts and circumstances when: *[IFRS 11.B14, IFRS 11.B32, IFRS 11.B33]*
 - (i) Because of their rights to, and obligations for, the assets of the joint arrangement, they provide cash flows that are used to settle liabilities of the joint arrangement
And
 - (ii) Settlement of the liabilities of the joint arrangement occurs on a continuous basis.

A joint arrangement structured through a separate vehicle is classified as a joint operation only when each party to the joint arrangement meets the above criteria and therefore has both rights to the assets of the joint arrangement and obligations for the liabilities of the joint arrangement through other facts and circumstances.

Although the IFRS IC decided not to add this issue to its agenda, it observed that a joint arrangement could be classified as a joint operation based on other facts and circumstances, only if an entity is able to demonstrate that:

- (a) Each party to the joint arrangement has rights and obligations relating to economic benefits of the assets of the arrangement.
And
- (b) Each party is obliged to provide cash to the arrangement through enforceable obligations, which is used to settle the liabilities of the joint arrangement on a continuous basis.

The IFRS IC observed that the concept of 'economic substance' might not be consistently understood or applied in practice in the context of this assessment. It confirmed that assessing other facts and circumstances focuses on whether each party has rights to the assets, and obligations for the liabilities, relating to the joint arrangement. It is not a test of how closely or fully involved each party is with the operation of the separate vehicle, but instead analyses whether other facts and circumstances override the rights and obligations conferred on each party by the legal form of the separate vehicle. It is therefore irrelevant whether the activities of the separate vehicle are closely related to the activities of the parties on their own, or whether the parties are closely involved in the operations of the arrangements. *[IFRS 11.BC43]*.

⁵ [IFRIC Update](#), March 2015, available on the IFRS Foundation's website.

In March 2014, the IFRS IC discussed a staff paper that examined common features of 'project entities' in the context of assessing 'other facts and circumstances.' As noted in Question 5-1 above, the IFRS IC decided not to add this issue to its agenda but noted that the examples are fact-specific, and consequently it is unclear if the Board agreed with all elements of the staff analysis that follows.

The staff's analysis⁶ argued that, in this hypothetical example, these features did not result in classification as a joint operation by the parties to the joint arrangement ('the parties'), for the following reasons:

- Certain features do not relate to the parties' rights to the assets and obligations for the liabilities: The nature of the project entity's assets and liabilities, the fact that the separate vehicle is thinly capitalised, has no workforce of its own, is a limited-life entity and obtains customers through the parties' resources.
- The parties are entitled to the net cash amount from the sale of output, indicating that the parties have rights to 'net' economic benefits.
- The parties are responsible for delivering the services to the ultimate customer, subcontracted by the separate vehicle. This is a subcontractor relationship and does not indicate rights to the assets of the separate vehicle.
- The separate vehicle has primary obligation for its liabilities, therefore the parties do not settle the liabilities of the separate vehicle on a continuous basis.
- The parties finance the separate vehicle for any loss or cash needs. This indicates an obligation, but obligations are not independent of rights and so this feature alone does not give the parties obligations for the liabilities.
- Non-completion and litigations risks are similar to the risks inherent in the role of guarantor and so do not indicate that the parties settle the liabilities of the separate vehicle on a continuous basis.

In July 2014, the IFRS IC discussed the classification of a specific type of joint arrangement structure established for a bespoke construction project to deliver a construction service to a single customer. The IFRS IC noted⁷ that the features analysed⁸ would not indicate that the parties to the joint arrangement have, in substance, direct rights to the assets of the joint arrangement, but could indicate that the parties to the joint arrangement have, in substance, direct obligations for the liabilities of the joint arrangement, depending on the nature of the parties' obligations. Therefore, the joint arrangement illustrated would not be classified as a joint operation.

Frequently asked questions

Question 5-2: Are constructive obligations considered when classifying a joint arrangement?

IFRS 11 uses the word 'obligation', therefore these obligations can be legal or constructive. One feature of obligations is that an entity has no realistic alternative to settling the obligation. In its comment letter analysis⁹, the staff noted that evaluating the existence of obligations includes consideration of the design and purpose of the joint arrangement, its business needs and its past practices to the extent that they affect the existence of obligations, including constructive obligations.

The agenda decision summarised at Question 5-1 above clarified that the assessment of other facts and circumstances focuses on whether they create enforceable rights to the assets and obligations for the liabilities. The assessment does not also consider the design and purpose of the joint arrangement, the entity's business needs and its past practices. However, when evaluating the existence of liabilities, these matters are considered.

5.4.2 Facts and circumstances indicating rights to assets

Extract from IFRS 11

B31 When the activities of an arrangement are primarily designed for the provision of output to the parties, this indicates that the parties have rights to substantially all the economic benefits of the assets of the arrangement. The parties to such arrangements often ensure their access to the outputs provided by the arrangement by preventing the arrangement from selling output to third parties.

[IFRS 11.B31].

5.4.2.A Output not taken in proportion to ownership

In March 2015, the IFRS IC published an agenda decision¹⁰ that addressed the accounting treatment when the joint operator's share of output purchased differs from its share of ownership interest in the joint operation. The IFRS IC specifically considered a variation to Example 5 of the application guidance to IFRS 11. Example 5 considers a joint arrangement structured through a separate vehicle from which the parties to the joint arrangement have committed to purchase substantially all the output produced at a price designed to achieve a break-even result. In that example, the parties to the joint arrangement are considered to have rights to the assets and obligations for the liabilities and the arrangement is classified as a joint operation. [IFRS 11.B32 Example 5]. In the variation considered, the parties' percentage ownership interest in the separate vehicle differs from the percentage share of the output produced, which each party is obliged to purchase.

The IFRS IC identified several issues:

- When the joint arrangement agreement does not specify the allocation of assets, liabilities, revenues or expenses, does the share of assets, liabilities, revenue and expenses recognised reflect the percentage of ownership of the legal entity or does it reflect the percentage of output purchased by each joint operator?
- When the share of output purchased by each party varies over the life of the joint arrangement, over what time horizon is the share of output considered?
- If the joint operators made a substantial investment in the joint operation that differed from their ownership interest, it would be necessary to determine the other elements of the arrangements that could explain why there is a difference between the percentage of ownership interest and the percentage share of the output produced that each party is obliged to purchase.

The IFRS IC noted that it is important to understand why the share of the output purchased differs from the ownership interests in the joint operation and that judgement would be needed to determine the appropriate classification and accounting for the joint arrangement. However, the IFRS IC decided not to add the issue to its agenda because it would require the development of additional guidance.¹¹

5.4.2.B Substantially all of the output

In March 2015, the IFRS IC published another agenda decision¹² applying the other facts and circumstances test to specific fact patterns. Parties to the joint arrangement have rights to the assets of the joint arrangement when they have rights to substantially all of the economic benefits (for example, 'output') of the assets of the arrangement. The IFRS IC noted that the economic benefits of the assets of the joint arrangement relate to the cash flows arising from the parties' rights to, and obligations for, the assets. [IFRS 11.B31, IFRS 11.B32]. Therefore, the term 'substantially all of the output' is based on the monetary value of the output, rather than physical quantities.

¹⁰ [IFRIC Update](#), March 2015, available on the IFRS Foundation's website.

¹¹ [IFRIC Update](#), March 2015, available on the IFRS Foundation's website.

¹² [IFRIC Update](#), March 2015, available on the IFRS Foundation's website.

5.4.3 Facts and circumstances indicating obligations for liabilities

“When the parties are substantially the only source of cash flows contributing to the continuity of the operations of the arrangement, this indicates that the parties have an obligation for the liabilities relating to the arrangement.” [IFRS 11.B32].

The parties to a joint arrangement might be substantially the only source of cash flows, for example, when the parties:

- Make payments to third parties under previously issued guarantees on behalf of the joint arrangement
- Are obliged to provide loan financing or working capital funding in the normal course of business
- Commit to provide cash calls in the future (see section 5.4.3.A below)

Or

- Are obliged to purchase all the output produced by the joint arrangement, which they can but are not required to resell to third parties (see section 5.4.3.B below)

5.4.3.A Assessing the obligation related to cash calls or capital contributions

Questions have arisen as to whether parties would be considered ‘substantially the only source of cash flows’ if they provide cash flows at inception of a joint arrangement, but are not expected to do so thereafter, and no other parties are expected to provide cash flows until the end of an activity.

Alternatively, parties might provide cash flows through a series of ‘cash calls’ throughout the arrangement. When a party is liable only to the extent of an obligation to contribute unpaid or additional capital to a joint arrangement, that is an indicator that the arrangement is a joint venture. [IFRS 11.B27].

How we see it

Notwithstanding IFRS 11.B27, in our view, the provision of cash flows at the inception of a joint arrangement, and/or the expectation that no other parties will provide cash flows until the end of an activity, are not conclusive in determining whether the party has rights to the net assets. That is, it is not conclusive whether the joint arrangement is a joint operation or a joint venture (see Illustration 5-2 below).

Illustration 5-2: Construction and real estate sales

Two parties established a separate vehicle over which they have joint control. Neither the legal form nor the contractual terms of the joint arrangement give the parties rights to the assets or obligations for the liabilities of the arrangement. Other facts and circumstances are as follows:

- The purpose of the joint arrangement is to construct a residential complex for selling residential units to the public.
- Contributed equity by the parties is sufficient to purchase land and raise debt finance from third parties to fund construction.
- Sales proceeds will be used in the following priority:
 - Repayment of external debt
 - Remaining profit distributed to parties

Analysis

Since there is a separate vehicle, and because neither the legal form nor the contractual terms of the joint arrangement give the parties rights to the assets or obligations for the liabilities of the vehicle, the preliminary analysis indicates that this is a joint venture. The fact that the parties are the only source of cash flows at inception does not necessarily indicate that the parties have rights to the assets or obligations for the liabilities. More information is needed and judgement will be required in determining whether this is a joint venture or a joint operation.

Variation

The contributed equity is not sufficient to purchase the land and raise debt financing. There is an expectation or requirement, that the parties will contribute cash to the joint arrangement through a series of cash calls. The fact that the parties are expected to be a source of cash flows is not conclusive that the parties have rights to the assets and/or obligations for the liabilities. More information is needed before concluding whether this is a joint venture or a joint operation.

The above example includes the fact that third party financing is available to fund construction. In March 2015, the IFRS IC considered the effect of third party financing on the classification of a joint arrangement.

Frequently asked questions

Question 5-3: Does financing from a third party prevent a joint arrangement from being classified as a joint operation?

No. The IFRS IC discussed how 'other facts and circumstances' should be applied to specific fact patterns. It subsequently published an agenda decision confirming that, if the cash flows to the joint arrangement from the sale of output to the parties, along with any other funding that the parties are obliged to provide, satisfy the joint arrangement's liabilities, then third party financing alone would not affect the classification of the joint arrangement. This conclusion is appropriate irrespective of whether the financing occurs at inception or during the course of the joint arrangement's operations. The IFRS IC noted that in this situation, "the joint arrangement will, or may, settle some of its liabilities using cash flows from third-party financing, but the resulting obligation to the third-party finance provider will, in due course, be settled using cash flows that the parties are obliged to provide."

5.4.3.B Assessing the obligation to purchase all the output produced by the joint arrangement

If the parties to the joint arrangement are obliged to purchase all the output produced by the joint arrangement, the effect of the arrangement is that, in substance, the liabilities of the joint arrangement are satisfied by the cash flows received from the parties. When the parties are substantially the only source of cash flows contributing to the continuity of the operations of the arrangement, this indicates that the parties have obligations for the liabilities of the arrangement. [IFRS 11.B32, IFRS 11.B32 Example 5].

In March 2015, the IFRS IC discussed the following matters related to this assessment.

Frequently asked questions

Question 5-4: Does the fact that the output from the joint arrangement is sold to the parties to the joint arrangement at a market price prevent the joint arrangement from being classified as a joint operation, when assessing other facts and circumstances?

No. The IFRS IC observed that the sale of output from the joint arrangement to the parties at market price, on its own, is not a determinative factor for the classification of the joint arrangement. Instead, the parties would need to exercise judgement and consider whether the cash flows provided to the joint arrangement through the parties' purchase of the output from the joint arrangement at market price, along with any other funding that the parties are obliged to provide, would be sufficient to enable the joint arrangement to settle its liabilities on a continuous basis.

Question 5-5: Does the nature of the output (i.e., fungible versus bespoke or custom) produced by the joint arrangement determine the classification of a joint arrangement when assessing other facts and circumstances?

No. The IFRS IC noted that whether the output that is produced by the joint arrangement and purchased by the parties is fungible or bespoke (or custom), is not a determinative factor for the classification of the joint arrangement. IFRS 11 focuses rather on the existence of cash flows flowing from the parties to satisfy the joint arrangement's liabilities.

5.4.4 Comprehensive example illustrating evaluation of facts and circumstances

Illustration 5-3 below (summarised from Example 5 of IFRS 11) illustrates how the facts and circumstances might indicate that the joint arrangement is a joint operation, even if the legal form and contractual terms point towards the joint arrangement being a joint venture. [IFRS 11.B32, IFRS 11.B32 Example 5].

Illustration 5-3: Modification of legal form and contractual arrangement by facts and circumstances

Companies A and B jointly establish a Corporation C, over which they have joint control. The legal form of C, an incorporated entity, initially indicates that the assets and liabilities held in C are the assets and liabilities of C. The contractual arrangement between the parties does not specify that the parties have rights to the assets or obligations for the liabilities of C. Accordingly, the legal form of C and the terms of the contractual arrangement indicate that the arrangement is a joint venture.

However, A and B agree to the following:

- A and B will purchase all the output produced by C in a ratio of 50:50.
- C cannot sell any of the output to third parties, unless A and B approve this. The purpose of the arrangement is to provide A and B with the output they require, so sales to third parties are expected to be uncommon and not material.
- The price of the output sold to A and B is set by the parties at a level that is designed to cover the costs of production and administrative expenses incurred by C. The arrangement is intended to operate at a break-even level.

Analysis

- The obligation of A and B to purchase all the output produced by C reflects the exclusive dependence of C upon A and B for the generation of cash flows and, thus, implicitly that A and B have an obligation for the liabilities of C.
- The fact that A and B have rights to all the output produced by C means that they are consuming, and therefore have rights to, all the economic benefits of the assets of C.

These facts and circumstances indicate that the arrangement is a joint operation.

Variation 1

If, instead of A and B using their share of the output themselves, they sold their share of the output to third parties, C would still be a joint operation because C remains exclusively dependent on A and B for generation of cash flows.

Variation 2

If A and B changed the terms of the contractual arrangement so that the arrangement was able to sell output to third parties, this would result in C assuming demand, inventory and credit risks, such that A and B would not have substantially all of the economic benefits of C's assets. In this case, it is likely that the joint arrangement would be a joint venture.

5.5 Illustrative examples accompanying IFRS 11

IFRS 11 provides several examples that illustrate aspects of IFRS 11, but are not intended to provide interpretative guidance. The examples portray hypothetical situations illustrating the judgements that might be used when applying IFRS 11 in different situations. [IFRS 11.IE1]. Illustration 5-4 to Illustration 5-9 are based on these illustrative examples accompanying IFRS 11. [IFRS 11.IE2-IE52, IFRS 11.IE Example 1-6].

Illustration 5-4: Construction services

Companies A and B (the parties) provide many types of public and private construction services. They set up a contractual arrangement to design and construct a road between two cities for a government. The contractual arrangement determines the participation shares of A and B and establishes joint control of the arrangement, the purpose of which is the delivery of the road.

The parties set up a separate vehicle (Entity Z) through which to conduct the arrangement. On behalf of A and B, Z enters into the contract with the government. In addition, the assets and liabilities relating to the arrangement are held in Z. The main feature of Z's legal form is that the parties, not Z, have rights to the assets, and obligations for the liabilities, of Z.

The contractual arrangement between A and B also establishes that:

- (a) The rights to all the assets needed to undertake the activities of the arrangement are shared by the parties based on their participation shares in the arrangement.
- (b) The parties have several and joint responsibility for all operating and financial obligations relating to the activities of the arrangement based on their participation shares in the arrangement.
- (c) The profit or loss resulting from the activities of the arrangement is shared by A and B based on their participation shares in the arrangement.

For the purposes of coordinating and overseeing the activities, A and B appoint an operator, who will be an employee of one of the parties. After a specified time, the role of the operator will rotate to an employee of the other party. A and B agree that the activities will be executed by the operator's employees on a 'no gain or loss' basis.

In accordance with the terms specified in the contract with the government, Z invoices the construction services to the government on behalf of the parties.

Analysis

The joint arrangement is carried out through a separate vehicle whose legal form does not confer separation between the parties and the separate vehicle (i.e., the assets and liabilities held in Z are the parties' assets and liabilities). This is reinforced by the terms agreed by the parties in their contractual arrangement, which state that A and B have rights to the assets, and obligations for the liabilities, relating to the arrangement that is conducted through Z.

The joint arrangement is a joint operation.

A and B each recognise in their financial statements their share of the assets (e.g., property, plant and equipment (PP&E), accounts receivable) and their share of any liabilities resulting from the arrangement (e.g., accounts payable to third parties) based on their agreed participation share.

Each also recognises its share of the revenue and expenses resulting from the construction services provided to the government through Z.

Illustration 5-5: Shopping centre operated jointly

Two real estate companies (the parties) set up a separate vehicle (Entity X) for acquiring and operating a shopping centre. The contractual arrangement between the parties establishes joint control of the activities that are conducted in X. The main feature of X's legal form is that the entity, not the parties, has rights to the assets, and obligations for the liabilities, relating to the arrangement. The activities include the rental of the retail units, managing the car park, maintaining the centre and its equipment, such as lifts, and building the reputation and customer base for the centre as a whole.

The terms of the contractual arrangement are such that:

- (a) X owns the shopping centre. The contractual arrangement does not specify that the parties have rights to the shopping centre.
- (b) The parties are not liable in respect of the debts, liabilities or obligations of X. If X is unable to pay any of its debts or other liabilities or to discharge its obligations to third parties, the liability of each party to any third party will be limited to the unpaid amount of that party's capital contribution.
- (c) The parties have the right to sell or pledge their interests in X.
- (d) Each party receives a share of the income from operating the shopping centre (which is the rental income net of the operating costs) in accordance with its interest in X.

Analysis

The joint arrangement is carried out through a separate vehicle whose legal form causes the separate vehicle to be considered in its own right (i.e., the assets and liabilities held in the separate vehicle are the assets and liabilities of the separate vehicle and not the assets and liabilities of the parties). In addition, the terms of the contractual arrangement do not specify that the parties have rights to the assets, or obligations for the liabilities, relating to the arrangement. Instead, the terms of the contractual arrangement establish that the parties have rights to the net assets of X.

Based on the description above, there are no other facts and circumstances that indicate that the parties have rights to substantially all the economic benefits of the assets relating to the arrangement, and that the parties have an obligation for the liabilities relating to the arrangement.

The joint arrangement is a joint venture.

The parties recognise their rights to the net assets of X as investments and account for them under IAS 28.

Illustration 5-6: Joint manufacturing and distribution of a product

Companies A and B (the parties) have set up a strategic and operating agreement (the framework agreement) that sets the terms by which they will conduct the manufacturing and distribution of product P in different markets.

The parties have agreed to conduct manufacturing and distribution activities by establishing joint arrangements, as described below:

- (a) **Manufacturing activity:** the parties have agreed to undertake the manufacturing activity through a joint arrangement (the manufacturing arrangement). The manufacturing arrangement is structured in a separate vehicle (Entity M) whose legal form causes it to be considered in its own right (i.e., the assets and liabilities held in M are the assets and liabilities of M and not the assets and liabilities of the parties). In accordance with the framework agreement, the parties have committed themselves to purchasing the whole production of product P manufactured by the manufacturing arrangement in accordance with their ownership interests in M. The parties subsequently sell product P to another arrangement, jointly controlled by the two parties themselves, that has been established exclusively for the distribution of product P as described below. Neither the framework agreement nor the contractual arrangement between A and B dealing with the manufacturing activity specifies that the parties have rights to the assets, and obligations for the liabilities, relating to the manufacturing activity.
- (b) **Distribution activity:** the parties have agreed to undertake the distribution activity through a joint arrangement (the distribution arrangement). The parties have structured the distribution arrangement in a separate vehicle (Entity D) whose legal form causes it to be considered in its own right (i.e., the assets and liabilities held in D are the assets and liabilities of D and not the assets and liabilities of the parties). In accordance with the framework agreement, the distribution arrangement orders its requirements for product P from the parties according to the needs of the different markets where the distribution arrangement sells the product. Neither the framework agreement nor the contractual arrangement between A and B dealing with the distribution activity specifies that the parties have rights to the assets, and obligations for the liabilities, relating to the distribution activity.

In addition, the framework agreement establishes:

- (a) That the manufacturing arrangement will produce product P to meet the requirements for product P that the distribution arrangement places on the parties
- (b) The commercial terms relating to the sale of product P by the manufacturing arrangement to the parties. The manufacturing arrangement will sell product P to the parties at a price agreed by A and B that covers all production costs incurred. Subsequently, the parties sell the product to the distribution arrangement at a price agreed by A and B
- (c) That any cash shortages that the manufacturing arrangement may incur will be financed by the parties in accordance with their ownership interests in M.

Analysis

The framework agreement sets up the terms under which parties A and B conduct the manufacturing and distribution of product P. These activities are undertaken through joint arrangements whose purpose is either the manufacturing or the distribution of product P.

The parties carry out the manufacturing arrangement through M whose legal form confers separation between the parties and the entity. In addition, neither the framework agreement nor the contractual arrangement dealing with the manufacturing activity specifies that the parties have rights to the assets, and obligations for the liabilities, relating to the manufacturing activity. However, when considering the following facts and circumstances the parties have concluded that the manufacturing arrangement is a joint operation:

- (a) The parties have committed themselves to purchasing the whole production of product P manufactured by the manufacturing arrangement. Consequently, A and B have rights to substantially all the economic benefits of the assets of the manufacturing arrangement.
- (b) The manufacturing arrangement manufactures product P to meet the quantity and quality needs of the parties so that they can fulfil the demand for product P of the distribution arrangement. The exclusive dependence of the manufacturing arrangement upon the parties for the generation of cash flows and the parties' commitments to provide funds when the manufacturing arrangement incurs any cash shortages indicate that the parties have an obligation for the liabilities of the manufacturing arrangement, because those liabilities will be settled through the parties' purchases of product P or by the parties' direct provision of funds.

The parties carry out the distribution activities through D, whose legal form confers separation between the parties and the entity. In addition, neither the framework agreement nor the contractual arrangement dealing with the distribution activity specifies that the parties have rights to the assets, and obligations for the liabilities, relating to the distribution activity.

There are no other facts and circumstances that indicate that the parties have rights to substantially all the economic benefits of the assets relating to the distribution arrangement or that the parties have an obligation for the liabilities relating to that arrangement.

The distribution arrangement is a joint venture.

A and B each recognise in their financial statements their share of the assets (e.g., PP&E, cash) and their share of any liabilities resulting from the manufacturing arrangement (e.g., accounts payable to third parties) based on their ownership interest in M. Each party also recognises its share of the expenses resulting from the manufacture of product P incurred by the manufacturing arrangement and its share of the revenues relating to the sales of product P to the distribution arrangement.

The parties recognise their rights to the net assets of the distribution arrangement as investments and account for them under IAS 28.

Variation

Assume that the parties agree that the manufacturing arrangement described above is responsible not only for manufacturing product P, but also for its distribution to third party customers.

The parties also agree to set up a distribution arrangement, like the one described above, to distribute product P exclusively to assist in widening the distribution of product P in additional specific markets.

The manufacturing arrangement also sells product P directly to the distribution arrangement. No fixed proportion of the production of the manufacturing arrangement is committed to be purchased by, or to be reserved to, the distribution arrangement.

Analysis

The variation has affected neither the legal form of the separate vehicle in which the manufacturing activity is conducted nor the contractual terms relating to the parties' rights to the assets, and obligations for the liabilities, relating to the manufacturing activity. However, it causes the manufacturing arrangement to be a self-financed arrangement because it can undertake trade on its own behalf, distributing product P to third party customers and, consequently, assuming demand, inventory and credit risks. Even though the manufacturing arrangement might also sell product P to the distribution arrangement, in this scenario the manufacturing arrangement is not dependent on the parties to be able to carry out its activities on a continuous basis.

In this case, the manufacturing arrangement is a joint venture.

The variation has no effect on the classification of the distribution arrangement as a joint venture.

The parties recognise their rights to the net assets of the manufacturing arrangement and their rights to the net assets of the distribution arrangement as investments and account for them under IAS 28.

Illustration 5-7: Bank operated jointly

Banks A and B (the parties) agreed to combine their corporate, investment banking, asset management and services activities by establishing a separate vehicle (Bank C). Both parties expect the arrangement to benefit them in different ways. A believes that the arrangement could enable it to achieve its strategic plans to increase its size, offering an opportunity to exploit its full potential for organic growth through an enlarged offering of products and services. B expects the arrangement to reinforce its offering in financial savings and market products.

The main feature of C's legal form is that it causes the separate vehicle to be considered in its own right (i.e., the assets and liabilities held in the separate vehicle are the assets and liabilities of the separate vehicle and not the assets and liabilities of the parties). A and B each have a 40% ownership interest in C, with the remaining 20% being listed and widely held. The shareholders' agreement between A and B establishes joint control of the activities of C. In addition, A and B entered into an irrevocable agreement under which, even in the event of a dispute, both banks agree to provide the necessary funds in equal amount and, if required, jointly and severally, to ensure that C complies with the applicable legislation and banking regulations, and honours any commitments made to the banking authorities. This commitment represents the assumption by each party of 50% of any funds needed to ensure that C complies with legislation and banking regulations.

Analysis

The joint arrangement is carried out through a separate vehicle whose legal form confers separation between the parties and the separate vehicle. The terms of the contractual arrangement do not specify that the parties have rights to the assets, or obligations for the liabilities, of C, but it establishes that the parties have rights to the net assets of C. The commitment by the parties to provide support if C is not able to comply with the applicable legislation and banking regulations is not by itself a determinant that the parties have an obligation for the liabilities of C. There are no other facts and circumstances that indicate that the parties have rights to substantially all the economic benefits of the assets of C and that the parties have an obligation for the liabilities of C.

The joint arrangement is a joint venture.

Both A and B recognise their rights to the net assets of C as investments and account for them under IAS 28.

Illustration 5-8: Oil and gas exploration, development and production activities

Companies A and B (the parties) set up a separate vehicle (Entity H) and a Joint Operating Agreement (JOA) to undertake oil and gas exploration, development and production activities in country O. The main feature of H's legal form is that it causes the separate vehicle to be considered in its own right (i.e., the assets and liabilities held in the separate vehicle are the assets and liabilities of the separate vehicle and not the assets and liabilities of the parties).

Country O has granted H permits for the oil and gas exploration, development and production activities to be undertaken in a specific assigned block of land (fields).

The shareholders' agreement and JOA agreed by the parties establish their rights and obligations relating to those activities. The main terms of those agreements are summarised below.

Shareholders' agreement

The board of H consists of a director from each party. Each party has a 50% shareholding in H. The unanimous consent of the directors is required for any resolution to be passed.

Joint Operating Agreement (JOA)

The JOA establishes an Operating Committee. This Committee consists of one representative from each party. Each party has a 50% participating interest in the Operating Committee.

The Operating Committee approves the budgets and work programmes relating to the activities, which also require the unanimous consent of the representatives of each party. One of the parties is appointed as operator and is responsible for managing and conducting the approved work programmes.

The JOA specifies that the rights and obligations arising from the exploration, development and production activities are shared among the parties in proportion to each party's shareholding in H. In particular, the JOA establishes that the parties share:

- (a) The rights and the obligations arising from the exploration and development permits granted to H (e.g., the permits, rehabilitation liabilities, any royalties and taxes payable)
- (b) The production obtained
- (c) All costs associated with all work programmes

The costs incurred in relation to all the work programmes are covered by cash calls on the parties. If either party fails to satisfy its monetary obligations, the other is required to contribute to H the amount in default. The amount in default is regarded as a debt owed by the defaulting party to the other party.

Analysis

The parties carry out the joint arrangement through a separate vehicle whose legal form confers separation between the parties and the separate vehicle. The parties reversed the initial assessment of their rights and obligations arising from the legal form of the separate vehicle in which the arrangement is conducted. They have done this by agreeing terms in the JOA that entitle them to rights to the assets (e.g., exploration and development permits, production, and any other assets arising from the activities) and obligations for the liabilities (e.g., all costs and obligations arising from the work programmes) that are held in H.

The joint arrangement is a joint operation.

Both A and B recognise in their financial statements their own share of the assets and of any liabilities resulting from the arrangement based on their agreed participating interest. On that basis, each party also recognises its share of the revenue (from the sale of their share of the production) and its share of the expenses.

Illustration 5-9: Liquefied natural gas arrangement

Company A owns an undeveloped gas field that contains substantial gas resources. Company A determines that the gas field will be economically viable only if the gas is sold to customers in overseas markets. To do so, a liquefied natural gas (LNG) facility must be built to liquefy the gas so that it can be transported by ship to the overseas markets.

A enters into a joint arrangement with Company B to develop and operate the gas field and the LNG facility. Under that arrangement, A and B (the parties) agree to contribute the gas field and cash, respectively, to a new separate vehicle, C. In exchange for those contributions, the parties each take a 50% ownership interest in C. The main feature of C's legal form is that it causes the separate vehicle to be considered in its own right (i.e., the assets and liabilities held in the separate vehicle are the assets and liabilities of the separate vehicle and not the assets and liabilities of the parties).

The contractual arrangement between the parties specifies that:

- (a) A and B must each appoint two members to the board of C. The board of directors must unanimously agree the strategy and investments made by C.
- (b) Day-to-day management of the gas field and LNG facility, including development and construction activities, will be undertaken by the staff of B in accordance with the directions jointly agreed by the parties. C will reimburse B for the costs it incurs in managing the gas field and LNG facility.
- (c) C is liable for taxes and royalties on the production and sale of LNG as well as for other liabilities incurred in the ordinary course of business, such as accounts payable, site restoration and decommissioning liabilities.
- (d) A and B have equal shares in the profit from the activities carried out in the arrangement and are entitled to equal shares of any dividends distributed by C.

The contractual arrangement does not specify that either party has rights to the assets, or obligations for the liabilities, of C.

The board of C decides to enter into a financing arrangement with a syndicate of lenders to help fund the development of the gas field and construction of the LNG facility. The estimated total cost of the development and construction is CU1,000m.

The lending syndicate provides C with a CU700m loan. The arrangement specifies that the syndicate has recourse to A and B only if C defaults on the loan arrangement during the development of the field and construction of the LNG facility. The lending syndicate agrees that it will not have recourse to A and B once the LNG facility is in production because it has assessed that the cash inflows that C should generate from LNG sales will be sufficient to meet the loan repayments. Although at this time the lenders have no recourse to A and B, the syndicate maintains protection against default by C by taking a lien on the LNG facility.

Analysis

The joint arrangement is carried out through a separate vehicle whose legal form confers separation between the parties and the separate vehicle. The terms of the contractual arrangement do not specify that the parties have rights to the assets, or obligations for the liabilities, of C, instead they establish that the parties have rights to the net assets of C. The recourse nature of the financing arrangement during the development of the gas field and construction of the LNG facility (i.e., A and B providing separate guarantees during this phase) does not, by itself, impose on the parties an obligation for the liabilities of C (i.e., the loan is a liability of C). A and B have separate liabilities, which are their guarantees to repay that loan if C defaults during the development and construction phase.

There are no other facts and circumstances that indicate that the parties have rights to substantially all the economic benefits of the assets of C and that the parties have an obligation for the liabilities of C.

The joint arrangement is a joint venture. The parties recognise their rights to the net assets of entity C as investments and account for them under IAS 28.

6 Accounting for joint operations

Extract from IFRS 11

- 20 A joint operator shall recognise in relation to its interest in a joint operation:
- (a) its assets, including its share of any assets held jointly;
 - (b) its liabilities, including its share of any liabilities incurred jointly;
 - (c) its revenue from the sale of its share of the output arising from the joint operation;
 - (d) its share of the revenue from the sale of the output by the joint operation; and
 - (e) its expenses, including its share of any expenses incurred jointly.

IFRS 11 requires each of these items to be accounted for in accordance with the applicable IFRS accounting standard. [IFRS 11.20, IFRS 11.21]. Careful consideration must be given to the nature of the rights to the assets, and the obligations for the liabilities (or the share of assets, liabilities, revenues, and expenses) if any, of the joint operation (see section 6.3 below).

6.1 Joint arrangements not structured through a separate vehicle

For joint arrangements not structured through a separate vehicle, the contractual arrangement establishes the parties' rights to the assets, and obligations for the liabilities, relating to the arrangement, and the parties' rights to the corresponding revenues and obligations for the corresponding expenses. [IFRS 11.B16].

A contractual arrangement often describes the nature of the activities that are the subject of the arrangement and how the parties intend to undertake those activities together. For example, the parties could conduct an activity together, with each party being responsible for a specific task and each using its own assets and incurring its own liabilities and the parties share revenues and expenses. In such a case, each joint operator recognises in its financial statements the assets and liabilities used for the specific task and recognises its share of the revenues and expenses in accordance with the contractual arrangement. [IFRS 11.B17]. When the parties agree, for example, to share and operate an asset together and share the output or revenue from the asset and operating costs, each joint operator accounts for its share of the joint asset, its agreed share of any liabilities, and of the output, revenues and expenses in accordance with the contractual arrangement. [IFRS 11.B18].

6.2 Accounting for rights and obligations

An entity's rights and obligations for the assets, liabilities, revenues and expenses relating to a joint operation as specified in the contractual arrangement are the basis for accounting for a joint operation under IFRS 11. This might differ from its ownership interest in the joint operation. [IFRS 11.BC38].

When the joint operator has differing rights (and percentages) to various assets, and/or differing obligations for various liabilities, these are reflected in its financial statements even when those rights and obligations differ from the joint operator's proportion of equity ownership. Illustration 6-1 below illustrates joint operation accounting in this case.

Illustration 6-1: Accounting for rights to assets and obligations for liabilities

Entities D and E establish Joint Arrangement F, using a separate vehicle, classified as a joint operation. Accordingly, D and E account for their rights to assets and their obligations for liabilities relating to F in accordance with the relevant IFRS accounting standard.

D and E each own 50% of the equity (e.g., shares) in F. However, the contractual terms of the joint arrangement state that D has the rights to all of Building No. 1 and the obligation to pay all the third party debt in F. D and E have rights to all other assets in F, and obligations for all other liabilities in F in proportion to their equity interests (i.e., 50%). F's balance sheet is as follows (in CUs):

Assets		Liabilities and equity	
Cash	20	Debt	120
Building No. 1	120	Employee benefit plan obligation	50
Building No. 2	100	Equity	70
Total assets	240	Total liabilities and equity	240

Under IFRS 11, D records the following in its financial statements, to account for its rights to the assets in F and its obligations for the liabilities in F. This differs from consolidating a blended percentage of all assets and liabilities or using the equity ownership percentages.

Assets		Liabilities and equity	
Cash	10	Debt ⁽²⁾	120
Building No. 1 ⁽¹⁾	120	Employee benefit plan obligation	25
Building No. 2	50	Equity	35
Total assets	180	Total liabilities and equity	180

(1) Since D has the rights to all of Building No. 1, it records that amount in its entirety.

(2) D's obligations are for the third party debt in its entirety.

6.3 Determining the relevant IFRS accounting standard

As noted in section 6 above, joint operators are required to recognise their rights to assets and their obligations for liabilities in accordance with the relevant IFRS accounting standard. In some cases, the relevant IFRS accounting standard is clear, but questions have arisen in other cases.

6.3.1 Right of use

The illustrative examples of joint operations in IFRS 11 refer to recognising the joint operator's share of assets, such as PP&E, accounts receivable and cash, rather than recognising a 'right of use'. [IFRS 11.IE8, IFRS 11.IE21]. Therefore, a joint operator recognises its share of an asset in accordance with IAS 16 *Property, Plant and Equipment* or IAS 38 *Intangible Assets*, as applicable. When the contractual terms of the joint operation provide a joint operator with a right to use an asset, not a share of the asset itself, the joint operator applies IFRS 16 *Leases* (see Chapter 24).

6.3.2 Liability for entire balance of certain liabilities

One of the joint operators might have obligations for the entire balance of certain liabilities of the joint operation. It might also have a right to reimbursement from the other parties for their share of that liability of the joint operation. The joint operator recognises 100% of the joint operation's liabilities and a receivable for the reimbursement due from the other parties for their share of the liability. IFRS accounting standards prohibit the offsetting of the liability against the receivable. If the other parties were unable to pay, the joint operator would not be able to recognise a receivable for the full amount due. Accordingly, the receivable would be impaired, which would result in a reduction in profit in the joint operator's financial statements.

This principle was emphasised in March 2019 when the IFRS IC finalised an agenda decision¹³ dealing with liabilities in relation to a joint operator's interest in a joint operation. In the fact pattern described in the request, the joint operation is not structured through a separate vehicle. One of the joint operators, as the sole signatory, enters into a lease contract with a third party lessor for an item of PP&E that will be operated jointly as part of the joint operation's activities. The joint operator that signed the lease contract has the right to recover a share of the lease costs from the other joint operators in accordance with the contractual arrangement to the joint operation. The request asked about the recognition of liabilities by the joint operator that signed the lease agreement. In relation to its interest in a joint operation, a joint operator recognises its liabilities, including its share of any liabilities incurred jointly. [IFRS 11.20(b)]. Accordingly, a joint operator identifies and recognises both:

- Liabilities it incurs in relation to its interest in the joint operation
- Its share of any liabilities incurred jointly with other parties to the joint arrangement

Identifying the liabilities that a joint operator incurs and those incurred jointly requires an assessment of the terms and conditions in all contractual agreements that relate to the joint operation, including consideration of the laws pertaining to those agreements. The IFRS IC observed that the liabilities a joint operator recognises include those for which it has primary responsibility. Based on this agenda decision, the joint operator that is the sole signatory of the lease agreement recognises the full lease liability and corresponding right-of-use asset in its financial statements. The agenda decision did not address how the joint operator accounts for its right to recover a share of the lease costs from the other joint operators in accordance with the contractual arrangement to the joint operation. The joint operator assesses the relevant IFRS accounting standard to apply to this right, for example, whether it represents a sub-lease of the right-of-use asset to the other joint operators.

¹³ [IFRIC Update](#), March 2019, available on the IFRS Foundation's website.

6.3.3 Jointly and severally liable

In some cases, the joint arrangement (or legal form of the separate vehicle, if applicable) gives joint and several liability for the obligations of the arrangement. That is, an entity is not only responsible for its proportionate share, but it is also liable for the other party's or parties' share(s) should it/they be unable or unwilling to pay. In this scenario, each party not only takes up its proportionate share of the decommissioning/restoration obligation, they are also required to assess the likelihood that the other party (or parties) will not be able or willing to meet their obligation for their share. The facts and circumstances are assessed in each case and the liability accounted for in accordance with IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*. This can result in the joint operator recognising the entire obligation due, not just its share of the obligation.

6.3.4 Obligation to reimburse other parties

A party to the joint arrangement that has an obligation to reimburse another party recognises a financial liability for the amount related to the reimbursement.

6.3.5 Sales to other joint operators

A joint operator might receive income from sales to another joint operator (or operators) for providing goods or services to the other joint operator(s).

If a joint operator provides goods or services to another joint operator, it assesses whether a vendor/customer relationship exists. IFRS 15 *Revenue from Contracts with Customers* explains that a contract with a collaborator or a partner in a joint arrangement could also be within the scope of IFRS 15 if that collaborator or partner meets the definition of a customer for some or all of the terms of the arrangement. [IFRS 15.BC55]. Therefore, judgement is applied to determine whether the income is in the scope of IFRS 15, depending on the facts and circumstances, and if not, which IFRS accounting standard applies. That is, the existence of a joint operation does not remove the need to determine whether IFRS 15 applies to an element of a contract that includes a joint arrangement.

6.3.6 Sales by a joint operation to a joint operator

A joint operation might have sales to the joint operator for providing output to the joint operator. This scenario can raise the question as to whether the joint operator should recognise revenue for its share of the following:

- The joint operator's revenue on the output that it has received from the joint operation
- The output that it has not yet received, but is entitled to under the terms of the joint arrangement

Regarding the first question, in March 2015, the IFRS IC published an agenda decision¹⁴ that addressed the issue of revenue recognition by a joint operator. If a joint arrangement is structured through a separate vehicle, classified as a joint operation, the joint operators' purchase of all the output from the joint operation is in effect a sale to themselves. The IFRS IC stated that a joint operator recognises its share of the joint operation's revenue only when the joint operation sells its output to third parties (i.e., parties that are not investors in the joint operation), see section 6.6 below. [IFRS 11.20(d)].

Regarding the second question, in March 2019, the IFRS IC finalised an agenda decision¹⁵ dealing with the recognition of revenue by a joint operator for output arising from a joint operation when the output it receives in a reporting period is different from the output to which it is entitled. This is commonly known in the oil and gas industry as an over-lift or under-lift (see Chapter 39).

In the fact pattern described in the request, the joint operator has the right to receive a fixed proportion of the output arising from the joint operation and is obliged to pay for a fixed proportion of the production costs incurred. For operational reasons, the output received by the joint operator and transferred to its customers in a particular reporting period is different from the output to which it is entitled. That difference will be settled through future deliveries of output arising from the joint operation, it cannot be settled in cash. Applying IFRS 15, the joint operator recognises revenue as a principal for the transfer of all the output to its customers.

¹⁴ [IFRIC Update](#), March 2015, available on the IFRS Foundation's website.

¹⁵ [IFRIC Update](#), March 2019, available on the IFRS Foundation's website.

A joint operator recognises its revenue from the sale of its share of the output arising from the joint operation. [IFRS 11.20(c)]. Therefore, the IFRS IC concluded that, in the fact pattern described in the request, the joint operator recognises revenue that depicts only the transfer of output to its customers in each reporting period, i.e., revenue recognised applying IFRS 15. The joint operator does not recognise revenue for the output to which it is entitled but which it has not received from the joint operation and sold.

The agenda decision did not address the cost of goods sold and hence diversity in practice will continue in this respect. See Chapter 39 and Chapter 28, Question 2-12 for more detail.

6.4 Interest in a joint arrangement without joint control

A party without joint control (see section 4 above) is not a joint operator. However, if that party has rights to assets and obligations for liabilities, the accounting is the same as that for a joint operator, as discussed at section 6 above. [IFRS 11.23].

If the party without joint control does not have rights to the assets and obligations for the liabilities relating to the joint operation, it accounts for its interest in the joint operation in accordance with other applicable IFRS accounting standards. [IFRS 11.23]. For example, if it has an interest in:

- (a) A separate vehicle over which it has significant influence, it applies IAS 28
 - (b) A separate vehicle over which it does not have significant influence, the interest is a financial asset under IFRS 9
- Or
- (c) An arrangement without a separate vehicle, it applies other applicable IFRS accounting standards (see section 4.4.1 above)

The disclosure requirements of IFRS 12 are discussed in Chapter 14.

6.5 Joint operation with a party without joint control

When a joint operation conducted through a separate vehicle involves a party without joint control (see sections 4 and 6.4 above), each joint operator recognises its share of any assets held jointly and its obligations for its share of any liabilities incurred jointly. A joint operator does not recognise the rights to assets and obligations for the liabilities attributable to the party that does not have joint control nor does it recognise a higher percentage with a 'non-controlling interest'. Illustration 6-2 below illustrates this point.

Illustration 6-2: Joint operation with a party without joint control

Entities A and B enter into a joint operation that is structured through a separate vehicle Z. Each of the two entities owns 40% of the shares of the separate vehicle. The remaining 20% of Z is owned by C, which participates in the joint arrangement but does not have joint control. C has rights to the assets and obligations for the liabilities of Z.

Accordingly, A, B and C (see sections 6 and 6.4 above) recognise their assets, including their share of any assets held jointly, and their liabilities, including their share of any liabilities incurred jointly, in accordance with relevant IFRS accounting standards.

In A's financial statements, it recognises its assets, liabilities, revenues and expenses in Z, which is 40% of Z's assets, liabilities, revenues and expenses, in accordance with the relevant IFRS accounting standard. A does not recognise a 'non-controlling interest' related to C's interest in Z.

6.6 Transactions between a joint operator and a joint operation

IFRS 11 addresses transactions such as the sale, contribution or purchase of assets between a joint operator and a joint operation. [IFRS 11.22].

When a joint operator enters into a transaction with its joint operation, such as a sale or contribution of assets to the joint operation, the joint operator is transacting with the other parties to the joint operation. The joint operator recognises gains and losses resulting from the transaction only to the extent of the other parties' interests in the joint operation. [IFRS 11.B34].

When a joint operator sells to its joint operation, it does not recognise revenue for the portion that is effectively sold to itself (see IFRS IC's discussions referred to below and at section 6.3.6 above). The joint operator applies IFRS 15 to assess whether revenue is recognised for the portion effectively sold to the other parties to the joint operation. [IFRS 11.BC55].

However, when these transactions provide evidence of a reduction in the net realisable value of the assets to be sold or contributed to the joint operation, or of an impairment loss of those assets, those losses are recognised fully by the joint operator. [IFRS 11.B35].

When a joint operator enters into a transaction with its joint operation, such as a purchase of assets from the joint operation, it does not recognise its share of the gains and losses until it resells those assets to a third party. [IFRS 11.B36].

However, when these transactions provide evidence of a reduction in the net realisable value of the assets to be purchased, or of an impairment loss of those assets, a joint operator recognises its share of those losses. [IFRS 11.B37].

When there is a transaction between a joint operator and a joint operation, consideration is given to whether the transaction changes the nature of the joint operator's rights to assets or obligations for liabilities. Any such change is reflected in the joint operator's financial statements and the new assets and liabilities are accounted for in accordance with the relevant IFRS accounting standard.

As described at 6.3.6 above, in March 2015, the IFRS IC published an agenda decision¹⁶ on the recognition of revenue by a joint operator in relation to output purchased from the joint operation. The sale of output by the joint operation to the joint operator would mean selling to itself and therefore, the joint operator does not recognise a share of the revenue from the sale of that output by the joint operation.

6.7 Accounting for a joint operation in separate financial statements

In the separate financial statements, both a joint operator and a party without joint control (see section 6.4 above) account for their interests in the same manner as accounting for a joint operation in consolidated financial statements. Regardless of whether the joint operation is structured through a separate vehicle, the party recognises in its separate financial statements:

- Assets, including its share of any assets held jointly
 - Liabilities, including its share of any liabilities incurred jointly
 - Revenue from the sale of its share of the output arising from the joint operation
 - Its share of the revenue from the sale of the output by the joint operation
- And
- Expenses, including its share of any expenses incurred jointly [IFRS 11.26(a), IFRS 11.27(a)]

The guidance in sections 6 to 6.6 above also applies to accounting for joint operations in separate financial statements.

¹⁶ [IFRIC Update](#), March 2015, available on the IFRS Foundation's website.

7 Accounting for joint ventures

Extract from IFRS 11

24 A joint venturer shall recognise its interest in a joint venture as an investment and shall account for that investment using the equity method in accordance with IAS 28 *Investments in Associates and Joint Ventures* unless the entity is exempted from applying the equity method as specified in that standard.

[IFRS 11.24].

A joint venturer accounts for its interest in a joint venture in accordance with IAS 28, applying the equity method unless an exemption in IAS 28 applies. [IFRS 11.24]. IFRS 11 does not describe how to apply the equity method. The requirements of IAS 28, including the accounting for transactions between a joint venturer and its joint venture, are discussed in Chapter 12.

As discussed in section 2.2.1 above, venture capital organisations, mutual funds, unit trusts and similar entities, including investment-linked insurance funds, can choose to measure investments in joint ventures at fair value or apply the equity method under IAS 28. This is a measurement exemption under IFRS 11 and IAS 28 (see Chapter 12). Such entities remain subject to the disclosure requirements for joint ventures set out in IFRS 12 (see Chapter 14).

Although the exemption in IAS 28 is optional for venture capital organisations and similar entities, IFRS 10 requires an 'investment entity' (as defined in IFRS 10) to elect the exemption from applying the equity method in IAS 28 for its investments in associates and joint ventures. [IFRS 10.B85L(b)].

7.1 Interest in a joint venture without joint control

IAS 28 applies when a party has significant influence over an entity, including when a party participates in a joint venture without having joint control (see section 6.4 above). [IFRS 11.25].

However, if the joint venture is structured through a separate vehicle that is **not** an entity (see section 5.1 above), IAS 28 does not apply and the investor applies the relevant IFRS accounting standard.

An investor in a joint venture that has neither joint control nor significant influence accounts for its interest as a financial asset under IFRS 9. [IFRS 11.25].

7.2 Contributions of non-monetary assets to a joint venture

When an entity contributes a non-monetary asset or liability to a joint venture in exchange for an equity interest in the joint venture, it recognises the portion of the gain or loss attributable to the other parties to the joint venture except when the contribution lacks commercial substance. This is discussed in more detail in Chapter 12.

When the contributed non-monetary asset is a subsidiary of an entity, a conflict arises between the requirements of IAS 28 and IFRS 10. This is discussed in Chapter 12 and in section 8.2.3 below.

7.3 Accounting for a joint venture in separate financial statements

In its separate financial statements, a joint venturer accounts for its interest in the joint venture at cost, as a financial asset under IFRS 9 or under the equity method. [IFRS 11.26(b), IAS 27.10]. The requirements for separate financial statements are discussed in Chapter 9.

In its separate financial statements, a party without joint control of a joint venture (see section 6.4 above) accounts for its interest as a financial asset under IFRS 9, unless it has significant influence over the joint venture. [IFRS 11.27(b)]. In this case, the joint venture is accounted for either at cost, as a financial asset under IFRS 9 or using the equity method. [IAS 27.10].

However, if an entity elects in accordance with IAS 28 to measure its investments in associates or joint ventures at fair value through profit or loss in accordance with IFRS 9, it also accounts for those investments in the same way in its separate financial statements. [IAS 27.11].

7.4 Accounting by the joint venture in its financial statements

In its financial statements, the joint venture accounts for its activities using the applicable IFRS accounting standard.

If a non-monetary asset is contributed by an investor (see section 7.2 above), the measurement of that asset depends on the method of settlement. When the consideration given by the joint venture is its own shares, the transaction is an equity-settled share-based payment transaction in the scope of IFRS 2 *Share-based Payment*. As a result, the joint venture measures the non-monetary asset received at its fair value. When the consideration given by the joint venture is not its own shares, the transaction is outside the scope of IFRS 2.

How we see it

When the transaction is outside the scope of IFRS 2, we believe the joint venture measures the non-monetary asset received at its cost, which is the fair value of the consideration given. In the rare cases when the fair value of the asset received by the joint venture does not equal the fair value of the consideration given (whether cash or shares), an assessment of all facts and circumstances is needed to determine whether it is appropriate to recognise a capital contribution or whether other accounting applies. These facts and circumstances include the actions and obligations of the other venturers, other services provided by the venturer, future rebates on delivery of goods and relationships between the venturers.

