Entity A enters into a contract to sell goods to Customer B in the ordinary course of business in exchange for cash consideration. Separately, Entity A enters into an agreement to purchase market research from Customer B related to the launch of a new product in exchange for cash consideration. The two contracts were not negotiated in contemplation of one another.

Entity A elects to purchase the market research, rather than internally developing such knowledge because of Customer's B expertise in this area. Entity A could purchase similar services from a non-customer.

Based on an evaluation of the circumstances, the cash consideration paid to the customer is in return for Customer B providing distinct services to Entity A. To reach this conclusion, Entity A considers the requirements in IFRS 15.27-30 and concludes that the market research services are capable of being distinct, as well as separately identifiable (or distinct within the context of the contract), from Entity A's sale of its goods to Customer B.

Entity A determines that market research is capable of being distinct from the sale of its goods to Customer B because the market research could be purchased from a non-customer. Therefore, Entity A is able to demonstrate that the market research can provide benefits on its own or with other readily available resources.

Entity A determines that the market research is distinct within the context of the contract because of the following:

- Customer B is not providing a significant service of integrating the market research with the purchases of Entity A's goods because the promises to Entity A are not a combined output of integrated goods or services.
- The market research provided by Customer B does not modify or customise the purchases of Entity A's goods. The market research and the purchases of goods are not being assembled together to produce a combined output.
- The market research is not highly interrelated or interdependent with the sale of Entity A's goods because the market research is not needed for Customer B to purchase the goods. That is, there is no significant two-way dependency between the promises.

Entity A accounts for the cash consideration paid to Customer B in the same way that it accounts for other purchases from suppliers, provided that the cash consideration paid does not exceed the fair value of the distinct services received from Customer B. If the amount of cash consideration paid by Entity A exceeds the fair value of the distinct services, that excess amount would be characterised as a reduction of the transaction price of the goods sold to Customer B in Entity A's income statement.

In many cases, determining the amount of consideration payable to a customer (e.g., cash amounts an entity pays to a customer) will be straightforward. However, if the consideration paid or payable to a customer includes a variable amount, IFRS 15.70 notes that an entity would estimate the amount using the variable consideration requirements in IFRS 15.50-58 (see section 5.2 above). [IFRS 15.70].

5.7.3 Timing of recognition of consideration paid or payable to a customer

If the consideration paid or payable to a customer is accounted for as a reduction of the transaction price, IFRS 15.72 states that this reduction of the transaction price (and, ultimately, revenue) is recognised at the later of when: (1) the entity recognises revenue for the transfer of the related promised goods or services to the customer; or (2) the entity pays or promises to pay the consideration (even if the payment is conditional on a future event) (see section 5.7 above). [IFRS 15.72]. For example, if goods subject to a discount through a coupon are already delivered to the retailers, the discount would be recognised when the coupons are issued. However, if a coupon is issued that can be used on a new line of products that have not yet been sold to retailers, the discount would be recognised upon sale of the products to a retailer. IFRS 15.72(b) also notes that the promise to pay the consideration might be implied by an entity's customary business practices. [IFRS 15.72(b)].

Certain sales incentives, such as mail-in rebates and manufacturer coupons, entitle a customer to receive a reduction in the price of goods or services by submitting a form or claim for a refund of a specified amount of the price charged to the customer at the point of sale. An entity must recognise a liability for those sales incentives at the later of: (a) when it recognises revenue on the goods or services; or (b) the date at which the sales incentive was offered. The amount of liability will be based on the estimated amount of discounts or refunds that will be claimed by customers, similar to how the entity would estimate variable consideration (see section 5.2.2 above).

Even if the sales incentives would result in a loss on the sale of the product or service, an entity would also recognise a liability for those sales incentives at the later of: (a) when it recognises revenue on the goods or services; or (b) the date at which the sales incentive was offered. That is, an entity would not recognise the loss before either date. However, an entity would need to consider whether the offer indicates that the net realisable value of inventories is lower than cost, which will require write-down of inventories to net realisable value. [IAS 2.9, IAS 2.28].

To determine the appropriate timing of recognition of consideration payable to a customer, entities also need to consider the requirements for variable consideration. That is, the standard's description of variable consideration is broad and includes amounts such as coupons or other forms of credits that can be applied to the amounts owed to an entity by the customer (see section 5.2.1 above). IFRS 15 requires that all potential variable consideration be considered and reflected in the transaction price at contract inception and reassessed as the entity performs. In other words, if an entity has a history of providing this type of consideration to its customers, the requirements on estimating variable consideration would require that such amounts be considered at contract inception, even if the entity has not yet provided or explicitly promised this consideration to the customer.

The TRG discussed the potential inconsistency that arises between the requirements on consideration payable to a customer and variable consideration because the requirements specific to consideration payable to a customer indicate that such amounts are not recognised as a reduction of revenue until the *later of when*:⁹⁶

- The related sales are recognised
- Or
- The entity promises to provide such consideration

A literal read of these requirements seems to suggest that an entity need not anticipate offering these types of programmes, even if it has a history of doing so, and would only recognise the effect of these programmes at the later of when the entity transfers the promised goods or services or makes a promise to pay the customer. The TRG members generally agreed that if an entity has historically provided or intends to provide this type of consideration to customers, the requirements on estimating variable consideration (i.e., IFRS 15.50-52) would require the entity to consider such amounts at contract inception when the transaction price is estimated, even if the entity has not yet provided or promised to provide this consideration to the customer.⁹⁷ If the consideration paid or payable to a customer includes variable consideration (e.g., in the form of a discount or refund for goods or services provided), an entity would use either the expected value method or most likely amount method to estimate the amount to which the entity expects to be entitled and apply the constraint to the estimate (see section 5.2.3 above for further discussion) to determine the effect of the variable consideration payable to the customer.

⁹⁶ TRG Agenda paper no. 37, *Consideration Payable to a Customer*, dated 13 July 2015.

⁹⁷ TRG Agenda paper no. 44, *July 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 9 November 2015.

How we see it

There was general agreement by the TRG members that entities need to consider the requirements for variable consideration to determine the appropriate timing of recognition of consideration payable to a customer. Therefore, significant judgement might be needed to determine the appropriate timing of recognition.

The standard includes the following example of consideration paid to a customer: [IFRS 15.IE Example 32, IFRS 15.IE160-IE162]

Extract from IFRS 15

Example 32-Consideration payable to a customer

An entity that manufactures consumer goods enters into a one-year contract to sell goods to a customer that is a large global chain of retail stores. The customer commits to buy at least CU15 million of products during the year. The contract also requires the entity to make a non-refundable payment of CU1.5 million to the customer at the inception of the contract. The CU1.5 million payment will compensate the customer for the changes it needs to make to its shelving to accommodate the entity's products.

The entity considers the requirements in paragraphs 70-72 of IFRS 15 and concludes that the payment to the customer is not in exchange for a distinct good or service that transfers to the entity. This is because the entity does not obtain control of any rights to the customer's shelves. Consequently, the entity determines that, in accordance with paragraph 70 of IFRS 15, the CU1.5 million payment is a reduction of the transaction price.

The entity applies the requirements in paragraph 72 of IFRS 15 and concludes that the consideration payable is accounted for as a reduction in the transaction price when the entity recognises revenue for the transfer of the goods. Consequently, as the entity transfers goods to the customer, the entity reduces the transaction price for each good by 10 per cent ($\text{CU1.5 million} \div \text{CU15 million}$). Therefore, in the first month in which the entity transfers goods to the customer, the entity recognises revenue of CU1.8 million (CU2.0 million invoiced amount less CU0.2 million of consideration payable to the customer).

Frequently asked questions

Question 5-34: How does an entity account for upfront payments to a customer or a potential customer?

(FASB TRG meeting 7 November 2016 - Agenda paper no. 59)

While the requirements for consideration payable to a customer clearly apply to payments to customers under current contracts, stakeholders have raised questions about how to account for upfront payments to potential customers and payments that relate to both current and anticipated contracts.

The FASB TRG members discussed two views. Under View A, an entity would recognise an asset for the upfront payment and reduce revenue as the related goods or services (or as the expected related goods or services) are transferred to the customer. As a result, the payment might be recognised in profit or loss over a period that is longer than the contract term. Entities would determine the amortisation period based on facts and circumstances and would assess the asset for recoverability using the principles in asset impairment models in other standards. Under View B, entities would reduce revenue in the current contract by the amount of the payment. If there is no current contract, entities would immediately recognise the payment in profit or loss. The FASB TRG members generally agreed that an entity needs to apply the view that best reflects the substance and economics of the payment to the customer; it would not be an accounting policy choice. Entities would evaluate the nature of the payment, the rights and obligations under the contract and whether the payment meets the definition of an asset. The FASB TRG members also noted that an entity's decision on which view is appropriate might be a significant judgement in the determination of the transaction price that would require disclosure under the revenue standard.⁹⁸

⁹⁸ FASB TRG Agenda paper no. 60, *November 2016 Meeting - Summary of Issues Discussed and Next Steps*, dated 31 January 2017.

How we see it

We believe an entity has to carefully evaluate all facts and circumstances of payments made to customers to determine the appropriate accounting treatment. However, if an entity expects to generate future revenue associated with the payment, we believe an entity generally applies View A (assuming any asset recorded is recoverable). If no revenue is expected as a result of the payment, View B might be appropriate.

If an entity recognises an asset for consideration paid to a customer (because the payment made to the customer will be recognised as a reduction from revenue in future periods when (or as) goods or services are transferred to the customer), a question arises about the nature of that asset. This is relevant because it would determine, among other things, which impairment requirements apply to the asset. This is discussed further in section 5.7.4 below.

Question 5-35: How does an entity present ‘negative revenue’ resulting from consideration paid or payable to a customer that exceeds the amount to which the entity expects to be entitled?

In certain arrangements, consideration paid or payable to a customer could exceed the consideration to which the entity expects to be entitled in exchange for transferring promised goods or services in a contract with a customer. In these situations, recognition of payments to the customer as a reduction of revenue could result in ‘negative revenue’. IFRS 15 does not specifically address how entities would present negative revenue.

Stakeholders had asked the TRG whether an entity would reclassify negative revenue resulting from consideration paid or payable to a customer to expense and, if so, in what circumstances. The TRG did not discuss this question in detail and no additional application guidance was provided.

As discussed above, IFRS 15.70 states that an entity shall account for consideration payable to a customer as a reduction of the transaction price (and, therefore, of revenue), unless the payment to the customer is in exchange for a distinct good or service that the customer transfers to the entity.

How we see it

Therefore, we believe it is appropriate for an entity to present payments to a customer in excess of the transaction price that are not in exchange for a distinct good or service within revenue.

However, we believe it may also be acceptable, in limited circumstances, to reclassify negative revenue to expense in an entity’s income statement. For example, if an entity demonstrates that characterisation of consideration payable to a customer as a reduction of revenue results in negative revenue for a specific customer on a cumulative basis (i.e., since the inception of the overall relationship between the entity and the customer), then the amount of the cumulative shortfall may be recharacterised as an expense.

In determining whether cumulative negative revenue exists for a specific customer, revenues from all transactions with that customer recognised by all entities within the consolidated group that includes the entity paying the consideration to the customer are considered (i.e., revenues recognised from sales to the customer from all of the consolidated entities needs to be considered). Therefore, an entity that considers reclassifying negative revenue to expense must carefully evaluate all of its historical contractual arrangements with the customer before reclassifying any cumulative shortfall in revenue to expense. In addition, when making this evaluation, we believe an entity needs to incorporate revenue from any current or anticipated contracts with the customer to transfer goods or services in the future.

To provide users with sufficient information about its revenue transactions, entities need to consider the disclosure requirements in IFRS 15.123 and IFRS 15.126 (see section 10.5.2 below).

The question of whether negative revenue can be reclassified to expense in the income statement was originally raised in the context of a submission to the IFRS IC in September 2019.⁹⁹ More recently, in a paper prepared in connection with the post-implementation review of IFRS 15, the IASB staff recognised that “there is evidence to suggest that the requirements in IFRS 15 are insufficient for entities to consistently account for incentives paid by an agent to an end customer and for ‘negative’ revenue.”¹⁰⁰

⁹⁹ [IFRIC Update](#), September 2019, available on the IFRS Foundation’s website.

¹⁰⁰ [IASB Agenda paper 6A](#), *Determining the transaction price*, dated March 2024, available on the IFRS Foundation’s website.

However, the Board decided against adding this issue to its standard-setting agenda and instead tentatively decided to consider it in the next agenda consultation.¹⁰¹

Question 5-36: When does an entity determine the effect of a variable amount of consideration payable to a customer on the transaction price?

In certain arrangements, consideration payable to a customer might include variable consideration (e.g., in the form of a discount or refund for goods or services provided). As discussed above, if an entity has historically provided or intends to provide this type of consideration to customers, when estimating variable consideration, IFRS 15.50-59 requires an entity to consider such amounts at contract inception when the transaction price is estimated (taking into consideration the effect of the constraint on variable consideration), even if the entity has not yet provided (or promised to provide) this consideration to the customer.¹⁰² That is, if an entity anticipates that it might pay consideration to its customer, it is not appropriate for the entity to wait until paying (or promising to pay) the consideration to the customer to determine the effect on the transaction price.

5.7.4 Impairment of consideration paid to a customer recognised as an asset

If an entity has recognised an asset for consideration paid to a customer (because the payment made to the customer will be recognised as a reduction from revenue in future periods when (or as) goods or services are transferred to the customer, see section 5.7.3 above), it will need to consider the nature of that asset to determine which impairment requirements apply. Specifically, whether the asset is subject to the impairment requirements in IFRS 9 (see section 10.1.3 below) or the impairment requirements in IAS 36 *Impairment of Assets* (see Chapter 21).

Consideration paid to a customer recognised as an asset arises from a contract that is within the scope of IFRS 15. However, it is not a 'contract asset' as defined in IFRS 15 (see Appendix C and section 10.1.1 below) because it does not represent a conditional right to consideration in exchange for goods or services that it has transferred to a customer. In substance, consideration paid to a customer recognised as an asset is similar to a prepayment.

If the payment to the customer is refundable, the IFRS 9 impairment requirements would apply. Otherwise, the asset would be within the scope of IAS 36 for impairment purposes (see Chapter 21). Judgement might be needed to assess impairment. For example, under IAS 36, an entity might need to test the asset for impairment as part of a cash-generating unit. When assessing indicators and/or testing for impairment, which goods or services are related to the deferred consideration payable to a customer and whether the customer is committed or only expected to purchase them might also be important.

5.8 Non-refundable upfront fees

In certain circumstances, entities receive payments from customers before they provide the contracted service or deliver a good. Upfront fees generally relate to the initiation, activation or set up of a good to be used or a service to be provided in the future. Upfront fees might also be paid to grant access to, or provide, a right to use a facility, product or service. In many cases, the upfront amounts paid by the customer are non-refundable. Examples include fees paid for membership to a health club or buying club and activation fees for phone, cable or internet services. [IFRS 15.B48].

Entities must evaluate whether a non-refundable upfront fee relates to the transfer of a promised good or service. If it does, the entity is required to determine whether to account for the promised good or service as a separate performance obligation (see section 4 above). [IFRS 15.B49, IFRS 15.B50]. In addition, Question 4-7 in section 4.2.1.H above discusses how entities would determine whether implementation services are distinct.

The standard notes that, even though a non-refundable upfront fee relates to an activity that the entity is required to undertake at or near contract inception in order to fulfil the contract, in many cases, that activity does not result in the transfer of a promised good or service to the customer. [IFRS 15.B49]. Instead, in many situations, an upfront fee represents an advance payment for future goods or services.

101 [IASB update](#), April 2024, available on the IFRS Foundation's website.

102 TRG Agenda paper no. 44, *July 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 9 November 2015.

The existence of a non-refundable upfront fee might indicate that the contract includes a renewal option for future goods or services at a reduced price (if the customer renews the agreement without the payment of an additional upfront fee). In such circumstances, an entity would need to assess whether the option is a material right (i.e., another performance obligation in the contract) (see section 4.6 above). [IFRS 15.B49]. If the entity concludes that the non-refundable upfront fee does not provide a material right, the fee would be part of the consideration allocable to the goods or services in the contract and would be recognised when (or as) the good or service to which the consideration was allocated is transferred to the customer. If an entity concludes that the non-refundable upfront fee provides a material right, the amount of the fee allocated to the material right would be recognised over the period of benefit of the fee, which might be the estimated customer life.

The following Illustration depicts the allocation of a non-refundable upfront fee determined to be a material right:

Illustration 5-8: Non-refundable upfront fees

A customer signs a one-year contract with a health club and is required to pay both a non-refundable initiation fee of CU150 and an annual membership fee in monthly instalments of CU40. At the end of each year, the customer can renew the contract for an additional year without paying an additional initiation fee. The customer is then required to pay an annual membership fee in monthly instalments of CU40 for each renewal period. The club's activity of registering the customer does not transfer any service to the customer and, therefore, is not a performance obligation. By not requiring the customer to pay the upfront membership fee again upon renewal, the club is effectively providing a discounted renewal rate to the customer.

The club determines that the renewal option is a material right because it provides a renewal option at a lower price than the range of prices typically charged for new customers. Therefore, it is a separate performance obligation. Based on its experience, the club determines that its customers, on average, renew their annual memberships twice before terminating their relationship with the club. As a result, the club determines that the option provides the customer with the right to two annual renewals at a discounted price. In this scenario, the club would allocate the total transaction consideration of CU630 (CU150 upfront membership fee + CU480 (CU40 x 12 months)) to the identified performance obligations (monthly services for the one-year contract and renewal option) based on the relative stand-alone selling price method. In accordance with IFRS 15.B40, the amount allocated to the renewal option would be recognised when, or as, the future goods or services are transferred (e.g., years two and three of the services if the renewal option is fully exercised) or when the renewal option expires.

Alternatively, the club could value the option by 'looking through' to the optional goods or services using the practical alternative provided in IFRS 15.B43 (see section 6.1.5 below). In that case, the club would determine that the total hypothetical transaction price (for purposes of allocating the transaction price to the option) is the sum of the upfront fee plus three years of service fees (i.e., CU150 + CU1,440) and would allocate that amount to all of the services expected to be delivered or 36 months of membership (or CU44.17 per month). Therefore, the total consideration in the contract of CU630 would be allocated to the 12 months of service (CU530 (CU44.17 x 12 months)) with the remaining amount being allocated to the renewal option (CU100 (CU630 - CU530)). Assuming the renewal option is exercised for year 2 and year 3, the amount allocated to the renewal option (CU100) would be recognised as revenue over each renewal period. One acceptable approach would be to reduce the initial CU100 deferred revenue balance for the material right by CU4.17 each month (CU100 ÷ 24 months remaining), assuming that the estimated renewal period of two years remains unchanged.

See section 4.6 above and section 6.1.5 below for a more detailed discussion of the treatment of options (including the practical alternative allowed under IFRS 15.B43) and sections 6.1 and 6.2 below for a discussion of estimating stand-alone selling prices and allocating consideration using the relative stand-alone selling price method.

The standard notes that, in some cases, an entity might charge a non-refundable fee in part as compensation for costs incurred in setting up a contract (or other administrative tasks). If those set-up activities do not satisfy a performance obligation, the entity is required to disregard them (and the related costs) when measuring progress (see section 7.1.4 below). This is because the costs of set-up activities do not depict the transfer of services to the customer. In addition, the entity is required to assess whether costs incurred in setting up a contract are costs incurred to fulfil a contract that meet the requirements for capitalisation in IFRS 15 (see section 9.3.2 below). [IFRS 15.B51].

Frequently asked questions

Question 5-37: Over what period would an entity recognise a non-refundable upfront fee (e.g., fees paid for membership to a club, activation fees for phone, cable or internet services) that does not relate to the transfer of a good or service?

(TRG meeting 30 March 2015 - Agenda paper no. 32)

The TRG members generally agreed that the period over which a non-refundable upfront fee is recognised depends on whether the fee provides the customer with a material right with respect to future contract renewals (see section 4.6 above).¹⁰³ For example, assume that an entity charges a one-time activation fee of CU50 to provide CU100 of services to a customer on a month-to-month basis. If the entity concludes that the activation fee provides a material right, the fee would be recognised over the service period during which the customer is expected to benefit from not having to pay an activation fee upon renewal of the service. That period might be the estimated customer life in some situations. If the entity concludes that the activation fee does not provide a material right, the fee would be recognised over the contract duration (i.e., one month).

Question 5-38: How does a utility entity determine whether a contract that includes a non-refundable upfront fee received for establishing a connection to a network (i.e., a connection fee) is within the scope of IFRS 15?

Utility entities are often responsible for constructing infrastructure (e.g., a pipe) that will physically connect a building to its network (i.e., connection) and for providing ongoing services (e.g., delivery of electricity, gas, water). In exchange, a utility entity generally charges the customer a non-refundable upfront connection fee and a separate fee for the ongoing services. Furthermore, the connection fee and/or the fee for ongoing services are often subject to rate regulation established through a formal regulatory framework that affects the rates that a utility entity is allowed to charge to its customers.

Utility entities first need to assess whether some or all of the contract is within the scope of another IFRS accounting standard (e.g., IFRS 16, IAS 16). If the contract is partially within the scope of IFRS 15, the entity would need to separate the non-revenue components, in accordance with IFRS 15.7, and account for the remainder within the scope of IFRS 15 (see section 2.5 above for further discussion).

To be within the scope of IFRS 15, a vendor-customer relationship needs to exist.

How we see it

Provided such goods or services are an output of the ordinary activities of the entity, we believe a vendor-customer relationship would exist (and the contract would be wholly, or partially, within the scope of the standard) if:

- The ongoing service is part of the contract or part of an associated contract for ongoing services that is combined with the contract to establish the connection if the combined contract criteria in IFRS 15.17 are met. In a rate-regulated environment, the contract to transfer ongoing services to a customer (e.g., delivery of energy) might be implied as the customer has no alternative other than purchasing the good or service from the entity that is responsible for creating the connection.
- Or
- The customer obtains control of the infrastructure asset (e.g., a pipe) or the connection.

Question 5-39: What factors might be relevant when a utility entity applies the application guidance to non-refundable upfront fees for establishing a connection to a network?

As discussed in Question 5-36 above, utility entities are often responsible for constructing infrastructure (e.g., a pipe) that will physically connect a building to its network (i.e., connection) and might receive a non-refundable upfront connection fee in exchange. Applying the non-refundable upfront fee application guidance in such contracts often requires significant judgement and depends on the facts and circumstances. For example, if more than one party is involved, the utility entity needs to consider the principal versus agent application guidance (see section 4.4 above) in addition to the non-refundable upfront fee application guidance.

The non-refundable upfront fee application guidance requires an entity to determine if the upfront fee is related to a distinct good or service. *[IFRS 15.B49, IFRS 15.B50].*

¹⁰³ TRG Agenda paper no. 32, *Accounting for a Customer's Exercise of a Material Right*, dated 30 March 2015 and TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015.

How we see it

Determining whether the connection to the network is a distinct good or service depends on the facts and circumstances and might require significant judgement.

As part of this assessment:

- A utility entity needs to determine whether the connection is a promised good or service in the contract. It considers explicit promises in the contract and implied promises that create a valid expectation of the customer that it will transfer control of the connection to the customer. *[IFRS 15.24, IFRS 15.25, IFRS 15.B51]*. This is likely to require significant judgement if the infrastructure asset remains an asset of the utility entity.
- If the connection is a promised good or service, a utility entity needs to determine whether the promise is distinct. In particular, the assessment of whether the connection is distinct in the context of the contract is highly judgemental and must consider the specific contract with the customer, including all relevant facts and circumstances. Entities must not assume that a particular type of good or service is distinct (or not distinct) in all instances. The manner in which the promised goods and services have been bundled within a contract, if any, will affect the entity's assessment. *[IFRS 15.27]*.

As part of assessing whether the promise is distinct within the context of the contract, a utility entity considers the three factors described in IFRS 15.29 (see section 4.2.1.B above), as follows: *[IFRS 15.29]*

- Factor (a): The utility entity needs to understand the promise(s) it has made to its customers and whether it integrates them to satisfy its promise(s). For example, if it promised its customer the ongoing supply of services, it might also bear the risk for distribution of these services (including ensuring continued connection). Therefore, it might be providing a significant service of integrating promised goods or services to provide a combined output.
- Factor (b): This factor is unlikely to be relevant in the assessment of whether connection is distinct within the context of the contract because the ongoing service and the connection are unlikely to modify or customise each other.
- Factor (c): The utility entity has to determine whether the connection is highly interdependent and highly interrelated with the ongoing service (e.g., supply of electricity). For example, whether there is more than just a functional relationship (i.e., one item, by its nature, depends on the other) because the utility entity cannot provide ongoing services (its main output, e.g., electricity, gas, water) without the connection and the customer cannot benefit from the connection without the ongoing services (i.e., is there two-way dependency?).

If the utility entity concludes that connection is not a distinct good or service, the non-refundable upfront fee is advanced payment for future goods or services and is recognised as revenue when (or as) the future goods or services are provided. As discussed above, in such situations, an entity must determine whether the non-refundable upfront fee represents an option to renew the contract at a lower price and must assesses whether the option to renew represents a material right. *[IFRS 15.B49, IFRS 15.B40, IFRS 15.BC391]*.

How we see it

Significant judgement might be needed to determine whether the customer has a material right. However, the fact that the customer remains connected to the network and does not to pay the connection fee again while in the same property, for example, might indicate that a material right exists.

If the renewal option represents a material right, the period over which the upfront fee is recognised is longer than the initial contract duration. *[IFRS 15.B49]*. It is likely that significant judgement will be needed to determine the appropriate period over which to recognise the upfront fee in such circumstances (see Question 5-35 above).

Question 5-40: How is consideration that was received from a customer, but not yet recognised as revenue, accounted for when the contract is cancelled?

See response to Question 3-10 in section 3.2 above.

5.9 Changes in the transaction price

Changes in the transaction price can occur for various reasons, including “the resolution of uncertain events or other changes in circumstances that change the amount of consideration to which an entity expects to be entitled in exchange for the promised goods or services”. [IFRS 15.87]. See section 6.5 below for additional requirements on accounting for a change in transaction price.

6 IFRS 15 - Allocate the transaction price to the performance obligations

Once the separate performance obligations are identified and the transaction price has been determined, the standard generally requires an entity to allocate the transaction price to the performance obligations in proportion to their stand-alone selling prices (i.e., on a relative stand-alone selling price basis). The Board noted in the Basis for Conclusions that, in most cases, an allocation based on stand-alone selling prices will faithfully depict the different margins that might apply to promised goods or services. [IFRS 15.BC266].

The standard's objective for the allocation of the transaction price to the performance obligations identified in a contract is as follows: [IFRS 15.73]

Extract from IFRS 15

73 The objective when allocating the transaction price is for an entity to allocate the transaction price to each performance obligation (or distinct good or service) in an amount that depicts the amount of consideration to which the entity expects to be entitled in exchange for transferring the promised goods or services to the customer.

When allocating on a relative stand-alone selling price basis, any discount within the contract is generally allocated proportionately to all of the performance obligations in the contract.

However, as discussed further in sections 6.3 and 6.4 below, there are some exceptions. For example, an entity could allocate variable consideration to a single performance obligation in some situations (see section 6.3 below). IFRS 15 also contemplates the allocation of any discount in a contract only to certain performance obligations, if specified criteria are met (see section 6.4 below). [IFRS 15.74]. An entity would not apply the allocation requirements if the contract has only one performance obligation (except for a single performance obligation that is made up of a series of distinct goods or services and includes variable consideration). [IFRS 15.75].

6.1 Determining stand-alone selling prices

To allocate the transaction price on a relative stand-alone selling price basis, an entity must first determine the stand-alone selling price of the distinct good or service (which might represent a bundle of goods or services) underlying each performance obligation. [IFRS 15.76]. Under the standard, this is the price at which an entity would sell a distinct good or service on a stand-alone (or separate) basis at contract inception. If multiple non-distinct goods or services are bundled to form a single performance obligation, the stand-alone selling price is determined at the price the entity would sell the bundle separately to the customer. This amount is not always the sum of the prices at which the entity would sell the individual goods or services that make up the bundle. [IFRS 15.77].

IFRS 15 indicates the observable price of a good or service sold separately (in similar circumstances and to similar customers) provides the best evidence of stand-alone selling price. [IFRS 15.77]. A contractually stated or list price for a good or service could be (but cannot be presumed to be) the stand-alone selling price of that good or service. However, in many situations, stand-alone selling prices are not directly observable. In those cases, the entity is required to estimate the stand-alone selling price by considering all relevant information (including market conditions, entity-specific factors, and information about the customer or class of customer) that is reasonably available to the entity. In doing so, an entity is required to maximise the use of observable inputs and apply estimation methods consistently in similar circumstances. The standard includes the following requirements on estimating stand-alone selling prices: [IFRS 15.78, IFRS 15.79, IFRS 15.80]

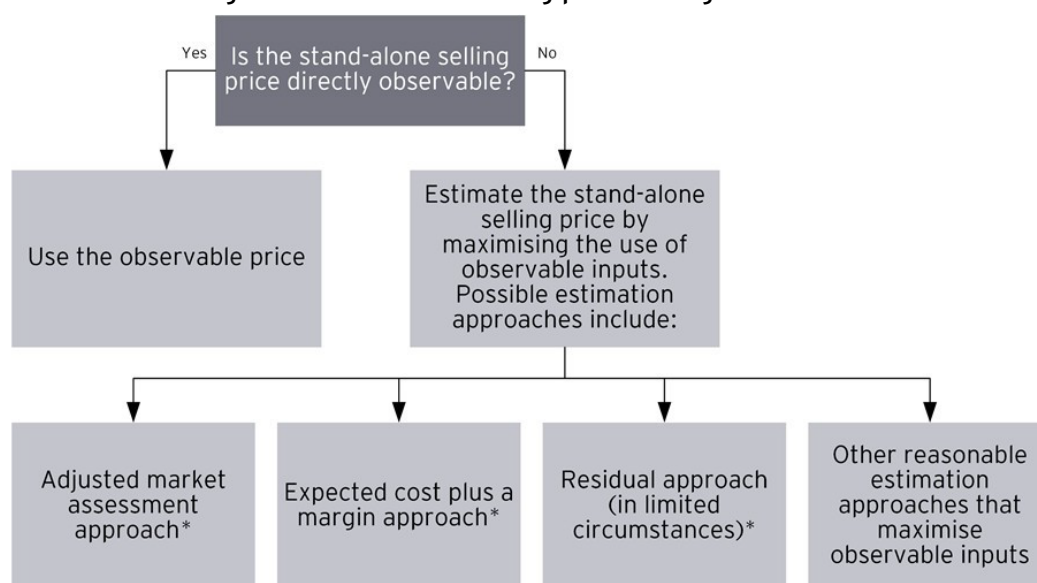

Extract from IFRS 15

78 If a stand-alone selling price is not directly observable, an entity shall estimate the stand-alone selling price at an amount that would result in the allocation of the transaction price meeting the allocation objective in paragraph 73. When estimating a stand-alone selling price, an entity shall consider all information (including market conditions, entity-specific factors and information about the customer or class of customer) that is reasonably available to the entity. In doing so, an entity shall maximise the use of observable inputs and apply estimation methods consistently in similar circumstances.

- 79 Suitable methods for estimating the stand-alone selling price of a good or service include, but are not limited to, the following:
- (a) Adjusted market assessment approach—an entity could evaluate the market in which it sells goods or services and estimate the price that a customer in that market would be willing to pay for those goods or services. That approach might also include referring to prices from the entity’s competitors for similar goods or services and adjusting those prices as necessary to reflect the entity’s costs and margins.
 - (b) Expected cost plus a margin approach—an entity could forecast its expected costs of satisfying a performance obligation and then add an appropriate margin for that good or service.
 - (c) Residual approach—an entity may estimate the stand-alone selling price by reference to the total transaction price less the sum of the observable stand-alone selling prices of other goods or services promised in the contract. However, an entity may use a residual approach to estimate, in accordance with paragraph 78, the stand-alone selling price of a good or service only if one of the following criteria is met:
 - (i) the entity sells the same good or service to different customers (at or near the same time) for a broad range of amounts (ie the selling price is highly variable because a representative stand-alone selling price is not discernible from past transactions or other observable evidence); or
 - (ii) the entity has not yet established a price for that good or service and the good or service has not previously been sold on a stand-alone basis (ie the selling price is uncertain).
- 80 A combination of methods may need to be used to estimate the stand-alone selling prices of the goods or services promised in the contract if two or more of those goods or services have highly variable or uncertain stand-alone selling prices. For example, an entity may use a residual approach to estimate the aggregate stand-alone selling price for those promised goods or services with highly variable or uncertain stand-alone selling prices and then use another method to estimate the stand-alone selling prices of the individual goods or services relative to that estimated aggregate stand-alone selling price determined by the residual approach. When an entity uses a combination of methods to estimate the stand-alone selling price of each promised good or service in the contract, the entity shall evaluate whether allocating the transaction price at those estimated stand-alone selling prices would be consistent with the allocation objective in paragraph 73 and the requirements for estimating stand-alone selling prices in paragraph 78.

The following flow chart illustrates how an entity determines the stand-alone selling price of a good or service, which might include estimation:

Figure 6-1: Determining the stand-alone selling price of a good or service

* See section 6.1.2 below for further discussion of these estimation approaches, including when it might be appropriate to use a combination of approaches.

Stand-alone selling prices are determined at contract inception and are not updated to reflect changes between contract inception and when performance is complete. [IFRS 15.88]. For example, assume an entity determines the stand-alone selling price for a promised good using the expected cost plus a margin approach and, before it can finish manufacturing and deliver that good, the underlying cost of the materials doubles. In such a situation, the entity would not revise its stand-alone selling price used for this contract. However, for future contracts involving the same good, the entity would need to determine whether the change in circumstances (i.e., the significant increase in the cost to produce the good) warrants a revision of the stand-alone selling price. If so, the entity would use that revised price for allocations in future contracts (see section 6.1.3 below).

Similarly, when a modification is treated as part of the existing contract (see section 3.4.2.B above), stand-alone selling prices are also not updated to reflect changes in a transaction price. However, new estimates of stand-alone selling prices are used if the modification creates a new or separate contract, as in the following situations:

- If the modification is treated as a termination of the existing contract and the creation of a new contract (see section 3.4.2.A above), the entity would update its estimate of the stand-alone selling price at the time of the modification.
- If the modification is treated as a separate contract (see section 3.4.1 above), the accounting for the original contract would not be affected (and the stand-alone selling prices of the goods or services in the original contract would not be updated), but the stand-alone selling prices of the distinct goods or services in the separate contract would have to be determined at the time of the modification.

Refer to section 3.4 above for further details about the accounting for contract modifications.

6.1.1 Factors to consider when estimating the stand-alone selling price

To estimate the stand-alone selling price (if not directly observable), an entity can consider the stated prices in the contract. However, the standard says an entity cannot presume that a contractually stated price, or a list price, for a good or service is the stand-alone selling price. [IFRS 15.77]. In estimating a stand-alone selling price, an “entity shall consider all information (including market conditions, entity-specific factors and information about the customer or class of customer) that is reasonably available to the entity”. [IFRS 15.78, IFRS 15.BC269]. An entity also needs to maximise the use of observable inputs in its estimate. This is a very broad requirement for which an entity needs to consider a variety of data sources.

The following list, which is not all-inclusive, provides examples of market conditions to consider:

- Potential limits on the selling price of the product
- Competitor pricing for a similar or identical product
- Market awareness and perception of the product
- Current market trends that are likely to affect the pricing (e.g., supply and demand for the good or service, competition)
- The entity’s market share and position (e.g., the entity’s ability to dictate pricing)
- Effects of the geographic area on pricing
- Effects of customisation on pricing
- Expected life of the product, including whether significant technological advances are expected in the market in the near future

Examples of entity-specific factors include:

- Profit objectives and internal cost structure
- Pricing practices and pricing objectives (including desired gross profit margin)
- Effects of customisation on pricing
- Pricing practices used to establish pricing of bundled products
- Effects of a proposed transaction on pricing (e.g., the size of the deal, the characteristics of the targeted customer)
- Expected life of the product, including whether significant entity-specific technological advances are expected in the near future

Examples of information about the customer, or class of customer, include:

- Type of customer
- Geographic region
- Distribution channel

An entity must also consider its customary business practices when determining the stand-alone selling price. To document its estimated stand-alone selling price, an entity ought to consider describing the information that it has considered (e.g., the factors listed above), especially if there is limited observable data or none at all.

6.1.2 Possible estimation approaches

IFRS 15.79 discusses three estimation approaches: (1) the adjusted market assessment approach; (2) the expected cost plus a margin approach; and (3) the residual approach. [IFRS 15.79]. All of these are discussed further below. When applying IFRS 15, an entity might need to use a different estimation approach for each of the distinct goods or services underlying the performance obligations in a contract. In addition, an entity might need to use a combination of approaches to estimate the stand-alone selling prices of goods or services promised in a contract, if two or more of those goods or services have highly variable or uncertain stand-alone selling prices.

Furthermore, these are not the only estimation approaches permitted. IFRS 15 allows any reasonable estimation approach, as long as it is consistent with the notion of a stand-alone selling price, maximises the use of observable inputs and is applied on a consistent basis for similar goods or services and customers. [IFRS 15.80].

In some cases, an entity will have sufficient observable data to determine the stand-alone selling price. For example, an entity might have sufficient stand-alone sales of a particular good or service that provide persuasive evidence of the stand-alone selling price of that particular good or service. In such situations, no estimation would be necessary. [IFRS 15.77].

In many instances, an entity will not have sufficient stand-alone sales data to determine the stand-alone selling price based solely on those sales. In those instances, it must maximise the use of whatever observable inputs it has available in order to make its estimate. That is, an entity would not disregard any observable inputs when estimating the stand-alone selling price of a good or service. [IFRS 15.78]. An entity needs to consider all factors contemplated in negotiating the contract with the customer and the entity's normal pricing practices factoring in the most objective and reliable information that is available. Accordingly, entities need to have robust practices and processes in place regarding the pricing of goods or services and developing estimates of stand-alone selling prices.