8 Continuous assessment

IFRS 11 incorporates the notion of continuous assessment, consistent with the requirements in IFRS 10. [IFRS 11.13, IFRS 11.19].

Extract from IFRS 11

- | | |
|----|--|
| 13 | If facts and circumstances change, an entity shall reassess whether it still has joint control of the arrangement. |
| 19 | If facts and circumstances change, an entity shall reassess whether the type of joint arrangement in which it is involved has changed. |

8.1 When to reassess under IFRS 11

A party reassesses whether it has joint control and whether the classification of the joint arrangement has changed whenever facts and circumstances change. [IFRS 11.13, IFRS 11.19].

Reassessment of a joint arrangement occurs upon a change in:

- Ownership - For example, Company A has a 50% interest in a joint venture over which it has joint control and purchases an additional 20% interest. Reassessment would be required to evaluate whether A now controls the joint venture.
- How activities are directed - For example, Company A sets up Company Z to develop a new product or technology. Initially, Z had a Board of Directors elected by shareholders, separate management and the relevant activities were directed by voting rights held exclusively by A. If A enters into an agreement with Company B so that A and B must agree on all decisions (e.g., they replace the Board and make decisions for management), reassessment would be required to evaluate whether A and B have joint control of Z.
- Legal form - For example, a separate vehicle that initially did not confer separation between the parties and the vehicle (e.g., a general partnership) and was considered a joint operation, is converted into a separate vehicle that now does confer separation between the parties and the vehicle (e.g., a corporation). Reassessment would be required to evaluate whether this indicates a change in classification from a joint operation to a joint venture.
- Contractual terms - For example, the terms of a joint arrangement are renegotiated such that the parties have rights to the assets or obligations for the liabilities. Reassessment would be required to evaluate whether this indicates a change in classification to a joint operation.
- Other facts and circumstances - For example, the terms and conditions of a joint operation are renegotiated such that a joint arrangement can sell output to third party customers, where previously sales were permitted only to the parties of the joint arrangement. Reassessment would be required to evaluate whether this indicates a change in classification from a joint operation to a joint venture.

As discussed in section 5.3.1 above, another event that might trigger reassessment would be an event that leads a guarantor to have to pay (or perform) under a guarantee.

8.1.1 Changes in classification

The accounting for changes in classification of a joint arrangement depends firstly on whether the underlying assets and liabilities constitute a 'business' as defined in IFRS 3. Secondly, it depends on the type of interest held before and after the change in classification occurred. Finally, it depends on whether the change in classification is results from a change in ownership interest or other factors.

The matrix below provides a reference for additional guidance when there is a change in ownership interest and the assets and liabilities meet the definition of a business. It contains references to general guidance that is useful to consider when assessing the accounting for the transaction concerned. However, there are several permutations possible for each transaction depending on the facts and circumstances and the nature of the investor's interest before and after the transaction. Therefore, the matrix is not intended to serve as a comprehensive accounting analysis. The key questions that arise on these transactions are:

- Is a cost-based approach or a fair value (IFRS 3) approach being used?
- Is any previously held (retained) interest remeasured?
- Is a profit on sale recognised and, if so, how is it measured?

Matrix of transactions involving changes of ownership interest in a joint arrangement that is a business

To: From:	Financial asset	Associate or joint venture (equity accounted)	Joint operation	Subsidiary
Financial asset	Not applicable to joint arrangements	IFRS accounting standards not clear See section 8.2.5 below and Chapter 12	IFRS accounting standards not clear See sections 8.3.1 and 8.3.4.A below	Not applicable to joint arrangements
Associate or joint venture (equity accounted)	IAS 28 and IFRS 9 See section 8.2.5 below and Chapter 12	IAS 28 See section 8.2.4 below and Chapter 12	IFRS accounting standards not clear See sections 8.3.1 and 8.3.4.A below	IFRS 3 and IAS 28 See section 8.2.2 below, Chapter 12 and Chapter 10
Joint operation	IFRS accounting standards not clear See section 8.3.4.A below		IFRS accounting standards not clear See sections 8.3.1 and 8.5.2 below	See section 8.3.2 below
Subsidiary	Not applicable to joint arrangements	IFRS 10 and IAS 28 See section 8.2.3 below, Chapter 12 and Chapter 8	IFRS accounting standards not clear See section 8.3.3 below and Chapter 8	Not applicable to joint arrangements

In sections 8.2 and 8.3 below, we discuss changes in ownership in joint ventures and joint operations that constitute a business, respectively.

When there is a change in:

- Ownership interest in a joint arrangement that is not a business, see section 8.4 below
- Classification arising from circumstances other than a change in ownership interests, see section 8.5 below

8.2 Changes in ownership of a joint venture that constitutes a business

8.2.1 Acquisition of an interest in a joint venture

The acquisition of an interest in a joint venture that meets the definition of a business is accounted for under IAS 28 (see Chapter 12) and the procedures are similar to those applied to the acquisition of a business in IFRS 3.

However, the formation of a joint venture that constitutes a business, in the financial statements of the joint venture itself, is outside the scope of IFRS 3. [IFRS 3.2(a)].

8.2.2 Gaining control over a former joint venture

If an entity gains control over a former joint venture, and the acquisition meets the definition of a business combination, the entity applies IFRS 3 (see Chapter 10).

8.2.3 Former subsidiary becomes a joint venture

Under IFRS 10, if a parent entity loses control of a subsidiary that constitutes a business in a transaction that is not a downstream transaction (i.e., one between the investor and its joint venture), the retained interest is remeasured at its fair value and this fair value becomes the cost on initial recognition of an investment in the joint venture. [IFRS 10.25]. IFRS 10 requires any gain or loss on loss of control of the subsidiary to be recognised in full. IAS 28 applies to downstream transactions between an investor and its joint venture. IAS 28 requires an investor to restrict any gain arising on disposal of its own assets to the amount attributable to the other party to the joint venture (see section 7.2 above). That is, IAS 28 requires partial gain recognition. Therefore, when a former subsidiary becomes a joint venture through a downstream transaction, these requirements in IFRS 10 and IAS 28 conflict. This is discussed in greater detail in Chapter 12 and Chapter 8.

In September 2014, the IASB issued *Sale or Contribution of Assets between an Investor and its Associate or Joint Venture* (amendments to IFRS 10 and IAS 28) to address the conflict between IFRS 10 and IAS 28.¹⁷ The amendments state that:

- Partial gain or loss recognition for transactions between an investor and its associate or joint venture applies only to a gain or loss resulting from the sale or contribution of assets that do not constitute a business as defined in IFRS 3.
- The gain or loss resulting from the sale or contribution of assets that constitute a business as defined in IFRS 3, between an investor and its associate or joint venture is recognised in full.

In December 2015, the IASB deferred the effective date of these amendments indefinitely due to feedback that the recognition of a partial gain or loss when a transaction involves assets that do not constitute a business, even if these assets are housed in a subsidiary, is inconsistent with the initial measurement requirements of IAS 28. This matter is discussed in more detail in Chapter 12 including illustrations of the different approaches.

8.2.4 Joint venture becomes an associate (or vice versa)

A joint venturer that loses joint control but retains an interest in an associate continues to apply the equity method. An entity does not remeasure its retained interest in an associate when it loses joint control over a joint venture. The same applies when an entity gains joint control over an associate that becomes an investment in a joint venture. [IAS 28.24]. While the nature of the investor-investee relationship changes upon changing from joint venture to associate (or vice versa), since the investment continues to be accounted for using the equity method (i.e., there is no change in the measurement requirements) and there is no change in the group, it is not an event that warrants remeasurement of the retained interest at fair value. [IAS 28.BC30].

If an entity's ownership interest in an associate or a joint venture is reduced, but the equity method continues to be applied, a gain or loss is recognised on partial disposal. This is discussed in more detail in Chapter 12.

8.2.5 Joint venture becomes a financial asset (or vice versa)

If a joint venture becomes a financial asset, the measurement method changes. An entity measures its retained interest in the financial asset at fair value, which becomes its fair value on initial recognition as a financial asset.

The entity recognises in profit or loss any difference between:

- (a) The fair value of any retained interest and any proceeds from disposing of a part interest in the joint venture
- And
- (b) The carrying amount of the interest in the joint venture at the date the equity method was discontinued

If a gain or loss previously recognised by the entity in OCI would be reclassified to profit or loss on the disposal of the related assets or liabilities, IAS 28 requires the entity to reclassify the gain or loss from equity to profit or loss when the equity method is discontinued. For example, gains and losses related to foreign currency translation adjustments accumulated in equity would be reclassified to profit or loss. [IAS 28.22, IAS 28.23]. This is also discussed in Chapter 12.

When a financial asset becomes a joint venture, IAS 28 is unclear how to account for the step acquisition of a joint venture. This is discussed in Chapter 12.

¹⁷ *Sale or Contribution of Assets between an Investor and its Associate or Joint Venture* (amendments to IFRS 10 and IAS 28), IASB, September 2014.

8.2.6 Disposal of its interest in a joint venture

When an entity disposes of its interest in a joint venture and loses joint control, it ceases to apply the equity method as of that date. It also derecognises its interest and recognises any gain or loss upon sale, as discussed in section 8.2.5 above. [IAS 28.22, IAS 28.23]. The entity uses the equity method up to the date that the joint venturer disposes of its interest in the joint venture. I.e., it does not restate its financial statements for the period (or the comparative period) as if it did not have joint control during the reporting period.

8.2.7 Interest in a joint venture held for sale

When a joint venturer plans to dispose of all or part of its interest in a joint venture, it applies IFRS 5 (see Chapter 5). The joint venturer continues to account for the retained interest in the joint venture (if any) using the equity method until the disposal of the interest classified as held for sale occurs. This is because an entity continues to have joint control over its entire interest in the joint venture until it disposes of that interest. Upon disposal, it reassesses the nature of any retained interest and accounts for that interest accordingly (e.g., as a financial asset if joint control is lost). [IAS 28.20].

If an interest (or a portion of an interest) in a joint venture no longer meets the criteria to be classified as held for sale, the interest is accounted for using the equity method retrospectively from the date of its classification as held for sale. [IAS 28.21].

These requirements are also discussed in Chapter 12.

8.3 Changes in ownership of a joint operation that is a business

8.3.1 Acquisition of an interest in a joint operation

An entity that acquires an interest in a joint operation that is a business as defined in IFRS 3 is required to apply, to the extent of its share, the principles of IFRS 3 and other IFRS accounting standards that do not conflict with IFRS 11, which include:

- (a) Measuring identifiable assets and liabilities at fair value, other than items for which exceptions are given in IFRS 3 and other IFRS accounting standards
- (b) Recognising acquisition-related costs as expenses in the periods in which the costs are incurred and the services are received, with the exception that the costs to issue debt or equity securities are recognised in accordance with IAS 32 *Financial Instruments: Presentation* and IFRS 9
- (c) Recognising deferred tax assets and deferred tax liabilities that arise from the initial recognition of assets or liabilities, except for deferred tax liabilities that arise from the initial recognition of goodwill
- (d) Recognising as goodwill (or negative goodwill) any excess (or shortfall) of the consideration transferred over the net amount of identifiable assets acquired and the liabilities assumed
- (e) Testing for impairment a cash-generating unit to which goodwill has been allocated at least annually and whenever there is an indication that the unit might be impaired, as required by IAS 36 *Impairment of Assets*. [IFRS 11.B33A].

In addition, the entity discloses the information that is required in those IFRS accounting standards in relation to business combinations.

Although the acquisition of an interest in a joint operation does not meet the definition of a business combination in IFRS 3, the IASB concluded that this was the most appropriate approach to account for an acquisition of an interest in a joint operation whose activity meets the definition of a business, as defined in IFRS 3. [IFRS 11.BC45E, IFRS 11.BC45F].

The above approach also applies to the formation of a joint operation, but only if an existing business (as defined in IFRS 3) is contributed by one of the parties that participates in the joint operation. In other words, the above approach is not applied if the parties that participate in the joint operation contribute only (groups of) assets that do not constitute businesses to the joint operation on its formation. [IFRS 11.B33B]. The requirements apply to the acquisition of both the initial interest and additional interests in a joint operation (while still maintaining joint control) in which the activity of the joint operation constitutes a business. [IFRS 11.21A].

If a joint operator increases its interest in a joint operation that is a business (as defined in IFRS 3) by acquiring an additional interest while still retaining joint control, it does not remeasure its previously held interest in that joint operation. [IFRS 11.B33C].

The requirements discussed above, to apply the principles of IFRS 3 and other relevant IFRS accounting standards, do not apply to “the acquisition of an interest in a joint operation when the parties sharing joint control, including the entity acquiring the interest in the joint operation, are under the common control of the same ultimate controlling party or parties both before and after the acquisition, and that control is not transitory.” [IFRS 11.B33D].

8.3.2 Obtaining control or joint control over a joint operation that is a business

When a party to a joint operation obtains control over the joint operation that meets the definition of a business, it applies the requirements for a business combination achieved in stages. This includes remeasuring previously held interests in the assets and liabilities of the joint operation at fair value. In doing so, the acquirer remeasures its entire previously held interest in the joint operation. [IFRS 3.42A].

A party without joint control of a joint operation that is a business and that has rights to assets and obligations for liabilities, might obtain joint control. In this scenario, in contrast to that described above, the previously held interest in that joint operation is not remeasured. [IFRS 11.B33CA]

8.3.3 Former subsidiary becomes a joint operation

IFRS accounting standards are not clear about the accounting when an entity loses control of a subsidiary and retains an interest in a joint operation.

In July 2016, the IFRS IC discussed this issue and noted that IFRS 11, which states that a joint operator recognises gains and losses resulting from the transaction only to the extent of the other parties’ interests in the joint operation [IFRS 11.B34] (see section 6.6 above) could be viewed as conflicting with the requirements in IFRS 10, which specify that an entity remeasures any retained interest when it loses control of a subsidiary. [IFRS 10.25]. The IASB decided not to add this issue to its agenda but instead to recommend that the Board consider the issue at the same time the Board further considers the accounting for the sale or contribution of assets to an associate or a joint venture. This application issue was identified as part of the equity method project (see Chapter 12).

How we see it

In our view, when a parent loses control over a subsidiary and retains an interest in a joint operation that is a business, entities have an accounting policy choice whether or not to remeasure the retained interest at fair value.

8.3.4 Joint operation becomes an associate or a financial instrument and vice versa

IFRS 11 does not explicitly address the accounting when a joint operation becomes an equity method associate or a financial instrument and vice versa. A former joint operation could become an equity method associate or financial instrument, for example, when a separate vehicle is accounted for as a joint operation in accordance with IFRS 11 and then a change in ownership interest results in joint control being lost and the separate vehicle being accounted for under IFRS 9 or IAS 28. In this scenario, it is generally appropriate to derecognise the assets and liabilities previously recognised in accordance with IFRS 11 and account for the new interest based on the applicable IFRS accounting standard at that date.

When an associate or financial instrument becomes a joint operation, it is not clear how the previously held interest is accounted for, i.e., whether remeasured to fair value or not.

8.3.5 Disposal of interest in a joint operation

When an entity disposes of its interest in a joint operation, it ceases to account for the rights to assets and obligations for liabilities and recognises any gain or loss as of the disposal date, in accordance with the relevant IFRS accounting standard (see section 6 above). The only exception would be if the same rights to assets or obligations for liabilities replaced that interest directly. In this case, there would be no change in accounting, because, in both cases, the assets and liabilities are recognised in accordance with the relevant IFRS accounting standard.

Consistent with the treatment of joint ventures (see section 8.2.6 above) an entity continues to reflect its interest in a joint operation for the reporting period (and comparative period) in which it held that interest. An entity does not restate its financial statements as if it never held the interest in the disposed joint operation.

8.3.6 Interest in a joint operation held for sale

When a joint operator plans to dispose of all or part of its interest in a joint operation, it applies IFRS 5 to those assets and liabilities within the scope of IFRS 5 (see Chapter 5).

If an interest in a joint operation (or portion thereof) no longer meets the criteria to be classified as held for sale, an entity restates the financial statements for the periods since classification as held for sale, (see Chapter 5). [IFRS 5.28].

8.4 Changes in ownership of a joint arrangement that does not constitute a business

8.4.1 Joint operator obtains control or parties without joint control obtain joint control

At its January 2016 meeting, the IFRS IC discussed whether previously held interests in the assets and liabilities of a joint operation, which does not constitute a business, are remeasured when:

- A joint operator or a party without joint control obtains control of a joint operation
- And
- A change of interests resulting in a party without joint control obtaining joint control over the joint operation

The IFRS IC noted in an asset acquisition in which the asset or group of assets do not meet the definition of a business, a cost-based approach is used and the existing assets generally are not remeasured (see Chapter 10 observed that it was not aware of significant diversity in practice and, therefore, decided not to add this issue to its agenda.¹⁸

8.5 Changes in classification of a joint arrangement

8.5.1 Equity method joint venture becomes a joint operation and vice versa

IFRS 11 does not explicitly address the accounting when an equity method joint venture becomes a joint operation, or vice versa. For example, when a separate vehicle is accounted for as a joint venture under IAS 28 and then a change in the terms governing the arrangement result in the separate vehicle being accounted for as a joint operation. In this scenario, it is generally appropriate to derecognise the equity method joint venture and recognise the joint operation in accordance with IFRS 11 and section 8.3.1 above. IFRS accounting standards are not clear how the previously held interest is accounted for.

When a joint operation becomes a joint venture, as described at section 8.3.5 above, the joint operator ceases to account for the rights to assets and obligations for liabilities and recognises any gain or loss as of the disposal date, in accordance with the relevant IFRS accounting standard. The equity method joint venture is recognised in accordance with IAS 28.

8.5.2 The rights to assets or obligations for liabilities of a joint operation change

A joint operator's rights to assets or obligations for liabilities could change, for example, when other operators obtain rights to the assets or assume obligations for those liabilities or when joint operators amend the terms governing their rights to assets or obligations for liabilities. To account for such changes, the joint operator generally:

- Derecognises the relevant portion of the assets and liabilities
- Recognises the fair value of any consideration received
- Recognises the resulting gain or loss
- Recognises any rights to assets it acquires from other joint operators and obligations it assumes from other joint operators or from the joint arrangement itself

¹⁸ [IFRIC Update](#), January 2016, available on the IFRS Foundation's website.

9 Disclosures

The disclosure requirements regarding joint arrangements accounted for under IFRS 11 are included in IFRS 12 and are discussed in Chapter 14. IFRS 12 combines the disclosure requirements for an entity's interests in subsidiaries, joint arrangements, associates and structured entities into one comprehensive disclosure standard.

In May 2024, the IASB issued IFRS 19 *Subsidiaries without Public Accountability: Disclosures*, a voluntary IFRS accounting standard for use by eligible subsidiaries that prepare financial statements applying IFRS accounting standards. IFRS 19 specifies which disclosure requirements apply to a subsidiary that does not have public accountability and whose parent produces consolidated financial statements that comply with IFRS accounting standards and are available for public use. IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). See Chapter 4 for further details on IFRS 19.

10 Future developments

In September 2024, the IASB published an exposure draft¹⁹ addressing application issues relating to the equity method of accounting, which is relevant to the accounting for joint ventures. This is discussed in Chapter 12.

¹⁹ Exposure Draft [ED/2024/7](#): Equity Method of Accounting, available on the IFRS Foundation's website.

Question 2-1:	How does a joint operation that is a separate vehicle account for the assets and liabilities of the joint operation in its financial statements?	943
Question 5-1:	How does an entity evaluate the other facts and circumstances when classifying a joint arrangement that is structured through a separate vehicle whose legal form causes the separate vehicle to be considered in its own right?	960
Question 5-2:	Are constructive obligations considered when classifying a joint arrangement?	961
Question 5-3:	Does financing from a third party prevent a joint arrangement from being classified as a joint operation?	964
Question 5-4:	Does the fact that the output from the joint arrangement is sold to the parties to the joint arrangement at a market price prevent the joint arrangement from being classified as a joint operation, when assessing other facts and circumstances?	964
Question 5-5:	Does the nature of the output (i.e., fungible versus bespoke or custom) produced by the joint arrangement determine the classification of a joint arrangement when assessing other facts and circumstances?	964

Appendix C - Defined terms

Extract from IFRS 11

Appendix A Defined terms

joint arrangement	An arrangement of which two or more parties have joint control .
joint control	The contractually agreed sharing of control of an arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control.
joint operation	A joint arrangement whereby the parties that have joint control of the arrangement have rights to the assets, and obligations for the liabilities, relating to the arrangement.
joint operator	A party to a joint operation that has joint control of that joint operation.
joint venture	A joint arrangement whereby the parties that have joint control of the arrangement have rights to the net assets of the arrangement.
joint venturer	A party to a joint venture that has joint control of that joint venture.
party to a joint arrangement	An entity that participates in a joint arrangement , regardless of whether that entity has joint control of the arrangement.
separate vehicle	A separately identifiable financial structure, including separate legal entities or entities recognised by statute, regardless of whether those entities have a legal personality.

Overview

This Chapter discusses the requirements of IFRS 12 *Disclosure of Interests in Other Entities*.

IFRS 12 is a disclosure standard that must be applied by entities that have an interest in subsidiaries, joint arrangements, associates, and unconsolidated structured entities. IFRS 12 does not provide any recognition or measurement guidance. The standard was issued as the disclosure requirements of certain standards overlapped in many areas and it was thought inappropriate that the disclosure requirements for interests in unconsolidated structured entities would be located in a consolidation standard. Therefore, a combined disclosure standard for interests in other entities would make it easier to understand and apply the disclosure requirements for subsidiaries, joint ventures, associates and unconsolidated structured entities. [IFRS 12.BC7].

In order to determine the appropriate recognition and measurement of subsidiaries, joint arrangements and associates, entities should refer to IFRS 10 *Consolidated Financial Statements* (see Chapter 7 and Chapter 8), IFRS 11 *Joint Arrangements* (see Chapter 13), IAS 27 *Separate Financial Statements* (see Chapter 9) and IAS 28 *Investments in Associates and Joint Ventures* (see Chapter 12) respectively.

What you need to know

- IFRS 12 requires an entity to disclose information that enables users of its financial statements to evaluate the nature of, and risks associated with, its interests in other entities and the effects of those interests on its financial position, financial performance and cash flows.
- An interest in another entity refers to contractual and non-contractual involvement that exposes the entity to variable returns.
- IFRS 12 contains disclosure requirements for interests in subsidiaries, joint arrangements and associates, as well as disclosures of interests in unconsolidated structured entities.

1 Introduction

IFRS 12 is a disclosure standard, issued in May 2011. It includes all of the disclosure requirements related to interests in subsidiaries, joint arrangements, associates and consolidated and unconsolidated structured entities.

Differences between IFRS 12 and US GAAP disclosure requirements are not addressed in this chapter.

The recognition and measurement of subsidiaries, joint arrangements and associates are dealt with in IFRS 10, IFRS 11, IAS 27 and IAS 28 (see Chapter 7, Chapter 8, Chapter 9, Chapter 12 and Chapter 13 respectively).

2 Objective and scope of IFRS 12

2.1 Objective

The stated objective and how to meet the objective of IFRS 12 are as follows: [IFRS 12.1, IFRS 12.2].

Extract from IFRS 12

- 1 The objective of this IFRS is to require an entity to disclose information that enables users of its financial statements to evaluate:
 - (a) the nature of, and risks associated with, its interests in other entities; and
 - (b) the effects of those interests on its financial position, financial performance and cash flows.
- 2 To meet the objective in paragraph 1, an entity shall disclose:
 - (a) the significant judgements and assumptions it has made in determining:
 - (i) the nature of its interest in another entity or arrangement;
 - (ii) the type of joint arrangement in which it has an interest (paragraphs 7-9);
 - (iii) that it meets the definition of an investment entity if applicable (paragraph 9A); and
 - (b) information about its interests in:
 - (i) subsidiaries (paragraphs 10-19);
 - (ii) joint arrangements and associates (paragraphs 20-23); and
 - (iii) structured entities that are not controlled by the entity (unconsolidated structured entities) (paragraphs 24-31).

If the disclosures required by the standard, together with the disclosures required by other IFRS accounting standards, do not meet the objective of IFRS 12, an entity must disclose whatever additional information is necessary to meet that objective. [IFRS 12.3]. This requirement reiterates the notion already stated in IAS 1 *Presentation of Financial Statements* that additional information shall be disclosed when necessary for an understanding of the financial statements. [IAS 1.17(c), IAS 1.31, IAS 1.112(c)].¹

How we see it

IFRS 12 provides no illustrative examples to support any of its disclosure requirements. In addition, several of the terms used in the standard are undefined. Therefore, judgement will be required by entities in interpreting the requirements.

2.1.1 Interim Financial Reporting

IAS 34 *Interim Financial Reporting* (see Chapter 37) allows an entity to include either a complete set of financial statements in the interim report or, which is predominant practice, a condensed version. [IAS 34.4]. In interim financial statements, entities must provide information about events and transactions in the interim period that are significant to an understanding of the changes in financial position and performance since the last annual reporting period (see Chapter 37). [IAS 34.15]. In addition, a number of specific disclosures are required to be given in the notes to the interim financial statements or elsewhere in the interim financial report (see Chapter 37). [IAS 34.16A]. For example, entities becoming or ceasing to be investment entities, as defined in IFRS 10, have to disclose the information required in IFRS 12.9B (see section 4.6.2 below). [IAS 34.16A(k)]. Certain disclosures about the effect of changes in the composition of the entity during the interim period and obtaining or losing control of subsidiaries and long-term investments are also required. [IAS 34.16A(i)].

The disclosures required by IAS 34 apply to both complete and condensed financial statements presented for an interim period. A complete set of financial statements, prepared for an interim period, would include all of the disclosures required by IAS 34 as well as those required by other IFRS accounting standards, including IFRS 12. [IAS 34.7].

¹ The same is required according to IAS 8(2027).6C(c), IFRS 18.20 and IFRS 18.113(c), once effective.

2.2 Scope

IFRS 12 applies to any entity that has an interest in any of the following:

- (a) Subsidiaries
- (b) Joint arrangements (i.e., joint operations or joint ventures)
- (c) Associates
- And
- (d) Unconsolidated structured entities *[IFRS 12.5]*

Despite the broad title of IFRS 12, there are several interests in other entities to which IFRS 12 does not apply (see section 2.2.3 below).

2.2.1 Definitions

The definitions that are relevant to the application of IFRS 12 and included within Appendix A of the standard are likewise included in Appendix C of this chapter. A list of these terms is produced below, in alphabetical order.

- Income from a structured entity
- Interest in another entity
- Structured entity

In addition, Appendix A to IFRS 12 provides a list of terms defined in IAS 27, IAS 28, IFRS 10 and IFRS 11, which are used in IFRS 12 with the meanings specified in those IFRS accounting standards. These definitions are included in Chapter 7, Chapter 8, Chapter 9, Chapter 12 and Chapter 13 respectively.

2.2.1.A Interests in other entities

An interest in another entity refers to contractual and non-contractual involvement that exposes the reporting entity to variability of returns from the performance of the other entity (i.e., the investee). Consideration of the purpose and design of the other entity may help the reporting entity when assessing whether it has an interest in that entity and, therefore, whether it is required to provide the disclosures in IFRS 12. That assessment must include consideration of the risks that the other entity was designed to create and the risks that the other entity was designed to pass on to the reporting entity and other parties. *[IFRS 12.B7]*.

IFRS 10 defines 'variability of returns'. As discussed in more detail in Chapter 7, IFRS 10 explains that variable returns are returns that are not fixed and have the potential to vary as a result of the performance of an investee. Variable returns can be only positive, only negative or both positive and negative. An investor assesses whether returns from an investee are variable and how variable these returns are, on the basis of the substance of the arrangement and regardless of the legal form of the returns. For example, an investor can hold a bond with fixed interest payments. The fixed interest payments are variable returns for the purpose of IFRS 10 because they are subject to default risk and they expose the investor to the credit risk of the issuer of the bond. The amount of variability (i.e., how variable those returns are) depends on the credit risk of the bond. Similarly, fixed performance fees for managing an investee's assets are variable returns because they expose the investor to the performance risk of the investee. The amount of variability depends on the investee's ability to generate sufficient income to pay the fee. *[IFRS 10.B56]*.

How we see it

The definition of an 'interest' in IFRS 12 is much wider than only equity instruments in an entity. As IFRS 12 requires disclosures of interests that a reporting entity holds in other entities, preparers will need to ensure that their reporting systems and processes are sufficient to identify those 'interests'.

IFRS 12 clarifies that a reporting entity is typically exposed to variability of returns from the performance of another entity by holding instruments (such as equity or debt instruments issued by the other entity) or having another involvement that absorbs variability. *[IFRS 12.B8]*. This is illustrated in Illustration 2-1 below.

Illustration 2-1: Variability of returns arising from issue of credit default swap (1)

A reporting entity issues a credit default swap to a structured entity. The credit default swap protects the structured entity from the default of interest and principal payments on its loan portfolio.

The reporting entity has an involvement in the structured entity that exposes it to variability of returns from the performance of the structured entity because the credit default swap absorbs variability of returns of the structured entity. *[IFRS 12.B8]*.

Some instruments are designed to transfer risk from the reporting entity to another entity. Such instruments create variability of returns for the other entity but do not typically expose the reporting entity to variability of returns from the performance of the other entity. [IFRS 12.B9]. This is illustrated in Illustration 2-2 below.

Illustration 2-2: Variability of returns arising from issue of credit default swap (2)

A reporting entity (Entity Z) enters into a credit default swap with a structured entity. The credit default swap gives the structured entity exposure to Entity Z's credit risk. The purpose of the arrangement is to give the investors in the structured entity exposure to Entity Z's credit risk (Entity Z is unrelated to any other party involved in the arrangement).

Entity Z does not have any involvement with the structured entity that exposes it to variable returns from the structured entity because the credit default swap transfers variability to the structured entity rather than absorbing variability of returns of the structured entity.

Purchased call options and written put options (in each case unless the exercise price is at fair value) would also be interests in other entities, because these instruments typically absorb variability created by assets held in the entity. In contrast, some derivative instruments, such as interest rate swaps, can both create and absorb variability and judgement will need to be exercised in determining whether these derivatives are interests in other entities.

How we see it

We believe that plain vanilla swaps and other derivatives that both create and absorb variability, based on market rates or indices and which rank senior to the issued notes, do not absorb the risks the entity was designed to pass on, and are not an exposure to variable returns. They are therefore unlikely to be interests in other entities that would require disclosure under IFRS 12. See Chapter 7.

An entity does not necessarily have an interest in another entity because of a typical customer-supplier relationship. However, as explained above, IFRS 10 states that fixed performance fees for managing an investee's assets create variable returns for the investor. The fixed performance fees are 'variable' because they expose the investor to the performance risk of the investee. [IFRS 10.B56]. Therefore, investment management fees and other fees based on assets under management are treated as variable interests.

2.2.1.B Structured entities

Whether an entity is a structured entity or not is important because additional disclosures are required by IFRS 12 for interests in structured entities. These disclosures are discussed in section 4.4 and section 6 below.

The IASB's rationale for including specific disclosures of investments in structured entities is that users requested such disclosures because they believed involvement with these entities posed more risk than involvement with traditional operating entities. The increased risk exposure arises because, for example, the structured entity may have been created to pass risks and returns arising from specified assets to investors, or may have insufficient equity to fund losses on its assets, if they arise. [IFRS 12.BC84].

As defined in Appendix A of IFRS 12 (see Appendix C of this chapter), a structured entity is an entity that has been designed so that voting or similar rights are not the dominant factor in deciding who controls the entity, such as when any voting rights relate to administrative tasks only and the relevant activities are directed by means of contractual arrangements.

IFRS 12 states that a structured entity often has some or all of the following features or attributes:

- (a) Restricted activities
- (b) A narrow and well-defined objective, such as:
 - (i) To effect a tax-efficient lease
 - (ii) To carry out research and development activities
 - (iii) To provide a source of capital or funding to an entity
 Or
 - (iv) To provide investment opportunities for investors by passing on risks and rewards associated with the assets of the structured entity to investors
- (c) Insufficient equity to permit the structured entity to finance its activities without subordinated financial support
And
- (d) Financing in the form of multiple contractually linked instruments to investors that create concentrations of credit or other risks (tranches) [IFRS 12.B22]

Appendix B of IFRS 12 provides the following examples of structured entities: [IFRS 12.B23]

Extract from IFRS 12

- B23 Examples of entities that are regarded as structured entities include, but are not limited to:
- (a) securitisation vehicles.
 - (b) asset-backed financings.
 - (c) some investment funds.

The Basis for Conclusions explains that the type of entity the Board envisages being characterised as a structured entity is an entity created to accomplish a narrow and well-defined objective, listing as examples entities established to effect a lease, entities established for research and development activities or entities established for the securitisation of financial assets. [IFRS 12.BC82]. The IFRS 12 definition of a structured entity implies that any entity which is not controlled by voting or similar rights is a structured entity. Conversely, any entity controlled by voting or similar rights cannot be a structured entity.

It is not clear what the IASB means by 'similar' (to voting) rights in the definition of a structured entity. No illustrative examples are provided. This will therefore require the exercise of judgement by reporting entities; consequently, there may be diversity in practice about what constitutes a 'similar' right and therefore, whether an entity is a structured entity. One example of 'similar' rights is an investment fund for which investors can vote to remove the manager of the fund without cause as long as a certain proportion of investors demand such a vote. The assessment of whether this right (to remove the fund manager) could be considered substantive, and therefore, whether the investment fund is a structured entity, would depend on the number of investors who would need to collaborate in order to force the vote, as well as other facts and circumstances. See Chapter 7 for additional guidance on identifying the significant activities of an entity, the rights to make decisions about those activities, and evaluating whether those rights are substantive.

How we see it

IFRS 12 does not state whether the 'features or attributes' of structured entities discussed above are determinative as to whether an entity is a structured entity or whether the features or attributes should always be subordinate to the definition (i.e., if the entity was controlled by voting or similar rights then the features or attributes would be irrelevant). Our view is that the features and attributes are subordinated to the definition. However, the features or attributes are often present in a structured entity.

The IASB considered, but rejected, defining a structured entity in a way similar to a variable interest entity (VIE) in US GAAP. That approach, in the IASB's opinion, would have introduced complicated guidance solely for disclosure purposes that was not previously in IFRS accounting standards. [IFRS 12.BC83]. US GAAP defines a VIE, in essence, as an entity whose activities are not directed through voting or similar rights, whose total equity is not sufficient to permit the entity to finance its activities without additional subordinated financial support, or whose equity is structured with non-substantive voting rights. The IASB had two reasons for not making the definition of a structured entity dependent on total equity at risk (as in US GAAP). First, including insufficient equity at risk in the definition of a structured entity would require extensive application guidance to help determine the sufficiency of the equity, to which the IASB was opposed. Second, the IASB feared that some traditional operating entities might be caught by this definition when this was not its intention. [IFRS 12.BC83, IFRS 12.BC84, IFRS 12.BC85].

IFRS 12 clarifies that an entity that is controlled by voting rights is not a structured entity simply because, for example, it receives funding from third parties following a restructuring. [IFRS 12.B24]. However, such funding is likely to give the investor a variable interest in the restructured entity that may still be a subsidiary as defined by IFRS 10.

2.2.1.C Interaction of IFRS 12 and IFRS 5

The requirements in IFRS 12, except as described in IFRS 12.B17, apply to an entity's interests listed in IFRS 12.5 (see section 2.2 above) that are classified (or included in a disposal group that is classified) as held for sale or discontinued operations in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*. [IFRS 12.5A].

An entity is not required to disclose summarised financial information, for its interests in a subsidiary, a joint venture or an associate in accordance with IFRS 12.B10-B16 when the entity's interest in that subsidiary, joint venture or associate (or a portion of its interest in a joint venture or an associate) is classified or included in a disposal group that is classified as held for sale in accordance with IFRS 5. [IFRS 12.B17].

2.2.2 Interests disclosed under IFRS 12

Extract from IFRS 12

- B4 An entity shall present information separately for interests in:
- (a) subsidiaries;
 - (b) joint ventures;
 - (c) joint operations;
 - (d) associates; and
 - (e) unconsolidated structured entities.

[IFRS 12.B4].

A reporting entity has to consider the level of detail necessary to satisfy the disclosure objective (see section 2.1 above) and how much emphasis to place on each of the requirements of IFRS 12. Disclosures can be aggregated or disaggregated so that useful information is not obscured by either the inclusion of a large amount of insignificant detail or the aggregation of items that have different characteristics. [IFRS 12.4]. However, a reporting entity must disclose how it has aggregated its interests in similar entities. [IFRS 12.B3].

In determining whether to aggregate information, an entity must consider qualitative and quantitative information about the different risk and return characteristics of each entity it is considering for aggregation and the significance of each entity to itself. The entity must present the disclosures in a manner that clearly explains to users of the financial statements the nature and extent of its interests in those other entities. [IFRS 12.B5].

Examples of aggregation levels within the classes of entities shown above that IFRS 12 considers appropriate are:

- Nature of activities (e.g., a research and development entity, a revolving credit card securitisation entity)
- Industry classification
- And
- Geography (e.g., country or region) [IFRS 12.B6]

This aggregation guidance above implies latitude for entities to exercise their judgement in determining the appropriate level of disclosure. However, summarised financial information is required separately for each material partly-owned subsidiary, each material joint venture and associate whilst minimum disclosures are required for interests in unconsolidated structured entities (see section 6.2 below).

2.2.2.A Subsidiaries

IFRS 10 defines a subsidiary as “an entity that is controlled by another entity”. [IFRS 10 Appendix A]. IFRS 10 provides guidance as to the circumstances in which an entity is controlled by another entity. See Chapter 7.

2.2.2.B Joint arrangements

Extract from IFRS 11

Appendix A Defined terms

joint arrangement	An arrangement of which two or more parties have joint control .
joint control	The contractually agreed sharing of control of an arrangement, which exists only when decisions about the relevant activities require the unanimous consent of the parties sharing control.
joint operation	A joint arrangement whereby the parties that have joint control of the arrangement have rights to the assets, and obligations for the liabilities, relating to the arrangement.
joint venture	A joint arrangement whereby the parties that have joint control of the arrangement have rights to the net assets of the arrangement.

[IFRS 11 Appendix A].

IFRS 11 provides guidance as to the circumstances in which joint control exists and on the characteristics of joint operations and joint ventures. See Chapter 13.

Interests in joint arrangements which are not structured entities and where the reporting entity does not have joint control or significant influence over the joint arrangement, are outside the scope of IFRS 12. See section 2.2.3.C below.

2.2.2.C Associates

IAS 28 defines an associate as “an entity over which the investor has significant influence”. [IAS 28.3]. IAS 28 provides guidance on the circumstances in which significant influence exists. See Chapter 12.

2.2.2.D Unconsolidated structured entities

The term ‘unconsolidated structured entities’ refers to all structured entities which are not consolidated by a reporting entity. Therefore, it includes structured entities that are joint arrangements and associates (unless specially excluded from the scope of the standard - see section 2.2.3 below), structured entities that are subsidiaries of parents that prepare separate but not consolidated financial statements (see section 2.2.3.B below), and structured entities over which the reporting entity does not have significant influence.

Where an unconsolidated structured entity is a joint venture or an associate, then the disclosures required for unconsolidated structured entities in section 6 below apply in addition to the disclosures in section 5 below for interests in joint ventures and associates. The IASB concluded that an entity should capture most, and in some cases all, of the disclosures required for interests in unconsolidated structured entities by providing the disclosures for interests in joint ventures and associates. Accordingly, the IASB considers that the requirement to make both sets of disclosures where applicable is not expected to result in a significant increase in the amount of information that an entity would be required to provide. [IFRS 12.BC77].

As discussed in section 2.2.1.A above, the definition of a variable interest is widely drawn so that a derivative issued to a structured entity may result in an interest in an unconsolidated structured entity, depending on the purpose and design of the entity. This interest would require disclosures under IFRS 12 that would not apply to an identical instrument issued to an entity which is not a structured entity. The disclosures focus on an entity’s exposure to risk from interests in structured entities that the entity rightly does not consolidate because it does not control them. [IFRS 12.BC69].

2.2.3 Interests not within the scope of IFRS 12

IFRS 12 clarifies that certain interests are not within its scope as discussed in sections 2.2.3.A, 2.2.3.B, 2.2.3.C and 2.2.3.D below.

2.2.3.A Employee benefit plans

Post-employment benefit plans or other long-term employee benefit plans to which IAS 19 *Employee Benefits* applies are not within the scope of IFRS 12. [IFRS 12.6(a)]. Without this exemption, some employee benefit plans might meet the definition of a structured entity.

2.2.3.B Separate financial statements

An entity’s separate financial statements to which IAS 27 applies are not within the scope of IFRS 12. The purpose of this exemption is to prevent a parent duplicating IFRS 12 disclosures in both its consolidated and separate financial statements. See Chapter 9 for guidance on separate financial statements.

However, an entity that has interests in unconsolidated structured entities and prepares separate financial statements as its only financial statements, is required to make the disclosures in IFRS 12.24-31 in respect of the unconsolidated structured entities (see section 6 below). As discussed in section 2.2.2.D above, unconsolidated structured entities include subsidiaries, joint ventures and associates that are structured entities.

In addition, an investment entity that prepares financial statements in which all of its subsidiaries are measured at fair value through profit or loss (i.e., an investment entity which has subsidiaries but does not prepare consolidated financial statements) must make the disclosures relating to investment entities discussed in section 4.6 below. [IFRS 12.6(b)].

The financial statements of an entity that does not have an interest in a subsidiary, associate or a joint venturer's interest in a joint venture are not separate financial statements. [IAS 27.7]. These financial statements are within the scope of IFRS 12. In practice, the only disclosures that apply to these entities are those related to unconsolidated structured entities (see section 6 below).

2.2.3.C Interests in joint arrangements that result in neither joint control nor significant influence and are not interests in structured entities

An interest held by an entity that participates in, but does not have joint control of, a joint arrangement is outside the scope of IFRS 12 unless that interest results in significant influence in that arrangement or is an interest in a structured entity. [IFRS 12.6(c)].

IFRS 11 states that an arrangement can be a joint arrangement even though not all of the parties have joint control of the arrangement. It distinguishes between parties that have joint control of a joint arrangement (joint operators or joint venturers) and parties that participate in, but do not have joint control of, a joint arrangement. [IFRS 11.11].

Determining whether an interest in a joint arrangement (which is not a structured entity) results in neither joint control nor significant influence will be a matter of judgement based on the facts and circumstances. See Chapter 13 for guidance on assessing joint control and Chapter 12 for guidance on assessing significant influence.

2.2.3.D Interests in other entities accounted for in accordance with IFRS 9

An interest in another entity that is accounted for under IFRS 9 *Financial Instruments* is outside the scope of IFRS 12; such interest is subject to the disclosure requirements in IFRS 7 *Financial Instruments: Disclosures* (see Chapter 50) and, if measured at fair value, IFRS 13 *Fair Value Measurement* (see Chapter 15). However, IFRS 12 applies to the following interests:

- (i) Interests in associates or joint ventures measured at fair value through profit or loss in accordance with IAS 28
Or
- (ii) Interests in unconsolidated structured entities [IFRS 12.6(d)]

In addition, IFRS 12 requires specific disclosures for unconsolidated subsidiaries of an investment entity measured at fair value through profit and loss. See section 4.6 below.

Interests in unconsolidated structured entities which are not subsidiaries, joint arrangements or associates would normally be accounted for in accordance with IFRS 9. See Chapter 45 for guidance on recognition and initial measurement of financial instruments in accordance with IFRS 9.

3 Disclosure of significant judgements and assumptions

Extract from IFRS 12

- 7 An entity shall disclose information about significant judgements and assumptions it has made (and changes to those judgements and assumptions) in determining:
- (a) that it has control of another entity, ie an investee as described in paragraphs 5 and 6 of IFRS 10 *Consolidated Financial Statements*;
 - (b) that it has joint control of an arrangement or significant influence over another entity; and
 - (c) the type of joint arrangement (ie joint operation or joint venture) when the arrangement has been structured through a separate vehicle.

[IFRS 12.7].

The significant judgements and assumptions disclosed in accordance with the requirements above include those made by an entity when changes in facts and circumstances are such that the conclusion about whether it has control, joint control or significant influence changes during the reporting period. [IFRS 12.8].

In order to comply with the requirements above, an entity must disclose, for example, significant judgements and assumptions made in determining that:

- It does not control another entity even though it holds more than half of the voting rights of the other entity.
- It controls another entity even though it holds less than half of the voting rights of the other entity.
- It is an agent or principal as defined by IFRS 10 (see Chapter 7).
- It does not have significant influence even though it holds 20% or more of the voting rights of another entity.
- It has significant influence even though it holds less than 20% of the voting rights of another entity. [IFRS 12.9].

The following extract from BP p.l.c.'s financial statements illustrates disclosure of the significant judgements and assumptions used in determining significant influence with a less than 20% holding of voting rights.

Practical example 3-1: BP p.l.c. (2023)

United Kingdom

bp Annual Report and Form 20-F 2023 [extract]

Notes on financial statements [extract]

1. Material accounting policy information, significant judgements, estimates and assumptions [extract]

Interests in other entities [extract]

Interests in associates [extract]

Significant judgement: investment in Aker BP

Judgement is required in assessing the level of control or influence over another entity in which the group holds an interest. For bp, the judgement that the group has significant influence over Aker BP, a Norwegian oil and gas company, is significant.

As a consequence of this judgement, bp uses the equity method of accounting for its investment and bp's share of Aker BP's oil and natural gas reserves is included in the group's estimated net proved reserves of equity-accounted entities. If significant influence was not present, the investment would be accounted for as an investment in an equity instrument measured at fair value as described under 'Financial assets' below and no share of Aker BP's oil and natural gas reserves would be reported.

Significant influence is defined in IFRS as the power to participate in the financial and operating policy decisions of the investee but is not control or joint control of those decisions. Significant influence is presumed when an entity owns 20% or more of the voting power of the investee. Significant influence is presumed not to be present when an entity owns less than 20% of the voting power of the investee.

bp owned 15.9% of the voting shares at 31 December 2023. bp's group chief executive officer, Murray Auchincloss, has been a member of the Aker BP board since 2017. bp's other nominated director, group chief financial officer, Kate Thomson, has been a member of the Aker BP board since formation of that company in 2016. She is also a member of the Aker BP board's Audit and Risk Committee. bp also holds the voting rights at general meetings of shareholders conferred by its stake in Aker BP. bp's management considers, therefore, that the group continues to have significant influence at 31 December 2023.

The following Illustration shows disclosure of significant judgements and assumptions made by an entity in determining whether a joint arrangement is a joint operation or a joint venture.

Illustration 3-1: Illustrative example of disclosure of significant judgements and assumptions made in determining the type of joint arrangement

The directors have determined that the Group's investment in ABC Inc. should be accounted for as a joint operation rather than a joint venture. Although the legal form of ABC Inc. and the contractual terms of the joint arrangement indicate that the arrangement is a joint venture, sales to third parties by ABC Inc. are expected to be uncommon and not material. In addition, the price of the output sold to the venturers is set by all parties at a level that is designed to cover only the costs of production and administrative expenses incurred by ABC Inc. On this basis, the directors consider that, in substance, the arrangement gives the venturers rights to the economic benefits of the assets, and obligations to fund the settlement of the liabilities, relating to the arrangement and not rights to the net assets of the arrangements and therefore is a joint operation.

When a parent determines that it is an investment entity in accordance with IFRS 10, the investment entity must disclose information about significant judgements and assumptions it has made in determining that it is an investment entity. If the investment entity does not have one or more of the typical characteristics of an investment entity (as per IFRS 10), it must disclose the reasons for concluding that it is nevertheless an investment entity. [IFRS 12.9A]. The definition of an investment entity is discussed in Chapter 7.

The following extract from 3i Group plc's financial statements illustrates disclosure of these significant judgements and assumptions.

Practical example 3-2: 3i Group plc (2024)

United Kingdom

Annual report and accounts 2024 [extract]

Audited financial statements [extract]

Material accounting policies [extract]

C Critical accounting judgements and estimates [extract]

(a) Critical judgements [extract]

I. Assessment as an investment entity

The Board has concluded that the Company continues to meet the definition of an investment entity, as its strategic objective of investing in portfolio investments and providing investment management services to investors for the purpose of generating returns in the form of investment income and capital appreciation remains unchanged.

IAS 1 requires an entity to disclose the judgements that management has made in the process of applying the entity's accounting policies and that have the most significant effect on the amounts recognised in the financial statements. [IAS 1.122].² IFRS 12 adds to those general requirements by specifically requiring an entity to disclose all significant judgements and estimates made in determining the nature of its interest in another entity or arrangement, and in determining the type of joint arrangement in which it has an interest. The IASB's intention is that disclosure is required for all situations in which an entity exercises significant judgement in assessing the nature of its interest in another entity. [IFRS 12.BC16].

There is no requirement for a reporting entity to disclose significant judgements and assumptions made in determining whether an entity in which it has an interest is a structured entity. Such a judgement or assumption affects disclosure only and not the determination of control, joint control or significant influence.

How we see it

Where judgements or assumptions made in determining whether an entity in which it has an interest is a structured entity have a significant impact on the volume of disclosures in the financial statements, we believe that it would be useful for a reader of the financial statements for such judgements or assumptions to be disclosed, consistent with the requirements of IAS 1.

There is no requirement to disclose quantitative information to help assess the accounting consequences of an entity's decision to consolidate (or not to consolidate) another entity. IFRS 3 *Business Combinations* already requires disclosures about the nature and effect of a business combination when an entity obtains control of another entity. Where an entity requires significant judgement to conclude that it does not control another entity, the IASB observed that the entity will often conclude that it has either joint control or significant influence over that other entity. IFRS 12 already requires disclosures of quantitative information about an entity's interests in joint ventures and associates and information about risk exposures to unconsolidated structured entities. Therefore, based on this, the IASB concluded that there was no need for a separate disclosure requirement. [IFRS 12.BC19].

² The consequential amendments resulting from IFRS 18, once effective, moves this guidance to IAS 8(2027).27G.

4 Disclosure of interests in subsidiaries

Extract from IFRS 12

- 10** An entity shall disclose information that enables users of its consolidated financial statements
- (a) to understand:
 - (i) the composition of the group; and
 - (ii) the interest that non-controlling interests have in the group's activities and cash flows (paragraph 12); and
 - (b) to evaluate:
 - (i) the nature and extent of significant restrictions on its ability to access or use assets, and settle liabilities, of the group (paragraph 13);
 - (ii) the nature of, and changes in, the risks associated with its interests in consolidated structured entities (paragraphs 14-17);
 - (iii) the consequences of changes in its ownership interest in a subsidiary that do not result in a loss of control (paragraph 18); and
 - (iv) the consequences of losing control of a subsidiary during the reporting period (paragraph 19).

[IFRS 12.10].

4.1 Disclosure about the composition of the group

IFRS 12 does not elaborate on what is meant by information that enables users 'to understand' the composition of the group. Judgement will therefore be required as to the extent of the disclosures made. It may be helpful to users of the financial statements to illustrate the composition of the group via a diagram or group organisation chart.

In interpreting the requirement to disclose information that enables users to understand the composition of the group for subsidiaries with immaterial or no non-controlling interests, preparers might wish to refer to the non-financial disclosures required for subsidiaries with non-controlling interests that are material to the reporting entity (see section 4.2 below). Applying these disclosures to other material subsidiaries would mean disclosing:

- The names of those entities
 - The principal place of business (and country of incorporation, if different) of those entities
- And
- The proportion of ownership interest (and the proportion of the voting rights, if different) held in those entities

Users of the financial statements might also benefit from a description of the nature of the operations and principal activities of each material subsidiary and an indication of the operating segment(s) to which each material subsidiary has been allocated. A description of the nature of the group's operations and its principal activities is required by IAS 1. [IAS 1.138(b)].³

³ The same is required according to IFRS 18.116(b), once effective.

Practical example 4.1 shows UBS Group AG's disclosure of individually significant subsidiaries.

Practical example 4-1: UBS Group AG (2023)

Switzerland

Annual Report 2023 [extract]

Consolidated financial statements [extract]

Notes to the UBS Group AG consolidated financial statements [extract]

Note 29 Interests in subsidiaries and other entities [extract]

a) Interests in subsidiaries [extract]

UBS defines its significant subsidiaries as those entities that, either individually or in aggregate, contribute significantly to the Group's financial position or results of operations, based on a number of criteria, including the subsidiaries' equity and contribution to the Group's total assets and profit or loss before tax, in accordance with the requirements set by IFRS 12, Swiss regulations and the rules of the US Securities and Exchange Commission (the SEC).

Individually significant subsidiaries

The two tables below list the Group's individually significant subsidiaries as of 31 December 2023. Unless otherwise stated, the subsidiaries listed below have share capital consisting solely of ordinary shares held entirely by the Group, and the proportion of ownership interest held is equal to the voting rights held by the Group.

The country where the respective registered office is located is also the principal place of business. UBS AG and Credit Suisse AG operate through a global branch network and a significant proportion of their business activity is conducted outside Switzerland, including in the UK, the US, Singapore, the Hong Kong SAR and other countries. UBS Europe SE has branches and offices in a number of EU Member States, including Germany, France, Italy, Luxembourg and Spain. Share capital is provided in the currency of the legally registered office.

Individually significant subsidiaries of UBS Group AG as of 31 December 2023

Company	Registered office	Share capital in million	Equity interest accumulated in %
UBS AG	Zurich and Basel, Switzerland	USD 385.8	100.0
UBS Business Solutions AG ¹	Zurich, Switzerland	CHF 1.0	100.0
Credit Suisse AG	Zurich, Switzerland	CHF 4,399.7	100.0
Credit Suisse Services AG	Zurich, Switzerland	CHF 1.0	100.0

¹ UBS Business Solutions AG holds subsidiaries in China, India, Israel and Poland.

Individually significant subsidiaries of UBS AG as of 31 December 2023¹

Company	Registered office	Primary business	Share capital in million	Equity interest accumulated in %
UBS Americas Holding LLC	Wilmington, Delaware, USA	Group Items	USD 2,900.0 ²	100.0
UBS Americas Inc.	Wilmington, Delaware, USA	Group Items	USD 0.0	100.0

¹ Includes direct and indirect subsidiaries of UBS AG. ² Consists of common share capital of USD 1,000 and non-voting preferred share capital of USD 2,900,000,000. ³ Consists of common share capital of USD 100,000 and non-voting preferred share capital of USD 1,283,000,000.

Individually significant subsidiaries of Credit Suisse AG as of 31 December 2023

Company	Registered office	Primary business	Share capital in million	Equity interest accumulated in %
Credit Suisse International	London, United Kingdom	Non-core and Legacy	USD 7,267.5	97.6 ¹
Credit Suisse (Schweiz) AG	Zurich, Switzerland	Personal & Corporate Banking	CHF 100.0	100.0
Credit Suisse Holdings (USA), Inc.	Wilmington, United States	Investment Bank	USD 0.0	100.0

¹ UBS Group AG owns the remaining 2.4%.

...

When the financial statements of a subsidiary used in the preparation of the consolidated financial statements are as of a date or for a period that is different from that of the consolidated financial statements, an entity must disclose:

- The date of the reporting period of the financial statements of that subsidiary
- And
- The reason for using a different date or period [IFRS 12.11]

4.2 Disclosure of interests of non-controlling interests

IFRS 12 requires that a reporting entity must disclose, for each of its subsidiaries that have non-controlling interests that are material:

- (a) The name of the subsidiary
 - (b) The principal place of business (and country of incorporation if different from the principal place of business) of the subsidiary
 - (c) The proportion of ownership interests held by non-controlling interests
 - (d) The proportion of voting rights held by non-controlling interests, if different to the proportion of ownership interests held
 - (e) The profit or loss allocated to the non-controlling interests of the subsidiary during the reporting period
 - (f) Accumulated non-controlling interests of the subsidiary at the end of the reporting period
- And
- (g) Summarised financial information about the subsidiary (see below) [IFRS 12.12]

The summarised financial information required to be disclosed is as follows:

- (a) Dividends paid to non-controlling interests
- And
- (b) Summarised financial information about the assets, liabilities, profit or loss and cash flows of the subsidiary that enables users to understand the interest that non-controlling interests have in the group's activities and cash flows. The information might include but is not limited to, for example, current assets, non-current assets, current liabilities, non-current liabilities, revenue, profit or loss and total comprehensive income. [IFRS 12.B10].

The summarised financial information must be presented before inter-company eliminations. [IFRS 12.B11].

The IASB believes that these disclosures will help users when estimating future profit or loss and cash flows by identifying, for example, the assets and liabilities that are held by subsidiaries, the risk exposures of particular group entities (e.g., by identifying which subsidiaries hold debt) and those subsidiaries that generate significant cash flows. [IFRS 12.BC27].

The IASB does not believe the requirement to provide information about subsidiaries with a material non-controlling interest is particularly onerous on the grounds that an entity is expected to have the information available in preparing its consolidated financial statements. [IFRS 12.BC29]. However, the IASB believes a requirement to disclose information about subsidiaries with immaterial or no non-controlling interests might prove to be onerous to prepare without any significant benefit for users. [IFRS 12.BC28].

Non-controlling interest is equity in a subsidiary not attributable, directly or indirectly, to a parent. [IFRS 10 Appendix A]. This means that these disclosures do not apply to instruments that might have the legal characteristics of equity, but which are classified as financial liabilities under IFRS accounting standards. This would also apply to instruments that are classified as equity in the separate financial statements of a subsidiary but that are classified as financial liabilities in the consolidated financial statements. Similarly, when a parent has concluded that it already has a present ownership interest in shares held by a non-controlling interest by virtue of call or put options in respect of those shares (see Chapter 8), then IFRS 12 disclosures in respect of those shares are not required by the parent because there is no non-controlling interest in the financial statements.

IFRS 12 is clear that this information is required only in respect of non-controlling interests that are material to the group. A subsidiary may have a significant non-controlling interest in a lower tier subsidiary, but disclosure is not required if that interest is not material at group level. Similarly, these disclosures do not apply to non-controlling interests that are material in aggregate but not individually.

Frequently asked questions

Question 4-1: Disclosures for a subsidiary with a material non-controlling interest

In January 2015, the IFRS IC discussed a request to clarify the level at which the financial information required by (e) to (g) of IFRS 12.12 should be provided where a subsidiary has non-controlling interests that are material to the group. The issue was whether the information provided should be either:

- At the subsidiary (i.e., entity) level based on the separate financial statements of the subsidiary.
Or
- At a subgroup level for the subgroup of the subsidiary and based on either (i) the amounts of the subgroup included in the consolidated financial statements of the parent or, (ii) the amounts included in the consolidated financial statements of the subgroup. In both (i) and (ii), transactions and balances between the subgroup and other subsidiaries of the reporting entity outside the subgroup would not be eliminated.

The IFRS IC noted that the decision on which approach is used to present the disclosures required by (e) to (g) of IFRS 12.12 should reflect the one that best meets the disclosure objective (see IFRS 12.10(a)) in the circumstances.

In respect of (e) and (f) of IFRS 12.12, the IFRS IC observed that a reporting entity should apply judgement in determining the level of disaggregation of information about subsidiaries that have a material non-controlling interest. That is, whether:

- The entity presents this information about the subgroup of the subsidiary.
Or
- Whether it is necessary in achieving the disclosure objective to disaggregate the information further to present information about the individual subsidiaries that have a material non-controlling interest within that subgroup.

In respect of (g) of IFRS 12.12, the IFRS IC observed that, in order to meet the overall disclosure requirement, information would need to be prepared on a basis that was consistent with the information included in the consolidated financial statements from the perspective of the reporting entity. This would mean, for example, that if the subsidiary was acquired in a business combination, the amounts disclosed should reflect the effects of the acquisition accounting (e.g., goodwill and fair value adjustments). The IFRS IC further observed that in providing the information, an entity would apply judgement in determining whether this information was presented at a subgroup level or whether further disaggregation was necessary about individual subsidiaries that have a material non-controlling interest within that subgroup. However, the IFRS IC noted that the information supplied would include transactions between the subgroup/subsidiary and other members of the reporting entity's group without elimination, but that transactions within the subgroup would be eliminated.

On the basis of the above analysis, the IFRS IC concluded that neither an Interpretation nor an amendment to IFRS 12 was necessary and decided not to add the issue to its agenda.⁴

Robert Bosch Gesellschaft mit beschränkter Haftung's financial statements illustrate disclosure of summarised financial information in respect of subsidiaries that have material non-controlling interests.

IFRS 12 does not address disclosure of non-controlling interests in the primary statements. IAS 1 requires disclosure of total non-controlling interests within equity in the statement of financial position, profit or loss and total comprehensive income for the period attributable to non-controlling interests and a reconciliation of the opening and closing carrying amount of each component of equity (which would include non-controlling interests) in the statement of changes in equity. [IAS 1.54, IAS 1.81B, IAS 1.106].⁵

4.3 Disclosure of the nature and extent of significant restrictions

Extract from IFRS 12

The nature and extent of significant restrictions

- 13 An entity shall disclose:
- (a) significant restrictions (eg statutory, contractual and regulatory restrictions) on its ability to access or use the assets and settle the liabilities of the group, such as:
 - (i) those that restrict the ability of a parent or its subsidiaries to transfer cash or other assets to (or from) other entities within the group.
 - (ii) guarantees or other requirements that may restrict dividends and other capital distributions being paid, or loans and advances being made or repaid, to (or from) other entities within the group.
 - (b) the nature and extent to which protective rights of non-controlling interests can significantly restrict the entity's ability to access or use the assets and settle the liabilities of the group (such as when a parent is obliged to settle liabilities of a subsidiary before settling its own liabilities, or approval of non-controlling interests is required either to access the assets or to settle the liabilities of a subsidiary).
 - (c) the carrying amounts in the consolidated financial statements of the assets and liabilities to which those restrictions apply.

[IFRS 12.13].

The Basis for Conclusions clarifies that these disclosures are intended to be limited to information about the nature and effect of significant restrictions on an entity's ability to access and use assets or settle liabilities of the group. They are not intended, in the IASB's opinion, to require an entity to disclose, for example, a list of all the protective rights held by non-controlling interests that are embedded in law and regulation. [IFRS 12.BC32].

The IASB also considers that the restrictions required to be disclosed by IFRS 12 are those that exist because of legal boundaries within the group. They are not, in the IASB's opinion, intended to replicate those in other IFRS accounting standards relating to restrictions such as those in IAS 16 *Property, Plant and Equipment* or IAS 40 *Investment Property*. [IFRS 12.BC33].

⁵ The same is required according to IFRS 18.104, IFRS 18.76, IFRS 18.87, IFRS 18.107, once effective.

Deutsche Bank Aktiengesellschaft makes the following disclosures about significant restrictions to access or use the group's assets:

Practical example 4-3: Deutsche Bank Aktiengesellschaft (2023)

Germany

Annual Report 2023 [extract]

Consolidated Financial Statements [extract]

Additional Notes [extract]

37 - Information on Subsidiaries [extract]

Significant restrictions to access or use the Group's assets

Statutory, contractual or regulatory requirements as well as protective rights of noncontrolling interests might restrict the ability of the Group to access and transfer assets freely to or from other entities within the Group and to settle liabilities of the Group.

The following contractual restrictions impact the Group's ability to use assets and the table below reflects the volume of those restricted assets:

- The Group has pledged assets to collateralize its obligations under repurchase agreements, securities financing transactions, collateralized loan obligations and for margining purposes for OTC derivative liabilities
- The assets of consolidated structured entities are held for the benefit of the parties that have bought the notes issued by these entities

Restricted assets

in € m.	Dec 31, 2023		Dec 31, 2022	
	Total assets	Restricted assets	Total assets	Restricted assets
Interest-earning deposits with banks	163,454	41	164,136	108
Financial assets at fair value through profit or loss	465,252	58,452	482,376	40,346
Financial assets at fair value through other comprehensive income	35,546	7,655	31,675	2,771
Loans at amortized cost	473,705	54,372	483,700	73,500
Other	174,374	8,861	174,902	3,592
Total	1,312,331	129,381	1,336,788	120,317

In addition to the above and in line with the regulation on Liquidity Coverage Ratio (LCR) (Commission Delegated Regulation (EU) 2015/61), the Group identifies if assets held in third country are subject to restrictions to their free transferability. The Group, identifies the volume of High Quality Liquid Assets (HQLA) in excess of net cash outflows held in the third countries which are not freely transferable and excludes them from the HQLA. The aggregated amount of such HQLA that are held at entities in third countries and considered restricted is € 13.3 billion as of December 31, 2023 (€ 21.8 billion as of December 31, 2022). During 2023, the Group has transitioned its risk appetite from liquidity reserves to HQLA.

4.4 Disclosure of the nature of the risks associated with interests in consolidated structured entities

IFRS 12 requires a number of disclosures in respect of financial or other support provided to consolidated structured entities. In short, the standard requires disclosure of certain intra-group transactions that are eliminated on consolidation and details of certain commitments by a group to itself. For groups with a number of structured entities, it is important that consolidation reporting packages capture the necessary information, as these transactions may have already been eliminated on consolidation.

The detailed disclosures that are required in respect of interests in consolidated structured entities are discussed in sections 4.4.1, 4.4.2, 4.4.3 and 4.4.4 below.

4.4.1 Terms of contractual arrangements to provide financial support

An entity must disclose the terms of any contractual arrangements that could require the parent or its subsidiaries to provide financial support to a consolidated structured entity, including events or circumstances that expose the reporting entity to a loss (e.g., liquidity arrangements or credit rating triggers associated with obligations to purchase assets of the structured entity or provide financial support). [IFRS 12.14]. The IASB concluded that this disclosure would help users of financial statements to understand an entity's exposure to risks. [IFRS 12.BC34]. For the same reason, the IASB concluded that an entity must disclose its risk exposure from non-contractual obligations to provide support to both consolidated and unconsolidated structured entities. [IFRS 12.BC35].

It is unclear which 'reporting entity' the IASB considers has suffered a 'loss' in the context of a consolidated structured entity since a group does not suffer a loss as a result of the parent or a subsidiary providing financial support to another subsidiary as that is an intra-group transaction which is eliminated on consolidation.

How we see it

We believe it is the potential for a 'loss' to the equity holders of the parent from these transactions (rather than a 'loss' to the group) that the IASB is trying to highlight. Consequently, a reporting entity would need to consider all of the non-controlling interests held in the entities involved in these transactions, as the differing shares held in those entities could affect the overall profit and comprehensive income attributable to non-controlling interests and owners of the parent.

Illustration 4-1: Illustrative example of disclosure of a contractual arrangement that could require parental support to a consolidated structured entity

The parent company has given a contractual commitment to its subsidiary, SE Limited, whereby if the assets held as collateral by SE Limited for its issued loan notes fall below a credit rating of 'AAA' then the parent will substitute assets of an equivalent fair value with an 'AAA' rating. The maximum fair value of assets to be substituted is CU10,000,000.

The following extract from HSBC Holdings plc's financial statements illustrates disclosure of financial support to consolidated structured entities.

Practical example 4-4: HSBC Holdings plc (2022)

United Kingdom

Annual Report and Accounts 2022 [extract]

Notes on the financial statements [extract]

20 Structured entities [extract]

Consolidated structured entities

Total assets of HSBC's consolidated structured entities, split by entity type

	Conduits	Securitisations	HSBC managed funds	Other	Total
	\$bn	\$bn	\$bn	\$bn	\$bn
At 31 Dec 2022	4.2	7.2	4.8	7.5	23.7
At 31 Dec 2021	4.4	10.0	6.3	8.4	29.1

Conduits

HSBC has established and manages two types of conduits: securities investment conduits ('SICs') and multi-seller conduits.

Securities investment conduits

The SICs purchase highly rated ABSs to facilitate tailored investment opportunities.

- At 31 December 2022, Solitaire, HSBC's principal SIC, held \$1.3bn of ABSs (2021: \$1.6bn). It is currently funded entirely by commercial paper ('CP') issued to HSBC. At 31 December 2022, HSBC held \$1.5bn of CP (2021: \$1.8bn).

Multi-seller conduit

HSBC's multi-seller conduit was established to provide access to flexible market-based sources of finance for its clients. Currently, HSBC bears risk equal to the transaction-specific facility offered to the multi-seller conduit, amounting to \$6.2bn at 31 December 2022 (2021: \$6.7bn). First loss protection is provided by the originator of the assets, and not by HSBC, through transaction-specific credit enhancements. A layer of secondary loss protection is provided by HSBC in the form of programme-wide enhancement facilities.

4.4.2 Financial or other support with no contractual obligation

If, during the reporting period, a parent or any of its subsidiaries has, without having any contractual obligation to do so, provided financial or other support to a consolidated structured entity (e.g., purchasing assets of or instruments issued by the structured entity), the entity must disclose:

- The type and amount of support provided, including situations in which the parent or its subsidiaries assisted the structured entity in obtaining financial support
And
- The reasons for providing the support [IFRS 12.15]

The transactions requiring disclosure are intra-group transactions eliminated on consolidation.

'Support' is not defined in IFRS accounting standards. A literal reading of 'purchasing assets of or instruments issued' is that any transfer of consideration to a structured entity in exchange for an asset is the provision of support requiring disclosure by the standard. The Basis for Conclusions explains that the IASB did not define 'support' because a definition would either be so broad that it would be an ineffective definition, or it would invite structuring so as to avoid the disclosure. The IASB believes that support is widely understood as a provision of resources to another entity, either directly or indirectly. In the case of implicit agreements, the support is provided without having the contractual obligation to do so. However, in order to address respondents' concerns about distinguishing the provision of financial support from any other commercial transaction, the IASB clarified that disclosure is required when an entity has provided non-contractual support to a consolidated or unconsolidated structured entity in which it previously had or currently has an interest. [IFRS 12.BC105, IFRS 12.BC106].

Examples of the type of support that the IASB envisages being disclosed for unconsolidated structured entities (see section 6.3 below) are liquidity arrangements or credit rating triggers associated with obligations to purchase assets of the structured entity or provide financial support.

How we see it

In our view, these examples imply that the IASB does not intend transactions in the ordinary course of business to be caught by the requirement to disclose support provided to consolidated structured entities. We believe that 'asset purchases' mean a 'forced' purchase caused by, for example, liquidity or credit rating triggers.

Interpreting financial support is therefore likely to involve judgement. One possible interpretation is that 'support' includes:

- An equity investment
 - A long-term loan
 - Forgiveness of debt
 - A transaction carried out on non-market terms resulting in a net outflow of resources from the reporting entity, including any transaction involving the gifting of funds
 - A transaction not made in the ordinary course of business
- Or
- Implicit or explicit guarantees of a structured entity's performance

IFRS 12 does not explain whether 'other support' extends to such non-financial support as the provision of human resources or management services outside of the ordinary course of business.

Illustration 4-2: Illustrative example of disclosure of financial or other support provided to a consolidated structured entity

During the reporting period the parent provided financial support in the form of assets with a fair value of CU12,000,000 (20X0: CU0) and a credit rating of 'AAA' to its subsidiary, SE 2 Limited, in exchange for assets with an equivalent fair value. There was no contractual obligation to exchange these assets. The transaction was initiated because the assets held by SE 2 Limited had a credit rating of less than 'AA' and a further ratings downgrade could potentially trigger calls on loan notes issued by SE 2 Limited. The parent did not suffer a loss on the transaction.

These disclosures are also required in respect of unconsolidated structured entities. See sections 6.2.2 and 6.3 below.

4.4.3 Financial or other support which resulted in consolidation

If, during the reporting period, a parent or any of its subsidiaries has, without having a contractual obligation to do so, provided financial or other support to a previously unconsolidated structured entity and that provision of support resulted in the entity controlling the structured entity, the entity (i.e., the reporting entity) must disclose an explanation of the relevant factors in making that decision. [IFRS 12.16].

The comments in section 4.4.2 above regarding the definition of 'support' apply here also.

4.4.4 Current intentions to provide financial or other support

An entity must disclose any current intentions to provide financial or other support to a consolidated structured entity, including intentions to assist the structured entity in obtaining financial support. [IFRS 12.17].

IFRS 12 does not define 'intentions'. The Basis for Conclusions states that it means "the entity has decided" to provide financial support (i.e., it has current intentions to do this). [IFRS 12.BC104].

How we see it

This implies that a decision to provide support has been approved at an appropriately senior level at the entity. Judgement will be required by entities in interpreting this requirement and defining the meaning of 'intention' in this context.

The wording in the Basis for Conclusions does not require any such 'intention' to have been communicated to the structured entity that will receive the support or that a constructive obligation has been established, as defined in IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*.

The comments in section 4.4.2 above in respect of the definition of 'support' apply here also.

These disclosures are also required in respect of unconsolidated structured entities. See section 6.2.2 below.

4.5 Disclosure of changes in ownership interests in subsidiaries

4.5.1 Changes that do not result in loss of control

An entity must present a schedule that shows the effects on the equity attributable to owners of the parent of any changes in its ownership interests in a subsidiary that do not result in loss of control. [IFRS 12.18]. This schedule must be presented in addition to the information required by IAS 1 in the statement of changes in equity.

IAS 1 requires an entity to present, for each component of equity, a reconciliation between the carrying amount at the beginning and the end of the period, separately disclosing transactions with owners in their capacity as owners, showing separately contributions by and distributions to owners and changes in ownership interests in subsidiaries that do not result in a loss of control. [IAS 1.106(d)].⁶

Despite this existing disclosure requirement, the IASB decided to require that if a parent has equity transactions with non-controlling interests, it must disclose in a separate schedule the effects of those transactions on the equity of the owners of the parent. See Chapter 8 for guidance on the accounting for equity transactions with non-controlling interests.

The IASB's rationale for this duplication is that many respondents to a 2005 exposure draft, which proposed amendments to a previous version of IAS 27, requested more prominent disclosure of the effects of transactions with non-controlling interests on the equity of the owners of the parent. [IFRS 12.BC38, IFRS 12.BC39].

IFRS 12 does not prescribe a format for this additional schedule. An example of the type of disclosure required is illustrated below.

Illustration 4-3: Illustrative example of disclosure of changes in ownership interest in subsidiary that does not result in loss of control

On 5 October 20X1 the Group, which had a 95% ownership interest, disposed of 25% of the ownership interests of Subsidiary Limited. Following the disposal, the Group still controls Subsidiary Limited and retains 70% of the ownership interests.

The transaction has been accounted for as an equity transaction with non-controlling interests (NCI), resulting in the following:

	CU'000
Proceeds from sale of 25% ownership interest	550
Net assets attributable to NCI	(500)
Increase in equity attributable to parent	50
Represented by:	
Decrease in currency revaluation reserve	(250)
Decrease in fair value reserve of financial assets at FVOCI	(100)
Increase in retained earnings	400
	50

⁶ The same is required according to IFRS 18.107(c), once effective.

4.5.2 Changes that do result in loss of control

Extract from IFRS 12

Consequences of losing control of a subsidiary during the reporting period

- 19 An entity shall disclose the gain or loss, if any, calculated in accordance with paragraph 25 of IFRS 10, and:
- (a) the portion of that gain or loss attributable to measuring any investment retained in the former subsidiary at its fair value at the date when control is lost; and
 - (b) the line item(s) in profit or loss in which the gain or loss is recognised (if not presented separately).

[IFRS 12.19].

See Chapter 8 for more guidance on accounting for a loss of control of a subsidiary under IFRS 10.

4.6 Disclosures required by investment entities

An investment entity that prepares financial statements in which all of its subsidiaries are measured at fair value through profit or loss must make the disclosures relating to investment entities discussed below.

[IFRS 12.6(b)(ii)].

If an investment entity has a subsidiary that it consolidates because that subsidiary is not an investment entity and its main purpose and activities are providing services related to the investment entity's investment activities, the disclosure requirements in IFRS 12 apply to the financial statements in which the investment entity consolidates that subsidiary. [IFRS 12.BC61].

An investment entity that is required by IFRS 10 to apply the exception from consolidation and instead account for its investment in a subsidiary at fair value through profit or loss must disclose that fact.

[IFRS 12.19A].

Disclosure requirements regarding significant judgements and assumptions in determining the investment entity status are discussed in section 3 above.

4.6.1 Disclosures about the composition of the group

For each unconsolidated subsidiary, an investment entity must disclose:

- (a) The subsidiary's name
 - (b) The principal place of business (and country of incorporation if different from the principal place of business) of the subsidiary
- And
- (c) The proportion of ownership interest held by the investment entity and, if different, the proportion of voting rights held [IFRS 12.19B]

If an investment entity is the parent of another investment entity, the parent must also provide the disclosures (a) to (c) of IFRS 12.19B above for investments that are controlled by its investment entity subsidiary. The disclosures may be provided by including, in the financial statements of the parent, the financial statements of the subsidiary that contain the information required in IFRS 12.19B. [IFRS 12.19C].

There is no explicit requirement in IFRS 12 to disclose this information in respect of consolidated subsidiaries with no material non-controlling interests (see section 4.1 above).

4.6.2 Disclosures required when investment entity status changes

When an entity becomes, or ceases to be, an investment entity it must disclose:

- The change of investment entity status
- And
- The reasons for the change

In addition, an entity that becomes an investment entity must disclose the effect of the change of status on the financial statements for the period presented, including:

- The total fair value, as of the date of change of status, of the subsidiaries that cease to be consolidated
 - The total gain or loss, if any, calculated in accordance with IFRS 10.B101
- And
- The line item(s) in profit or loss in which the gain or loss is recognised (if not presented separately) *[IFRS 12.9B]*

The accounting effect of becoming or ceasing to become an investment entity is discussed in Chapter 7.

4.6.3 Disclosures required in respect of significant restrictions, commitments and financial and other support

Extract from IFRS 12

- 19D An investment entity shall disclose:
- (a) the nature and extent of any significant restrictions (eg resulting from borrowing arrangements, regulatory requirements or contractual arrangements) on the ability of an unconsolidated subsidiary to transfer funds to the investment entity in the form of cash dividends or to repay loans or advances made to the unconsolidated subsidiary by the investment entity; and
 - (b) any current commitments or intentions to provide financial or other support to an unconsolidated subsidiary, including commitments or intentions to assist the subsidiary in obtaining financial support.
- 19E If, during the reporting period, an investment entity or any of its subsidiaries has, without having a contractual obligation to do so, provided financial or other support to an unconsolidated subsidiary (eg purchasing assets of, or instruments issued by, the subsidiary or assisting the subsidiary in obtaining financial support), the entity shall disclose:
- (a) the type and amount of support provided to each unconsolidated subsidiary; and
 - (b) the reasons for providing the support.

[IFRS 12.19D, IFRS 12.19E].

In addition, an investment entity must disclose the terms of any contractual arrangements that require the entity or its unconsolidated subsidiaries to provide financial support to an unconsolidated, controlled, structured entity, including events and circumstances that could expose the reporting entity to a loss (e.g., liquidity arrangements or credit rating triggers associated with obligations to purchase assets of the structured entity or to provide financial support). *[IFRS 12.19F].*

During a reporting period an investment entity or any of its unconsolidated subsidiaries may have, without having a contractual obligation to do so, provided financial or other support to an unconsolidated structured entity that the investment entity did not control. In such a situation, if that provision of financial support resulted in the investment entity controlling the structured entity, the investment entity must provide an explanation of the relevant factors considered in reaching the decision to provide that support. *[IFRS 12.19G].*

These disclosures are similar to those required for consolidated subsidiaries, including consolidated structured entities discussed in sections 4.3, 4.4.1, 4.4.2 and 4.4.4 above - see the comments in these sections.

4.6.4 Valuation methodologies and nature of investing activities

IFRS 12 does not require any disclosure of fair value measurements made by investment entities. This information is already required by IFRS 7 and by IFRS 13 when reporting investments at fair value through profit or loss or other comprehensive income in accordance with IFRS 9. *[IFRS 12.BC61C].*

5 Disclosure of interests in joint arrangements and associates

Extract from IFRS 12

- 20** An entity shall disclose information that enables users of its financial statements to evaluate:
- (a) the nature, extent and financial effects of its interests in joint arrangements and associates, including the nature and effects of its contractual relationship with the other investors with joint control of, or significant influence over, joint arrangements and associates (paragraphs 21 and 22); and
 - (b) the nature of, and changes in, the risks associated with its interests in joint ventures and associates (paragraph 23).

[IFRS 12.20].

These requirements, explained in detail in sections 5.1 and 5.2 below, apply in full to both consolidated financial statements and individual financial statements of entities with joint arrangements and associates. IFRS 12 does not address the presentation of joint ventures and associates in the primary statements. IAS 1 requires separate presentation of investments accounted for using the equity method on the face of the statement of financial position, although it does not require a split of those investments between joint ventures and associates. [IAS 1.54].⁷ IAS 1 also requires a reporting entity's post-tax share of the profit or loss of associates and joint ventures accounted for using the equity method to be disclosed on the face of the statement of comprehensive income. [IAS 1.82].⁸ In addition, IAS 1 specifically requires that entities must present the share of other comprehensive income items of their equity method investees, in aggregate, as single line items within the 'to be reclassified' and the 'not to be reclassified' groups. [IAS 1.82A].⁹

5.1 Disclosure of the nature, extent and financial effects of interests

An entity must disclose:

- (a) For each joint arrangement and associate that is material to the reporting entity:
 - (i) The name of the joint arrangement or associate
 - (ii) The nature of the entity's relationship with the joint arrangement or associate (by, for example, describing the nature of the activities of the joint arrangement or associate and whether they are strategic to the entity's activities)
 - (iii) The principal place of business (and country of incorporation, if applicable and different from the principal place of business) of the joint arrangement or associate
 - And
 - (iv) The proportion of ownership interest held by the entity and, if different, the proportion of voting rights held (if applicable)
- (b) For each joint venture (but not a joint operation) and associate that is material to the reporting entity:
 - (i) Whether the investment in the joint venture or associate is measured using the equity method or at fair value
 - (ii) Summarised financial information about the joint venture or associate (see section 5.1.1 below)
 - And
 - (iii) If the joint venture or associate is accounted for using the equity method, the fair value of the investment in the joint venture or associate, if there is a quoted market price for the investment
- (c) Financial information (see section 5.1.2 below) about the entity's investments in joint ventures and associates that are not individually material:
 - (i) In aggregate for all individually immaterial joint ventures and, separately
 - (ii) In aggregate for all individually immaterial associates [IFRS 12.21]

⁷ The same is required according to IFRS 18.103, once effective. In addition, IFRS 18.53 and IFRS 18.55(a) require entities to classify income and expenses specified in IFRS 18.54 from investments in associates and joint ventures accounted for applying the equity method in the investing category.

⁸ The same is required according to IFRS 18.75, once effective.

⁹ The same is required according to IFRS 18.89, once effective.

Disclosures (b) and (c) are not required by an investment entity. [IFRS 12.21A].

Frequently asked questions

Question 5-1: Disclosure of summarised financial information about material joint ventures or associates

In January 2015, the IFRS IC discussed a request to clarify the requirement described above to disclose summary financial information about material joint ventures and associates and its interaction with the aggregation principle of IFRS 12 (see section 2.2.2 above). The issues raised were:

- Whether the summary financial information can be disclosed in aggregate for all material joint ventures and associates, or whether such information should be disclosed individually for each material joint venture or associate.
- And
- Whether an investor should be excused from disclosing information related to a listed joint venture or associate if the local regulatory requirements prevented the investor from disclosing such information until the joint venture or associate has released its own financial statements.

In respect of the first issue, the IFRS IC noted that it expected the requirement to prepare summarised financial information about a joint venture or an associate in IFRS 12 to lead to the disclosure of summarised information on an individual basis for each joint venture or associate that is material to the reporting entity (i.e., this information should not be presented in aggregate for all material joint ventures or associates). The IFRS IC observed that this reflects the IASB's intentions as described in the Basis for Conclusions to IFRS 12.

In respect of the second issue, the IFRS IC also noted that there is no provision in IFRS 12 that permits non-disclosure of this information (on the grounds of confidentiality or local regulatory requirements) and that outreach performed indicated that there was no significant diversity observed in practice on this issue.

Consequently, the IFRS IC determined that neither an Interpretation nor an amendment to a standard was necessary and decided not to add these issues to its agenda.¹⁰

Extract from IFRS 12

- 22 An entity shall also disclose:
- (a) the nature and extent of any significant restrictions (eg resulting from borrowing arrangements, regulatory requirements or contractual arrangements between investors with joint control of or significant influence over a joint venture or an associate) on the ability of joint ventures or associates to transfer funds to the entity in the form of cash dividends, or to repay loans or advances made by the entity.
 - (b) when the financial statements of a joint venture or associate used in applying the equity method are as of a date or for a period that is different from that of the entity:
 - (i) the date of the end of the reporting period of the financial statements of that joint venture or associate; and
 - (ii) the reason for using a different date or period.
 - (c) the unrecognised share of losses of a joint venture or associate, both for the reporting period and cumulatively, if the entity has stopped recognising its share of losses of the joint venture or associate when applying the equity method.

[IFRS 12.22].

The implication from this wording is that these disclosures in respect of significant restrictions, reporting dates and unrecognised losses are required separately for each material joint venture or associate.

¹⁰ [IFRIC Update](#), January 2015, p.7, available on the IFRS Foundation's website.

A summary of the disclosures required for individually material and, collectively for immaterial joint ventures and associates is shown in the table below.

Topic	Material joint ventures and associates	Individually immaterial joint ventures and associates
Accounting policy	✓	X
Summarised financial information	✓	✓ (in aggregate)
Fair value, if quoted market price is available	✓	X
Restrictions on ability to transfer funds	✓	✓ (in aggregate)
Date of financial statements, if different from entity	✓	✓
Unrecognised share of losses	✓	✓ (in aggregate)

5.1.1 Summarised financial information of individually material joint ventures and associates

The summarised financial information specified by IFRS 12.21(b)(ii) (see section 5.1 above) for each material joint venture and associate is as follows:

Extract from IFRS 12	
B12	<p>For each joint venture and associate that is material to the reporting entity, an entity shall disclose:</p> <ul style="list-style-type: none"> (a) dividends received from the joint venture or associate. (b) summarised financial information for the joint venture or associate (see paragraphs B14 and B15) including, but not necessarily limited to: <ul style="list-style-type: none"> (i) current assets. (ii) non-current assets. (iii) current liabilities. (iv) non-current liabilities. (v) revenue. (vi) profit or loss from continuing operations. (vii) post-tax profit or loss from discontinued operations. (viii) other comprehensive income. (ix) total comprehensive income.
B13	<p>In addition to the summarised financial information required by paragraph B12, an entity shall disclose for each joint venture that is material to the reporting entity the amount of:</p> <ul style="list-style-type: none"> (a) cash and cash equivalents included in paragraph B12(b)(i). (b) current financial liabilities (excluding trade and other payables and provisions) included in paragraph B12(b)(iii). (c) non-current financial liabilities (excluding trade and other payables and provisions) included in paragraph B12(b)(iv). (d) depreciation and amortisation. (e) interest income. (f) interest expense. (g) income tax expense or income.

[IFRS 12.B12, IFRS 12.B13].

The summarised financial information presented must be the 100% amounts included in the IFRS financial statements of the joint venture or associate (and not the entity's share of those amounts). However, if the entity accounts for the joint venture or associate using the equity method:

- (a) The amounts included in the IFRS financial statements of the joint venture or associate must be adjusted to reflect adjustments made by the entity when using the equity method, such as the fair value adjustments made at the time of acquisition and adjustments for differences in accounting policies.

And

- (b) The entity must provide a reconciliation of the summarised financial information presented to the carrying amount of its interest in the joint venture or associate. [IFRS 12.B14].

IFRS 12 does not specifically require a reporting entity's share of (a) to (d) of IFRS 12.B16 (see section 5.1.2 below) to be disclosed in total for material joint ventures or associates.

Frequently asked questions

Question 5-2: Where the investee is a group: On which basis should an entity prepare the required summarised financial information about material joint ventures or associates?

In January 2015, the IFRS IC discussed the basis on which an entity should prepare the required summarised financial information for joint ventures and associates. The question raised was whether summarised financial information should be presented for each material joint venture or associate on an individual basis, or whether this information should be disclosed for the subgroup of the joint venture or associate together with its investees. The IFRS IC observed that a reporting entity should present the summarised financial information required about a joint venture or an associate that is material to the reporting entity based on the consolidated financial statements for the joint venture or associate, if it has subsidiaries. If it does not have subsidiaries, the presentation should be based on the financial statements of the joint venture or associate in which its own joint ventures or associates are equity accounted. The IFRS IC noted that these views are consistent with IFRS 12.B14(a), which requires that the amounts included in the financial statements of the joint venture or associate must be adjusted to reflect adjustments made by the reporting entity using the equity method, such as fair value adjustments made at the time of acquisition and adjustments for differences in accounting policies. Consequently, the IFRS IC decided that neither an interpretation nor an amendment to a standard was necessary and decided not to add this issue to its agenda.¹¹

The standard does not specify what components are to be included in the reconciliation of the summarised financial information presented to the carrying amount of the entity's interest in the joint venture or associate. As clarified by the IFRS IC, the amounts included in the IFRS financial statements of the joint venture or associate must be adjusted to reflect fair value and accounting policy adjustments per IFRS 12.B14(a). Therefore, any pre-existing goodwill in the books of the joint venture or associate at the time it became a joint venture or an associate of the reporting entity must be eliminated from the amounts in IFRS 12.B14(a) as a fair value adjustment.

How we see it

The implications regarding the reporting entity's goodwill attributable to the joint venture or associate that is included in the carrying amount of the investment are less clear. Such goodwill could be included in the summarized financial information as a fair value adjustment per IFRS 12.B14(a) or in the reconciliation per IFRS 12.B14(b). Care will therefore be needed in adequately explaining how the summarised IFRS financial information reconciles to the carrying amount of the reporting entity's interest in the joint venture or associate.

An entity may present the summarised financial information required on the basis of the joint venture's or associate's financial statements if:

- (a) The entity measures its interest in the joint venture or associate at fair value in accordance with IAS 28.
- And
- (b) The joint venture or associate does not prepare IFRS financial statements and preparation on that basis would be impracticable or cause undue cost. In that case, the entity must disclose the basis on which the summarised financial information has been prepared. [IFRS 12.B15].

¹¹ [IFRIC Update](#), January 2015, p.7, available on the IFRS Foundation's website.

This implies that the summarised financial information of the joint venture or associate can be prepared on a non-IFRS basis in those circumstances where both conditions (a) and (b) of IFRS 12.B15 are satisfied.

Where a joint venture or an associate measured at fair value in accordance with IAS 28 does prepare IFRS financial statements, or where the preparation of IFRS financial information would not be impracticable or cause undue cost, the summarised financial information disclosed are the unadjusted IFRS numbers of the joint venture or associate (as compared to the adjusted basis used where the equity method is applied).

In principle, the IASB concluded that the disclosure requirements for joint ventures and associates will be the same for all entities regardless of whether those entities are venture capital organisations, mutual funds, unit trusts or similar entities which are permitted by IAS 28 to hold investments in joint ventures and associates at fair value. [IFRS 12.BC60].

Nevertheless, the minimum line item disclosures required for material associates are less than those required for material joint ventures on the grounds that, in the IASB's opinion, an entity is generally more involved with joint ventures than with associates because joint control means that an entity has a veto over decisions relating to the relevant activities of the joint venture. Accordingly, the IASB considers that the different nature of the relationship between a joint venturer and its joint ventures from that between an investor and its associates warrants a different level of detail in the disclosures of summarised financial information. [IFRS 12.BC51].

Summarised financial information is not required for material joint operations since assets and liabilities arising from joint operations are the reporting entity's own assets and liabilities and consequently are recognised separately in the entity's financial statements. They are accounted for in accordance with the requirements of applicable IFRS accounting standards and are therefore subject to the disclosure requirements of those standards. [IFRS 12.BC52]. See Chapter 13 for guidance on accounting for joint operations.

In the below extract, Heidelberg Materials AG discloses summarised financial information for a material joint venture.

Share of total comprehensive income after income taxes	(104)	(155)	(33)	(7)
Carrying amount as of December 31	826	791	67	59

¹ Also including gains from remeasurement of investments accounted for using the equity method due to the loss of significant influence and the fact that they then ceased being accounted for using the equity method

5.2 Risks associated with interests in joint ventures and associates

An entity must disclose:

- Commitments that it has relating to its joint ventures separately from the amount of other commitments
And
- Contingent liabilities (as defined in IAS 37) relating to its interests in joint ventures or associates (including its share of contingent liabilities incurred jointly with other investors with joint control of, or significant influence over, the joint ventures and associates) separately from the amount of other contingent liabilities [IFRS 12.23]

5.2.1 Disclosure of commitments relating to joint ventures

IAS 24 *Related Party Disclosures* already requires aggregate commitments relating to joint ventures to be disclosed separately from other commitments. [IAS 24.18, IAS 24.19]. IFRS 12 clarifies that the commitments required to be disclosed under IAS 24 include an entity's share of commitments made jointly with other investors with joint control of a joint venture. Commitments are those that may give rise to a future outflow of cash or other resources. [IFRS 12.B18].

IFRS 12 provides the following examples of unrecognised commitments that must be disclosed under IAS 24:

- (a) Unrecognised commitments to contribute funding or resources as a result of, for example:
 - (i) The constitution or acquisition agreements of a joint venture (that, for example, require an entity to contribute funds over a specific period)
 - (ii) Capital intensive projects undertaken by a joint venture
 - (iii) Unconditional purchase obligations, comprising procurement of equipment, inventory or services that an entity is committed to purchasing from, or on behalf of, a joint venture
 - (iv) Unrecognised commitments to provide loans or other financial support to a joint venture
 - (v) Unrecognised commitments to contribute resources to a joint venture, such as assets or services
 - (vi) Other non-cancellable unrecognised commitments relating to a joint venture
- And
- (b) Unrecognised commitments to acquire another party's ownership interest (or a portion of that ownership interest) in a joint venture if a particular event occurs or does not occur in the future [IFRS 12.B19]

There is no requirement to disclose these commitments for individual joint ventures. However, IAS 24 requires disclosure of information about those transactions and outstanding balances, including commitments, necessary for users to understand the potential effect of the relationship on the financial statements. [IAS 24.18]. This implies that there is to be separate disclosure of different types of significant commitments. IAS 24 does not require the names of any joint ventures to be disclosed.

In the below extract, BP p.l.c. has provided information about commitments made to joint ventures and associates:

Practical example 5-3: BP p.l.c. (2023)	United Kingdom
bp Annual Report and Form 20-F 2023 [extract] Notes on financial statements [extract]	
13. Capital commitments Authorized future capital expenditure for property, plant and equipment (excluding right-of-use assets) by group companies for which contracts had been signed at 31 December 2023 amounted to \$10,354 million (2022 \$9,381 million, 2021 \$8,208 million). bp has contracted capital commitments amounting to \$1,580 million (2022 \$1,764 million, 2021 \$1,075 million) in relation to joint ventures and \$105 million (2022 \$18 million, 2021 \$126 million) in relation to associates.	

5.2.2 Disclosure of contingent liabilities relating to joint ventures and associates

IFRS 12 requires disclosure of the same information as required by IAS 37 for contingent liabilities relating to an entity's interests in joint ventures and associates, separately from an entity's other contingent liabilities. [IFRS 12.23(b)].

IAS 37 requires, for each class of contingent liability at the end of a reporting period, a brief description of the nature of the contingent liability and, where practicable:

- (a) An estimate of its financial effect, measured under the requirements of the standard
- (b) An indication of the uncertainties relating to the amount or timing of any outflow
- And
- (c) The possibility of any reimbursement [IAS 37.86]

IAS 37 further defines what is intended by 'class' and the circumstances in which aggregation of disclosures of contingent liabilities is appropriate.

The definition of a contingent liability with details on contingent liabilities can be found in Chapter 27.

6 Disclosure of interests in unconsolidated structured entities

Extract from IFRS 12

- 24** An entity shall disclose information that enables users of its financial statements:
- (a) to understand the nature and extent of its interests in unconsolidated structured entities (paragraphs 26-28); and
 - (b) to evaluate the nature of, and changes in, the risks associated with its interests in unconsolidated structured entities (paragraphs 29-31).

[IFRS 12.24].

These disclosures are not required by an investment entity for an unconsolidated structured entity that it controls and for which it presents the disclosures required in section 4.6 above. [IFRS 12.25A].

Disclosure requirements in respect of risks associated with interests in consolidated structured entities are discussed in section 4.4 above.

As discussed in section 2.2.2.D above, these disclosures also apply to interests in joint ventures and associates that are structured entities, in addition to the disclosures required in section 5 above for joint ventures and associates.

The information required by IFRS 12.24(b) includes information about an entity's exposure to risk from involvement that it had with unconsolidated structured entities in previous periods (e.g., sponsoring the structured entity) even if the entity no longer has any contractual involvement with the structured entity at the reporting date. [IFRS 12.25].

Some of the disclosure requirements for unconsolidated structured entities overlap with those of IFRS 7, since many interests in unconsolidated structured entities are financial assets within the scope of IFRS 7. However, IFRS 12 and IFRS 7 require different types of risk disclosure. IFRS 7 requires disclosures about risks associated with financial instruments. IFRS 12 adopts a different perspective and requires an entity to disclose its exposure to risks from its interest in a structured entity. [IFRS 12.BC72]. The IASB therefore considered the disclosure requirements in both standards to complement each other. [IFRS 12.BC74].

6.1 Disclosure of the nature and extent of interests

6.1.1 Disclosure of the nature, purpose, size, activities and financing

An entity must disclose qualitative and quantitative information about its interests in unconsolidated structured entities, including, but not limited to, the nature, purpose, size and activities of the structured entity and how the structured entity is financed. [IFRS 12.26].

The IASB concluded that this requirement will provide users with sufficient information about the assets held by structured entities and the funding of those assets without requiring specific disclosures of the assets of unconsolidated structured entities in which the entity has an interest in all circumstances. If relevant to an assessment of its exposure to risk, an entity would be required to provide additional information about the assets and funding of structured entities. [IFRS 12.BC96].

6.1.1.A Nature and purpose

Examples of the nature and purpose of a structured entity might include:

- To manage balance sheet exposure and risk, including securitisation of assets
 - To provide investors with a synthetic exposure to debt and equity instruments such as credit linked notes and equity linked notes
 - To provide investors with a variety of investment opportunities through managed investment strategies
- And
- To obtain and facilitate funding

Quilter plc discloses the nature, purpose and type of interest in unconsolidated structured entities in a narrative format as follows:

Practical example 6-1: Quilter plc (2022)	United Kingdom
Annual Report 2022 [extract] Notes to the consolidated financial statements [extract] 21: Structured entities [extract]	
<p>21(a): Group's involvement in structured entities</p> <p>The Group invests in collective investment vehicles, including open-ended investment companies ("OEICs") and unit trusts, in order to match unit-linked investment contract liabilities. This means that all of the investment risk associated with these assets is borne by policyholders and any change in the value of these assets is closely matched by a corresponding change in liability due to policyholders. As the Group earns management fees based on the market value of unit-linked assets, any change in asset values will increase or decrease the Group's revenues. The Group has not provided any non-contractual support to any consolidated or unconsolidated structured entities during 2021 or 2022.</p> <p>As at 31 December 2021 and 31 December 2022, the Group has no obligation or intention to provide financial support to structured entities that could expose the Group to a loss.</p> <p>In addition, shareholder funds are also invested in collective investment vehicles, principally in respect of money market funds as an alternative to bank deposits.</p> <p>The Group's holdings in collective investment vehicles are subject to the terms and conditions of the respective investment vehicles' offering documentation and are susceptible to market price risk arising from uncertainties about the future values of those investment vehicles. All of the investment vehicles in the investment portfolios are managed by portfolio managers who are compensated by the respective investment vehicles for their services. Such compensation generally consists of an asset-based fee and a performance-based incentive fee and is reflected in the valuation of the investment vehicles.</p> <p>These structured entities are not consolidated where the Group determines that it does not have control.</p>	

6.1.1.B Size

The requirement to disclose the size of a structured entity is often met by providing information about the total value of the assets of the entity. However, the Basis for Conclusions states that IFRS 12 does not require specific disclosure of the reported assets of unconsolidated structured entities in which the entity has an interest. [IFRS 12.BC96]. This suggests that other measures of size would be acceptable, including the principal amount of securities issued by structured entities.

6.1.1.C Activities

When disclosing the activities of a structured entity, these activities must include the primary activities for which the entity was designed, which are the activities that significantly affect the entity's returns. See Chapter 7 for guidance on purpose and design of an investee and relevant activities, respectively, as described in IFRS 10.

For example, the activities that could significantly affect the entity's returns, include:

- Providing a source of long-term capital to an entity or funding to support a reporting entity's ongoing major or central operations through issuing notes.
- Or
- Providing a supply of goods and services that is consistent with a reporting entity's ongoing major or central operations which, without the existence of the structured entity, would have to be provided by the reporting entity itself.

6.1.1.D Financing

This disclosure requirement is not limited to financing provided by the reporting entity to the structured entity and would include financing received by the structured entity from unrelated third parties. It is also not limited to equity financing and includes all forms of financing that allow the structured entity to conduct its business activities.

6.1.2 Disclosures of sponsored structured entities for which no interest is held at the reporting date

If an entity has sponsored an unconsolidated structured entity for which it does not disclose the risk information required by section 6.2 below (e.g., because it does not have an interest in the entity at the reporting date), the entity must disclose:

- (a) How it has determined which structured entities it has sponsored
- (b) Income from those structured entities during the reporting period, including a description of the types of income presented
And
- (c) The carrying amount (at the time of transfer) of all assets transferred to those structured entities during the reporting period [IFRS 12.27]

The information required by (b) and (c) of IFRS 12.27 must be presented in a tabular format unless some other format is more appropriate and the sponsoring activities must be classified into relevant categories. [IFRS 12.28].