The standard includes the following estimation approaches: [IFRS 15.79]

- **Adjusted market assessment approach** - this approach focuses on the amount that the entity believes a participant in the market in which it sells goods or services is willing to pay for a good or service. For example, an entity might refer to competitors' prices for similar goods or services and adjust those prices, as necessary, to reflect the entity's costs and margins. When using the adjusted market assessment approach, an entity considers market conditions, such as those listed in section 6.1.1 above. Applying this approach is likely to be easiest when an entity has sold the good or service for a period of time (such that it has data about customer demand) or a competitor offers similar goods or services that the entity can use as a basis for its analysis. Applying this approach will be difficult when an entity is selling an entirely new good or service because it might be difficult to anticipate market demand. In these situations, entities might want to use the market assessment approach, with adjustments, as necessary, to reflect the entity's costs and margins, in combination with other approaches to maximise the use of observable inputs (e.g., using competitors' pricing, adjusted based on the market assessment approach in combination with an entity's planned internal pricing strategies if the performance obligation has never been sold separately).
- **Expected cost plus margin approach** - this approach focuses more on internal factors (e.g., the entity's cost basis), but has an external component as well. That is, the margin included in this approach must reflect the margin the market would be willing to pay, not just the entity's desired margin. The margin might have to be adjusted for differences in products, geographies, customers and other factors. The expected cost plus margin approach could be useful in many situations, especially when the performance obligation has a determinable direct fulfilment cost (e.g., the performance obligation is a tangible product or an hourly service). However, this approach will be less helpful when there are no clearly identifiable direct fulfilment costs or the amount of those costs is unknown (e.g., when the performance obligation is a new software licence or specified upgrade rights).
- **Residual approach** - this approach allows an entity to estimate the stand-alone selling price of a promised good or service as the difference between the total transaction price and the observable (i.e., not estimated) stand-alone selling prices of other promised goods or services in the contract, provided that one of the following two criteria are met: [IFRS 15.79(c)]

- At or near the same time, the same good or service is sold by the entity to different customers at a wide range of prices (i.e., the representative stand-alone selling price cannot be determined from past transactions or other observable evidence as it is highly variable)
- The good or service has not yet been sold on a stand-alone basis and a price for that good or service has not previously been established by the entity (i.e., the selling price is uncertain)

We expect the use of the residual approach will be limited because the standard indicates that it can only be used for contracts with multiple promised goods or services when: (1) the selling price of one or more of the promised goods or services is unknown because one of the two criteria above are met; and (2) the remaining promised goods or services (of which there needs to be at least one) in the contract have observable (i.e., not estimated) stand-alone selling prices. That is, the residual approach cannot be used if the selling price for all the goods or services in the contract are unknown. However, allowing entities to use a residual technique provides relief to entities that rarely, or never, sell goods or services on a stand-alone basis, such as entities that sell intellectual property only with physical goods or services.

The Board noted in the Basis for Conclusions that the use of the residual approach cannot result in a stand-alone selling price of zero if the good or service is distinct. [IFRS 15.BC273]. This is because a good or service must have value on a stand-alone basis to be distinct. The Board also stated that, if use of the residual approach results in very little, or no, consideration being allocated to a good or service or a bundle of goods or services, an entity has to re-evaluate whether the use of the residual approach is appropriate.

An example of an appropriate use of the residual approach would be an entity that frequently sells software, professional services and maintenance, bundled together, at prices that vary widely. However, the entity also sells the professional services and maintenance individually at relatively stable, observable prices. The Board indicated that in such situation it would be appropriate to estimate the stand-alone selling price for the software as the difference between the total transaction price and the observable selling prices of the professional services and maintenance. See Example 34, Cases B and C, from IFRS 15 (included in section 6.4 below) for examples of when the residual approach is or is not appropriate.

The Board clarified in the Basis for Conclusions that an entity could also use the residual approach if there are two or more goods or services in the contract with highly variable or uncertain stand-alone selling prices, provided that the other promised goods or services in the contract (of which there needs to be at least one) have observable stand-alone selling prices. The Board observed that, in such an instance, an entity might need to use a combination of techniques to estimate the stand-alone selling prices. [IFRS 15.BC272]. For example, an entity could apply the residual approach to estimate the aggregate of the stand-alone selling prices for all of the promised goods or services with highly variable or uncertain stand-alone selling prices, but then use another approach (e.g., adjusted market assessment, expected cost plus margin) to estimate the stand-alone selling prices of each of those promised goods or services with highly variable or uncertain stand-alone selling prices.

Illustration 6-1: Estimating the stand-alone selling price using the residual approach

Entity X enters into a contract with a customer to sell equipment, professional services and maintenance as a bundled package for CU20,000. The professional services and maintenance have observable prices from Entity X's historical sales. The equipment is a new product for Entity X for which it has limited historical sales and no established price. Entity X has not historically sold any similar equipment, and Entity X's cost of the equipment is CU6,000.

Scenario A

Entity X frequently sells professional services and maintenance separately for observable prices of CU7,000 and CU5,000, respectively.

If Entity X determines that there is no other relevant observable data to determine the stand-alone selling price of the equipment, it could use the residual approach. This approach results in a stand-alone selling price for the equipment of CU8,000 (CU20,000 - CU7,000 - CU5,000).

Scenario B

Entity X frequently sells professional services and maintenance separately for observable prices of CU14,000 and CU5,500, respectively.

The residual approach would result in a stand-alone selling price for the equipment of CU500 (CU20,000 - CU14,000 - CU5,500). It might not be appropriate to use the approach in this situation because the result allocates very little consideration to the equipment.

The standard includes the following example in which two estimation approaches are used to estimate stand-alone selling prices of two different goods in a contract: [IFRS 15.IE Example 33, IFRS 15.IE164-IE166]

Extract from IFRS 15

Example 33-Allocation methodology

An entity enters into a contract with a customer to sell Products A, B and C in exchange for CU100. The entity will satisfy the performance obligations for each of the products at different points in time. The entity regularly sells Product A separately and therefore the stand-alone selling price is directly observable. The stand-alone selling prices of Products B and C are not directly observable.

Because the stand-alone selling prices for Products B and C are not directly observable, the entity must estimate them. To estimate the stand-alone selling prices, the entity uses the adjusted market assessment approach for Product B and the expected cost plus a margin approach for Product C. In making those estimates, the entity maximises the use of observable inputs (in accordance with paragraph 78 of IFRS 15). The entity estimates the stand-alone selling prices as follows:

Product	Stand-alone selling price	Method
CU		
Product A	50	Directly observable (see paragraph 77 of IFRS 15)
Product B	25	Adjusted market assessment approach (see paragraph 79(a) of IFRS 15)
Product C	75	Expected cost plus a margin approach (see paragraph 79(b) of IFRS 15)
Total	150	

The customer receives a discount for purchasing the bundle of goods because the sum of the stand-alone selling prices (CU150) exceeds the promised consideration (CU100). The entity considers whether it has observable evidence about the performance obligation to which the entire discount belongs (in accordance with paragraph 82 of IFRS 15) and concludes that it does not. Consequently, in accordance with paragraphs 76 and 81 of IFRS 15, the discount is allocated proportionately across Products A, B and C. The discount, and therefore the transaction price, is allocated as follows:

Product	Allocated transaction price
CU	
Product A	33 (CU50 ÷ CU150 × CU100)
Product B	17 (CU25 ÷ CU150 × CU100)
Product C	50 (CU75 ÷ CU150 × CU100)
Total	100

Given the flexibility provided by the standard to estimate stand-alone selling prices, it is both appropriate and necessary for entities to tailor the approach(es) used to their specific facts and circumstances. However, regardless of whether the entity uses a single approach or a combination of approaches, it must evaluate whether the resulting allocation of the transaction price is consistent with the overall allocation objective in IFRS 15.73 and the requirements for estimating stand-alone selling prices discussed above. [IFRS 15.80].

In accordance with IFRS 15, an entity must make a reasonable estimate of the stand-alone selling price for the distinct good or service underlying each performance obligation if an observable selling price is not directly available.

How we see it

We believe entities generally have sufficient information to develop a reasonable estimate, even in instances in which limited information is available.

Entities need robust processes to estimate stand-alone selling prices. If those estimates have limited underlying observable data, it is important for entities to be able to demonstrate the reasonableness of the calculations they make in estimating stand-alone selling prices.

6.1.3 Updating estimated stand-alone selling prices

As discussed in section 6.1 above, stand-alone selling prices are determined at contract inception and are not updated to reflect changes between contract inception and when performance is complete. Similarly, when a modification is treated as part of the existing contract (see section 3.4.2.B above), stand-alone selling prices are also not updated to reflect changes in a transaction price. However, new estimates of stand-alone selling prices are used if the modification creates a new or separate contract, as in the following situations:

- If the modification is treated as a termination of the existing contract and the creation of a new contract (see section 3.4.2.A above), the entity would update its estimate of the stand-alone selling price at the time of the modification.
- If the modification is treated as a separate contract (see section 3.4.1 above), the accounting for the original contract would not be affected (and the stand-alone selling prices of the goods and services in the original contract would not be updated), but the stand-alone selling prices of the distinct goods or services in the separate contract would have to be determined at the time of the modification.

Refer to section 3.4 above for further details about the accounting for contract modifications.

Furthermore, an entity needs to update its estimates of stand-alone selling prices for future transactions to reflect changes in circumstances. IFRS 15 does not specifically address how frequently estimated stand-alone selling prices for new contracts must be updated. Instead, it indicates that an entity must make this estimate for each distinct good or service underlying each performance obligation in each contract with a customer, which suggests that an entity needs to constantly update its estimates of stand-alone selling prices for each new contract.

In practice, we expect that entities will be able to consider their own facts and circumstances in order to determine how frequently they will need to update their stand-alone selling price estimates for new contracts. If, for example, the information used to estimate the stand-alone selling price for similar transactions has not changed, an entity might determine at inception of the new contract that it is still reasonable to use the previously determined stand-alone selling price.

However, in order for the changes in circumstances to be reflected in the estimate in a timely manner, we expect that an entity would formally update the estimate on a regular basis (e.g., monthly, quarterly, semi-annually). The frequency of updates needs to be based on the facts and circumstances of the distinct good or service underlying each performance obligation for which the estimate is made. An entity uses current information each time it develops or updates its estimate. While the estimates might be updated, the approach used to estimate stand-alone selling price does not change (i.e., an entity must use a consistent approach), unless facts and circumstances change. [IFRS 15.78].

6.1.4 Additional considerations for determining the stand-alone selling price

While not explicitly stated in IFRS 15, a single good or service could have more than one stand-alone selling price. That is, the entity might be willing to sell goods or services at different prices to different customers. Furthermore, an entity might use different prices in different geographies or in markets where it uses different methods to distribute its products (e.g., it might use a distributor or reseller, rather than selling directly to the end-consumer) or for other reasons (e.g., different cost structures or strategies in different markets). Accordingly, an entity might need to stratify its analysis to determine its stand-alone selling price for each class of customer, geography and/or market, as applicable.

Frequently asked questions

Question 6-1: When estimating the stand-alone selling price, does an entity have to consider its historical pricing for the sale of the good or service involved?

Historical pricing is likely to be an important input as it often reflects both market conditions and entity-specific factors and can provide supporting evidence about the reasonableness of management's estimate. For example, if management determines, based on its pricing policies and competition in the market, that the stand-alone selling price of its good or service is X, historical transactions within a reasonable range of X would provide supporting evidence for management's estimate. However, if historical pricing was only 50% of X, this would indicate that historical pricing is no longer relevant due to changes in the market, for example, or that management's estimate is flawed.

Depending on the facts and circumstances, an entity might conclude that other factors such as internal pricing policies are more relevant to its determination of a stand-alone selling price. When historical pricing has been established using the entity's normal pricing policies and procedures, it is more likely that this information will be relevant in the estimation.

How we see it

We believe that an entity has to consider its historical pricing in all circumstances, but it is not necessarily determinative. If the entity has sold the product separately or has information on competitors' pricing for a similar product, it is likely that the entity would find historical data relevant to its estimate of stand-alone selling prices, among other factors. In addition, we believe it might be appropriate for entities to stratify stand-alone selling prices based on: the type or size of customer; the amount of product or services purchased; the distribution channel; the geographic location; or other factors.

Question 6-2: When using an expected cost plus margin approach to estimate a stand-alone selling price, how would an entity determine an appropriate margin?

When an entity elects to use the expected cost plus margin approach, it is important for the entity to use an appropriate margin.

How we see it

Determining an appropriate margin might require the use of significant judgement and involve the consideration of many market conditions and entity-specific factors, discussed in section 6.1.1 above.

It would not be appropriate, for example, to determine that the entity's estimate of stand-alone selling price is equivalent to cost plus a 30% margin if a review of market conditions demonstrates that customers are only willing to pay the equivalent of cost plus a 12% margin for a comparable product. Similarly, it would be inappropriate to determine that cost plus a specified margin represents the stand-alone selling price if competitors are selling a comparable product at twice the determined estimate. Furthermore, the determined margin might have to be adjusted for differences in products, geographic locations, customers and other factors.

Question 6-3: When estimating the stand-alone selling price of a good or service, can an entity estimate a range of prices or does it have to identify a point estimate?

Entities might use a range of prices to help estimate the stand-alone selling price of a good or service.

How we see it

We believe it is reasonable for an entity to use such a range for the purpose of assessing whether a stand-alone selling price (i.e., a single price) that the entity intends to use is reasonably within that range. That is, we do not believe that an entity is required to determine a point estimate for each estimated stand-alone selling price if a range is a more practical means of estimating the stand-alone selling price for a good or service.

The objective of the standard is to allocate the transaction price to each performance obligation in "an amount that depicts the amount of consideration to which the entity expects to be entitled in exchange for transferring the promised goods or services to the customer". [IFRS 15.73]. While the standard does not address ranges of estimates, using a range of prices would not be inconsistent with the objective of the standard. The only requirements in the standard are that an entity maximise its use of observable inputs and apply the estimation approaches consistently. Therefore, the use of a range would also be consistent with these principles.

Practices we have observed include an entity establishing that a large portion of the stand-alone selling prices falls within a narrow range (e.g., by reference to historical pricing).

How we see it

We believe the use of a narrow range is acceptable for determining estimates of stand-alone selling prices under the standard because it is consistent with the standard's principle that an entity must maximise its use of observable inputs. While the use of a range would be appropriate for estimating the stand-alone selling price, we believe that some approaches to identifying this range do not meet the requirements of IFRS 15.

It would not be appropriate, for example, for an entity to determine a range by estimating a single price point for the stand-alone selling price and then adding an arbitrary range on either side of that point estimate, nor would it be appropriate to take the historical prices and expand the range around the midpoint until a significant portion of the historical transactions fall within that band. The wider the

range necessary to capture a high proportion of historical transactions, the less relevant it is in terms of providing a useful data point for estimating stand-alone selling prices.

Management's analysis of market conditions and entity-specific factors could support it in determining the best estimate of the stand-alone selling price. The historical pricing data from transactions, while not necessarily determinative, could be used as supporting evidence for management's conclusion. This is because it is consistent with the standard's principle that an entity must maximise its use of observable inputs. However, management would need to analyse the transactions that fall outside the range to determine whether they have similar characteristics and, therefore, need to be evaluated as a separate class of transactions with a different estimated selling price.

If the entity has established a reasonable range for the estimated stand-alone selling prices and the stated contractual price falls within that range, it would be appropriate to use the stated contractual price as the stand-alone selling price in the allocation calculation. However, if the stated contractual price for the good or service falls outside of the range, the stand-alone selling price needs to be adjusted to a point within the established range in order to allocate the transaction price on a relative stand-alone selling price basis. In these situations, the entity would need to determine which point in the range is most appropriate to use (e.g., the midpoint of the range or the outer limit nearest to the stated contractual price) when performing the allocation calculation.

Illustration 6-2: Allocating transaction price when there is a range of stand-alone selling prices

Entity X sells a product to Customer Y, along with a distinct service. Entity X sells the product on a stand-alone basis for prices that range from CU7,500 to CU8,500, and the service is sold on a stand-alone basis for CU4,000.

Scenario A

Assume the stated contract prices for the product and the service are CU8,000 and CU2,000, respectively, for a total transaction price of CU10,000.

The contract price for the product falls within the range that Entity X determined for the stand-alone selling price. Therefore, Entity X could use the stated contract price for the product as the stand-alone selling price when allocating the transaction price. The total stand-alone selling prices of the product and service would be CU12,000 (CU8,000 for the product and CU4,000 for the service). This calculation is illustrated, as follows:

	Stand-alone selling price		Allocated transaction price
	CU		CU
Product	8,000	$(8,000 \div 12,000 \times 10,000)$	6,667
Service	4,000	$(4,000 \div 12,000 \times 10,000)$	3,333
Total	12,000		10,000

Scenario B

Assume the stated contract prices for the product and the service are CU6,500 and CU2,000, respectively, for a total transaction price of CU8,500. Entity X has a policy that it will use the outer limit nearest to the stated contractual price when performing the allocation calculation.

In this scenario, the contract price for the product is not within the range of stand-alone selling prices. Therefore, Entity X would need to determine a price within the range to use as the stand-alone selling price of the product. Consistent with its policy, Entity X uses the outer limit closest to the contractual price, or CU7,500. Therefore, in this scenario, the total of the stand-alone selling prices is CU11,500 (CU7,500 for the product and CU4,000 for the service). The calculation is illustrated as follows:

	Stand-alone selling price	Allocated transaction price
	CU	CU
Product	7,500 $(7,500 \div 11,500 \times 8,500)$	5,543
Service	4,000 $(4,000 \div 11,500 \times 8,500)$	2,957
Total	11,500	8,500

Question 6-4: How does an entity evaluate a contract where the total transaction price exceeds the sum of the stand-alone selling prices?

If the total transaction price exceeds the sum of the stand-alone selling prices, it indicates that the customer is paying a premium for bundling the goods or services in the contract. This situation is likely to be rare because most customers expect to receive a discount for purchasing a bundle of goods or services. If a premium exists after determining the stand-alone selling prices of each good or service, the entity needs to evaluate whether it properly identified both the estimated stand-alone selling prices (i.e., are they too low?) and the number of performance obligations in the contract.

How we see it

If the entity determines that a premium does exist after this evaluation, we believe the entity would need to allocate the premium in a manner consistent with the standard's allocation objective, which would typically be on a relative stand-alone selling price basis.

Question 6-5: Can an entity use the residual method to estimate stand-alone selling prices if none of the distinct goods or services in the contract have an observable price?

As noted in section 6.1.2 above, IFRS 15.79(c) requires that an estimate determined using the residual approach equal "... the total transaction price less the sum of the observable stand-alone selling prices of other goods or services promised in the contract." Therefore, the residual method cannot be applied if none of the distinct goods or services in the contract have an observable stand-alone selling price.

Question 6-6: Can an entity use the stated contract price as the stand-alone selling price of a good or service?

As noted in section 6.1 above, IFRS 15.77 states that "A contractually stated price or a list price for a good or service may be (but shall not be presumed to be) the stand-alone selling price of that good or service." Therefore, an entity cannot assume that the contract price is the stand-alone selling price. However, the stated contract or list price might be a data point in determining the stand-alone selling price.

Question 6-7: How does an entity consider transactions in which the entity sells distinct goods or services in a bundled (i.e., multiple element) contract when determining the stand-alone selling price?

The standard states that "the best evidence of a stand-alone selling price is the observable price of a good or service when the entity sells that good or service separately in similar circumstances and to similar customers." [IFRS 15.77]. That is, when determining whether a distinct good or service has an observable stand-alone selling price, an entity needs to evaluate transactions in which the entity sells the distinct good or service separately.

An entity that never sells a good or service separately or concludes it does not have sufficient stand-alone sales that provide persuasive evidence of the stand-alone selling price of that good or service will need to estimate the stand-alone selling price of that good or service.

Transactions in which the entity sells the distinct good or service in a contract together with other distinct goods or services (e.g., a transaction in which software, professional services and maintenance are bundled together) often include discounts. Therefore, these transactions may provide less persuasive evidence of the price at which an entity would sell a promised good or service separately to its customer. However, entities might be able to use selling prices from multiple-element transactions along with other readily available information (e.g., the entity's selling practices and policies) to support an estimated, rather than observable, stand-alone selling price.

6.1.5 Measurement of options that are separate performance obligations

An entity that determines that a customer option for additional goods or services is a separate performance obligation (because the option provides the customer with a material right, as discussed in section 4.6 above) needs to determine the stand-alone selling price of the option. [IFRS 15.B42].

If the option's stand-alone selling price is not directly observable, the entity needs to estimate it. In doing so, IFRS 15.B42 requires an entity to take into consideration any discount the customer would receive in a stand-alone transaction and the likelihood that the customer would exercise the option. [IFRS 15.B42].

Generally, option pricing models consider both the intrinsic value of the option (i.e., the value of the option if it were exercised today) and its time value (e.g., the option might be more or less valuable based on the amount of time until its expiration date and/or the volatility of the price of the underlying good or service). However, an entity is only required to measure the intrinsic value of the option when estimating the stand-alone selling price of the option. In the Basis for Conclusions, the Board noted that the benefits of valuing the time value component of an option would not justify the cost of doing so. [IFRS 15.BC390]. Example 49 in the standard (included in section 4.6 above) illustrates the measurement of an option determined to be a material right under IFRS 15.B42. The following Illustration also explains this concept:

Illustration 6-3: Estimating the stand-alone selling price of options that are separate performance obligations

Publisher A sells a physical textbook for CU10 and offers the customer an option to purchase the digital version of the publication at 50% off the retail price of CU8. The typical discount for digital versions is 15%. Therefore, Publisher A concludes that this discount exceeds the typical discount offered to customers and that it provides the customer with a material right.

To estimate the stand-alone selling price of the option, Publisher A estimates there is a 50% likelihood that a customer will redeem the discount option. Therefore, Publisher A's estimated stand-alone selling price of the discount option is CU1.40 (CU8 digital price x 35% incremental discount x 50% likelihood of exercising the option).

Publisher A allocates CU1.23 (CU10 x [CU1.40 ÷ (CU1.40 + CU10)]) of the transaction price to the discount option and recognises revenue for the option when the customer exercises its right for the digital version or when the option expires. Publisher A allocates CU8.77 (CU10 - CU1.23) to the physical book and recognises revenue for the physical book when it transfers control of the book to the customer.

IFRS 15.B43 provides an alternative to estimating the stand-alone selling price of an option. This practical alternative applies when the additional goods or services are both: (1) similar to the original goods or services in the contract (i.e., the entity continues to provide what it was already providing); [IFRS 15.BC394] and (2) provided in accordance with the terms of the original contract. The standard indicates that this practical alternative generally applies to options for contract renewals (i.e., the renewal option approach). [IFRS 15.B43].

The Basis for Conclusions states that customer loyalty points and discount vouchers typically do not meet the criteria for use of this practical alternative. This is because customer loyalty points and discount vouchers are redeemable for goods or services that might differ in nature from those offered in the original contract and the terms of the original contract do not restrict the pricing of the additional goods or services. For example, if an airline offers flights to customers in exchange for points from its frequent flyer programme, the airline is not restricted because it can subsequently determine the number of points that are required to be redeemed for any particular flight. [IFRS 15.BC394, IFRS 15.BC395].

Under the practical alternative, a portion of the transaction price is allocated to the option (i.e., the material right that is a performance obligation) by reference to the total goods or services expected to be provided to the customer (including expected renewals) and the corresponding expected consideration. That is, the total amount of consideration expected to be received from the customer (including consideration from expected renewals) is allocated to the total goods or services expected to be provided to the customer, including those from the expected contract renewals. The amount allocated to the goods or services that the entity is required to transfer to the customer under the contract (i.e., excluding the optional goods or services that will be transferred if the customer exercises the renewal option(s)) is then subtracted from the total amount of consideration received (or that will be received) for transferring those goods or services. The difference is the amount that is allocated to the option at contract inception. An entity using this alternative needs to apply the constraint on variable consideration (as discussed in section 5.2.3 above) to the estimated consideration for the optional goods or services prior to performing the allocation (see Scenario B in Illustration 6-4 below). [IFRS 15.B43]. Example 51 in IFRS 15 also illustrates the use of the allocation alternative in IFRS 15.B43. [IFRS 15.IE Example 51, IFRS 15.IE257-IE266].

It is important to note that the calculation of total expected consideration (i.e., the hypothetical transaction price), including consideration related to expected renewals, is only performed for the purpose of allocating a portion of the hypothetical transaction price to the option at contract inception. It does not change the enforceable rights or obligations in the contract, nor does it affect the actual transaction price for the goods or services that the entity is presently obliged to transfer to the customer (which would not include expected renewals). Accordingly, the entity would not include any remaining hypothetical transaction price in its disclosure of remaining performance obligations (see section 10.5.1.C below). In this respect, the practical alternative is consistent with the conclusion in Question 4-21 in section 4.6 above. That is, even if an entity thinks that it is almost certain that a customer will exercise an option to buy additional goods or services, an entity does not include the additional goods or services underlying the option as promised goods or services (or performance obligations), unless there are substantive contractual penalties.

Subsequent to contract inception, if the actual number of contract renewals is different from an entity's initial expectations, the entity updates the hypothetical transaction price and allocation. However, as discussed in section 6.1 above, the estimate of the stand-alone selling price at contract inception is not updated. See Scenario B in Illustration 6-4 below for an example of how an entity could update its practical alternative calculation based on a change in expectations.

The following Illustration shows the two possible approaches for measuring options included in a contract:

Illustration 6-4: Measuring an option

A machinery maintenance contract provider offers a promotion to new customers who pay full price for the first year of maintenance coverage that grants them an option to renew the services for up to two years at a discount. The entity regularly sells maintenance coverage for CU750 per year. With the promotion, the customer can renew the one-year maintenance at the end of each year for CU600. The entity concludes that the ability to renew is a material right because the customer would receive a discount that exceeds any discount available to other customers. The entity also determines that no directly observable stand-alone selling price exists for the option to renew at a discount.

Scenario A - Estimate the stand-alone selling price of the option directly (IFRS 15.B42)

Since the entity has no directly observable evidence of the stand-alone selling price for the renewal option, it estimates the stand-alone selling price of an option for a CU150 discount on the renewal of service in years two and three. When developing its estimate, the entity considers factors such as the likelihood that the option will be exercised and the price of comparable discounted offers. For example, the entity might consider the selling price of an offer for a discounted price of similar services found on a 'deal of the day' website.

The option will then be included in the relative stand-alone selling price allocation. In this example, there are two performance obligations: one-year of maintenance services; and an option for discounted renewals. The consideration of CU750 is allocated between these two performance obligations based on their relative stand-alone selling prices.

Example 49 in the standard (included in section 4.6 above) illustrates the estimation of the stand-alone selling price of an option determined to be a material right under IFRS 15.B42.

Scenario B - Practical alternative to estimating the stand-alone selling price of the option using the renewal option approach (IFRS 15.B43)

If the entity chooses to use the renewal option approach, it allocates the transaction price to the option for maintenance services by reference to the maintenance services expected to be provided (including expected renewals) and the corresponding expected consideration. Since there is a discount offered on renewal of the maintenance service, this calculation will result in less revenue being allocated to the first year of the maintenance service when compared to the amount of consideration received for the first year of service (i.e., an amount less than CU750). The difference between the consideration received (or that will be received) for the first year of maintenance service (i.e., CU750) and the revenue allocated to the first year of maintenance service (i.e., an amount less than CU750) will represent the amount allocated to the option using the renewal option approach.

Assume the entity obtained 100 new customers under the promotion. Based on its experience, the entity anticipates approximately 50% attrition annually, after giving consideration to the anticipated effect that the CU150 discount will have on attrition. The entity considers the constraint on variable consideration and concludes that it is highly probable that a significant revenue reversal will not occur. Therefore, the entity concludes that, for this portfolio of contracts, it will ultimately sell 175 contracts, each contract providing one-year of maintenance services (i.e., 100 customers in the first year, 50 customers in the second year and 25 customers in the third year).

Therefore, the total consideration the entity expects to receive is CU120,000 [(100 x CU750) + (50 x CU600) + (25 x CU600)] (i.e., the hypothetical transaction price). Assuming the stand-alone selling price for each maintenance contract period is the same, the entity allocates CU685.71 (CU120,000 ÷ 175) to each maintenance contract sold.

During the first year, the entity will recognise revenue of CU68,571 (100 one-year maintenance service contracts sold x the allocated price of CU685.71 per maintenance service contract). Consequently, at contract inception, the entity would allocate CU6,429 to the option to renew (CU75,000 cash received - CU68,571 revenue to be recognised in the first year).

If the actual renewals in years two and three differ from expectations, the entity would have to update the hypothetical transaction price and allocation accordingly. However, beyond stating, as discussed in section 6.1 above, that the estimate of the stand-alone selling prices at contract inception would not be updated, the standard is not explicit about how the entity would update the hypothetical transaction price and allocation. Below is an illustration of how an entity could update its practical alternative calculation based on a change in expectations.

For example, assume that the entity experiences less attrition than expected (e.g., 40% attrition annually, instead of 50%). Therefore, the entity's revised estimate is that it will ultimately sell 196 one-year maintenance services (100 + 60 renewals after year one + 36 renewals after year two). Accordingly, the total consideration that the entity expects to receive is CU132,600 [(100 x CU750) + (60 x CU600) + (36 x CU600)] (i.e., the updated hypothetical transaction price). The entity would not update its estimates of the stand-alone selling prices (which were assumed to be the same for each maintenance period). As such, the entity allocates CU676.53 (CU132,600 ÷ 196) to each maintenance period. The entity would reduce the amount of revenue it recognises in year one by CU918 (CU68,571 - (100 x CU676.53)) because the amount allocated to the option would have been higher at contract inception.

See Illustration 5-8 in section 5.8 above for another example of applying the practical alternative when the contract includes a non-refundable upfront fee that is deemed to be a material right.

Frequently asked questions

Question 6-8: Could the form of an option (e.g., a gift card versus a coupon) affect how an option's stand-alone selling price is estimated?

How we see it

We believe that the form of an option would not affect how the stand-alone selling price is estimated.

Consider, for example, a retailer that gives customers who spend more than CU100 during a specified period a CU15 discount on a future purchase in the form of a coupon or a gift card that expires two weeks from the sale date. If the retailer determines that this type of offer represents a material right (see section 4.6 above), it will need to allocate a portion of the transaction price to the option on a relative stand-alone selling price basis.

As discussed in section 6.1 above, the standard requires that an entity first look to any directly observable stand-alone selling price. This requires the retailer to consider the nature of the underlying transaction. In this example, while a customer can purchase a CU15 gift card for its face value, that transaction is not the same in substance as a transaction in which the customer is given a CU15 gift card or coupon in connection with purchasing another good or service. As such, the retailer could conclude that there is no directly observable stand-alone selling price for a 'free' gift card or coupon obtained in connection with the purchase of another good or service. It would then need to estimate the stand-alone selling price in accordance with IFRS 15.B42.

The estimated stand-alone selling price of an option given in the form of a gift card or a coupon would be the same because both estimates would reflect the likelihood that the option will be exercised (i.e., breakage, as discussed in section 7.9 below).

Question 6-9: Can an entity use the practical alternative when some, but not all, of the goods or services in the original contract are subject to a renewal option?

How we see it

In certain instances, we believe it might be appropriate to apply the practical alternative even if not all of the goods or services in the original contract are subject to a renewal option, provided that at least one of the goods or services in the original contract is subject to the renewal terms included in the original contract.

Consider a contract to sell hardware and a service-type warranty where the customer has the option to renew only the warranty. Furthermore, assume that the renewal option is determined to be a material right. If the terms of any future warranty renewals are consistent with the terms provided in the original contract, we believe it would be reasonable to use the practical alternative when allocating the transaction price of the contract.

6.2 Applying the relative stand-alone selling price method

Once an entity has determined the stand-alone selling price for the separate goods or services in a contract, the entity allocates the transaction price to those performance obligations. The standard requires an entity to use the relative stand-alone selling price method to allocate the transaction price, except in the two specific circumstances (variable consideration and discounts), which are described in sections 6.3 and 6.4 below.

Under the relative stand-alone selling price method, the transaction price is allocated to each performance obligation based on the proportion of the stand-alone selling price of each performance obligation to the sum of the stand-alone selling prices of all of the performance obligations in the contract, as described in Illustration 6-5 below: [IFRS 15.76]

Illustration 6-5: Relative stand-alone selling price allocation

Manufacturing Co. entered into a contract with a customer to sell a machine for CU100,000. The total contract price included installation of the machine and a two-year extended warranty. Assume that Manufacturing Co. determined there were three performance obligations and the stand-alone selling prices of those performance obligations were as follows: machine - CU75,000, installation services - CU14,000 and extended warranty - CU20,000.

The aggregate of the stand-alone selling prices (CU109,000) exceeds the total transaction price of CU100,000, indicating there is a discount inherent in the contract. That discount must be allocated to each of the individual performance obligations based on the relative stand-alone selling price of each performance obligation. Therefore, the amount of the CU100,000 transaction price is allocated to each performance obligation as follows:

- Machine - CU68,807 ($\text{CU100,000} \times (\text{CU75,000} \div \text{CU109,000})$)
- Installation - CU12,844 ($\text{CU100,000} \times (\text{CU14,000} \div \text{CU109,000})$)
- Warranty - CU18,349 ($\text{CU100,000} \times (\text{CU20,000} \div \text{CU109,000})$)

The entity would recognise as revenue the amount allocated to each performance obligation when (or as) each performance obligation is satisfied.

Frequently asked questions

Question 6-10: How does an entity allocate the transaction price in a contract with multiple performance obligations in which the entity acts as both a principal and an agent?

(TRG meeting 18 July 2014 - Agenda paper no. 1)

The standard does not illustrate the allocation of the transaction price for a contract with multiple performance obligations in which the entity acts as both a principal and an agent (see section 4.4 above for a discussion of principal versus agent considerations). Below we illustrate two acceptable ways to perform the allocation for this type of contract that are consistent with the standard's objective for allocating the transaction price. Entities need to evaluate the facts and circumstances of their contracts to make sure that the allocation involving multiple performance obligations in which an entity acts as both a principal and an agent meets the allocation objective in IFRS 15.73.

Illustration 6-6: Allocation when an entity is both a principal and an agent in a contract

Entity X sells two distinct products (i.e., Product A and Product B) to Customer Y, along with a distinct service for an aggregate contract price of CU800. Entity X is the principal for the sale of Product A and Product B, but is an agent for the sale of the service.

The stand-alone selling price of each good and service in the contract is, as follows:

Contract	Stand-alone selling price
	CU
Product A	500
Product B	300
Service	200
Total	1,000

Entity X earns a 20% commission from the third-party service provider based on the stand-alone selling price of the service. That is, Entity X earns CU40 of commission (i.e., CU200 x 20%) and remits the remaining CU160 to the third-party service provider.

Method A - Entity X determines that it has provided a single discount of CU200 (i.e., sum of stand-alone selling prices of CU1,000 less the contract price of CU800) on the bundle of goods and services sold to Customer Y in the contract (i.e., Products A and B and the service provided by the third party). Assume that the criteria for allocating the discount to one or more, but not all, performance obligations in accordance with IFRS 15.82 are not met - see section 6.4 below.

In order to allocate the discount to all of the goods and services in the contract, Entity X considers the performance obligation for the agency service as part of the contract with Customer Y for purposes of allocating the transaction price. Entity X determines the stand-alone selling prices of Products A and B and the agency service and allocates the transaction price of CU640 (i.e., CU800 contract price less CU160 to be remitted to the third-party service provider) for Products A and B and the service on a relative stand-alone selling price basis. This method is illustrated, as follows:

Contract	Stand-alone selling price	Allocated transaction price
	CU	CU
Product A	500 (500 ÷ 840 × 640)	381
Product B	300 (300 ÷ 840 × 640)	229
Service	40 (40 ÷ 840 × 640)	30
Total	840	640

Method B - Entity X determines that it has provided a discount of CU200 on Products A and B since it is the principal for the transfer of those goods to Customer Y. Entity X believes the third-party service provider is a separate customer for its agency services and the commission Entity X expects to be entitled to receive for the agency service is not part of the transaction price in the contract with Customer Y. Entity X allocates a transaction price of CU600 (i.e., CU800 contract price less CU200 stand-alone selling price of service) to Product A and B on a relative stand-alone selling price basis. This method is illustrated, as follows:

Contract 1	Stand-alone selling price	Allocated transaction price
	CU	CU
Product A	500 (500 ÷ 800 × 600)	375
Product B	300 (300 ÷ 800 × 600)	225
Total	800	600

The entity would recognise CU40 separately for its earned commission on the service contract when the performance obligation for the agency service has been satisfied.

In either method, the same amount of revenue is ultimately recognised (i.e., CU640). However, the timing of revenue recognition would be different if the products and agency service are transferred to the customer at different times.

Question 6-11: How does an entity allocate the transaction price in a contract with optional purchases using the relative stand-alone selling price method?

(TRG meeting 9 November 2015 - Agenda paper no. 48)

TRG members generally agreed that, if there are no contractual penalties, the entity would not identify the additional goods and services underlying the option as performance obligations at contract inception. Therefore, the consideration that would be received for the optional goods or services is not included in the transaction price at contract inception (refer to Question 4-21 in section 4.6 above for additional details). The option needs to be assessed to determine whether it represents a material right that would be accounted for as a performance obligation. If the entity concludes the option is a material right, a portion of the consideration is allocated to that option using the relative stand-alone selling price method. Consider the following Illustration based on an example from the TRG agenda paper:

Illustration 6-7: Allocation using the relative stand-alone selling price method

An entity sells equipment and consumables, both of which are determined to be distinct goods that generate revenue that is recognised at a point in time. The stand-alone selling prices of the equipment and each consumable are CU10,000 and CU100, respectively.

The entity enters into a contract to sell the equipment for CU10,000 and gives the customer the option to purchase each consumable for CU80 (the entity concludes the 20% discount on consumables is material). The equipment cost the entity CU8,000, and each consumable costs the entity CU60. The customer is not required to purchase any consumables, however, the option to purchase consumables represents a material right. The entity estimates that 200 consumables would be purchased, and the stand-alone selling price of the material right is CU4,000.

The transaction price of CU10,000 for the sale of the equipment (prior to the purchase of any consumables) is allocated to the performance obligations on a relative stand-alone selling price basis. This method is illustrated, as follows:

	Stand-alone selling price		Allocated transaction price
	CU		CU
Equipment	10,000	$(10,000 \div 14,000 \times 10,000)$	7,143
Material right	4,000	$(4,000 \div 14,000 \times 10,000)$	2,857
Total	14,000		10,000

The allocated transaction price would be recognised as each performance obligation is satisfied (refer to section 7 below). The entity would recognise a loss on the sale of the equipment, and recognition of some of the transaction price would be deferred until the option to purchase the consumables has been exercised and control of the consumables is transferred.

Question 6-12: How does an entity allocate a significant financing component when there are multiple performance obligations in a contract?

(TRG meeting 30 March 2015 - Agenda paper no. 30)

See response to Question 5-26 in section 5.5.4 above.

6.3 Allocating variable consideration

The relative stand-alone selling price method is the default method for allocating the transaction price. However, the Board noted in the Basis for Conclusions on IFRS 15 that this method might not always result in a faithful depiction of the amount of consideration to which an entity expects to be entitled from the customer. [IFRS 15.BC280]. Therefore, the standard provides two exceptions to the relative selling price method of allocating the transaction price.