The rationale for this disclosure requirement is that sponsoring a structured entity can create risks for a reporting entity, even though the entity may not retain an interest in the structured entity. The Basis for Conclusions states that “if the structured entity encounters difficulties, it is possible that the sponsor could be challenged on its advice or actions, or might choose to act to protect its reputation.” [IFRS 12.BC87].

IFRS 12 does not define ‘sponsor’. However, an illustrative example in IFRS 10 uses the word ‘sponsor’ in a similar context when it states that “a decision maker (the sponsor) sponsors a multi-seller conduit”. In the IFRS 10 example, the sponsor establishes the terms of the conduit and manages the operations of the conduit for a market-based fee. [IFRS 10.B72 Example 16].

Factors that may indicate that a reporting entity has sponsored a structured entity include:

- The reporting entity established and set up the entity.
And
- The reporting entity was involved in the creation and design of the structured entity.
Or
- The reporting entity is the majority user of the structured entity.
Or
- The reporting entity’s name appears in the name of the structured entity or on the products issued by the structured entity.

Determining whether the reporting entity is the sponsor of a structured entity will be a matter of individual facts and circumstances and may require judgement to be exercised.

Many financial institutions define ‘sponsor’ for the purpose of their IFRS 12 disclosures as illustrated by this disclosure from HSBC Holdings plc’s financial statements.

Practical example 6-2: HSBC Holdings plc (2022)

United Kingdom

Annual Report and Accounts 2022 [extract]

Notes on the financial statements [extract]

1. Basis of preparation and significant accounting policies [extract]

1.2 Summary of significant accounting policies [extract]

(a) Consolidation and related policies [extract]

HSBC sponsored structured entities

HSBC is considered to sponsor another entity if, in addition to ongoing involvement with the entity, it had a key role in establishing that entity or in bringing together relevant counterparties so the transaction that is the purpose of the entity could occur. HSBC is generally not considered a sponsor if the only involvement with the entity is merely administrative.

The information required by (a) and (b) of IFRS 12.27 must be disclosed whether or not any assets were transferred to the structured entity during the reporting period. There is no time limit set for these disclosures so, in theory, they could continue indefinitely after the cessation of any interest in the structured entity. IFRS 12 does not specify whether (c) of IFRS 12.27 refers to assets transferred to the structured entity by the reporting entity or to the total assets transferred to the structured entity irrespective of who the transferor may be. However, the Basis for Conclusions states that the IASB concluded that the asset information disclosed must refer not only to assets transferred by the sponsor but to all assets transferred to the structured entity during the reporting period. [IFRS 12.BC90].

Income received from structured entities would not be confined to the income derived from the reporting entity's 'interest(s)' as defined by IFRS 12 but would cover all types of income received and reported by the entity. IFRS 12 states that 'income from a structured entity' includes, but is not limited to:

- Recurring and non-recurring fees (structuring fees, management fees, placing agent fees, etc.)
 - Interest
 - Dividends
 - Gains or losses on the remeasurement or derecognition of interests in structured entities
- And
- Gains or losses from the transfer of assets or liabilities to the structured entity. [IFRS 12 Appendix A].

There is no requirement for a quantitative split of the fee income by type although it may be useful for users of the financial statements.

An illustrative example of the disclosures required by (a) to (c) of IFRS 12.27 is shown below.

Illustration 6-1: Illustrative example of disclosures for sponsored structured entities where no interest exists at the reporting date

The Group considers itself the sponsor of a number of structured entities. The Group designed and established these entities. In some cases, it also transferred assets to them, in others it markets products associated with the entities in its own name and/or provides guarantees regarding the performance of the entities.

For some structured entities, the Group has no interest at the reporting date. However, it has sold assets to those entities during the reporting period in such a way that it has no continuing involvement in those assets and has earned fees for selling those assets and for other transactions carried out for the entities. The table below presents the Group's income recognised during the reporting period and the carrying amounts (at the time of transfer) of any assets transferred to those structured entities during the reporting period as follows:

Income from unconsolidated structured entities in which no interest is held at 31 December 20X3

	Income	Income
	20X3	20X2
	CU'000	CU'000
Commissions and fees	69	50
Interest income	48	47
Gains and losses on sale of assets	66	-
	183	97

Split by:

Mortgage-backed securitisations	75	41
CDOs and CLOs	50	20
Asset-backed commercial paper	25	30
Property, credit-related and other investing	33	6
	183	97

Carrying amounts (at the time of transfer) of assets transferred to unconsolidated structured entities in reporting period

	Transferred in year	Transferred in year
	20X3	20X2
	CU'000	CU'000
Mortgage-backed securitisations	3,065	-
CDOs and CLOs	2,536	-
Asset-backed commercial paper	1,325	3,000
Property, credit-related and other investing	178	-
	7,104	3,000

UBS Group AG makes the following disclosures in respect of sponsored unconsolidated structured entities in which UBS did not have an interest at the year-end.

Practical example 6-3: UBS Group AG (2023)

Switzerland

Annual Report 2023 [extract]

Consolidated financial statements [extract]

Notes to the UBS Group AG consolidated financial statements [extract]

Note 29 Interests in subsidiaries and other entities [extract]

c) Unconsolidated structured entities [extract]

Sponsored unconsolidated structured entities in which UBS did not have an interest at year-end

During 2023 and 2022, the Group did not earn material income from sponsored unconsolidated SEs in which UBS did not have an interest at year-end.

During 2023 and 2022, UBS and third parties did not transfer any assets into sponsored securitization vehicles created in those years. UBS and third parties transferred assets, alongside deposits and debt issuances (which are assets from the perspective of the vehicle), of USD 0.5bn and USD 0.5bn, respectively, into sponsored client vehicles created in 2023 (2022: USD 1bn and USD 3bn, respectively). For sponsored investment funds, transfers arose during the period as investors invested and redeemed positions, thereby changing the overall size of the funds, which, when combined with market movements, resulted in a total closing net asset value of USD 137bn (31 December 2022: USD 38bn).

...

Aviva plc made the following disclosures in respect of investment management fees earned in respect of its asset management business.

Practical example 6-4: Aviva plc (2022)

United Kingdom

Annual Report and Accounts 2022 [extract]

Notes to the consolidated financial statements [extract]

25 - Interests in structured entities [extract]

(c) Other interests in unconsolidated structured entities

The Group receives management fees and other fees in respect of its asset management businesses. The Group does not sponsor any of the funds or investment vehicles from which it receives fees. Management fees received for investments that the Group manages, but does not have a holding in, also represent an interest in unconsolidated structured entities. As these investments are not held by the Group, the investment risk is borne by the external investors and therefore the Group's maximum exposure to loss relates to future management fees. The table below shows the assets under management of entities that the Group manages but does not have a holding in and the fees earned from those entities.

	2022		2021	
	Assets under management £m	Investment management fees £m	Assets under management £m	Investment management fees £m
Specialised investment vehicles:	5,623	22	6,036	24
Analysed as:				
OEICs	398	1	253	2
PLPs	4,165	17	4,257	16
SICAVs	1,060	4	1,526	6
Total	5,623	22	6,036	24

6.2 Minimum disclosures regarding the nature of risks

The IASB decided that, although it agreed with the concept that an entity is generally allowed to tailor its disclosures to meet the specific information needs of its users, disclosure requirements relating to an entity's risk from its interests in unconsolidated structured entities must contain a minimum set of requirements that must be applied by all entities. In making this decision, the IASB was convinced by comments from users who pointed out that without any specific disclosure requirements, comparability would be impaired, and an entity might not disclose information that users find important. [IFRS 12.BC94].

These minimum disclosures are discussed in sections 6.2.1 and 6.2.2 below.

Depending on the circumstances, an entity might need to provide additional disclosures to meet the disclosure objective to disclose information that allows users of a reporting entity's financial statements to evaluate the nature of, and changes to, the risks associated with its interests in unconsolidated structured entities. Examples provided by the standard are discussed in section 6.3 below.

6.2.1 Disclosures of interests and of the maximum exposure to loss

Extract from IFRS 12

- 29 An entity shall disclose in tabular format, unless another format is more appropriate, a summary of:
- (a) the carrying amounts of the assets and liabilities recognised in its financial statements relating to its interests in unconsolidated structured entities.
 - (b) the line items in the statement of financial position in which those assets and liabilities are recognised.
 - (c) the amount that best represents the entity's maximum exposure to loss from its interests in unconsolidated structured entities, including how the maximum exposure to loss is determined. If an entity cannot quantify its maximum exposure to loss from its interests in unconsolidated structured entities it shall disclose that fact and the reasons.
 - (d) a comparison of the carrying amounts of the assets and liabilities of the entity that relate to its interests in unconsolidated structured entities and the entity's maximum exposure to loss from those entities.

[IFRS 12.29].

Disclosure of an entity's maximum exposure to loss was considered necessary by the IASB as it was concerned that, if only information about expected losses was required, an entity might often identify a positive expected value of returns from its interests in unconsolidated structured entities and, as a consequence, would not disclose any loss exposure. [IFRS 12.BC97].

IFRS 12 does not define maximum exposure to loss. The IASB decided not to provide such a definition of 'loss' but to leave it to the entity to identify what constitutes a loss in the particular context of that reporting entity. Therefore, the entity has to disclose how it has determined maximum loss exposure. The IASB acknowledged that an entity might not always be able to calculate the maximum exposure to loss, such as when a financial instrument exposes an entity to theoretically unlimited losses. The IASB decided that when this is the case an entity must disclose the reasons why it is not possible to calculate the maximum exposure to loss. [IFRS 12.BC98, IFRS 12.BC99].

How we see it

In our view 'maximum exposure to loss' refers to the maximum loss that an entity could be required to record in its statement of comprehensive income as a result of its involvement with a structured entity. Further, this maximum possible loss must be disclosed regardless of the probability of such losses actually being incurred. IFRS 12 is silent on whether the maximum exposure is gross or net of collateral or hedging instruments held that would mitigate any loss. Consistent with the equivalent disclosures required by IFRS 7.36, we believe that the maximum exposure to loss should be disclosed gross of any collateral or hedging instruments and that separate disclosure should be made in respect of instruments held that would mitigate the loss on a net basis.

The IASB also decided to require an entity to disclose a comparison of the carrying amounts of the assets and liabilities in its statement of financial position and its maximum exposure to loss. This is because the information will provide users with a better understanding of the differences between the maximum loss exposure and the expectation of whether it is likely that an entity will bear all or only some of the losses. The IASB reasoned that this information would help an entity explain why the maximum exposure to loss is unrepresentative of its actual exposure if that is the case. [IFRS 12.BC100].

6.2.2 Disclosures of actual and intended financial and other support

Extract from IFRS 12

- 30 If during the reporting period an entity has, without having a contractual obligation to do so, provided financial or other support to an unconsolidated structured entity in which it previously had or currently has an interest (for example, purchasing assets of or instruments issued by the structured entity), the entity shall disclose:
- (a) the type and amount of support provided, including situations in which the entity assisted the structured entity in obtaining financial support; and
 - (b) the reasons for providing the support.

[IFRS 12.30].

An entity must also disclose any current intentions to provide financial or other support to an unconsolidated structured entity, including intentions to assist the structured entity in obtaining financial support. [IFRS 12.31].

See sections 4.4.2 and 4.4.4 above for discussion of these disclosure requirements.

Illustration 4-2 in section 4.4.2 above is an illustrative disclosure of the provision of financial support to a structured entity.

6.3 Additional disclosures regarding the nature of risks

In addition to the requirements in section 6.2 above, IFRS 12 also requires an entity to disclose additional information that is necessary to meet the disclosure objective to disclose information that allows users of a reporting entity's financial statements to evaluate the nature of, and changes to, the risks associated with its interests in unconsolidated structured entities.

IFRS 12 provides the following examples of additional information that, depending on the circumstances, might be relevant to an assessment of the risks to which a reporting entity is exposed where it has an interest in an unconsolidated structured entity:

- (a) The terms of an arrangement that could require the entity to provide support to an unconsolidated structured entity (e.g., liquidity arrangements or credit rating triggers associated with obligations to purchase assets of the structured entity or provide financial support) including:
 - (i) A description of the events or circumstances that could expose the reporting entity to a loss
 - (ii) Whether there are any terms that would limit the obligation
 - (iii) Whether there are any other parties that provide financial support and, if so, how the reporting entity's obligation ranks with those of other parties
 - (b) Losses incurred by the entity during the reporting period relating to its interests in unconsolidated structured entities
 - (c) The types of income the entity received during the reporting period from its interests in unconsolidated structured entities
 - (d) Whether an entity is required to absorb losses of an unconsolidated structured entity before other parties, the maximum limit of such losses for the entity and (if relevant) the ranking and amounts of potential losses borne by parties whose interests rank lower than the entity's interest in the unconsolidated structured entity
 - (e) Information about any liquidity requirements, guarantees or other commitments with third parties that may affect the fair value or risk of the entity's interests in unconsolidated structured entities
 - (f) Any difficulties an unconsolidated structured entity has experienced in financing its activities during the reporting period
- And
- (g) In relation to the funding of an unconsolidated structured entity, the forms of funding (e.g., commercial paper or medium-term notes) and their weighted-average life. That information might include maturity analyses of the assets and funding of an unconsolidated structured entity if the structured entity has longer-term assets funded by shorter-term funding. [IFRS 12.B25, IFRS 12.B26].

No prescriptive format is required for these disclosures. Therefore, a reporting entity will have to decide whether a tabular or narrative format is suitable depending on its individual circumstances. The examples above are not exhaustive.

The IASB does not intend each item in the list of examples above to apply in all circumstances. The IASB's intention regarding the disclosure of risk is that each entity ought to disclose information that is important when assessing that exposure but not to cloud the information with unnecessary detail that would be considered irrelevant. If an entity has a large exposure to risk because of transactions with a particular unconsolidated structured entity, then the Board would expect extensive disclosure about that exposure. In contrast, if the entity has very little exposure to risk, little disclosure would be required. Therefore, the list of additional information above is a list of examples of information that might be relevant and not a list of requirements that must be applied regardless of the circumstances. [IFRS 12.BC113, IFRS 12.BC114].

Given that this information is required in respect of structured entities that the reporting entity does not control, and over which it may not exercise significant influence, some of the disclosures suggested in respect of (d), (f) and (g) of IFRS 12.B26 may be difficult to provide. This is because they require current information about the activities of the structured entity, rather than information about the interests held by the reporting entity.

Comments on some of the suggested disclosures are in sections 6.3.1 to 6.3.7 below.

6.3.1 Disclosure of support

Illustration 4-1 above illustrates disclosure of a contractual arrangement that could require support to a structured entity.

Illustration 4-2 above illustrates disclosure of support provided to a structured entity where there is no contractual obligation to provide such support.

The meaning of 'support' is discussed in section 4.4.2 above.

6.3.2 Disclosure of losses incurred

How we see it

IFRS 12 does not elaborate on 'losses incurred' but we believe that it refers to both realised and unrealised losses and losses recognised in both profit and loss and other comprehensive income. It may be informative to explain to users of the financial statements the line items in the primary statements in which the losses have been recognised. It would also be informative to disclose the aggregate losses incurred in respect of investments held at the reporting date as well as the losses incurred in the reporting period for those interests disposed of during the period.

Illustration 6-2: Illustrative example of disclosure of losses incurred from investments in unconsolidated structured entities

The Group has incurred the following realised and unrealised losses in respect of its investments in unconsolidated structured entities:

	20X1	20X0
	CU'000	CU'000
Realised losses	200	200
Unrealised losses (profit and loss)	400	300
Unrealised losses (other comprehensive income)	500	400
	1,100	900
<i>Split by:</i>		
Collateralised debt obligations	800	700
Credit card receivables	300	200
	1,100	900
<i>Aggregate losses incurred</i>	<i>Transferred in year</i>	<i>Transferred in year</i>
	20X1	20X0
	CU'000	CU'000
Collateralised debt obligations	2,300	1,500
Credit card receivables	1,700	1,400
	4,000	2,900

6.3.3 Disclosure of the types of income received

This disclosure is similar to the disclosure discussed in section 6.1.2 above in respect of unconsolidated structured entities for which the reporting entity does not have an interest at the reporting date. However, subparagraph (c) of IFRS 12.B26 refers only to the types of income received and does not refer to the need for a specific quantification of the income received.

'Income from a structured entity' includes, but is not limited to:

- Recurring and non-recurring fees (structuring fees, management fees, placing agent fees, etc.)
- Interest
- Dividends
- Gains or losses on the remeasurement or derecognition of interests in structured entities
- And
- Gains or losses from the transfer of assets or liabilities to the structured entity [IFRS 12 Appendix A]

6.3.4 Disclosure of the maximum limit, ranking and amounts of potential losses

Disclosure is required of the maximum limit of losses for a reporting entity where a reporting entity is required to absorb losses of a structured entity before other parties. This requirement is likely to be relevant for reporting entities which hold notes in securitised structured entities or where the interests in the structured entity are in the form of multiple contractually linked or 'tranching' notes.

An example of the type of disclosure that could be made is shown below.

Illustration 6-3: Illustrative example of disclosure of maximum exposure to and ranking of loss exposure by type of structured entity

The following table shows the maximum exposure to loss for ABC Bank by type of structured entity and by seniority of interest, where ABC Bank's interest ranks lower than interests of other investors, therefore, ABC Bank absorbs losses before other parties.

	Seniority of interests				
CU'000	Subordinated interests	Mezzanine interests	Senior interests	Most senior interests	Total
Mortgage backed securitisations					
i) ABC Bank's maximum exposure to loss	150	592	850	346	1,938
ii) Potential losses borne by more junior interests	-	897	7,875	10,332	19,104
CDOs and CLOs					
i) ABC Bank's maximum exposure to loss	60	167	243	32	502
ii) Potential losses borne by more junior interests	27	456	4,787	5,311	10,581
Asset backed commercial paper					
i) ABC Bank's maximum exposure to loss	-	-	-	379	379
ii) Potential losses borne by more junior interests	-	-	-	25	25

6.3.5 Disclosure of liquidity arrangements

This disclosure might include:

- Liquidity arrangements, guarantees or other commitments provided by third parties to the structured entity which affect the fair value or risk of the reporting entity's interests in the structured entity.
- And
- Liquidity arrangements, guarantees or other commitments provided by third parties to the reporting entity which affect the risks of the reporting entity's interests in the structured entity.

How we see it

We do not believe that this disclosure is intended to include liquidity arrangements, guarantees or other commitments made by the structured entity to third parties. While an arrangement provided to a third party may itself qualify as an interest in a structured entity, it would not normally affect the fair value of an entity's interests in an unconsolidated structured entity.

6.3.6 Disclosure of funding difficulties

Disclosure of 'any difficulties' that a structured entity has experienced in financing its activities during a reporting period could potentially be wide-ranging. In practice, we believe that such a disclosure is likely to focus on issues of debt (including short-term commercial paper) and equity securities that have failed either in whole or in part.

6.3.7 Disclosure of the forms of funding

This disclosure appears to refer to the overall funding of the structured entity including forms of funding in which the reporting entity has not participated. A tabular presentation may be the most appropriate way of making this disclosure.

7 Future developments

In April 2024, the IASB issued IFRS 18 *Presentation and Disclosure in Financial Statements* to replace IAS 1. IFRS 18 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). See Chapter 4 for further details on the new concepts and requirements in IFRS 18.

IFRS 19 *Subsidiaries without Public Accountability: Disclosures* was issued by the IASB in May 2024 to simplify the preparation of financial statements by eligible subsidiaries. Eligible subsidiaries that elect to apply IFRS 19 are allowed to provide reduced disclosures while still applying the recognition, measurement and presentation requirements in other IFRS accounting standards. IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). See Chapter 4 for further details on the requirements of IFRS 19.

In September 2024, the IASB published for public comment the exposure draft ED/2024/7 *Equity Method of Accounting* which, amongst other improvements, proposes changes to disclosure requirements for investments in joint ventures and associates accounted for using the equity method.

Extract from IFRS 12

Appendix A Defined terms

income from a structured entity	For the purpose of this IFRS, income from a structured entity includes, but is not limited to, recurring and non-recurring fees, interest, dividends, gains or losses on the remeasurement or derecognition of interests in structured entities and gains or losses from the transfer of assets and liabilities to the structured entity.
interest in another entity	For the purpose of this IFRS, an interest in another entity refers to contractual and non-contractual involvement that exposes an entity to variability of returns from the performance of the other entity. An interest in another entity can be evidenced by, but is not limited to, the holding of equity or debt instruments as well as other forms of involvement such as the provision of funding, liquidity support, credit enhancement and guarantees. It includes the means by which an entity has control or joint control of, or significant influence over, another entity. An entity does not necessarily have an interest in another entity solely because of a typical customer supplier relationship. Paragraphs B7-B9 provide further information about interests in other entities. Paragraphs B55-B57 of IFRS 10 explain variability of returns.
structured entity	An entity that has been designed so that voting or similar rights are not the dominant factor in deciding who controls the entity, such as when any voting rights relate to administrative tasks only and the relevant activities are directed by means of contractual arrangements. Paragraphs B22-B24 provide further information about structured entities.

Overview

Many IFRS accounting standards permit or require entities to measure or disclose the fair value of assets, liabilities or equity instruments. However, until 2011 there was limited guidance in IFRS on how to measure fair value and, in some cases, the guidance was conflicting. To remedy this, the International Accounting Standards Board (IASB or the Board) issued IFRS 13 *Fair Value Measurement* in May 2011. The standard was the result of a convergence project between the IASB and the US Financial Accounting Standards Board (FASB) (collectively, the Boards). The standard first applied to annual periods beginning on or after 1 January 2013. [IFRS 13.C1].

IFRS 13 defines fair value, provides principles-based guidance on how to measure fair value under IFRS and requires information about those fair value measurements to be disclosed. [IFRS 13.1]. IFRS 13 does not attempt to remove the judgement that is involved in estimating fair value; however, it provides a framework that is intended to reduce inconsistency and increase comparability in the fair value measurements used in financial reporting.

IFRS 13 does not address which assets or liabilities to measure at fair value or when those measurements must be performed; an entity must look to the other standards in that regard. The standard applies to all fair value measurements, when fair value is required or permitted by IFRS, with some limited exceptions. The standard also applies to measurements, such as fair value less costs to sell, that are based on fair value. However, it does not apply to similar measurement bases, such as value in use.

This chapter outlines the requirements of IFRS 13, its definitions, measurement framework and disclosure requirements. It addresses some of the key questions that are being asked about how to apply IFRS 13, recognising that some aspects of the standard are still unclear and different views may exist. Further issues and questions may be raised in the future as entities continue to apply the standard and practices evolve. Significant differences to the US GAAP fair value requirements are discussed in Appendix D and highlighted throughout the chapter.

Fair value measurement may be affected by economic and market disruptions caused by war and pandemics. Similarly, climate change can potentially affect the fair value of an asset or liability. Please refer to our publications *Applying IFRS: Accounting considerations related to geopolitical events and uncertainty*; *Applying IFRS: and Connected Financial Reporting: Accounting for Climate Change*.¹

What you need to know

- IFRS 13 applies to all fair value measurements, when fair value is required or permitted by IFRS (whether recognised or only disclosed), with limited exceptions.
- IFRS 13 does not specify when an entity is required to use fair value, but rather, provides guidance on *how* to measure the fair value of financial and non-financial assets and liabilities when required or permitted by IFRS.
- Fair value is defined as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.
- The fair value framework in IFRS 13 is based on a number of key concepts, including unit of account, exit price, valuation premise, highest and best use, principal market, market participant assumptions and the fair value hierarchy.
- IFRS 13 includes extensive disclosure requirements.
- IFRS 13 is largely converged with US GAAP on how to measure fair value.

1 Introduction

1.1 Overview of IFRS 13

The framework of IFRS 13 is based on a number of key concepts including unit of account, exit price, valuation premise, highest and best use, principal market, market participant assumptions and the fair value hierarchy. The requirements incorporate financial theory and valuation techniques but are solely focused on how these concepts are to be applied when determining fair value for financial reporting purposes.

IFRS 13 does not address the issues of what to measure at fair value and when to measure fair value. The IASB separately considers these issues on a project-by-project basis. Other IFRS accounting standards, therefore, specify which items must be measured at fair value and when. IFRS 13 addresses how to measure fair value. The principles in IFRS 13 provide the IASB with a consistent definition that, together with the *Conceptual Framework for Financial Reporting* (see Chapter 2), will assist in determining whether fair value is the appropriate measurement basis to be used in any given future project.

The definition of fair value in IFRS 13 is based on an exit price notion, which incorporates the following key concepts:

- Fair value is the price to sell an asset or transfer a liability and, therefore, represents an exit price, not an entry price.
- The exit price for an asset or liability is conceptually different from its transaction price (an entry price). While exit and entry prices may be identical in many situations, the transaction price is not presumed to represent the fair value of an asset or liability on its initial recognition.
- Fair value is an exit price in the principal market, i.e., the market with the highest volume and level of activity. In the absence of a principal market, it is assumed that the transaction to sell the asset or transfer the liability would occur in the most advantageous market. This is the market that would maximise the amount that would be received to sell an asset or minimise the amount that would be paid to transfer a liability, taking into account transport and transaction costs. In either case, the entity must have access to the market on the measurement date.

While transaction costs are considered in determining the most advantageous market, they do not form part of a fair value measurement (i.e., they are not added to or deducted from the price used to measure fair value). However, an exit price would be adjusted for transportation costs if location is a characteristic of the asset or liability being measured. This is discussed further in section 8 below.

- Fair value is a market-based measurement, not an entity-specific measurement. When determining fair value, management uses the assumptions that market participants would use when pricing the asset or liability. However, an entity need not identify specific market participants.

These key concepts and the following aspects of the guidance in IFRS 13 require particular focus when applying the standard:

- If another standard provides a fair value measurement exemption that applies when fair value cannot be measured reliably, an entity may need to consider the measurement framework in IFRS 13 in order to determine whether fair value can be reliably measured (see section 2 below).
- If there is a principal market for the asset or liability, a fair value measurement represents the price in that market at the measurement date (regardless of whether that price is directly observable or estimated using another valuation technique), even if the price in a different market is potentially more advantageous (see section 5 below).
- Fair value measurements should take into consideration the characteristics of the asset or liability being measured, but not characteristics of the transaction to sell the asset or transfer a liability. Transportation costs, for example, must be deducted from the price used to measure fair value when location is a characteristic of the item being measured at fair value (see sections 4 and 8 below). This principle also clarifies when a restriction on the sale or use of an asset or transfer of a liability affects the measurement of fair value (see section 4 below) and when premiums and discounts can be included. In particular, an entity is prohibited from making adjustments for the size of an entity's holding in comparison to current trading volumes (i.e., blockage factors, see section 14 below).
- The fair value measurement of non-financial assets must reflect the highest and best use of the asset from a market participant's perspective, which might be its current use or some alternative use. This establishes whether to assume a market participant would derive value from using the non-financial asset on its own or in combination with other assets or with other assets and liabilities (see section 9 below).

- The standard clarifies that a fair value measurement of a liability must consider non-performance risk (which includes, but is not limited to, an entity's own credit risk, see section 10 below).
- IFRS 13 provides guidance on how to measure the fair value of an entity's own equity instruments (see section 10 below) and aligns it with the fair value measurement of liabilities. If there are no quoted prices available for the transfer of an identical or a similar liability or entity's own equity instrument, but the identical item is held by another party as an asset, an entity uses the fair value of the corresponding asset (from the perspective of the market participant that holds that asset) to measure the fair value of the liability or equity instrument. When no corresponding asset exists, the fair value of the liability is measured from the perspective of a market participant that owes the liability (see section 10 below).
- A measurement exception in IFRS 13 allows entities to measure financial instruments with offsetting risks on a portfolio basis, provided certain criteria are met both initially and on an ongoing basis (see section 11 below).
- The requirements of IFRS 13 in relation to valuation techniques apply to all methods of measuring fair value. Traditionally, references to valuation techniques in IFRS have indicated a lack of market-based information with which to value an asset or liability. Valuation techniques as discussed in IFRS 13 are broader and, importantly, include market-based approaches (see section 13 below). When selecting inputs to use, an entity must prioritise observable inputs over unobservable inputs (see section 15 below).
- IFRS 13 provides application guidance to assist entities measuring fair value in situations where there has been a decrease in the volume or level of activity (see section 7 below).
- Categorisation within the fair value hierarchy is required for all fair value measurements. Disclosures required by IFRS 13 are substantially greater for those fair value measurements that are categorised within Level 3 (see sections 15 and 19 below).

1.2 Objective of IFRS 13

A primary goal of IFRS 13 is to increase the consistency and comparability of fair value measurements used in financial reporting under IFRS. It provides a common objective whenever IFRS permits or requires a fair value measurement, irrespective of the type of asset or liability being measured or the entity that holds it. The objective of a fair value measurement is to estimate the price at which an orderly transaction would take place between market participants under the market conditions that exist at the measurement date. [IFRS 13.2].

By highlighting that fair value considers market conditions that exist at the measurement date, the IASB is emphasising that the intent of the measurement is to convey the current value of the asset or liability at the measurement date and not its potential value at some future date. In addition, a fair value measurement does not consider management's intent to sell the asset or transfer the liability at the measurement date. Instead, it represents a market-based measurement that contemplates a hypothetical transaction between market participants at the measurement date (these concepts are discussed further in sections 5 to 8 below). [IFRS 13.3].

IFRS 13 makes it clear that the objective of a fair value measurement remains the same, regardless of the reason for the fair value measurement (e.g., impairment testing or a recurring measurement) or the extent of observable information available to support the measurement. While the standard requires that the inputs used to measure fair value be prioritised based on their relative observability (see section 15 below), the nature of the inputs does not affect the objective of the measurement. That is, the requirement to determine an exit price under current market conditions is not relaxed because the reporting entity cannot observe similar assets or liabilities being transacted at the measurement date. [IFRS 13.2].

Even when fair value is estimated using significant unobservable inputs (because observable inputs do not exist), the goal is to determine an exit price based on the assumptions that market participants would consider when transacting for the asset or liability on the measurement date, including assumptions about risk. This might require the inclusion of a risk premium in the measurement to compensate market participants for the uncertainty inherent in the expected cash flows of the asset or liability being measured. [IFRS 13.3].

IFRS 13 generally does not provide specific rules or detailed 'how-to' guidance. Given the broad use of fair value measurements in accounting for various kinds of assets and liabilities (both financial and non-financial), providing detailed valuation guidance was not deemed practical. As such, the application of IFRS 13 requires significant judgement; but this judgement is applied using the core concepts of the standard's principles-based framework for fair value measurements.

1.3 Post-implementation review

During 2018, the IASB concluded its post-implementation review (PIR) of IFRS 13, which was intended to assess the effect of the standard on financial reporting. In particular, the Board's aim was to assess "whether:

- the information required by IFRS 13 is useful to users of financial statements;
- areas of IFRS 13 present implementation challenges and might result in inconsistent application of the requirements; and
- unexpected costs have arisen when preparing, auditing or enforcing the requirements of IFRS 13 or when obtaining the information that the Standard requires entities to provide."²

Areas of focus in the PIR included: the usefulness of disclosures about fair value measurements; whether to prioritise unit of account or the use of Level 1 inputs; applying the requirements for highest and best use in fair value measurements of non-financial assets; and the use of judgement in relation to specific areas of IFRS 13 (e.g., assessing whether a market is active (see section 7.1.1 below), determining whether an unobservable input is significant when categorising a fair value measurement within the hierarchy (see section 15.2.1 below)).³

In December 2018, the IASB released its Report and Feedback Statement on the PIR of IFRS 13, in which it stated its conclusion that IFRS 13 is working as it intended. As a result of the PIR, the Board decided to:⁴

- (a) Feed the PIR findings regarding the usefulness of disclosures into the Board's work on Better Communication in Financial Reporting, in particular, into the Targeted Standards-level Review of Disclosures and the Primary Financial Statements projects
- (b) Continue liaising with the valuation profession, monitor new developments in practice and promote knowledge development and sharing
- (c) Conduct no other follow-up activities as a result of findings from the PIR

In 2018, the Board selected IFRS 13 as one of the two Standards (the other was IAS 19 *Employee Benefits*) on which to test the draft guidance for the Board to use when developing and drafting disclosure objectives and requirements in future. During 2019 and 2020, the Board decided to propose amendments to the disclosure objective of IFRS 13 and items of information that could be used to meet those objectives. In March 2021, the Board issued an Exposure Draft ED/2021/3, *Disclosure Requirements in IFRS Standards - A Pilot Approach (Proposed amendments to IFRS 13 and IAS 19)* (the ED). However, in October 2022, the Board decided not to proceed with any amendments (see section 19.6 below for more detail).

4 [IFRS Project Report and Feedback Statement](#), *Post-implementation Review of IFRS 13 Fair Value Measurement*, IASB, December 2018, p.3. Available on the IFRS Foundation's website.

2 Scope

IFRS 13 applies whenever another IFRS requires or permits the measurement or disclosure of fair value, or a measure that is based on fair value (such as fair value less costs to sell), [IFRS 13.5], with the following exceptions:

- (a) The measurement and disclosure requirements do not apply to: [IFRS 13.6]
 - Share-based payment transactions within the scope of IFRS 2 *Share-based Payment*
 - Leasing transactions accounted for in accordance with IFRS 16 *Leases* (see section 2.2.2 below)
 - Measurements that are similar to fair value, but are not fair value, such as net realisable value in IAS 2 *Inventories* or value in use in IAS 36 *Impairment of Assets* (see section 2.2.3 below)
- (b) The measurement requirements in IFRS 13 apply, but the disclosure requirements do not apply to: [IFRS 13.7]
 - Plan assets measured at fair value in accordance with IAS 19
 - Retirement benefit plan investments measured at fair value in accordance with IAS 26 *Accounting and Reporting by Retirement Benefit Plans*
 - Assets for which recoverable amount is fair value less costs of disposal in accordance with IAS 36 (see section 2.2.4 below)

2.1 Items in the scope of IFRS 13

2.1.1 Fair value measurements

The measurement framework in IFRS 13 applies to both fair value measurements on initial recognition and subsequent fair value measurements, if permitted or required by another IFRS. [IFRS 13.8]. This includes both assets and liabilities, as well as an entity's own equity instruments measured at fair value. [IFRS 13.4]. Fair value measurement at initial recognition is discussed further in section 12 below.

IFRS 13 establishes how to measure fair value. It does not prescribe:

- What should be measured at fair value
 - When to measure fair value (i.e., the measurement date)
- Nor
- How (or whether) to account for any subsequent changes in fair value (e.g., in profit or loss or in other comprehensive income) - however, the standard does partly address day one gains or losses on initial recognition at fair value, requiring that they be recognised in profit or loss immediately unless the IFRS that permits or requires initial measurement at fair value specifies otherwise

An entity must consider the relevant IFRS accounting standards (e.g., IFRS 3 *Business Combinations*, IFRS 9 *Financial Instruments*, IAS 40 *Investment Property*) for each of these requirements.

2.1.2 Fair value disclosures

The scope of IFRS 13 includes disclosures of fair value. This refers to situations where an entity is permitted, or may be required, by a standard or interpretation to disclose the fair value of an item whose carrying amount in the financial statements is not fair value. Examples include:

- IAS 40, which requires the fair value to be disclosed for investment properties measured using the cost model. [IAS 40.79(e)].
- IFRS 7 *Financial Instruments: Disclosures*, which requires the fair value of financial instruments that are subsequently measured at amortised cost in accordance with IFRS 9 (including amortised cost hedged items that are fair valued for the hedged risk) to be disclosed. [IFRS 7.25].

In such situations, the disclosed fair value must be measured in accordance with IFRS 13 and an entity would also need to make certain disclosures about that fair value measurement in accordance with IFRS 13 (see section 19 below).

In certain circumstances, IFRS 7 provides relief from the requirement to disclose the fair value of a financial instrument that is not measured subsequently at fair value. An example is when the carrying amount is considered a reasonable approximation of fair value. [IFRS 7.29]. In these situations, an entity would not need to measure the fair value of the financial asset or financial liability for disclosure purposes. However, it would need to consider the requirements of IFRS 13 in order to determine whether the carrying amount is a reasonable approximation of fair value.

2.1.3 Measurements based on fair value

The measurement of amounts (whether recognised or only disclosed) that are based on fair value, such as fair value less costs to sell, are within the scope of IFRS 13. This includes the following:

- A non-current asset (or disposal group) held for sale measured at fair value less costs to sell in accordance with IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations*, when the fair value less costs to sell is lower than its carrying amount (see Chapter 5)
- Commodity inventories that are held by commodity broker-traders and measured at fair value less costs to sell, as discussed in IAS 2 (see Chapter 23)
- Where the recoverable amount for an asset or cash-generating unit(s), determined in accordance with IAS 36, is its fair value less costs of disposal. This includes impairment testing of investments in associates accounted for in accordance with IAS 28 *Investments in Associates and Joint Ventures*, when that standard requires the test to be performed in accordance with IAS 36 (see Chapter 21)
- Biological assets (including produce growing on a bearer plant), and agricultural produce at the point of harvest measured at fair value less costs to sell in accordance with IAS 41 *Agriculture* (see Chapter 38)

In each of these situations, the fair value component is measured in accordance with IFRS 13. Costs to sell or costs of disposal are determined in accordance with the applicable standard, for example, IFRS 5.

2.1.4 Short-term receivables and payables

Prior to the issuance of IFRS 13, the then extant IFRS 9 allowed entities to measure short-term receivables and payables with no stated interest rate at invoice amounts without discounting, when the effect of not discounting was immaterial. [IFRS 9(2012).B5.4.12]. That paragraph was deleted as a consequence of the IASB issuing IFRS 13. In the absence of that paragraph, some questioned whether discounting would be required for such short-term receivables and payables. The IASB amended IFRS 13, as part of its 2010-2012 cycle of *Improvements to IFRSs*, to clarify that, when making those amendments to IFRS 9, it did not intend to remove the ability to measure such short-term receivables and payables at their invoice amount. The Board also noted that, when the effects of applying accounting policies set out in IFRS accounting standards are immaterial, IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* permits entities not to apply them. [IFRS 13.BC138A, IAS 8.8].

2.2 Scope exclusions

2.2.1 Share-based payments

IFRS 2 requires certain share-based payments to be measured at grant date fair value (see Chapter 30). However, the objective of an IFRS 2 fair value measurement is not entirely consistent with IFRS 13. Rather than trying to distinguish between these two measures, the IASB decided to exclude share-based payment transactions that are accounted for in accordance with IFRS 2 from the scope of IFRS 13. The grant date fair value of such share-based payments is, therefore, measured and disclosed in accordance with IFRS 2, not IFRS 13. [IFRS 13.BC21].

2.2.2 Lease transactions

As noted in section 2 above, IFRS 13 does not apply to any leasing transactions accounted for in accordance with IFRS 16. The fair value measurement and disclosure requirements in IFRS 16 apply instead (see Chapter 24 for further discussion on IFRS 16). This scope exception does not extend to lease assets acquired or liabilities assumed in a business combination in accordance with IFRS 3. IFRS 13 would apply to that measurement of fair value. In addition, after adoption of IFRS 16, an entity may need to apply IFRS 13 to sale and leaseback transactions.

While it is clear that leasing transactions that are within the scope of IFRS 16 are excluded from IFRS 13, lease liabilities (for lessees) and finance lease receivables (for lessors) are financial instruments, per IAS 32 *Financial Instruments: Presentation*, and are, therefore, within the scope of IFRS 7. [IFRS 7.4, IAS 32.AG9]. As discussed in section 2.1.2 above, IFRS 7.25 requires an entity to disclose, for each class of financial asset and financial liability, a comparison of fair value to carrying amount (except where the carrying amount is a reasonable approximation of fair value). [IFRS 7.25, IFRS 7.29(a)]. Lease liabilities are explicitly excluded from this disclosure requirement. [IFRS 7.29(d)]. However, finance lease receivables are not. Therefore, since IFRS 7 is not excluded from the scope of IFRS 13, lessors will need to measure the fair value of finance lease receivables in accordance with IFRS 13 in order to provide the IFRS 7 disclosure (unless the carrying amount is a reasonable approximation for fair value).

2.2.3 Measurements similar to fair value

Some IFRS accounting standards permit or require measurements that are similar to fair value but are not fair value. These measures are excluded from the scope of IFRS 13. Such measures may be derived using techniques that are similar to those permitted in IFRS 13. IAS 36, for example, requires value in use to be determined using discounted cash flows (see Chapter 21). An entity may also consider the selling price of an asset, for example, in determining net realisable value for inventories in accordance with IAS 2 (see Chapter 23). Despite these similarities, the objective is not to measure fair value. Therefore, IFRS 13 does not apply to these measurements.

2.2.4 Exemptions from the disclosure requirements of IFRS 13

As noted in section 2 above, IFRS 13's disclosure requirements do not apply to plan assets measured at fair value in accordance with IAS 19, retirement benefit plan investments measured at fair value in accordance with IAS 26 and assets for which the recoverable amount is fair value less costs of disposal in accordance with IAS 36.

In addition, the disclosure requirements in IFRS 13 do not apply to any fair value measurements at initial recognition. That is, the disclosure requirements of IFRS 13 apply to fair value measurements after initial recognition (this is discussed further in section 19 below).

The fair value measurement requirements of IFRS 13 still apply to each of these items above, even though the disclosure requirements do not. Therefore, an entity would measure the item in accordance with IFRS 13 and then make the required disclosures in accordance with the applicable standard (i.e., IAS 19, IAS 26 and IAS 36) or the standard that requires fair value at initial recognition. For example, an entity that acquires a brand as part of a business combination would be required by IFRS 3 to measure the intangible asset at fair value at initial recognition. The acquirer would measure the asset's fair value in accordance with IFRS 13 but would disclose information about that fair value measurement in accordance with IFRS 3 (since those fair values are measured at initial recognition), not IFRS 13.

2.3 Present value techniques

IFRS 13 provides guidance for using present value techniques, such as a discounted cash flow analysis, to measure fair value (see section 20 below for additional discussion on the application of present value techniques). However, the use of present value techniques does not always result in a fair value measurement. As discussed in section 2.2.3 above, some IFRS accounting standards use present value techniques to measure assets and liabilities at amounts that are not intended to represent a fair value measurement. Unless the objective is to measure fair value, IFRS 13 does not apply.

2.4 Fair value measurement exceptions and practical expedients in other standards

2.4.1 Fair value measurement exceptions

Some standards provide an exception to a requirement to measure an asset or liability at fair value. IFRS 13 does not eliminate these exceptions. *[IFRS 13.BC8]*.

IFRS typically limits fair value measurement exceptions to circumstances where fair value is not reliably measurable and, where applied, requires the application of a cost model. For example, IAS 41 permits the use of a cost model if, on initial recognition of a biological asset, an entity is able to rebut the presumption that fair value can be reliably measured. In addition, it requires an entity to revert to the fair value model if fair value subsequently becomes reliably measurable. *[IAS 41.30]*. Additional disclosures are often required to explain why fair value cannot be reliably measured and, if possible, the range of estimates within which fair value is highly likely to lie, as is required in IAS 40 for investment properties, for example.

[IAS 40.79(e)(iii)].

In these situations, an entity would need to consider the requirements of IFRS 13 in order to determine whether fair value can be reliably measured. If the entity concludes that it could reliably measure fair value based on the requirements of IFRS 13, even in situations where observable information is not available, it would not be able to apply these exceptions.

2.4.2 Practical expedient for impaired financial assets carried at amortised cost

Prior to the issuance of IFRS 9, IAS 39 *Financial Instruments: Recognition and Measurement* allowed, as a practical expedient, creditors to measure the impairment of a financial asset carried at amortised cost based on an instrument's fair value using an observable market price. [IAS 39(2017).AG84]. If the practical expedient was used, IFRS 13 applied to the measurement of fair value. When the practical expedient was not used, the measurement objective was not intended to be fair value (and IFRS 13 did not apply). Instead, IAS 39's requirements for measuring the impairment of the financial asset carried at amortised cost applied.

Under IFRS 9, entities are allowed to use observable market information to estimate the credit risk of a particular financial instrument and as a consequence the fair value can no longer be used as an approximation of amortised cost. Instead, IFRS 9's requirements for measuring the impairment of the financial asset carried at amortised cost would apply.

2.5 Practical expedients and measurement exceptions within IFRS 13

2.5.1 Practical expedients in IFRS 13

In addition to the various practicability exceptions discussed in section 2.4 above, IFRS 13 provides two practical expedients to assist with applying the fair value framework in certain instances. These practical expedients, each of which is discussed separately in this chapter, are the use of mid-market pricing within a bid-ask spread (see section 14.3.1 below) and the use of alternative pricing methods (e.g., matrix pricing) when an entity holds a large number of similar assets and liabilities for which quoted prices exist but are not easily accessible (see section 16.2 below).

2.5.1.A Use of net asset value to measure fair value

Under IFRS, net asset value (NAV) cannot be presumed to equal fair value, as the asset that is being measured (i.e., the unit of account) is the equity investment in an investment entity (e.g., each individual share per IFRS 9), not the underlying assets (and liabilities) of the investment entity itself. [IFRS 13.14]. While NAV may represent the fair value of the equity interest in certain situations (e.g., in situations where an open-ended fund provides a source of liquidity through ongoing subscriptions and redemptions at NAV), one cannot presume this to be the case. Instead, the characteristics of the investment being measured need be considered when determining its fair value. [IFRS 13.11].

FASB differences

Under US GAAP, the equivalent standard, Topic 820, *Fair Value Measurement* in the FASB Accounting Standards Codification (ASC 820), provides a practical expedient to measure the fair value of certain investments in investment companies using NAV or its equivalent if certain criteria are met. IFRS 13 does not explicitly permit the use of NAV to estimate the fair value. [IFRS 13.BC238(a)].

If a quoted price in an active market for an identical instrument is available (i.e., a Level 1 input), the fair value of the equity instrument would need to be measured using that price multiplied by the quantity held (i.e., price × quantity), without adjustment, even if this deviates from NAV. [IFRS 13.77]. An example of when the Level 1 input may differ from NAV is shares in certain closed-end funds that trade on exchanges at prices that differ from the reported NAV of the funds. In some cases, if the investment trades in an active market, the quoted price may be equal to the NAV (for example, for some open-ended mutual funds); however, the principle remains that the quoted price will be the input used to determine fair value, rather than the NAV.

In situations where there is no quoted price for an identical instrument, reported NAV may represent a starting point in estimating fair value. However, adjustments may be required to reflect the specific characteristics that market participants would consider in pricing the equity investment in an investment entity. [IFRS 13.11].

How we see it

It may be helpful to understand the factors that would reconcile a reported NAV of the investment entity to the fair value used by the reporting entity in order to provide explanations to investors, if necessary, and to support disclosures required by IFRS 13 and other IFRS accounting standards. Factors to consider include, but are not limited to, the following:

- (a) Is the reported NAV an appropriate input for use in measuring fair value?
- (b) Are adjustments to reported NAV needed to reflect characteristics that market participants would consider in pricing an equity investment?

Each of these is discussed in more detail below.

(a) Is the reported NAV an appropriate input for use in measuring fair value?

Before concluding that the reported NAV is an appropriate input when measuring fair value, a reporting entity should evaluate the effectiveness of the investment entity's valuation practices, by considering the valuation techniques and inputs used by the investment entity when estimating NAV. This assists in determining whether the investment entity's valuation practices and inputs are aligned with those that would need to be used by a market participant in respect of the equity instruments of the investment entity.

Sources for information on valuation practices and inputs that may be helpful to consider include, but are not limited to, the following:

- Evidence gathered during the initial due diligence and ongoing monitoring procedures
- The investment entity's fair value estimation processes and control environment, as well as its policies and procedures for estimating fair value of underlying investments, and any changes to those processes, the control environment, or policies and procedures
- The use of independent third-party valuation experts by the investment entity
- The portion of the underlying securities that are actively traded
- Comparison of historical realisations to last reported fair value
- Professional reputation and standing of the investment entity's service providers
- Whether there is a history of significant adjustments to the NAV

The sources of information above may help an investor consider the appropriateness of making use of a reported NAV as an input in its determination of the fair value of the equity instrument and whether market participants would make adjustment(s) to NAV.

(b) Are adjustments to reported NAV needed to reflect characteristics that market participants would consider in pricing an equity investment?

A reporting entity should consider the characteristics of the equity investment that are not reflected in reported NAV. The fair value of the underlying assets within an investment entity would, for example, ignore any restrictions or possible obligations imposed on the holder of an equity investment in an investment entity. Obligations may take the form of commitments to contribute further capital, as and when called for by the investment entity. If market participants would be expected to place a discount or premium on the reported NAV because of features, risk or other factors relating to the equity investment, then the fair value measurement of the investment would need to be adjusted for those factors.

However, in some cases adjustments to NAV may not be required. For example, if a fund is open to new investors, presumably the fair value of the fund investment would not be expected to exceed the amount that a new investor would be required to invest directly with the fund to obtain a similar interest. Similarly, the hypothetical seller of a fund investment would not be expected to accept lower proceeds than it would receive by redeeming its investment directly with the fund (if possible). As such, the willingness and ability of an investment entity to provide a source of liquidity for the investment through subscriptions and redemptions are important considerations in assessing whether adjustments to NAV would be required in determining the exit price of an investment.

Information related to relevant secondary market transactions should be considered unless they are determined to be disorderly. Limited Partners in such funds may seek to sell their investments for a variety of reasons, including mergers or acquisitions, the need for liquidity or a change in strategy, among others. While premiums have been observed in practice, discounts on sales of investments in investment entities are also common.

In addition to the specific characteristics of equity investments noted above, premiums or discounts on the reported NAV can also arise based on the following factors:

- Type of investment entity, specific portfolio investments in the investment entity, market conditions and the reputation of the fund manager
- An evaluation of the fund manager's valuation methodology (e.g., if a fund manager's valuations were deemed to be conservative, a premium or lower discount may result)
- How difficult it is to value the investment entity's underlying portfolio investments
- The seller's motivation in observed sales, which may/may not indicate a distressed sale. There are many reasons why investors sell their investments, market observers cannot merely assume that an observed sale is distressed

Likewise, sales of an investment in an investment entity to independent third parties at the reported NAV without a premium or discount, may suggest that no adjustment is needed.

2.5.2 Measurement exception to the fair value principles for financial instruments

IFRS 13 makes it clear that the concepts of 'highest and best use' and 'valuation premise' only apply to the measurement of non-financial assets. Such concepts could have significantly changed the valuation of some over-the-counter (OTC) derivatives, many of which are measured on a portfolio basis. That is, reporting entities typically determine valuation adjustments related to bid-ask spreads and credit risk for OTC derivative contracts considering the net exposure of a portfolio of contracts to a particular market risk or credit risk (as defined in IFRS 7, see Chapter 50). To address this concern, IFRS 13 provides an exception to the principles of fair value when measuring financial instruments with offsetting risks if certain criteria are met.

The exception allows an entity to estimate the fair value of a portfolio of financial instruments based on the sale or transfer of its net position for a particular market risk exposure (rather than to the individual instruments in the portfolio). The exception also enables an entity to consider its credit exposure to a particular counterparty on a net basis, provided there is an arrangement in place that mitigates credit risk upon default (e.g., a master netting agreement).

See section 11 below for additional discussion on measuring the fair value of financial assets and financial liabilities with offsetting risks.

3 The fair value framework

3.1 Definition of fair value

Fair value is defined as follows: [IFRS 13.9]

Extract from IFRS 13

9 This IFRS defines fair value as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.

The definition of fair value in IFRS 13 is not significantly different from the previous definition in IFRS, which was “the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm’s length transaction”. [IFRS 13.BC29]. However, the definition in IFRS 13 and its guidance in the fair value framework clarify the following:

- The definition of fair value in IFRS 13 is a current exit price, not an entry price. [IFRS 13.BC36]. The exit price for an asset or liability is conceptually different from its transaction price (an entry price). While exit and entry prices may be identical in many situations, the transaction price is not presumed to represent the fair value of an asset or liability on its initial recognition as measured in accordance with IFRS 13.
- The exit price objective of a fair value measurement applies regardless of the reporting entity’s intent and/or ability to sell the asset or transfer the liability at the measurement date. [IFRS 13.BC39, IFRS 13.BC40]. Fair value is the exit price in the principal market (or in the absence of a principal market, the most advantageous market - see section 5 below - in which the reporting entity would transact). However, the price in the exit market should not be adjusted for transaction costs - i.e., transaction costs incurred to acquire an item are not added to the price used to measure fair value and transaction costs incurred to sell an item are not deducted from the price used to measure fair value. [IFRS 13.25].
- Fair value is a market-based measurement, not an entity-specific measurement, and, as such, is determined based on the assumptions that market participants would use when pricing the asset or liability. [IFRS 13.BC31].
- A fair value measurement contemplates the sale of an asset or transfer of a liability, not a transaction to offset the risks associated with an asset or liability (see section 7 below for further discussion).
- The transaction to sell the asset or transfer the liability is a hypothetical transaction as at the measurement date that is assumed to be orderly and considers an appropriate period of exposure to the market (see section 7 below for further discussion). [IFRS 13.15].
- The objective of a fair value measurement does not change based on the level of activity in the exit market or the valuation technique(s) used. That is, fair value remains a market-based exit price that considers the current market conditions as at the measurement date, even if there has been a significant decrease in the volume and level of activity for the asset or liability. [IFRS 13.2, IFRS 13.B41].

3.2 The fair value measurement framework

In addition to providing a single definition of fair value, IFRS 13 includes a framework for applying this definition to financial reporting. Many of the key concepts used in the fair value framework are interrelated and their interaction should be considered in the context of the entire approach.

As discussed in section 1.2 above, the objective of a fair value measurement is “to estimate the price at which an orderly transaction to sell the asset or to transfer the liability would take place between market participants at the measurement date under current market conditions”. [IFRS 13.B2].

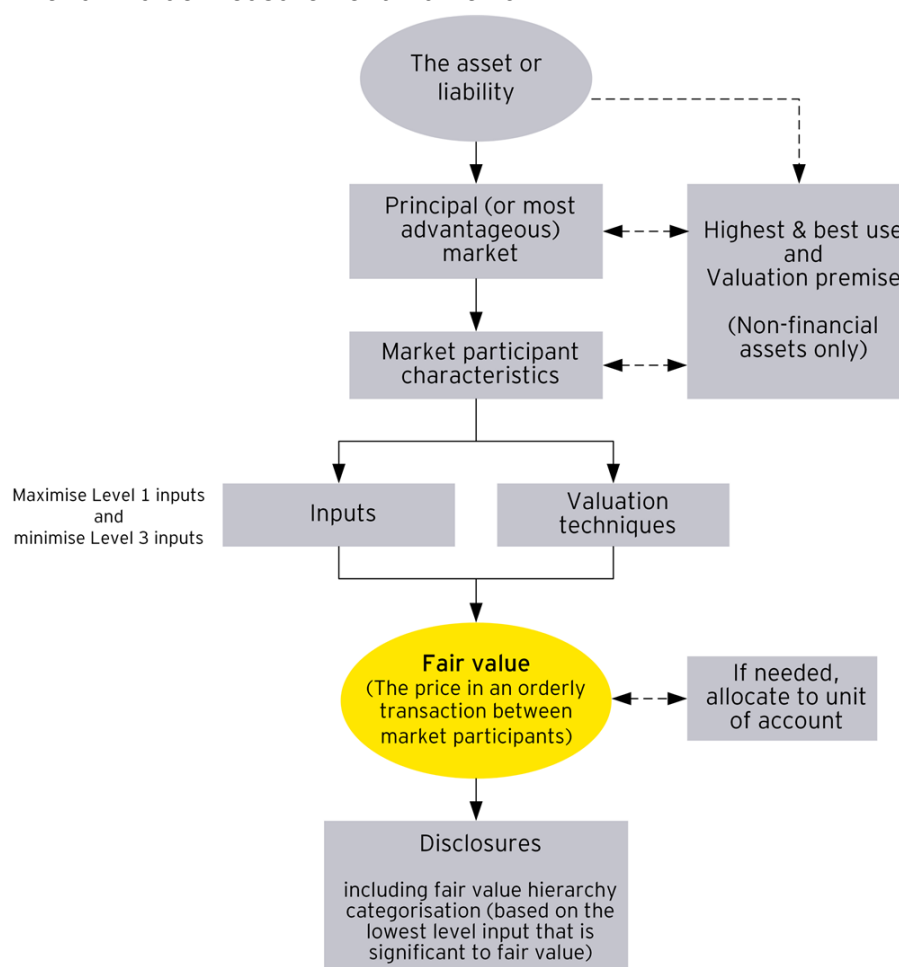

In light of this objective, when measuring fair value, an entity must determine all of the following: [IFRS 13.B2]

- (a) The particular asset or liability that is the subject of the measurement (consistent with its unit of account - see section 4 below)
- (b) For a non-financial asset, the valuation premise that is appropriate for the measurement (consistent with its highest and best use - see section 9 below)
- (c) The principal (or most advantageous) market for the asset or liability (see section 5 below)
- (d) The valuation technique(s) appropriate for the measurement (see section 13 below), considering the availability of data with which to develop inputs (see section 14 below) that represent the assumptions that market participants would use when pricing the asset or liability (see section 6 below) and the level of the fair value hierarchy within which the inputs are categorised (see section 15 below)

How we see it

The following diagram illustrates our view of the interdependence of the various components of the fair value measurement framework in IFRS 13.

Figure 3-1: The fair value measurement framework

In practice, navigating the fair value framework may be more straightforward for certain types of assets (e.g., assets that trade in a formalised market) than for others (e.g., intangible assets). For non-financial assets that derive value when used in combination with other assets or for which a developed market does not exist, resolving the circular nature of the relationship between valuation premise, highest and best use and exit market is important in applying the fair value framework (refer to section 9 below for additional discussion on the fair value measurement of non-financial assets).

IFRS 13 clarifies that the concepts of 'highest and best use' and 'valuation premise' are only applicable when determining the fair value of non-financial assets. Therefore, the fair value framework is applied differently to non-financial assets versus other items, such as financial instruments, non-financial liabilities and instruments classified in a reporting entity's shareholders' equity (refer to section 11 below for additional discussion on the fair value of financial instruments with offsetting positions and to section 10 below for the fair value measurement of liabilities and instruments classified as own equity). Although there are differences in the application of the fair value framework for non-financial assets, the objective of the fair value measurement remains the same, that is, an exit price in the principal (or most advantageous) market.

As discussed in more detail in section 11 below, IFRS 13 provides an exception to the principles of fair value, allowing entities to measure a group of financial instruments based on the price to sell (or transfer) its net position for a particular risk exposure, if certain criteria are met. The use of this exception may require a reporting entity to allocate portfolio-level valuation adjustments to the appropriate unit of account.

4 The asset or liability

IFRS 13 states that a fair value measurement is for a particular asset or liability, which is different from the price to offset certain of the risks associated with that particular asset or liability. This is an important distinction, particularly in the valuation of certain financial instruments that are typically not 'exited' through a sale or transfer, but whose risks are hedged through other transactions (e.g., derivatives). However, IFRS 13 does allow for financial instruments with offsetting risks to be measured based on their net risk exposure to a particular risk, in contrast to the assets or liabilities that give rise to this exposure (see section 11 below for additional discussion on the criteria to qualify for this measurement exception and application considerations).

4.1 The unit of account

The identification of exactly what asset or liability is being measured is fundamental to determining its fair value. Fair value may need to be measured for either:

- A stand-alone asset or liability (e.g., a financial instrument or an operating asset)
- Or
- A group of assets, a group of liabilities, or a group of assets and liabilities (e.g., a cash-generating unit (CGU) or a business)

The unit of account defines what is being measured for financial reporting purposes. It is an accounting concept that determines the level at which an asset or liability is aggregated or disaggregated for the purpose of applying IFRS 13, as well as other standards.

Unless specifically addressed in IFRS 13 (see sections 4.1.1 and 4.1.2 below), the appropriate unit of account is determined by the applicable IFRS (i.e., the standard that permits or requires the fair value measurement or disclosure). [IFRS 13.13, IFRS 13.14]. Assume, for example, that an investment property is valued at CU100. Further assume that the investment property is owned by a single asset entity (or corporate wrapper) and the shares in the entity are only valued at CU90. If another entity were to acquire the shares of the single asset entity for CU90, at acquisition, the entity would allocate the purchase price to the property inside it. The property would, therefore, initially be recognised at CU90. Assume that, at year-end, the fair value of the property is CU110 and that the entity measures the property at fair value in accordance with IAS 40. Assume that the fair value of the shares in the single asset entity are CU99 at year end. IAS 40 requires that an entity measure an investment property, not the shares of a single entity that owns it. [IAS 40.33]. As such, the property would be measured at its fair value of CU110 rather than at the fair value of the shares in the entity.

The fair value should be consistent with the unit of account being measured and ensure that the measurement appropriately considers the relevant risks that market participants would consider. Those risks are ones that could potentially affect the fair value of an asset or liability, whether the risk or opportunity is real or perceived. For example, entities need to understand to which assets and/or liabilities climate-related factors are attributable and ensure they do not double count or omit relevant factors. Anticipated increases in costs due to climate-related developments may affect the value of an item of property, plant or equipment held by a mining company and also a related rehabilitation provision. However, when measuring the fair value of an item of property, plant or equipment, the entity would need to consider only the inputs that market participants would consider when pricing the asset.

Frequently asked questions

Question 4-1: Does IFRS 13 allow fair value to be measured by reference to an asset's (or liability's) components?

IFRS 13 states that the objective of a fair value measurement is to determine the price that would be received for an asset or paid to transfer a liability at the measurement date. That is, a fair value measurement is to be determined for a particular asset or liability. The unit of account determines what is being measured by reference to the level at which the asset or liability is aggregated (or disaggregated) for accounting purposes.

How we see it

Unless separation of an asset (or liability) into its component parts is required or allowed under IFRS (e.g., a requirement to separate under IFRS 9), we generally do not believe it is appropriate to consider the unit of account at a level below that of the legal form of the asset or liability being measured. In addition, if fair value can be determined for an asset or liability as a whole, we would generally not expect that an entity would use a higher amount to measure fair value because the sum of the parts exceeds the whole.

A valuation methodology that uses a 'sum-of-the-parts' approach may still be appropriate under IFRS 13; for example, when measuring complex financial instruments, entities often use valuation methodologies that attempt to determine the value of the entire instrument based on its component parts. However, in situations where fair value can be determined for an asset or liability as a whole, we would generally not expect that an entity would use a higher amount to measure fair value because the sum of the parts exceeds the whole. Using a higher value inherently suggests that the asset would be broken down and the various components, or risk attributes, transferred to different market participants who would pay more for the pieces than a market participant would for the asset or liability as a whole. Such an approach is not consistent with IFRS 13's principles, which contemplate the sale of an asset or transfer of a liability (consistent with its unit of account) in a single transaction. [IFRS 13.B2].

4.1.1 Unit of account and P×Q

IFRS 13 does specify the unit of account to be used when measuring fair value in relation to a reporting entity that holds a position in a single asset or liability that is traded in an active market (including a position comprising a large number of identical assets or liabilities, such as a holding of financial instruments). In this situation, IFRS 13 requires an entity to measure the asset or liability based on the product of the quoted price for the individual asset or liability and the quantity held (P×Q).

This requirement is generally accepted when the asset or liability being measured is a financial instrument in the scope of IFRS 9. However, when an entity holds an investment in a listed subsidiary, joint venture or associate, some believe the unit of account is the entire holding and the fair value should include an adjustment (e.g., a control premium) to reflect the value of the investor's control, joint control or significant influence over their investment as a whole.

Questions have also arisen on how this requirement applies to CGUs that are equivalent to listed investments. Some argue that, because IAS 36 requires certain assets and liabilities to be excluded from a CGU, the unit of account is not identical to a listed subsidiary, joint venture or associate and an entity can include adjustments that are consistent with the CGU as a whole. Similarly, some argue that approach is appropriate because in group financial statements an entity is accounting for the assets and liabilities of consolidated entities, rather than the investment. However, others argue that if the CGU is effectively the same as an entity's investment in a listed subsidiary, joint venture or associate, the requirement to use P×Q should apply.

IFRS 13 requires entities to select inputs that are consistent with the characteristics of the asset or liability being measured and would be considered by market participants when pricing the asset or liability (see section 6.2 below). Apart from block discounts (which are specifically prohibited), determining whether a premium or discount applies to a particular fair value measurement requires judgement and depends on specific facts and circumstances.

As discussed in section 14.2 below, the standard indicates that premiums or discounts should not be incorporated into fair value measurements unless all of the following conditions are met:

- The application of the premium or discount reflects the characteristics of the asset or liability being measured
- Market participants, acting in their economic best interest, would consider these premiums or discounts when pricing the asset or liability
- The inclusion of the premium or discount is not inconsistent with the unit of account in the IFRS that requires (or permits) the fair value measurement

How we see it

Therefore, when an entity holds an investment in a listed subsidiary, joint venture or associate, if the unit of account is the entire holding, it would be appropriate to include, for example, a control premium when determining fair value, provided that market participants would take this into consideration when pricing the asset. If, however, the unit of account is the individual share of the listed subsidiary, joint venture or associate, the requirement to use $P \times Q$ (without adjustment) to measure the fair value would override the requirements in IFRS 13 that permit premiums or discounts to be included in certain circumstances.

In September 2014, in response to these questions regarding the unit of account for an investment in a listed subsidiary, joint venture or associate, the IASB proposed amendments to clarify that:⁵

- The unit of account for investments in subsidiaries, joint ventures and associates should be the investment as a whole and not the individual financial instruments that constitute the investment.
- For investments that are comprised of financial instruments for which a quoted price in an active market is available, the requirement to use $P \times Q$ would take precedence, irrespective of the unit of account. Therefore, for all such investments, the fair value measurement would be the product of $P \times Q$, even when the reporting entity has an interest that gives it control, joint control or significant influence over the investee.
- When testing CGUs for impairment, if those CGUs correspond to an entity whose financial instruments are quoted in an active market, the fair value measurement would be the product of $P \times Q$.

When testing for impairment in accordance with IAS 36, the recoverable amount of a CGU is the higher of its value in use or fair value less costs of disposal. The fair value component of fair value less costs of disposal is required to be measured in accordance with IFRS 13.

When a CGU effectively corresponds to a listed entity, the same issue arises regarding whether the requirement to use $P \times Q$, without adjustment, to measure fair value applies.

Consistent with its proposal in relation to listed investments in subsidiaries, joint ventures and associates, the IASB proposed that, if the CGU corresponds to an entity whose financial instruments are quoted in an active market, the requirement to use $P \times Q$ would apply.

The exposure draft also included proposed clarifications for the portfolio exception, discussed in section 4.1.2 below.

The IASB proposed the following transition requirements:

- For quoted investments in subsidiaries, joint ventures and associates, an entity would recognise a cumulative catch-up adjustment to opening retained earnings for the period in which the proposed amendments are first applied. The entity would then recognise the change in measurement of the quoted investments during that period in profit or loss (i.e., retrospective application).
- For impairment testing in accordance with IAS 36, an entity would apply the requirements on a prospective basis. If an entity incurs an impairment loss or reversal during the period of initial application, it would provide quantitative information about the likely effect on the impairment loss, or reversal amount, had the amendments been applied in the immediately preceding period presented.

⁵ Exposure Draft [ED/2014/4: Measuring Quoted Investments in Subsidiaries, Joint Ventures and Associates at Fair Value: Proposed amendments to IFRS 10, IFRS 12, IAS 27, IAS 28, IAS 36 and Illustrative Examples for IFRS 13](#), IASB, September 2014. Available on the IFRS Foundation's website.

The exposure draft did not include a proposed effective date. However, permitting early adoption was proposed. Furthermore, the Board proposed that a first-time adopter of IFRS be able to apply the amendments at the beginning of the earliest period for which it presents full comparative information under IFRS in its first IFRS financial statements (i.e., prospectively from the date of the first-time adopter's transition to IFRS). The comment period for this exposure draft ended on 16 January 2015 and the Board began redeliberations in March 2015. During redeliberations, additional research was undertaken on fair value measurements of investments in subsidiaries, associates and joint ventures that are quoted in an active market and on the measurement of the recoverable amount of CGUs on the basis of fair value less costs of disposal when the CGU is an entity that is quoted in an active market.

Following the redeliberations, in its January 2016 meeting, the IASB concluded that the research would be fed into the PIR of IFRS 13.⁶ As part of its PIR of IFRS 13, the IASB specifically asked about prioritising Level 1 inputs in relation to the unit of account. The feedback was discussed at the IASB's March 2018 meeting. In respect of the valuation of quoted subsidiaries, associates and joint ventures, the PIR found that there were continuing differences in views between users and preparers over whether to prioritise Level 1 inputs or the unit of account. The issue is not pervasive in practice according to the PIR findings. However, respondents noted it can have a material effect when it does occur. Some stakeholders said that there are material differences between measuring an investment using the P×Q and a valuation using a method such as discounted cash flows. Respondents indicated the reasons for such differences include that share prices do not reflect market liquidity for the shares nor the value of control and/or synergies. A few respondents also noted that markets may lack depth and are, therefore, susceptible to speculative trading, asymmetrical information and other factors.⁷

As noted in section 1.3 above, the IASB released its Report and Feedback Statement on the PIR in December 2018. The Board decided not to conduct any follow-up activities as a result of findings from the PIR and stated, as an example, that it will not do any further work on the issue of unit of account versus P×Q because the costs of such work would outweigh the benefits for the following reasons:

- The Board's previous significant work on the topic and the PIR suggest the issue is narrow and affects only a limited population of entities.
- Users have not expressed major concerns with reporting in practice, although they would like better transparency.
- There are differences in views between preparers and users, meaning any follow-up work would be likely to require significant resource. Thus, this project may be possible only as part of a major amendment to IFRS 13 or other IFRS accounting standards.⁸

How we see it

In the absence of prescriptive guidance from the IASB, some diversity in practice will continue. The amendments the IASB had proposed in the exposure draft may assist preparers of financial statements in determining an appropriate accounting policy.

4.1.2 Unit of account and the portfolio exception

There is some debate about whether IFRS 13 prescribes the unit of account in relation to the portfolio exception. Under IFRS 13, a reporting entity that manages a group of financial assets and financial liabilities with offsetting risks on the basis of its net exposure to market or credit risks is allowed to measure the group based on the price that would be received to sell its net long position, or paid to transfer its net short position, for a particular risk (if certain criteria are met).

Some believe the portfolio exception in IFRS 13 specifies the unit of measurement for any financial instruments within the portfolio(s), i.e., that the net exposure of the identified group to a particular risk, and not the individual instruments within the group, represents the new unit of measurement. This may have a number of consequences. For example, the entity may be able to include premiums or discounts in the fair value measurement of the portfolio that are consistent with that unit of account, but not the individual instruments that make up the portfolio. In addition, because the net exposure for the identified group may not be actively traded (even though some financial instruments within the portfolio may be) P×Q may not be applied to the actively traded instruments within the portfolio.

⁶ [IASB Update](#), January 2016, available on the IFRS Foundation's website.

⁷ [IASB Staff Paper 7B](#): Project: *Post-implementation Review of IFRS 13 Fair Value Measurement*, Paper topic: *Background - Detailed analysis of feedback received*, IASB Meeting, March 2018; and [IASB Staff Paper 7D](#): Project: *Post-implementation Review of IFRS 13 Fair Value Measurement*, Paper topic: *Background - Prioritising Level 1 inputs or the unit of account*, IASB meeting, March 2018. Available on the IFRS Foundation's website.

⁸ [IFRS Project Report and Feedback Statement](#), *Post-implementation Review of IFRS 13 Fair Value Measurement*, IASB, December 2018, p.14. Available on the IFRS Foundation's website.

Others believe that the portfolio exception does not override the unit of account as provided in IFRS 9. Therefore, any premiums or discounts that are inconsistent with this unit of account, i.e., the individual financial instruments within the portfolio, would be excluded from the fair value measurement under the portfolio exception, including any premiums or discounts related to the size of the portfolio.

Regardless of which view is taken, it is clear in the standard that the portfolio exception does not change the financial statement presentation requirements (see section 11 below for further discussion on the portfolio exception and section 14.2 below for further discussion on premiums and discounts). In the US, ASC 820 has been interpreted by many as prescribing the unit of measurement when the portfolio exception is used. That is, when the portfolio approach is used to measure an entity's net exposure to a particular market risk or credit risk, the net position becomes the unit of measurement. This view is consistent with how many US financial institutions determined the fair value of their over-the-counter derivative portfolios prior to the amendments to ASC 820 (ASU 2011-04)⁹ (see Appendix D below). We understand that the IASB did not intend application of the portfolio exception to override the requirements in IFRS 13 regarding the use of P×Q to measure instruments traded in active markets and the prohibition on block discounts, which raises questions as to how the portfolio exception would be applied to Level 1 instruments.

In 2013, the IFRS IC referred a request to the Board on the interaction between the use of Level 1 inputs and the portfolio exception. The IASB noted that this issue had similarities with the issues of the interaction between the use of Level 1 inputs and the unit of account that arises when measuring the fair value of investments in listed subsidiaries, joint ventures and associates (see section 4.1.1 above). The IASB discussed this issue in December 2013, but only in relation to portfolios that comprise only Level 1 financial instruments whose market risks are substantially the same. For that specific circumstance, the Board tentatively decided that the measurement of such portfolios should be the one that results from multiplying the net position by the Level 1 prices (e.g., multiplying the net long or short position by the Level 1 price for either a gross long or short position). Given this tentative decision, in September 2014 the IASB proposed adding a non-authoritative example to illustrate the application of the portfolio exception in this specific circumstance.¹⁰ However, after reviewing the comments received on the proposal, the Board concluded that it was not necessary to add the proposed non-authoritative illustrative example to IFRS 13 (see section 11.2 below for further discussion) because the example would have been non-authoritative and the comments received did not reveal significant diversity in practice for the specific circumstance of portfolios that comprise only Level 1 financial instruments whose market risks are substantially the same.¹¹

4.1.3 Unit of account versus the valuation premise

In valuing non-financial assets, the concepts of 'unit of account' and 'valuation premise' are distinct, even though both concepts deal with determining the appropriate level of aggregation (or disaggregation) for assets and liabilities. The unit of account identifies what is being measured for financial reporting and drives the level of aggregation (or disaggregation) for presentation and disclosure purposes (e.g., whether categorisation in the fair value hierarchy is determined at the individual asset level or for a group of assets). Valuation premise is a valuation concept that addresses how a non-financial asset derives its maximum value to market participants, either on a stand-alone basis or through its use in combination with other assets and liabilities.

Since financial instruments do not have alternative uses and their fair values typically do not depend on their use within a group of other assets or liabilities, the concepts of highest and best use and valuation premise are not relevant for financial instruments. As a result, the fair value for financial instruments should be largely based on the unit of account prescribed by the standard that requires (or permits) the fair value measurement.

The distinction between these two concepts becomes clear when the unit of account of a non-financial asset differs from its valuation premise. Consider an asset (e.g., customised machinery) that was acquired other than by way of a business combination, along with other assets as part of an operating line. Although the unit of account for the customised machinery may be as a stand-alone asset (i.e., it is presented for financial reporting purposes at the individual asset level in accordance with IAS 16 *Property, Plant and Equipment*), the determination of the fair value of the machinery may be derived from its use with other assets in the operating line (see section 9.2 below for additional discussion on the concept of valuation premise).

4.2 Characteristics of the asset or liability

When measuring fair value, IFRS 13 requires an entity to consider the characteristics of the asset or liability. For example, age and miles flown are attributes to be considered in determining a fair value measure for an aircraft. Examples of such characteristics could include:

- The condition and location of an asset
- Restrictions, if any, on the sale or use of an asset or transfer of a liability (see sections 4.2.2, 9.1 and 10.4 below)

The fair value of the asset or liability must take into account those characteristics that market participants would take into consideration when pricing the asset or liability at the measurement date. [IFRS 13.11, IFRS 13.12]. For example, when valuing individual shares in an unlisted company, market participants might consider factors such as the nature of the company's operations; its performance to date and forecast future performance; and how the business is funded, including whether it is highly leveraged.

The requirement to consider the characteristics of the asset or liability being measured is not new to fair value measurement under IFRS. For example, prior to the issuance of IFRS 13, IAS 41 referred to measuring the fair value of a biological asset or agricultural produce in its present location and condition and IAS 40 stated that an entity should identify any differences between the investment property being measured at fair value and similar properties for which observable market prices are available and make the appropriate adjustments for those differences. [IFRS 13.BC46].

4.2.1 Condition and location

An asset may not be in the condition or location that market participants would require for its sale at an observable market price. In order to determine the fair value of the asset as it currently exists, the market price needs to be adjusted to the price market participants would be prepared to pay for the asset in its current condition and location. This includes deducting the cost of transporting the asset to the market if location is a characteristic of the asset being measured, and may include deducting the costs of converting or transforming the asset, as well as a normal profit margin.

For non-financial assets, condition and location considerations may influence, or be dependent on, the highest and best use of an asset (see section 9 below). That is, an asset's highest and best use may require an asset to be in a different condition. However, the objective of a fair value measurement is to determine the price for the asset in its current form. Therefore, if no market exists for an asset in its current form, but there is a market for the converted or transformed asset, an entity could adjust this market price for the costs a market participant would incur to re-condition the asset (after acquiring the asset in its current condition) and the compensation they would expect for the effort. Illustration 4-1 below provides an example of how costs to convert or transform an asset might be considered in determining fair value based on the current use of the asset.

Illustration 4-1: Adjusting fair value for condition and location

An entity owns a pine forest. The pine trees take approximately 25 years to mature, after which they can be cut down and sold. The average age of the trees in the forest is 14 years at the end of the reporting period. The current use of the forest is presumed to be its highest and best use.

There is no market for the trees in their current form. However, there is a market for the harvested timber from trees aged 25 years or older. To measure the fair value of the forest, the entity uses an income approach and uses the price for 25-year-old harvested timber in the market today as an input. However, since the trees are not yet ready for harvest, the cash flows must be adjusted for the costs a market participant would incur. Therefore, the estimated cash flows include costs to manage the forest (including silviculture activities, such as fertilising and pruning the trees) until the trees reach maturity; costs to harvest the trees; and costs to transport the harvested logs to the market. The entity estimates these costs using market participant assumptions. The entity also adjusts the value for a normal profit margin because a market participant acquiring the forest today would expect to be compensated for the cost and effort of managing the forest for the period (i.e., 11 years) before the trees will be harvested and the timber is sold (i.e., this would include compensation for costs incurred and a normal profit margin for the effort of managing the forest).

4.2.2 Restrictions on assets or liabilities

IFRS 13 indicates that the effect on fair value of a restriction on the sale or use of an asset will differ depending on whether the restriction is deemed to be a characteristic of the asset or the entity holding the asset. A restriction that would transfer with the asset in an assumed sale would generally be deemed a characteristic of the asset and, therefore, would likely be considered by market participants when pricing the asset. Conversely, a restriction that is specific to the entity holding the asset would not transfer with the asset in an assumed sale and, therefore, would not be considered when measuring fair value.

Determining whether a restriction is a characteristic of the asset or of the entity holding the asset may be contractual in some cases. In other cases, this determination may require judgement based on the specific facts and circumstances.

The following illustrative examples based on the standard highlight the distinction between restrictions that are characteristics of the asset and those of the entity holding the asset, including how this determination affects the fair value measurement. [IFRS 13.IE Example 8, IFRS 13.IE28, IFRS 13.IE Example 9, IFRS 13.IE29].

Restrictions on non-financial assets are discussed further in section 9 below.

Illustration 4-2: Restrictions on assets

An entity holds an equity instrument for which sale is legally restricted for a specified period. The restriction is a characteristic of the instrument that would transfer to market participants. As such, the fair value of the instrument would be measured based on the quoted price for an otherwise identical unrestricted equity instrument that trades in a public market, adjusted for the effect of the restriction. The adjustment would reflect the discount market participants would demand for the risk relating to the inability to access a public market for the instrument for the specified period. The adjustment would vary depending on:

- The nature and duration of the restriction
- The extent to which buyers are limited by the restriction
- Qualitative and quantitative factors specific to both the instrument and the issuer

Illustration 4-3: Entity-specific restrictions on assets

A donor of land specifies that the land must be used by a sporting association as a playground in perpetuity. Upon review of relevant documentation, the association determines that the donor's restriction would not transfer to market participants if the association sold the asset (i.e., the restriction on the use of the land is specific to the association). Furthermore, the association is not restricted from selling the land. Without the restriction on the use of the land, the land could be used as a site for residential development. In addition, the land is subject to an easement (a legal right that enables a utility to run power lines across the land).

Under these circumstances, the effect of the restriction and the easement on the fair value measurement of the land is as follows:

- (a) Donor restriction on use of land - The donor restriction on the use of the land is specific to the association and thus would not be transferred to market participants. Therefore, regardless of the restriction on the use of the land by the association, the fair value of the land would be measured based on the higher of its indicated value either:
 - (i) As a playground (i.e., the maximum value of the land is through its use in combination with other assets or with other assets and liabilities)
 - Or
 - (ii) As a residential development (i.e., the fair value of the asset would be maximised through its use by market participants on a stand-alone basis)
- (b) Easement for utility lines - Because the easement for utility lines is a characteristic of the land, this easement would be transferred to market participants with the land. The fair value of the land would include the effect of the easement, regardless of whether the land's valuation premise is as a playground or as a site for residential development.

In contrast to Illustration 4-2 above, Illustration 4-3 illustrates a restriction on the use of donated land that applies to a specific entity, but not to other market participants.

The calculation of the fair value should take account of any restrictions on the sale or use of an asset, if those restrictions relate to the asset rather than to the holder of the asset and the market participant would take those restrictions into account in his determination of the price that he is prepared to pay. For example, if a portion of a forest is restricted from harvest as part of a carbon capture scheme, this restriction would be considered as part of the fair value since it represents a characteristic of the asset (the forest) being measured.

A liability or an entity's own equity instrument may be subject to restrictions that prevent the transfer of the item. When measuring the fair value of a liability or equity instrument, IFRS 13 does not allow an entity to include a separate input (or an adjustment to other inputs) for such restrictions. This is because the effect of the restriction is either implicitly or explicitly included in other inputs to the fair value measurement. Restrictions on liabilities and an entity's own equity are discussed further in section 10.4 below.

IFRS 13 has different treatments for restrictions on assets and those over liabilities. The IASB believes this is appropriate because restrictions on the transfer of a liability relate to the performance of the obligation (i.e., the entity is legally obliged to satisfy the obligation and needs to do something to be relieved of the obligation), whereas restrictions on the transfer of an asset generally relate to the marketability of the asset. In addition, nearly all liabilities include a restriction preventing the transfer of the liability. In contrast, most assets do not include a similar restriction. As a result, the effect of a restriction preventing the transfer of a liability, theoretically, would be consistent for all liabilities and, therefore, would require no additional adjustment beyond the factors considered in determining the original transaction price. If an entity is aware that a restriction on the transfer of a liability is not already reflected in the price (or in the other inputs used in the measurement), it would adjust the price or inputs to reflect the existence of the restriction. [IFRS 13.BC99, IFRS 13.BC100]. However, this would be rare because nearly all liabilities include a restriction and, when measuring fair value, market participants are assumed by IFRS 13 to be sufficiently knowledgeable about the liability to be transferred.

Frequently asked questions

Question 4-2: In determining the fair value of a restricted security, is it appropriate to apply a constant discount percentage over the entire life of the restriction?

How we see it

We generally do not believe a constant discount percentage needs to be used to measure the fair value of a restricted security because market participants would consider the remaining time on the security's restriction and that time period changes from period to period. Market participants, for example, would generally not assign the same discount for a restriction that terminates in one month, as they would for a two-year restriction.

One approach to value the restriction may be through an option pricing model that explicitly incorporates the duration of the restriction and the characteristics of the underlying security. The principal economic factor underlying a discount for lack of marketability is the increased risk resulting from the inability to return the investment, quickly and efficiently, to a cash position (i.e., the risk of a price decline during the restriction period). One way in which the price of this risk may be determined is by using an option pricing model that estimates the value of a protective put option. For example, restricted or non-marketable securities are acquired along with a separate option that provides the holder with the right to sell those shares at the current market price for unrestricted securities. The holder of such an option has, in effect, purchased marketability for the shares. The value of the put option may be considered an estimate of the discount for the lack of marketability associated with the restricted security. Other techniques or approaches may also be appropriate in measuring the discount associated with restricted securities.

Question 4-3: Considerations when a restriction is present on a call option for its entire contractual life

In certain instances, there may be a legal restriction preventing sale for an asset's entire life. Consider the following example where an entity holds a call option to acquire a controlling stake in its associate. The call option is an integral part of the shareholders' agreement to acquire the associate and, therefore, cannot be sold or transferred to a third party. The call option is not currently exercisable and is, therefore, accounted for under IFRS 9 and measured at fair value. The call option is assumed to have a positive fair value because the strike price per share of the option is significantly lower than the fair value per share of the associate. The entity needs to consider whether and, if so, how the effect of this restriction should be incorporated into the measurement of fair value for the call option.

This restriction is contractually specified and is, therefore, considered a characteristic of the asset and would be considered by market participants when pricing the call option. Therefore, it must be considered when measuring the fair value of the call option.

To understand how the restriction should be incorporated into the fair value measurement, the entity needs to consider how market participants would view it. Unlike the situation in Illustration 4-2 above, the restriction is not for a portion of the instrument's life, but instead for the entire contractual life (i.e., until the option expires). In contrast to an investment in shares, market participant holders of a call option can realise the value of the option both through its sale and by exercising it. In this example, although there is a restriction on sale, there is no restriction on exercise. That is, the entity could assume that market participants would realise value from exercising the option. Therefore, in this example, no adjustment related to the sale restriction would be made to the fair value of the call option.

When considering what market participants would assume, an entity should not consider its own intentions. For example, the entity determines that in this case, the strategic risks or costs involved are too great to justify the decision to exercise the option to realise its value. As discussed in section 6.2 below, fair value must be determined from the perspective of a market participant. Therefore, the fair value would not be nil solely because the entity does not intend to exercise the option.

5 The principal (or most advantageous) market

A fair value measurement contemplates an orderly transaction to sell the asset or transfer the liability in either: *[IFRS 13.16]*

- The principal market for the asset or liability
- Or
- In the absence of a principal market, the most advantageous market for the asset or liability

IFRS 13 is clear that, if there is a principal market for the asset or liability, the fair value measurement represents the price in that market at the measurement date (regardless of whether that price is directly observable or estimated using another valuation technique). The price in the principal market must be used even if the price in a different market is potentially more advantageous. *[IFRS 13.18]*. This is illustrated in Illustration 5-1 below, adapted from Example 6 in the standard. *[IFRS 13.IE Example 6, IFRS 13.IE19, IFRS 13.IE20]*.

Illustration 5-1: Determining the principal market

An asset is sold in two different active markets at different prices. An entity enters into transactions in both markets and can access the price in those markets for the asset at the measurement date.

	Market A	Market B
	CU	CU
Price that would be received	26	25
Transaction costs in that market	(3)	(1)
Costs to transport the asset to the market	(2)	(2)
Net amount that would be received	21	22

If Market A is the principal market for the asset (i.e., the market with the greatest volume and level of activity for the asset), the fair value of the asset would be measured using the price that would be received in that market, even though the net proceeds in Market B are more advantageous. In this case, the fair value would be CU24, after taking into account transport costs excluding transactions costs.

The identification of a principal (or most advantageous) market could be impacted by whether there are observable markets for the item being measured. However, even where there is no observable market, fair value measurement assumes a transaction takes place at the measurement date. The assumed transaction establishes a basis for estimating the price to sell the asset or to transfer the liability. *[IFRS 13.21]*.

5.1 The principal market

The principal market is the market for the asset or liability that has the greatest volume or level of activity for the asset or liability. *[IFRS 13 Appendix A]*. There is a general presumption that the principal market is the one in which the entity would normally enter into a transaction to sell the asset or transfer the liability, unless there is evidence to the contrary. In practice, an entity would first consider the markets it can access. Then it would determine which of those markets has the greatest volume and liquidity in relation to the particular asset or liability. *[IFRS 13.17]*.

Management is not required to perform an exhaustive search to identify the principal market; however, it cannot ignore evidence that is reasonably available when considering which market has the greatest volume and level of activity. *[IFRS 13.17]*. For example, it may be appropriate to take into account information available in trade journals, if reliable market information about volumes transacted is available in such journals. Absent evidence to the contrary, the principal market is presumed to be the market in which an entity normally enters into transactions for the asset and liability.

The principal market is considered from the perspective of the reporting entity, which means that the principal market could be different for different entities (this is discussed further in Question 5-1 below). For example, a securities dealer may exit a financial instrument by selling it in the inter-dealer market, while a manufacturing company would sell a financial instrument in the retail market. The entity must be able to access the principal market as at the measurement date. Therefore, continuing with our example, it would not be appropriate for a manufacturing company to assume that it would transact in the inter-dealer market (even when considering a hypothetical transaction) because the company does not have access to this market.

Because IFRS 13 indicates that the principal market is determined from the perspective of the reporting entity, some have questioned whether the principal market should be determined on the basis of: (a) entity-specific volume (i.e., the market where the reporting entity has historically sold, or intends to sell, the asset with the greatest frequency and volume); or (b) market-based volume and activity. However, IFRS 13 is clear that the principal market for an asset or liability should be determined based on the market with the greatest volume and level of activity that the reporting entity can access. It is not determined based on the volume or level of activity of the reporting entity's transactions in a particular market. That is, the determination as to which market(s) a particular entity can access is entity-specific, but once the accessible markets are identified, market-based volume and activity determine the principal market. [IFRS 13.BC52].

The recognition in IFRS 13 that different entities may sell identical instruments in different markets (and therefore at different exit prices) has important implications, particularly with respect to the initial recognition of certain financial instruments, such as derivatives. For example, a derivative contract between a dealer and a retail customer would likely be initially recorded at different fair values by the two entities, as they would exit the derivative in different markets and, therefore, at different exit prices. Day one gains and losses are discussed further in section 12.2 below.

Although an entity must be able to access the market at the measurement date, IFRS 13 does not require an entity to be able to sell the particular asset or transfer the particular liability on that date. [IFRS 13.20]. For example, if there is a restriction on the sale of the asset, IFRS 13 simply requires that the entity be able to access the market for that asset when that restriction ceases to exist. It is important to note that the existence of the restriction may still affect the price a market participant would pay (see section 4.2.2 above for discussion on restrictions on assets and liabilities).

In general, the market with the greatest volume and deepest liquidity will probably be the market in which the entity most frequently transacts. In these instances, it is likely that the principal market would be the same as the most advantageous market (see section 5.2 below).

Prior to the adoption of IFRS 13, some entities determined fair value based solely on the market where they transact with the greatest frequency (without considering other markets with greater volume and deeper liquidity). As noted above, IFRS 13 requires an entity to consider the market with the greatest volume and deepest liquidity for the asset. Therefore, an entity cannot presume a commonly used market is the principal market. For example, if an entity previously measured the fair value of agricultural produce based on its local market, but there is a deeper and more liquid market for the same agricultural produce (for which transportation costs are not prohibitive), the latter market would be deemed the principal market and would be used when measuring fair value.

In a speech¹², a member of the SEC staff highlighted the importance of determining the principal or most advantageous market because it drives the identification of market participants and the set of information and assumptions that a market participant would use in determining fair value. While traditional markets (e.g., equities, commodities) have a limited number of transaction venues, the staff member noted that this is not necessarily the case for crypto assets due to the evolving nature of the crypto markets. He highlighted that characteristics such as pricing, regulatory oversight, and the general availability and reliability of information vary across different crypto assets and entities. As a result, thought is required when determining fair value for crypto assets.

12 Remarks by Gaurav Hiranandani, Senior Associate Chief Accountant, SEC Office of the Chief Accountant, 4 December 2024. Refer to our publication, [2023 AICPA & CIMA Conference on Current SEC and PCAOB Developments - Compendium of significant accounting and reporting issues](#), available on Accounting Link.

Frequently asked questions

Question 5-1: Can an entity have more than one principal market for the same asset or liability?

IFRS 13 states that “because different entities (and businesses within those entities) with different activities may have access to different markets, the principal (or most advantageous) market for the same asset or liability might be different for different entities (and businesses within those entities). Therefore, the principal (or most advantageous) market (and thus, market participants) shall be considered from the perspective of the entity, thereby allowing for differences between and among entities with different activities.” [IFRS 13.19].

Therefore, in certain instances it may be appropriate for a reporting entity to determine that it has different principal markets for the same asset or liability. However, such a determination would need to be based on the reporting entity’s business units engaging in different activities to ensure they were accessing different markets.

How we see it

Determining the principal market is not based on management’s intent. Therefore, we would not expect a reporting entity to have different principal markets for identical assets held within a business unit solely because management has different exit strategies for those assets.

Consider Illustration 5-2 below, in which multiple exit markets exist for an asset and the reporting entity has access to all of the various exit markets. The fact that a reporting entity (or business unit within a reporting entity) has historically exited virtually identical assets in different markets does not justify the entity utilising different exit markets in determining the fair value of these assets, unless the entity has different business units engaging in different activities. Instead, the concept of a principal market (and most advantageous market) implies that one consistent market should generally be considered in determining the fair value of these identical assets.

Illustration 5-2: Determining the principal market - consistent principal market

The following three markets exist for a particular asset. The company has the ability to transact in all three markets (and has historically done so).

Market	Price
A	CU30,000
B	CU25,000
C	CU22,000

Under the principal market concept, it would not be appropriate to value identical assets at different prices solely because management intends to sell the assets in different markets. Likewise, a consistent fair value measurement for each asset utilising a blended price that is determined based on the proportion of assets that management intends to sell in each market would not be appropriate. Instead, each of the assets would be measured at the price in the market determined to be the company’s principal market.

If Market B were determined to represent the principal market for the asset being measured, each asset would be valued at CU25,000. Selling the assets in either Market A or Market C would result in a gain or loss for the company. We believe this result is consistent with one of the fundamental concepts in the fair value framework. That is, the consequences of management’s decisions (or a company’s comparative advantages or disadvantages) should be recognised when those decisions are executed (or those advantages or disadvantages are achieved).

Question 5-2: In situations where an entity has access to multiple markets, is the determination of the principal market based on entity-specific volume and activity or market-based volume and activity?

In most instances, the market in which a reporting entity would sell an asset (or transfer a liability) with the greatest frequency will also represent the market with the greatest volume and deepest liquidity for all market participants. In these instances, the principal market would be the same regardless of whether it is determined based on entity-specific volume and activity or market-based volume and activity. However, when this is not the case, a reporting entity’s principal market is determined using market-based volume.

Different entities engage in different activities. Therefore, some entities have access to certain markets that other entities do not. For example, an entity that does not function as a wholesaler would not have access to the wholesale market and, therefore, would need to look to the retail market as its principal market.

Once the markets to which a particular entity has access have been identified, the determination of the principal market is not based on management's intent or entity-specific volume, but rather it is based on the market with the greatest volume and level of activity for the asset or liability. [IFRS 13.19].

Illustration 5-3: Determining the principal market - market-based versus entity-specific volume

The following three markets exist for Entity A's fleet of vehicles. Entity A has the ability to transact in all three markets (and has historically done so). As at the measurement date, the entity has 100 vehicles (same make, model and mileage) that it needs to measure at fair value. Volumes and prices in the respective markets are as follows:

Market	Price	The entity's volume for the asset in the market (based on history and/or intent)	Total market-based volume for the asset
A	CU30,000	60%	15%
B	CU25,000	25%	75%
C	CU22,000	15%	10%

Based on this information, Market B would be the principal market as this is the market in which the majority of transactions for the asset occur. As such, the fair value of the 100 cars as at the measurement date would be CU2.5 million (i.e., CU25,000 per car). Actual sales of the assets in either Market A or C would result in a gain or loss to the entity, i.e., when compared to the fair value of CU25,000.

5.2 The most advantageous market

As noted above, if there is a principal market for the asset or liability being measured, fair value is determined using the price in that market, even if the price in a different market is more advantageous at the measurement date.

Only in situations where there is no principal market for the asset or liability being measured, can an entity consider the most advantageous market. [IFRS 13.16].

The most advantageous market is the one that maximises the amount that would be received to sell the asset or minimises the amount that would be paid to transfer the liability, after considering transaction costs and transport costs. [IFRS 13 Appendix A].

This definition reasonably assumes that most entities transact with an intention to maximise profits or net assets. Assuming economically rational behaviour, the IASB observed that the principal market would generally represent the most advantageous market. However, when this is not the case, the IASB decided to prioritise the price in the most liquid market (i.e., the principal market) as this market provides the most representative input to determine fair value and also serves to increase consistency among reporting entities. [IFRS 13.BC52].

When determining the most advantageous market, an entity must take into consideration the transaction costs and transportation costs it would incur to sell the asset or transfer the liability. The market that would yield the highest price after deducting these costs is the most advantageous market. This is illustrated in Illustration 5-4, adapted from Example 6 in the standard. [IFRS 13.IE Example 6, IFRS 13.IE19, IFRS 13.IE20, IFRS 13.IE21, IFRS 13.IE22].

Illustration 5-4: Determining the most advantageous market

Consider the same facts as in Illustration 5-1 above. If neither market is the principal market for the asset, the fair value of the asset would be measured using the price in the most advantageous market.

The most advantageous market is the market that maximises the amount that would be received to sell the asset, after taking into account transaction costs and transport costs (i.e., the net amount that would be received in the respective markets).

	Market A	Market B
	CU	CU
Price that would be received	26	25
Transaction costs in that market	(3)	(1)
Costs to transport the asset to the market	(2)	(2)
Net amount that would be received	21	22

Because the entity would maximise the net amount that *would be received* for the asset in Market B (CU22), that is the most advantageous market. Market B is the most advantageous market even though the fair value that would be recognised in that market ($CU23 = CU25 - CU2$) is lower than in Market A ($CU24 = CU26 - CU2$).

It is important to note that, while transaction costs and transportation costs are considered in determining the most advantageous market, the treatment of these costs in relation to measuring fair value differs (transaction costs and transportation costs are discussed further in section 8 below).

6 Market participants

When measuring fair value, an entity is required to use the assumptions that market participants would use when pricing the asset or liability. However, IFRS 13 does not require an entity to identify specific market participants. Instead, an entity must identify the characteristics of market participants that would generally transact for the asset or liability being measured. Determining these characteristics takes into consideration factors that are specific to the asset or liability; the principal (or most advantageous) market; and the market participants in that market. [IFRS 13.22, IFRS 13.23]. This determination, and how these characteristics affect a fair value measurement, may require significant judgement.

The principal (or most advantageous) market is determined from the perspective of the reporting entity (or business units within a reporting entity). As a result, other entities within the same industry as the reporting entity will most likely be considered market participants. However, market participants may come from outside of the reporting entity's industry, especially when considering the fair value of assets on a stand-alone basis. For example, a residential real estate development entity may be considered a market participant when measuring the fair value of land held by a manufacturing company if the highest and best use of the land is deemed to be residential real estate development.

Entities may need to re-assess the market or market participant characteristics if facts and circumstances change; for example, with the gradual decline in demand for diesel, market participants may lose their ability to sell products in the diesel market and turn to alternative markets.

6.1 Characteristics of market participants

IFRS 13 defines market participants as "buyers and sellers in the principal (or most advantageous) market for the asset or liability". [IFRS 13 Appendix A].

IFRS 13 assumes that market participants have all of the following characteristics: [IFRS 13 Appendix A, IFRS 13.BC55-BC59]

- They are independent of each other, that is, they are not related parties, as defined in IAS 24 *Related Party Disclosures* (see Chapter 35)
- They are knowledgeable, having a reasonable understanding about the asset or liability using all available information, including information obtained through usual and customary due diligence efforts
- They are able to enter into a transaction for the asset or liability
- They are willing to enter into a transaction for the asset or liability, that is, they are motivated but not forced or otherwise compelled to do so

Since market participants are independent of each other, the hypothetical transaction is assumed to take place between market participants at the measurement date, not between the reporting entity and another market participant. While market participants are not related parties, the standard does allow the price in a related party transaction to be used as an input in a fair value measurement provided the entity has evidence the transaction was entered into at market terms. [IFRS 13.BC57].

Market participants in the principal (or most advantageous) market should have sufficient knowledge about the asset or liability for which they are transacting. The appropriate level of knowledge does not necessarily need to come from publicly available information, but could be obtained in the course of a normal due diligence process.

When determining potential market participants, certain characteristics should be considered. These include the legal capability and the operating and financial capacity to purchase the asset or assume the liability. Market participants must have both the willingness and the ability to transact for the item being measured. For example, when measuring the fair value less costs of disposal of a CGU, as part of testing the CGU for impairment in accordance with IAS 36, the market participants considered in the analysis should be in both a financial and operating position to purchase the CGU.

6.2 Market participant assumptions

IFRS 13 specifies that fair value is not the value specific to one entity, but rather is meant to be a market-based measurement. If market participants would consider adjustments for the inherent risk of the asset or liability or consider the risk in the valuation technique used to measure fair value, then such risk adjustments should be considered in the fair value assumptions. For example, when measuring the fair value of certain financial instruments, market participants may include adjustments for liquidity, climate-related risks, uncertainty and/or non-performance risk.

Fair value is not the value specific to the reporting entity and it is not the specific value to one market participant whose risk assessment or specific synergies may differ from other market participants. The reporting entity needs to consider those factors that market participants, in general, would consider. Fair value is not measured based on a single market participant's assumptions or their specific intent or use of the asset or liability. To illustrate, assume a single market participant, Market Participant A, is willing to pay a higher price for an asset than the remaining market participants, due to specific synergies that only Market Participant A could achieve. In such a situation, fair value would not be the price that Market Participant A would be willing to pay for the asset. Instead, fair value would be the price that typical market participants would pay for the asset.