The first relates to the allocation of variable consideration (see section 6.4 below for the second exception on the allocation of a discount). This exception requires variable consideration to be allocated entirely to a specific part of a contract, such as one or more (but not all) performance obligations in the contract (e.g., a bonus might be contingent on an entity transferring a promised good or service within a specified period of time) or one or more (but not all) distinct goods or services promised in a series of distinct goods or services that form part of a single performance obligation (see section 4.2.2 above). For example, the consideration promised for the second year of a two-year cleaning contract will increase on the basis of movements in a specified inflation index. This exception will be applied to a single performance obligation, a combination of performance obligations or distinct goods or services that make up part of a performance obligation depending on the facts and circumstances of each contract. [IFRS 15.84].

Two criteria must be met to apply this exception, as follows: [IFRS 15.85, IFRS 15.86]

Extract from IFRS 15

- 85 An entity shall allocate a variable amount (and subsequent changes to that amount) entirely to a performance obligation or to a distinct good or service that forms part of a single performance obligation in accordance with paragraph 22(b) if both of the following criteria are met:
- (a) the terms of a variable payment relate specifically to the entity's efforts to satisfy the performance obligation or transfer the distinct good or service (or to a specific outcome from satisfying the performance obligation or transferring the distinct good or service); and
 - (b) allocating the variable amount of consideration entirely to the performance obligation or the distinct good or service is consistent with the allocation objective in paragraph 73 when considering all of the performance obligations and payment terms in the contract.
- 86 The allocation requirements in paragraphs 73-83 shall be applied to allocate the remaining amount of the transaction price that does not meet the criteria in paragraph 85.

While the language in IFRS 15.85 in the extract above implies that this exception is limited to allocating variable consideration to a single performance obligation or a single distinct good or service within a series, IFRS 15.84 indicates that the variable consideration can be allocated to 'one or more, but not all', performance obligations or distinct goods or services within a series. We understand it was not the Board's intent to limit this exception to a single performance obligation or a single distinct good or service within a series, even though the standard uses a singular construction for the remainder of the discussion and does not repeat 'one or more, but not all'.

The Board noted in the Basis for Conclusions that this exception is necessary because allocating contingent amounts to all performance obligations in a contract might not reflect the economics of a transaction in all cases. [IFRS 15.BC284]. Allocating variable consideration entirely to a distinct good or service would be appropriate when the result is that the amount allocated to that particular good or service is reasonable relative to all other performance obligations and payment terms in the contract. Subsequent changes in variable consideration must be allocated in a consistent manner. It is important to note that allocating variable consideration to one or more, but not all, performance obligations or distinct goods or services in a series is a requirement, not a policy choice. If the above criteria in IFRS 15.85 are met, the entity must allocate the variable consideration to the related performance obligation(s) or distinct goods or services in a series. Entities might need to exercise significant judgement to determine whether they meet the requirements to allocate variable consideration to specific performance obligations or distinct goods or services within a series. [IFRS 15.85].

Firstly, entities need to determine whether they meet the first criterion in IFRS 15.85, which requires that the terms of a variable payment relate specifically to either: 1) an entity's efforts to satisfy a performance obligation (or to transfer a distinct good or service that is part of a series); or 2) a specific outcome from satisfying the performance obligation (or transferring the distinct good or service).

In performing this assessment, an entity needs to consider the nature of its promise and how the performance obligation has been defined. In addition, the entity needs to clearly understand the variable payment terms and how they align with the entity's promise. This includes evaluating any clawbacks or other potential adjustments to the variable payment. For example, an entity might conclude that the nature of its promise in a contract is to provide hotel management services (including management of the hotel employees, accounting services, training, and procurement, etc.) that comprise a series of distinct services (i.e., daily hotel management). For providing this service, the entity receives a variable fee based on a percentage of occupancy rates. It is likely that the entity would determine that it meets the first criterion to allocate the daily variable fee to the distinct service performed that day because the uncertainty related to the consideration is resolved on a daily basis as the entity satisfies its obligation to perform daily hotel management services. This is because the variable payments specifically relate to transferring the distinct service that is part of a series of distinct goods or services (i.e., the daily management service). The fact that the payments do not directly correlate with each of the underlying activities performed each day does not affect this assessment. Refer to section 4 above for further discussion on identifying the nature of the goods or services promised in a contract, including whether they meet the series requirement.

In contrast, consider an entity that has a contract to sell equipment and maintenance services for that equipment. The maintenance services have been determined to be a series of distinct services because the customer benefits from the entity standing ready to perform in case the equipment breaks down. The consideration for the maintenance services is based on usage of the equipment and is, therefore, variable.

In this example, the payment terms do not align with the nature of the entity's promise. This is because the payment terms are usage-based, but the nature of the entity's promise is to stand ready each day to perform any maintenance that is needed, regardless of how much the customer uses the equipment. Since the entity does not meet the criteria to apply the allocation exception, it must estimate the variable consideration at contract inception and over the life of the contract, including consideration of the constraint. The entity would then recognise revenue based on its selected measure of progress (see section 7.1.4 below).

After assessment of the first criterion, entities need to determine whether they meet the second criterion in IFRS 15.85; to confirm that allocating the consideration in this manner is consistent with the overall allocation objective of the standard in IFRS 15.73. That is, an entity must allocate to each performance obligation (or distinct good or service in a series) the portion of the transaction price that reflects the amount of consideration the entity expects to be entitled to in exchange for transferring those goods or services to the customer.

The TRG discussed four types of contracts with different variable payment terms that are accounted for as a series of distinct goods or services (see section 4.2.2 above) and for which an entity might reasonably conclude that the allocation objective has been met (and the variable consideration could be allocated to each distinct period of service, such as day, month or year), which are detailed below:¹⁰⁴

- Declining prices - The TRG agenda paper included an IT outsourcing contract in which the events that trigger the variable consideration are the same throughout the contract, but the per unit price declines over the life of the contract. The allocation objective could be met if the pricing is based on market terms (e.g., if the contract contains a benchmarking clause) or the changes in price are substantive and linked to changes in an entity's cost to fulfil the obligation or value provided to the customer.
- Consistent fixed prices - The TRG agenda paper included a transaction processing contract with an unknown quantity of transactions, but a fixed contractual rate per transaction. The allocation objective could be met if the fees are priced consistently throughout the contract and the rates charged are consistent with the entity's standard pricing practices with similar customers.
- Consistent variable fees, cost reimbursements and incentive fees - The TRG agenda paper included a hotel management contract in which monthly consideration is based on a percentage of monthly rental revenue, reimbursement of labour costs and an annual incentive payment. The allocation objective could be met for each payment stream as follows. The base monthly fees could meet the allocation objective if the consistent measure throughout the contract period (e.g., 1% of monthly rental revenue) reflects the value to the customer. The cost reimbursements could meet the allocation objective if they are commensurate with an entity's efforts to fulfil the promise each day. The annual incentive fee could also meet the allocation objective if it reflects the value delivered to the customer for the annual period and is reasonable compared with incentive fees that could be earned in other periods.
- Sales-based and usage-based royalty for licences of intellectual property - The TRG agenda paper included a franchise agreement in which franchisor will receive a sales-based royalty of 5% in addition to a fixed fee. The allocation objective could be met if the consistent formula throughout the licence period reasonably reflects the value to the customer of its access to the franchisor's intellectual property (e.g., reflected by the sales that have been generated by the customer).

Beyond these four types of contracts discussed by the TRG, entities might also need to use judgement to determine whether contracts with usage-based variable consideration provisions meet the variable consideration allocation exception criteria, as discussed in sections 6.3.1 and 6.3.2 below.

6.3.1 Variable fee arrangements based on usage

Consideration for some service contracts is based entirely on customer usage, and an entity has a stand-ready obligation to perform, regardless of how often the customer uses the service. Therefore, the usage-based fees are variable consideration.

It is important to note that, while these usage-based transactions might be economically similar to licensing arrangements that include sales-based or usage-based royalties, the accounting would be different. As described in section 8.5 below, sales-based and usage-based royalties on licences of intellectual property are subject to the royalty recognition constraint and that requirement must be applied to the overall royalty stream when the sole or predominant item to which the royalty relates is a licence of intellectual property. Entities cannot analogise to the royalty recognition constraint for other situations.

104 TRG Agenda paper no. 39, *Application of the Series Provision and Allocation of Variable Consideration*, dated 13 July 2015.

If the usage-based fees relate specifically to the entity's effort to satisfy the performance obligation to provide services (or to a specific outcome from satisfying the performance obligation) and allocating the variable consideration to each distinct day is consistent with the allocation objective, the variable consideration allocation exception is met and the consideration is allocated to the period in which the usage occurred. If the usage-based fees do not relate to an entity's effort to satisfy the performance obligation (or to a specific outcome from satisfying the performance obligation) or if the allocation of the usage-based fees is not consistent with the allocation exception, the allocation exception is not met. For example, the allocation exception would not be met if the fees decline over the contract term as an incentive for the customer to achieve certain volume thresholds if, as discussed in section 6.3 above, such pricing is not based on market terms or not linked to changes in the entity's cost to fulfil the obligation or value provided to the customer. In this situation, the variable consideration is estimated at contract inception and it is to be recognised over the contract duration based on a selected measure of progress. These estimates of variable consideration must be updated at the end of each reporting period and are subject to the constraint on variable consideration. See section 5.2 above for further discussion on estimating variable consideration.

Consider the following Illustration of a contract with variable usage-based fees calculated daily that is likely to meet the variable consideration allocation exception:

Illustration 6-8: Variable fee service arrangement based on usage

Provider C enters into a contract for cloud storage in which a customer agrees to pay daily fees based on the amount of storage space it uses (i.e., a fixed daily rate of CU0.025 per gigabyte of storage is multiplied by the number of gigabytes used). Provider C invoices the customer at the end of each month. Assume that the entity has appropriately concluded that the nature of the entity's performance obligation is to stand ready to provide any amount of storage space the customer needs at any time during the contract term and the consideration in the contract is variable based on the number of gigabytes of storage used (and, therefore, each gigabyte used is not an optional purchase - refer to Question 4-20 in section 4.6 above).

Provider C determines that the service provided to the customer in this contract meets the criteria to be accounted for as a series of distinct goods or services (see section 4.2.2 above). This is because the performance obligation to stand ready to provide any amount of storage space represents a series of distinct services that are substantially the same and have the same pattern of transfer to the customer.

Provider C then considers whether the variable consideration allocation exception would apply to the daily usage-based fees. Provider C determines that it meets the first criterion to allocate the daily variable fee to the distinct service performed that day because the uncertainty related to the consideration is resolved on a daily basis as the entity satisfies its obligation to provide cloud storage. This is because the variable payments specifically relate to transferring the distinct service (i.e., access to any amount of cloud storage that the customer chooses to use each day).

Provider C concludes that allocating the variable payments to each day is consistent with the allocation objective because the fixed-rate-per-gigabyte fees reflect the value to the customer based on the amount of storage the customer uses each day. Furthermore, the rates charged are consistent with Provider C's standard pricing practices.

Therefore, Provider C determines that it needs to apply the variable consideration allocation exception and recognises each day's fee for the day in which it occurs. That is, if the customer uses 250 gigabytes of storage the first day and 300 gigabytes the second, Provider C will recognise CU6.25 and CU7.50 of revenue for the respective days.

6.3.2 Fixed-fee arrangements with overages

Some service contracts have fixed fees (including any minimum amounts guaranteed) but also require customers to pay overage fees when they exceed certain thresholds based on usage. When an entity's performance obligation is to stand ready to perform, regardless of customer usage, the overage fee is considered variable consideration that the entity needs to estimate at contract inception, unless the variable consideration allocation exception is met.

How we see it

We believe that, for an entity to apply the variable consideration allocation exception by allocating overage fees to a particular period (e.g., day, month, year), the entity would have to conclude that the overage fees relate to its performance during that particular period.

Consider the following Illustration of a contract with fixed fees and annual overages:

Illustration 6-9: Fixed-fee service arrangement with overages

Entity X enters into a three-year contract with a customer to provide access to its SaaS application, which allows the customer to process transactions, among other functions. The customer agrees to pay an annual fee of CU100,000, plus overage fees at a rate of CU0.10 per transaction for transactions processed through the application during the year that exceed one million (i.e., overage fees are only paid if the customer processes more than one million transactions during the year).

Assume that Entity X has determined that the nature of its performance obligation is to provide continuous access to the SaaS application, regardless of the number of transactions processed. Entity X determines that the CU100,000 annual fee is fixed consideration and all additional consideration received as overage fees is variable consideration.

Also assume that Entity X has determined that the fixed component of the consideration needs to be recognised rateably over the contract term because the service is provided to the customer on a consistent basis (i.e., the performance obligation is satisfied evenly over the period). Entity X will then need to determine whether the variable consideration allocation exception applies to the overage fees, which are calculated based on annual usage.

Evaluating the allocation exception for distinct daily periods

We believe that, for the entity to apply the variable consideration allocation exception by allocating overage fees to a particular day, the entity would have to conclude that the overage fees relate to its performance on that particular day. Therefore, Entity X concludes that it cannot apply the variable consideration allocation exception to the daily reporting periods for the overage fees because those payments do not relate to its efforts to satisfy the performance obligation to provide continuous access to the platform. That is, the nature of the performance obligation is a series of daily stand-ready obligations that are satisfied evenly over time, and the overage fees are additional consideration for satisfying that performance obligation over the course of each year.

Since the overage fees are only incurred after the annual minimum is reached, recognising revenue when the fees are incurred would result in more revenue recognised for the periods after the minimum is reached (i.e., backloading the revenue recognition), which is inconsistent with the allocation objective in IFRS 15.73. Therefore, the criteria for using the variable consideration allocation exception would not be met for each day of service, and Entity X would not recognise revenue for the overages on the days when the fees are incurred. However, we believe that if the overages in this example were calculated based on a short period of usage (e.g., daily or monthly (instead of annually)), Entity X might be able to demonstrate that it meets the criteria to apply the variable consideration allocation exception. This is because of the relatively short period of time between Entity X's performance and when it is entitled to the variable consideration such that Entity X could reasonably conclude that the allocation objective in IFRS 15.73 has been met.

Evaluating the allocation exception for annual periods

Since Entity X earns overage fees over a period of time that is less than the contract term (i.e., a three-year contract where overage fees are accrued and reset on an annual basis), Entity X would evaluate whether the overages need to be allocated to the period in which the overage fees are earned (e.g., to the annual period in which overages accrue).

To do so, Entity X evaluates whether it meets the criteria to apply the variable consideration allocation exception to the overage fees earned in each annual period in the three-year contract. Entity X might conclude that it needs to apply the variable consideration allocation exception to the overage fees earned in annual periods, which would require the entity to allocate the annual overage fees to each respective year (since the overages can be attributed to a single year). Therefore, Entity X will need to estimate overage fees only for each annual period (also considering the variable consideration constraint, as discussed in section 5.2 above), rather than for the full three-year period at contract inception (which would be required if the variable consideration allocation exception was not met for any period). This would result in recognition of revenue from the overage fees only in the annual period to which the overages relate and not over the entire contract term.

For example, if the entity estimated that the overage fees for the first year would be CU20,000, it would recognise this amount rateably over the year (i.e., CU5,000 in each quarter), in addition to the fixed consideration that is also recognised rateably. The estimates of variable consideration must be updated at the end of each reporting period, as discussed in section 5.2.4 above.

6.3.3 Example of allocating variable consideration

The standard provides the following example to illustrate when an entity is or is not able to allocate variable consideration to a specific part of a contract. Note that the example focuses on licences of intellectual property, which are discussed in section 8 below: [IFRS 15.IE Example 35, IFRS 15.IE178-IE187]

Extract from IFRS 15

Example 35-Allocation of variable consideration

An entity enters into a contract with a customer for two intellectual property licences (Licences X and Y), which the entity determines to represent two performance obligations each satisfied at a point in time. The stand-alone selling prices of Licences X and Y are CU800 and CU1,000, respectively.

Case A-Variable consideration allocated entirely to one performance obligation

The price stated in the contract for Licence X is a fixed amount of CU800 and for Licence Y the consideration is three per cent of the customer's future sales of products that use Licence Y. For purposes of allocation, the entity estimates its sales-based royalties (ie the variable consideration) to be CU1,000, in accordance with paragraph 53 of IFRS 15.

To allocate the transaction price, the entity considers the criteria in paragraph 85 of IFRS 15 and concludes that the variable consideration (ie the sales-based royalties) should be allocated entirely to Licence Y. The entity concludes that the criteria in paragraph 85 of IFRS 15 are met for the following reasons:

- (a) the variable payment relates specifically to an outcome from the performance obligation to transfer Licence Y (ie the customer's subsequent sales of products that use Licence Y).
- (b) allocating the expected royalty amounts of CU1,000 entirely to Licence Y is consistent with the allocation objective in paragraph 73 of IFRS 15. This is because the entity's estimate of the amount of sales-based royalties (CU1,000) approximates the stand-alone selling price of Licence Y and the fixed amount of CU800 approximates the stand-alone selling price of Licence X. The entity allocates CU800 to Licence X in accordance with paragraph 86 of IFRS 15. This is because, based on an assessment of the facts and circumstances relating to both licences, allocating to Licence Y some of the fixed consideration in addition to all of the variable consideration would not meet the allocation objective in paragraph 73 of IFRS 15.

The entity transfers Licence Y at inception of the contract and transfers Licence X one month later. Upon the transfer of Licence Y, the entity does not recognise revenue because the consideration allocated to Licence Y is in the form of a sales-based royalty. Therefore, in accordance with paragraph B63 of IFRS 15, the entity recognises revenue for the sales-based royalty when those subsequent sales occur. When Licence X is transferred, the entity recognises as revenue the CU800 allocated to Licence X.

Case B-Variable consideration allocated on the basis of stand-alone selling prices

The price stated in the contract for Licence X is a fixed amount of CU300 and for Licence Y the consideration is five per cent of the customer's future sales of products that use Licence Y. The entity's estimate of the sales-based royalties (ie the variable consideration) is CU1,500 in accordance with paragraph 53 of IFRS 15.

To allocate the transaction price, the entity applies the criteria in paragraph 85 of IFRS 15 to determine whether to allocate the variable consideration (ie the sales-based royalties) entirely to Licence Y. In applying the criteria, the entity concludes that even though the variable payments relate specifically to an outcome from the performance obligation to transfer Licence Y (ie the customer's subsequent sales of products that use Licence Y), allocating the variable consideration entirely to Licence Y would be inconsistent with the principle for allocating the transaction price. Allocating CU300 to Licence X and CU1,500 to Licence Y does not reflect a reasonable allocation of the transaction price on the basis of the stand-alone selling prices of Licences X and Y of CU800 and CU1,000, respectively. Consequently, the entity applies the general allocation requirements in paragraphs 76-80 of IFRS 15.

The entity allocates the transaction price of CU300 to Licences X and Y on the basis of relative stand-alone selling prices of CU800 and CU1,000, respectively. The entity also allocates the consideration related to the sales-based royalty on a relative stand-alone selling price basis. However, in accordance with paragraph B63 of IFRS 15, when an entity licenses intellectual property in which the consideration is in the form of a sales-based royalty, the entity cannot recognise revenue until the later of the following events: the subsequent sales occur or the performance obligation is satisfied (or partially satisfied).

Licence Y is transferred to the customer at the inception of the contract and Licence X is transferred three months later. When Licence Y is transferred, the entity recognises as revenue the CU167 ($\text{CU1,000} \div \text{CU1,800} \times \text{CU300}$) allocated to Licence Y. When Licence X is transferred, the entity recognises as revenue the CU133 ($\text{CU800} \div \text{CU1,800} \times \text{CU300}$) allocated to Licence X.

In the first month, the royalty due from the customer's first month of sales is CU200. Consequently, in accordance with paragraph B63 of IFRS 15, the entity recognises as revenue the CU111 ($\text{CU1,000} \div \text{CU1,800} \times \text{CU200}$) allocated to Licence Y (which has been transferred to the customer and is therefore a satisfied performance obligation). The entity recognises a contract liability for the CU89 ($\text{CU800} \div \text{CU1,800} \times \text{CU200}$) allocated to Licence X. This is because although the subsequent sale by the entity's customer has occurred, the performance obligation to which the royalty has been allocated has not been satisfied.

Frequently asked questions

Question 6-13: In order to meet the criteria to allocate variable consideration entirely to a specific part of a contract, must the allocation be made on a relative stand-alone selling price basis?

(TRG meeting 13 July 2015 - Agenda paper no. 39)

The members of the TRG generally agreed that a relative stand-alone selling price allocation is not required to meet the allocation objective when it relates to the allocation of variable consideration to a specific part of a contract (e.g., a distinct good or service in a series). That is, the guidance would not require the same amount (absolute value) of variable consideration to be allocated to each distinct service that is substantially the same. The Basis for Conclusions notes that stand-alone selling price is the default method for meeting the allocation objective, but other methods could be used in certain instances (e.g., in allocating variable consideration). [IFRS 15.BC279, IFRS 15.BC280].

While the standard does not state what other allocation methods could be used beyond the relative stand-alone selling price basis, the members of the TRG generally agreed that an entity would apply reasonable judgement to determine whether the allocation results in a reasonable outcome (and, therefore, meets the allocation objective in the standard), as discussed in section 6.3 above.

6.4 Allocating a discount

The second exception to the relative stand-alone selling price allocation (see section 6.3 above for the first exception) relates to discounts inherent in contracts. When an entity sells a bundle of goods or services, the selling price of the bundle is often less than the sum of the stand-alone selling prices of the individual elements. Under the relative stand-alone selling price allocation method, this discount would be allocated proportionately to all performance obligations. [IFRS 15.81]. However, if an entity determines that a discount is not related to all of the promised goods or services in the contract, the entity must allocate the contract's entire discount only to the goods or services to which it relates, if all of the following criteria are met: [IFRS 15.82]

Extract from IFRS 15

- 82 An entity shall allocate a discount entirely to one or more, but not all, performance obligations in the contract if all of the following criteria are met:
- (a) the entity regularly sells each distinct good or service (or each bundle of distinct goods or services) in the contract on a stand-alone basis;
 - (b) the entity also regularly sells on a stand-alone basis a bundle (or bundles) of some of those distinct goods or services at a discount to the stand-alone selling prices of the goods or services in each bundle; and
 - (c) the discount attributable to each bundle of goods or services described in paragraph 82(b) is substantially the same as the discount in the contract and an analysis of the goods or services in each bundle provides observable evidence of the performance obligation (or performance obligations) to which the entire discount in the contract belongs.

An entity makes this determination when the price of certain goods or services is largely independent of other goods or services in the contract. In these situations, an entity is able to effectively 'carve out' an individual performance obligation, or some of the performance obligations in the contract, and allocate the contract's entire discount to one or more, but not all, performance obligations provided the above criteria are met. However, an entity cannot use this exception to allocate only a portion of the discount to one or more, but not all, performance obligations in the contract.

The Board noted in the Basis for Conclusions that the requirements in IFRS 15.82 generally apply to contracts that include at least three performance obligations. While the standard contemplates that it might be possible for an entity to allocate the entire discount to as few as one performance obligation, the Board noted that such situations are expected to be rare. [IFRS 15.BC283]. Instead, the Board believes it is more likely that an entity will be able to demonstrate that a discount relates to two or more performance obligations. This is because an entity is likely to have observable information that the stand-alone selling price of a group of promised goods or services is lower than the price of those items when sold separately. It could be more difficult for an entity to have sufficient evidence to demonstrate that a discount is associated with a single performance obligation. When an entity applies a discount to one or more performance obligations in accordance with the above criteria, the standard states that the discount is allocated first before using the residual approach to estimate the stand-alone selling price of a good or service (see section 6.1.2 above). [IFRS 15.83].

The standard includes the following example to illustrate this exception and when the use of the residual approach (discussed in section 6.1.2 above) for estimating stand-alone selling prices is or is not appropriate: [IFRS 15.IE Example 34, IFRS 15.IE167-IE177]

Extract from IFRS 15

Example 34-Allocating a discount

An entity regularly sells Products A, B and C individually, thereby establishing the following stand-alone selling prices:

Product	Stand-alone selling price
	CU
Product A	40
Product B	55
Product C	45
Total	140

In addition, the entity regularly sells Products B and C together for CU60.

Case A-Allocating a discount to one or more performance obligations

The entity enters into a contract with a customer to sell Products A, B and C in exchange for CU100. The entity will satisfy the performance obligations for each of the products at different points in time.

The contract includes a discount of CU40 on the overall transaction, which would be allocated proportionately to all three performance obligations when allocating the transaction price using the relative stand-alone selling price method (in accordance with paragraph 81 of IFRS 15). However, because the entity regularly sells Products B and C together for CU60 and Product A for CU40, it has evidence that the entire discount should be allocated to the promises to transfer Products B and C in accordance with paragraph 82 of IFRS 15.

If the entity transfers control of Products B and C at the same point in time, then the entity could, as a practical matter, account for the transfer of those products as a single performance obligation. That is, the entity could allocate CU60 of the transaction price to the single performance obligation and recognise revenue of CU60 when Products B and C simultaneously transfer to the customer.

If the contract requires the entity to transfer control of Products B and C at different points in time, then the allocated amount of CU60 is individually allocated to the promises to transfer Product B (stand-alone selling price of CU55) and Product C (stand-alone selling price of CU45) as follows:

Product	Allocated transaction price
	CU
Product B	33 (CU55 ÷ CU100 total stand-alone selling price × CU60)
Product C	27 (CU45 ÷ CU100 total stand-alone selling price × CU60)
Total	60

Case B-Residual approach is appropriate

The entity enters into a contract with a customer to sell Products A, B and C as described in Case A. The contract also includes a promise to transfer Product D. Total consideration in the contract is CU130. The stand-alone selling price for Product D is highly variable (see paragraph 79(c) of IFRS 15) because the entity sells Product D to different customers for a broad range of amounts (CU15-CU45). Consequently, the entity decides to estimate the stand-alone selling price of Product D using the residual approach.

Before estimating the stand-alone selling price of Product D using the residual approach, the entity determines whether any discount should be allocated to the other performance obligations in the contract in accordance with paragraphs 82 and 83 of IFRS 15.

As in Case A, because the entity regularly sells Products B and C together for CU60 and Product A for CU40, it has observable evidence that CU100 should be allocated to those three products and a CU40 discount should be allocated to the promises to transfer Products B and C in accordance with paragraph 82 of IFRS 15. Using the residual approach, the entity estimates the stand-alone selling price of Product D to be CU30 as follows:

Product	Stand-alone selling price	Method
	CU	
Product A	40	Directly observable (see paragraph 77 of IFRS 15)
Products B and C	60	Directly observable with discount (see paragraph 82 of IFRS 15)
Product D	30	Residual approach (see paragraph 79(c) of IFRS 15)
Total	130	

The entity observes that the resulting CU30 allocated to Product D is within the range of its observable selling prices (CU15-CU45). Therefore, the resulting allocation (see above table) is consistent with the allocation objective in paragraph 73 of IFRS 15 and the requirements in paragraph 78 of IFRS 15.

Case C-Residual approach is inappropriate

The same facts as in Case B apply to Case C except the transaction price is CU105 instead of CU130.

Consequently, the application of the residual approach would result in a stand-alone selling price of CU5 for Product D (CU105 transaction price less CU100 allocated to Products A, B and C). The entity concludes that CU5 would not faithfully depict the amount of consideration to which the entity expects to be entitled in exchange for satisfying its performance obligation to transfer Product D, because CU5 does not approximate the stand-alone selling price of Product D, which ranges from CU15-CU45.

Consequently, the entity reviews its observable data, including sales and margin reports, to estimate the stand-alone selling price of Product D using another suitable method. The entity allocates the transaction price of CU105 to Products A, B, C and D using the relative stand-alone selling prices of those products in accordance with paragraphs 73-80 of IFRS 15.

How we see it

The exception allowing allocation of a discount to some, but not all, performance obligations within a contract gives entities the ability to better reflect the economics of the transaction in certain circumstances. However, the criteria that must be met to demonstrate that a discount is associated with only some of the performance obligations in the contract is likely to limit the number of transactions that are eligible for this exception.

Frequently asked questions

Question 6-14: If a discount also meets the definition of variable consideration (because it is variable in amount and/or contingent on a future event), which allocation exception would an entity apply?

(TRG meeting 30 March 2015 - Agenda paper no. 31)

TRG members generally agreed that an entity will first determine whether a variable discount meets the variable consideration exception (see section 6.3 above). [IFRS 15.86]. If it does not, the entity then considers whether it meets the discount exception (see section 6.4 above). In reaching that conclusion, the TRG agenda paper noted that IFRS 15.86 establishes a hierarchy for allocating variable consideration that requires an entity to identify variable consideration and then determine whether it must allocate variable consideration to one or some, but not all, performance obligations (or distinct goods or services that comprise a single performance obligation) based on the exception for allocating variable consideration. The entity would consider the requirements for allocating a discount only if the discount is not variable consideration (i.e., the amount of the discount is fixed and not contingent on future events) or the entity does not meet the criteria to allocate variable consideration to a specific part of the contract.¹⁰⁵

6.5 Changes in transaction price after contract inception

The standard requires entities to determine the transaction price at contract inception. However, there could be changes to the transaction price after contract inception. For example, as discussed in section 5.2.4 above, when a contract includes variable consideration, entities need to update their estimate of the transaction price at the end of each reporting period to reflect any changes in circumstances. Changes in the transaction price can also occur due to contract modifications (see section 3.4 above).

As stated in IFRS 15.88-89, changes in the total transaction price are generally allocated to the performance obligations on the same basis as the initial allocation, whether they are allocated based on the relative stand-alone selling price (i.e., using the same proportionate share of the total) or to individual performance obligations under the allocation exceptions discussed in section 6.3 and section 6.4 above. Amounts allocated to a satisfied performance obligation must be recognised as revenue, or a reduction in revenue, in the period that the transaction price changes.

As discussed in section 6.1 and section 6.1.3 above, stand-alone selling prices are not updated after contract inception, unless the contract has been modified and the contract modification is accounted for as a new or separate contract. Furthermore, any amounts allocated to satisfied (or partially satisfied) performance obligations must be recognised in revenue in the period in which the transaction price changes (i.e., on a cumulative catch-up basis). This could result in either an increase or decrease to revenue in relation to a satisfied performance obligation or to cumulative revenue recognised for a partially satisfied over time performance obligation (see section 7.1 below). [IFRS 15.88, IFRS 15.89].

The following Illustration explains this concept for a partially satisfied over-time performance obligation:

Illustration 6-10: Change in transaction price after contract inception

Entity A, a construction company, enters into a contract with a customer on 1 January 20X1 to build three specific amenities at a community centre, a swimming pool, playground and a parking lot, for CU3,000,000. Entity A will earn a bonus of CU250,000 if it completes the swimming pool by 1 May 20X1.

At contract inception, Entity A concludes that the swimming pool, playground and parking lot are each distinct and, therefore, represent separate performance obligations. Entity A also concludes that the CU250,000 bonus needs to be allocated entirely to the swimming pool because the criteria in IFRS 15.85 for the variable consideration allocation are met. However, Entity A does not expect it will be entitled to the CU250,000 bonus related to the completion of the swimming pool by 1 May 20X1 due to factors outside of Entity A's control, including inclement winter weather and the swimming pool supplier's backlog. Therefore, Entity A uses the most likely amount method to estimate variable consideration and does not include the bonus in the transaction price.

As at 1 January 20X1, Entity A allocates the transaction price to the performance obligations on a relative stand-alone selling price basis, as follows:

¹⁰⁵ TRG Agenda paper no. 31, *Allocation of the Transaction Price for Discounts and Variable Consideration*, dated 30 March 2015 and TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015.

Performance obligations	Allocation of the transaction price
Swimming pool	CU2,000,000
Playground	CU750,000
Parking lot	CU250,000
Total	CU3,000,000

Entity A concludes that each of the performance obligations are satisfied over time because they meet the criteria in IFRS 15.35 (refer to section 7.1 below for further discussion on evaluating whether performance obligations are satisfied over time). Due to the nature of Entity A's business, it determines that an input method based on costs incurred is an appropriate measure of progress over time.

As at 31 March 20X1, Entity A determines that it has incurred 60% of the total expected costs to complete each of its performance obligations. Therefore, Entity A recognises CU1,800,000 ($\text{CU3,000,000} \times 60\%$) as revenue.

In addition, as at 31 March 20X1, Entity A reassesses its estimate of variable consideration in the contract (including the constraint) and believes it will be able to complete the swimming pool by 1 May 20X1, because the significant uncertainties related to the weather and the supplier have been resolved. Entity A updates its transaction price to include the CU250,000 bonus related to the swimming pool in accordance with IFRS 15.59. Therefore, Entity A updates the transaction price as at 31 March 20X1, as follows:

Performance obligations	Allocation of the transaction price
Swimming pool	CU2,250,000
Playground	CU750,000
Parking lot	CU250,000
Total	CU3,250,000

Due to the change in the transaction price related to the swimming pool performance obligation, Entity A recognises CU150,000 ($\text{CU250,000} \times 60\%$) as revenue on a cumulative catch-up basis as at 31 March 20X1.

If the change in the transaction price is due to a contract modification, the contract modification requirements in IFRS 15.18-21 must be followed (see section 3.4 above for a discussion on contract modifications). [IFRS 15.90]. See Question 3-15 in section 3.4 above for further discussion on how an entity would distinguish between a contract modification and a change in the estimated transaction price due to variable consideration after contract inception. In addition, when contracts include variable consideration, it is possible that changes in the transaction price that arise after a modification are (or are not) related to performance obligations that existed before the modification. For changes in the transaction price arising after a contract modification that is not treated as a separate contract, an entity must apply one of the two approaches: [IFRS 15.90]

- If the change in transaction price is attributable to an amount of variable consideration promised before the modification and the modification was considered a termination of the existing contract and the creation of a new contract, the entity allocates the change in transaction price to the performance obligations that existed before the modification.
- In all other cases, the change in the transaction price is allocated to the performance obligations in the modified contract (i.e., the performance obligations that were unsatisfied and partially unsatisfied immediately after the modification).

The first approach is applicable to a change in transaction price that occurs after a contract modification that is accounted for in accordance with IFRS 15.21(a) (i.e., as a termination of the existing contract and the creation of a new contract) and the change in the transaction price is attributable to variable consideration promised before the modification. For example, an estimate of variable consideration in the initial contract might have changed or might no longer be constrained. [IFRS 15.21(a), IFRS 15.90(a)]. In this scenario, the Board decided that an entity has to allocate the corresponding change in the transaction price to the performance obligations identified in the contract before the modification (e.g., the original contract), including performance obligations that were satisfied prior to the modification. [IFRS 15.BC83]. That is, it would not be appropriate for an entity to allocate the corresponding change in the transaction price to the performance obligations that are in the modified contract if the promised variable consideration (and the resolution of the associated uncertainty) were not affected by the contract modification.

The second approach (i.e., IFRS 15.90(b)) is applicable in all other cases when a modification is not treated as a separate contract (e.g., when the change in the transaction price is not attributable to variable consideration promised before the modification). [IFRS 15.90(b)]. Under this approach, the change in the transaction price is allocated to the performance obligation(s) in the modified contract (i.e., the

performance obligations that were unsatisfied or partially unsatisfied immediately after the modification). Example 6 in IFRS 15 illustrates the accounting for a change in transaction price that occurs after a contract modification. [IFRS 15.IE Example 6, IFRS 15.IE25-IE32].

The IASB noted in the Basis for Conclusions on IFRS 15 that in some cases, an estimate of variable consideration made at the end of a reporting period could be affected by information that arises after the end of the reporting period, but before the release of the financial statements. The Board decided not to include guidance in IFRS 15 to address this circumstance because an entity would follow the accounting requirements for subsequent events in IAS 10 (see Chapter 34). [IFRS 15.BC228].

Frequently asked questions

Question 6-15: How would an entity distinguish between a contract modification and a change in the estimated transaction price due to variable consideration after contract inception?

See response to Question 3-15 in section 3.4 above.

6.6 Allocation of transaction price to components outside the scope of IFRS 15

Revenue arrangements might include some components that are not within the scope of IFRS 15. As discussed in section 2.5 above, the standard indicates that in such situations, an entity must first apply the other standards if those standards address separation and/or measurement. [IFRS 15.7].

For example, some standards require certain components, such as financial liabilities, to be accounted for at fair value. As a result, when a revenue contract includes that type of component, the fair value of that component must be separated from the total transaction price. The remaining transaction price is then allocated to the remaining performance obligations.

The following Illustration explains this concept:

Illustration 6-11: Arrangements with components outside the scope of the standard

Retailer sells products to customers and often bundles them with prepaid gift cards when the customer buys multiple units of its products. The prepaid gift cards are non-refundable, non-redeemable and non-exchangeable for cash and do not have an expiry date or back-end fees. That is, any remaining balance on the prepaid gift cards does not reduce, unless it is spent by the customer. Customers can redeem prepaid gift cards only at third-party merchants specified by Retailer (i.e., the prepaid gift card cannot be redeemed at the Retailer) in exchange for goods or services up to a specified monetary amount. When a customer uses the prepaid gift cards at a merchant(s) to purchase goods or services, Retailer delivers cash to the merchant(s).

Customer X enters into a contract to purchase 100 units of a product and a prepaid gift card for total consideration of CU1,000. Because it bought 100 units, Retailer gives Customer X a discount on the bundle. The stand-alone selling price of the product and the fair value of the prepaid gift card are CU950 and CU200, respectively.

Retailer determines that it has a contractual obligation to deliver cash to specified merchants on behalf of the prepaid gift card owner (Customer X) and that this obligation is conditional upon Customer X using the prepaid gift card to purchase goods or services. Also, Retailer does not have an unconditional right to avoid delivering cash to settle this contractual obligation. Therefore, Retailer concludes that the liability for the prepaid gift card meets the definition of a financial liability and applies the requirements in IFRS 9 to account for it. In accordance with IFRS 15.7, because IFRS 9 provides measurement requirements for initial recognition (i.e., requires that financial liabilities within its scope be initially recognised at fair value), Retailer excludes from the IFRS 15 transaction price the fair value of the prepaid gift card. Retailer allocates the remaining transaction price to the products purchased. The allocation of the total transaction price is, as follows:

	Stand-alone selling price and fair value	% Allocated discount	Allocated discount	Arrangement consideration allocation
Products (100 units)	CU950	100%	CU150	C800
Prepaid gift card	CU200	0%	-	CU200
	CU1,150		CU150	CU1,000

For components that must be recognised at fair value at inception, any subsequent remeasurement would be pursuant to other IFRS accounting standards (e.g., IFRS 9). That is, subsequent adjustments to the fair value of those components have no effect on the amount of the transaction price previously allocated to any performance obligations included within the contract or on revenue recognised.