The underlying assumptions used in a fair value measurement are driven by the characteristics of the market participants who would transact for the item being measured and the factors those market participants would consider when pricing the asset or liability. Importantly, IFRS 13 notes that fair value is based on assumptions that market participants acting in their 'economic best interest' would use when pricing an asset or liability. [IFRS 13.22]. That is, market participants are assumed to transact in a manner that is consistent with the objective of maximising the value of their business, their net assets or profits. In certain instances, this may result in market participants considering premiums or discounts (e.g., control premiums or discounts for lack of marketability) when determining the price at which they would transact for a particular asset or liability (see section 14.2 below for additional discussion on the consideration of premiums and discounts in a fair value measurement). For example, a market participant may factor a discount into the valuation of a fossil fuel asset in relation to climate-risk.

In situations where market observable data is not available, the reporting entity can use its own data as a basis for its assumptions. This might be relevant to climate-related variables which an entity may factor into the value of its assets although inputs are largely unobservable at this stage. However, adjustments need to be made to the entity's own data if readily available market data indicates that market participant assumptions would differ from the assumptions specific to that reporting entity (see section 18 below for further discussion regarding Level 3 inputs). With the global drive towards increased transparency in relation to climate-related risks, for example, the recent publication of IFRS S2 Climate-related Disclosures by the International Sustainability Standards Board (ISSB), more information will be available to market participants when valuations are undertaken. Determining the impact of that information on market participant assumptions, inputs and sensitivities, is likely to require significant judgement. For example, a 'green' building could command a rental premium, however, judgement would be required in determining whether the premium is due to the green qualities of the building or due to other factors such as the building's location.

The intended use and risk assumptions for an asset or asset group may differ among market participants transacting in the principal market for the asset. For example, the principal market in which the reporting entity would transact may contain both strategic and financial buyers. Both types of buyers would be considered in determining the characteristics of market participants; however, the fair value measurement of an asset may differ among these two types of market participants. The following example from the standard illustrates this point. [IFRS 13.IE Example 1, IFRS 13.IE3, IFRS 13.IE4, IFRS 13.IE5, IFRS 13.IE6].

Extract from IFRS 13**Example 1-Asset group**

An entity acquires assets and assumes liabilities in a business combination. One of the groups of assets acquired comprises Assets A, B and C. Asset C is billing software integral to the business developed by the acquired entity for its own use in conjunction with Assets A and B (ie the related assets). The entity measures the fair value of each of the assets individually, consistently with the specified unit of account for the assets. The entity determines that the highest and best use of the assets is their current use and that each asset would provide maximum value to market participants principally through its use in combination with other assets or with other assets and liabilities (ie its complementary assets and the associated liabilities). There is no evidence to suggest that the current use of the assets is not their highest and best use.

In this situation, the entity would sell the assets in the market in which it initially acquired the assets (ie the entry and exit markets from the perspective of the entity are the same). Market participant buyers with whom the entity would enter into a transaction in that market have characteristics that are generally representative of both strategic buyers (such as competitors) and financial buyers (such as private equity or venture capital firms that do not have complementary investments) and include those buyers that initially bid for the assets. Although market participant buyers might be broadly classified as strategic or financial buyers, in many cases there will be differences among the market participant buyers within each of those groups, reflecting, for example, different uses for an asset and different operating strategies.

As discussed below, differences between the indicated fair values of the individual assets relate principally to the use of the assets by those market participants within different asset groups:

- (a) **Strategic buyer asset group.** The entity determines that strategic buyers have related assets that would enhance the value of the group within which the assets would be used (ie market participant synergies). Those assets include a substitute asset for Asset C (the billing software), which would be used for only a limited transition period and could not be sold on its own at the end of that period. Because strategic buyers have substitute assets, Asset C would not be used for its full remaining economic life. The indicated fair values of Assets A, B and C within the strategic buyer asset group (reflecting the synergies resulting from the use of the assets within that group) are CU360,¹ CU260 and CU30, respectively. The indicated fair value of the assets as a group within the strategic buyer asset group is CU650.
- (b) **Financial buyer asset group.** The entity determines that financial buyers do not have related or substitute assets that would enhance the value of the group within which the assets would be used. Because financial buyers do not have substitute assets, Asset C (ie the billing software) would be used for its full remaining economic life. The indicated fair values of Assets A, B and C within the financial buyer asset group are CU300, CU200 and CU100, respectively. The indicated fair value of the assets as a group within the financial buyer asset group is CU600.

The fair values of Assets A, B and C would be determined on the basis of the use of the assets as a group within the strategic buyer group (CU360, CU260 and CU30). Although the use of the assets within the strategic buyer group does not maximise the fair value of each of the assets individually, it maximises the fair value of the assets as a group (CU650).

¹ In these examples, monetary amounts are denominated in 'currency units (CU)'.

The example above illustrates that the principal (or most advantageous) market for an asset group may include different types of market participants (e.g., strategic and financial buyers), who would make different assumptions in pricing the assets.

When there are two or more different types of market participants that would transact for the asset, or the asset group, separate fair value estimates of the assets should generally be performed for each type of market participant in order to identify which type of market participant (and the appropriate related assumptions) should be considered in the fair value measurement.

In each of these analyses, the intended use of the asset and any resulting market participant synergies are considered. These include synergies among the assets in the asset grouping and synergies in combination with other assets held by (or available to) market participants generally. The selection of the appropriate market participants is based on the type of market participants that generate the maximum value for the asset group, in aggregate.

This is illustrated in Example 1 in the standard (in the extract above). Fair value would be measured by reference to assumptions made by the Strategic Buyer because the fair value of the group of assets (CU650) exceeds that of the Financial Buyer (CU600). Consequently, the fair value of the individual assets within the asset grouping would be estimated based on the indicated values related to the market participants with the highest overall value for the asset grouping. In other words, once the assets are appropriately grouped based on their valuation premise, they should be valued using a consistent set of assumptions (i.e., the assumptions for the same type of market participants and the same related use). As shown in the example, this is true even though the fair value measurement of a specific asset, Asset C in the example, is deemed to be higher for the Financial Buyer.

Example 1 (in the extract above) also highlights the interdependence between the key concepts within the IFRS 13 fair value framework. Understanding the interrelationships between market participants, exit market and the concepts of valuation premise and highest and best use is important when measuring the fair value of non-financial assets (the concepts of 'valuation premise' and 'highest and best use' are discussed in section 9 below).

In the example, the indicated value for the assets as a group is determined based on the valuation premise (i.e., their use in combination with other assets) and market participant assumptions that would maximise the value of the asset group as a whole (i.e., assumptions consistent with strategic buyers). The valuation premise for Assets A, B and C is based on their use in combination with each other (or with other related assets and liabilities held by or available to market participants), consistent with the highest and best use of these assets.

The example also highlights the distinction between the unit of account (i.e., what is being measured and presented for financial reporting purposes) and the valuation premise, which forms the basis of how assets are grouped for valuation purposes (i.e., as a group or on a stand-alone basis). The unit of account may be the individual assets (i.e., Asset A, separate from Asset B and Asset C), but the valuation premise is the asset group comprised of Assets A, B and C. Therefore, the indicated value of the assets in combination (CU650) must be attributed to the assets based on their unit of account, resulting in the fair value measurement to be used for financial reporting purposes.

7 The transaction

As at the measurement date, the transaction to sell an asset or transfer a liability is, by definition, a hypothetical transaction for the particular asset or liability being measured at fair value. If the asset had actually been sold or the liability actually transferred as at the measurement date, there would be no asset or liability for the reporting entity to measure at fair value.

IFRS 13 assumes this hypothetical transaction will take place in the principal (or most advantageous) market (see section 5 above) and will: [IFRS 13.15]

- Be orderly in nature
- Take place between market participants that are independent of each other, but knowledgeable about the asset or liability (see section 6 above for additional discussion on market participants)
- Take place under current market conditions
- Occur on the measurement date

These assumptions are critical in ensuring that the estimated exit price in the hypothetical transaction is consistent with the objective of a fair value measurement. For example, the concept of an orderly transaction is intended to distinguish a fair value measurement from the exit price in a distressed sale or forced liquidation. Unlike a forced liquidation, an orderly transaction assumes that the asset or liability is exposed to the market prior to the measurement date for a period that is usual and customary to allow for information dissemination and marketing. That is, the hypothetical transaction assumes that market participants have sufficient knowledge and awareness of the asset or liability, including that which would be obtained through customary due diligence even if, in actuality, this process may not have begun yet (or may never occur at all, if the entity does not sell the asset or transfer the liability).

The hypothetical transaction between market participants does not consider whether management actually intends to sell the asset or transfer the liability at the measurement date; nor does it consider the reporting entity's ability to enter into the transaction on the measurement date. [IFRS 13.20]. To illustrate, consider a hypothetical transaction to sell a security that, due to a restriction, cannot be sold as at the measurement date. Although the restriction may affect the measurement of fair value, it does not preclude the entity from assuming a hypothetical transaction to sell the security (see section 4.2.2 above for further discussion on restrictions).

An orderly transaction assumes there will be adequate market exposure, so that market participants would be sufficiently knowledgeable about the asset or liability. This does not mean the hypothetical exchange takes place at some point in the future. A fair value measurement considers market conditions as they exist at the measurement date and is intended to represent the current value of the asset or liability, not the potential value of the asset or liability at some future date. The transaction is therefore assumed to take place on the measurement date and the entity assumes that the marketing activities and due diligence activities have already been performed. For example, assume an entity is required to re-measure an asset to fair value at its reporting date of 31 December 2022. The customary marketing activities and due diligence procedures required for the asset to be sold take six months. The asset's fair value should not be based on the price the entity expects to receive for the asset in June 2023. Instead, it must be determined based on the price that would be received if the asset were sold on 31 December 2022, assuming adequate market exposure had already taken place.

Although a fair value measurement contemplates a price in an assumed transaction, pricing information from actual transactions for identical or similar assets and liabilities is considered in measuring fair value. IFRS 13 establishes a fair value hierarchy (discussed in section 15 below) to prioritise the inputs used to measure fair value, based on the relative observability of those inputs. The standard requires that valuation techniques maximise the use of observable inputs and minimise the use of unobservable inputs. As such, even in situations where the market for a particular asset is deemed to be inactive (e.g., due to liquidity issues), relevant prices or inputs from this market should still be considered in the measurement of fair value. It would not be appropriate for an entity to default solely to a model's value based on unobservable inputs (a Level 3 measurement), when Level 2 information is available. Judgement is required in assessing the relevance of observable market data to determine the priority of inputs under the fair value hierarchy, particularly in situations where there has been a significant decrease in market activity for an asset or liability, as discussed in section 7.1 below.

Assessing whether a transaction is orderly can require significant judgement. The Boards believe this determination can be more difficult if there has been a significant decrease in the volume or level of activity for the asset or liability in relation to normal market activity. As such, IFRS 13 provides various factors to consider when assessing whether there has been a significant decrease in the volume or level of activity in the market (see section 7.1 below) as well as circumstances that may indicate that a transaction is not orderly (see section 7.2 below). Making these determinations is based on the weight of all available evidence. [IFRS 13.B43].

7.1 Evaluating whether there has been a significant decrease in the volume and level of activity for an asset or liability

There are many reasons why the trading volume or level of activity for a particular asset or liability may decrease significantly. For example, shifts in supply and demand dynamics, changing levels of investors' risk appetites and liquidity constraints of key market participants could all result in a significant reduction in the level of activity for certain items or class of items. While determining fair value for any asset or liability that does not trade in an active market often requires judgement, the application guidance in IFRS 13 is primarily focused on assets and liabilities in markets that have experienced a significant reduction in volume or activity. Prior to a decrease in activity, a market approach is often the primary valuation approach used to estimate fair value for these items, given the availability and relevance of observable data. Under a market approach, fair value is based on prices and other relevant information generated by market transactions involving assets and liabilities that are identical or comparable to the item being measured. As transaction volume or activity for the asset decreases significantly, application of the market approach can prove more challenging and the use of additional valuation techniques may be warranted.

The objective of a fair value measurement remains the same even when there has been a significant decrease in the volume or level of activity for the asset or liability. IFRS 13.B37 provides a number of factors that should be considered when evaluating whether there has been a significant decrease in the volume or level of activity for the asset or liability. [IFRS 13.B37].

Extract from IFRS 13

- B37** The fair value of an asset or a liability might be affected when there has been a significant decrease in the volume or level of activity for that asset or liability in relation to normal market activity for the asset or liability (or similar assets or liabilities). To determine whether, on the basis of the evidence available, there has been a significant decrease in the volume or level of activity for the asset or liability, an entity shall evaluate the significance and relevance of factors such as the following:
- (a) There are few recent transactions.
 - (b) Price quotations are not developed using current information.
 - (c) Price quotations vary substantially either over time or among market-makers (eg some brokered markets).
 - (d) Indices that previously were highly correlated with the fair values of the asset or liability are demonstrably uncorrelated with recent indications of fair value for that asset or liability.
 - (e) There is a significant increase in implied liquidity risk premiums, yields or performance indicators (such as delinquency rates or loss severities) for observed transactions or quoted prices when compared with the entity's estimate of expected cash flows, taking into account all available market data about credit and other non-performance risk for the asset or liability.
 - (f) There is a wide bid-ask spread or significant increase in the bid-ask spread.
 - (g) There is a significant decline in the activity of, or there is an absence of, a market for new issues (ie a primary market) for the asset or liability or similar assets or liabilities.
 - (h) Little information is publicly available (eg for transactions that take place in a principal-to-principal market).

These factors are not intended to be all-inclusive and should be considered along with any additional factors that are relevant based on the individual facts and circumstances. Determining whether the asset or liability has experienced a significant decrease in activity is based on the weight of the available evidence.

IFRS 13 is clear that a decrease in the volume or level of activity, on its own, does not necessarily indicate that a transaction price or quoted price does not represent fair value or that a transaction in that market is not orderly. Additional analysis is required in these instances to assess the relevance of observed transactions or quoted prices in these markets. When market volumes decrease, adjustments to observable prices (which could be significant) may be necessary (see section 7.3 below). As discussed in section 15 below, an adjustment based on unobservable inputs that is significant to the fair value measurement in its entirety would result in a Level 3 measurement. Observed prices associated with transactions that are not orderly would not be deemed to be representative of fair value. As part of the PIR feedback some respondents highlighted this as an issue where additional guidance is required, however as noted in section 1.3 above the IASB has decided that no follow-up actions will be undertaken. In their view, the requirements are principle-based, and there will always be a need for exercise of judgement, the challenges raised are detailed valuation assessments and an accounting standard-setter may not be best placed to provide guidance in this area. Lastly, there is evidence of practice having developed guidance to aid these assessments. Those aids are used by some and promote consistent application.

7.1.1 Can a market exhibit a significant decrease in volume or level of activity and still be considered active?

A significant decrease in the volume of transactions does not automatically imply that a market is no longer active. IFRS 13 defines a market as active if transactions for the asset or liability occur with sufficient frequency and volume to provide pricing information on an ongoing basis. While the same factors may be used to assess whether a market has experienced a significant decrease in activity and to determine whether a market is active or inactive, these are separate and distinct determinations.

The determination that a market has experienced a significant decrease in volume does not change the requirements of IFRS 13 related to the use of relevant observable data from active markets. That is, despite a decrease from recent (or historical) levels of activity, transactions for an asset or liability in a particular market may still occur with sufficient frequency and volume to provide pricing information on an ongoing basis, thereby qualifying as an active market. If there has been a significant decrease in activity, but a market is still deemed to be active, entities would continue to measure the fair value of identical instruments that trade in this market using P×Q (Level 1 measurement).

An example of this is related to 2011 trading activity for Greek sovereign bonds. During that calendar year, the economic situation in Greece had deteriorated and some had questioned whether the Greek sovereign bonds were still being actively traded. In a public statement, ESMA indicated that, “Based on trading data obtained from the Bank of Greece, it [was their] opinion that, as of 30 June 2011, the market was active for some Greek sovereign bonds but could be judged inactive for some others.”¹³ While ESMA provided no predictions about the level of trading activity as at 31 December 2011, ESMA clearly stated their expectation that a fair value measurement of Greek sovereign bonds, in interim and annual financial statements during 2011 should be a Level 1 measurement in situations where there was still an active market. Furthermore, ESMA expected entities to use a Level 2 measurement method that maximises the use of observable market data to measure the fair value of those bonds that were traded in inactive markets.

Similarly, securities trading sanctions with the consequence of restricting trades in the affected markets could lead to questions on whether those markets remain active.

Determining whether a particular market is considered liquid or active versus illiquid or inactive may require significant judgement and consider a variety of factors (e.g., what the bid-ask spread represents, how deep the bid-ask spread has to be to signal an inactive market, what is the sufficient level of trade volume to signify an active market). This can be particularly challenging in emerging markets.

While traditionally, the focus of such assessments has been public markets and listed securities, an active market is not confined to regulated markets and listed securities. We have observed that sometimes trading in unlisted securities may be more active than in some listed securities.¹⁴ In its 2008 report, the IASB Expert Advisory Panel noted “There is no bright line between active markets and inactive markets. However, the biggest distinction between prices observed in active markets and prices observed in inactive markets is typically that, for inactive markets, an entity needs to put more work into the valuation process to gain assurance that the transaction price provides evidence of fair value or to determine the adjustments to transaction prices that are necessary to measure the fair value of the instrument.

“The issue to be addressed, therefore, is not about market activity *per se*, but about whether the transaction price observed represents fair value. Characteristics of an inactive market include a significant decline in the volume and level of trading activity, the available prices vary significantly over time or among market participants or the prices are not current. However, these factors alone do not necessarily mean that a market is no longer active. An active market is one in which transactions are taking place regularly on an arm’s length basis. What is ‘regularly’ is a matter of judgement and depends upon the facts and circumstances of the market for the instrument being measured at fair value”.¹⁵

13 European Securities and Markets Authority public statement [ESMA/2011/397](#), *Sovereign Debt in IFRS Financial Statements*, issued in November 2011.

14 Financial Times article, *Value of private companies hits high of \$490bn as tech start-ups shun markets*, 29 May 2017: “...said Peter Christiansen, a former Blackrock director who now heads research at Scenic. “We expect the trend will be towards private markets looking more and more like the public markets.”

15 [Report of the IASB Expert Advisory Panel](#): *Measuring and disclosing the fair value of financial instruments in markets that are no longer active*, IASB, October 2008, paragraphs 17-18. Available on the IFRS Foundation’s website.

Similar challenges exist for entities assessing whether a market is active for thinly traded investments. While trading volumes may be low, it may be challenging to conclude a market is not active when it regularly provides pricing information. For example, IAS 38 *Intangible Assets* mentions that an active market may exist for taxi licences and production quotas. [IAS 38.78]. These may not be traded every day suggesting that the threshold for an active market is fairly low. However, this may be particularly difficult in some emerging markets, therefore, significant judgement will be needed to assess whether a market is active based on the weight of evidence available.

Determining whether a market is active may be more challenging if regulators challenge an entity's judgement. For example, in its July 2015 enforcement report, ESMA noted that, in order to assess the existence of an active market, the entity had "calculated a number of ratios and compared them against the following benchmarks:

- daily % of average value of trades / capitalisation lower than 0.05%;
- daily equivalent value of trades lower than CU50,000;
- daily bid-ask spread higher or equal to 3%;
- maximum number of consecutive days with unvaried prices higher than 3;
- % of trading days lower than 100%."¹⁶

After performing this analysis and considering the limited trading volume, the issuer concluded that shares held in three of its listed available-for-sale investments were not traded in active markets. As a result, it measured fair value using a valuation technique based on Level 3 inputs. The enforcer disagreed with the issuer's assessment of whether the markets were active and thought that the quoted prices for these investments should have been used to measure fair value. In reaching this decision, the enforcer specifically noted that "the indicators used by the issuer were insufficient to conclude that the transaction price did not represent fair value or that transactions occurred with insufficient frequency and volume. ... [T]he issuer did not gather sufficient information to determine whether transactions were orderly or took place with sufficient frequency and volume to provide pricing information. Therefore, based on available data, it was not possible to conclude that the markets, where the investments were listed, were not active and further analysis should have been performed to measure fair value."¹⁷ The enforcer also raised concerns that the valuations based on Level 3 inputs were much higher than the quoted prices. Care will be needed when reaching a conclusion that a market is not active as this is a high hurdle.

During the PIR on IFRS 13, many respondents indicated they found the assessment of whether a market is active to be challenging and asked for additional guidance. The IASB decided not to provide additional guidance, noting in particular that the requirements are principles-based and, as such, judgement will always be needed in their application.¹⁸

7.2 Identifying transactions that are not orderly

IFRS 13 defines an orderly transaction as "a transaction that assumes exposure to the market for a period before the measurement date to allow for marketing activities that are usual and customary for transactions involving such assets or liabilities; it is not a forced transaction (eg a forced liquidation or distress sale)". [IFRS 13 Appendix A]. This definition includes two key components:

- (i) Adequate market exposure is required in order to provide market participants the ability to obtain an awareness and knowledge of the asset or liability necessary for a market-based exchange
- (ii) The transaction should involve market participants that, while being motivated to transact for the asset or liability, are not compelled to do so

IFRS 13 includes the following: [IFRS 13.B43, IFRS 13.B44]

16 European Securities and Markets Authority report [ESMA/2015/1135: 17th Extract from the EECS's Database of Enforcement](#), July 2015, Decision ref EECS/0115-03, pp.7.

Extract from IFRS 13

B43 The determination of whether a transaction is orderly (or is not orderly) is more difficult if there has been a significant decrease in the volume or level of activity for the asset or liability in relation to normal market activity for the asset or liability (or similar assets or liabilities). In such circumstances it is not appropriate to conclude that all transactions in that market are not orderly (ie forced liquidations or distress sales). Circumstances that may indicate that a transaction is not orderly include the following:

- (a) There was not adequate exposure to the market for a period before the measurement date to allow for marketing activities that are usual and customary for transactions involving such assets or liabilities under current market conditions.
- (b) There was a usual and customary marketing period, but the seller marketed the asset or liability to a single market participant.
- (c) The seller is in or near bankruptcy or receivership (ie the seller is distressed).
- (d) The seller was required to sell to meet regulatory or legal requirements (ie the seller was forced).
- (e) The transaction price is an outlier when compared with other recent transactions for the same or a similar asset or liability.

An entity shall evaluate the circumstances to determine whether, on the weight of the evidence available, the transaction is orderly.

B44 An entity shall consider all the following when measuring fair value or estimating market risk premiums:

- (a) If the evidence indicates that a transaction is not orderly, an entity shall place little, if any, weight (compared with other indications of fair value) on that transaction price.
- (b) If the evidence indicates that a transaction is orderly, an entity shall take into account that transaction price. The amount of weight placed on that transaction price when compared with other indications of fair value will depend on the facts and circumstances, such as the following:
 - (i) the volume of the transaction.
 - (ii) the comparability of the transaction to the asset or liability being measured.
 - (iii) the proximity of the transaction to the measurement date.
- (c) If an entity does not have sufficient information to conclude whether a transaction is orderly, it shall take into account the transaction price. However, that transaction price may not represent fair value (ie the transaction price is not necessarily the sole or primary basis for measuring fair value or estimating market risk premiums). When an entity does not have sufficient information to conclude whether particular transactions are orderly, the entity shall place less weight on those transactions when compared with other transactions that are known to be orderly.

An entity need not undertake exhaustive efforts to determine whether a transaction is orderly, but it shall not ignore information that is reasonably available. When an entity is a party to a transaction, it is presumed to have sufficient information to conclude whether the transaction is orderly.

IFRS 13 acknowledges that the determination of whether a transaction is orderly may be more difficult if there has been a significant decrease in the volume or level of activity. However, the standard is clear that, even when there has been a significant decrease in the volume or level of activity for an asset or liability, it is not appropriate to conclude that all transactions in that market are not orderly (i.e., distressed or forced). [IFRS 13.B43]. Instead, further assessment as to whether an observed transaction is not orderly generally needs to be made at the individual transaction level.

IFRS 13 does not require an entity to undertake all possible efforts in assessing whether a transaction is orderly. However, information that is available without undue cost and effort cannot be ignored. For instance, when an entity is party to a transaction, the standard presumes it would have sufficient information to conclude whether the transaction is orderly. [IFRS 13.B44]. Conversely, the lack of transparency into the details of individual transactions occurring in the market, to which the entity is not a party, can pose practical challenges for many entities in making this assessment. Recognising this difficulty, the IASB provided additional guidance in IFRS 13, which indicates that while observable data should not be ignored when the reporting entity does not have sufficient information to conclude on whether the transaction is orderly, the entity should place less weight on those transactions in comparison to other transactions that the reporting entity has concluded are orderly (see section 7.3 below for further discussion). [IFRS 13.B44(c)].

Frequently asked questions

Question 7-1: Are all transactions entered into to meet regulatory requirements or transactions initiated during bankruptcy assumed to be not orderly?

Although an entity may be viewed as being compelled to sell assets to comply with regulatory requirements, such transfers are not necessarily disorderly. If the entity was provided with the usual and customary period of time to market the asset to multiple potential buyers, the transaction price may be representative of the asset's fair value. Similarly, transactions initiated during bankruptcy are not automatically assumed to be disorderly. The determination of whether a transaction is not orderly requires a thorough evaluation of the specific facts and circumstances, including the exposure period and the number of potential buyers.

Question 7-2: Is it possible for orderly transactions to take place in a 'distressed' market?

How we see it

While there may be increased instances of transactions that are not orderly when a market has undergone a significant decrease in volume, it is not appropriate to assume that all transactions that occur in a market during a period of dislocation are distressed or forced. This determination is made at the individual transaction level and requires the use of judgement based on the specific facts and circumstances.

While market factors such as an imbalance in supply and demand can affect the prices at which transactions occur in a given market, such an imbalance, in and of itself, does not indicate that the parties to a transaction were not knowledgeable and willing market participants or that a transaction was not orderly. For example, a transaction in a dislocated market is less likely to be considered a 'distressed sale' when multiple buyers have bid on the asset.

In addition, while a fair value measurement incorporates the assumptions that sellers, as well as buyers, would consider in pricing the asset or liability, an entity's conclusion that it would not sell its own asset (or transfer its own liability) at prices currently observed in the market does not mean these transactions should be presumed to be distressed. IFRS 13 makes clear that fair value is a market-based measurement, not an entity-specific measurement, and notes that the entity's intention to hold an asset or liability is not relevant in estimating its fair value. The objective of a fair value measurement is to estimate the exit price in an orderly transaction between willing market participants at the measurement date under current market conditions. This price should include a risk premium that reflects the amount market participants would require as compensation for bearing any uncertainty inherent in the cash flows, and this uncertainty (as well as the compensation demanded to assume it) may be affected by current marketplace conditions. The objective of a fair value measurement does not change when markets are inactive or in a period of dislocation.

An example of the application of this principle relates to 2020 trading activity in many public markets during the outset of the coronavirus pandemic. The pandemic resulted in downturns and significant volatility in the financial and commodities markets worldwide. Despite the downturns seen in many public markets, this did not generally translate into significant decreases in volume in those markets. Therefore, even if a financial instrument's value declined, since the markets remained active, entities had to continue using a Level 1 measurement as they could not presume the transactions were distressed. While volatility in the financial markets may suggest that the prices are aberrations and do not reflect fair value, it would not be appropriate for an entity to disregard market prices at the measurement date. IFRS 13 makes it clear that fair value is a market-based measurement, not an entity-specific measurement, and notes that the reporting entity's intention to hold an asset or liability in a market downturn is not relevant. [IFRS 13.3].

7.3 Estimating fair value when there has been a significant decrease in the volume and level of activity

Estimating the price at which market participants would be willing to enter into a transaction if there has been a significant decrease in the volume or level of activity for the asset or liability will depend on the specific facts and circumstances and will require judgement. However, the core concepts of the fair value framework continue to apply. For example, an entity's intentions regarding the asset or liability (e.g., to sell an asset or settle a liability), are not relevant when measuring fair value because that would result in an entity-specific measurement. [IFRS 13.B42].

If there has been a significant decrease in the volume or level of activity for the asset or liability, it may be appropriate to reconsider the valuation technique being used or to use multiple valuation techniques, for example, the use of both a market approach and a present value technique (see section 7.3.2 below for further discussion). [IFRS 13.B40].

If quoted prices provided by third parties are used, an entity must evaluate whether those quoted prices have been developed using current information that reflects orderly transactions or a valuation technique that reflects market participant assumptions, including assumptions about risk. This evaluation must take into consideration the nature of a quote (e.g., whether the quote is an indicative price or a binding offer). In weighting a quoted price as an input to a fair value measurement, more weight is given to quotes that reflect the result of actual transactions or those that represent binding offers. Less weight is given to quotes that are not binding, reflect indicative pricing or do not reflect the result of transactions.

In some instances, an entity may determine that a transaction or quoted price requires an adjustment, such as when the price is stale or when the price for a similar asset requires significant adjustment to make it comparable to the asset being measured. [IFRS 13.B38]. The impact of these adjustments may be significant to the fair value measure and, if so, would affect its categorisation in the fair value hierarchy (see section 15.2 below for further discussion on categorisation within the fair value hierarchy).

7.3.1 Assessing the relevance of observable data

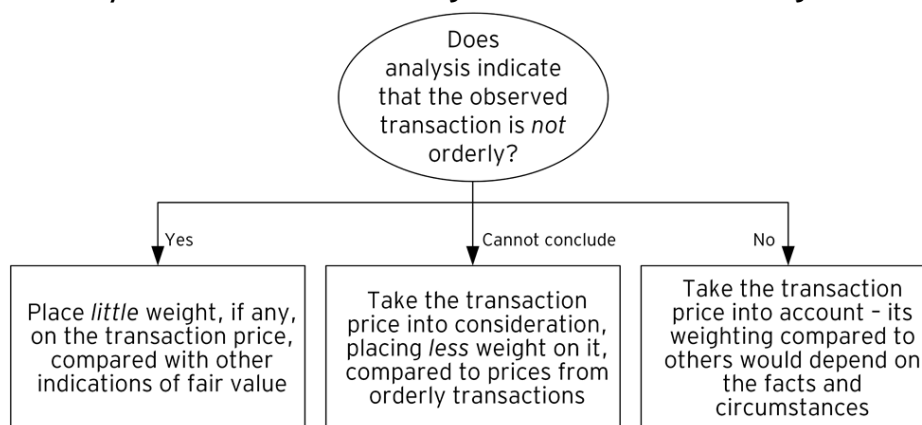

While observable prices from inactive markets may not be representative of fair value in all cases, this data should not be ignored. Instead, IFRS 13 clarifies that additional analysis is required to assess the relevance of the observable data. [IFRS 13.B38, IFRS 13.B44]. The relevance of a quoted price from an inactive market is dependent on whether the transaction is determined to be orderly. If the observed price is based on a transaction that is determined to be forced or disorderly, little, if any, weight should be placed on it compared with other indications of value.

If the quoted price is based on a transaction that is determined to be orderly, this data point should be considered in the estimation of fair value. However, the relevance of quoted prices associated with orderly transactions can vary based on factors specific to the asset or liability being measured and the facts and circumstances surrounding the price. Some of the factors to be considered include:

- Condition and/or location of the asset or liability
- Similarity of the transactions to the asset or liability being measured (e.g., the extent to which the inputs relate to items that are comparable to the asset or liability)
- Size of the transactions
- Volume or level of activity in the markets within which the transactions are observed
- Proximity of the transactions to the measurement date
- Whether the market participants involved in the transaction had access to information about the asset or liability that is usual and customary

If the adjustments made to the observable price are significant and based on unobservable data, the resulting measurement would represent a Level 3 measurement.

Figure 7-1: Orderly transactions: measuring fair value and estimating market risk premiums

7.3.2 Selection and use of valuation techniques when there has been a significant decrease in volume or level of activity

As discussed above, when activity has significantly decreased for an asset or liability, an assessment of the relevance of observable market data will be required and adjustments to observable market data may be warranted. A significant decrease in volume or activity can also influence which valuation technique(s) are used and how those techniques are applied.

The following example from IFRS 13 highlights some key valuation considerations for assets that trade in markets that have experienced a significant decrease in volume and level of activity. [IFRS 13.IE Example 14, IFRS 13.IE49-IE58].

Extract from IFRS 13

Example 14-Estimating a market rate of return when the volume or level of activity for an asset has significantly decreased

Entity A invests in a junior AAA-rated tranche of a residential mortgage-backed security on 1 January 20X8 (the issue date of the security). The junior tranche is the third most senior of a total of seven tranches. The underlying collateral for the residential mortgage-backed security is unguaranteed non-conforming residential mortgage loans that were issued in the second half of 20X6.

At 31 March 20X9 (the measurement date) the junior tranche is now A-rated. This tranche of the residential mortgage-backed security was previously traded through a brokered market. However, trading volume in that market was infrequent, with only a few transactions taking place per month from 1 January 20X8 to 30 June 20X8 and little, if any, trading activity during the nine months before 31 March 20X9.

Entity A takes into account the factors in paragraph B37 of the IFRS to determine whether there has been a significant decrease in the volume or level of activity for the junior tranche of the residential mortgage-backed security in which it has invested. After evaluating the significance and relevance of the factors, Entity A concludes that the volume and level of activity of the junior tranche of the residential mortgage-backed security have significantly decreased. Entity A supported its judgement primarily on the basis that there was little, if any, trading activity for an extended period before the measurement date.

Because there is little, if any, trading activity to support a valuation technique using a market approach, Entity A decides to use an income approach using the discount rate adjustment technique described in paragraphs B18-B22 of the IFRS to measure the fair value of the residential mortgage-backed security at the measurement date. Entity A uses the contractual cash flows from the residential mortgage-backed security (see also paragraphs 67 and 68 of the IFRS).

Entity A then estimates a discount rate (ie a market rate of return) to discount those contractual cash flows. The market rate of return is estimated using both of the following:

- (a) the risk-free rate of interest.
- (b) estimated adjustments for differences between the available market data and the junior tranche of the residential mortgage-backed security in which Entity A has invested. Those adjustments reflect available market data about expected non-performance and other risks (eg default risk, collateral value risk and liquidity risk) that market participants would take into account when pricing the asset in an orderly transaction at the measurement date under current market conditions.

Entity A took into account the following information when estimating the adjustments in paragraph IE53(b):

- (a) the credit spread for the junior tranche of the residential mortgage-backed security at the issue date as implied by the original transaction price.
- (b) the change in the credit spread implied by any observed transactions from the issue date to the measurement date for comparable residential mortgage-backed securities or on the basis of relevant indices.
- (c) the characteristics of the junior tranche of the residential mortgage-backed security compared with comparable residential mortgage-backed securities or indices, including all the following:
 - (i) the quality of the underlying assets, ie information about the performance of the underlying mortgage loans such as delinquency and foreclosure rates, loss experience and prepayment rates;
 - (ii) the seniority or subordination of the residential mortgage-backed security tranche held; and
 - (iii) other relevant factors.
- (d) relevant reports issued by analysts and rating agencies.
- (e) quoted prices from third parties such as brokers or pricing services.

Entity A estimates that one indication of the market rate of return that market participants would use when pricing the junior tranche of the residential mortgage-backed security is 12 per cent (1,200 basis points). This market rate of return was estimated as follows:

- (a) Begin with 300 basis points for the relevant risk-free rate of interest at 31 March 20X9.
- (b) Add 250 basis points for the credit spread over the risk-free rate when the junior tranche was issued in January 20X8.
- (c) Add 700 basis points for the estimated change in the credit spread over the risk-free rate of the junior tranche between 1 January 20X8 and 31 March 20X9. This estimate was developed on the basis of the change in the most comparable index available for that time period.
- (d) Subtract 50 basis points (net) to adjust for differences between the index used to estimate the change in credit spreads and the junior tranche. The referenced index consists of subprime mortgage loans, whereas Entity A's residential mortgage-backed security consists of similar mortgage loans with a more favourable credit profile (making it more attractive to market participants). However, the index does not reflect an appropriate liquidity risk premium for the junior tranche under current market conditions. Thus, the 50 basis point adjustment is the net of two adjustments:
 - (i) the first adjustment is a 350 basis point subtraction, which was estimated by comparing the implied yield from the most recent transactions for the residential mortgage-backed security in June 20X8 with the implied yield in the index price on those same dates. There was no information available that indicated that the relationship between Entity A's security and the index has changed.
 - (ii) the second adjustment is a 300 basis point addition, which is Entity A's best estimate of the additional liquidity risk inherent in its security (a cash position) when compared with the index (a synthetic position). This estimate was derived after taking into account liquidity risk premiums implied in recent cash transactions for a range of similar securities.

As an additional indication of the market rate of return, Entity A takes into account two recent indicative quotes (ie non-binding quotes) provided by reputable brokers for the junior tranche of the residential mortgage-backed security that imply yields of 15-17 per cent. Entity A is unable to evaluate the valuation technique(s) or inputs used to develop the quotes. However, Entity A is able to confirm that the quotes do not reflect the results of transactions.

Because Entity A has multiple indications of the market rate of return that market participants would take into account when measuring fair value, it evaluates and weights the respective indications of the rate of return, considering the reasonableness of the range indicated by the results.

Entity A concludes that 13 per cent is the point within the range of indications that is most representative of fair value under current market conditions. Entity A places more weight on the 12 per cent indication (ie its own estimate of the market rate of return) for the following reasons:

- (a) Entity A concluded that its own estimate appropriately incorporated the risks (eg default risk, collateral value risk and liquidity risk) that market participants would use when pricing the asset in an orderly transaction under current market conditions.
- (b) The broker quotes were non-binding and did not reflect the results of transactions, and Entity A was unable to evaluate the valuation technique(s) or inputs used to develop the quotes.

In Example 14 from the standard (in the extract above), Entity A uses an income approach (i.e., discount rate adjustment technique, see section 20 below for further discussion regarding present value techniques) to estimate the fair value of its residential mortgage-backed security (RMBS), because limited trading activity precluded a market approach as at the measurement date.

Example 14 above illustrates that the entity's use of an income approach does not change the objective of the fair value measurement, which is a current exit price. Valuation models should take into account all the factors that market participants would consider when pricing an asset or liability. The discount rate used by Entity A, for example, tries to incorporate all of the risks (e.g., liquidity risk, non-performance risk) market participants would consider in pricing the RMBS under current market conditions. Liquidity, credit or any other risk factors market participants would consider in pricing the asset or liability may require adjustments to model values if such factors are not sufficiently captured in the model.

Entity A prioritises observable inputs (to the extent available) over unobservable inputs in its application of the income approach. Entity A assesses market-based data from various sources to estimate the discount rate. For example, the entity estimates the change in the credit spread of the RMBS since its issuance based on spread changes observed from the most comparable index, for which trades continue to occur. Using the best available market information, the entity adjusts this input to account for differences between the observed index and the RMBS. These adjustments include the entity's assessment of the additional liquidity risk inherent in the RMBS compared to the index.

IFRS 13 indicates that an entity may use its own internal assumptions when relevant observable market data does not exist. [IFRS 13.89]. However, if reasonably available data indicates that market participant assumptions would differ, the entity should adjust its assumptions to incorporate that information. Relevant market data is not limited to transactions for the identical asset or liability being measured.

In Example 14 above, Entity A is unable to use a market approach because of limited trading activity for the RMBS. Therefore, Entity A considers implied liquidity risk premiums from recent transactions for a range of similar securities to estimate the incremental premium market participants would demand for its RMBS in the current market (as compared to the benchmark spread). In addition, Entity A considers two indicative broker quotes to estimate an appropriate discount rate for its RMBS. Although these quotes are specific to the RMBS being valued, Entity A puts less weight on these quotes since they are not binding and are not based on actual transactions. Furthermore, Entity A was unable to evaluate the valuation techniques and underlying data used by the brokers.

Importantly, the illustrative example is not intended to imply that an entity's own assumptions carry more weight than non-binding broker quotes. Rather, the example illustrates that each indication of value needs to be assessed based on the extent these indications rely on observable versus unobservable inputs.

Even though the market approach could not be used because of limited trading activity for the RMBS, Entity A was able to corroborate many of the assumptions used in developing the discount rate with relevant observable market data. As a result, the decision by the entity to place additional weight on its own market-corroborated assumptions (and less on the broker quotes) was warranted. When differences between broker quotes or pricing service data and an entity's own determination of value are significant, management should seek to understand the reasons behind these differences, if possible.

8 The price

IFRS 13 states the following: [IFRS 13.24]

Extract from IFRS 13

24 Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction in the principal (or most advantageous) market at the measurement date under current market conditions (ie an exit price) regardless of whether that price is directly observable or estimated using another valuation technique.

IFRS 13 requires the entity to estimate fair value based on the price that would be received to sell the asset or transfer the liability being measured (i.e., an exit price). While the determination of this price may be straightforward in some cases (e.g., when the identical instrument trades in an active market), in others it will require significant judgement. However, IFRS 13 makes it clear that the price used to measure fair value shall not be adjusted for transaction costs, but would consider transportation costs. [IFRS 13.25, IFRS 13.26].

The standard's guidance on the valuation techniques and inputs to these techniques used in determining the exit price (including the prohibition on block discounts) is discussed in sections 13 and 14 below.

8.1 Transaction costs

Transaction costs are defined as the costs to sell an asset or transfer a liability in the principal (or most advantageous) market for the asset or liability that are directly attributable to the disposal of an asset or the transfer of the liability. In addition, these costs must be incremental, i.e., they would not have been incurred by the entity had the decision to sell the asset or transfer the liability not been made. [IFRS 13 Appendix A]. Examples of transaction costs include commissions or certain due diligence costs. As noted above, transaction costs do not include transportation costs.

Fair value is not adjusted for transaction costs. This is because transaction costs are not a characteristic of an asset or a liability; they are a characteristic of the transaction. While not deducted from fair value, an entity considers transaction costs in the context of determining the most advantageous market in the absence of a principal market (see section 5.2 above) because in this instance the entity is seeking to determine the market that would maximise the net amount that would be received for the asset.

Frequently asked questions

Question 8-1: Are transaction costs in IFRS 13 the same as 'costs to sell' in other IFRS accounting standards?

As discussed in section 2.1.3 above, some IFRS accounting standards permit or require measurements based on fair value, where costs to sell or costs of disposal are deducted from the fair value measurement. IFRS 13 does not change the measurement objective for assets accounted for at fair value less cost to sell. The 'fair value less cost to sell' measurement objective includes: (1) fair value; and (2) cost to sell. The fair value component is measured in accordance with IFRS 13.

Consistent with the definition of transaction costs in IFRS 13, IAS 36 describes costs of disposal as "incremental costs directly attributable to the disposal of an asset or cash-generating unit, excluding finance costs and income tax expense". [IAS 36.6]. IAS 41 and IFRS 5 similarly define costs to sell.

As such, transaction costs excluded from the determination of fair value in accordance with IFRS 13 will generally be consistent with costs to sell or costs of disposal, determined in other IFRS accounting standards (listed in section 2.1.3 above), provided they exclude transportation costs.

Since the fair value component is measured in accordance with IFRS 13, the standard's disclosure requirements apply in situations where the fair value less cost to sell measurement is required subsequent to the initial recognition, unless specifically exempt from the disclosure requirements (see section 19 below). In addition, IFRS 13 clarifies that adjustments used to arrive at measurements based on fair value (e.g., the cost to sell when estimating fair value less cost to sell) should not be considered when determining where to categorise the measurement in the fair value hierarchy (see section 15 below).

Question 8-2: Transaction costs in IFRS 13 versus acquisition-related transaction costs in other IFRS accounting standards

The term 'transaction costs' is used in many IFRS accounting standards, but sometimes it refers to transaction costs actually incurred when acquiring an item and sometimes to transaction costs expected to be incurred when selling an item. While the same term might be used, it is important to differentiate between these types of transaction costs.

IAS 36, IAS 41 and IFRS 5 discuss costs to sell or dispose of an item (as discussed in Question 8-1 above). In contrast, other standards refer to capitalising or expensing transaction costs incurred in the context of acquiring an asset, assuming a liability or issuing an entity's own equity (a buyer's perspective). IFRS 3, for example, requires acquisition-related costs to be expensed in the period incurred. [IFRS 3.53].

IFRS 13 indicates that transaction costs are not included in a fair value measurement. As such, actual transaction costs (e.g., commissions paid) that are incurred by an entity when acquiring an asset would not be included at initial recognition when fair value is the measurement objective. Likewise, transaction costs that would be incurred in a hypothetical sales transaction would also not be included in a fair value measurement.

Some standards permit acquisition-related transaction costs to be capitalised at initial recognition, then permit or require the item, to which those costs relate, to be subsequently measured at fair value. In those situations, some or all of the acquisition-related transaction costs that were capitalised will effectively be expensed as part of the resulting fair value gain or loss. This is consistent with current practice. For example, IAS 40 permits transaction costs to be capitalised as part of an investment property's cost on initial recognition. [IAS 40.20]. However, if the fair value model is applied to the subsequent measurement of the investment property, transaction costs would be excluded from the fair value measurement (see Chapter 20).

Similarly, at initial recognition, financial assets or liabilities in the scope of IFRS 9 are generally measured at their "fair value plus or minus, in the case of a financial asset or liability not at fair value through profit or loss, transaction costs that are directly attributable to the acquisition or issue of the financial asset or liability". [IFRS 9.5.1.1]. For those items subsequently measured at amortised cost, these transaction costs will be captured as part of the instrument's effective interest rate.

8.2 Transportation costs

Transportation costs represent those that would be incurred to transport an asset or liability to (or from) the principal (or most advantageous) market. If location is a characteristic of the asset or liability being measured (e.g., as might be the case with a commodity), the price in the principal (or most advantageous) market should be adjusted for transportation costs. The following simplified example illustrates this concept.

Illustration 8-1: Transportation costs

Entity A holds a physical commodity measured at fair value in its warehouse in Europe. For this commodity, the London exchange is determined to be the principal market as it represents the market with the greatest volume and level of activity for the asset that the entity can reasonably access.

The exchange price for the asset is CU25. However, the contracts traded on the exchange for this commodity require physical delivery to London. Entity A determines that it would cost CU5 to transport the physical commodity to London and the broker's commission would be CU3 to transact on the London exchange.

Since location is a characteristic of the asset and transportation to the principal market is required, the fair value of the physical commodity would be CU20 - the price in the principal market for the asset of CU25, less transportation costs of CU5. The CU3 broker commission represents a transaction cost that would not adjust the price in the principal market.

9 Application to non-financial assets

Many non-financial assets, either through the initial or subsequent measurement requirements of an IFRS or the requirements of IAS 36 for impairment testing (if recoverable amount is based on fair value less costs of disposal), are either permitted or required to be measured at fair value (or a measure based on fair value). For example, management may need to measure the fair value of non-financial assets and liabilities when completing the purchase price allocation for a business combination in accordance with IFRS 3. First-time adopters of IFRS might need to measure fair value of assets and liabilities if they use a 'fair value as deemed cost' approach in accordance with IFRS 1 *First-time Adoption of International Financial Reporting Standards*.

In addition to the principles described in the sections above, the fair value measurement of non-financial assets must reflect the highest and best use of the asset from a market participant's perspective.

The highest and best use of an asset establishes the valuation premise used to measure the fair value of the asset. In other words, whether to assume market participants would derive value from using the non-financial asset (based on its highest and best use) on its own or in combination with other assets or with other assets and liabilities. As discussed below, this might be its current use or some alternative use.

As discussed in section 3.2 above, the concepts of highest and best use and valuation premise in IFRS 13 are only relevant for non-financial assets (and not financial assets and liabilities). This is because:

[IFRS 13.BC63]

- Financial assets have specific contractual terms; they do not have alternative uses. Changing the characteristics of the financial asset (i.e., changing the contractual terms) causes the item to become a different asset and the objective of a fair value measurement is to measure the asset as it exists as at the measurement date.
- The different ways by which an entity may relieve itself of a liability are not alternative uses. In addition, entity-specific advantages (or disadvantages) that enable an entity to fulfil a liability more or less efficiently than other market participants are not considered in a fair value measurement.
- The concepts of highest and best use and valuation premise were developed within the valuation profession to value non-financial assets, such as land.

9.1 Highest and best use

Highest and best use refers to "the use of a non-financial asset by market participants that would maximise the value of the asset or the group of assets and liabilities (eg a business) within which the asset would be used". [IFRS 13 Appendix A]. The standard includes the following guidance on highest and best use: [IFRS 13.27, IFRS 13.28]

Extract from IFRS 13

- | | |
|----|--|
| 27 | A fair value measurement of a non-financial asset takes into account a market participant's ability to generate economic benefits by using the asset in its highest and best use or by selling it to another market participant that would use the asset in its highest and best use. |
| 28 | The highest and best use of a non-financial asset takes into account the use of the asset that is physically possible, legally permissible and financially feasible, as follows: <ul style="list-style-type: none"> (a) A use that is physically possible takes into account the physical characteristics of the asset that market participants would take into account when pricing the asset (eg the location or size of a property). (b) A use that is legally permissible takes into account any legal restrictions on the use of the asset that market participants would take into account when pricing the asset (eg the zoning regulations applicable to a property). (c) A use that is financially feasible takes into account whether a use of the asset that is physically possible and legally permissible generates adequate income or cash flows (taking into account the costs of converting the asset to that use) to produce an investment return that market participants would require from an investment in that asset put to that use. |

Highest and best use is a valuation concept that considers how market participants would use a non-financial asset to maximise its benefit or value. The maximum value of a non-financial asset to market participants may come from its use: (a) in combination with other assets or with other assets and liabilities; or (b) on a stand-alone basis.

In determining the highest and best use of a non-financial asset, IFRS 13.28 indicates uses that are physically possible, legally permissible (see section 9.1.1 below for further discussion) and financially feasible should be considered. As such, when assessing alternative uses, entities should consider the physical characteristics of the asset, any legal restrictions on its use and whether the value generated provides an adequate investment return for market participants.

Provided there is sufficient evidence to support these assertions, alternative uses that would enable market participants to maximise value should be considered, but a search for potential alternative uses need not be exhaustive. In addition, any costs to transform the non-financial asset (e.g., obtaining a new zoning permit or converting the asset to the alternative use) and profit expectations from a market participant's perspective are also considered in the fair value measurement.

If there are multiple types of market participants who would use the asset differently, these alternative scenarios must be considered before concluding on the asset's highest and best use. While applying the fair value framework may be straightforward in many situations, in other instances, an iterative process may be needed to consistently apply the various components. This may be required due to the interdependence among several key concepts in IFRS 13's fair value framework (see Figure 3-1 in section 3.2 above). For example, the highest and best use of a non-financial asset determines its valuation premise and affects the identification of the appropriate market participants. Likewise, the determination of the principal (or most advantageous) market can be important in determining the highest and best use of a non-financial asset.

Determining whether the maximum value to market participants would be achieved either by using an asset in combination with other assets and liabilities as a group, or by using the asset on a stand-alone basis, requires judgement and an assessment of the specific facts and circumstances.

A careful assessment is particularly important when the highest and best use of a non-financial asset is in combination with one or more non-financial assets. As discussed in section 9.2 below, assets in an asset group should all be valued using the same valuation premise. For example, if the fair value of a piece of machinery on a manufacturing line is measured assuming its highest and best use is in conjunction with other equipment in the manufacturing line, those other non-financial assets in the asset group (i.e., the other equipment on the manufacturing line) would also be valued using the same premise. As highlighted by Illustration 9-2 in section 9.2.2 below, once it is determined that the value for a set of assets is maximised when considered as a group, all of the assets in that group would be valued using the same premise, regardless of whether any individual asset within the group would have a higher value on a stand-alone basis.