7 IFRS 15 - Satisfaction of performance obligations

Under IFRS 15, an entity only recognises revenue when it satisfies an identified performance obligation by transferring a promised good or service to a customer. A good or service is considered to be transferred when the customer obtains control. [IFRS 15.31].

IFRS 15 states that “Control of an asset refers to the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset.” [IFRS 15.33]. Control also means the ability to prevent others from directing the use of, and receiving the benefit from, a good or service. The Board noted that both goods and services are assets that a customer acquires (even if many services are not recognised as an asset because those services are simultaneously received and consumed by the customer). [IFRS 15.BC118]. The IASB explained the key terms in the definition of control in the Basis for Conclusions, which are, as follows: [IFRS 15.BC120]

- *Ability* - a customer must have the present right to direct the use of, and obtain substantially all of the remaining benefits from, an asset for an entity to recognise revenue. For example, in a contract that requires a manufacturer to produce an asset for a customer, it might be clear that the customer will ultimately have the right to direct the use of, and obtain substantially all of the remaining benefits from, the asset. However, the entity does not recognise revenue until the customer has actually obtained that right (which, depending on the contract, might occur during production or afterwards).
- *Direct the use of* - a customer’s ability to direct the use of an asset refers to the customer’s right to deploy or to allow another entity to deploy that asset in its activities or to restrict another entity from deploying that asset.
- *Obtain the benefits from* - the customer must have the ability to obtain substantially all of the remaining benefits from an asset for the customer to obtain control of it. Conceptually, the benefits from a good or service are potential cash flows (either an increase in cash inflows or a decrease in cash outflows). IFRS 15.33 indicates that a customer can obtain the benefits directly or indirectly in many ways, such as: using the asset to produce goods or services (including public services); using the asset to enhance the value of other assets; using the asset to settle a liability or reduce an expense; selling or exchanging the asset; pledging the asset to secure a loan; or holding the asset. [IFRS 15.33].

Under IFRS 15, the transfer of control to the customer represents the transfer of the rights with regard to the good or service. The customer’s ability to receive the benefit from the good or service is represented by its right to substantially all of the cash inflows, or the reduction of the cash outflows, generated by the goods or services. [IFRS 15.33]. Upon transfer of control, the customer has sole possession of the right to use the good or service for the remainder of its economic life or to consume the good or service in its own operations.

The IASB explained in the Basis for Conclusions that control must be assessed primarily from the customer’s perspective. While a seller often surrenders control at the same time the customer obtains control, the Board required the assessment of control to be from the customer’s perspective to minimise the risk of an entity recognising revenue from activities that do not coincide with the transfer of goods or services to the customer. [IFRS 15.BC121].

The standard indicates that an entity must determine, at contract inception, whether it will transfer control of a promised good or service over time. If an entity does not satisfy a performance obligation over time, the performance obligation is satisfied at a point in time. [IFRS 15.32]. These concepts are explored further in the following sections.

7.1 Performance obligations satisfied over time

Frequently, entities transfer the promised goods or services to the customer over time. While the determination of whether goods or services are transferred over time is straightforward in some contracts (e.g., many service contracts), it is more difficult in other contracts.

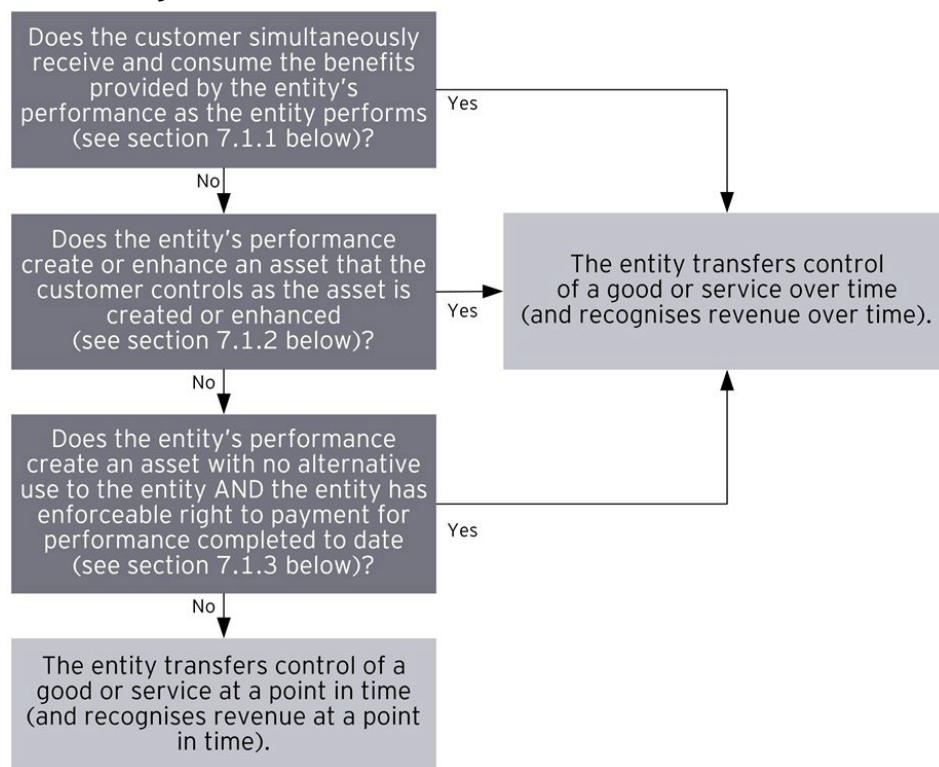

To help entities determine whether control transfers over time (rather than at a point in time), the standard states that an entity transfers control of a good or service over time (and, therefore, satisfies a performance obligation and recognises revenue over time) if one of the following criteria is met: [IFRS 15.35, IFRS 15.B2]

- As the entity performs, the customer simultaneously receives and consumes the benefits provided by the entity's performance (see section 7.1.1 below).
- The entity's performance creates or enhances an asset (e.g., work in progress) that the customer controls as the asset is created or enhanced (see section 7.1.2 below).
- The entity's performance does not create an asset with an alternative use to the entity and the entity has an enforceable right to payment for performance completed to date (see section 7.1.3 below).

Examples of each of the criteria above are included in the following sections. If an entity is unable to demonstrate that control transfers over time, the presumption is that control transfers at a point in time (see section 7.2 below). [IFRS 15.32].

The following flow chart illustrates how to evaluate whether control transfers over time:

Figure 7-1: Evaluating whether control transfers over time

How we see it

Determining when performance obligations are satisfied requires judgement. IFRS 15.119(a) requires an entity to disclose when it typically satisfies its performance obligations (e.g., upon shipment, as services are delivered). See section 10.5.1.C below for more information. IFRS 15.123(a) requires entities to disclose significant judgements made in determining the timing of satisfaction of performance obligations and IFRS 15.124 requires entities to disclose the method used to recognise revenue (e.g., a description of the input or output method used and how that method is applied) and why the method selected provides a faithful depiction of the transfer of goods or services. See section 10.5.2 below for more information on these disclosure requirements. Entities are required to review their disclosures to verify that they not only meet the specific requirements of IFRS 15.119(a), 123(a) and 124, but they also meet the overall disclosure objective in IFRS 15.110 (See section 10.4 below).

Frequently asked questions

Question 7-1: Can an entity elect to recognise revenue at a point in time under IFRS 15?

Entities cannot elect to recognise revenue at a point in time. Rather, entities have to analyse their contracts to determine the appropriate timing and pattern of recognition while considering the specific criteria and requirements of IFRS 15. As discussed above, for each performance obligation identified in the contract, an entity is required to consider at contract inception whether it satisfies the performance obligation over time (i.e., whether it meets one of the three criteria for over-time recognition in IFRS 15.35) or at a point in time. If an entity does not satisfy a performance obligation over time, the performance obligation is satisfied at a point in time. That is, there is no exception in IFRS 15 that would allow entities to elect point-in-time recognition for contracts, including those with a short duration (e.g., a year or less).

Question 7-2: Do all contracts with a stand-ready element include a single performance obligation that is satisfied over time?

(TRG meeting 9 November 2015 - Agenda paper no. 48)

See response to Question 4-3 in section 4.1.1 above.

7.1.1 Customer simultaneously receives and consumes benefits as the entity performs

As the Board explained in the Basis for Conclusions, in many service contracts the entity's performance creates an asset, momentarily, because that asset is simultaneously received and consumed by the customer. In these cases, the customer obtains control of the entity's output as the entity performs. Therefore, the performance obligation is satisfied over time. [IFRS 15.BC125]. While this criterion most often applies to service contracts, the TRG discussed instances in which commodity contracts (e.g., electricity, natural gas, heating oil) could be recognised over time. These situations could arise if the facts and circumstances of the contract indicate that the customer will simultaneously receive and consume the benefits (e.g., a continuous supply contract to meet immediate demands).¹⁰⁶ Refer to Question 7-3 below for further information.

There might be contracts in which it is unclear whether the customer simultaneously receives and consumes the benefit of the entity's performance over time. To assist entities, IFRS 15 provides the following application guidance: [IFRS 15.B3, IFRS 15.B4]

Extract from IFRS 15

Simultaneous receipt and consumption of the benefits of the entity's performance (paragraph 35(a))

- B3 For some types of performance obligations, the assessment of whether a customer receives the benefits of an entity's performance as the entity performs and simultaneously consumes those benefits as they are received will be straightforward. Examples include routine or recurring services (such as a cleaning service) in which the receipt and simultaneous consumption by the customer of the benefits of the entity's performance can be readily identified.
- B4 For other types of performance obligations, an entity may not be able to readily identify whether a customer simultaneously receives and consumes the benefits from the entity's performance as the entity performs. In those circumstances, a performance obligation is satisfied over time if an entity determines that another entity would not need to substantially re-perform the work that the entity has completed to date if that other entity were to fulfil the remaining performance obligation to the customer. In determining whether another entity would not need to substantially re-perform the work the entity has completed to date, an entity shall make both of the following assumptions:
- (a) disregard potential contractual restrictions or practical limitations that otherwise would prevent the entity from transferring the remaining performance obligation to another entity; and
 - (b) presume that another entity fulfilling the remainder of the performance obligation would not have the benefit of any asset that is presently controlled by the entity and that would remain controlled by the entity if the performance obligation were to transfer to another entity.

¹⁰⁶ TRG Agenda paper no. 43, *Determining When Control of a Commodity Transfers*, dated 13 July 2015.

The IASB added this application guidance because the notion of ‘benefit’ can be subjective. As discussed in the Basis for Conclusions, the Board provided an example of a freight logistics contract. Assume that the entity has agreed to transport goods from Vancouver to New York City. Some stakeholders had suggested that the customer receives no benefit from the entity’s performance until the goods are delivered to, in this case, New York City. However, the Board said that the customer benefits as the entity performs. This is because, if the goods were only delivered part of the way (e.g., to Chicago), another entity would not need to substantially re-perform the entity’s performance to date. The Board observed that in these cases, the assessment of whether another entity would need to substantially re-perform the entity’s performance to date is an objective way to assess whether the customer receives benefit from the entity’s performance as it occurs. [IFRS 15.BC126].

In assessing whether a customer simultaneously receives and consumes the benefits provided by an entity’s performance, all relevant facts and circumstances need to be considered. This includes considering the inherent characteristics of the good or service, the contract terms and information about how the good or service is transferred or delivered. However, as noted in IFRS 15.B4(a), an entity disregards any contractual or practical restrictions when it assesses this criterion. In the Basis for Conclusions, the IASB explained that the assessment of whether control of the goods or services has transferred to the customer is performed by making a hypothetical assessment of what another entity would need to do if it were to take over the remaining performance. Therefore, actual practical or contractual restrictions would have no bearing on the assessment of whether the entity had already transferred control of the goods or services provided to date. [IFRS 15.BC127].

The standard provides the following example that illustrates a customer simultaneously receiving and consuming the benefits as the entity performs in relation to a series of distinct payroll processing services: [IFRS 15.IE Example 13, IFRS 15.IE67-IE68]

Extract from IFRS 15

Example 13-Customer simultaneously receives and consumes the benefits

An entity enters into a contract to provide monthly payroll processing services to a customer for one year.

The promised payroll processing services are accounted for as a single performance obligation in accordance with paragraph 22(b) of IFRS 15. The performance obligation is satisfied over time in accordance with paragraph 35(a) of IFRS 15 because the customer simultaneously receives and consumes the benefits of the entity’s performance in processing each payroll transaction as and when each transaction is processed. The fact that another entity would not need to re-perform payroll processing services for the service that the entity has provided to date also demonstrates that the customer simultaneously receives and consumes the benefits of the entity’s performance as the entity performs. (The entity disregards any practical limitations on transferring the remaining performance obligation, including setup activities that would need to be undertaken by another entity.) The entity recognises revenue over time by measuring its progress towards complete satisfaction of that performance obligation in accordance with paragraphs 39-45 and B14-B19 of IFRS 15.

The IASB clarified, in the Basis for Conclusions, that an entity does not evaluate this criterion (to determine whether a performance obligation is satisfied over time) if the entity’s performance creates an asset that the customer does not consume immediately as the asset is received. The IFRS IC reiterated this point at its meeting in March 2018, in relation to a contract for the sale of a real estate unit (see Question 7-11 in section 7.1.3.B below for further discussion).¹⁰⁷ Instead, an entity assesses that performance obligation using the criteria discussed in sections 7.1.2 and 7.1.3 below.

For some service contracts, the entity’s performance will not satisfy its obligation over time because the customer does not consume the benefit of the entity’s performance until the entity’s performance is complete. The standard provides an example (Example 14) of an entity providing consulting services that will take the form of a professional opinion upon the completion of the services. In this situation, an entity cannot conclude that the services are transferred over time based on this criterion. Instead, the entity must consider the remaining two criteria in IFRS 15.35 (see sections 7.1.2 and 7.1.3 and Example 14, extracted in full in section 7.1.3.B below). [IFRS 15.IE Example 14, IFRS 15.IE69-IE72].

¹⁰⁷ [IFRIC Update](#), March 2018, available on the IFRS Foundation’s website.

Frequently asked questions

Question 7-3: What factors does an entity consider when evaluating whether a customer simultaneously receives and consumes the benefits of a commodity (e.g., electricity, natural gas or heating oil) as the entity performs?

(TRG meeting 13 July 2015 - Agenda paper no. 43)

The TRG members generally agreed that an entity would consider all known facts and circumstances when evaluating whether a customer simultaneously receives and consumes the benefits of a commodity. These might include the inherent characteristics of the commodity (e.g., whether the commodity can be stored), contract terms (e.g., a continuous supply contract to meet immediate demands) and information about infrastructure or other delivery mechanisms.

As such, revenue related to the sale of a commodity might or might not be recognised over time, depending on whether the facts and circumstances of the contract indicate that the customer simultaneously receives and consumes the benefits. This evaluation could require the use of significant judgement.

Whether a commodity meets this criterion and is transferred over time is important in determining whether the sale of a commodity meets the criteria to apply the series requirement (see section 4.2.2 above). This, in turn, affects how an entity allocates variable consideration and applies the requirements for contract modifications and changes in the transaction price.

7.1.2 Customer controls the asset as it is created or enhanced

The second criterion to determine whether control of a good or service is transferred over time requires entities to evaluate whether the customer controls the asset as it is being created or enhanced. An entity applies the requirements for control in IFRS 15.31-34 and IFRS 15.38. *[IFRS 15.B5]*.

For the purpose of this determination, the definition of 'control' is the same as previously discussed (i.e., the ability to direct the use of and obtain substantially all of the remaining benefits from the asset). The IASB explained in the Basis for Conclusions that this criterion addresses situations in which the customer clearly controls any work in progress arising from the entity's performance. It also noted that the second over-time criterion acknowledges that, in effect, the entity has agreed to sell its rights to the asset (i.e., work in progress) as the entity performs (i.e., a continuous sale). The Board provided an example in which the entity has entered into a construction contract to build on the customer's land, stating that any work in progress arising from the entity's performance is generally controlled by the customer.

[IFRS 15.BC129, IFRS 15.BC130]. IFRS IC also reiterated the overall intent of the criterion and referred to this example from the Basis for Conclusions during its March 2018 meeting (see Question 7-11 in section 7.1.3.B below).¹⁰⁸ In addition, some construction contracts might also contain clauses indicating that the customer owns any work in progress as the contracted item is being built. Furthermore, the asset being created or enhanced can be either tangible or intangible. *[IFRS 15.B5]*.

¹⁰⁸ [IFRIC Update](#), March 2018, available on the IFRS Foundation's website.

Frequently asked questions

Question 7-4: How does an entity evaluate a customer's right to sell (or pledge) a right to obtain an asset when determining whether the customer controls the asset as it is created or enhanced under IFRS 15.35(b)?

How we see it

We believe that an entity needs to assess control of the asset that the entity's performance creates or enhances, rather than any contractual rights to obtain the completed asset in the future.

As an example, and as discussed by the IFRS IC (see Question 7-11 in section 7.1.3.B below), in a contract for the sale of real estate that the entity constructs, the asset created is the real estate itself and not the customer's right to obtain the completed real estate in the future. That is, an entity would evaluate whether the customer controls the partially constructed real estate as it is being constructed to determine whether the criterion IFRS 15.35(b) is met. The customer's right to sell (or pledge) a right to obtain a completed asset in the future is not evidence that the customer controls the asset itself as it is being created or enhanced.¹⁰⁹

7.1.3 Asset with no alternative use and right to payment

In some cases, it might be unclear whether the asset that an entity creates or enhances is controlled by the customer when considering the first two criteria (discussed in sections 7.1.1 and 7.1.2 above) for evaluating whether control transfers over time. Therefore, the Board added a third criterion, which requires revenue to be recognised over time if both of the following two requirements are met: [IFRS 15.35(c)]

- The entity's performance does not create an asset with alternative use to the entity (see section 7.1.3.A below).
- The entity has an enforceable right to payment for performance completed to date (see section 7.1.3.B below).

7.1.3.A No alternative use

The IASB explained in the Basis for Conclusions that it had developed the notion of 'alternative use' to prevent over time revenue recognition when the entity's performance does not transfer control of the goods or services to the customer over time. When the entity's performance creates an asset with an alternative use to the entity (e.g., standard inventory items), the entity can readily direct the asset to another customer. In those cases, the entity (not the customer) controls the asset as it is created because the customer does not have the ability to direct the use of the asset or restrict the entity from directing that asset to another customer. The standard includes the following requirements for 'alternative use': [IFRS 15.36, IFRS 15.B6, IFRS 15.B7, IFRS 15.B8]

Extract from IFRS 15

36 An asset created by an entity's performance does not have an alternative use to an entity if the entity is either restricted contractually from readily directing the asset for another use during the creation or enhancement of that asset or limited practically from readily directing the asset in its completed state for another use. The assessment of whether an asset has an alternative use to the entity is made at contract inception. After contract inception, an entity shall not update the assessment of the alternative use of an asset unless the parties to the contract approve a contract modification that substantively changes the performance obligation. Paragraphs B6-B8 provide guidance for assessing whether an asset has an alternative use to an entity.

Entity's performance does not create an asset with an alternative use (paragraph 35(c))

B6 In assessing whether an asset has an alternative use to an entity in accordance with paragraph 36, an entity shall consider the effects of contractual restrictions and practical limitations on the entity's ability to readily direct that asset for another use, such as selling it to a different customer. The possibility of the contract with the customer being terminated is not a relevant consideration in assessing whether the entity would be able to readily direct the asset for another use.

¹⁰⁹ [IFRIC Update](#), March 2018, available on the IFRS Foundation's website.

- B7** A contractual restriction on an entity's ability to direct an asset for another use must be substantive for the asset not to have an alternative use to the entity. A contractual restriction is substantive if a customer could enforce its rights to the promised asset if the entity sought to direct the asset for another use. In contrast, a contractual restriction is not substantive if, for example, an asset is largely interchangeable with other assets that the entity could transfer to another customer without breaching the contract and without incurring significant costs that otherwise would not have been incurred in relation to that contract.
- B8** A practical limitation on an entity's ability to direct an asset for another use exists if an entity would incur significant economic losses to direct the asset for another use. A significant economic loss could arise because the entity either would incur significant costs to rework the asset or would only be able to sell the asset at a significant loss. For example, an entity may be practically limited from redirecting assets that either have design specifications that are unique to a customer or are located in remote areas.

In making the assessment of whether a good or service has alternative use, an entity must consider any substantive contractual restrictions. A contractual restriction is substantive if a customer could enforce its rights to the promised asset if the entity sought to direct the asset for another use. Contractual restrictions that are not substantive, such as protective rights for the customer, are not considered. The Board explained in the Basis for Conclusions that a protective right typically gives an entity the practical ability to physically substitute or redirect the asset without the customer's knowledge or objection to the change. For example, a contract might specify that an entity cannot transfer a good to another customer because the customer has legal title to the good. Such a contractual term would not be substantive if the entity could physically substitute that good for another and could redirect the original good to another customer for little cost. In that case, the contractual restriction would merely be a protective right and would not indicate that control of the asset has transferred to the customer. [IFRS 15.BC138].

An entity also needs to consider any practical limitations on directing the asset for another use. In making this determination, the Board clarified that an entity considers the characteristics of the asset that ultimately will be transferred to the customer and assesses whether the asset in its completed state could be redirected without a significant cost of rework. The Board provided an example of manufacturing contracts in which the basic design of the asset is the same across all contracts, but substantial customisation is made to the asset. As a result, redirecting the finished asset would require significant rework and the asset would not have an alternative use because the entity would incur significant economic losses to direct the asset for another use. [IFRS 15.BC138].

Considering the level of customisation of an asset could help entities assess whether an asset has an alternative use. The IASB noted in the Basis for Conclusions that, when an entity is creating an asset that is highly customised for a particular customer, it is less likely that the entity could use that asset for any other purpose. [IFRS 15.BC135]. That is, it is likely that the entity would need to incur significant rework costs to redirect the asset to another customer or sell the asset at a significantly reduced price. As a result, the asset would not have an alternative use to the entity and the customer could be regarded as receiving the benefit of the entity's performance as the entity performs (i.e., having control of the asset), provided that the entity also has an enforceable right to payment (discussed below). However, the Board clarified that the level of customisation is a factor to consider, but it would not be a determinative factor. For example, in some real estate contracts, the asset could be standardised (i.e., not highly customised), but it still might not have an alternative use to the entity because of substantive contractual restrictions that preclude the entity from readily directing the asset to another customer. [IFRS 15.BC137].

The standard provides the following example to illustrate an evaluation of practical limitations on directing an asset for another use: [IFRS 15.IE Example 15, IFRS 15.IE73-IE76]

Extract from IFRS 15

Example 15-Asset has no alternative use to the entity

An entity enters into a contract with a customer, a government agency, to build a specialised satellite. The entity builds satellites for various customers, such as governments and commercial entities. The design and construction of each satellite differ substantially, on the basis of each customer's needs and the type of technology that is incorporated into the satellite.

At contract inception, the entity assesses whether its performance obligation to build the satellite is a performance obligation satisfied over time in accordance with paragraph 35 of IFRS 15.

As part of that assessment, the entity considers whether the satellite in its completed state will have an alternative use to the entity. Although the contract does not preclude the entity from directing the completed satellite to another customer, the entity would incur significant costs to rework the design and function of the satellite to direct that asset to another customer. Consequently, the asset has no alternative use to the entity (see paragraphs 35(c), 36 and B6-B8 of IFRS 15) because the customer-specific design of the satellite limits the entity's practical ability to readily direct the satellite to another customer.

For the entity's performance obligation to be satisfied over time when building the satellite, paragraph 35(c) of IFRS 15 also requires the entity to have an enforceable right to payment for performance completed to date. This condition is not illustrated in this example.

Requiring an entity to assess contractual restrictions when evaluating this criterion might seem to contradict the requirements in IFRS 15.B4 to ignore contractual and practical restrictions when evaluating whether another entity would need to substantially reperform the work the entity has completed to date (see section 7.1.1 above). The Board explained that this difference is appropriate because each criterion provides a different method for assessing when control transfers and the criteria were designed to apply to different situations. [IFRS 15.BC139].

After contract inception, an entity does not update its assessment of whether an asset has an alternative use for any subsequent changes in facts and circumstances, unless the parties approve a contract modification that substantively changes the performance obligation. [IFRS 15.36]. The IASB also decided that an entity's lack of an alternative use for an asset does not, by itself, mean that the customer effectively controls the asset. The entity would also need to determine that it has an enforceable right to payment for performance to date, as discussed below. [IFRS 15.BC141].

Frequently asked questions

Question 7-5: Does an entity consider the completed asset or the work in progress when assessing whether its performance creates an asset with no alternative use under IFRS 15.35(c)? (FASB TRG meeting 7 November 2016 - Agenda paper no. 56)

The FASB TRG members generally agreed that when an entity evaluates whether its performance creates an asset with no alternative use, it considers whether it could sell the completed asset to another customer without incurring a significant economic loss (i.e., whether it could sell the raw materials or work in progress to another customer is not relevant). This conclusion is supported by the Board's comment in the Basis for Conclusions "that an entity should consider the characteristics of the asset that will ultimately be transferred to the customer". [IFRS 15.BC136].¹¹⁰

However, as discussed above and in accordance with IFRS 15.36, if the entity is contractually restricted or has a practical limitation on its ability to direct the asset for another use, the asset would not have an alternative use, regardless of the characteristics of the completed asset. A contractual restriction is substantive if a customer could enforce its rights to the promised asset if the entity sought to direct the asset for another use. A practical limitation exists if an entity would incur a significant economic loss to direct the asset for another use.

The FASB TRG agenda paper included an example, which the following Illustration is based on:

Illustration 7-1: No alternative use

An entity enters into a contract with a customer to build customised equipment. The customisation of the equipment occurs when the manufacturing process is approximately 75% complete. That is, for approximately the first 75% of the manufacturing process, the in-process asset could be redirected to fulfil another customer's equipment order (assuming no contractual restrictions). However, the equipment cannot be sold in its completed state to another customer without incurring a significant economic loss. The design specifications of the equipment are unique to the customer and the entity would only be able to sell the completed equipment at a significant economic loss.

The entity would evaluate, at contract inception, whether there is any contractual restriction or practical limitation on its ability to readily direct the asset (in its completed state) for another use. Because the entity cannot sell the completed equipment to another customer without incurring a significant economic loss, the entity has a practical limitation on its ability to direct the equipment in its completed state and, therefore, the asset does not have an alternative use. However, before concluding that revenue would be recognised over time, an entity must evaluate whether it has an enforceable right to payment.

¹¹⁰ FASB TRG Agenda paper no. 60, November 2016 Meeting - Summary of Issues Discussed and Next Steps, dated 31 January 2017.

7.1.3.B Enforceable right to payment for performance completed to date

To evaluate whether it has an enforceable right to payment for performance completed to date, the entity is required to consider the terms of the contract and any laws or regulations that relate to it. [IFRS 15.37, IFRS 15.B12]. The standard states that the right to payment for performance completed to date need not be for a fixed amount. However, at any time during the contract term, an entity must be entitled to an amount that at least compensates the entity for performance completed to date (as defined in IFRS 15.B9, see extract below), even if the contract is terminated by the customer (or another party) for reasons other than the entity's failure to perform as promised. [IFRS 15.37, IFRS 15.B9]. The IASB concluded that a customer's obligation to pay for the entity's performance is an indicator that the customer has obtained benefit from the entity's performance. [IFRS 15.BC142].

The standard states the following about an entity's right to payment for performance completed to date: [IFRS 15.B9, IFRS 15.B10, IFRS 15.B11, IFRS 15.B12]

Extract from IFRS 15

- B9** In accordance with paragraph 37, an entity has a right to payment for performance completed to date if the entity would be entitled to an amount that at least compensates the entity for its performance completed to date in the event that the customer or another party terminates the contract for reasons other than the entity's failure to perform as promised. An amount that would compensate an entity for performance completed to date would be an amount that approximates the selling price of the goods or services transferred to date (for example, recovery of the costs incurred by an entity in satisfying the performance obligation plus a reasonable profit margin) rather than compensation for only the entity's potential loss of profit if the contract were to be terminated. Compensation for a reasonable profit margin need not equal the profit margin expected if the contract was fulfilled as promised, but an entity should be entitled to compensation for either of the following amounts:
- (a) a proportion of the expected profit margin in the contract that reasonably reflects the extent of the entity's performance under the contract before termination by the customer (or another party); or
 - (b) a reasonable return on the entity's cost of capital for similar contracts (or the entity's typical operating margin for similar contracts) if the contract-specific margin is higher than the return the entity usually generates from similar contracts.
- B10** An entity's right to payment for performance completed to date need not be a present unconditional right to payment. In many cases, an entity will have an unconditional right to payment only at an agreed-upon milestone or upon complete satisfaction of the performance obligation. In assessing whether it has a right to payment for performance completed to date, an entity shall consider whether it would have an enforceable right to demand or retain payment for performance completed to date if the contract were to be terminated before completion for reasons other than the entity's failure to perform as promised.
- B11** In some contracts, a customer may have a right to terminate the contract only at specified times during the life of the contract or the customer might not have any right to terminate the contract. If a customer acts to terminate a contract without having the right to terminate the contract at that time (including when a customer fails to perform its obligations as promised), the contract (or other laws) might entitle the entity to continue to transfer to the customer the goods or services promised in the contract and require the customer to pay the consideration promised in exchange for those goods or services. In those circumstances, an entity has a right to payment for performance completed to date because the entity has a right to continue to perform its obligations in accordance with the contract and to require the customer to perform its obligations (which include paying the promised consideration).
- B12** In assessing the existence and enforceability of a right to payment for performance completed to date, an entity shall consider the contractual terms as well as any legislation or legal precedent that could supplement or override those contractual terms. This would include an assessment of whether:
- (a) legislation, administrative practice or legal precedent confers upon the entity a right to payment for performance to date even though that right is not specified in the contract with the customer;
 - (b) relevant legal precedent indicates that similar rights to payment for performance completed to date in similar contracts have no binding legal effect; or

- (c) an entity's customary business practices of choosing not to enforce a right to payment has resulted in the right being rendered unenforceable in that legal environment. However, notwithstanding that an entity may choose to waive its right to payment in similar contracts, an entity would continue to have a right to payment to date if, in the contract with the customer, its right to payment for performance to date remains enforceable.

The IASB described in the Basis for Conclusions how the factors of 'no alternative use' and the 'right to payment' relate to the assessment of control. Since an entity is constructing an asset with no alternative use to the entity, the entity is effectively creating an asset at the direction of the customer. That asset would have little or no value to the entity if the customer were to terminate the contract. As a result, the entity will seek economic protection from the risk of customer termination by requiring the customer to pay for the entity's performance to date in the event of customer termination. The customer's obligation to pay for the entity's performance to date (or the inability to avoid paying for that performance) suggests that the customer has obtained the benefits from the entity's performance. [IFRS 15.BC142].

The enforceable right to payment criterion has two components that an entity must assess:

- The amount that the customer would be required to pay
- And
- What it means to have the enforceable right to payment

The Board provided additional application guidance on how to evaluate each of these components.

The amount that the customer would be required to pay

Firstly, the Board explained in the Basis for Conclusions that the focus of the analysis is on the amount to which the entity would be entitled upon termination. [IFRS 15.BC144]. This amount is not the amount the entity would settle for in a negotiation and it does not need to reflect the full contract margin that the entity would earn if the contract were completed. The Board clarified in IFRS 15.B9 that a 'reasonable profit margin' would either be a proportion of the entity's expected profit margin that reasonably reflects the entity's performance to date or a reasonable return on the entity's cost of capital. In addition, the standard clarifies, in IFRS 15.B13, that including a payment schedule in a contract does not, in and of itself, indicate that the entity has the right to payment for performance completed to date. This is because, in some cases, the contract might specify that the consideration received from the customer is refundable for reasons other than the entity failing to perform as promised in the contract. The entity must examine information that might contradict the payment schedule and might represent the entity's actual right to payment for performance completed to date. As highlighted in Example 16 from the standard (included below), payments from a customer must approximate the selling price of the goods or services transferred to date to be considered a right to payment for performance to date. A fixed payment schedule might not meet this requirement. [IFRS 15.B13].

What it means to have the enforceable right to payment

Secondly, the IASB added application guidance in IFRS 15.B12 to help an entity assess the existence and enforceability of a right to payment. In making this assessment, entities need to consider any laws, legislation or legal precedent that could supplement or override the contractual terms. Furthermore, the standard indicates that an entity might have an enforceable right to payment even when the customer terminates the contract without having the right to terminate. This would be the case if the contract (or other law) entitles the entity to continue to transfer the goods or services promised in the contract and require the customer to pay the consideration promised for those goods or services (often referred to as 'specific performance'). [IFRS 15.BC145, IFRS 15.BC147]. The standard also states that even when an entity chooses to waive its right to payment in other similar contracts, an entity would continue to have a right to payment for the contract if, in the contract, its right to payment for performance to date remains enforceable.

The standard provides the following example to illustrate the concepts described in section 7.1.3 above. Example 14 depicts an entity providing consulting services that will take the form of a professional opinion upon the completion of the services. In this example, the entity's performance obligation meets the no alternative use and right to payment criterion of IFRS 15.35(c), as follows: [IFRS 15.IE Example 14, IFRS 15.IE69-IE72]

Extract from IFRS 15**Example 14-Assessing alternative use and right to payment**

An entity enters into a contract with a customer to provide a consulting service that results in the entity providing a professional opinion to the customer. The professional opinion relates to facts and circumstances that are specific to the customer. If the customer were to terminate the consulting contract for reasons other than the entity's failure to perform as promised, the contract requires the customer to compensate the entity for its costs incurred plus a 15 per cent margin. The 15 per cent margin approximates the profit margin that the entity earns from similar contracts.

The entity considers the criterion in paragraph 35(a) of IFRS 15 and the requirements in paragraphs B3 and B4 of IFRS 15 to determine whether the customer simultaneously receives and consumes the benefits of the entity's performance. If the entity were to be unable to satisfy its obligation and the customer hired another consulting firm to provide the opinion, the other consulting firm would need to substantially re-perform the work that the entity had completed to date, because the other consulting firm would not have the benefit of any work in progress performed by the entity. The nature of the professional opinion is such that the customer will receive the benefits of the entity's performance only when the customer receives the professional opinion. Consequently, the entity concludes that the criterion in paragraph 35(a) of IFRS 15 is not met.

However, the entity's performance obligation meets the criterion in paragraph 35(c) of IFRS 15 and is a performance obligation satisfied over time because of both of the following factors:

- (a) in accordance with paragraphs 36 and B6-B8 of IFRS 15, the development of the professional opinion does not create an asset with alternative use to the entity because the professional opinion relates to facts and circumstances that are specific to the customer. Therefore, there is a practical limitation on the entity's ability to readily direct the asset to another customer.
- (b) in accordance with paragraphs 37 and B9-B13 of IFRS 15, the entity has an enforceable right to payment for its performance completed to date for its costs plus a reasonable margin, which approximates the profit margin in other contracts.

Consequently, the entity recognises revenue over time by measuring the progress towards complete satisfaction of the performance obligation in accordance with paragraphs 39-45 and B14-B19 of IFRS 15.

Example 16 below illustrates a contract in which the fixed payment schedule is not expected to correspond, at all times throughout the contract, to the amount that would be necessary to compensate the entity for performance completed to date. Accordingly, the entity concludes that it does not have an enforceable right to payment for performance completed to date as follows: *[IFRS 15.IE Example 16, IFRS 15.IE77-IE80]*

Extract from IFRS 15**Example 16-Enforceable right to payment for performance completed to date**

An entity enters into a contract with a customer to build an item of equipment. The payment schedule in the contract specifies that the customer must make an advance payment at contract inception of 10 per cent of the contract price, regular payments throughout the construction period (amounting to 50 per cent of the contract price) and a final payment of 40 per cent of the contract price after construction is completed and the equipment has passed the prescribed performance tests. The payments are non-refundable unless the entity fails to perform as promised. If the customer terminates the contract, the entity is entitled only to retain any progress payments received from the customer. The entity has no further rights to compensation from the customer.

At contract inception, the entity assesses whether its performance obligation to build the equipment is a performance obligation satisfied over time in accordance with paragraph 35 of IFRS 15.

As part of that assessment, the entity considers whether it has an enforceable right to payment for performance completed to date in accordance with paragraphs 35(c), 37 and B9-B13 of IFRS 15 if the customer were to terminate the contract for reasons other than the entity's failure to perform as promised. Even though the payments made by the customer are non-refundable, the cumulative amount of those payments is not expected, at all times throughout the contract, to at least correspond to the amount that would be necessary to compensate the entity for performance completed to date. This is because at various times during construction the cumulative amount of consideration paid by the customer might be less than the selling price of the partially completed item of equipment at that time. Consequently, the entity does not have a right to payment for performance completed to date.

Because the entity does not have a right to payment for performance completed to date, the entity's performance obligation is not satisfied over time in accordance with paragraph 35(c) of IFRS 15. Accordingly, the entity does not need to assess whether the equipment would have an alternative use to the entity. The entity also concludes that it does not meet the criteria in paragraph 35(a) or (b) of IFRS 15 and thus, the entity accounts for the construction of the equipment as a performance obligation satisfied at a point in time in accordance with paragraph 38 of IFRS 15.

Example 17 below contrasts similar situations and illustrates when revenue would be recognised over time (see section 7.1 above) versus at a point in time (see section 7.2 below). Specifically, this example illustrates the evaluation of the 'no alternative use' and 'right to payment for performance to date' concepts, as follows. [IFRS 15.IE Example 17, IFRS 15.IE81-IE90].

Extract from IFRS 15

Example 17-Assessing whether a performance obligation is satisfied at a point in time or over time

An entity is developing a multi-unit residential complex. A customer enters into a binding sales contract with the entity for a specified unit that is under construction. Each unit has a similar floor plan and is of a similar size, but other attributes of the units are different (for example, the location of the unit within the complex).

Case A-Entity does not have an enforceable right to payment for performance completed to date

The customer pays a deposit upon entering into the contract and the deposit is refundable only if the entity fails to complete construction of the unit in accordance with the contract. The remainder of the contract price is payable on completion of the contract when the customer obtains physical possession of the unit. If the customer defaults on the contract before completion of the unit, the entity only has the right to retain the deposit.

At contract inception, the entity applies paragraph 35(c) of IFRS 15 to determine whether its promise to construct and transfer the unit to the customer is a performance obligation satisfied over time. The entity determines that it does not have an enforceable right to payment for performance completed to date because, until construction of the unit is complete, the entity only has a right to the deposit paid by the customer.

Because the entity does not have a right to payment for work completed to date, the entity's performance obligation is not a performance obligation satisfied over time in accordance with paragraph 35(c) of IFRS 15. Instead, the entity accounts for the sale of the unit as a performance obligation satisfied at a point in time in accordance with paragraph 38 of IFRS 15.

Case B-Entity has an enforceable right to payment for performance completed to date

The customer pays a non-refundable deposit upon entering into the contract and will make progress payments during construction of the unit. The contract has substantive terms that preclude the entity from being able to direct the unit to another customer. In addition, the customer does not have the right to terminate the contract unless the entity fails to perform as promised. If the customer defaults on its obligations by failing to make the promised progress payments as and when they are due, the entity would have a right to all of the consideration promised in the contract if it completes the construction of the unit. The courts have previously upheld similar rights that entitle developers to require the customer to perform, subject to the entity meeting its obligations under the contract.

At contract inception, the entity applies paragraph 35(c) of IFRS 15 to determine whether its promise to construct and transfer the unit to the customer is a performance obligation satisfied over time. The entity determines that the asset (unit) created by the entity's performance does not have an alternative use to the entity because the contract precludes the entity from transferring the specified unit to another customer. The entity does not consider the possibility of a contract termination in assessing whether the entity is able to direct the asset to another customer.

The entity also has a right to payment for performance completed to date in accordance with paragraphs 37 and B9-B13 of IFRS 15. This is because if the customer were to default on its obligations, the entity would have an enforceable right to all of the consideration promised under the contract if it continues to perform as promised.

Therefore, the terms of the contract and the practices in the legal jurisdiction indicate that there is a right to payment for performance completed to date. Consequently, the criteria in paragraph 35(c) of IFRS 15 are met and the entity has a performance obligation that it satisfies over time. To recognise revenue for that performance obligation satisfied over time, the entity measures its progress towards complete satisfaction of its performance obligation in accordance with paragraphs 39-45 and B14-B19 of IFRS 15.

In the construction of a multi-unit residential complex, the entity may have many contracts with individual customers for the construction of individual units within the complex. The entity would account for each contract separately. However, depending on the nature of the construction, the entity's performance in undertaking the initial construction works (ie the foundation and the basic structure), as well as the construction of common areas, may need to be reflected when measuring its progress towards complete satisfaction of its performance obligations in each contract.

Case C-Entity has an enforceable right to payment for performance completed to date

The same facts as in Case B apply to Case C, except that in the event of a default by the customer, either the entity can require the customer to perform as required under the contract or the entity can cancel the contract in exchange for the asset under construction and an entitlement to a penalty of a proportion of the contract price.

Notwithstanding that the entity could cancel the contract (in which case the customer's obligation to the entity would be limited to transferring control of the partially completed asset to the entity and paying the penalty prescribed), the entity has a right to payment for performance completed to date because the entity could also choose to enforce its rights to full payment under the contract. The fact that the entity may choose to cancel the contract in the event the customer defaults on its obligations would not affect that assessment (see paragraph B11 of IFRS 15), provided that the entity's rights to require the customer to continue to perform as required under the contract (ie pay the promised consideration) are enforceable.

Frequently asked questions

Question 7-6: How does an entity determine whether it has an enforceable right to payment under IFRS 15.35(c)? (FASB TRG meeting 7 November 2016 - Agenda paper no. 56)

The FASB TRG members generally agreed that entities need to evaluate the contractual provisions to determine whether the right to payment compensates the entity for performance completed to date. For example, a contract might not explicitly provide an entity with an enforceable right to payment for anything other than finished goods. However, if the termination provisions in the contract allow for a notice period (e.g., 60 days) that would provide sufficient time for an entity to move all work in progress to the finished goods stage, it is likely that an entity would conclude that the contract provides for an enforceable right to payment for performance completed to date. In addition, an entity considers any legislation or legal precedent that could supplement or override any contractual terms.

The FASB TRG also discussed the linkage amongst right to payment, measure of progress and the timing of the customisation of a good. For example, the FASB TRG noted an entity might not always have an enforceable right to payment at contract inception, such as when an entity is producing standard goods (i.e., inventory) that might be customised for a customer towards the end of the production process. The FASB TRG members generally agreed that an entity would need to consider whether it has an enforceable right to payment related to its performance completed to date. If the entity's performance obligation is to customise its standard goods for a customer, the FASB TRG members generally agreed that an entity would evaluate whether it has an enforceable right to payment at the point that the entity begins to satisfy the performance obligation to customise the goods for the customer. That is, because the right to payment is for performance completed to date, an entity's performance needs to coincide with how it defines the nature of its performance obligation and its measure of progress toward satisfaction of that performance obligation.

Question 7-7: To have an enforceable right to payment for performance completed to date, does an entity need to have a present unconditional right to payment?

In the Basis for Conclusions, the IASB clarified that the contractual payment terms in a contract might not always align with an entity's enforceable rights to payment for performance completed to date. As a result, an entity does not need to have a present unconditional right to payment. Instead, it must have an enforceable right to demand and/or retain payment for performance completed to date upon customer termination without cause. To illustrate this point, the Board included an example of a consulting contract that requires an entity to provide a report at the end of the project. In return, the entity earns a fixed amount, which is due and payable to the entity when it delivers the report. Assume that the entity is performing under the contract and that the contract (or the law) requires the customer to compensate the entity for its performance completed to date. In that situation, the entity would have an enforceable right to payment for performance completed to date, even though an unconditional right to the fixed amount only exists at the time the report is provided to the customer. This is because the entity has a right to demand and retain payment for performance completed to date if the customer terminates the contract without cause. [IFRS 15.BC145].

Question 7-8: Does an entity have a right to payment for performance completed to date if the entity receives a non-refundable upfront payment that represents the full transaction price?

The Board explained in the Basis for Conclusions that such a payment would represent an entity's right to payment for performance completed to date provided that the entity's right to retain and not refund the payment is enforceable upon termination by the customer. This is because a full upfront payment would at least compensate an entity for the work completed to date throughout the contract.

[IFRS 15.BC146]. If the non-refundable upfront payment does not represent the full transaction price, an entity will have to apply judgement to determine whether the upfront payment provides the entity with a right to payment for performance completed to date in the event of a contract termination.

Question 7-9: Can an entity conclude it has an enforceable right to payment for performance completed to date when a contract is priced at a loss?

The specific facts and circumstances of the contract must be considered to determine whether an entity has an enforceable right to payment for performance completed to date when a contract is priced at a loss. As discussed above, the standard states that, if a contract is terminated for reasons other than the entity's failure to perform as promised, the entity must be entitled to an amount that at least compensates it for its performance to date. Furthermore, IFRS 15.B9 states that "An amount that would compensate an entity for performance completed to date would be an amount that approximates the selling price of the goods or services transferred to date (for example, recovery of the costs incurred by an entity in satisfying the performance obligation plus a reasonable profit margin)." Accordingly, stakeholders had asked whether an entity could have an enforceable right to payment for performance completed to date if the contract was priced at a loss.

How we see it

We believe that the example in IFRS 15.B9 of cost recovery plus a reasonable profit margin does not preclude an entity from having an enforceable right to payment even if the contract is priced at a loss. Rather, we believe an entity needs to evaluate whether it has an enforceable right to receive an amount that approximates the selling price of the goods or services for performance completed to date in the event the customer terminates the contract.

Consider the following Illustration based on an example from the American Institute of Certified Public Accountants (AICPA) Audit and Accounting Guide, Revenue Recognition:¹¹¹

Illustration 7-2: Determination of enforceable right to payment for a contract priced at a loss

Customer X requests bids for the design of a highly customised system. The customer expects to award subsequent contracts for systems over the next 10 years to the entity that wins the design contract. Contractor A is aware of the competition and knows that in order to win the design contract it must bid the contract at a loss. That is, Contractor A is willing to bid the design contract at a loss due to the significant value in future expected orders.

Contractor A wins the contract with a value of CU100 and estimated costs to complete of CU130. Contractor A has determined that the contract contains a single performance obligation and that its performance does not create an asset with an alternative use. The contract is non-cancellable, however, the contract terms stipulate that if the customer terminates the contract, Contractor A would be entitled to payment for work completed to date. The payment amount would be equal to a proportional amount of the price of the contract based upon the performance of work done to date. For example, if at the termination date Contractor A was 50% complete (i.e., incurred CU65 of costs), it would be entitled to a CU50 payment from Customer X (i.e., 50% of CU100 contract value).

In this example, we believe Contractor A has an enforceable right to payment for performance completed to date. This is in accordance with IFRS 15.35(c) because Contractor A is entitled to an amount that approximates the selling price of the good or service for performance completed to date in the event the customer terminates the contract.

Refer to section 9.2 below regarding accounting for anticipated losses on contracts.

Question 7-10: Can an entity have an enforceable right to payment for performance completed to date if it is not entitled to a reasonable profit margin on standard inventory materials that were purchased but not yet used in completing the performance obligation?

It is possible for an entity to have an enforceable right to payment for performance completed to date if it is not entitled to a reasonable profit margin on standard inventory materials that were purchased, but not yet used in completing the performance obligation. Consider an example in which an entity agrees to construct a specialised asset for a customer that has no alternative use to the entity. The construction of

this asset requires the use of standard inventory materials that could be used interchangeably on other projects of the entity until they are integrated into the production of the customer's asset. The contract with the customer entitles the entity to reimbursement of costs incurred plus a reasonable profit margin if the contract is terminated. However, the contract specifically excludes reimbursement of standard inventory purchases before they are integrated into the customer's asset. As previously discussed, the standard states that, at any time during the contract, an entity must be entitled to an amount that compensates the entity for performance completed to date (as defined in IFRS 15.B9) if the contract is terminated for reasons other than the entity's failure to perform. However, in this example, the standard inventory materials have not yet been used in fulfilling the performance obligation, so the entity does not need to have an enforceable right to payment in relation to these materials. The entity could also repurpose the materials for use in other contracts with customers.

The entity will still need to evaluate whether it has an enforceable right to payment for performance completed to date once the standard inventory materials are used in fulfilling the performance obligation. [IFRS 15.B9].

Question 7-11: What does an entity consider when assessing the over-time criteria for the sale of a real estate unit?

The IFRS IC received three requests regarding the assessment of the over-time criteria in relation to contracts for the sale of a real estate unit. At its March 2018 meeting, the IFRS IC concluded that the principles and requirements in IFRS 15 provide an adequate basis for an entity to determine whether to recognise revenue over time, or at a point in time, including whether it has an enforceable right to payment for performance completed to date for a contract for the sale of a real estate unit. Consequently, the IFRS IC decided not to add these matters to its agenda.¹¹²

After considering these requests, the IFRS IC decided that the agenda decisions should discuss the requirements of IFRS 15, as well as how the requirements apply to the fact patterns within the requests. The agenda decisions included the following reminders:

- An entity accounts for contracts within the scope of IFRS 15 only when all the criteria in IFRS 15.9 are met (which includes the collectability criterion).
- Before considering the over-time criteria, an entity is required to apply IFRS 15.22-30 to identify whether each promise to transfer a good or service to the customer is a performance obligation (see section 4.2 above for further discussion).
- An entity assesses the over-time criteria in IFRS 15.35 at contract inception. IFRS 15.35 specifies that an entity transfers control of a good or service over time and, therefore, satisfies a performance obligation and recognises revenue over time, if any of the three criteria is met. If an entity does not satisfy a performance obligation over time, it satisfies the performance obligation at a point in time.

The agenda decisions also noted the following in relation to the over-time criteria.

Criterion (a)

According to IFRS 15.35(a), an entity recognises revenue over time if the customer simultaneously receives and consumes the benefits provided by the entity's performance as the entity performs. This criterion is not applicable in a contract for the sale of a real estate unit that the entity constructs because the real estate unit created by the entity's performance is not consumed immediately.

Criterion (b)

IFRS 15.35(b) specifies that an entity recognises revenue over time if the customer controls the asset that an entity's performance creates or enhances as the asset is created or enhanced. Control refers to the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset. The Board included this criterion to "address situations in which an entity's performance creates or enhances an asset that a customer *clearly* controls as the asset is created or enhanced". [IFRS 15.BC129]. Therefore, all relevant facts and circumstances need to be considered by an entity when assessing whether there is evidence that the customer clearly controls the asset that is being created or enhanced (e.g., the part-constructed real estate unit) as it is created or enhanced. None of the facts and circumstances is determinative.

The IFRS IC observed that "in a contract for the sale of real estate that the entity constructs, the asset created is the real estate itself. It is not, for example, the right to obtain the real estate in the future. The right to sell or pledge a right to obtain real estate in the future is not evidence of control of the real

¹¹¹ See AICPA guide, *Revenue Recognition*, Chapter 3, *Aerospace and Defense Entities*, paragraphs 3.5.18 - 3.5.23.

¹¹² [IFRIC Update](#), March 2018, available on the IFRS Foundation's website.

estate itself".¹¹³ That is, it is important to apply the requirements for control to the asset that the entity's performance creates or enhances (see Question 7-4 in section 7.1.2 above).

Criterion (c)

The Board developed this third criterion because, in some cases, it might not be clear whether the asset that is created or enhanced is controlled by the customer. IFRS 15.35(c) requires an entity to determine whether: (a) the asset created by an entity's performance does not have an alternative use to the entity; and (b) the entity has an enforceable right to payment for performance completed to date. However, the underlying objective of this criterion is still to determine whether the entity is transferring control of goods or services to the customer as it is creating the asset for that customer. The agenda decisions reiterate that:

- The asset being created does not have an alternative use to the entity if the entity is restricted contractually from readily directing the asset for another use during the asset's creation or if it is limited practically from readily directing the asset in the completed state for another use.
[IFRS 15.36].¹¹⁴
- The entity has an enforceable right to payment if it is entitled to an amount that at least compensates it for performance completed to date were the contract to be terminated by the customer for reasons other than the entity's failure to perform as promised. [IFRS 15.37].¹¹⁵ The entity must be entitled to this amount at all times throughout the duration of the contract and this amount must at least approximate the selling price of the goods or services transferred to date. That is, it is not meant to refer to compensation for only the entity's potential loss of profit were the contract to be terminated. The IFRS IC observed that "it is the payment the entity is entitled to receive under the contract with the customer relating to performance under that contract that is relevant in determining whether the entity has an enforceable right to payment for performance completed to date". As discussed in Question 7-12 below, the IFRS IC also observed that an entity does not consider consideration it might receive upon resale of the asset if the original customer were to terminate the contract.¹¹⁶

In determining whether it has an enforceable right to payment, an entity considers the contractual terms as well as any legislation or legal precedent that could supplement or override those contractual terms. While an entity does not need to undertake an exhaustive search for evidence, it is not appropriate for an entity to ignore evidence of relevant legal precedent that is available to it or to anticipate evidence that might become available in the future. The IFRS IC also observed that "the assessment ... is focused on the existence of the right and its enforceability. The likelihood that the entity would exercise the right is not relevant to this assessment. Similarly, if a customer has the right to terminate the contract, the likelihood that the customer would terminate the contract is not relevant to this assessment".¹¹⁷

Question 7-12: Does an entity contemplate consideration it might receive from the potential resale of the asset to determine whether an enforceable right to payment for performance completed to date exists?

How we see it

We believe that only the payment the entity is entitled to receive relating to performance under the current customer contract is relevant in determining whether the entity has an enforceable right to payment for performance completed to date.

As an example, and as discussed by the IFRS IC (see Question 7-11 above), an entity would not look to potential consideration it might receive upon resale of the asset if the original customer were to terminate the contract. This is because the resale of an asset typically represents a separate contract with a different customer and, therefore, is not relevant to determining the existence and enforceability of a right to payment with the existing customer.

¹¹⁶ [IFRIC Update](#), March 2018, available on the IFRS Foundation's website.

¹¹⁷ [IFRIC Update](#), March 2018, available on the IFRS Foundation's website.

Consider the following Illustration based on an example discussed by the IFRS IC:¹¹⁸

Illustration 7-3: Determining whether an enforceable right to payment exists when cancellation by a customer obliges an entity to resell the asset

Entity X, a construction company, enters into a contract with a customer to sell a real estate unit in a residential multi-unit complex before the entity constructs the unit. The entity determines that it has a single performance obligation to construct and deliver the real estate unit. The customer pays 10% of the purchase price at contract inception and the remainder after construction is complete. The entity retains legal title to the real estate unit (and any land attributed to it) until the customer has paid the purchase price after construction is complete.

Under the contract, the customer has the right to cancel the contract at any time before construction is complete. However, if it does, the entity is legally required to make reasonable efforts to resell the real estate unit to a third party. If the entity finds a new buyer, a new contract is executed and the original contract is not novated to the third party. If the resale price in the contract with the third party is less than the original purchase price (plus selling costs), the customer is legally obliged to pay the difference to the entity.

The entity concludes that the over-time criteria in IFRS 15.35(a) and (b) are not met. In considering the over-time criterion in IFRS 15.35(c), the entity determines that its performance does not create an asset with an alternative use to the entity. It, therefore, considers whether it has an enforceable right to payment.

The IFRS IC observed that, when determining whether an entity has an enforceable right to payment, an entity considers the payment to which it is entitled under the existing contract with the customer, which relates to its performance under that contract. It does not consider the consideration it would receive from a third party in a potential resale contract. Such consideration relates to that resale contract and is not payment for performance under the existing contract with the customer.

Since Entity X cannot consider the resale contract, the only future payment to which it has rights under the existing contract with the customer is for the difference between the resale price of the unit, if any, and its original purchase price (plus selling costs). That payment, together with the deposit received, does not (at all times throughout the duration of the contract) entitle the entity to an amount that at least approximates the selling price of the part-constructed real estate unit (i.e., it does not compensate for performance completed to date). Therefore, Entity X does not have an enforceable right to payment for performance completed to date. The IFRS IC concluded that none of the over-time criteria are met and the entity would recognise revenue at a point in time in accordance with IFRS 15.38.

¹¹⁸ [IFRIC Update](#), March 2018, available on the IFRS Foundation's website.

7.1.4 Measuring progress

When an entity has determined that a performance obligation is satisfied over time, the standard requires the entity to select a single revenue recognition method for the relevant performance obligation that faithfully depicts the entity's performance in transferring control of the goods or services. An entity applies the method selected consistently to similar performance obligations. In addition, at the end of each reporting period, an entity is required to remeasure its progress toward completion of the performance obligation. [IFRS 15.40]. The standard provides the following requirements to meet this objective: [IFRS 15.41, IFRS 15.42, IFRS 15.43]

Extract from IFRS 15¹¹⁹

Methods for measuring progress

- 41 Appropriate methods of measuring progress include output methods and input methods. Paragraphs B14-B19 provide guidance for using output methods and input methods to measure an entity's progress towards complete satisfaction of a performance obligation. In determining the appropriate method for measuring progress, an entity shall consider the nature of the good or service that the entity promised to transfer to the customer.
- 42 When applying a method for measuring progress, an entity shall exclude from the measure of progress any goods or services for which the entity does not transfer control to a customer. Conversely, an entity shall include in the measure of progress any goods or services for which the entity does transfer control to a customer when satisfying that performance obligation.
- 43 As circumstances change over time, an entity shall update its measure of progress to reflect any changes in the outcome of the performance obligation. Such changes to an entity's measure of progress shall be accounted for as a change in accounting estimate in accordance with IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors*.

While the standard (i.e., IFRS 15.40) requires an entity to remeasure its progress towards satisfaction of an over-time performance obligation at the end of each reporting period related to the measure of progress selected, it does not permit a change in method. A performance obligation is accounted for using the method the entity selects (i.e., either the specific input or output method it has chosen) from inception until the performance obligation has been fully satisfied. It would not be appropriate for an entity to start recognising revenue based on an input measure and later switch to an output measure (or to switch from one input method to a different input method). Furthermore, the standard requires that the selected method be applied to similar contracts in similar circumstances. It also requires that a single method of measuring progress be used for each performance obligation. [IFRS 15.40]. The Board noted that applying more than one method to measure performance would effectively override the guidance on identifying performance obligations. [IFRS 15.BC161].

When measuring progress of an over-time performance obligation, IFRS 15.42 requires an entity to exclude any goods or services for which the entity does not transfer control to a customer. Conversely, an entity must include in the measure of progress any goods or services for which the entity does transfer control to a customer when satisfying that performance obligation.

IFRS 15.43 notes that changes in circumstances over time might require an entity to update its measure of progress to reflect any changes in the outcome of the performance obligation. For example, an entity might determine that total expected costs are greater than its original expectation. If the entity was using an input method based on costs incurred, it would need to update its measure-of-progress calculation with this new information.

Changes to an entity's measure of progress are accounted for in accordance with the requirements in IAS 8 for changes in accounting estimates. IAS 8 requires a change in accounting estimate to be accounted for prospectively, i.e., by adjusting the carrying amount of an asset, liability or item of equity in the statement of financial position; and recognising the change by including it "in profit or loss in: (a) the period of the change, if the change affects that period only; or (b) the period of the change and future periods, if the change affects both". [IAS 8.5, IAS 8.36, IAS 8.37]. IAS 8 is clear that a change in accounting estimate, by its nature, does not relate to prior periods and is not the correction of an error. [IAS 8.34]. The disclosure requirements in IAS 8 related to changes in accounting estimates are also applicable (See Chapter 3).

¹¹⁹ The consequential amendments resulting from IFRS 18, once effective, changes the title of IAS 8 to 'Basis of Preparation of Financial Statements' to better reflect the amended content of IAS 8. See Chapter 4 for more details on IFRS 18.

If an entity does not have a reasonable basis to measure its progress, revenue cannot be recognised until progress can be reasonably measured in accordance with IFRS 15.44. [IFRS 15.44]. However, if an entity can determine that a loss will not be incurred, the standard requires the entity to recognise revenue up to the amount of the costs incurred. [IFRS 15.45]. The IASB explained that an entity would need to stop using this method once it is able to reasonably measure its progress towards satisfaction of the performance obligation. [IFRS 15.BC180]. A cumulative catch-up adjustment would be recognised in the period in which the entity is able to reasonably measure its progress.

Finally, stakeholders had asked whether an entity's inability to measure progress would mean that costs incurred would also be deferred. The Board clarified that costs cannot be deferred in these situations, unless they meet the criteria for capitalisation under IFRS 15.95 (see section 9.3.2 below). [IFRS 15.BC179].

The standard provides two methods for recognising revenue on contracts involving the transfer of goods or services over time: input methods and output methods. [IFRS 15.41, IFRS 15.B14]. The standard contains the following application guidance on these methods: [IFRS 15.B15, IFRS 15.B16, IFRS 15.B17, IFRS 15.B18]

Extract from IFRS 15

- B15** Output methods recognise revenue on the basis of direct measurements of the value to the customer of the goods or services transferred to date relative to the remaining goods or services promised under the contract. Output methods include methods such as surveys of performance completed to date, appraisals of results achieved, milestones reached, time elapsed and units produced or units delivered. When an entity evaluates whether to apply an output method to measure its progress, the entity shall consider whether the output selected would faithfully depict the entity's performance towards complete satisfaction of the performance obligation. An output method would not provide a faithful depiction of the entity's performance if the output selected would fail to measure some of the goods or services for which control has transferred to the customer. For example, output methods based on units produced or units delivered would not faithfully depict an entity's performance in satisfying a performance obligation if, at the end of the reporting period, the entity's performance has produced work in progress or finished goods controlled by the customer that are not included in the measurement of the output.
- B16** As a practical expedient, if an entity has a right to consideration from a customer in an amount that corresponds directly with the value to the customer of the entity's performance completed to date (for example, a service contract in which an entity bills a fixed amount for each hour of service provided), the entity may recognise revenue in the amount to which the entity has a right to invoice.
- B17** The disadvantages of output methods are that the outputs used to measure progress may not be directly observable and the information required to apply them may not be available to an entity without undue cost. Therefore, an input method may be necessary.
- B18** Input methods recognise revenue on the basis of the entity's efforts or inputs to the satisfaction of a performance obligation (for example, resources consumed, labour hours expended, costs incurred, time elapsed or machine hours used) relative to the total expected inputs to the satisfaction of that performance obligation. If the entity's efforts or inputs are expended evenly throughout the performance period, it may be appropriate for the entity to recognise revenue on a straight-line basis.

In determining the best method for measuring progress that faithfully depicts an entity's performance, an entity needs to consider both the nature of the promised goods or services and the nature of the entity's performance. [IFRS 15.41]. In other words, an entity's selection of a method to measure its performance needs to be consistent with the nature of its promise to the customer and what the entity has agreed to transfer to the customer. To illustrate this concept, the Basis for Conclusions cites, as an example, a contract for health club services. [IFRS 15.BC160]. Regardless of when, or how frequently, the customer uses the health club, the entity's obligation to stand ready for the contractual period does not change. Furthermore, the customer is required to pay the fee regardless of whether the customer uses the health club. As a result, the entity would need to select a measure of progress based on its service of standing ready to make the health club available. Example 18 in the standard (see section 7.1.4.E below) illustrates how a health club might select this measure of progress. [IFRS 15.IE Example 18, IFRS 15.IE92-IE94].

An entity is required to recognise as revenue the amount of the transaction price it allocates to each performance obligation in a contract when (or as) it transfers the promised goods or services to customers, regardless of whether the consideration is paid upfront or the entity has a conditional or unconditional right to receive the consideration in the future. An entity that has not yet received the consideration to which it is entitled for transferring promised goods or services recognises a corresponding receivable if its right to payment is unconditional or a contract asset if its right to payment is conditional (see section 10.1 below for further discussion). This requirement, which applies to both revenue recognised over time and at a point in time, does not limit the arrangement consideration otherwise allocable to a satisfied performance obligation to the amount that is not contingent on future performance. See section 6 above for further discussion of allocating the transaction price to the performance obligations.

7.1.4.A Output methods

While there is no preferable measure of progress, the IASB stated in the Basis for Conclusions that, conceptually, an output measure is the most faithful depiction of an entity's performance. This is because it directly measures the value of the goods or services transferred to the customer. [IFRS 15.BC164]. However, the Board discussed two output methods that might not be appropriate in many instances if the entity's performance obligation is satisfied over time: units of delivery and units of production. [IFRS 15.BC165].

Units-of-delivery or units-of-production methods might not result in the best depiction of an entity's performance over time if there is material work in progress at the end of the reporting period. In these cases, the IASB observed that using a units-of-delivery or units-of-production method would distort the entity's performance because it would not recognise revenue for the customer-controlled assets that are created before delivery or before construction is complete. This is because, when an entity determines control transfers to the customer over time, it has concluded that the customer controls any resulting asset as it is created. Therefore, the entity must recognise revenue related to those goods or services for which control has transferred. The IASB also stated, in the Basis for Conclusions, that a units-of-delivery or units-of-production method might not be appropriate if the contract provides both design and production services because each item produced "may not transfer an equal amount of value to the customer". [IFRS 15.BC166]. That is, it is likely that the items produced earlier have a higher value than those that are produced later.

It is important to note that 'value to the customer' in IFRS 15.B15 refers to an objective method of measuring the entity's performance in the contract. This is not intended to be assessed by reference to the market prices, stand-alone selling prices or the value a customer perceives to be embodied in the goods or services. [IFRS 15.BC163]. The TRG agenda paper noted that this concept of value is different from the concept of value an entity uses to determine whether it can use the 'right to invoice' practical expedient, as discussed below. When an entity determines whether items individually transfer an equal amount of value to the customer (i.e., when applying IFRS 15.B15), the evaluation related to how much, or what proportion, of the goods or services (i.e., quantities) have been delivered (but not the price). For example, for the purpose of applying IFRS 15.B15, an entity might consider the amount of goods or services transferred to date in proportion to the total expected goods or services to be transferred when measuring progress. However, if this measure of progress results in material work in progress at the end of the reporting period, it would not be appropriate, as discussed above.¹²⁰ See the discussion in section 7.1.4.B below regarding the evaluation of 'value to the customer' in the context of evaluating the 'right to invoice' practical expedient in IFRS 15.B16.

7.1.4.B Output methods: practical expedient for measuring progress towards satisfaction of a performance obligation

The IASB provided a practical expedient in IFRS 15.B16 for an entity that is using an output method to measure progress towards completion of a performance obligation that is satisfied over time. The practical expedient only applies if an entity can demonstrate that the invoiced amount corresponds directly with the value to the customer of the entity's performance completed to date. In that situation, the practical expedient allows an entity to recognise revenue in the amount for which it has the right to invoice (i.e., the 'right to invoice' practical expedient). An entity might be able to use this practical expedient for a service contract in which an entity bills a fixed amount for each hour of service provided.

¹²⁰ TRG Agenda paper no. 40, *Practical Expedient for Measuring Progress toward Complete Satisfaction of a Performance Obligation*, dated 13 July 2015.

A TRG agenda paper noted that IFRS 15.B16 is intended as an expedient to some aspects of Step 3, Step 4 and Step 5 in the standard. Because this practical expedient allows an entity to recognise revenue on the basis of invoicing, revenue is recognised by multiplying the price (assigned to the goods or services delivered) by the measure of progress (i.e., the quantities or units transferred). Therefore, an entity effectively bypasses the steps in the model for determining the transaction price, allocating that transaction price to the performance obligations and determining when to recognise revenue. However, it does not permit an entity to bypass the requirements for identifying the performance obligations in the contract and evaluating whether the performance obligation is satisfied over time, which is a requirement to use this expedient.¹²¹

To apply the practical expedient, an entity must also be able to assert that the right to consideration from a customer corresponds directly with the value to the customer of the entity's performance to date. When determining whether the amount that has been invoiced to the customer corresponds directly with the value to the customer of an entity's performance completed to date, the entity could evaluate the amount that has been invoiced in comparison to market prices, stand-alone selling prices or another reasonable measure of value to the customer. See Question 7-18 in section 7.1.4.E below for the TRG discussion on evaluating value to the customer in contracts with changing rates.

Furthermore, the TRG members also noted in their discussion of the TRG agenda paper that an entity would have to evaluate all significant upfront payments or retrospective adjustments (e.g., accumulating rebates) in order to determine whether the amount the entity has a right to invoice for each good or service corresponds directly to the value to the customer of the entity's performance completed to date. That is, if an upfront payment or retrospective adjustment significantly shifts payment for value to the customer to the front or back-end of a contract, it might be difficult for an entity to conclude that the amount invoiced corresponds directly with the value provided to the customer for goods or services.¹²²

The TRG agenda paper also stated that the presence of an agreed-upon customer payment schedule does not mean that the amount an entity has the right to invoice corresponds directly with the value to the customer of the entity's performance completed to date. In addition, the TRG agenda paper stated that the existence of specified contract minimums (or volume discounts) would not always preclude the application of the practical expedient, provided that these clauses are deemed non-substantive (e.g., the entity expects to receive amounts in excess of the specified minimums).¹²³

7.1.4.C Input methods

Input methods recognise revenue based on an entity's efforts or inputs towards satisfying a performance obligation relative to the total expected efforts or inputs to satisfy the performance obligation. Examples of input methods mentioned in the standard include costs incurred, time elapsed, resources consumed, or labour hours expended. An entity is required to select a single measure of progress for each performance obligation that depicts the entity's performance in transferring control of the goods or services promised to a customer. If an entity's efforts or inputs are used evenly throughout the entity's performance period, a time-based measure that results in a straight-line recognition of revenue might be appropriate. However, there might be a disconnect between an entity's inputs (e.g., cost of non-distinct goods included in a single performance obligation satisfied over time) and the depiction of an entity's performance to date. The standard includes specific application guidance on adjustments to the measure of progress that might be necessary in those situations. See below for additional discussion.

Regardless of which method an entity selects, it excludes from its measure of progress any goods or services for which control has not transferred to the customer. Likewise, if an entity uses an input method based on costs incurred, it excludes from its measure of progress those costs that do not reflect its performance in transferring a good or service to the customer (e.g., borrowing costs incurred, which it incurs to fund its activities, rather than to fulfil a performance obligation). [IFRS 15.42, IFRS 15.B19(a)].

121 TRG Agenda paper no. 40, *Practical Expedient for Measuring Progress toward Complete Satisfaction of a Performance Obligation*, dated 13 July 2015.

122 TRG Agenda paper no. 40, *Practical Expedient for Measuring Progress toward Complete Satisfaction of a Performance Obligation*, dated 13 July 2015.

123 TRG Agenda paper no. 44, *July 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 9 November 2015.

7.1.4.D Input methods: adjustments to the measure of progress based on an input method

If an entity applies an input method that uses costs incurred to measure its progress towards completion (e.g., cost to cost), the cost incurred might not always be proportionate to the entity's progress in satisfying the performance obligation. To address this shortcoming of input methods, the standard provides the following guidance: [IFRS 15.B19]

Extract from IFRS 15

- B19** A shortcoming of input methods is that there may not be a direct relationship between an entity's inputs and the transfer of control of goods or services to a customer. Therefore, an entity shall exclude from an input method the effects of any inputs that, in accordance with the objective of measuring progress in paragraph 39, do not depict the entity's performance in transferring control of goods or services to the customer. For instance, when using a cost-based input method, an adjustment to the measure of progress may be required in the following circumstances:
- (a) When a cost incurred does not contribute to an entity's progress in satisfying the performance obligation. For example, an entity would not recognise revenue on the basis of costs incurred that are attributable to significant inefficiencies in the entity's performance that were not reflected in the price of the contract (for example, the costs of unexpected amounts of wasted materials, labour or other resources that were incurred to satisfy the performance obligation).
 - (b) When a cost incurred is not proportionate to the entity's progress in satisfying the performance obligation. In those circumstances, the best depiction of the entity's performance may be to adjust the input method to recognise revenue only to the extent of that cost incurred. For example, a faithful depiction of an entity's performance might be to recognise revenue at an amount equal to the cost of a good used to satisfy a performance obligation if the entity expects at contract inception that all of the following conditions would be met:
 - (i) the good is not distinct;
 - (ii) the customer is expected to obtain control of the good significantly before receiving services related to the good;
 - (iii) the cost of the transferred good is significant relative to the total expected costs to completely satisfy the performance obligation; and
 - (iv) the entity procures the good from a third party and is not significantly involved in designing and manufacturing the good (but the entity is acting as a principal in accordance with paragraphs B34-B38).

In a combined performance obligation comprised of non-distinct goods or services, the customer might obtain control of some of the goods before the entity provides the services related to those goods. This could be the case when goods are delivered to a customer site, but the entity has not yet integrated the goods into the overall project (e.g., the materials are 'uninstalled'). The Board concluded that, if an entity were using a percentage-of-completion method based on costs incurred to measure its progress (i.e., cost-to-cost), the measure of progress might be inappropriately affected by the delivery of these goods and that a pure application of such a measure of progress would result in overstated revenue. [IFRS 15.BC171].

IFRS 15.B19 indicates that, in such circumstances (e.g., when control of the individual goods has transferred to the customer, but the integration service has not yet occurred), the best depiction of the entity's performance might be to recognise revenue at an amount equal to the cost of the goods used to satisfy the performance obligation (i.e., a zero margin). This is because the costs incurred are not proportionate to an entity's progress in satisfying the performance obligation. It is also important to note that determining when control of the individual goods (that are part of a performance obligation) have transferred to the customer requires judgement.

The Board noted that the adjustment to the cost-to-cost measure of progress for uninstalled materials is generally intended to apply to a subset of construction-type goods that have a significant cost relative to the contract and for which the entity is effectively providing a simple procurement service to the customer. [IFRS 15.BC172]. By applying the adjustment to recognise revenue at an amount equal to the cost of uninstalled materials, an entity is recognising a margin similar to the one the entity would have recognised if the customer had supplied the materials. The IASB clarified that the outcome of recognising no margin for uninstalled materials is necessary to adjust the cost-to-cost calculation to faithfully depict an entity's performance. [IFRS 15.BC174].

In addition, situations might arise in which not all of the costs incurred contribute to the entity's progress in completing the performance obligation. IFRS 15 requires that, under an input method, an entity exclude these types of costs (e.g., costs related to significant inefficiencies, wasted materials, required rework) from the measure of progress, unless such costs were reflected in the price of the contract. [IFRS 15.B19(a)].

How we see it

As discussed above and in paragraph 172 of the Basis for Conclusions on IFRS 15, the IASB generally intended the application guidance to apply to a subset of construction-type goods that have a significant cost relative to the contract and for which the entity is effectively providing a simple procurement service to the customer. This was confirmed in a speech by a member of the US SEC staff who noted that they would be sceptical of broad application of the uninstalled materials application guidance.¹²⁴

The standard includes the following example, illustrating how uninstalled materials are considered in measuring progress towards complete satisfaction of a performance obligation: [IFRS 15.IE Example 19, IFRS 15.IE95-IE100]

Extract from IFRS 15

Example 19-Uninstalled materials

In November 20X2, an entity contracts with a customer to refurbish a 3-storey building and install new elevators for total consideration of CU5 million. The promised refurbishment service, including the installation of elevators, is a single performance obligation satisfied over time. Total expected costs are CU4 million, including CU1.5 million for the elevators. The entity determines that it acts as a principal in accordance with paragraphs B34-B38 of IFRS 15, because it obtains control of the elevators before they are transferred to the customer.

A summary of the transaction price and expected costs is as follows:

	CU
Transaction price	5,000,000
Expected costs	
Elevators	1,500,000
Other costs	2,500,000
Total expected costs	<u>4,000,000</u>

The entity uses an input method based on costs incurred to measure its progress towards complete satisfaction of the performance obligation. The entity assesses whether the costs incurred to procure the elevators are proportionate to the entity's progress in satisfying the performance obligation, in accordance with paragraph B19 of IFRS 15. The customer obtains control of the elevators when they are delivered to the site in December 20X2, although the elevators will not be installed until June 20X3. The costs to procure the elevators (CU1.5 million) are significant relative to the total expected costs to completely satisfy the performance obligation (CU4 million). The entity is not involved in designing or manufacturing the elevators.

The entity concludes that including the costs to procure the elevators in the measure of progress would overstate the extent of the entity's performance. Consequently, in accordance with paragraph B19 of IFRS 15, the entity adjusts its measure of progress to exclude the costs to procure the elevators from the measure of costs incurred and from the transaction price. The entity recognises revenue for the transfer of the elevators in an amount equal to the costs to procure the elevators (ie at a zero margin).

As of 31 December 20X2 the entity observes that:

- (a) other costs incurred (excluding elevators) are CU500,000; and
- (b) performance is 20 per cent complete (ie $\text{CU}500,000 \div \text{CU}2,500,000$).

124 Speech by Sylvia Alicea, Professional Accounting Fellow, SEC Office of the Chief Accountant, 8 May 2017, [SEC.gov](https://www.sec.gov).

Consequently, at 31 December 20X2, the entity recognises the following:

	CU	
Revenue	2,200,000	^(a)
Cost of goods sold	2,000,000	^(b)
Profit	<u>200,000</u>	
(a) Revenue recognised is calculated as (20 per cent × CU3,500,000) + CU1,500,000. (CU3,500,000 is CU5,000,000 transaction price - CU1,500,000 costs of elevators.)		
(b) Cost of goods sold is CU500,000 of costs incurred + CU1,500,000 costs of elevators.		