During the PIR, some respondents noted application of this concept as challenging and requested further guidance on for example what is meant by legally permissible however the Board concluded that there was insufficient evidence of inconsistent application of requirements and that it is doubtful whether supporting material would be helpful in the situations when the application of the highest and best use is challenging.¹⁹

9.1.1 Highest and best use: determining what is legally permissible

To be legally permissible, the standard indicates a use of a non-financial asset need not be legal (or have legal approval) at the measurement date, but it must not be legally prohibited in the jurisdiction. [IFRS 13.BC69].

What is legally permissible is a matter of law. However, the IASB seems to be distinguishing between a use that is explicitly prohibited and a use that would be permitted if the jurisdiction's specific legal requirements were met. However, in some situations it may be difficult to determine whether a use is capable of being legally permitted when, at the measurement date, it is subject to legal restrictions that are not easily overcome.

The standard gives the example of a land development. Assume the government has prohibited building on or developing certain land (i.e., the land is a protected area). For the entity to develop the land, a change of law would be required. Since development of this land would be illegal, it cannot be the highest and best use of the land. Alternatively, assume the land has been zoned for commercial use, but nearby areas have recently been developed for residential use and, as such, market participants would consider residential development as a potential use of the land. Since re-zoning the land for residential development would only require approval from an authority and that approval is usually given, this alternative use could be deemed to be legally permissible.

¹⁹ [IFRS Project Report and Feedback Statement](#), *Post-implementation Review of IFRS 13 Fair Value Measurement*, IASB, December 2018, p.15. Available on the IFRS Foundation's website.

It is assumed that market participants would consider all relevant factors, as they exist at the measurement date, in determining whether the legally permissible use of the non-financial asset may be something other than its current use. That is, market participants would consider the probability, extent and timing of different types of approvals that may be required in assessing whether a change in the legal use of the non-financial asset could be obtained.

The scenarios, of protected land and re-zoning of land, considered above illustrate either end of the spectrum; uses that are unlikely and likely to be legally permissible, respectively. However, consider the protected land example above. Assume the government were expected to change the law in the near future to permit residential development, but there had not been any similar changes in law to date. An entity would need to consider the weight of evidence available and whether market participants would have similar expectations. This may be more difficult without past history of similar changes in law. However, an entity might consider factors such as whether expectations are based on verbal assurances or written evidence; whether the process to change the law has begun; and the risk that the change in law will not be approved. It may also help to determine whether market participants would pay for this potential. However, this fact, on its own, is unlikely to be sufficient to support a use being legally permissible.

How we see it

In our view, an entity would need to have sufficient evidence to support its assumption about the potential for an alternative use, particularly in light of IFRS 13's presumption that the highest and best use is an asset's current use.

In the example above of re-zoning land for residential development, the entity's belief that re-zoning was possible (or even likely) is unlikely to be sufficient evidence that the re-zoning is legally permissible. However, the fact that nearby areas had recently been re-zoned for residential use may provide additional evidence as to the likelihood that the land being measured could similarly be re-zoned. If obtaining re-zoning permission is not merely perfunctory, there may be a significant burden on the entity to prove that market participants would consider commercial use of the land 'legally permissible'.

9.1.2 Highest and best use versus current use

Although IFRS 13 presumes that an entity's current use of an asset is its highest and best use, market or other factors may suggest that a different use by market participants would maximise the value of that asset. [IFRS 13.29]. Because the highest and best use of an asset is determined based on market participants' expectations, reporting entities may need to consider alternative uses of an asset (e.g., land) in their analysis of fair value. An entity's current or intended use of a non-financial asset might not be the highest and best use of the asset, and thus would not determine its premise of value. Instead, the highest and best use of the asset (or asset group) should be determined based on how market participants would maximise the asset's value. For example, market participants may maximise the value of land, currently used as a site for a manufacturing facility, for residential housing instead.

The consideration of alternative uses is not intended to be exhaustive. It is not necessary that all possible alternatives be considered. Instead, judgement is required in assessing those alternative uses that market participants would consider in pricing the asset. As noted above, consideration of what is physically possible, legally permissible and financially feasible would be part of this assessment. Illustration 9-1 below, which is based on Example 2 in IFRS 13, illustrates this further. If an entity determines that the highest and best use of an asset is different from its current use, IFRS 13 requires that fact to be disclosed as well as the reason why the non-financial asset is being used in a manner that differs from its highest and best use (disclosures are discussed further in section 19 below). [IFRS 13.93(i)].

It is important to note that even if the current use of a non-financial asset is the same as its highest and best use, the underlying assumptions used to value the asset should not be entity-specific, but instead should be based on the assumptions that market participants would use when transacting for the asset in its current condition. Entity-specific synergies, if they would differ from market participant synergies, would not be considered in the determination of the highest and best use of the asset. This is illustrated in Illustration 9-1 below. [IFRS 13.IE Example 2, IFRS 13.IE7, IFRS 13.IE8].

Illustration 9-1: Highest and best use versus current use

Entity X acquires land in a business combination. The land is currently developed for industrial use as a site for a factory. The current use of the land is presumed to be its highest and best use unless market or other factors suggest a different use. Nearby sites have recently been developed for residential use as sites for high-rise apartment buildings. On the basis of that development and recent zoning and other changes to facilitate that development, Entity X determines that the land currently used as a site for a factory could be developed as a site for residential use (i.e., for high-rise apartment buildings) because market participants would take into account the potential to develop the site for residential use when pricing the land.

The highest and best use of the land would be determined by comparing both of the following:

- (a) The value of the land as currently developed for industrial use (i.e., the land would be used in combination with other assets, such as the factory, or with other assets and liabilities)
- (b) The value of the land as a vacant site for residential use, taking into account the costs of demolishing the factory and other costs (including the uncertainty about whether Entity X would be able to convert the asset to the alternative use) necessary to convert the land to a vacant site (i.e., the land is to be used by market participants on a stand-alone basis)

The highest and best use of the land would be determined on the basis of the higher of those values. In situations involving real estate appraisal, the determination of highest and best use might consider factors relating to the factory operations, including its assets and liabilities.

Assume that the fair value of the land in-use as a manufacturing operation is determined to be CU4,000,000 and that the fair value for the land as a vacant site that can be used for residential purposes is CU5,000,000. In order to convert the land from a manufacturing operation to a vacant site for residential use, the manufacturing facility must be removed. Assuming demolition and other costs of CU500,000.* In order to determine the fair value of the land, the price of the land as a residential development site (CU5,000,000) would need to be adjusted for the transformation costs (CU500,000) necessary to prepare the land for residential use. Therefore, the amount of CU4,500,000 must be used as the fair value of the land.

* For simplicity purposes, this example does not specifically discuss other types of costs that may need to be considered in determining the fair value of the land for residential use (such as the effect of intangible or other assets related to the manufacturing facility).

9.1.3 Highest and best use versus intended use (including defensive value)

An entity's intended use of an asset, at the time it is acquired, may not be the same as how market participants would use the asset. If the highest and best use and the entity's intended use of an asset are not the same, it could result in differences between the price to acquire the asset and fair value measured in accordance with IFRS 13 (see section 12 below). IFRS 13 requires that the highest and best use of an asset be determined from the perspective of market participants, even if management intends a different use, [IFRS 13.29, IFRS 13.30], as is illustrated in Illustration 9-2 below.

In certain instances, the highest and best use of an asset may be to not actively use it, but instead to lock it up or 'shelve it' (commonly referred to as a defensive asset). That is, the maximum value provided by an asset may be its defensive value. IFRS 13 clarifies that the fair value of an asset used defensively is not assumed to be zero or a nominal amount. Instead, an entity should consider the incremental value such a use provides to the assets being protected, such as the incremental value provided to an entity's existing brand name by acquiring and shelving a competing brand. Generally speaking, a nominal fair value is appropriate only when an asset is abandoned (i.e., when an entity would be willing to give the asset away for no consideration).

Importantly, an entity's decision to use an asset defensively does not mean that market participants would necessarily maximise the asset's value in a similar manner. Likewise, an entity's decision to actively use an asset does not preclude its highest and best use to market participants as being defensive in nature. The following example from IFRS 13 illustrates these points. [IFRS 13.IE Example 3, IFRS 13.IE9].

Extract from IFRS 13**Example 3-Research and development project**

An entity acquires a research and development (R&D) project in a business combination. The entity does not intend to complete the project. If completed, the project would compete with one of its own projects (to provide the next generation of the entity's commercialised technology). Instead, the entity intends to hold (ie lock up) the project to prevent its competitors from obtaining access to the technology. In doing this the project is expected to provide defensive value, principally by improving the prospects for the entity's own competing technology. To measure the fair value of the project at initial recognition, the highest and best use of the project would be determined on the basis of its use by market participants. For example:

- (a) The highest and best use of the R&D project would be to continue development if market participants would continue to develop the project and that use would maximise the value of the group of assets or of assets and liabilities in which the project would be used (ie the asset would be used in combination with other assets or with other assets and liabilities). That might be the case if market participants do not have similar technology, either in development or commercialised. The fair value of the project would be measured on the basis of the price that would be received in a current transaction to sell the project, assuming that the R&D would be used with its complementary assets and the associated liabilities and that those assets and liabilities would be available to market participants.
- (b) The highest and best use of the R&D project would be to cease development if, for competitive reasons, market participants would lock up the project and that use would maximise the value of the group of assets or of assets and liabilities in which the project would be used. That might be the case if market participants have technology in a more advanced stage of development that would compete with the project if completed and the project would be expected to improve the prospects for their own competing technology if locked up. The fair value of the project would be measured on the basis of the price that would be received in a current transaction to sell the project, assuming that the R&D would be used (ie locked up) with its complementary assets and the associated liabilities and that those assets and liabilities would be available to market participants.
- (c) The highest and best use of the R&D project would be to cease development if market participants would discontinue its development. That might be the case if the project is not expected to provide a market rate of return if completed and would not otherwise provide defensive value if locked up. The fair value of the project would be measured on the basis of the price that would be received in a current transaction to sell the project on its own (which might be zero).

The fair value of the in-process research and development project in Example 3 above depends on whether market participants would use the asset offensively, defensively or abandon it (as illustrated by points (a), (b) and (c) in the example, respectively). If the highest and best use in Example 3 (in the extract above) was (a), then that is the value that the entity must ascribe to the R&D project, even though its intended use is to lock-up the project.

As discussed in section 9.1 above, if there are multiple types of market participants who would use the asset differently, these alternative scenarios must be considered before concluding on the asset's highest and best use.

9.2 Valuation premise for non-financial assets

Dependent on its highest and best use, the fair value of the non-financial asset will either be measured based on the value it would derive on a stand-alone basis or in combination with other assets or other assets and liabilities - i.e., the asset's valuation premise.

9.2.1 Valuation premise - stand-alone basis

If the highest and best use of the asset is to use it on a stand-alone basis, an entity measures the fair value of the asset individually. In other words, the asset is assumed to be sold to market participants for use on its own. Fair value is the price that would be received in a current transaction under those circumstances.

[IFRS 13.31(b)]. For instance, alternative (c) of Example 3 from the standard (extracted in section 9.1.3 above) suggests the highest and best use of the research and development project could be to cease development. Since its highest and best use is on a stand-alone basis, the fair value of the project would be the price that would be received in a current transaction to sell the project on its own and assuming a market participant would cease development of the project. In addition, the asset should be measured based only on its current characteristics, potentially requiring an adjustment for transformation costs. For example, if land that is used as a factory site is to be valued on a stand-alone basis, transformation costs (e.g., the cost of removing the factory) should be considered in the fair value measurement.

When the valuation premise of one non-financial asset in an asset group is valued on a stand-alone basis, all of the other assets in the group should also be valued using a consistent valuation premise. For example, based on Illustration 9-1 in section 9.1.2 above, if the highest and best use of the land is determined to be on a stand-alone basis (i.e., as vacant land), the fair value of the equipment in the factory could be determined under two alternative valuation premises: (a) stand-alone (i.e., the value of the equipment sold on a stand-alone basis); or (b) in conjunction with other equipment on the operating line, but in a different factory (i.e., not in combination with the land, since the land would be valued on a stand-alone basis). Regardless of the valuation premise used to measure the equipment, market participant assumptions regarding the cost of redeployment, such as costs for disassembling, transporting and reinstalling the equipment should be considered in the fair value measurement.

9.2.2 Valuation premise - in combination with other assets and/or liabilities

If the highest and best use of a non-financial asset is in combination with other assets as a group or in combination with other assets and liabilities, the fair value of the asset is the price that would be received in a current transaction to sell the asset and would assume that: *[IFRS 13.31(a)(i)]*

- (i) Market participants would use the asset together with other assets or with other assets and liabilities
- (ii) Those assets and liabilities (i.e., its complementary assets and the associated liabilities) would be available to market participants - that is, the fair value of the asset would be measured from the perspective of market participants who are presumed to hold the complementary assets and liabilities (see section 9.2.3 below for further discussion regarding associated liabilities)

Once an entity determines that the valuation premise for a non-financial asset is its use in combination with a set of assets (or assets and liabilities), all of the complementary non-financial assets in that group should be valued using the same valuation premise (i.e., assuming the same highest and best use), regardless of whether any individual asset within the group would have a higher value under another premise.

[IFRS 13.31(a)(iii)]. Illustration 9-2 below illustrates this further.

Illustration 9-2: Consistent assumptions about highest and best use in an asset group

A wine producer owns and manages a vineyard and produces its own wine onsite. The grapes growing on the vines are measured at fair value less costs to sell in accordance with IAS 41 at the end of each reporting period. At the point of harvest, the grapes are measured at the point of harvest at fair value less costs to sell in accordance with IAS 41 (being the grapes' 'cost' when transferred to IAS 2). The wine producer elects to measure its land and vines using IAS 16's revaluation model (fair value less any subsequent accumulated depreciation and accumulated impairment). All other non-financial assets are measured at cost.

At the end of the reporting period, the entity assesses the highest and best use of the grapes growing on the vines, the vines and the land from the perspective of market participants. The grapes growing on the vines, vines and land could continue to be used, in combination with the entity's other assets and liabilities, to produce and sell its wine (i.e., its current use). Alternatively, the land could be converted into residential property. Conversion would include removing the grapes growing on the vines, vines and plant and equipment from the land.

Scenario A

The entity determines that the highest and best use of these assets in combination is as a vineyard (i.e., its current use). The entity must make consistent assumptions for assets in the group (for which highest and best use is relevant, i.e., non-financial assets). Therefore, the highest and best use of all non-financial assets in the group is to produce and sell wine, even if conversion into residential property might yield a higher value for the land on its own.

Scenario B

The entity determines that the highest and best use of these assets is to convert the land into residential property, even if the current use might yield a higher value for the grapes growing on the vines and/or the vines. The entity would need to consider what a market participant would do to convert the land, which could include the cost of rezoning, selling cuttings from the vines or simply removing the vines and the grapes growing thereon, and the sale of the buildings and equipment, either individually or as an asset group.

Since the highest and best use of these assets is not their current use in this scenario, the entity would disclose that fact, as well as the reason why those assets are being used in a manner that differs from their highest and best use.

When the asset's highest and best use is in combination with other items, the effect of the valuation premise on the measurement of fair value will depend on the specific circumstances. The following extract from IFRS 13 provides some examples: [IFRS 13.B3]

Extract from IFRS 13

Valuation premise for non-financial assets (paragraphs 31-33)

- B3 When measuring the fair value of a non-financial asset used in combination with other assets as a group (as installed or otherwise configured for use) or in combination with other assets and liabilities (eg a business), the effect of the valuation premise depends on the circumstances. For example:
- (a) the fair value of the asset might be the same whether the asset is used on a stand-alone basis or in combination with other assets or with other assets and liabilities. That might be the case if the asset is a business that market participants would continue to operate. In that case, the transaction would involve valuing the business in its entirety. The use of the assets as a group in an ongoing business would generate synergies that would be available to market participants (ie market participant synergies that, therefore, should affect the fair value of the asset on either a stand-alone basis or in combination with other assets or with other assets and liabilities).
 - (b) an asset's use in combination with other assets or with other assets and liabilities might be incorporated into the fair value measurement through adjustments to the value of the asset used on a stand-alone basis. That might be the case if the asset is a machine and the fair value measurement is determined using an observed price for a similar machine (not installed or otherwise configured for use), adjusted for transport and installation costs so that the fair value measurement reflects the current condition and location of the machine (installed and configured for use).
 - (c) an asset's use in combination with other assets or with other assets and liabilities might be incorporated into the fair value measurement through the market participant assumptions used to measure the fair value of the asset. For example, if the asset is work in progress inventory that is unique and market participants would convert the inventory into finished goods, the fair value of the inventory would assume that market participants have acquired or would acquire any specialised machinery necessary to convert the inventory into finished goods.
 - (d) an asset's use in combination with other assets or with other assets and liabilities might be incorporated into the valuation technique used to measure the fair value of the asset. That might be the case when using the multi-period excess earnings method to measure the fair value of an intangible asset because that valuation technique specifically takes into account the contribution of any complementary assets and the associated liabilities in the group in which such an intangible asset would be used.
 - (e) in more limited situations, when an entity uses an asset within a group of assets, the entity might measure the asset at an amount that approximates its fair value when allocating the fair value of the asset group to the individual assets of the group. That might be the case if the valuation involves real property and the fair value of improved property (ie an asset group) is allocated to its component assets (such as land and improvements).

Although the approach used to incorporate the valuation premise into a fair value measurement may differ based on the facts and circumstances, the determination of a non-financial asset's valuation premise (based on its highest and best use) and the inputs applied in the valuation technique used to estimate fair value should always be considered from the perspective of market participants, not the reporting entity.

9.2.3 How should associated liabilities be considered when measuring the fair value of a non-financial asset?

As discussed in section 9.2.2 above, an asset's highest and best use might be in combination with associated liabilities and complementary assets in an asset group. For example, many intangible assets do not generate independent cash inflows as individual assets and so they might be tested for impairment under IAS 36 with other assets of the CGU of which they are a part. A trademark, for example, will generate largely independent cash inflows if it is licensed to a third party but more commonly its highest and best use will be to use it with other assets and liabilities of a CGU. Please refer to Chapter 21 for more information on testing intangible assets for impairment subsequent to initial recognition.

IFRS 13.B3(d) notes that an asset's use in combination with other assets and liabilities might be incorporated when using the multi-period excess earnings method to measure the fair value of an intangible asset that has been acquired in a business acquisition. [IFRS 13.B3]. The multi-period excess earnings method specifically takes into account the contribution of any complementary assets and the associated liabilities in the group in which such an intangible asset would be used.

'Associated liabilities' is not defined and IFRS 13 provides limited guidance on the types of liabilities that could be considered associated to a non-financial asset. IFRS 13 provides some guidance, stating that associated liabilities can include those that fund working capital, but must exclude liabilities used to fund assets other than those within the group of assets. [IFRS 13.31(a)(ii)].

Entities will need to exercise judgement in determining which liabilities to include or exclude from the group, based on the specific facts and circumstances. This assessment must reflect what market participants would consider when determining the non-financial asset's highest and best use. Entities will need to be careful to exclude entity-specific assumptions when valuing liabilities, particularly if valuation techniques are used that are based on their own data (valuation techniques are discussed further in section 13 below). The requirement to consider associated liabilities when measuring the fair value of non-financial assets was generally intended to align the guidance in IFRS 13 with previous practice for measuring the fair value of certain non-financial assets (e.g., intangible assets) and generally did not result in significant changes to the valuation of most non-financial assets. For example, real estate should generally be valued independently from any debt used to finance the property.

9.2.4 Unit of account versus the valuation premise

Fair value measurement of a non-financial asset assumes the asset is sold consistently with its unit of account (as specified in other IFRSs), irrespective of its valuation premise. This assumption applies even if the highest and best use of the asset is in combination with other assets and/or liabilities. This is because the fair value measurement contemplates the sale of the individual asset to market participants that already hold, or are able to obtain, the complementary assets and liabilities. [IFRS 13.32]. Only when the unit of account of the item being measured at fair value is an asset group (which may be the case when measuring non-financial assets for impairment as part of a CGU), can one consider the sale of an asset group. That is, the valuation premise for a non-financial asset does not override the unit of account as defined by the applicable IFRS. However, this can be confusing in practice as both concepts deal with determining the appropriate level of aggregation or disaggregation for assets and liabilities.

Unit of account is an accounting concept. It identifies what is being measured for financial reporting purposes. When applying IFRS 13, this drives the level of aggregation (or disaggregation) for presentation and disclosure purposes, for example, whether the information presented and disclosed in the financial statements is for an individual asset or for a group of assets.

The valuation premise is a valuation concept (sometimes referred to as the 'unit of valuation'). It determines how the asset or liability is measured, i.e., based on the value it derives on a stand-alone basis or the value it derives in conjunction with other assets and liabilities. As discussed above, the unit of account established by an IFRS may be an individual item. However, that item may need to be grouped with others for the purpose of measuring fair value, i.e., the valuation premise may differ from the unit of account.

For example, an entity may own an investment property that is attached to land and contains other assets, such as fixtures and fittings. The unit of account for the investment property would likely be the stand-alone asset in accordance with IAS 40. However, the value of this asset on a stand-alone basis may have little meaning since it is physically attached to the land and derives its benefit in combination with the fixtures and fittings in the building. Therefore, when determining fair value, the valuation premise would likely reflect its use in combination with other assets.

It is important to note that when the valuation premise for measuring the fair value of a non-financial asset (or group of assets and corresponding liabilities) differs from its unit of account, categorisation within IFRS 13's fair value hierarchy (for disclosure purposes) must be determined at a level consistent with the unit of account for the asset or liability (see section 15.2 below).

10 Application to liabilities and an entity's own equity

IFRS 13 applies to liabilities, both financial and non-financial, and an entity's own equity whenever an IFRS requires those instruments to be measured at fair value. For example, in accordance with IFRS 3, in a business combination management might need to determine the fair value of liabilities assumed, when completing the purchase price allocation, and the fair value of its own equity instruments to measure the consideration given.

For financial liabilities and an entity's own equity that are within the scope of IAS 32 or IFRS 9, it is important to note that IFRS 13 would apply to any initial and subsequent fair value measurements that are recognised in the statement of financial position. In addition, if those instruments are not subsequently measured at fair value in the statement of financial position, for example financial liabilities may be subsequently measured at amortised cost, an entity may still need to disclose their fair value in the notes to the financial statements. At a minimum, this would be a requirement for financial liabilities. In these situations, IFRS 13 would also need to be applied to measure the instruments' fair value for disclosure.

The classification of an instrument as either a liability or equity instrument by other IFRS accounting standards may depend on the specific facts and circumstances, such as the characteristics of the transaction and the characteristics of the instrument. Examples of these instruments include contingent consideration issued in a business combination in accordance with IFRS 3 or equity warrants issued by an entity in accordance with IFRS 9. In developing the requirements in IFRS 13 for measuring the fair value of liabilities and an entity's own equity, the Boards concluded the requirements should generally be consistent between these instruments. That is, the accounting classification of an instrument, as either a liability or own equity, should not affect that instrument's fair value measurement. [IFRS 13.BC106].

Prior to the issuance of IFRS 13, IFRS did not provide guidance on how to measure the fair value of an entity's own equity instruments. While IFRS 13 may be consistent with how many entities valued their own equity prior to adoption of IFRS 13, it changed practice for entities that concluded the principal market for their own equity (and therefore the assumption of market participants in that market) would be different when valuing the instrument as an asset. For example, this might have been the case if an entity measuring the fair value of a warrant previously assumed a volatility that differs from the volatility assumptions market participants would use in pricing the warrant as an asset.

10.1 General principles

IFRS 13 includes the following general principles for fair value measurement of a liability or an entity's own equity instrument: [IFRS 13.34]

Extract from IFRS 13

- 34** A fair value measurement assumes that a financial or non-financial liability or an entity's own equity instrument (eg equity interests issued as consideration in a business combination) is transferred to a market participant at the measurement date. The transfer of a liability or an entity's own equity instrument assumes the following:
- (a) A liability would remain outstanding and the market participant transferee would be required to fulfil the obligation. The liability would not be settled with the counterparty or otherwise extinguished on the measurement date.
 - (b) An entity's own equity instrument would remain outstanding and the market participant transferee would take on the rights and responsibilities associated with the instrument. The instrument would not be cancelled or otherwise extinguished on the measurement date.

10.1.1 Fair value of a liability

IFRS 13 states that the fair value measurement of a liability contemplates the transfer of the liability to a market participant at the measurement date. The liability is assumed to continue (i.e., it is not settled or extinguished), and the market participant to whom the liability is transferred would be required to fulfil the obligation.

The fair value of a liability also reflects the effect of non-performance risk. Non-performance risk is the risk that an obligation will not be fulfilled. This risk includes, but may not be limited to, the entity's own credit risk (see section 10.3 below). The requirement that non-performance risk remains unchanged before and after the transfer implies that the liability is hypothetically transferred to a market participant of equal credit standing.

The clarification in IFRS 13 that fair value is not based on the price to settle a liability with the existing counterparty, but rather to transfer it to a market participant of equal credit standing, affects the assumptions about the principal (or most advantageous) market and the market participants in the exit market for the liability (see section 10.1.3 below for further detail on the distinction between the settlement notion for liabilities and the transfer notion in IFRS 13).

10.1.2 Fair value of an entity's own equity

For an entity's own equity, IFRS 13 states that the fair value measurement would contemplate a transfer of the equity instrument. The equity instrument would remain outstanding and the market participant transferee would take on the rights and responsibilities associated with the instrument. The instrument would not be cancelled or otherwise extinguished on the measurement date.

The requirements for measuring the fair value of an entity's own equity are generally consistent with the requirements for measuring liabilities, except for the requirement to incorporate non-performance risk, which does not apply directly to an entity's own equity.

10.1.3 Settlement value versus transfer value

While IFRS 13 requires the use of an exit price to measure fair value, an entity might not intend (or be able) to transfer its liability to a third party. For example, it might be more beneficial for the entity to fulfil or settle a liability or the counterparty might not permit the liability to be transferred to another party. The issuer of an equity instrument may only be able to exit from that instrument if it ceases to exist or if the entity repurchases the instrument from the holder. Even if an entity is unable to transfer a liability, the IASB believes the transfer notion is necessary for measuring fair value, because it "captures market participants' expectations about the liquidity, uncertainty and other factors associated with the liability, whereas a settlement notion may not because it may incorporate entity-specific factors". [IFRS 13.BC82].

Under a transfer notion, the fair value of a liability is based on the price that would be paid to market participants to assume the obligation. The guidance is clear that an entity's intention to settle or otherwise fulfil the liability or exit the equity instrument is not relevant when measuring its fair value. Because the fair value of the liability is considered from the perspective of market participants, and not the entity itself, any relative efficiencies (or inefficiencies) of the reporting entity in settling the liability would not be considered in the fair value measurement.

Unlike a transfer notion, a settlement notion may allow for the consideration of a reporting entity's specific advantages (or disadvantages) in settling (or performing) the obligation. However, the Boards concluded that "when a liability is measured at fair value, the relative efficiency of an entity in settling the liability using its own internal resources appears in profit or loss over the course of its settlement, and not before". [IFRS 13.BC81].

While similar thought processes are needed to estimate both the amount to settle a liability and the amount to transfer that liability, [IFRS 13.BC82], IFRS 13 requires the fair value of a liability to be measured on the assumption that the liability is transferred to a market participant. Therefore, an entity cannot presume that the fair value of a liability is the same as its settlement value. In particular, the requirement to reflect the effect of non-performance risk in the fair value measurement of a liability could result in a difference between the fair value of a liability and the settlement value because it is unlikely that the counterparty would accept a different amount as settlement of the obligation if the entity's credit standing changed (i.e., the settlement value would not necessarily consider changes in credit risk).

At its January 2020 meeting, the IASB added a project to its work plan to amend aspects of IAS 37 *Provisions, Contingent Liabilities and Contingent Assets*. In April 2024, the IASB proposed an amendment to IAS 37 to specify that when measuring a provision, the discount rate reflects the time value of money, represented by a risk-free rate with no adjustment for non-performance risk.²⁰ The proposal would, therefore, retain a difference between the settlement and transfer value. The IASB will consider the feedback from the Accounting Standards Advisory Forum received in July 2024²¹ and from other stakeholders before the expected publication of an exposure draft in Q4 2024.

10.2 Measuring the fair value of a liability or an entity's own equity when quoted prices for the liability or equity instruments are not available

In many cases, there may be no quoted prices available for the transfer of an instrument that is identical or similar to an entity's own equity or a liability, particularly as liabilities are generally not transferred. For example, this might be the case for debt obligations that are legally restricted from being transferred, or for decommissioning liabilities that the entity does not intend to transfer. In such situations, an entity must determine whether the identical item is held by another party as an asset:

- If the identical item is held by another party as an asset - an entity is required to measure the fair value of a liability or its own equity from the perspective of a market participant that holds the asset (see section 10.2.1 below). [IFRS 13.35, IFRS 13.37].
- If the identical item is not held by another party as an asset - an entity measures the fair value of the liability or equity instrument using a valuation technique from the perspective of a market participant that owes the liability or has issued the claim on equity (see section 10.2.2 below). [IFRS 13.40].

Regardless of how an entity measures the fair value of a liability or its own equity, the entity is required to maximise the use of relevant observable inputs and minimise the use of unobservable inputs to meet the objective of a fair value measurement. That is, it must estimate the price at which an orderly transaction to transfer the liability or its own equity would take place between market participants at the measurement date under current market conditions. [IFRS 13.36].

10.2.1 Liabilities or an entity's own equity that are held by other parties as assets

If there are no quoted prices available for the transfer of an identical or a similar liability or the entity's own equity instrument and the identical item is held by another party as an asset, an entity uses the fair value of the corresponding asset to measure the fair value of the liability or equity instrument. [IFRS 13.37]. The fair value of the asset should be measured from the perspective of the market participant that holds that asset at the measurement date. This approach applies even when the identical item held as an asset is not traded (i.e., when the fair value of the corresponding asset is a Level 3 measurement). For example, under the guidance in IFRS 13, the fair value of a contingent consideration liability should equal its fair value when held as an asset despite the fact that the asset would likely be a Level 3 measurement.

In these situations, the entity measures the fair value of the liability or its own equity by: [IFRS 13.38]

- (a) Using the quoted price in an active market for the identical item held by another party as an asset if that price is available - this is illustrated in Example 12 in the standard (included in the extract below)
 - (b) If that price is not available, using other observable inputs, such as the quoted price in a market that is not active for the identical item held by another party as an asset
- Or
- (c) If the observable prices in (a) and (b) are not available, using another valuation technique (see section 13 below for further discussion), such as:
 - (i) An income approach, as is illustrated in Example 13 in the standard (included in the extract below)
- Or
- (ii) A market approach

As with all fair value measurements, inputs used to determine the fair value of a liability or an entity's own equity from the perspective of a market participant that holds the identical instrument as an asset must be prioritised in accordance with the fair value hierarchy. Accordingly, IFRS 13 indicates that the fair value of a liability or equity instrument held by another party as an asset should be determined based on the quoted price of the corresponding asset in an active market, if available. This is illustrated in Example 12 in the extract below. If such a price is not available, other observable inputs for the identical asset would be used, such as a quoted price in an inactive market. In the absence of quoted prices for the identical instrument held as an asset, other valuation techniques, including an income approach (as is illustrated in Example 13 in the extract below) or a market approach, would be used to determine the liability's or equity's fair value. In these instances, the objective is still to determine the fair value of the liability or equity from the perspective of a market participant that holds the identical instrument as an asset.

In some cases, the corresponding asset price may need to be adjusted for factors specific to the identical item held as an asset but not applicable to the liability, such as the following: [IFRS 13.39]

- The quoted price for the asset relates to a similar (but not identical) liability or equity instrument held by another party as an asset. IFRS 13 gives the example of a liability or equity instrument where the credit quality of the issuer is different from that reflected in the fair value of the similar liability or equity instrument held as an asset.
- The unit of account for the asset is not the same as for the liability or equity instrument. For instance, assume the price for an asset reflected a combined price for a package that comprised both the amounts due from the issuer and a third-party credit enhancement. If the unit of account for the liability is only its own liability, not the combined package, the entity would adjust the observed price for the asset to exclude the effect of the third-party credit enhancement.

In addition, IFRS 13 states that when using the price of a corresponding asset to determine the fair value of a liability or entity's own equity, the fair value of the liability or equity should not incorporate the effect of any restriction preventing the sale of that asset. [IFRS 13.39]. If the quoted price did reflect the effect of a restriction, it would need to be adjusted. That is, all else being equal, the liability's or equity's fair value would be the same as the fair value of an otherwise unrestricted corresponding asset.

The fair value of a liability may also differ from the price of its corresponding asset when the instrument is priced within a bid-ask spread. In these instances, the liability should be valued based on the price within the bid-ask spread that is most representative of where the liability would be exited, not the corresponding asset (see section 14.3 below for discussion on pricing within the bid-ask spread).

The Boards believe the fair value of a liability or equity instrument will equal the fair value of a properly defined corresponding asset (i.e., an asset whose features mirror those of the liability), assuming an exit from both positions in the same market. This assumes markets are efficient and arbitrage free. For example, if the prices differed for a liability and the corresponding asset, the market participant taking on the liability would be able to earn a profit by financing the purchase of the asset with the proceeds received by taking on the liability. In an efficient market, the price for the liability and the price for the asset would adjust until the arbitrage opportunity was eliminated. In the Boards' view, the price for the liability or equity instrument and the corresponding asset would generally only differ if the entity was measuring an asset relating to a similar (not identical) instrument or the unit of account was different. The Boards did consider whether the effects of illiquidity could create a difference but noted that they are difficult to differentiate from credit-related effects. [IFRS 13.BC88, IFRS 13.BC89].

The following two examples extracted from IFRS 13 include factors to consider when measuring the fair value of a liability or entity's own equity by estimating the fair value of the corresponding asset held by another party. The first example highlights how entities need to assess whether the quoted price for a corresponding asset includes the effects of factors not applicable to the liability. However, for the sake of simplicity, the example does not consider bid-ask spread considerations. [IFRS 13.IE Example 12, IFRS 13.IE40, IFRS 13.IE41, IFRS 13.IE42].

Extract from IFRS 13

Example 12-Debt obligation: quoted price

On 1 January 20X1 Entity B issues at par a CU2 million BBB-rated exchange-traded five-year fixed rate debt instrument with an annual 10 per cent coupon. Entity B designated this financial liability as at fair value through profit or loss.

On 31 December 20X1 the instrument is trading as an asset in an active market at CU929 per CU1,000 of par value after payment of accrued interest. Entity B uses the quoted price of the asset in an active market as its initial input into the fair value measurement of its liability ($\text{CU}929 \times [\text{CU}2 \text{ million} \div \text{CU}1,000] = \text{CU}1,858,000$).

In determining whether the quoted price of the asset in an active market represents the fair value of the liability, Entity B evaluates whether the quoted price of the asset includes the effect of factors not applicable to the fair value measurement of a liability, for example, whether the quoted price of the asset includes the effect of a third-party credit enhancement if that credit enhancement would be separately accounted for from the perspective of the issuer. Entity B determines that no adjustments are required to the quoted price of the asset. Accordingly, Entity B concludes that the fair value of its debt instrument at 31 December 20X1 is CU1,858,000. Entity B categorises and discloses the fair value measurement of its debt instrument within Level 1 of the fair value hierarchy.

The second example provides factors that would be incorporated when using a present value technique to estimate the fair value of a financial liability (e.g., changes in credit spreads for the liability), as well as factors that would be excluded (e.g., adjustments related to transferability restrictions or profit margin). [IFRS 13.IE Example 13, IFRS 13.IE43-IE47].

Extract from IFRS 13

Example 13-Debt obligation: present value technique

On 1 January 20X1 Entity C issues at par in a private placement a CU2 million BBB-rated five-year fixed rate debt instrument with an annual 10 per cent coupon. Entity C designated this financial liability as at fair value through profit or loss.

At 31 December 20X1 Entity C still carries a BBB credit rating. Market conditions, including available interest rates, credit spreads for a BBB-quality credit rating and liquidity, remain unchanged from the date the debt instrument was issued. However, Entity C's credit spread has deteriorated by 50 basis points because of a change in its risk of non-performance. After taking into account all market conditions, Entity C concludes that if it was to issue the instrument at the measurement date, the instrument would bear a rate of interest of 10.5 per cent or Entity C would receive less than par in proceeds from the issue of the instrument.

For the purpose of this example, the fair value of Entity C's liability is calculated using a present value technique. Entity C concludes that a market participant would use all the following inputs (consistently with paragraphs B12-B30 of the IFRS) when estimating the price the market participant would expect to receive to assume Entity C's obligation:

- (a) the terms of the debt instrument, including all the following:
 - (i) coupon of 10 per cent;
 - (ii) principal amount of CU2 million; and
 - (iii) term of four years.
- (b) the market rate of interest of 10.5 per cent (which includes a change of 50 basis points in the risk of non-performance from the date of issue).

On the basis of its present value technique, Entity C concludes that the fair value of its liability at 31 December 20X1 is CU1,968,641.

Entity C does not include any additional input into its present value technique for risk or profit that a market participant might require for compensation for assuming the liability. Because Entity C's obligation is a financial liability, Entity C concludes that the interest rate already captures the risk or profit that a market participant would require as compensation for assuming the liability. Furthermore, Entity C does not adjust its present value technique for the existence of a restriction preventing it from transferring the liability.

While Example 13 above assumes that relevant market data on the non-performance risk of the debt obligation is readily available, estimating the appropriate credit spreads is often the most challenging aspect of using a present value technique to value a debt instrument. Credit spreads on identical or similar liabilities issued by the same obligor represent high quality market data. But even when issued by the same obligor, credit spreads on liabilities with significantly different features or characteristics may not appropriately capture the credit risk of the liability being measured. When spreads on identical instruments do not exist and data from comparable debt instruments (e.g., option adjusted spreads (OAS)) is used, the specific characteristics of these comparable liabilities (e.g., tenor, seniority, collateral, coupon, principal amortisation, covenant strength) should be analysed carefully. In addition, credit default swap (CDS) spreads, which represent the compensation required by the CDS issuer to accept the default risk of a debt issuer (i.e., the reference obligor), may also provide useful market data.

In some instances, observable market data is not available for a specific debt issuer, but the issuer has a reported credit rating. In these circumstances, credit spreads or CDS spreads of similarly rated entities or debt instruments may be used as a proxy to evaluate the credit risk of the liability being measured. In other instances, an entity lacking a published rating might use the rating of its parent as a proxy. In such cases, it would then be necessary to adjust this proxy rating to accurately reflect the entity's own credit profile. Once again, the specific characteristics of these similar debt instruments and the subject liability should be compared.

Other situations may involve a liability with no observable credit quality measures (e.g., credit spreads) issued by an entity that is not rated. In these circumstances, techniques such as a regression or other quantitative analysis may be performed to determine the credit quality of the issuer. Comparing financial metrics such as profit margins, leverage ratios, and asset sizes between the non-rated issuer of the liability being measured to rated entities may allow a credit rating to be estimated. Once a credit rating has been determined, an appropriate credit spread could be quantified from other comparable (i.e., similarly rated) debt instruments.

10.2.2 Liabilities or an entity's own equity not held by other parties as assets

While many liabilities are held by market participants as corresponding assets, some are not. For example, there is typically no corresponding asset holder for a decommissioning liability. When no observable price is available for a liability and no corresponding asset exists, the fair value of the liability is measured from the perspective of a market participant that owes the liability, using an appropriate valuation technique (e.g., a present value technique). [IFRS 13.40].

Generally, an instrument classified as an entity's own equity would have a corresponding asset. However, if no corresponding asset exists and no observable price is available for an entity's own equity, fair value is measured from the perspective of a market participant that has issued the claim on equity, using an appropriate valuation technique.

IFRS 13 gives two examples of what an entity might take into account in measuring fair value in this situation: [IFRS 13.41]

- (a) The future cash outflows that a market participant would expect to incur in fulfilling the obligation (i.e., a present value technique). This includes any compensation a market participant would require for taking on the obligation. This approach is discussed further in section 10.2.2.A below.
- (b) The amount that a market participant would receive to enter into an identical liability or issue an identical equity instrument. This approach is discussed further in section 10.2.2.B below.

10.2.2.A Use of present value techniques to measure fair value for liabilities and an entity's own equity instruments not held by other parties as assets

If an entity uses a present value technique to measure the fair value of a liability or its own equity not held by other parties as assets, IFRS 13 requires the entity to estimate the future cash outflows that a market participant would expect to incur in fulfilling the obligation, among other things. The estimated cash flows include: [IFRS 13.B31]

- Market participants' expectations about the costs of fulfilling the obligation
- Compensation that a market participant would require for taking on the obligation - this compensation includes the return that a market participant would require for the following:
 - (i) Undertaking the activity (i.e., the value of fulfilling the obligation) - for example, by using resources that could be used for other activities
 - (ii) Assuming the risk associated with the obligation (i.e., a *risk premium* that reflects the risk that the actual cash outflows might differ from the expected cash outflows)

In some cases, the components of the return a market participant would require will be indistinguishable from one another. In other cases, an entity will need to estimate those components separately. For example, assume an entity uses the price a third-party contractor would charge as part of the discounted cash flows. If the contract is priced on a fixed fee basis, both the return for undertaking the activity and the risk premium would be indistinguishable. However, as is shown in Example 11 in the standard (included in the extract below), if the contractor would charge on a cost-plus basis, an entity would need to estimate the components separately, because the contractor in that case would not bear the risk of future changes in costs. [IFRS 13.B32].

A risk premium can be included in such fair value measurements, either by:

- (a) Adjusting the cash flows (i.e., as an increase in the amount of cash outflows)
- Or
- (b) Adjusting the rate used to discount the future cash flows to their present values (i.e., as a reduction in the discount rate)

However, an entity must ensure adjustments for risk are not double-counted or omitted. [IFRS 13.B33].

IFRS 13 provides the following example, which illustrates how these considerations would be captured when using a valuation technique to measure the fair value of a liability not held by another party as an asset.

[IFRS 13.IE Example 11, IFRS 13.IE35-IE39].

Extract from IFRS 13**Example 11-Decommissioning liability**

On 1 January 20X1 Entity A assumes a decommissioning liability in a business combination. The entity is legally required to dismantle and remove an offshore oil platform at the end of its useful life, which is estimated to be 10 years.

On the basis of paragraphs B23-B30 of the IFRS, Entity A uses the expected present value technique to measure the fair value of the decommissioning liability.

If Entity A was contractually allowed to transfer its decommissioning liability to a market participant, Entity A concludes that a market participant would use all the following inputs, probability-weighted as appropriate, when estimating the price it would expect to receive:

- (a) labour costs;
- (b) allocation of overhead costs;
- (c) the compensation that a market participant would require for undertaking the activity and for assuming the risk associated with the obligation to dismantle and remove the asset. Such compensation includes both of the following:
 - (i) profit on labour and overhead costs; and
 - (ii) the risk that the actual cash outflows might differ from those expected, excluding inflation;
- (d) effect of inflation on estimated costs and profits;
- (e) time value of money, represented by the risk-free rate; and
- (f) non-performance risk relating to the risk that Entity A will not fulfil the obligation, including Entity A's own credit risk.

The significant assumptions used by Entity A to measure fair value are as follows:

- (a) Labour costs are developed on the basis of current marketplace wages, adjusted for expectations of future wage increases, required to hire contractors to dismantle and remove offshore oil platforms. Entity A assigns probability assessments to a range of cash flow estimates as follows:

Cash flow estimate (CU)	Probability assessment	Expected cash flows (CU)
100,000	25%	25,000
125,000	50%	62,500
175,000	25%	43,750
		<u>CU131,250</u>

The probability assessments are developed on the basis of Entity A's experience with fulfilling obligations of this type and its knowledge of the market.

- (b) Entity A estimates allocated overhead and equipment operating costs using the rate it applies to labour costs (80 per cent of expected labour costs). This is consistent with the cost structure of market participants.
- (c) Entity A estimates the compensation that a market participant would require for undertaking the activity and for assuming the risk associated with the obligation to dismantle and remove the asset as follows:
 - (i) A third-party contractor typically adds a mark-up on labour and allocated internal costs to provide a profit margin on the job. The profit margin used (20 per cent) represents Entity A's understanding of the operating profit that contractors in the industry generally earn to dismantle and remove offshore oil platforms. Entity A concludes that this rate is consistent with the rate that a market participant would require as compensation for undertaking the activity.
 - (ii) A contractor would typically require compensation for the risk that the actual cash outflows might differ from those expected because of the uncertainty inherent in locking in today's price for a project that will not occur for 10 years. Entity A estimates the amount of that premium to be 5 per cent of the expected cash flows, including the effect of inflation.
- (d) Entity A assumes a rate of inflation of 4 per cent over the 10-year period on the basis of available market data.
- (e) The risk-free rate of interest for a 10-year maturity on 1 January 20X1 is 5 per cent. Entity A adjusts that rate by 3.5 per cent to reflect its risk of non-performance (ie the risk that it will not fulfil the obligation), including its credit risk. Therefore, the discount rate used to compute the present value of the cash flows is 8.5 per cent.

Entity A concludes that its assumptions would be used by market participants. In addition, Entity A does not adjust its fair value measurement for the existence of a restriction preventing it from transferring the liability. As illustrated in the following table, Entity A measures the fair value of its decommissioning liability as CU194,879.

	Expected cash flows (CU) 1 January 20X1
Expected labour costs	131,250
Allocated overhead and equipment costs ($0.80 \times \text{CU}131,250$)	105,000
Contractor's profit mark-up [$0.20 \times (\text{CU}131,250 + \text{CU}105,000)$]	47,250
Expected cash flows before inflation adjustment	283,500
Inflation factor (4% for 10 years)	1.4802
Expected cash flows adjusted for inflation	419,637
Market risk premium ($0.05 \times \text{CU}419,637$)	20,982
Expected cash flows adjusted for market risk	440,619
Expected present value using discount rate of 8.5% for 10 years	194,879

In practice, estimating the risk premium for a decommissioning liability, such as in Example 11 above, requires significant judgement, particularly in circumstances where the decommissioning activities will be performed many years in the future. Information about the compensation market participants would demand to assume decommissioning liability may be limited, because very few decommissioning liabilities are transferred in the manner contemplated by IFRS 13 in a separate transaction.

Because of these data limitations, entities might look to risk premiums observed from business combinations where decommissioning liabilities are assumed, including their own business combination transactions. IFRS 13 indicates that when market information is not reasonably available, an entity may consider its own data in developing assumptions related to the market risk premium (see section 18 below for additional discussion on the use of an entity's own data to determine unobservable inputs).

Alternatively, as noted above, the market risk premium might be estimated by considering the difference between a fixed-price arrangement and a cost-plus arrangement with a third party to complete the remediation and monitor the site. The difference between the fixed-price arrangement and the cost-plus arrangement may provide insight into the risk premium market participants would demand to fulfil the obligation.

How we see it

While all available evidence about market participant assumptions regarding the market risk premium needs to be considered, circumstances may exist when an explicit assumption cannot be determined. In such cases, based on the specific guidance in IFRS 13 - which acknowledges that explicit assumptions in some cases may not be able to be incorporated into the measurement of a decommissioning liability - we believe the market risk premium might already be incorporated into the fair value measurement on an implicit basis. This means it is assumed that market participants might already have factored the market risk premium into their assumptions.

10.2.2.B Consideration of an entry price in measuring a liability or entity's own equity not held as an asset

Although fair value represents an exit price, IFRS 13 indicates that in certain situations an entry price may be considered in estimating the fair value of a liability or an entity's own equity instrument. This approach uses assumptions that market participants would use when pricing the identical item (e.g., having the same credit characteristics) in the principal (or most advantageous) market - that is, the principal (or most advantageous) market for issuing a liability or equity instrument with the same contractual terms.

The standard allows for entry prices to be considered in estimating the fair value of a liability because the IASB believes that a liability's entry and exit prices will be identical in many instances. As a result, the price at which a market participant could enter into the identical liability on the measurement date (e.g., an obligation having the same credit characteristics) may be indicative of its fair value.

However, an entry price may differ from the exit price for a liability for a number of reasons. For example, an entity may transfer the liability in a different market from that in which the obligation was incurred. When entry and exit prices differ, IFRS 13 is clear that the objective of the measurement remains an exit price.

10.3 Non-performance risk

IFRS 13 requires a fair value measurement of a liability to incorporate non-performance risk (i.e., the risk that an obligation will not be fulfilled). Conceptually, non-performance risk encompasses more than just an entity's credit risk. It may also include other risks, such as settlement risk. In the case of non-financial instruments, such as commodity contracts, non-performance risk could represent the risk associated with physically extracting and transferring an asset to the point of delivery. When measuring the fair value of a liability, an entity must:

- Take into account the effect of its credit risk (credit standing) and any other factors that could influence the likelihood whether or not the obligation will be fulfilled. [IFRS 13.43].
- Assume that non-performance risk will be the same before and after the transfer of a liability. [IFRS 13.42].
- Ensure the effect of non-performance risk on the fair value of the liability is consistent with its unit of account for financial reporting purposes. [IFRS 13.44].

If a liability is issued with a third-party credit enhancement that the issuer accounts for separately from the liability, the fair value of the liability does not include the effect of the credit enhancement (e.g., a third-party guarantee of debt). That is, the issuer would take into account its own credit standing and not that of the third-party guarantor when measuring the fair value of the liability (see section 10.3.1 below). [IFRS 13.44].

An entity takes into account the effect of its credit risk (credit standing) on the fair value of the liability in all periods in which the liability is measured at fair value because market participants valuing the entity's obligations as assets would take into account the effect of the entity's credit standing when estimating the prices at which they would transact. [IFRS 13.IE31]. Valuation techniques continue to evolve and new concepts are developing in relation to considering non-performance risk. Whether an entity should incorporate them into an IFRS 13 fair value measurement depends on whether market participants would take them into account.

Incorporating non-performance risk into subsequent fair value measurements of a liability is also consistent with the notion that credit risk affects the initial measurement of a liability. Since the terms of a liability are determined based on an entity's credit standing at the time of issuance (and since IFRS 13 assumes the liability is transferred to another party with the same credit standing at the measurement date), subsequent changes in an entity's credit standing will result in the obligation's terms being favourable or unfavourable relative to the market requirements at initial recognition. The standard gives the following example illustrating how the fair value of the same instrument could be different depending on the credit risk of the issuer. [IFRS 13.IE32].

Extract from IFRS 13

IE32 For example, assume that Entity X and Entity Y each enter into a contractual obligation to pay cash (CU500) to Entity Z in five years. Entity X has a AA credit rating and can borrow at 6 per cent, and Entity Y has a BBB credit rating and can borrow at 12 per cent. Entity X will receive about CU374 in exchange for its promise (the present value of CU500 in five years at 6 per cent). Entity Y will receive about CU284 in exchange for its promise (the present value of CU500 in five years at 12 per cent). The fair value of the liability to each entity (ie the proceeds) incorporates that entity's credit standing.