How we see it

When costs for uninstalled materials are excluded from the measure of progress and those materials are subsequently installed, an entity will need to apply significant judgement, based on its assessment of which treatment best depicts its performance in the contract, to determine whether the costs are: (a) included in the measure of progress upon installation; or (b) excluded from the measure of progress for the duration of the contract. These approaches are described below.

Approach (a) - once the materials have been installed, the costs for those materials are included in the measure of progress

IFRS 15.B19(b) can be read to apply only while materials are uninstalled. Once installed, it no longer applies to the materials and the entity reverts to the general requirements for measuring progress over time. The Basis for Conclusions indicates that recognising the profit margin for the performance obligation as a whole before the goods are installed could result in overstated revenue, and that IFRS 15.B19(b) applies to uninstalled materials and that it is only those materials that are not yet installed that attract a zero margin. [IFRS 15.BC171, IFRS 15.BC172, IFRS 15.BC174]. Furthermore, Example 19 of IFRS 15 (see extract above) illustrates the accounting for materials before they are installed (at the point in time that control of those materials has passed to the customer) and not after being installed.

When the profit margin applicable to the procured item(s) differs significantly from the profit margin attributable to other goods and services to be provided in accordance with the contract, the application of the profit margin for the performance obligation as a whole might overstate the amount of revenue and profit that is attributed to the procured item(s). Entities will need to consider whether the outcome of applying this approach is consistent with the underlying principle in IFRS 15.39, that the amount of revenue recognised depict its performance, as it satisfies its performance obligation.

If this approach is used, an entity needs to ensure it does not use a profit margin that differs from the profit margin for the performance obligation as a whole. That is, it does not attribute different profit margins to each component within a single performance obligation. This would effectively treat each component as a separate performance obligation when they are not distinct (and, therefore, inappropriately bypass the requirements for identifying performance obligations). [IFRS 15.BC171].

Approach (b) - the costs for uninstalled materials are excluded from the measure of progress for the duration of the contract

IFRS 15.B19(b) does not distinguish goods that have been installed from those that have not yet been installed and the adjustments to the measure of progress in Example 19 of IFRS 15 can be read to apply for the duration of the contract. [IFRS 15.IE98]. As discussed above, IFRS 15.B19(b) is generally intended to apply to a subset of construction-type goods that have a significant cost relative to the contract and for which the entity is effectively providing a simple procurement service to the customer or if the customer had supplied the materials themselves. [IFRS 15.BC172].

Approach (b) shifts the margin from uninstalled materials to the other components within the single performance obligation, which is recognised as the related costs are incurred (and included in the measure of progress). Entities might need to consider whether this reflects their performance if they typically charge a margin for procurement of similar materials.

7.1.4.E Examples of measures of progress

The following Illustration shows some possible considerations when determining an appropriate measure of progress:

Illustration 7-4: Choosing the measure of progress

A ship-building entity enters into a contract to build 15 vessels for a customer over a three-year period. The contract includes both design and production services. The entity has not built a vessel of this type in the past. In addition, the entity expects that the first vessels might take longer to produce than the last vessels because, as the entity gains experience building the vessels, it expects to be able to construct the vessels more efficiently.

Assume that the entity has determined that the design and production services represent a single performance obligation. In this situation, it is likely that the entity would not choose a 'units-of-delivery' method as a measure of progress because that method would not accurately capture the level of performance. That is, such a method would not reflect the entity's efforts during the design phase of the contract because no revenue would be recognised until a vessel was shipped. In such situations, an entity would likely determine that an input method is more appropriate, such as a percentage of completion method based on costs incurred.

The standard also includes the following example on selecting an appropriate measure of progress towards satisfaction of a performance obligation: [IFRS 15.IE Example 18, IFRS 15.IE92-IE94]

Extract from IFRS 15

Example 18-Measuring progress when making goods or services available

An entity, an owner and manager of health clubs, enters into a contract with a customer for one year of access to any of its health clubs. The customer has unlimited use of the health clubs and promises to pay CU100 per month.

The entity determines that its promise to the customer is to provide a service of making the health clubs available for the customer to use as and when the customer wishes. This is because the extent to which the customer uses the health clubs does not affect the amount of the remaining goods and services to which the customer is entitled. The entity concludes that the customer simultaneously receives and consumes the benefits of the entity's performance as it performs by making the health clubs available. Consequently, the entity's performance obligation is satisfied over time in accordance with paragraph 35(a) of IFRS 15.

The entity also determines that the customer benefits from the entity's service of making the health clubs available evenly throughout the year. (That is, the customer benefits from having the health clubs available, regardless of whether the customer uses it or not.) Consequently, the entity concludes that the best measure of progress towards complete satisfaction of the performance obligation over time is a time-based measure and it recognises revenue on a straight-line basis throughout the year at CU100 per month.

Frequently asked questions

Question 7-13 How are the effects of learning curve costs addressed in IFRS 15?

See response to Question 9-17 in section 9.3.2 below.

Question 7-14: How would an entity measure progress towards satisfaction of a stand-ready obligation that is satisfied over time?

(TRG meeting 26 January 2015 - Agenda paper no. 16)

The TRG members generally agreed that an entity cannot default to a straight-line revenue attribution model. However, they also generally agreed that if an entity expects the customer to receive and consume the benefits of its promise throughout the contract period, a time-based measure of progress (e.g., straight-line) would be appropriate. The TRG agenda paper noted that this is generally the case for unspecified upgrade rights, help-desk support contracts and cable or satellite television contracts. In contrast, the TRG members generally agreed that rateable recognition might not be appropriate if the benefits are not spread evenly over the contract period (e.g., an annual snow removal contract that provides most benefits in winter).

As discussed in Question 4-13 in section 4.2.2 above, we generally believe that a stand-ready obligation that is satisfied over time will meet the criteria to be accounted for as a series of distinct goods and services. Similar to the discussion above, while it is not appropriate to default to a straight-line revenue attribution model for a series, straight-line revenue recognition might be reasonable in many cases.

Management needs to select the measure of progress that faithfully depicts the entity's performance in transferring the goods or services promised in a series.

Question 7-15: Can multiple measures of progress be used to depict an entity's performance in transferring a performance obligation comprised of two or more goods and/or services that is satisfied over time (i.e., a combined performance obligation)?¹²⁵

(TRG meeting 13 July 2015 - Agenda paper no. 41)

The TRG members agreed that when an entity has determined that a combined performance obligation is satisfied over time, the entity has to select a single measure of progress that faithfully depicts the entity's performance in transferring the goods or services. For example, using different measures of progress for different non-distinct goods or services in the combined performance obligation would be inappropriate because doing so ignores the unit of account that has been identified under the standard (i.e., the single combined performance obligation). Furthermore, it would also be inappropriate because the entity would recognise revenue in a way that overrides the separation and allocation requirements in the standard. [IFRS 15.BC161].

The TRG agenda paper noted that a single method of measuring progress cannot be broadly interpreted to mean an entity might apply multiple measures of progress as long as all measures used are either output or input measures.

Question 7-16: How would an entity determine the appropriate single measure of progress for a combined performance obligation that is satisfied over time?

(TRG meeting 13 July 2015 - Agenda paper no. 41)

The TRG members acknowledged that it might be difficult to appropriately determine a single measure of progress when the entity transfers goods or services that make up the combined performance obligation over different points of time and/or the entity would otherwise use a different measure of progress (e.g., a time-based method versus a labour-based input method) if each promise was a separate performance obligation.

Such a determination requires significant judgement, but the TRG members generally agreed that the measure of progress selected is not meant to be a 'free choice'. Entities need to consider the nature of the overall promise for the combined performance obligation in determining the measure of progress to use. For example, entities must not default to a 'final deliverable' methodology, such that all revenue would be recognised over the performance period of the last promised good or service. Rather, an entity is required to select the single measure of progress that most faithfully depicts the entity's performance in satisfying its combined performance obligation.

Some of the TRG members observed that an entity would need to consider the reasons why goods or services were bundled into a combined performance obligation in order to determine the appropriate pattern of revenue recognition. For example, if a good or service was combined with other goods or services because it was not capable of being distinct, that might indicate that it does not provide value or use to the customer on its own. As such, the entity would not contemplate the transfer of that good or service when determining the pattern of revenue recognition for the combined performance obligation.

The TRG members also generally agreed that, if an appropriately selected single measure of progress does not faithfully depict the economics of the arrangement, the entity needs to challenge whether the performance obligation was correctly combined (i.e., there might be more than one performance obligation).

Consider the following Illustration based on an example included in the TRG paper:

Illustration 7-5: Combined licence and installation service performance obligation

An entity promises to provide a software licence and installation services that will substantially customise the software to add significant new functionality that enables the software to interface with other customised applications used by the customer.

The entity concludes that the software and services are not separately identifiable from the customised installation service, and the criterion in IFRS 15.27(b) is not met (see section 4.2.1 above). Therefore, the software licence and installation service are combined into a single performance obligation and the entity concludes that the combined performance obligation is satisfied over time. If the licence was distinct, it would be considered a right-to-use licence and revenue would be recognised at a point in time.

¹²⁵ Under Step 2 of the model (see section 4 above), a single performance obligation might contain multiple non-distinct goods or services and/or distinct goods or services that were required to be combined with non-distinct goods or services in order to identify a distinct bundle. This bundled performance obligation is referred to as a 'combined performance obligation' for the purpose of this discussion.

The entity further determines that the nature of its overall promise is to develop the customised software over time. Accordingly, the entity determines that it needs to use a measure of progress that depicts the performance of completing the customised software solution. Therefore, all of the revenue for this contract would be recognised over the period that the customisation services are performed.

Question 7-17: Can control of a good or service underlying a performance obligation satisfied over time be transferred at discrete points in time? (FASB TRG meeting 18 April 2016 - Agenda paper no. 53)

The FASB TRG members generally agreed that, if a performance obligation meets the criteria for revenue to be recognised over time (rather than at a point in time), control of the underlying good or service is not transferred at discrete points in time. Because control transfers as an entity performs, an entity's performance (as reflected using an appropriate measure of progress) must not result in the creation of a material asset in the entity's accounts (e.g., work in progress).

Stakeholders had queried whether control of a good or service underlying a performance obligation that is satisfied over time can be transferred at discrete points in time because the standard highlights several output methods, including 'milestones reached', as potentially acceptable methods for measuring progress towards satisfaction of an over-time performance obligation. The FASB TRG members generally agreed that an entity could use an output method only if that measure of progress correlates to the entity's performance to date.

At the May 2016 IASB meeting, the IASB staff indicated support for the conclusions reached in the TRG agenda paper on this issue, noting that it provides some clarity about when to use milestones reached as a measure of progress. Furthermore, the members of the IASB who observed the FASB TRG meeting indicated that the FASB TRG discussion on the topic was helpful.

Question 7-18: Can an entity use the 'right to invoice' practical expedient for a contract that includes rates that change over the contractual term?

(TRG meeting 13 July 2015 - Agenda paper no. 40)

The TRG members generally agreed that determining whether an entity can apply the 'right to invoice' practical expedient requires judgement. They also generally agreed that it is possible for entities to meet the requirements for the practical expedient in contracts with changing rates, provided that the changes in rates correspond directly to changes in value to the customer. That is, a contract does not need to have a fixed price per unit for the duration of a contract to qualify for the practical expedient. Examples of contracts that might qualify include an IT outsourcing arrangement with rates that decrease over the contract term as the level of effort to the customer decreases or a multi-year electricity contract that contemplates the forward market price of electricity. However, the US SEC staff observer also noted that entities need to have strong evidence that variable prices reflect the value to the customer to recognise variable amounts of revenue for similar goods or services.

Question 7-19: If an entity does not meet the criteria to use the 'right to invoice' practical expedient, can it still use the disclosure practical expedient regarding the amount of transaction price allocated to remaining performance obligations?

(TRG meeting 13 July 2015 - Agenda paper no. 40)

See response to Question 10-11 in section 10.5.1.C below.

Question 7-20: If an entity begins activities on a specifically anticipated contract either: (1) before it agrees to the contract with the customer; or (2) before the arrangement meets the criteria to be considered a contract under the standard, how would revenue for those activities be recognised at the date a contract exists?

(TRG meeting 30 March 2015 - Agenda paper no. 33)

The TRG members generally agreed that if the goods or services that ultimately will be transferred meet the criteria to be recognised over time, revenue would be recognised on a cumulative catch-up basis at the 'contract establishment date', reflecting the performance obligation(s) that are partially or fully satisfied at that time. The TRG agenda paper noted that the cumulative catch-up method is considered to be consistent with the overall principle of the standard that revenue is recognised when (or as) an entity transfers control of goods or services to a customer.

When recording revenue on a cumulative catch-up basis in these circumstances, an entity needs to consider the requirements in Step 5 of the model to determine the goods or services that the customer controls. This determines what portion of costs incurred before the contract establishment date would be included in any measure of progress used to calculate the cumulative catch-up adjustment. If, for example, costs incurred prior to the contract establishment date relate to uninstalled materials or any goods or services that the customer does not control, the inclusion of those costs in determining how much revenue to recognise might not be appropriate (see section 7.1.4.D above for further discussion on uninstalled materials).

Question 7-21: How do entities consider costs subject to volatility caused by factors such as foreign exchange rates and commodity prices in a measure of progress if an entity applies an input method based on costs incurred?

Entities might enter into contracts for which they will incur costs that are subject to volatility caused by market factors such as foreign exchange rates, inflation and commodity prices, either directly or indirectly (e.g., when suppliers pass on such costs to the entity). That volatility in prices might be passed along to the customer in some cases but not in others.

The underlying premise of an input method based on costs incurred (e.g., cost-to-cost) for measuring progress is that the costs incurred are proportionate to an entity's progress as the entity performs. That is, an entity must include costs that contribute to its performance and exclude those costs that do not.

[IFRS 15.42, IFRS 15.B19].

Under IFRS 15, an entity needs to ensure that the measure of progress appropriately reflects the entity's performance in transferring control of the promised good or service to the customer, which could require judgement. Exchange rates and commodity prices are subject to changes in market activity and often drive a degree of mismatch between expected costs and market prices. In some cases, the entity might conclude that the use of an input method based on costs incurred is not appropriate if the costs it will incur will be subject to significant market volatility.

If the entity concludes the cost contributes to performance, but the volatility of the market price or exchange rate does not, it will need to appropriately reflect that in an input method based on costs incurred to measure progress, which will require judgement.

Entities might need to consider whether the determination of an exchange rate or commodity price applied on an input method based on costs incurred requires significant judgement or is a source of estimation uncertainty. If so, disclosure would be required in accordance with IAS 1.

Question 7-22: How does an entity account for fulfilment costs incurred prior to the contract establishment date that are outside the scope of another standard (e.g., IAS 2)?

(TRG meeting 30 March 2015 - Agenda paper no. 33)

See response to Question 9-16 in section 9.3.2 below.

7.2 Control transferred at a point in time

For performance obligations in which control is not transferred over time, control is transferred as at a point in time. [IFRS 15.38]. In many situations, the determination of *when* that point in time occurs is relatively straightforward. However, in other circumstances, this determination is more complex.

To help entities determine the point in time when a customer obtains control of a particular good or service, the Board provided the following requirements: [IFRS 15.38]

Extract from IFRS 15

Performance obligations satisfied at a point in time

- 38 If a performance obligation is not satisfied over time in accordance with paragraphs 35-37, an entity satisfies the performance obligation at a point in time. To determine the point in time at which a customer obtains control of a promised asset and the entity satisfies a performance obligation, the entity shall consider the requirements for control in paragraphs 31-34. In addition, an entity shall consider indicators of the transfer of control, which include, but are not limited to, the following:
- (a) The entity has a present right to payment for the asset-if a customer is presently obliged to pay for an asset, then that may indicate that the customer has obtained the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset in exchange.
 - (b) The customer has legal title to the asset-legal title may indicate which party to a contract has the ability to direct the use of, and obtain substantially all of the remaining benefits from, an asset or to restrict the access of other entities to those benefits. Therefore, the transfer of legal title of an asset may indicate that the customer has obtained control of the asset. If an entity retains legal title solely as protection against the customer's failure to pay, those rights of the entity would not preclude the customer from obtaining control of an asset.

- (c) The entity has transferred physical possession of the asset-the customer's physical possession of an asset may indicate that the customer has the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset or to restrict the access of other entities to those benefits. However, physical possession may not coincide with control of an asset. For example, in some repurchase agreements and in some consignment arrangements, a customer or consignee may have physical possession of an asset that the entity controls. Conversely, in some bill-and-hold arrangements, the entity may have physical possession of an asset that the customer controls. Paragraphs B64-B76, B77-B78 and B79-B82 provide guidance on accounting for repurchase agreements, consignment arrangements and bill-and-hold arrangements, respectively.
- (d) The customer has the significant risks and rewards of ownership of the asset-the transfer of the significant risks and rewards of ownership of an asset to the customer may indicate that the customer has obtained the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset. However, when evaluating the risks and rewards of ownership of a promised asset, an entity shall exclude any risks that give rise to a separate performance obligation in addition to the performance obligation to transfer the asset. For example, an entity may have transferred control of an asset to a customer but not yet satisfied an additional performance obligation to provide maintenance services related to the transferred asset.
- (e) The customer has accepted the asset-the customer's acceptance of an asset may indicate that it has obtained the ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset. To evaluate the effect of a contractual customer acceptance clause on when control of an asset is transferred, an entity shall consider the guidance in paragraphs B83-B86.

None of the indicators above are meant to individually determine whether the customer has gained control of the good or service. For example, while shipping terms might provide information about when legal title to a good transfers to the customer, they are not determinative when evaluating the point in time at which the customer obtains control of the promised asset. See Question 7-23 in section 7.2.5 below for further discussion on shipping terms. An entity must consider all relevant facts and circumstances to determine whether control has transferred. The IASB also made it clear that the indicators are not meant to be a checklist. Furthermore, not all of them must be present for an entity to determine that the customer has gained control. Rather, the indicators are factors that are often present when a customer has obtained control of an asset and the list is meant to help entities apply the principle of control. [IFRS 15.BC155].

IFRS 15.38 also states that indicators of control transfer are not limited to those listed above. For example, channel stuffing is a practice that entities sometimes use to increase sales by inducing distributors or resellers to buy substantially more goods than can be promptly resold. To induce the distributors to make such purchases, an entity might offer deep discounts that it would have to evaluate as variable consideration in estimating the transaction price (see section 5.2 above). Channel stuffing also might be accompanied by side agreements with the distributors that provide a right of return for unsold goods that is in excess of the normal sales return privileges offered by the entity. Significant increases in, or excess levels of, inventory in a distribution channel due to channel stuffing might affect or preclude the ability to conclude that control of such goods has transferred.

How we see it

Entities need to carefully consider the expanded rights of returns offered to customers in connection with channel stuffing in order to determine whether they prevent the entity from recognising revenue at the time of the sales transaction.

If an entity uses channel stuffing practices, it needs to consider whether disclosure in its financial statements is required when it expects these practices to materially affect future operating results.

If, for example, an entity sold excess levels into a certain distribution channel at, or near, the end of a reporting period, it is likely that those sales volumes would not be sustainable in future periods. That is, sales into that channel might, in fact, slow down in future periods as the excess inventory takes longer to entirely sell through the channel. In such a case, the entity needs to consider whether disclosure of the effect of the channel stuffing practice on its current and future earnings is required, if material.

In determining when control transfers, it is important that the entity consider the good or service it is transferring, not the right to obtain that good or service in the future. In its March 2018 meeting, the IFRS IC noted that the right to sell (or pledge) a right to obtain an asset (e.g., real estate) in the future is not evidence of control of the asset itself (see Question 7-4 in section 7.1.2 above and Question 7-11 in section 7.1.3.B above for further discussion).¹²⁶

We discuss the indicators in IFRS 15.38 that an entity considers when determining when it transfers control of the promised good or service to the customer in more detail in sections 7.2.1 - 7.2.4 below.

7.2.1 Present right to payment for the asset

As noted in the Basis for Conclusions, the IASB considered, but rejected specifying a right to payment as an overarching criterion for determining when revenue would be recognised. Therefore, while the date at which the entity has a right to payment for the asset might be an indicator of the date the customer obtained control of the asset, it does not always indicate that the customer has obtained control of the asset. [IFRS 15.BC148]. For example, in some contracts, a customer is required to make a non-refundable upfront payment but receives no goods or services in return at that time.

7.2.2 Legal title and physical possession

The term 'title' is often associated with a legal definition denoting the ownership of an asset or legally recognised rights that preclude others' claim to the asset. Accordingly, the transfer of title often indicates that control of an asset has been transferred. Determination of which party has title to an asset does not always depend on which party has physical possession of the asset, but without contractual terms to the contrary, title generally passes to the customer at the time of the physical transfer. For example, in a retail store transaction, there is often no clear documentation of the transfer of title. However, it is generally understood that the title to a product is transferred at the time it is purchased by the customer.

While the retail store transaction is relatively straightforward, determining when title has transferred might be more complicated in other arrangements. Transactions that involve the shipment of products might have varying shipping terms and could involve third-party shipping agents. In such cases, a clear understanding of the seller's practices and the contractual terms is required in order to make an assessment of when title transfers. As indicated in IFRS 15.38(b), legal title and/or physical possession might be an indicator of which party to a contract has the ability to direct the use of, and obtain substantially all of the remaining benefits from, an asset or to restrict the access of other entities to those benefits. See Question 7-23 in section 7.2.5 below for further discussion on how shipping terms affect when an entity has transferred control of a good to a customer.

7.2.3 Risks and rewards of ownership

Although the Board included the risks and rewards of ownership as one factor to consider when evaluating whether control of an asset has transferred, it emphasised, in the Basis for Conclusions, that this factor does not change the principle of determining the transfer of goods or services on the basis of control. [IFRS 15.BC154]. The concept of the risks and rewards of ownership is based on how the seller and the customer share both the potential gain (the reward) and the potential loss (risk) associated with owning an asset. Rewards of ownership include the following:

- Rights to all appreciation in value of the asset
- Unrestricted usage of the asset
- Ability to modify the asset
- Ability to transfer or sell the asset
- Ability to grant a security interest in the asset

Conversely, the risks of ownership include the following:

- Absorbing all of the declines in market value
- Incurring losses due to theft or damage of the asset
- Incurring losses due to changes in the business environment (e.g., obsolescence, excess inventory, effect of retail pricing environment)

However, as noted in IFRS 15.38(d), an entity does not consider risks that give rise to a separate performance obligation when evaluating whether the entity has the risks of ownership of an asset. For example, an entity does not consider warranty services that represent a separate performance obligation when evaluating whether it retains the risks of ownership of the asset sold to the customer.

¹²⁶ [IFRIC Update](#), March 2018, available on the IFRS Foundation's website.

7.2.4 Customer acceptance

When determining whether the customer has obtained control of the goods or services, an entity must consider any customer acceptance clauses that require the customer to approve the goods or services before it is obliged to pay for them. If a customer does not accept the goods or services, the entity might not be entitled to consideration, might be required to take remedial action or be required to take back the delivered good. [IFRS 15.38(e), IFRS 15.B83].

The standard provides the following application guidance regarding how to evaluate customer acceptance provisions: [IFRS 15.B84, IFRS 15.B85, IFRS 15.B86]

Extract from IFRS 15

- | | |
|-----|---|
| B84 | If an entity can objectively determine that control of a good or service has been transferred to the customer in accordance with the agreed-upon specifications in the contract, then customer acceptance is a formality that would not affect the entity's determination of when the customer has obtained control of the good or service. For example, if the customer acceptance clause is based on meeting specified size and weight characteristics, an entity would be able to determine whether those criteria have been met before receiving confirmation of the customer's acceptance. The entity's experience with contracts for similar goods or services may provide evidence that a good or service provided to the customer is in accordance with the agreed-upon specifications in the contract. If revenue is recognised before customer acceptance, the entity still must consider whether there are any remaining performance obligations (for example, installation of equipment) and evaluate whether to account for them separately. |
| B85 | However, if an entity cannot objectively determine that the good or service provided to the customer is in accordance with the agreed-upon specifications in the contract, then the entity would not be able to conclude that the customer has obtained control until the entity receives the customer's acceptance. That is because in that circumstance the entity cannot determine that the customer has the ability to direct the use of, and obtain substantially all of the remaining benefits from, the good or service. |
| B86 | If an entity delivers products to a customer for trial or evaluation purposes and the customer is not committed to pay any consideration until the trial period lapses, control of the product is not transferred to the customer until either the customer accepts the product or the trial period lapses. |

Some acceptance provisions might be straightforward, giving a customer the ability to accept or reject the transferred products based on objective criteria specified in the contract (e.g., the goods function at a specified speed). Other acceptance clauses might be subjective or appear in parts of the contract that do not typically address acceptance matters, such as warranty provisions or indemnification clauses. Professional judgement might be required to determine the effect on revenue recognition of the latter types of acceptance clauses.

Acceptance criteria that an entity cannot objectively evaluate against the agreed-upon specifications in the contract preclude an entity from concluding that a customer has obtained control of a good or service until formal customer sign-off is obtained or the acceptance provisions lapse. However, the entity would consider its experience with other contracts for similar goods or services because that experience might provide evidence about whether the entity is able to objectively determine that a good or service provided to the customer is in accordance with the agreed-upon specifications in the contract.

How we see it

We believe one or more of the following would represent circumstances in which the entity might not be able to objectively evaluate the acceptance criteria:

- The acceptance provisions are unusual or 'non-standard'. Indicators of 'non-standard' acceptance terms are:
 - The duration of the acceptance period is longer than in contracts for similar goods or services.
 - The majority of the entity's contracts lack similar acceptance terms.
 - The contract contains explicit customer-specified requirements that must be met prior to acceptance.

- The contract contains a requirement for explicit notification of acceptance (not just deemed acceptance). Explicit notification requirements might indicate that the criteria with which the customer is assessing compliance are not objective. In addition, such explicit notification clauses might limit the time period within which the customer can reject transferred products and might require the customer to provide, in writing, the reasons for the rejection of the products by the end of a specified period. When such clauses exist, acceptance can be deemed to have occurred at the end of the specified time period if notification of rejection has not been received from the customer, as long as the customer has not indicated it will reject the products.

In determining whether compliance with the criteria for acceptance can be objectively assessed (and acceptance is only a formality), the following is considered:

- Whether the acceptance terms are standard in arrangements entered into by the entity.
- Whether the acceptance is based on the transferred product performing to standard, published, specifications, and the entity can demonstrate that it has an established history of objectively determining that the product functions in accordance with those specifications.

As discussed above, customer acceptance would not be deemed a formality if the acceptance terms are unusual or non-standard. If a contract contains acceptance provisions that are based on customer-specified criteria, it might be difficult for the entity to objectively assess compliance with the criteria and the entity might not be able to recognise revenue prior to obtaining evidence of customer acceptance. However, determining that the acceptance criteria have been met (and, therefore, acceptance is merely a formality) might be appropriate if the entity can demonstrate that its product meets all of the customer's acceptance specifications by replicating, before shipment, those conditions under which the customer intends to use the product.

If it is reasonable to expect that the product's performance (once it has been installed and is operating at the customer's facility) will be different from the performance when it was tested prior to shipment, this acceptance provision will not have been met. The entity, therefore, would not be able to conclude that the customer has obtained control until customer acceptance occurs. Factors indicating that specifications cannot be tested effectively prior to shipment include:

- The customer has unique equipment, software or environmental conditions that can reasonably be expected to make performance in that customer's environment different from testing performed by the entity. If the contract includes customer acceptance criteria or specifications that cannot be effectively tested before delivery or installation at the customer's site, revenue recognition would be deferred until it can be demonstrated that the criteria are met.
- The products that are transferred are highly complex.
- The entity has a limited history of testing products prior to control transferring to the customer or a limited history of having customers accept products that it has previously tested.

Determining when a customer obtains control of an asset in a contract with customer-specified acceptance criteria requires the use of professional judgement and depends on the weight of the evidence in the particular circumstances. The conclusion could change based on an analysis of an individual factor, such as the complexity of the equipment, the nature of the interface with the customer's environment, the extent of the entity's experience with this type of transaction or a particular clause in the agreement. An entity might need to discuss the situation with knowledgeable project managers or engineers in making such an assessment.

In addition, each contract containing customer-specified acceptance criteria might require a separate compliance assessment of whether the acceptance provisions have been met prior to confirmation of the customer's acceptance. That is, since different customers might specify different acceptance criteria, an entity might not be able to make one compliance assessment that applies to all contracts because of the variations in contractual terms and customer environments.

Even if a contract includes a standard acceptance clause, if the clause relates to a new product or one that has only been sold on a limited basis previously, an entity might be required to initially defer revenue recognition for the product until it establishes a history of successfully obtaining acceptance.

IFRS 15.B86 states that, if an entity delivers products to a customer for trial or evaluation purposes and the customer is not committed to pay any consideration until the trial period lapses, control of the product is not transferred to the customer until either the customer accepts the product or the trial period lapses. See further discussion of 'free' trial periods in Question 3-2 in section 3.1 above, including when such arrangements might meet the criteria to be considered a contract within the scope of the model in IFRS 15.

7.2.5 Example of control transferring at a point in time

The following Illustration shows the application of the indicators of the transfer of control in IFRS 15.38 to a performance obligation that is satisfied at a point in time:

Illustration 7-6: Applying the indicators of the transfer of control to a performance obligation satisfied at a point in time

BCB Liquors (BCB) uses a distribution network to sell its product to end-consumers. Upon receipt of the product, a distributor receives legal title to the goods and is required to pay BCB for the product. In this example, BCB has determined its relationship with the distributor is not a consignment agreement (see section 7.4 below). Rather, the distributor is BCB's customer.

BCB determines that its performance obligation for the sale of product to the distributor is satisfied at a point in time. BCB considers the indicators of the transfer of control and concludes that control transfers to the distributor when the product is delivered to the distributor. At this point in time, BCB has a present right to payment and the distributor has legal title and physical possession of the product, as well as the risks and rewards of ownership. BCB concludes customer acceptance is a formality as BCB can objectively determine that the goods meet the agreed-upon specifications before shipment to the distributor.

Alternatively, if BCB sold the product to the distributor on consignment or determined that the end-consumer was its customer, the distributor was not obligated to pay for the product until it was sold to the end-consumer and BCB had the ability to require the return of any unsold product or the distributor had an unlimited amount of time to return any unsold products, then BCB might have concluded that control of the product would not transfer until it is sold to the end-consumer. Therefore, BCB would not recognise revenue until the product was sold to the end-consumer.

An entity is required to recognise as revenue the amount of the transaction price it allocates to each performance obligation in a contract when (or as) it transfers the promised goods or services to customers, regardless of whether the consideration is paid upfront or the entity has a conditional or unconditional right to receive the consideration in the future. An entity that has not yet received the consideration to which it is entitled for transferring promised goods or services recognises a corresponding receivable if its right to payment is unconditional or a contract asset if its right to payment is conditional (see section 10.1 below for further discussion). This requirement, which applies to both revenue recognised over time and at a point in time, does not limit the arrangement consideration allocable to satisfied performance obligation to the amount that is not contingent on future performance. See section 6 above for further discussion of allocating the transaction price to the performance obligations.

Frequently asked questions

Question 7-23: How do shipping terms affect when an entity has transferred control of a good to a customer?

Under the standard, an entity recognises revenue only when it satisfies an identified performance obligation by transferring a promised good or service to a customer. While shipping terms might provide information about when legal title to a good transfers to the customer, they are not determinative when evaluating the point in time at which the customer obtains control of the promised asset. Entities must consider all relevant facts and circumstances to determine whether control has transferred. [IFRS 15.38].

As an example, when the shipping terms are free on board (FOB), entities need to carefully consider whether the customer or the entity has the ability to control the goods during the shipment period. Furthermore, if the entity has the legal or constructive obligation to replace goods that are lost or damaged in transit, it needs to evaluate whether that obligation influences the customer's ability to direct the use, and obtain substantially all of the remaining benefits from, the goods. A selling entity's historical practices also need to be considered when evaluating whether control of a good has transferred to a customer because the entity's practices might override the contractual terms of the arrangement.

Contractually specified shipping terms might vary depending on factors such as the mode of transport (e.g., by sea, inland waterway, road, air) and whether the goods are shipped locally or internationally. A selling entity might utilise International Commerce Terms (Incoterms®) to clarify when delivery occurs. Incoterms® are a series of pre-defined commercial terms published by the International Chamber of Commerce (ICC) relating to international commercial law. For example, 'EXW' or 'Ex Works' in Incoterms® 2020 means that the selling entity 'delivers' when it places the goods at the disposal of the customer, either at the seller's premises or at another named location (e.g., a factory, warehouse). The selling entity is not required to load the goods on any collecting vehicle, nor does it need to clear the goods for export (if applicable, see further discussion on Ex Works in section 7.5 below). The Incoterm FOB means "the seller delivers the goods on board the vessel nominated by the buyer at the named port of shipment or procures the goods already so delivered. The risk of loss of or damage to the goods passes when the goods are on board the vessel, and the buyer bears all costs from that moment onwards".¹²⁷

¹²⁷ See the [ICC website](#) for further information.

7.3 Repurchase agreements

Some agreements include repurchase provisions, either as part of a sales contract or as a separate contract that relates to the goods in the original agreement or similar goods. These provisions affect how an entity applies the requirements on control to affected transactions. That is, when evaluating whether a customer obtains control of an asset, an entity needs to consider any agreement to repurchase the asset. [IFRS 15.34].

The standard clarifies the types of arrangements that qualify as repurchase agreements: [IFRS 15.B64, IFRS 15.B65]

Extract from IFRS 15

- B64 A repurchase agreement is a contract in which an entity sells an asset and also promises or has the option (either in the same contract or in another contract) to repurchase the asset. The repurchased asset may be the asset that was originally sold to the customer, an asset that is substantially the same as that asset, or another asset of which the asset that was originally sold is a component.
- B65 Repurchase agreements generally come in three forms:
- (a) an entity's obligation to repurchase the asset (a forward);
 - (b) an entity's right to repurchase the asset (a call option); and
 - (c) an entity's obligation to repurchase the asset at the customer's request (a put option).

For an obligation or right to purchase an asset to be accounted for as a repurchase agreement under IFRS 15, it needs to exist at contract inception, either as a part of the same contract or in another contract. The IASB clarified that an entity's subsequent decision to repurchase an asset (after transferring control of that asset to a customer) without reference to any pre-existing contractual right would not be accounted for as a repurchase agreement under the standard. That is, the customer is not obliged to resell that good to the entity as a result of the initial contract. Therefore, any subsequent decision to repurchase the asset does not affect the customer's ability to control the asset upon initial transfer. However, in cases in which an entity decides to repurchase a good after transferring control of the good to a customer, the Board observed that the entity needs to carefully consider whether the customer obtained control in the initial transaction. Furthermore, it might need to consider the application guidance on principal versus agent considerations (see section 4.4 above). [IFRS 15.BC423].

How we see it

An entity that has an obligation or a right to repurchase an asset might be required to account for the contract as either a lease or a financing arrangement. While IFRS 15.B66 refers to accounting for 'the contract' when stipulating the accounting for a repurchase agreement, we believe applying the repurchase application guidance to one or more, but not all, performance obligations in a contract might be appropriate in certain circumstances. For example, if a repurchase option applies to an asset in a separately identified performance obligation but does not apply to goods or services in other performance obligations, accounting for the effect of the forward or call at the contract level could prevent the entity from recognising revenue when (or as) it satisfies the performance obligations unaffected by the repurchase option.

7.3.1 Forward or call option held by the entity

When an entity has the obligation or right to repurchase an asset (i.e., a forward or a call option), the standard indicates that the customer has not obtained control of the asset. The standard provides the following application guidance: [IFRS 15.B66, IFRS 15.B67]

Extract from IFRS 15

- B66** If an entity has an obligation or a right to repurchase the asset (a forward or a call option), a customer does not obtain control of the asset because the customer is limited in its ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset even though the customer may have physical possession of the asset. Consequently, the entity shall account for the contract as either of the following:
- (a) a lease in accordance with IFRS 16 *Leases* if the entity can or must repurchase the asset for an amount that is less than the original selling price of the asset, unless the contract is part of a sale and leaseback transaction. If the contract is part of a sale and leaseback transaction, the entity shall continue to recognise the asset and shall recognise a financial liability for any consideration received from the customer. The entity shall account for the financial liability in accordance with IFRS 9; or
 - (b) a financing arrangement in accordance with paragraph B68 if the entity can or must repurchase the asset for an amount that is equal to or more than the original selling price of the asset.
- B67** When comparing the repurchase price with the selling price, an entity shall consider the time value of money.

The application guidance in the extract above requires that an entity account for a transaction including a forward or a call option based on the relationship between the repurchase price and the original selling price, regardless of whether the option will be exercised. The standard indicates that if the entity has the right or obligation to repurchase the asset at a price less than the original selling price (taking into consideration the effects of the time value of money), the entity would account for the transaction as a lease in accordance with IFRS 16, unless the contract is part of a sale and leaseback transaction. For additional information on lease accounting under IFRS 16, see Chapter 24. If the entity has the right or obligation to repurchase the asset at a price equal to or greater than the original selling price (considering the effects of the time value of money) or if the contract is part of a sale and leaseback transaction, the entity would account for the contract as a financing arrangement in accordance with IFRS 15. [IFRS 15.B68].

How we see it

It is important to remember that the effect of the time value of money must be considered when comparing the repurchase price to the original selling price of the asset. This evaluation can influence the determination of whether the repurchase agreement represents a lease or financing arrangement.

The following figure depicts this application guidance for transactions that are not sale and leaseback transactions:

Figure 7-2: Forward or call options

Forward or call option				
Repurchase price	<	Original selling price	=	Lease
Repurchase price	≥	Original selling price	=	Financing

Note: When comparing the repurchase price with the selling price, an entity considers the time value of money.

Under the standard, a transaction in which a seller has an option to repurchase the product is treated as a lease or a financing arrangement (i.e., not a sale). This is because the customer does not have control of the product and is constrained in its ability to direct the use of and obtain substantially all of the remaining benefits from the good. The Board noted in the Basis for Conclusions that entities would not need to consider the likelihood that a call option will be exercised in determining the accounting for the repurchase provision. However, the Board also stated that non-substantive call options are ignored and would not affect when a customer obtains control of an asset. [IFRS 15.BC427]. See Question 7-24 below for how an entity might consider conditional call options and an example of a conditional call option that might qualify to be treated as a sale.

In the Basis for Conclusions, the Board also observed that, “Theoretically, a customer is not constrained in its ability to direct the use of and obtain substantially all of the benefits from, the asset if an entity agrees to repurchase, at the prevailing market price, an asset from the customer that is substantially the same and is readily available in the marketplace.” [IFRS 15.BC425]. For example, an entity might transfer control of a commodity to a customer together with a forward or call option to repurchase that commodity (or one that is substantially the same). If (1) the repurchase price in the forward or call option is at the prevailing market price at the repurchase date, (2) the commodity to be repurchased is substantially the same, and (3) the commodity to be repurchased under the forward or call option is readily available (e.g., by being traded in an active commodity market), then the customer might not be constrained in its ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset as discussed in IFRS 15.B66.

How we see it

To conclude that the customer obtains control in such an arrangement would require the use of significant judgement, and such a conclusion might not be appropriate in situations that do not meet the narrow fact pattern discussed above.

If a transaction is considered a financing arrangement under the IFRS 15, in accordance with IFRS 15.B68, the selling entity continues to recognise the asset. In addition, it records a financial liability for the consideration received from the customer. The difference between the consideration received from the customer and the consideration subsequently paid to the customer (upon repurchasing the asset) represents the interest and holding costs (as applicable) that are recognised over the term of the financing arrangement. If the option lapses unexercised, the entity derecognises the liability and recognises revenue at that time. [IFRS 15.B68, IFRS 15.B69].

Also note that IFRS 15.B66(a) specifies that, if the contract is part of a sale and leaseback transaction, the entity continues to recognise the asset. Furthermore, the entity recognises a financial liability for any consideration received from the customer to which IFRS 9 would apply.

How we see it

Since the IASB has embedded lease guidance in IFRS 15, it is important for entities to understand the interaction between the lease and revenue standards.

The standard provides the following example of a call option: [IFRS 15.IE Example 62 Case A, IFRS 15.IE315-IE318]

Extract from IFRS 15

Example 62-Repurchase agreements

An entity enters into a contract with a customer for the sale of a tangible asset on 1 January 20X7 for CU1 million.

Case A-Call option: financing

The contract includes a call option that gives the entity the right to repurchase the asset for CU1.1 million on or before 31 December 20X7.

Control of the asset does not transfer to the customer on 1 January 20X7 because the entity has a right to repurchase the asset and therefore the customer is limited in its ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset. Consequently, in accordance with paragraph B66(b) of IFRS 15, the entity accounts for the transaction as a financing arrangement, because the exercise price is more than the original selling price. In accordance with paragraph B68 of IFRS 15, the entity does not derecognise the asset and instead recognises the cash received as a financial liability. The entity also recognises interest expense for the difference between the exercise price (CU1.1 million) and the cash received (CU1 million), which increases the liability.

On 31 December 20X7, the option lapses unexercised; therefore, the entity derecognises the liability and recognises revenue of CU1.1 million.

Frequently asked questions

Question 7-24: How can an entity evaluate a conditional call option to repurchase an asset?

The standard does not specifically address conditional call options.

How we see it

We believe entities need to consider the following when evaluating conditional call options to repurchase an asset.

- If the entity controls the outcome of the condition that causes the call option to become active, then the presence of the call option indicates that control has not transferred because the customer is limited in its ability to direct the use of and obtain substantially all of the remaining benefits from the asset. That is, the entity would be required to treat the contract as a lease or a financing arrangement as required by IFRS 15.B66.
- If the entity does not control the condition that causes the call option to become active, then it would be acceptable for the entity to apply judgement to determine whether the call option limits the customer's ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset. For example, if neither the entity nor the customer controls the outcome of the contingency, the entity could evaluate the nature of the contingency, together with the likelihood of the contingency becoming active, to determine whether it limits the customer's ability to obtain control of the asset. This could be the case for certain types of product recalls. See also Question 9-3 in section 9.1.1 below for how an entity would account for a customer's return of a defective item in exchange for compensation (i.e., not for a replacement item).
- If the customer controls the outcome of the contingency, then the conditional call option might not prevent the customer from obtaining control of the asset if the customer can direct the use of, and obtain substantially all the remaining benefits from, the asset. The application guidance in IFRS 15.B70-B76 (see section 7.3.2 below) might be helpful for an entity to consider when determining whether the customer obtains control of the asset when it controls the outcome of the contingency.
- In the case of perishable products, an entity's conditional right to remove and replace expired goods does not necessarily constrain the customer's ability to direct the use of and obtain substantially all of the remaining benefits from the products. That is, the entity is not able to remove and replace the products until they expire. Furthermore, the customer has control of the products over their entire useful life. Consequently, it might be reasonable for an entity to conclude that control of the initial product does transfer to the customer in this situation and that an entity could consider this right to be a form of a right of return (see section 5.4 above).

7.3.2 Put option held by the customer

IFRS 15 indicates that if the customer has the ability to require an entity to repurchase an asset (i.e., a put option) at a price lower than its original selling price, the entity considers, at contract inception, whether the customer has a significant economic incentive to exercise that right. [IFRS 15.B70]. That is, this determination influences whether the customer truly has control over the asset received.

The determination of whether an entity has a significant economic incentive to exercise its right determines whether the arrangement is treated as a lease or a sale with the right of return (discussed in section 5.4 above). An entity must consider all relevant facts and circumstances to determine whether a customer has a significant economic incentive to exercise its right, including the relationship between the repurchase price to the expected market value (taking into consideration the effects of the time value of money) of the asset at the date of repurchase and the amount of time until the right expires. [IFRS 15.B71, IFRS 15.B75]. The standard notes that if the repurchase price is expected to significantly exceed the market value of the asset, the customer might have a significant economic incentive to exercise the put option. Since the standard provides limited guidance on determining whether a significant economic incentive exists, judgement might be required to make this determination:

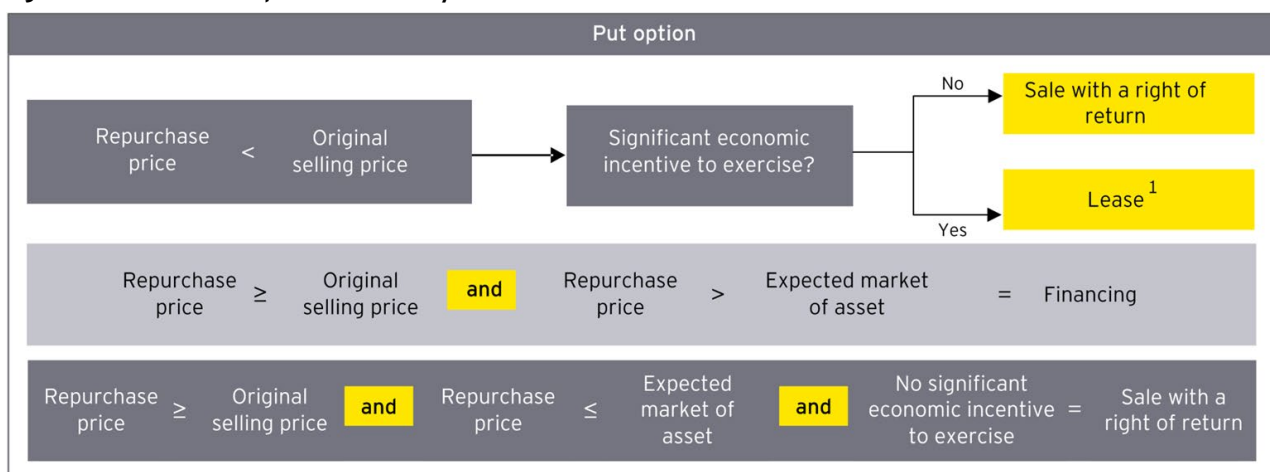

- If a customer has a significant economic incentive to exercise its right, the customer is expected to ultimately return the asset. The entity accounts for the agreement as a lease because the customer is effectively paying the entity for the right to use the asset for a period of time. However, one exception to this would be if the contract is part of a sale and leaseback, in which case, the contract would be accounted for as a financing arrangement (financing arrangements are discussed in section 7.3.1 above). [IFRS 15.B73]. If the contract is part of a sale and leaseback transaction, the entity continues to recognise the asset. Furthermore, the entity recognises a financial liability for any consideration received from the customer to which IFRS 9 would apply.
- If a customer does not have a significant economic incentive to exercise its right, the entity accounts for the agreement in a manner similar to a sale of a product with a right of return. [IFRS 15.B72].

The repurchase price of an asset that is equal to or greater than the original selling price, but less than or equal to the expected market value of the asset, must also be accounted for as a sale of a product with a right of return, if the customer does not have a significant economic incentive to exercise its right. [IFRS 15.B74]. See section 5.4 above for a discussion on sales with a right of return.

If the customer has the ability to require an entity to repurchase the asset at a price equal to, or more than, the original selling price and the repurchase price is more than the expected market value of the asset, the contract is in effect a financing arrangement.

If the option lapses unexercised, an entity derecognises the liability and recognises revenue. [IFRS 15.B76]. The following figure depicts this application guidance:

Figure 7-3: Put options held by the customer

¹ If the transaction is not part of a sale and leaseback transaction.

The standard provides the following example of a put option: [IFRS 15.IE Example 62 Case B, IFRS 15.IE315, IFRS 15.IE319-IE321]

Extract from IFRS 15

Example 62-Repurchase agreements

An entity enters into a contract with a customer for the sale of a tangible asset on 1 January 20X7 for CU1 million.

...

Case B-Put option: lease

Instead of having a call option, the contract includes a put option that obliges the entity to repurchase the asset at the customer's request for CU900,000 on or before 31 December 20X7. The market value is expected to be CU750,000 on 31 December 20X7.

At the inception of the contract, the entity assesses whether the customer has a significant economic incentive to exercise the put option, to determine the accounting for the transfer of the asset (see paragraphs B70-B76 of IFRS 15). The entity concludes that the customer has a significant economic incentive to exercise the put option because the repurchase price significantly exceeds the expected market value of the asset at the date of repurchase. The entity determines there are no other relevant factors to consider when assessing whether the customer has a significant economic incentive to exercise the put option. Consequently, the entity concludes that control of the asset does not transfer to the customer, because the customer is limited in its ability to direct the use of, and obtain substantially all of the remaining benefits from, the asset.

In accordance with paragraphs B70-B71 of IFRS 15, the entity accounts for the transaction as a lease in accordance with IFRS 16 Leases.

7.3.3 Sales with residual value guarantees

An entity that sells equipment might use a sales incentive programme under which it guarantees that the customer will receive a minimum resale amount when it disposes of the equipment (i.e., a residual value guarantee). If the customer holds a put option and has a significant economic incentive to exercise, the customer is effectively restricted in its ability to consume, modify or sell the asset. In contrast, when the entity guarantees that the customer will receive a minimum amount of sales proceeds, the customer is not constrained in its ability to direct the use of, and obtain substantially all of the benefits from, the asset. Accordingly, the Board decided that it was not necessary to expand the application guidance on repurchase agreements to consider guaranteed amounts of resale. [IFRS 15.BC427].

Therefore, it is important for an entity to review all its contracts and make sure that the residual value guarantee is not accomplished through a repurchase provision, such as a put within the contract (e.g., the customer has the right to require the entity to repurchase equipment two years after the date of purchase at 85% of the original purchase price). If a put option is present, the entity would have to use the application guidance in the standard discussed in section 7.3.2 above to determine whether the existence of the put option precludes the customer from obtaining control of the acquired item. In such circumstances, the entity would determine whether the customer has a significant economic incentive to exercise the put. If the entity concludes that there is no significant economic incentive, the transaction would be accounted for as a sale with a right of return. Alternatively, if the entity concludes there is a significant economic incentive for the customer to exercise its right, the transaction would be accounted for as a lease, unless the contract is part of a sale and leaseback transaction as noted in IFRS 15.B66 (see section 7.3.1 above).

However, assume the transaction includes a residual value guarantee in which no put option is present. If the entity guarantees that it will compensate the customer (or 'make whole') on a qualifying future sale if the customer receives less than 85% of the initial sale price, the application guidance on repurchase agreements in IFRS 15 would not apply. That is because the entity is not repurchasing the asset.

In such situations, judgement is needed to determine the appropriate accounting treatment, which will depend on the specific facts and circumstances. In some cases, an entity might need to consider the requirements of other IFRS accounting standards to appropriately account for the residual value guarantee. In 2024, the IFRS IC received a request related to guarantees provided by an entity to third parties on the obligations of a joint venture. In the final agenda decision, the IFRS IC noted that determining the applicable standard requires judgement and consideration of the facts and circumstances, and that based on this, the guarantee could be in the scope of IFRS 17, IFRS 9, IFRS 15 or IAS 37 (see Chapter 41 for further guidance on the accounting for guarantee contracts that are not in the scope of IFRS 15).¹²⁸ In other situations, IFRS 15 might apply to the entire transaction. If IFRS 15 applies, an entity would need to assess whether the guarantee affects control of the asset transferring, which will depend on the promise to the customer. In some cases, it might not affect the transfer of control. In the Basis for Conclusions, the Board noted that "when the entity guarantees that the customer will receive a minimum amount of sales proceeds, the customer is not constrained in its ability to direct the use of, and obtain substantially all of the benefits from, the asset." [IFRS 15.BC431]. However, while a residual value guarantee might not affect the transfer of control, an entity would need to consider whether it affects the transaction price (see section 5 above). While the economics of a repurchase agreement and a residual value guarantee might be similar, the accounting could be quite different.

7.4 Consignment arrangements

Entities frequently deliver inventory on a consignment basis to other parties (e.g., distributor, dealer). A consignment sale is one in which physical delivery of a product to a counterparty has occurred, but the counterparty is not required to pay until the product is either resold to an end-consumer or used by the counterparty. Under such arrangements, the seller (or consignor) retains the legal title to the merchandise and the counterparty (or consignee) acts as a selling agent. The consignee earns a commission on the products that have been sold and periodically remits the cash from those sales, net of the commission it has earned, to the consignor. In addition, consigned products that are not sold or used generally can be returned to the consignor. By shipping on a consignment basis, consignors are able to better market products by moving them closer to the end-consumer. However, they do so without selling the goods to the intermediary (consignee). [IFRS 15.B77].

The standard provides the following application guidance for determining whether an arrangement is a consignment arrangement: [IFRS 15.B78]

128 [IFRIC Update](#), March 2025, available on the IFRS Foundation's website.

Extract from IFRS 15

- B78** Indicators that an arrangement is a consignment arrangement include, but are not limited to, the following:
- (a) the product is controlled by the entity until a specified event occurs, such as the sale of the product to a customer of the dealer or until a specified period expires;
 - (b) the entity is able to require the return of the product or transfer the product to a third party (such as another dealer); and
 - (c) the dealer does not have an unconditional obligation to pay for the product (although it might be required to pay a deposit).

Entities entering into a consignment arrangement need to determine the nature of the performance obligation (i.e., whether the obligation is to transfer the product to the consignee or to transfer the product to the end-consumer). This determination would be based on whether control of the product passes to the consignee. Typically, a consignor does not relinquish control of the consigned product until the product is sold to the end-consumer or, in some cases, when a specified period expires. Consignees commonly do not have any obligation to pay for the product, other than to pay the consignor the agreed-upon portion of the sale price once the consignee sells the product to a third party. As a result, for consignment arrangements, revenue generally would not be recognised when the products are delivered to the consignee because control has not transferred (i.e., the performance obligation to deliver goods to the end-consumer has not yet been satisfied). [IFRS 15.B77].

While some transactions are clearly identified as consignment arrangements, there are other less transparent transactions, in which the seller has retained control of the goods, despite no longer having physical possession. Such arrangements might include the shipment of products to distributors that are not required (either explicitly or implicitly), or do not have the wherewithal, to pay for the product until it is sold to the end-consumer.

Judgement is necessary in assessing whether the substance of a transaction is a consignment arrangement. The identification of such arrangements often requires a careful analysis of the facts and circumstances of the transaction, as well as an understanding of the rights and obligations of the parties and the seller's customary business practices in such arrangements. [IFRS 15.B78]. While not required by IFRS 15 or IAS 2, we would encourage entities to separately disclose the amount of their consigned inventory, if material.

7.5 Bill-and-hold arrangements

In some sales transactions, the selling entity fulfils its obligations and bills the customer for the work performed, but does not ship the goods until a later date. These transactions, often called bill-and-hold transactions, are usually designed this way at the request of the purchaser for a number of reasons, including a lack of storage capacity or an inability to use the goods until a later date. Whereas in a consignment sale (discussed in section 7.4 above), physical delivery has occurred, but control of the goods has not transferred to the customer, the opposite might be true in a bill-and-hold transaction.

The standard provides the following application guidance with respect to these arrangements: [IFRS 15.B79, IFRS 15.B80, IFRS 15.B81, IFRS 15.B82]

Extract from IFRS 15**Bill-and-hold arrangements**

- B79 A bill-and-hold arrangement is a contract under which an entity bills a customer for a product but the entity retains physical possession of the product until it is transferred to the customer at a point in time in the future. For example, a customer may request an entity to enter into such a contract because of the customer's lack of available space for the product or because of delays in the customer's production schedules.
- B80 An entity shall determine when it has satisfied its performance obligation to transfer a product by evaluating when a customer obtains control of that product (see paragraph 38). For some contracts, control is transferred either when the product is delivered to the customer's site or when the product is shipped, depending on the terms of the contract (including delivery and shipping terms). However, for some contracts, a customer may obtain control of a product even though that product remains in an entity's physical possession. In that case, the customer has the ability to direct the use of, and obtain substantially all of the remaining benefits from, the product even though it has decided not to exercise its right to take physical possession of that product. Consequently, the entity does not control the product. Instead, the entity provides custodial services to the customer over the customer's asset.
- B81 In addition to applying the requirements in paragraph 38, for a customer to have obtained control of a product in a bill-and-hold arrangement, all of the following criteria must be met:
- (a) the reason for the bill-and-hold arrangement must be substantive (for example, the customer has requested the arrangement);
 - (b) the product must be identified separately as belonging to the customer;
 - (c) the product currently must be ready for physical transfer to the customer; and
 - (d) the entity cannot have the ability to use the product or to direct it to another customer.
- B82 If an entity recognises revenue for the sale of a product on a bill-and-hold basis, the entity shall consider whether it has remaining performance obligations (for example, for custodial services) in accordance with paragraphs 22-30 to which the entity shall allocate a portion of the transaction price in accordance with paragraphs 73-86.

When evaluating whether revenue recognition is appropriate for a bill-and-hold transaction, an entity must evaluate the application guidance in both IFRS 15.38 (to determine whether control has been transferred to the customer - see section 7.2 above) and IFRS 15.B81 (to determine whether all four bill-and-hold criteria are met). That is, in addition to IFRS 15.38, the criteria that must be met for bill-and-hold transactions are:

- *The reason for the bill-and-hold arrangement must be substantive (e.g., the customer has requested the arrangement).* A bill-and-hold transaction initiated by the selling entity typically indicates that a bill-and-hold arrangement is not substantive. Generally, a customer requests such an arrangement and the selling entity would need to evaluate the reasons for the request to determine whether the customer has a substantive business purpose. Judgement is required when assessing this criterion. For example, a customer with an established buying history that places an order in excess of its normal volume and requests that the entity retains the product needs to be evaluated carefully because the request might not appear to have a substantive business purpose.
- *The product must be identified separately as belonging to the customer.* Even if the entity's inventory is homogenous, the customer's product must be segregated from the entity's ongoing fulfilment operations.
- *The product currently must be ready for physical transfer to the customer.* In any revenue transactions recognised at a point in time, revenue is recognised when an entity has satisfied its performance obligation to transfer control of the product to the customer. If an entity has remaining costs or effort to develop, manufacture or refine the product, the entity might not have satisfied its performance obligation. This criterion does not include the actual costs to deliver a product, which would be normal and customary in most revenue transactions, or if the entity identifies a separate performance obligation for custodial services, as discussed below.
- *The entity cannot have the ability to use the product or to direct it to another customer.* If the entity has the ability to freely substitute goods to fill other orders, control of the goods has not passed to the buyer. That is, the entity has retained the right to use the customer's product in a manner that best suits the entity.

If an entity concludes that it can recognise revenue for a bill-and-hold transaction, IFRS 15.B82 states that the entity needs to further consider whether it is also providing custodial services for the customer that would be identified as a separate performance obligation in the contract. Entities need to carefully evaluate their bill-and-hold arrangements and apply judgement to determine the performance obligations in the arrangements (e.g., products, custodial services) and assess when control transfers to the customer.

As discussed in Question 7-23 in section 7.2.5 above, certain entities might use Ex Works from Incoterms® 2020 in contracts with customers. Under an Ex Works arrangement, the entity's responsibility is to make ordered goods available to the customer at the entity's premises or another named location. The customer is responsible for arranging, and paying for, shipment of the goods to the desired location and bears all of the risks related to them once they are made available.

How we see it

We believe that all Ex Works arrangements need to be evaluated using the bill-and-hold criteria discussed above to determine whether revenue recognition is appropriate prior to shipment.

The standard provides the following example to illustrate the application guidance on bill-and-hold arrangements: [IFRS 15.IE Example 63, IFRS 15.IE323-IE327]

Extract from IFRS 15

Example 63-Bill-and-hold arrangement

An entity enters into a contract with a customer on 1 January 20X8 for the sale of a machine and spare parts. The manufacturing lead time for the machine and spare parts is two years.

Upon completion of manufacturing, the entity demonstrates that the machine and spare parts meet the agreed-upon specifications in the contract. The promises to transfer the machine and spare parts are distinct and result in two performance obligations that each will be satisfied at a point in time. On 31 December 20X9, the customer pays for the machine and spare parts, but only takes physical possession of the machine. Although the customer inspects and accepts the spare parts, the customer requests that the spare parts be stored at the entity's warehouse because of its close proximity to the customer's factory. The customer has legal title to the spare parts and the parts can be identified as belonging to the customer.

Furthermore, the entity stores the spare parts in a separate section of its warehouse and the parts are ready for immediate shipment at the customer's request. The entity expects to hold the spare parts for two to four years and the entity does not have the ability to use the spare parts or direct them to another customer.

The entity identifies the promise to provide custodial services as a performance obligation because it is a service provided to the customer and it is distinct from the machine and spare parts. Consequently, the entity accounts for three performance obligations in the contract (the promises to provide the machine, the spare parts and the custodial services). The transaction price is allocated to the three performance obligations and revenue is recognised when (or as) control transfers to the customer.

Control of the machine transfers to the customer on 31 December 20X9 when the customer takes physical possession. The entity assesses the indicators in paragraph 38 of IFRS 15 to determine the point in time at which control of the spare parts transfers to the customer, noting that the entity has received payment, the customer has legal title to the spare parts and the customer has inspected and accepted the spare parts. In addition, the entity concludes that all of the criteria in paragraph B81 of IFRS 15 are met, which is necessary for the entity to recognise revenue in a bill-and-hold arrangement. The entity recognises revenue for the spare parts on 31 December 20X9 when control transfers to the customer.

The performance obligation to provide custodial services is satisfied over time as the services are provided. The entity considers whether the payment terms include a significant financing component in accordance with paragraphs 60-65 of IFRS 15.

7.6 Recognising revenue for licences of intellectual property

IFRS 15 provides application guidance for recognising revenue from licences of intellectual property that differs in some respects from the general requirements for other promised goods or services. We discuss licensing in detail in section 8 below.

7.7 Recognising revenue when a right of return exists

As discussed in section 4.7 above, a right of return does not represent a separate performance obligation. Instead, the existence of a right of return affects the transaction price and the entity must determine whether the customer will return the transferred product.

Under IFRS 15, as discussed in section 5 above, an entity estimates the transaction price and applies the constraint to the estimated transaction price. In doing so, it considers the products expected to be returned in order to determine the amount to which the entity expects to be entitled (excluding consideration for the products expected to be returned). The entity recognises revenue based on the amounts to which the entity expects to be entitled through to the end of the return period (considering expected product returns). An entity does not recognise the portion of the revenue that is subject to the constraint until the amount is no longer constrained, which could be at the end of the return period or earlier if the entity's expectations about the products expected to be returned change prior to the end of the return period. The entity recognises the amount received or receivable that is expected to be returned as a refund liability, representing its obligation to return the customer's consideration. An entity also updates its estimates at the end of each reporting period. See sections 4.7 and 5.4 above for further discussion on this topic.

7.8 Recognising revenue for customer options for additional goods or services

As discussed in section 4.6 above, when an entity grants a customer the option to acquire additional goods or services, that option is a separate performance obligation if it provides a material right to the customer that the customer would not receive without entering into the contract (e.g., a discount that exceeds the range of discounts typically given for those goods or services to that class of customer in that geographical area or market). If the option provides a material right to the customer, the customer has, in effect, paid the entity in advance for future goods or services. IFRS 15 requires the entity to allocate a portion of the transaction price to the material right at contract inception (see section 6.1.5 above). The revenue allocated to the material right is recognised when (or as) the option is exercised (and the underlying future goods or services are transferred) or when the option expires.

In contrast, if a customer option is not deemed to be a material right and is instead a marketing offer, the entity does not account for the option and waits to account for the underlying goods or services until those subsequent purchases occur.

Frequently asked questions

Question 7-25: How would an entity account for the exercise of a material right? That is, would an entity account for it as: a contract modification, a continuation of the existing contract or variable consideration?

(TRG meeting 30 March 2015 - Agenda paper no. 32)

See response to Question 4-27 in section 4.6 above.

7.9 Breakage and prepayments for future goods or services

In certain industries, an entity collects non-refundable payments from its customers for goods or services that the customer has a right to receive in the future. However, a customer might ultimately leave that right unexercised (often referred to as 'breakage'). [IFRS 15.B45]. Retailers, for example, frequently sell gift cards that might not be partially redeemed or completely redeemed and airlines sometimes sell non-refundable tickets to passengers who allow the tickets to expire unused.

Under IFRS 15.B44, when an entity receives consideration that is attributable to a customer's unexercised rights, the entity recognises a contract liability equal to the full amount prepaid by the customer for the performance obligation to transfer, or to stand ready to transfer, goods or services in the future.

[IFRS 15.B44]. As discussed further below, an entity derecognises that contract liability (and recognises revenue) when (or as) it transfers those goods or services and, therefore, satisfies its performance obligation. The Board noted that this application guidance requires the same pattern of revenue recognition as the requirements for customer options (see section 6.1.5 above). [IFRS 15.BC398].

However, since entities might not be required by customers to fully satisfy their performance obligations, IFRS 15.B46 requires that when an entity expects to be entitled to a breakage amount, the expected breakage would be recognised as revenue in proportion to the pattern of rights exercised by the customer. If an entity does not expect to be entitled to a breakage amount, it would not recognise any breakage amounts as revenue until the likelihood of the customer exercising its right becomes remote. [IFRS 15.B46, IFRS 15.BC398].

When estimating any breakage amount, an entity has to consider the constraint on variable consideration, as discussed in section 5.2.3 above. [IFRS 15.B46]. That is, if it is highly probable that a significant revenue reversal would occur for any estimated breakage amounts, an entity would not recognise those amounts until the breakage amounts are no longer constrained.

Entities cannot recognise estimated breakage as revenue immediately upon receipt of prepayment from the customer. The Board noted that it rejected such an approach because the entity has not performed under the contract. That is, recognising revenue would not be a faithful depiction of the entity's performance and would understate its obligation to stand ready to provide future goods or services. [IFRS 15.BC400]. This would be the case even if an entity has historical evidence to support the view that no further performance will be required for some portion of the customer contract(s).

Furthermore, in accordance with IFRS 15.B47, regardless of whether an entity can demonstrate the ability to reliably estimate breakage, entities would not estimate or recognise any amounts attributable to a customer's unexercised rights in income (e.g., an unused gift card balance) if the amounts are required to be remitted to another party (e.g., the government). Such an amount is recognised as a liability (not as revenue). [IFRS 15.B47]. The liability would not be derecognised until the derecognition requirements in IFRS 9 are met, generally when cash is remitted to the other party.

Consider the following Illustration which shows how an entity would apply the above application guidance to the sale of a gift card that is within the scope of IFRS 15 (see Question 2-9 in section 2.5 above for further discussion):

Illustration 7-7: Accounting for the sale of a gift card

Entity A sells a CU500 non-refundable gift card that can be redeemed at any of its retail locations. Any unused balance is not subject to laws that require from the entity to remit the payment to another party. When the gift card is sold, Entity A recognises a contract liability of CU500 (i.e., the full amount that was prepaid by the customer). No breakage is recognised as revenue upon sale of the gift card.

Scenario A - Entity expects to be entitled to a breakage amount

Based on historical redemption rates, Entity A expects 90% of the gift card (or CU450) to be redeemed. That is, Entity A expects breakage of 10% (or CU50). Upon its first use, the customer redeems CU225 of the gift card. That is, 50% of the expected redemption has occurred (i.e., CU225 redemption ÷ CU450 total expected redemption). Upon this redemption, Entity A recognises revenue and reduces the contract liability by CU250. This is equal to CU225 for the transfer of goods or services purchased by the customer, as well as breakage of CU25 (50% redemption × CU50 breakage estimate) that is recognised in proportion to the exercise of the customer's rights. Similar accounting would occur for future redemptions.

Scenario B - Entity does not expect to be entitled to a breakage amount

Based on historical redemption experiences that customers fully redeem similar gift cards (or possibly the lack of historical experience due to a new gift card programme that means Entity A is unable to estimate the redemption rates), Entity A does not expect to be entitled to a breakage amount. Upon its first use of the gift card, the customer redeems CU225. Entity A recognises revenue and reduces the contract liability by the same amount as the redemption (or CU225). That is, no additional amounts are recognised for breakage. Similar accounting would occur for future redemptions.

If no further redemptions occur, Entity A recognises the remaining gift card balance (or CU275) as revenue (and reduces the contract liability by the same amount) when the likelihood of the customer exercising its remaining rights becomes remote.

As discussed above, the application guidance on breakage requires that an entity recognise a contract liability for the full amount of the prepayment. It would then recognise breakage on that contract liability proportionate to the pattern of rights exercised by the customer. If the prepayment element (e.g., the sale of a gift card, loyalty points) is part of a multiple-element arrangement, an entity needs to allocate the transaction price between the identified performance obligations. As a result, the deferred revenue associated with this element would be less than the 'prepaid' amount received for the unsatisfied performance obligations.

The following example depicts the sale of goods with loyalty points. In this example, the amount allocated to the points (i.e., the 'prepaid' element) is less than the stand-alone selling price of those points because of the allocation of the transaction price among the two performance obligations. [IFRS 15.IE Example 52, IFRS 15.IE267-IE270].

Extract from IFRS 15**Example 52-Customer loyalty programme**

An entity has a customer loyalty programme that rewards a customer with one customer loyalty point for every CU10 of purchases. Each point is redeemable for a CU1 discount on any future purchases of the entity's products. During a reporting period, customers purchase products for CU100,000 and earn 10,000 points that are redeemable for future purchases. The consideration is fixed and the stand-alone selling price of the purchased products is CU100,000. The entity expects 9,500 points to be redeemed. The entity estimates a stand-alone selling price of CU0.95 per point (totalling CU9,500) on the basis of the likelihood of redemption in accordance with paragraph B42 of IFRS 15.

The points provide a material right to customers that they would not receive without entering into a contract. Consequently, the entity concludes that the promise to provide points to the customer is a performance obligation. The entity allocates the transaction price (CU100,000) to the product and the points on a relative stand-alone selling price basis as follows:

	CU	
Product	91,324	$[\text{CU}100,000 \times (\text{CU}100,000 \text{ stand-alone selling price} \div \text{CU}109,500)]$
Points	8,676	$[\text{CU}100,000 \times (\text{CU}9,500 \text{ stand-alone selling price} \div \text{CU}109,500)]$

At the end of the first reporting period, 4,500 points have been redeemed and the entity continues to expect 9,500 points to be redeemed in total. The entity recognises revenue for the loyalty points of CU4,110 $[(4,500 \text{ points} \div 9,500 \text{ points}) \times \text{CU}8,676]$ and recognises a contract liability of CU4,566 $(\text{CU}8,676 - \text{CU}4,110)$ for the unredeemed points at the end of the first reporting period.

At the end of the second reporting period, 8,500 points have been redeemed cumulatively. The entity updates its estimate of the points that will be redeemed and now expects that 9,700 points will be redeemed. The entity recognises revenue for the loyalty points of CU3,493 $\{[(8,500 \text{ total points redeemed} \div 9,700 \text{ total points expected to be redeemed}) \times \text{CU}8,676 \text{ initial allocation}] - \text{CU}4,110 \text{ recognised in the first reporting period}\}$. The contract liability balance is CU1,073 $(\text{CU}8,676 \text{ initial allocation} - \text{CU}7,603 \text{ of cumulative revenue recognised})$.

As depicted in Example 52 above (i.e., IFRS 15.IE269-IE270), entities need to routinely refine and evaluate estimates of breakage. An entity can elect to apply the portfolio approach practical expedient (see section 3.3.1 above) to estimate breakage. Similar to the discussion in Question 5-16 in section 5.4 above, an entity can consider evidence from similar contracts to develop an estimate without applying the portfolio approach practical expedient. That is, considering historical experience does not necessarily mean the entity is applying the portfolio approach practical expedient.

Frequently asked questions

Question 7-26: Are customers' unexercised rights (i.e., breakage) a form of variable consideration?

How we see it

Although the breakage application guidance in IFRS 15.B46 specifically refers to the constraint on variable consideration, we do not believe breakage is a form of variable consideration (see section 5.2 above).

This is because it does not affect the transaction price. Breakage is a recognition concept (Step 5) that could affect the timing of revenue recognition. It is not a measurement concept (Step 3). For example, the transaction price for a sale of a CU20 gift card is fixed at CU20 regardless of the expected breakage amount. The expected breakage, however, could affect the timing of revenue recognition because an entity is required under IFRS 15.B46 to "recognise the expected breakage amount as revenue in proportion to the pattern of rights exercised by the customer" if it expects to be entitled to a breakage amount. [IFRS 15.B46].

Question 7-27: How would revenue be recognised for customer options for additional goods or services that represent a material right, but do not have an expiration date (i.e., can an entity recognise breakage for these options)?

See response to Question 4-29 in section 4.6 above.

8 IFRS 15 - Licences of intellectual property

IFRS 15 provides application guidance for recognising revenue from licences of intellectual property that differs in some respects from the requirements for other promised goods or services. Given that licences include a wide array of features and economic characteristics, the Board decided that an entity needs to evaluate the nature of its promise to grant a licence of intellectual property in order to determine whether the promise is satisfied (and revenue is recognised) over time or at a point in time. A licence provides either: *[IFRS 15.B56]*

- A right to access the entity's intellectual property throughout the licence period, which results in revenue that is recognised over time
- Or
- A right to use the entity's intellectual property as it exists at the point in time in which the licence is granted, which results in revenue that is recognised at a point in time

The standard states that licences of intellectual property establish a customer's rights to the intellectual property of an entity and may include licences for any of the following: software and technology, media and entertainment (e.g., motion pictures and music), franchises, patents, trademarks and copyrights.

[IFRS 15.B52].

The application guidance provided on licences of intellectual property is only applicable to licences that are distinct. When the licence is the only promised item (either explicitly or implicitly) in the contract, the application guidance is clearly applicable to that licence. The assessment as to whether the contract includes a distinct licence of intellectual property will be straightforward for many contracts. However, if there are multiple promises in a contract, entities might have to more carefully evaluate the nature of the rights conveyed.

Licences of intellectual property are frequently included in multiple-element arrangements with promises for additional goods or services that could be explicit or implicit. In these situations, an entity first applies the requirements of Step 2 of the model to determine whether the licence of intellectual property is distinct, as discussed in section 4 above and section 8.1 below.

For most licences that are not distinct, an entity would follow the general requirements in Step 5 of the model to account for the recognition of revenue for the performance obligation that includes the licence (i.e., the requirements in IFRS 15.31-38 to determine whether the performance obligation transfers over time or at a point in time, as discussed in sections 7.1 and 7.2 above). Furthermore, the IASB noted in the Basis for Conclusions that there may be some situations in which, even though the licence is not distinct from the good or service transferred with the licence, the licence is the primary or dominant component (i.e., the predominant item) of the combined performance obligation. *[IFRS 15.BC407]*. In such situations, the IASB indicated that the application guidance for licences still applies. The Board provided no application guidance or bright lines for determining when a licence is the primary or dominant component. However, the IASB referred to an example in the Basis for Conclusions to illustrate this concept further.

[IFRS 15.BC414X]. See section 8.2.1 below for further discussion. The determination of whether a licence is the predominant component will be obvious in some cases, but not in others. Therefore, entities might need to exercise significant judgement and consider both qualitative and quantitative factors.

In 2020, the IFRS IC received a request regarding the customer's accounting for configuration and customisation costs in a cloud computing arrangement. The IFRS IC concluded that the principles and requirements in IFRS accounting standards provide sufficient guidance and, consequently, decided not to add this matter to its agenda. In situations where the customer does not recognise an intangible asset in relation to configuration or customisation of the application software, a customer needs to determine which goods or services must be accounted for separately. IAS 38 does not include guidance on identifying separate goods or services that the customer receives. Therefore, the IFRS IC noted that, in developing a policy in accordance with IAS 8, the customer might look to the requirements in IFRS 15 for guidance on identifying the promised goods or services in a contract with a customer.¹²⁹ See Chapter 18 for further discussion of the IFRS IC's agenda decision and considerations for customers when looking to IFRS 15 for guidance to account for such transactions.

129 [IFRIC Update](#), March 2021, Addendum, available on the IFRS Foundation's website.

8.1 Identifying performance obligations in a licensing arrangement

Contracts for licences of intellectual property frequently include explicit or implicit promises for additional goods or services (e.g., equipment, when-and-if available upgrades, maintenance and installation). Consistent with Step 2 of the general model (see section 4 above), entities need to apply the requirements on identifying performance obligations in IFRS 15.22-30 when a contract with a customer includes a licence of intellectual property and other promised goods or services in order to appropriately determine whether the licence of intellectual property and the other promises are distinct (i.e., are separate performance obligations).

In respect of identifying performance obligations in a licensing arrangement, the standard states that “In addition to a promise to grant a licence (or licences) to a customer, an entity may also promise to transfer other goods or services to the customer. Those promises may be explicitly stated in the contract or implied by an entity’s customary business practices, published policies or specific statements (see paragraph 24). As with other types of contracts, when a contract with a customer includes a promise to grant a licence (or licences) in addition to other promised goods or services, an entity applies paragraphs 22-30 to identify each of the performance obligations in the contract”. [IFRS 15.B53].