The effect of non-performance risk on the fair value measurement of the liability will depend on factors, such as the terms of any related credit enhancement or the nature of the liability - that is, whether the liability is an obligation to deliver cash (a financial liability) or an obligation to deliver goods or services (a non-financial liability).

The following example, from the standard, illustrates changes in fair value measurement due to changes in non-performance risk. As indicated in this example, changes to an entity's non-performance risk does not require there to be a change in credit rating. Instead, such changes are often based on changes in credit spreads. [IFRS 13.IE Example 10, IFRS 13.IE34].

Extract from IFRS 13

Example 10-Structured note

On 1 January 20X7 Entity A, an investment bank with a AA credit rating, issues a five-year fixed rate note to Entity B. The contractual principal amount to be paid by Entity A at maturity is linked to an equity index. No credit enhancements are issued in conjunction with or otherwise related to the contract (ie no collateral is posted and there is no third-party guarantee). Entity A designated this note as at fair value through profit or loss. The fair value of the note (ie the obligation of Entity A) during 20X7 is measured using an expected present value technique. Changes in fair value are as follows:

- (a) *Fair value at 1 January 20X7.* The expected cash flows used in the expected present value technique are discounted at the risk-free rate using the government bond curve at 1 January 20X7, plus the current market observable AA corporate bond spread to government bonds, if non-performance risk is not already reflected in the cash flows, adjusted (either up or down) for Entity A's specific credit risk (ie resulting in a credit-adjusted risk-free rate). Therefore, the fair value of Entity A's obligation at initial recognition takes into account non-performance risk, including that entity's credit risk, which presumably is reflected in the proceeds.
- (b) *Fair value at 31 March 20X7.* During March 20X7 the credit spread for AA corporate bonds widens, with no changes to the specific credit risk of Entity A. The expected cash flows used in the expected present value technique are discounted at the risk-free rate using the government bond curve at 31 March 20X7, plus the current market observable AA corporate bond spread to government bonds, if non-performance risk is not already reflected in the cash flows, adjusted for Entity A's specific credit risk (ie resulting in a credit-adjusted risk-free rate). Entity A's specific credit risk is unchanged from initial recognition. Therefore, the fair value of Entity A's obligation changes as a result of changes in credit spreads generally. Changes in credit spreads reflect current market participant assumptions about changes in non-performance risk generally, changes in liquidity risk and the compensation required for assuming those risks.
- (c) *Fair value at 30 June 20X7.* As of 30 June 20X7 there have been no changes to the AA corporate bond spreads. However, on the basis of structured note issues corroborated with other qualitative information, Entity A determines that its own specific creditworthiness has strengthened within the AA credit spread. The expected cash flows used in the expected present value technique are discounted at the risk-free rate using the government bond yield curve at 30 June 20X7, plus the current market observable AA corporate bond spread to government bonds (unchanged from 31 March 20X7), if non-performance risk is not already reflected in the cash flows, adjusted for Entity A's specific credit risk (ie resulting in a credit-adjusted risk-free rate). Therefore, the fair value of the obligation of Entity A changes as a result of the change in its own specific credit risk within the AA corporate bond spread.

The standard's assumption that the non-performance risk related to a liability is the same before and after its transfer is not intended to reflect reality. In most cases, the reporting entity and the market participant transferee will have different credit standings. However, this assumption is important when measuring fair value under IFRS 13 for the following reasons: [IFRS 13.BC94]

- If the transaction results in changes to the non-performance risk associated with the liability, the market participant taking on the obligation would not enter into the transaction without reflecting that change in the price.
IFRS 13 gives the following examples; a creditor would not generally permit a debtor to transfer its obligation to another party of lower credit standing, nor would a transferee of higher credit standing be willing to assume the obligation using the same terms negotiated by the transferor if those terms reflect the transferor's lower credit standing.
- If IFRS 13 did not specify the credit standing of the entity taking on the obligation, there could be fundamentally different fair values for a liability depending on an entity's assumptions about the characteristics of the market participant transferee.
- Those who might hold the entity's liability as an asset would consider the effect of the entity's credit risk and other risk factors when pricing those assets (see section 10.2.1 above).

In developing IFRS 13, there was some debate among constituents about the usefulness of including non-performance risk after initial recognition because this might lead to counter-intuitive and potentially confusing reporting (i.e., gains for credit deterioration and losses for credit improvements). However, in the IASB's view, this does not affect how to measure fair value, but rather whether an IFRS should require fair value measurement subsequent to initial recognition, which is outside the scope of IFRS 13. The standard is clear that a measurement that does not consider the effect of an entity's non-performance risk is not a fair value measurement. [IFRS 13.BC95]. The adoption of IFRS 9 may have resolved some of these concerns. For financial liabilities designated at fair value through profit or loss (using the fair value option), IFRS 9 requires fair value changes that are the result of changes in an entity's own credit risk to be presented in other comprehensive income, unless doing so would introduce an accounting mismatch. If it would introduce an accounting mismatch, the whole fair value change is presented in profit or loss (see Chapter 46 for further discussion). [IFRS 9.5.7.7].

10.3.1 Liabilities issued with third-party credit enhancements

As discussed in section 10.3 above, IFRS 13 requires entities to measure the fair value of a liability issued with an inseparable third-party credit enhancement that is accounted for separately from the liability from the issuer's perspective, i.e., considering the issuer's credit risk rather than that of the third-party providing the credit enhancement. [IFRS 13.44]. This would apply in situations where a credit enhancement (or guarantee) is purchased by an issuer, then combined with a liability and issued as a combined security to an investor. IFRS 13's requirements are based on the fact that the third-party credit enhancement does not relieve the issuer of its ultimate obligation under the liability. Generally, if the issuer fails to meet its payment obligations to the investor, the guarantor has an obligation to make the payments on the issuer's behalf and the issuer has an obligation to the guarantor. By issuing debt combined with a credit enhancement, the issuer is able to market its debt more easily and can either reduce the interest rate paid to the investor or receive higher proceeds when the debt is issued.

IFRS 13 requires the fair value measurement of a liability to follow the unit of account of the liability for financial reporting purposes. The standard anticipates that there may be instances where, even though it may be inseparable, the credit enhancement may need to be separated (i.e., separately recognised) for financial reporting purposes. However, this assumes that: (i) the unit of account is clear in other standards, which may not be the case; and (ii) that standards, such as IFRS 9, may permit or require separation when a credit enhancement is inseparable.

As discussed in Figure 10-1 below, if the unit of account excludes the credit enhancement, the fair value of the liability measured from the issuer's perspective in accordance with IFRS 13, will not equal its fair value as a guaranteed liability held by another party as an asset. The fair value of the asset held by the investor considers the credit standing of the guarantor. However, under the guarantee, any payments made by the guarantor result in a transfer of the issuer's debt obligation from the investor to the guarantor. That is, the amount owed by the issuer does not change; the issuer must now pay the guarantor instead of the investor. Therefore, as discussed in section 10.2.1 above, if the fair value of a third-party guaranteed liability is measured based on the fair value of the corresponding asset, it would need to be adjusted. [IFRS 13.BC96, IFRS 13.BC97, IFRS 13.BC98].

Figure 10-1: Liabilities with credit enhancements

	Issuer's perspective (i.e., the obligor)	Perspective of the entity that holds the corresponding asset
Credit enhancement provided by the issuer (e.g., collateral or master netting agreement)		
Separate unit of account?	Dependent on the relevant IFRS (e.g., IFRS 9). Depending on the nature of the credit enhancement, it may be recognised (e.g., collateral recognised as an asset in the financial statements of the issuer) or unrecognised (e.g., a master netting agreement).	Dependent on the relevant IFRS (e.g., IFRS 9) and the nature of the credit enhancement.
Considered in the fair value measurement?	Generally, yes. The fair value measurement of a liability takes into consideration the credit standing of the issuer. The effect may differ depending on the terms of the related credit enhancement.	Possibly. If the credit enhancement is not accounted for separately, the fair value of the corresponding asset would take into consideration the effect of the related credit enhancement.
Credit enhancement provided by a third-party (e.g., financial guarantee)		
Separate unit of account?	Dependent on the relevant IFRS (e.g., IFRS 9). Likely to be a separate unit of account and remain unrecognised unless the issuer fails to meet its obligations under the liability.	Dependent on the relevant IFRS (e.g., IFRS 9) and the nature of the credit enhancement.
Considered in the fair value measurement?	Generally, no. If the credit enhancement is accounted for separately from the liability, the issuer would take into account its own credit standing and not that of the third-party guarantor when measuring the fair value of the liability.	Possibly. If the credit enhancement is not accounted for separately, the fair value of the corresponding asset would take into consideration the effect of the related third-party credit enhancement.

Frequently asked questions

Question 10-1: Do the requirements of IFRS 13 regarding third-party credit enhancements in a fair value measurement apply to liabilities other than debt?

The requirements of IFRS 13 for liabilities issued with third-party credit enhancements apply to all liabilities that are measured or disclosed at fair value on a recurring basis. Although the requirements would not affect financial liabilities after their initial recognition if they are subsequently measured at amortised cost in accordance with IFRS 9, it would apply to the disclosure of the fair value of those liabilities, as required by IFRS 7.

While an issuer's accounting for guaranteed debt may be the most common application of this guidance, the clarification with respect to the unit of account for certain types of credit enhancements could affect other liabilities, including derivative instruments measured at fair value in accordance with IFRS 9. Many OTC derivative contracts are subject to credit support requirements under an International Swaps and Derivatives Association²² (ISDA) Master Agreement between the derivative counterparties. The application of this guidance to OTC derivatives will depend on the nature of the credit support provided. For example, while credit support is typically provided through the posting of collateral, in certain industries posting a letter of credit (LOC) for the benefit of a derivative counterparty is not uncommon.

In those instances where a LOC is posted for the benefit of a derivative counterparty, we believe the requirement in IFRS 13.44, to consider the issuer's credit risk rather than that of the third party providing the LOC, would generally apply. [IFRS 13.44]. If an entity defaults on its derivative contracts, the bank issuing the LOC will pay the counterparty and the entity's obligation merely transfers from the original counterparty to the issuing bank. In other words, the entity will have a continuing obligation, even in the event it defaults on the derivative. As such, the entity's non-performance risk (not that of the bank providing the LOC) would be considered in determining the fair value of the derivative liability.

How we see it

We believe the above generally would apply even if the LOC were deemed separable from the derivative contract. In our view, including the effect of separable credit enhancements while excluding the effect of inseparable credit enhancements would contradict the principles of IFRS 13.

Question 10-2: Does IFRS 13 require an entity to consider the effects of both counterparty credit risk and its own credit risk when valuing its derivative transactions?

IFRS 13 addresses the issue of credit risk both explicitly and implicitly. As discussed in section 10.3 above, in relation to an entity's own credit risk in the valuation of liabilities, the guidance is explicit; the fair value of a liability should reflect the effect of non-performance risk, which includes own credit risk.

The standard's requirements are less explicit regarding counterparty credit risk. IFRS 13 requires the fair value of an asset or liability to be measured based on market participant assumptions. Because market participants consider counterparty credit risk in pricing a derivative contract, an entity's valuation methodology should incorporate counterparty credit risk in its measurement of fair value.

10.3.2 How should an entity incorporate credit risk into the valuation of its derivative contracts?

As discussed in section 10.3 above, IFRS 13 requires entities to consider the effects of credit risk when determining a fair value measurement, e.g., by calculating a debit valuation adjustment (DVA) or a credit valuation adjustment (CVA) on their derivatives.

As no specific method is prescribed in IFRS 13, various approaches are used in practice by derivatives dealers and end-users to estimate the effect of credit risk on the fair value of OTC derivatives.

²² The International Swaps and Derivatives Association (ISDA) agreement is part of a framework of documents designed to enable OTC derivatives to be documented fully and flexibly. The ISDA master agreement sets out the standard terms that apply to all transactions and is published by the International Swaps and Derivatives Association.

The degree of sophistication in the credit adjustment valuation method used by a reporting entity is influenced by the qualitative factors noted below. Estimation can be complex and requires the use of significant judgement, which is often influenced by various qualitative factors, including:

- Materiality of the entity's derivative's carrying value to its financial statements
- Number and type of contracts for derivatives in the entity's portfolio and the specific terms of those instruments (e.g., maturity dates, fixed and/or variable payments)
- Specific timing and amounts of expected cash flows and the extent to which derivative instruments are either deeply in or out of the money
- Existence and terms of credit mitigation arrangements (e.g., collateral arrangements in place)
- Cost and availability of technology to model complex credit exposures
- Cost and consistent availability of suitable input data to calculate an accurate credit adjustment
- Creditworthiness of the entity and its counterparties

While the degree of sophistication and complexity may differ by entity and by the size and nature of the derivative portfolio, any inputs used under any methodology should be consistent with assumptions market participants would use. For example, the CVA measurement might need to be adjusted when a counterparty is materially exposed to climate-related risks and the adjustment is consistent with those that market participants would make. The complexity and judgement involved in selecting and consistently applying a method may require entities to provide additional disclosures to assist users of financial statements (see section 19 below). Section 10.3.3.A to 10.3.3.B below provide further insights into some of the considerations for determining valuation adjustments for credit risk on derivatives measured at fair value, except for which a quoted price in an active market is available (i.e., over-the-counter derivatives).

In situations where an entity has a master netting agreement or credit support annex²³ (CSA) with a counterparty, the entity may consider the credit risk of its derivative instruments with that counterparty on a net basis if it qualifies to use the measurement exception noted in section 2.5.2 above (see section 11 below for more detail on applying the measurement exception for financial instruments with offsetting credit risks).

10.3.2.A How do credit adjustments work?

In simple terms, the requirement for a credit adjustment as a component of fair value measurement can be analogised to the need for a provision on a trade receivable or an impairment charge on an item of property, plant and equipment. Whilst this analogy helps conceptualise the requirement, the characteristics of derivatives mean that the calculation itself can be significantly more complex than for assets measured at amortised cost.

Consistent with the fact that credit risk affects the initial measurement of a derivative asset or liability, IFRS 13 requires that changes in counterparty credit risk or an entity's own credit standing be considered in subsequent fair value measurements. It cannot be assumed that the parties to the derivative contract will perform.

The terms of the asset or liability were determined based on the counterparty's or entity's credit standing at the time of entering into the contract. In addition, IFRS 13 assumes a liability is transferred to another party with the same credit standing at the measurement date. As a result, subsequent changes in a counterparty's or entity's credit standing will result in the derivative's terms being favourable or unfavourable relative to the market conditions at initial recognition.

Unlike the credit exposure of a 'vanilla' receivable, which generally remains constant over time (typically at the principal amount of the receivable), the bilateral nature of the credit exposure in many derivatives varies, whereby both parties to the contract may face potential exposure in the future. As such, many instruments may possibly have a value that is either positive (a derivative asset) or negative (a derivative liability) at different points in time based on changes in the underlying variables of the contract.

²³ A credit support annex (CSA) is a legal document that regulates the credit support (collateral) for derivative transactions and forms part of an ISDA Master Agreement.

Figure 10-2 below illustrates the effect on the income statement and on the statement of financial position of CVA and DVA adjustments as a component of fair value measurement on a single derivative asset or liability.

Figure 10-2: Accounting for CVA and DVA

	Derivative asset example - CVA	CU		Derivative liability example - DVA	CU
Derivative position valued using the risk-free curve (1)	Risk-free derivative asset	100,000		Risk-free derivative liability	(100,000)
Credit adjustment required (2)	Counterparty credit adjustment	(10,000)		Debit adjustment based on own credit	5,000
Credit-adjusted derivative position	Derivative asset	90,000		Derivative liability	(95,000)
Subsequent credit movements					
Counterparty credit improves	A gain arises in the income statement and is reflected by a larger derivative asset in the statement of financial position		Own credit improves	A loss arises in the income statement and is reflected by a larger derivative liability in the statement of financial position	
Counterparty credit deteriorates	A further CVA charge is required in the income statement and is reflected by a reduced derivative asset in the statement of financial position		Own credit deteriorates	A further DVA credit is required to the income statement and is reflected by a reduced derivative liability in the statement of financial position	

Notes:

- (1) The table represents a point-in-time during the life of a derivative asset or liability
- (2) For illustrative purposes, we have assumed the counterparty credit valuation adjustment is CU10,000 and the debit valuation adjustment is CU5,000. These credit adjustments are not intended to reflect reality

10.3.2.B Valuation methods

The determination of a credit adjustment can be complex. Part of the complexity stems from the particular nature of credit risk in many OTC derivative contracts. Credit risk associated with a derivative contract is similar to other forms of credit risk in that the cause of economic loss is an obligor's default on its contractual obligation. However, for many derivative products, two features set credit risk in OTC derivative contracts apart from traditional forms of credit risk in instruments such as debt:

- Uncertainty of the future exposure associated with the instrument - this is due to the uncertainty of future changes in value of the derivative, as the cash flows required under the instrument stem from: (a) movements in underlying variables that drive the value of the contract; and (b) the progression of time towards the contract's expiry.
- Bilateral nature of credit exposure in many derivatives, whereby both parties to the contract may face potential exposure in the future - this can occur in instruments, such as swaps and forwards, given the potential for these derivatives to 'flip' from an asset to a liability (or *vice versa*), based on changes in the underlying variables to the contract (e.g., interest rates or foreign exchange rates).

As previously noted in section 10.3.2 above, IFRS does not prescribe any specific valuation methods to quantify the impact of non-performance risk on derivatives' fair value. IFRS 13 is a principles-based standard intended to provide a general framework for measuring fair value. It was not intended to provide detailed application guidance for calculating the fair value of various types of assets and liabilities. Likewise, IFRS 9 does not provide specific valuation guidance related to derivatives. As a result, extensive judgement needs to be applied, potentially resulting in diversity in the methods and approaches used to quantify credit risk, particularly as it pertains to derivatives. As discussed in section 10.3.2 above, a variety of factors may influence the method an entity chooses for estimating credit adjustments. In addition, the cost and availability of technology and input data to model complex credit exposures will also be a contributing factor.

Some derivative dealers include a funding valuation adjustment (FVA) in the valuation of their uncollateralised derivative positions, as is illustrated in the extract from the financial statements of ING Groep N.V. included in Practical example 10-1 below. FVA is included in order to capture the funding cost (or benefit) that results from posting (or receiving) collateral on inter-bank transactions that are used to economically hedge the market risk associated with these uncollateralised trades. The methods for determining FVA can vary. As such, determining whether these methods comply with IFRS 13 requires judgement based on the specific facts and circumstances.

A number of valuation adjustments have also emerged in addition to CVA, DVA and FVA. Examples include self-default potential hedging (LVA), collateral (CollVA) and market hedging positions (HVA), as well as capital value adjustments (KVA), which collectively are now referred to as X-Value Adjustments (XVA). It is important to note that some of these valuation adjustments may be useful for internal reporting, but may not be appropriate to use when measuring fair value in accordance with IFRS 13. As noted above, the inputs used in measuring fair value must reflect the assumptions of market participants transacting for the asset or liability in the principal (or most advantageous) market at the measurement date and many of these adjustments are specific to the entity (for example, their regulatory position).

Practical example 10-1: ING Groep N.V. (2023)

Netherlands

Annual Report 2023 [extract]**Consolidated financial statements [extract]****Notes to the Consolidated financial statements [extract]****1 Basis of preparation and material accounting policy information [extract]****1.5 Financial instruments [extract]****1.5.3 Fair values of financial assets and liabilities**

All financial assets and liabilities are recognised initially at fair value. The fair value of a financial instrument on initial recognition is generally its transaction price (that is, the fair value of the consideration given or received). However, if there is a material difference between the transaction price and the fair value of financial instruments whose fair value is based on a valuation technique using significant unobservable inputs, the entire day one difference (a 'Day One Profit or Loss') is deferred. ING Group defers the Day One Profit or Loss relating to financial instruments classified as Level 3 and financial instruments with material unobservable inputs into CVA which are not necessarily classified as Level 3. The deferred Day One Profit or Loss is recognised in the statement of profit or loss over the life of the transaction until the transaction matures, or until the significant unobservable inputs become observable, or until the significant unobservable inputs become non-significant. In all other cases, ING Group recognises the difference as a gain or loss at inception.

Subsequently, except for financial assets and financial liabilities measured at amortised cost, all the other financial assets and liabilities are measured at fair value.

Fair value is defined as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. It assumes that market participants would use and take into account the characteristics of the asset or liability when pricing the asset or liability. Fair values of financial assets and liabilities are based on unadjusted quoted market prices where available. Such quoted market prices are primarily obtained from exchange prices for listed financial instruments. Where an exchange price is not available, quoted prices in an active market may be obtained from independent market vendors, brokers, or market makers. In general, positions are valued at the bid price for a long position and at the offer price for a short position or are valued at the price within the bid-offer spread that is most representative of fair value in the circumstances. In some cases where positions are marked at mid-market prices, a fair value adjustment is calculated.

For certain financial assets and liabilities, quoted market prices are not available. For such instruments, fair value is determined using valuation techniques. These range from discounting of cash flows to various valuation models, where relevant pricing factors including the market price of underlying reference instruments, market parameters (volatilities, correlations and credit ratings), and customer behaviour are taken into account. ING Group maximises the use of market observable inputs and minimises the use of unobservable inputs in determining the fair value. It can be subjective dependent on the significance of the unobservable input to the overall valuation. All valuation techniques used are subject to internal review and approval. Most data used in these valuation techniques are validated on a daily basis when possible.

When a group of financial assets and liabilities are managed on the basis of their net risk exposures, the fair value of a group of financial assets and liabilities are measured on a net portfolio level.

To include credit risk in fair value, ING Group applies both Credit and Debit Valuation Adjustments (CVA, DVA, also known as Bilateral Valuation Adjustments or BVA). Own issued debt and structured notes that are designated at FVPL are adjusted for ING Group's own credit risk by means of a DVA. To include the funding risk, ING Group applies an additional 'Funding Valuation Adjustment' (FVA) to the uncollateralised derivatives based on the market price of funding liquidity. ING Group also applies to certain positions other valuation adjustments to arrive at the fair value: Bid-Offer adjustments, Model Risk Adjustments and Collateral Valuation Adjustments (CollVA).

Significant judgements and critical accounting estimates and assumptions:

- Even if market prices are available, when markets are less liquid there may be a range of prices for the same security from different price sources. Selecting the most appropriate price requires judgement and could result in different estimates of fair value.
- Valuation techniques are subjective in nature and significant judgement is involved in establishing fair values for certain financial assets and liabilities. Valuation techniques involve various assumptions regarding pricing factors. The use of different valuation techniques and assumptions could produce significantly different estimates of fair value.
- Price testing is performed to assess whether the process of valuation has led to an appropriate fair value of the position and to minimise the potential risks of economic losses due to incorrect or misused models.
- Assessing whether a market is active, and whether an input is observable and significant, requires judgement. ING Group categorises its financial instruments that are either measured in the statement of financial position at fair value or of which the fair value is disclosed, into a three-level hierarchy based on the observability and significance of the valuation inputs. The use of different approaches to assess whether a market is active, whether an input is observable, and whether an unobservable input is significant could produce different classification within the fair value hierarchy as well as potentially different deferral of the Day One Profit or Loss.
- Reference is made to Note 35 'Fair value of assets and liabilities ' and to the 'Market risk' paragraph in the 'Risk management' section of the Annual Report for the basis of the determination of the fair value of financial instruments and related sensitivities.

10.3.2.C Data challenges

In addition to the method employed to determine a credit adjustment, the inputs used in the various approaches can often require significant judgement. Regardless of the method used, probability of default, loss given default (i.e., the amount that one party expects not to recover if the other party defaults) or credit spread assumptions are important inputs. While the sources of information may vary, the objective remains unchanged - i.e., to incorporate inputs that reflect the assumptions of market participants in the current market.

Where available, IFRS 13 requires entities to make maximum use of market-observable credit information. For example, credit default swap (CDS) spreads may provide a good indication of the market's current perception of a particular reporting entity's or counterparty's creditworthiness. However, CDS spreads will likely not be available for smaller public companies or private entities. In these instances, reporting entities may need to consider other available indicators of creditworthiness, such as publicly traded debt or loans.

In the absence of any observable indicator of creditworthiness, a reporting entity may be required to combine a number of factors to arrive at an appropriate credit valuation adjustment. For example, it may be necessary to determine an appropriate credit spread using a combination of own issuance credit spread data, publicly available information on competitors' debt pricing, sector specific CDS spreads or relevant indices, or historical company or sector-specific probabilities of default.

In all cases, identifying the basis for selecting the proxy, benchmark or input, including any analysis performed and assumptions made, should be documented. Such an analysis may include calculating financial ratios to evaluate the reporting entity's financial position relative to its peer group and their credit spreads. These metrics may consider liquidity, leverage and general financial strength, as well as comparable attributes such as credit ratings, similarities in business mix and level of regulation or geographic footprint.

The use of historical default rates would seem to be inconsistent with the exit price notion in IFRS 13, particularly when credit spread levels in the current environment differ significantly from historical averages. Therefore, when current observable information is unavailable, management should adjust historical data to arrive at its best estimate of the assumptions that market participants would use to price the instrument in an orderly transaction in the current market.

Figure 10-3 below highlights some of the common sources of credit information and the advantages and disadvantages of using each input for the credit adjustment calculation.

Figure 10-3: Credit data requirements

Data requirements	Advantages	Disadvantages
CDS curve (own or counterparty)	<ul style="list-style-type: none"> ▪ Market observable ▪ Information is current (for counterparties with adequate CDS trading volume) ▪ Easy to source from third party data providers ▪ Exposure specific data available for most banking counterparties 	<ul style="list-style-type: none"> ▪ Not available for many entities ▪ May not be representative of all the assets of the entity ▪ May have liquidity issues due to low trading volumes, resulting in higher-than-expected spreads and additional volatility in calculations ▪ CDS quotes may be indicative quotes, not necessarily reflective of actual trades
Current debt credit spread	<ul style="list-style-type: none"> ▪ Market observable ▪ Available for some publicly traded debt instruments ▪ Easy to source from third party data providers 	<ul style="list-style-type: none"> ▪ May require an adjustment for illiquidity ▪ May require a judgemental adjustment due to maturity mismatch and amount of security of debt issuance and derivative to be valued
Sector-specific CDS Index or competitor CDS Curve	<ul style="list-style-type: none"> ▪ Market-observable ▪ Information is current ▪ Easy to source from third party data providers ▪ Proxy CDS curve mapping is possible for almost all entities 	<ul style="list-style-type: none"> ▪ Not exposure-specific; may require judgemental adjustments to reflect differences between proxy and entity (e.g., size, credit rating) ▪ Index CDS curves can be influenced by macro-economic factors, which do not affect entity or affect entity to a lesser or greater extent

10.3.3 Does the existence of master netting agreements and/or CSAs eliminate the need to consider an entity's own credit risk when measuring the fair value of derivative liabilities?

IFRS 13 is clear that non-performance risk should be considered from the perspective of the liability being measured, not the entity obligated under the liability. As such, non-performance risk may differ for various liabilities of the same entity. This difference may result from the specific terms of the liability (e.g., seniority or priority in the event of liquidation) or from specific credit enhancements related to the liability (e.g., collateral).

Bilateral collateral arrangements, master netting agreements and other credit enhancement or risk mitigation tools will reduce the credit exposure associated with a liability (or asset) and should be considered in determining the fair value of the liability. Although these agreements reduce credit exposure, they typically do not eliminate the exposure completely. For example, most CSAs do not require collateral to be posted until a certain threshold has been reached, and once reached require collateral only for the exposure in excess of the threshold. Therefore, while the existence of master netting agreements or CSAs mitigates the effect of own credit risk on the fair value of a liability, their presence alone would not enable an entity to ignore its own credit risk. Entities should assess their credit exposure to a specific liability when determining how their own credit risk would affect its fair value.

10.3.3.A Portfolio approaches and credit mitigation arrangements

When calculating derivative credit adjustments, reporting entities may factor in their ability to reduce their counterparty exposures through any existing netting or collateral arrangements. The measurement exception in IFRS 13 (see section 11 below) allows a reporting entity to measure the net credit risk of a portfolio of derivatives to a single counterparty, assuming there is an enforceable arrangement in place that mitigates credit risk upon default (e.g., a master netting agreement). [IFRS 13.48].

- *Netting arrangements*

A master netting agreement is a legally binding contract between two counterparties to net exposures under other agreements or contracts (e.g., relevant ISDA agreements, CSAs and any other credit enhancements or risk mitigation arrangements in place) between the same two parties. Such netting may be effected with periodic payments (payment netting), settlement payments following the occurrence of an event of default (close-out netting) or both. In cases of default, such an agreement serves to protect the parties from paying out on the gross amount of their payable positions, while receiving less than the full amount on their gross receivable positions with the same counterparty.

IFRS 7 requires disclosure of the effects of set-off and related netting on an entity's financial position (see Chapter 50 for further discussion).

In situations where an entity meets the criteria to apply the measurement exception in IFRS 13 (discussed in section 11 below), it will still need to assess whether it has the practical ability to implement a credit valuation method which reflects the net counterparty exposure. This can be challenging, particularly for those entities that do not have systems in place to capture the relevant net positions by debtor/counterparty. Also, an allocation of the portfolio level adjustments is required, as discussed in section 10.3.3.B below.

A further complication arises if the net exposure represents the position across different classes of derivatives (e.g., interest rate swaps and foreign exchange forwards). Basic valuation methods can attempt to approximate a net position through the creation of an appropriate 'modelled net position' representing the net risk.

- *Collateral arrangements*

In many instances, counterparty credit exposure in derivative transactions can be further reduced through collateral requirements. Such arrangements serve to limit the potential exposure of one counterparty to the other by requiring the out-of-the-money counterparty to post collateral (e.g., cash or liquid securities) to the in-the-money counterparty. While these and other credit mitigation arrangements often serve to reduce credit exposure, they typically do not eliminate the exposure completely.

Many collateral agreements, for example, do not require collateral to be posted until a certain threshold has been reached, and then, collateral is required only for the exposure in excess of the threshold. In addition, even when transactions with a counterparty are subject to collateral requirements, entities remain exposed to what is commonly referred to as 'gap risk' (i.e., the exposure arising from fluctuations in the value of the derivatives before the collateral is called and between the time it is called and the time it is actually posted).

Finally, collateral arrangements may be either unilateral or bilateral. Unilateral arrangements require only one party to the contract to post collateral. Under bilateral agreements, both counterparties are subject to collateral requirements, although potentially at different threshold levels.

Given their ability to reduce credit exposure, netting and collateral arrangements are typically considered in determining the CVA for a portfolio of derivatives. This can add to the complexity of the calculation as total expected credit exposure should be determined not just for a single derivative contract (whose value changes over time), but for a portfolio of derivative contracts (which can include both derivative assets and derivative liabilities). Simply taking the sum of the CVA of individual trades could dramatically overstate the potential credit exposure, as it would not take into account positions in the portfolio with offsetting exposures. Consequently, when netting agreements and collateral arrangements are in place, and a company has elected to measure its derivative positions with offsetting credit risk using the measurement exception in IFRS 13, the expected exposure is generally analysed at the portfolio level (i.e., on a net basis).

10.3.3.B Portfolio-level credit adjustments

The measurement exception (the portfolio approach) permits measuring non-performance risk of derivatives with the same counterparty on a portfolio basis (see section 11 below), allowing the mitigating effect of CSAs and master netting agreements to have their full effect in the financial statements taken as a whole. The use of the measurement exception does not change the fact that the unit of account is the individual derivative contract, a concept particularly important when an individual derivative is designated as a hedging instrument in a hedging relationship.

There is no specific guidance under IFRS on how portfolio level credit adjustments should be allocated to individual derivatives. A number of quantitative allocation methods have been observed in practice and have been accepted as long as a reporting entity is able to support that the method is: (a) reasonable in the circumstances; and (b) applied consistently. [IFRS 13.50]. Given the continued focus on credit adjustments and changing banking regulation, it is likely that sophisticated valuation methods will become more widespread and standardised.

10.4 Restrictions preventing the transfer of a liability or an entity's own equity

A liability or an entity's own equity may be subject to restrictions that prevent the transfer of the item. When measuring the fair value of a liability or equity instrument, IFRS 13 does not allow an entity to include a separate input (or an adjustment to other inputs) for such restrictions. This is because the effect of the restriction is either implicitly or explicitly included in other inputs to the fair value measurement. The standard gives the example of both a creditor and an obligor accepting a transaction price for a liability with full knowledge that the obligation includes a restriction that prevents its transfer. In this case, the restriction is implicitly included in the price. Therefore, further adjustment would be inappropriate. [IFRS 13.45, IFRS 13.46]. In Example 11 in the standard (extracted in section 10.2.2.A above), the fair value of the decommissioning liability was not adjusted for the existence of a restriction because that restriction was contemplated in developing the inputs to the valuation techniques used to measure fair value.

IFRS 13 states that a separate adjustment for lack of transferability is not necessary for either the initial or subsequent fair value measurement of a liability. This differs from the treatment of asset restrictions.

[IFRS 13.46]. IFRS 13 considers liability restrictions and asset restrictions differently because:

- Restrictions on the transfer of a liability relate to the performance of the obligation (i.e., the entity is legally obliged to satisfy the obligation and needs to do something to be relieved of the obligation), whereas restrictions on the transfer of an asset relate to the marketability of the asset.
- Unlike assets, virtually all liabilities include a restriction preventing their transfer. As a result, the effect of a restriction preventing the transfer of a liability would, in theory, be consistent for all liabilities.

The standard also appears to assume that the effect of a restriction on the fair value of a liability remains constant over the life of the liability. Therefore, no additional adjustments are required in subsequent measurements if the effect of the restriction was already captured in the initial pricing of the liability. Unlike restrictions on assets, which typically expire and whose effect on fair value changes over time, restrictions on liabilities usually remain throughout the life of the obligation.

How we see it

The Basis for Conclusions to IFRS 13 states that if an entity is aware that a restriction on transfer is not already reflected in the price (or in the other inputs used in the measurement), it would adjust the price or inputs to reflect the existence of the restriction. However, in our view this would be rare because nearly all liabilities include a restriction and, when measuring fair value, market participants are assumed by IFRS 13 to be sufficiently knowledgeable about the liability to be transferred.

10.5 Financial liability with a demand feature

IFRS 13 states the following: [IFRS 13.47]

Extract from IFRS 13

- | | |
|----|---|
| 47 | The fair value of a financial liability with a demand feature (eg a demand deposit) is not less than the amount payable on demand, discounted from the first date that the amount could be required to be paid. |
|----|---|

This requirement is consistent with the requirements in IFRS 9. In many cases, the observed market price for these financial liabilities would be the demand amount, i.e., the price at which they are originated between the customer and the deposit-taker. Recognising such a financial liability at less than the demand amount may give rise to an immediate gain on the origination of the deposit, which the IASB believes is inappropriate. [IFRS 13.BCZ102, IFRS 13.BCZ103].

11 Financial assets and liabilities with offsetting positions

IFRS 13 specifies that the concepts of ‘highest and best use’ and ‘valuation premise’ are not relevant when measuring the fair value of financial instruments. Therefore, the fair value of financial assets and financial liabilities is based on the unit of account prescribed by the IFRS that requires (or permits) the fair value measurement, which is generally the individual financial instrument. However, IFRS 13 provides a measurement exception that allows an entity to determine the fair value of a group of financial assets and liabilities with offsetting risks based on the sale or transfer of its *net* exposure to a particular risk (or risks), if certain criteria are met. [IFRS 13.48]. This measurement approach is an exception to the principles of fair value because it represents an entity-specific measure (i.e., an entity’s net risk exposure is a function of the other financial instruments specifically held by that entity and its unique risk preferences).

It may be possible for entities to offset multiple risks (e.g., both market and credit risks) within the same portfolio. In addition, since the focus is on offsetting risks, entities may offset credit and market risks stemming from a group of financial instruments at different levels of aggregation. For example, under IFRS 13, management could continue its existing practice of offsetting credit risk at the counterparty level (e.g., based on its portfolio of interest rate swaps with a particular counterparty) while offsetting market risks on a more aggregated portfolio basis (e.g., based on its portfolio of interest rate swaps with all counterparties), provided all of the criteria in section 11.1 below are met.

This guidance is largely consistent with practice under IFRS prior to adoption of IFRS 13 when determining valuation adjustments for derivative instruments related to bid-ask spreads and credit risk.

11.1 Criteria for using the portfolio approach for offsetting positions

Entities that hold a group of financial assets and liabilities are generally exposed to market risks (e.g., interest rate risk, currency risk or other price risk) and to the credit risk of each of its counterparties. IFRS 13 allows entities to make an accounting policy choice (see section 11.1.1 below) to measure the fair value of a group of financial assets and liabilities based on the price that would be received to sell a net long position or transfer a net short position for a particular risk exposure (that is, a portfolio approach). In order to use the portfolio approach, entities are required to meet all of the following criteria, both initially and on an ongoing basis: [IFRS 13.49]

- The entity manages the group of financial assets and financial liabilities on the basis of the entity’s net exposure to a particular market risk(s) or credit risk, in accordance with the entity’s documented risk management or investment strategy
- The entity provides information based on the group of financial assets and financial liabilities to the entity’s key management personnel (as defined in IAS 24, see Chapter 35)
- The entity measures (either by requirement or by choice) the financial assets and financial liabilities at fair value in the statement of financial position at each reporting date

The measurement exception for offsetting positions only applies to financial assets and financial liabilities within the scope of IFRS 9. [IFRS 13.52]. Also, as indicated by these criteria, the portfolio approach only applies to financial instruments with offsetting risks. As such, a group of financial instruments comprised of only financial assets (e.g., a portfolio of loans) would not qualify for the exception and would need to be valued in a manner consistent with the appropriate unit of account. However, an entity need not maintain a static portfolio to use the measurement exception, i.e., the entity could have assets and liabilities within the portfolio that are traded.

When the standard was issued, IFRS 13.52 stated that the measurement exception only applied to financial assets and financial liabilities within the scope of IFRS 9. However, it was not the Boards’ intention to exclude contracts to buy or sell a non-financial item (e.g., physically settled commodity derivative contracts) that are within the scope of IFRS 9 (and that are measured at fair value) from the scope of the measurement exception. [IFRS 13.BC119A, IFRS 13.BC119B]. If a contract to buy or sell a non-financial item is within the scope of IFRS 9, those standards treat that contract as if it were a financial instrument. Therefore, the IASB amended IFRS 13.52 to clarify that all contracts within the scope of IFRS 9 are eligible for the measurement exception, regardless of whether they meet the definitions of financial assets or financial liabilities in IAS 32. [IFRS 13.52].

Frequently asked questions

Question 11-1: Is there a minimum level of offset required to use the portfolio approach?

While there are explicit criteria that an entity must meet in order to use the portfolio approach, IFRS 13 does not specify any minimum level of offset within the group of financial instruments.

How we see it

If, for example, an entity has positions with offsetting credit risk to a particular counterparty, we believe use of the portfolio approach is appropriate even if the extent of offset is minimal (provided that the entity has in place a legally enforceable agreement, as discussed in section 11.2.2 below, that provides for offsetting upon default and all the other required criteria are met). To illustrate, even if the gross credit exposure was CU100,000 (long) and CU5,000 (short), upon counterparty default the entity would be exposed to a credit loss of only CU95,000 under the terms of its master netting agreement.

With respect to market risk, considering the degree of offset may require additional judgement. Entities should assess the appropriateness of using the portfolio approach based on the nature of the portfolio being managed (e.g., derivative versus cash instruments) and its documented risk management policies (or investment strategies). An entity should use the portfolio approach in a manner consistent with the IASB's basis for providing the measurement exception and not in a manner to circumvent other principles within the standard.

Question 11-2: Can Level 1 instruments be included in a portfolio of financial instruments with offsetting risks when calculating the net exposure to a particular market risk?

It is our understanding that Level 1 instruments can be included when using the exception to value financial instruments with offsetting risks. An entity is allowed to consider the effect of holding futures contracts when evaluating its net exposure to a particular market risk, such as interest rate risk. IFRS 13.54 gives an example stating that 'an entity would not combine the interest rate risk associated with a financial asset with the commodity price risk associated with a financial liability because doing so would not mitigate the entity's exposure to interest rate risk or commodity price risk'. [IFRS 13.54].

We understand that some constituents believe that the requirement in IFRS 13 to measure instruments that trade in active markets based on $P \times Q$ does not apply to the measurement of the net exposure when the portfolio exception is used, since the net exposure does not trade in an active market. As such, these constituents argue that the measurement of the net exposure and the allocation of this value back to the instruments that comprise the group are not constrained by the price at which the individual instruments trade in active markets. Others believe that although Level 1 instruments, such as futures contracts, may be considered when calculating an entity's net exposure to a particular market risk, the quoted price (unadjusted) for these Level 1 instruments should be used when allocating the fair value to the individual units of account for presentation and disclosure purposes, to comply with the requirement in IFRS 13 to measure Level 1 instruments at $P \times Q$. However, depending on the extent of Level 1 instruments in the group, it may not always be possible to allocate the fair value determined for the net exposure back to the individual instruments in a manner that results in each of these instruments being recorded at $P \times Q$. For this reason, there are constituents who believe that the use of the portfolio exception should never result in the measurement of Level 1 instruments at an amount other than $P \times Q$. That is, the determination of the fair value of the net exposure is constrained by the requirement that all Level 1 instruments within the group are recorded at a value based on $P \times Q$.

As discussed in section 4.1.2 above, we understand that the IASB did not intend the portfolio exception to change existing practice under IFRS or override the requirement in IFRS 13 to measure Level 1 instruments at $P \times Q$ or the prohibition on block discounts. However, given the lack of clarity, some have asked questions about how these requirements would apply in practice. In 2013, the IFRS IC referred a request to the Board on the interaction between the use of Level 1 inputs and the portfolio exception. The IASB discussed this issue in December 2013, but only in relation to portfolios that comprise only Level 1 financial instruments whose market risks are substantially the same. The Board tentatively decided that the measurement of such portfolios should be the one that results from multiplying the net position by the Level 1 prices. Therefore, in September 2014, the IASB proposed adding a non-authoritative example to illustrate the application of the portfolio exception in these circumstances (included in section 11.2 below).

As discussed in section 4.1.2 above and section 11.2 below, in April 2015, after considering responses to this proposal from constituents, the IASB concluded it was not necessary to add the proposed illustrative example to IFRS 13.

11.1.1 Accounting policy considerations

As noted above, the use of the portfolio approach is an accounting policy decision, to be made in accordance with IAS 8 (see Chapter 3), which must include an entity's policy regarding measurement assumptions - i.e., for both allocating bid-ask adjustments and credit adjustments (see section 11.2 below).

An entity can choose to use the portfolio approach on a portfolio-by-portfolio basis. In addition, if entities choose this policy for a particular portfolio, they are not required to apply the portfolio approach to all of the risks of the financial assets and liabilities that make up the particular group. For example, an entity could choose to measure only the credit risk associated with a group of financial instruments on a net basis, but not the group's exposure to market risk.

An entity may also decide to apply the portfolio approach to only certain market risks related to the group. For example, an entity that is exposed to both interest rate and foreign currency risk in a portfolio of financial assets and liabilities could choose to measure only its interest rate risk exposure on a net basis.

The accounting policy decision can be changed if an entity's risk exposure preferences change, for example, a change in strategy to have fewer offsetting positions. In that case, the entity can decide not to use the exception but instead to measure the fair value of its financial instruments on an individual instrument basis. We generally expect that an entity's use of the portfolio approach would be consistent from period to period as changes in risk management policies are typically not common. [IFRS 13.51, IFRS 13.BC121].

11.1.2 Presentation considerations

IFRS 13 is clear that applying the portfolio approach for measurement purposes does not affect financial statement presentation. For example, an entity might manage a group of financial assets and liabilities based on the net exposure(s) for internal risk management or investment strategy purposes, but be unable to present those instruments on a net basis in the statement of financial position because the entity does not have a positive intention and ability to settle those instruments on a net basis, as is required by IAS 32. [IAS 32.42].

If the requirements for presentation of financial instruments in the statement of financial position differ from the basis for the measurement, an entity may need to allocate the portfolio-level adjustments (see section 11.2 below) to the individual assets or liabilities that make up the portfolio. Entities may also need to allocate portfolio-level adjustments for disclosure purposes when items in the group would be categorised within different levels of the fair value hierarchy (see section 15 below for additional discussion on the allocation of portfolio-level adjustments related to the fair value hierarchy disclosures).

IFRS 13 does not prescribe any methodologies for allocating portfolio-level adjustments; instead, it states that the allocation should be performed in a reasonable and consistent manner that is appropriate in the circumstances. [IFRS 13.50].

11.2 Measuring fair value for offsetting positions

If the portfolio approach is used to measure an entity's net exposure to a particular market risk, the net risk exposure becomes the unit of measurement. That is, the entity's net exposure to a particular market risk (e.g., the net long or short Euro interest rate exposure within a specified maturity bucket) represents the asset or liability being measured.

In applying the portfolio approach, an entity must assume an orderly transaction between market participants to sell or transfer the net risk exposure at the measurement date under current market conditions. The fair value of the portfolio is measured on the basis of the price that would be received to sell a net long position (i.e., an asset) for a particular risk exposure or transfer a net short position (i.e., a liability) for a particular risk exposure. [IFRS 13.48]. That is, the objective of the valuation is to determine the price that market participants would pay (or receive) in a single transaction for the entire net risk exposure, as defined.

Some argue that, as a result, an adjustment based on the size of the net exposure could be considered in the valuation if market participants would incorporate such an adjustment when transacting for the net exposure. Since the unit of measurement is the net exposure, size is considered a characteristic of the asset (net long position) or liability (net short position) being measured, not a characteristic of the entity's specific holdings. Many have interpreted the equivalent requirements in US GAAP in this way.

Others believe that the portfolio exception does not override the unit of account guidance provided in IFRS 9 and, therefore, any premiums or discounts that are inconsistent with that unit of account, i.e., the individual financial instruments within the portfolio, must be excluded. This would include any premiums or discounts related to the size of the portfolio. As discussed in section 4.1.2 above, we understand the IASB did not intend the portfolio exception to override the requirement in IFRS 13 to measure Level 1 instruments at $P \times Q$ or the prohibition on block discounts which raises questions as to how the portfolio exception would be applied to Level 1 instruments.

In 2013, the IFRS IC referred a request to the Board on the interaction between the use of Level 1 inputs and the portfolio exception. The IASB discussed this issue in December 2013, but only in relation to portfolios that comprise only Level 1 financial instruments whose market risks are substantially the same. The Board tentatively decided that the measurement of such portfolios should be the one that results from multiplying the net position by the Level 1 prices. In September 2014, the IASB proposed adding the following non-authoritative example to illustrate the application of the portfolio exception in these circumstances.²⁴

Extract from Exposure draft: ED/2014/4 *Measuring Quoted Investments in Subsidiaries, Joint Ventures and Associates at Fair Value*

Example 13A—Applying the exception in paragraph 48 of the IFRS to a group of financial assets and financial liabilities whose market risks are substantially the same and whose fair value measurement is categorised within Level 1 of the fair value hierarchy

Entity A holds a group of financial assets and financial liabilities consisting of a long position of 10,000 financial assets and a short position of 9,500 financial liabilities whose market risks are substantially the same. Entity A manages that group of financial assets and financial liabilities on the basis of its net exposure to market risks. The fair value measurement of all the financial instruments in the group is categorised within Level 1 of the fair value hierarchy.

The mid-price and the most representative bid and ask prices are as follows:

CU	Bid	Mid	Ask
Most representative exit price	99	100	101

Entity A applies the exception in paragraph 48 of the IFRS that permits Entity A to measure the fair value of the group of financial assets and financial liabilities on the basis of the price that would be received to sell, in this particular case, a net long position (ie an asset) in an orderly transaction between market participants at the measurement date under current market conditions.

Accordingly, Entity A measures the net long position (500 financial assets) in accordance with the corresponding Level 1 prices. Because the market risks arising from the financial instruments are substantially the same, the measurement of the net position coincides with the measurement of the exposure arising from the group of financial assets and financial liabilities. Consequently, Entity A measures the group of financial assets and financial liabilities on the basis of the price that it would receive if it would exit or close out its outstanding exposure as follows:

	Quantity held (Q)	Level 1 price (CU) (P)	(CU) $P \times Q$
Net long position	500	99	49,500

Entity A would have also achieved the same measurement of CU49,500 by measuring the net long position at the mid-price (ie $CU100 \times 500 = CU50,000$) adjusted by a bid-offer reserve ($CU1 \times 500 = CU500$).

Entity A allocates the resulting measurement (ie CU49,500) to the individual (10,000) financial assets and (9,500) financial liabilities. In accordance with paragraph 51 of the IFRS, Entity A performs this allocation on a reasonable basis that is consistent with previous allocations of that nature using a methodology appropriate to the circumstances.

²⁴ Exposure Draft [ED/2014/4: Measuring Quoted Investments in Subsidiaries, Joint Ventures and Associates at Fair Value: Proposed amendments to IFRS 10, IFRS 12, IAS 27, IAS 28, IAS 36 and Illustrative Examples for IFRS 13](#), IASB, September 2014, Proposed illustrative example 13A, paragraphs IE47A-IE47G. Available on the IFRS Foundation's website.

In response to this proposal, some respondents raised concerns because they believed there was a risk that constituents may infer principles from this simple example that could lead to unintended consequences. Respondents noted that the illustrative example did not address:

- Other scenarios and circumstances to which the portfolio approach would apply. For example, situations where the instruments in the portfolio are categorised within Level 2 or Level 3 of the fair value hierarchy or for which different Level 1 prices are available.

Nor

- Allocation of the resulting measurement to each instrument in the portfolio for disclosure purposes

The proposed illustrative example also raised questions about the interaction between the portfolio exception and the use of mid-market pricing as a practical expedient in accordance with IFRS 13.71 and may have required clarification of the term 'bid-offer reserve adjustment' used in the example. Despite these concerns, the majority of the respondents agreed that the proposed additional illustrative example appropriately illustrated application of the portfolio approach.²⁵

As discussed in section 4.1.2 above, in April 2015, after considering responses to this proposal from constituents, the IASB concluded that it was not necessary to add the proposed illustrative example to IFRS 13. However, in reaching this decision, the Board noted that the proposed illustrative example appropriately illustrated the application of the portfolio approach. "That is, if an entity elects to use the exception in paragraph 48 of IFRS 13, the appropriate fair value measurement of the net risk exposure arising from a group of financial assets and financial liabilities whose market risks are substantially the same, and whose fair value measurement is categorised within Level 1 of the fair value hierarchy, would be determined by multiplying the financial instruments included in the resulting net position by the corresponding unadjusted Level 1 price".²⁶ [IFRS 13.48].

How we see it

While the proposed non-authoritative example provides one approach to consider, in light of the above discussion, entities will need to use judgement to determine the most appropriate approach to employ when applying the portfolio exception.

When measuring fair value using the portfolio approach, IFRS 13 also requires that the market risks be substantially the same (see section 11.2.1 below) and that the fair value measurement must take into consideration any exposure to the credit risk of a particular counterparty (see section 11.2.2 below).