As discussed in section 4.2 above, the standard outlines a two-step process for determining whether a promised good or service (including a licence of intellectual property) is distinct and, therefore, is a performance obligation, as follows:

- (a) Consideration of the individual good or service (i.e., whether the good or service is capable of being distinct)
- And
- (b) Consideration of whether the good or service is separately identifiable from other promises in the contract (i.e., whether the promise to transfer the good or service is distinct in the context of the contract)

To conclude that a good or service is distinct, an entity needs to determine that the good or service is both capable of being distinct and distinct in the context of the contract. These requirements need to be applied to determine whether a promise to grant a licence of intellectual property is distinct from other promised goods or services in the contract. Therefore, entities are required to assess whether the customer can benefit from a licence of intellectual property on its own or together with readily available resources (i.e., whether it is capable of being distinct) and whether the entity’s promise to transfer a licence of intellectual property is separately identifiable from other promises in the contract (i.e., whether it is distinct in the context of the contract). The assessment of whether a licence of intellectual property is distinct needs to be based on the facts and circumstances of each contract.

8.1.1 Licences of intellectual property that are distinct

Licences are frequently capable of being distinct (i.e., the first criteria of a distinct good or service) as a customer can often obtain at least some benefit from the licence of intellectual property on its own or with other readily available resources. Consider Example 11, Case A, from the standard (extracted in full in section 4.2.3 above), which includes a contract for a software licence that is transferred along with installation services, technical support and unspecified software updates. The installation service is routinely performed by other entities and does not significantly modify the software. The software licence is delivered before the other goods or services and remains functional without the updates and technical support. The entity concludes that the customer can benefit from each of the goods or services either on their own or together with other goods or services that are readily available. That is, each good or service, including the software licence, is capable of being distinct under IFRS 15.27. [IFRS 15.IE Example 11 Case A, IFRS 15.IE49-IE53].

If an entity determines that a licence of intellectual property and other promised goods or services are capable of being distinct, the second step in the evaluation is to determine whether they are distinct in the context of the contract. As part of this evaluation, an entity considers the indicators for whether the goods or services are not separately identifiable, including whether:

- (a) The entity provides a significant service of integrating the licence and other goods or services into a combined output or outputs
- (b) The licence and other goods or services significantly modify or customise each other
- Or
- (c) The licence and other goods or services are highly interdependent or highly interrelated, such that the entity would not be able to fulfil its promise to transfer the licence independently of fulfilling its promise to transfer the other goods or services to the customer

Continuing with Example 11, Case A, which is discussed above, the entity considers the separately identifiable principle and factors in IFRS 15.29 and determines that the promise to transfer each good and service, including the software licence, is separately identifiable. In reaching this determination, the entity considers that the installation services are routine and can be obtained from other providers. In addition, the entity considers that, although it integrates the software into the customer's system, the software updates do not significantly affect the customer's ability to use and benefit from the software licence during the licence period. Therefore, neither the installation services nor the software updates significantly affect the customer's ability to use and benefit from the software licence. The entity further observes that none of the promised goods or services significantly modify or customise one another and the entity is not providing a significant service of integrating the software and services into one combined output. Lastly, the software and the services are not deemed to be highly interdependent or highly interrelated because the entity would be able to fulfil its promise to transfer the initial software licence independent from its promise to subsequently provide the installation service, software updates and the technical support.

[IFRS 15.IE Example 11 Case A, IFRS 15.IE49-IE53].

The following example from the standard also illustrates a contract for which a licence of intellectual property is determined to be distinct from other promised goods or services: [IFRS 15.IE Example 56 Case B, IFRS 15.IE281, IFRS 15.IE285-IE288]

Extract from IFRS 15

Example 56-Identifying a distinct licence

An entity, a pharmaceutical company, licenses to a customer its patent rights to an approved drug compound for 10 years and also promises to manufacture the drug for the customer. The drug is a mature product; therefore the entity will not undertake any activities to support the drug, which is consistent with its customary business practices.

Case B-Licence is distinct

In this case, the manufacturing process used to produce the drug is not unique or specialised and several other entities can also manufacture the drug for the customer.

The entity assesses the goods and services promised to the customer to determine which goods and services are distinct, and it concludes that the criteria in paragraph 27 of IFRS 15 are met for each of the licence and the manufacturing service. The entity concludes that the criterion in paragraph 27(a) of IFRS 15 is met because the customer can benefit from the licence together with readily available resources other than the entity's manufacturing service (because there are other entities that can provide the manufacturing service), and can benefit from the manufacturing service together with the licence transferred to the customer at the start of the contract.

The entity also concludes that its promises to grant the licence and to provide the manufacturing service are separately identifiable (ie the criterion in paragraph 27(b) of IFRS 15 is met). The entity concludes that the licence and the manufacturing service are not inputs to a combined item in this contract on the basis of the principle and the factors in paragraph 29 of IFRS 15. In reaching this conclusion, the entity considers that the customer could separately purchase the licence without significantly affecting its ability to benefit from the licence. Neither the licence, nor the manufacturing service, is significantly modified or customised by the other and the entity is not providing a significant service of integrating those items into a combined output. The entity further considers that the licence and the manufacturing service are not highly interdependent or highly interrelated because the entity would be able to fulfil its promise to transfer the licence independently of fulfilling its promise to subsequently manufacture the drug for the customer. Similarly, the entity would be able to manufacture the drug for the customer even if the customer had previously obtained the licence and initially utilised a different manufacturer. Thus, although the manufacturing service necessarily depends on the licence in this contract (ie the entity would not provide the manufacturing service without the customer having obtained the licence), the licence and the manufacturing service do not significantly affect each other. Consequently, the entity concludes that its promises to grant the licence and to provide the manufacturing service are distinct and that there are two performance obligations:

- (a) licence of patent rights; and
- (b) manufacturing service.

The entity assesses, in accordance with paragraph B58 of IFRS 15, the nature of the entity's promise to grant the licence. The drug is a mature product (ie it has been approved, is currently being manufactured and has been sold commercially for the last several years). For these types of mature products, the entity's customary business practices are not to undertake any activities to support the drug. The drug compound has significant stand-alone functionality (ie its ability to produce a drug that treats a disease

or condition). Consequently, the customer obtains a substantial portion of the benefits of the drug compound from that functionality, rather than from the entity's ongoing activities. The entity concludes that the criteria in paragraph B58 of IFRS 15 are not met because the contract does not require, and the customer does not reasonably expect, the entity to undertake activities that significantly affect the intellectual property to which the customer has rights. In its assessment of the criteria in paragraph B58 of IFRS 15, the entity does not take into consideration the separate performance obligation of promising to provide a manufacturing service. Consequently, the nature of the entity's promise in transferring the licence is to provide a right to use the entity's intellectual property in the form and the functionality with which it exists at the point in time that it is granted to the customer. Consequently, the entity accounts for the licence as a performance obligation satisfied at a point in time.

The entity applies paragraphs 31-38 of IFRS 15 to determine whether the manufacturing service is a performance obligation satisfied at a point in time or over time.

8.1.2 Licences of intellectual property that are not distinct

The licences of intellectual property included in the examples in section 8.1.1 above were determined to be distinct because they met the two criteria of IFRS 15.27. In other situations, a licence of intellectual property might not be distinct from other promised goods or services in a contract, either because it is not capable of being distinct and/or it is not separately identifiable.

IFRS 15.B54 requires that a licence that is not distinct from other promised goods or services in a contract be combined into a single performance obligation. It also identifies two examples of licences of intellectual property that are not distinct from other goods or services, as follows: [IFRS 15.B54]

- A licence that is a component of, and integral to the functionality of, a tangible good
- A licence that the customer can benefit from, but only in conjunction with a related service (e.g., as a result of the entity granting a licence, the customer has access to an online service provided by the entity)

In both examples, a customer only benefits from the combined output of the licence of intellectual property and the related good or service. Therefore, the licence is not distinct and would be combined with those other promised goods or services in the contract.

The standard includes other examples of licences of intellectual property that are not distinct, which are combined with other promised goods or services because the customer can only benefit from the licence in conjunction with a related service (as described in IFRS 15.B54(b)). For example, Example 55 and Example 56, Case A (the latter extracted in full in section 8.2.1 below) illustrate contracts that include licences of intellectual property that are not distinct from other goods or services promised to the customer. [IFRS 15.IE Example 55, IFRS 15.IE278 -IE280, IFRS 15.IE Example 56 Case A, IFRS 15.IE281-IE284].

When an entity is required to bundle a licence of intellectual property with other promised goods or services in a contract, it often needs to consider the licensing application guidance to help determine the nature of its promise to the customer when the licence is the predominant item in the combined performance obligation. See section 8.2.1 below for further discussion on applying the licensing application guidance to such performance obligations.

8.1.3 Contractual restrictions

Some licences contain substantive contractual restrictions on how the customer can employ them. The standard explicitly states that restrictions of time, geography or use do not affect the licensor's determination of whether the promise to transfer a licence is satisfied over time or at a point in time, as follows: [IFRS 15.B62(a)]

Extract from IFRS 15

- B62 An entity shall disregard the following factors when determining whether a licence provides a right to access the entity's intellectual property or a right to use the entity's intellectual property:
- (a) Restrictions of time, geographical region or use—those restrictions define the attributes of the promised licence, rather than define whether the entity satisfies its performance obligation at a point in time or over time.
 - (b) ...

While stakeholders acknowledged that IFRS 15.B62 is clear that restrictions of time, geographical region or use do not affect the licensor's determination about whether the promise to transfer a licence is satisfied over time or at a point in time, some stakeholders thought that the standard was unclear about whether particular types of contractual restrictions would affect the identification of the promised goods or services in the contract. For example, an arrangement might grant a customer a licence to a well-known television programme or movie for a period of time (e.g., three years), but the customer might be restricted in how often it can show that licensed content to only once per year during each of those three years. In this instance, stakeholders thought that it was unclear whether contractual restrictions affect the entity's identification of its promises in the contract (i.e., do the airing restrictions affect whether the entity has granted one licence or three licences?). [IFRS 15.BC414Q].

In considering this issue further, the IASB explained that contracts that include a promise to grant a licence to a customer require an assessment of the promises in the contract using the criteria for identifying performance obligations, as is the case with other contracts. [IFRS 15.BC405, IFRS 15.BC406]. This assessment is done before applying the criteria to determine the nature of an entity's promise in granting a licence. [IFRS 15.BC414P].

In the Basis for Conclusions, the IASB further explained that they considered Example 59 in the standard (see extract in section 8.3.2 below) in the context of this issue. The entity concludes that its only performance obligation is to grant the customer a right to use the music recording. [IFRS 15.IE Example 59, IFRS 15.IE303-IE306]. When, where and how the right can be used is defined by the attributes of time (i.e., two years), geographical scope (i.e., Country A) and permitted use (i.e., in commercials). If, instead, the entity had granted the customer rights to use the recording for two different time periods in two geographical locations, for example, years X1-X3 in Country A and years X2-X4 in Country B, the entity would need to use the criteria for identifying performance obligations in IFRS 15.27-30 to determine whether the contract included one licence that covers both countries or separate licences for each country. [IFRS 15.BC414Q].

Consequently, the entity considers all of the contractual terms to determine whether the promised rights result in the transfer to the customer of one or more licences. In making this determination, judgement is needed to distinguish between contractual provisions that create promises to transfer rights to use the entity's intellectual property from contractual provisions that establish when, where and how those rights may be used. Therefore, in the Board's view, the clarifications made to the requirements on identifying performance obligations in IFRS 15.22-30 provide sufficient guidance to entities. [IFRS 15.BC414P].

How we see it

We believe a critical part of the evaluation of contractual restrictions is whether the lifting of a restriction at a future date requires an entity to *grant additional rights* to the customer at that future date in order to fulfil its promises under the contract. The presence of a requirement to grant additional rights to the customer indicates that there could be multiple performance obligations that need to be accounted for under Step 2 of the model.

Entities might need to use significant judgement to distinguish between a single promised licence with multiple attributes and a licence that contains multiple promises to the customer that could be separate performance obligations.

FASB differences

ASC 606 requires that entities distinguish between contractual provisions that define the attributes of a single promised licence (e.g., restrictions of time, geography or use) and contractual provisions that require them to transfer additional goods or services to customers (e.g., additional rights to use or access intellectual property). Contractual provisions that are attributes of a promised licence define the scope of a customer's rights to intellectual property and do not affect whether a performance obligation is satisfied at a point in time or over time. Nor do they affect the number of performance obligations in the contract. IFRS 15 does not include similar requirements. [IFRS 15.BC414P].

8.1.4 Guarantees to defend or maintain a patent

IFRS 15 states that a guarantee to defend or maintain a patent does not represent a performance obligation in a licensing contract. Furthermore, this type of guarantee does not affect the licensor's determination as to whether the licence provides a right to access intellectual property (satisfied over time) or a right to use intellectual property (satisfied at a point in time).

The requirements for guarantees to defend or maintain a patent are included in the following extract from the standard: [IFRS 15.B62(b)]

Extract from IFRS 15

- B62 An entity shall disregard the following factors when determining whether a licence provides a right to access the entity's intellectual property or a right to use the entity's intellectual property:
- (a) ...
 - (b) Guarantees provided by the entity that it has a valid patent to intellectual property and that it will defend that patent from unauthorised use - a promise to defend a patent right is not a performance obligation because the act of defending a patent protects the value of the entity's intellectual property assets and provides assurance to the customer that the licence transferred meets the specifications of the licence promised in the contract.

It is not unusual for intellectual property arrangements to include a clause that requires a licensor to defend and maintain related patents. While patent defence and maintenance is a continuing obligation, it is an obligation to ensure the licensee can continue to use the intellectual property as intended, and, as discussed above, is not a promised good or service under IFRS 15 that has to be evaluated under Step 2. However, if there are questions regarding the validity of a patent at the time a licence arrangement is entered into, licensors need to consider whether that component of the arrangement meets the attributes to be considered a contract within the scope of the model (see section 3.1 above).

Furthermore, as discussed above, because such a provision is to ensure that the licensee can continue to use the intellectual property as intended, it is similar to an assurance-type warranty discussed in section 9.1 below (i.e., a warranty that promises the customer that the delivered product is as specified in the contract). Assurance-type warranties are not within the scope of IFRS 15 and, as stated in IFRS 15.B30, would be accounted for in accordance with the requirements for product warranties in IAS 37.

Frequently asked questions**Question 8-1: How do entities account for modifications and other changes to licences of intellectual property?**

A licence provides a customer with a right to use or a right to access the intellectual property of an entity. The terms of each licence of intellectual property are defined by the contract, which establishes the customer's rights (e.g., period of time, area of use). Parties to a licensing arrangement might agree to renew (or extend) the terms and conditions of an existing licence (refer to section 8.4 below for further discussion on the accounting for licence renewals).

However, parties to a licensing arrangement might agree to extend the licence term, but the extension is not solely a renewal of the terms and conditions of a licence (i.e., the parties could add goods or services, change the pricing, or do both). The standard does not explicitly address the accounting for these types of licence changes.

How we see it

The following are two approaches that entities have applied in practice that we believe would be acceptable. The approaches described below assume a right-to-use licence. Approach A is based on the use and benefit requirement in IFRS 15.B61 (discussed in section 8.3.3 below) and approach B is based on the contract modification requirements in IFRS 15.18-21 (discussed in section 3.4 above).¹³⁰

While we believe both approaches are acceptable, an entity must make a policy choice to select one approach and apply it consistently to similar transactions. We believe other approaches could also be acceptable, depending on the facts and circumstances.

¹³⁰ These approaches are consistent with the alternatives described in the FASB staff's memo, *Issue Summary No. 1*, when the FASB's Emerging Issues Task Force (EITF) considered the accounting for contract modifications of licences of intellectual property. For further details about these alternatives, refer to *Issue 1: Accounting for contract modifications under which the contract term for existing rights is extended, while also adding rights* in the staff's memo, available on the [FASB's website](#). The FASB will consider this issue as part of the post-implementation review process of ASC 606.

Approach A

New rights granted in a licensing arrangement (i.e., an extension for existing rights and the granting of additional rights) do not constitute a contract modification but, instead, create a new contract. Under this approach, because the performance related to the existing right-to-use licence was completed at the beginning of the original licence period (when the customer was able to use and benefit from the licence), any changes to the terms or pricing (or both) of the licence cannot modify or revoke the existing licence.

Instead, new rights granted in the licensing arrangement would be accounted for using the licensing application guidance (i.e., the use and benefit requirement in IFRS 15.B61 that is discussed in section 8.3.3 below). As a result, revenue related to the renewal or extension of the existing licence would be recognised when (or as) that performance obligation is satisfied, which might not be until the beginning of the renewal or extension period (see section 8.4 below) or some other date.

Approach B

The contract modification requirements in IFRS 15.18-21 (discussed in section 3.4 above) are applied to the licence extension. Under this approach, the accounting for the renewed licence follows the form of the contract modification.

How we see it

We believe that when a contract that only includes a licence of intellectual property is modified, the additional and/or modified licence of intellectual property is distinct from the existing licence because the new and/or modified rights will always differ from those conveyed by the existing licence.

The standard contains requirements on accounting for contract modification and it requires that a modification in which the additional promised goods or services are distinct be accounted for on a prospective basis, as follows:

- The modification is accounted for as a separate contract if the additional consideration from the modification reflects the new licence's stand-alone selling price in accordance with IFRS 15.20(b). [IFRS 15.20(b)].
- If the additional consideration does not reflect the stand-alone selling price of the new licence, the modification is accounted for in accordance with IFRS 15.21(a). [IFRS 15.21(a)].

If the modification is determined to be a separate contract in accordance with IFRS 15.20(b), the existing contract is not considered terminated. As a result, any revenue allocated to a performance obligation created at the modification date for the renewal or extension of a licence would be recognised when (or as) that performance obligation is satisfied, which might not occur until the beginning of the renewal or extension period (consistent with Approach A above).

If the modification is determined to be a termination of the existing contract and the creation of a new contract in accordance with IFRS 15.21(a), any revenue recognised to date under the original contract would not be adjusted. At the date of the modification, the remaining unrecognised transaction price from the existing contract (if any) and the additional transaction price from the new contract are allocated to the remaining performance obligation(s) in the new contract. Any revenue allocated to a performance obligation created at the modification date for the renewal or extension of a licence would be recognised when (or as) that performance obligation is satisfied, which might occur as early as the modification date (if the customer can use and benefit from the licences) because the existing contract (including the existing licence) would be considered terminated.

Example

The following Illustration shows the application of each of the approaches discussed above:

Illustration 8-1: Additional rights under a right-to-use licence granted to a licensee

Entity A enters into a contract on 1 January 20X0 with Customer B to transfer a right-to-use licence of software. The licence provides 100 seats (i.e., a right-to-use licence for 100 users to access the software) of Product C for a two-year term for CU200,000. The consideration is paid annually in two equal instalments (i.e., CU100,000 is due 30 January 20X0 and the remaining CU100,000 is due on 30 January 20X1). The price reflects the stand-alone selling price of Product C.

On 1 January 20X1, Entity A and Customer B agree to add more seats to the licence. The existing licence is terminated, and the customer is granted a new licence for 150 seats for a two-year term for CU276,000, which represents the second CU100,000 payment from the original contract plus an additional CU176,000. That is, Customer B receives an 8% discount per seat on the original price because of the added volume.

Entity A determines that the additional seats are distinct from the existing seats and the additional seats are not priced at their stand-alone selling prices because the price has decreased by 8%.

Since it is a right-to-use licence under IFRS 15, Entity A needs to evaluate when Customer B can use and benefit from the new software licence because that determines the point before which control cannot transfer (and Entity A cannot recognise revenue) related to the new software licence. Entity A also needs to evaluate ongoing services, such as post-contract customer support, which could change the allocation of consideration to the performance obligations and, therefore, the timing of revenue recognition.

To illustrate the different approaches that would be acceptable, the analysis below focuses only on the creation of the new licence itself:

Approach A

Entity A determines that the new licence is: (1) the addition of 50 new seats for a two-year term (from 1 January 20X1 through to 31 December 20X2); (2) a one-year renewal of the original 100 seats (from 1 January 20X2 through to 31 December 20X2); and (3) an 8% reduction from the original price for each of the 100 original seats for the second year (from 1 January 20X1 through to 31 December 20X1).

Entity A allocates the additional consideration of CU176,000 between the 50 new seats and the renewal of the original 100 seats. The consideration allocated to the new seats is recognised on 1 January 20X1, which is the date when Customer B can use and benefit from the new seats (and assuming control has transferred at the beginning of licence period). Entity A would then need to determine when it has satisfied its performance obligation for the renewal (which cannot be before Customer B can use and benefit from the renewed licence) to determine when to recognise the consideration allocated to the renewal. Entity A might, for example, determine that this is at the time of the new licence is granted (1 January 20X1), not before the beginning of the licence renewal period (1 January 20X2) or some other date.

Approach B

Entity A determines that a contract modification has occurred in accordance with IFRS 15.21(a), whereby a new licence for 150 seats for a two-year term has been granted and the original licence has been terminated as at 1 January 20X1 when the additional, distinct seats were added to the contract. Entity A concludes that Customer B can use the software and benefit from the modified licence immediately because the customer is not renewing a licence with the same terms and conditions as the original contract due to the addition of 50 new seats and change in pricing. It also determines control has transferred to Customer B at the same date. As a result, Entity A recognises the entire CU176,000 on 1 January 20X1.

Question 8-2: How do entities account for an option to revoke licensing rights?

Certain licensing arrangements include an option that allows the customer to revoke licensing rights in the future. For example, a contract for an on-premise software licence might include an option that allows the customer to migrate the on-premise software to a SaaS arrangement (i.e., the on-premise licence is revoked).

The standard does not provide guidance on how to account for an option that allows a customer to revoke rights to a licence of intellectual property. We believe there are two acceptable alternatives, if the option is determined not to be a material right, that entities could apply to account for the option:¹³¹

- Account for the option as a right of return (refer to section 4.7 above for further details about the accounting for rights of return).
- Account for the conversion prospectively when it occurs by applying the contract modification requirements (refer to section 3.4 above for further details about the accounting for contract modifications).

However, if the option is determined to be a material right, refer to section 4.6 above for further details about the accounting for material rights.

How we see it

We believe entities must select one of the two alternatives above to account for the revocation of a licence and apply it consistently to similar transactions.

¹³¹ These alternatives are consistent with the alternatives described in the FASB staff's memo, *Issue Summary No. 1*, when the EITF considered this issue. For further details about these alternatives, refer to *Issue 2: Accounting for the revocation of licensing rights (including conversion of term software licences to SaaS arrangements)* in the staff's memo, available on the [FASB's website](#). The FASB will consider the issue as part of the post-implementation review process of ASC 606.

Question 8-3: How does an entity account for contracts that grant both permission for past use of intellectual property and a licence to use the intellectual property in the future?

An entity might enter into a contract with a customer that grants the right to use intellectual property and the customer also agrees to pay consideration for past use of that intellectual property. Such an agreement could be partially a settlement for the use of the intellectual property in the past without the entity's permission.

In such circumstances, it would require judgement to determine what aspects of the contract are within the scope of IFRS 15. This would include consideration of whether, and to what extent, the counterparty is acting as a customer as defined in the standard (see section 2.3 above).

If the contract is only partially within the scope of IFRS 15, an entity would need to use judgement when applying the requirements in IFRS 15.7 (see section 2.5 above) to separate the consideration between the revenue in exchange for the licence, any amount received for the past use and any other components. [IFRS 15.7].

If, or to the extent, the contract is outside the scope of IFRS 15, an entity considers whether the income is arising in the course of the entity's ordinary activities in order to determine whether presentation as (other) revenue is appropriate (see Question 10-7 in section 10.2 below).

Question 8-4: Does a licence to a content library include more than one performance obligation?

Whether a contract that includes the transfer of one or more licences of intellectual property to a content library includes more than one performance obligation depends on facts and circumstances, and requires an entity to apply significant judgement. For example, an entity might enter into a licensing arrangement that provides the customer with a right to use all of the entity's existing content at contract inception, together with a right to use unspecified future updates to the content library (e.g., a licence for a film producer's completed titles and any titles produced in the future, a licence for an existing music library and any songs added or removed in the future). Typically, the contractual licence fee is not adjusted if the licensor does not obtain or create new content to provide to the licensee over the term of the contract.

In these arrangements, the licensor needs to evaluate the promised goods or services in the contract to determine the number of performance obligations (e.g., whether the licence for the existing content library provided at inception of the arrangement is distinct from other promises in the contract, including the obligation to provide updates to the content library on a when-and-if-available basis). That is, entities need to consider whether each individual good or service is both capable of being distinct and distinct in the context of the contract.

The licence for the existing content library is considered distinct from the other promised goods or services in the contract if it is separately identifiable from them. That might be the case if the licensor does not provide a significant service of integrating the existing content library with other promised goods or services in the contract (e.g., unspecified future updates to the content library), the promise goods or services do not significantly modify or customise each other, or the existing content library is not highly interdependent or interrelated with the other promised goods or services.

In many cases, a licensing arrangement that provides the customer with a right to use all of the entity's existing content at contract inception, together with a right to use unspecified future updates to the content library will generally be both capable of being distinct and distinct within the context of the contract (i.e., separately identifiable). Therefore, these promises are generally two separate performance obligations.

When an entity determines that there is more than one performance obligation (e.g., one for the licence to the content library provided at the inception of the arrangement, and another for the obligation to provide updates to the content library in the future, when and if available), the licensor will need to allocate the transaction price to the separate performance obligations on a relative stand-alone selling price basis.¹³²

¹³² Licences of content library arrangements are typically provided in exchange for fixed consideration and/or variable consideration in the form of a sales-based or usage-based royalty. This paragraph assumes the transaction price does not include any other form of variable consideration that could be subject to the variable consideration allocation exception in IFRS 15.84.

8.2 Determining the nature of the entity's promise in granting a licence

Entities need to evaluate the nature of a promise to grant a licence of intellectual property in order to determine whether the promise is satisfied (and revenue is recognised) over time or at a point in time.

In order to help entities in determining whether a licence provides a customer with a right to access or a right to use the intellectual property (which is important when determining the period of performance and, therefore, the timing of revenue recognition - see section 8.3 below), the Board provided the following application guidance: [IFRS 15.B58, IFRS 15.B59, IFRS 15.B59A]

Extract from IFRS 15

- B58** The nature of an entity's promise in granting a licence is a promise to provide a right to access the entity's intellectual property if all of the following criteria are met:
- (a) the contract requires, or the customer reasonably expects, that the entity will undertake activities that significantly affect the intellectual property to which the customer has rights (see paragraphs B59 and B59A);
 - (b) the rights granted by the licence directly expose the customer to any positive or negative effects of the entity's activities identified in paragraph B58(a); and
 - (c) those activities do not result in the transfer of a good or a service to the customer as those activities occur (see paragraph 25).
- B59** Factors that may indicate that a customer could reasonably expect that an entity will undertake activities that significantly affect the intellectual property include the entity's customary business practices, published policies or specific statements. Although not determinative, the existence of a shared economic interest (for example, a sales-based royalty) between the entity and the customer related to the intellectual property to which the customer has rights may also indicate that the customer could reasonably expect that the entity will undertake such activities.
- B59A** An entity's activities significantly affect the intellectual property to which the customer has rights when either:
- (a) those activities are expected to significantly change the form (for example, the design or content) or the functionality (for example, the ability to perform a function or task) of the intellectual property; or
 - (b) the ability of the customer to obtain benefit from the intellectual property is substantially derived from, or dependent upon, those activities. For example, the benefit from a brand is often derived from, or dependent upon, the entity's ongoing activities that support or maintain the value of the intellectual property.
- Accordingly, if the intellectual property to which the customer has rights has significant stand-alone functionality, a substantial portion of the benefit of that intellectual property is derived from that functionality. Consequently, the ability of the customer to obtain benefit from that intellectual property would not be significantly affected by the entity's activities unless those activities significantly change its form or functionality. Types of intellectual property that often have significant stand-alone functionality include software, biological compounds or drug formulas, and completed media content (for example, films, television shows and music recordings).

In providing this application guidance, the Board decided to focus on the characteristics of a licence that provides a right to access the entity's intellectual property. If the licensed intellectual property does not have those characteristics, it provides a right to use the entity's intellectual property, by default. This analysis is focused on situations in which the underlying intellectual property is subject to change over the licence period.

The key determinants of whether the nature of an entity's promise is a right to access the entity's intellectual property are whether: (1) the entity is required to undertake activities that affect the licensed intellectual property (or the customer has a reasonable expectation that the entity will do so); and (2) the customer is exposed to positive or negative effects resulting from those changes.

It is important to note that when an entity is making this assessment, it excludes the effect of any other performance obligations in the contract. For example, if an entity enters into a contract to license software and provide access to any future upgrades to that software during the licence period, the entity first determines whether the licence and the promise to provide future updates are separate performance obligations. If they are separate, when the entity considers whether it has a contractual (explicit or implicit) obligation to undertake activities to change the software during the licence period, it excludes any changes and activities associated with the performance obligation to provide future upgrades.

While the activities considered in this assessment do not include those that are a performance obligation, these activities can be part of an entity's ongoing ordinary activities and customary business practices (i.e., they do not have to be activities the entity is undertaking specifically as a result of the contract with the customer). In addition, the IASB noted in the Basis for Conclusions that the existence of a shared economic interest between the parties (e.g., sales-based or usage-based royalties) could be an indicator that the customer has a reasonable expectation that the entity will undertake such activities. [IFRS 15.BC413].

After an entity has identified the activities for this assessment, it must determine if those activities significantly affect the intellectual property to which the customer has rights. The standard clarifies that such activities significantly affect the intellectual property if they: [IFRS 15.B59A]

- Significantly change the form (e.g., design or content) or functionality (e.g., the ability to perform a function or task) of the intellectual property
- Or
- Affect the ability of the customer to obtain benefit from the intellectual property (e.g., the benefit from a brand is often derived from, or dependent upon, the entity's ongoing activities that support or maintain the value of the intellectual property)

If the intellectual property has significant stand-alone functionality, the standard clarifies that the customer derives a substantial portion of the benefit of that intellectual property from that functionality. As such, "the ability of the customer to obtain benefit from that intellectual property would not be significantly affected by the entity's activities unless those activities significantly change its form or functionality." Therefore, if the intellectual property has significant stand-alone functionality, revenue is recognised at a point in time. Examples of types of intellectual property that often have significant stand-alone functionality that are mentioned in the standard include software, biological compounds or drug formulas, and completed media content. [IFRS 15.B59A].

The IASB has not defined the term 'significant stand-alone functionality', but has made clarifications to the examples in the standard to illustrate when the intellectual property to which the customer has rights might have significant stand-alone functionality. In some cases, it will be clear when intellectual property has significant stand-alone functionality. If there is no significant stand-alone functionality, the benefit to the customer might be substantially derived from the value of the intellectual property and the entity's activities to support or maintain that value. The IASB noted, however, that an entity may need to apply judgement to determine whether the intellectual property to which the customer has rights has significant stand-alone functionality. [IFRS 15.BC414].

How we see it

It is important for entities that provide licences of intellectual property to their customers to appropriately identify the performance obligations as part of Step 2 of the model because those conclusions will directly affect their evaluation of whether the entity's activities significantly change the form or functionality of the intellectual property or affect the ability of the customer to obtain benefit from the intellectual property.

FASB differences

Unlike IFRS 15, ASC 606 requires entities to classify intellectual property in one of two categories to determine the nature of the entity's promise in granting a licence:

- (a) *Functional*: This intellectual property has significant stand-alone functionality (e.g., many types of software, completed media content such as films, television shows and music). Revenue for these licences is generally recognised at a point in time.
- (b) *Symbolic*: This intellectual property does not have significant stand-alone functionality (e.g., brands, team and trade names, character images). Revenue from these licences is recognised over time.

The IASB and FASB agreed that their approaches will generally result in consistent answers, but the Boards acknowledged that different outcomes may arise due to the different approaches when entities license brand names that no longer have any related ongoing activities (e.g., the licence to the brand name of a defunct sports team, such as the Brooklyn Dodgers). [IFRS 15.BC414K, IFRS 15.BC414N].

8.2.1 Applying the licensing application guidance to a single (bundled) performance obligation that includes a licence of intellectual property

If a licence is not distinct, entities are required to follow the requirements in IFRS 15.31-38 to determine whether the performance obligation is satisfied over time or at a point in time (i.e., the general requirements in Step 5 of the model, as discussed in sections 7.1 and 7.2 above). [IFRS 15.B55].

IFRS 15 does not explicitly state that an entity needs to consider the nature of its promise in granting a licence when applying the general revenue recognition model to performance obligations that are comprised of both a licence (that is not distinct) and other goods or services. However, the Board clarified in the Basis for Conclusions that to the extent that an entity is required to combine a licence with other promised goods or services in a single performance obligation and the licence is the primary or dominant component (i.e., the predominant item) of that performance obligation, the entity needs to consider the licensing application guidance to help determine the nature of its promise to the customer. [IFRS 15.BC407].

If the licence is the predominant item of a single performance obligation, entities need to consider the licensing application guidance when:

- (a) Determining whether the performance obligation is satisfied over time or at a point in time
- And
- (b) Selecting an appropriate method for measuring progress of that performance obligation if it is satisfied over time

Considering the nature of an entity's promise in granting a licence that is part of a single combined performance obligation is not a separate step or evaluation in the revenue model. Rather, it is part of the overall requirements in Step 5 of the model to determine whether that single performance obligation is satisfied over time or at a point in time and the appropriate measure of progress toward the satisfaction, if it is satisfied over time.

The Board did not provide application guidance or bright lines for determining when a licence is the primary or dominant (i.e., the predominant) component. However, the IASB explained in the Basis for Conclusions that, in some instances, not considering the nature of the entity's promise in granting a licence that is combined with other promised goods or services in a single performance obligation would result in accounting that does not best reflect the entity's performance. For example, consider a situation where an entity grants a 10-year licence that is not distinct from a one-year service arrangement. The IASB noted that a distinct licence that provides access to an entity's intellectual property over a 10-year period could not be considered completely satisfied before the end of the access period. The IASB observed in that example that it is, therefore, inappropriate to conclude that a single performance obligation that includes that licence is satisfied over the one-year period of the service arrangement. [IFRS 15.BC414X].

The standard includes examples that illustrate how an entity applies the licensing application guidance to help determine the nature of a performance obligation that includes a licence of intellectual property and other promised goods or services.

In Example 56, Case A (extracted below), an entity licences the patent rights for an approved drug compound to its customer and also promises to manufacture the drug for the customer. The entity considers that no other entity can perform the manufacturing service because of the highly specialised nature of the manufacturing process. Therefore, the licence cannot be purchased separately from the manufacturing service and the customer cannot benefit from the licence on its own or with other readily available resources (i.e., the licence and the manufacturing service are not capable of being distinct).

Accordingly, the entity's promises to grant the licence and to manufacture the drug are accounted for as a single performance obligation, as follows: [IFRS 15.IE Example 56 Case A, IFRS 15.IE281-IE284]

Extract from IFRS 15

Example 56-Identifying a distinct licence

An entity, a pharmaceutical company, licenses to a customer its patent rights to an approved drug compound for 10 years and also promises to manufacture the drug for the customer. The drug is a mature product; therefore the entity will not undertake any activities to support the drug, which is consistent with its customary business practices.

Case A-Licence is not distinct

In this case, no other entity can manufacture this drug because of the highly specialised nature of the manufacturing process. As a result, the licence cannot be purchased separately from the manufacturing services.

The entity assesses the goods and services promised to the customer to determine which goods and services are distinct in accordance with paragraph 27 of IFRS 15. The entity determines that the customer cannot benefit from the licence without the manufacturing service; therefore, the criterion in paragraph 27(a) of IFRS 15 is not met. Consequently, the licence and the manufacturing service are not distinct and the entity accounts for the licence and the manufacturing service as a single performance obligation.

The entity applies paragraphs 31-38 of IFRS 15 to determine whether the performance obligation (ie the bundle of the licence and the manufacturing services) is a performance obligation satisfied at a point in time or over time.

The example in the extract above (Example 56, Case A) illustrates the importance of applying the licensing application guidance when determining the nature of an entity's promise in granting a licence that is combined into a single performance obligation with other promised goods or services. This is because the conclusion of whether a non-distinct licence provides the customer with a right to use intellectual property or a right to access intellectual property might have a significant effect on the timing of revenue recognition for the single combined performance obligation. In Example 56, Case A, the entity needs to determine the nature of its promise in granting the licence within the single performance obligation (comprising the licence and the manufacturing service) to appropriately apply the general principle of recognising revenue when (or as) it satisfies its performance obligation to the customer. If the licence in this example provided a right to use the entity's intellectual property that on its own would be recognised at the point in time in which control of the licence is transferred to the customer, it is likely that the combined performance obligation would only be fully satisfied when the manufacturing service is complete. In contrast, if the licence provided a right to access the entity's intellectual property, the combined performance obligation would not be fully satisfied until the end of the 10-year licence period, which could extend the period of revenue recognition beyond the date when the manufacturing service is complete.

FASB differences

ASC 606 explicitly states that an entity considers the nature of its promise in granting a licence when applying the general revenue recognition model to a single performance obligation that includes a licence and other goods or services (i.e., when applying the general requirements, consistent with those in IFRS 15.31-45, to assess whether the performance obligations are satisfied at a point in time or over time). IFRS 15 does not explicitly state this. [IFRS 15.BC414Y].

8.3 Transfer of control of licensed intellectual property

When determining whether a licence of intellectual property transfers to a customer (and revenue is recognised) over time or at a point in time, the standard states that an entity provides a customer with either:

- A right to access the entity's intellectual property throughout the licence period for which revenue is recognised over the licence period
- Or
- A right to use the entity's intellectual property as it exists at the point in time the licence is granted for which revenue is recognised at the point in time the customer can first use and benefit from the licensed intellectual property

The standard provides the following application guidance on the timing of revenue recognition for right-to-access and right-to-use licences: [IFRS 15.B60, IFRS 15.B61]

Extract from IFRS 15

- B60** If the criteria in paragraph B58 are met, an entity shall account for the promise to grant a licence as a performance obligation satisfied over time because the customer will simultaneously receive and consume the benefit from the entity's performance of providing access to its intellectual property as the performance occurs (see paragraph 35(a)). An entity shall apply paragraphs 39-45 to select an appropriate method to measure its progress towards complete satisfaction of that performance obligation to provide access.
- B61** If the criteria in paragraph B58 are not met, the nature of an entity's promise is to provide a right to use the entity's intellectual property as that intellectual property exists (in terms of form and functionality) at the point in time at which the licence is granted to the customer. This means that the customer can direct the use of, and obtain substantially all of the remaining benefits from, the licence at the point in time at which the licence transfers. An entity shall account for the promise to provide a right to use the entity's intellectual property as a performance obligation satisfied at a point in time. An entity shall apply paragraph 38 to determine the point in time at which the licence transfers to the customer. However, revenue cannot be recognised for a licence that provides a right to use the entity's intellectual property before the beginning of the period during which the customer is able to use and benefit from the licence. For example, if a software licence period begins before an entity provides (or otherwise makes available) to the customer a code that enables the customer to immediately use the software, the entity would not recognise revenue before that code has been provided (or otherwise made available).

8.3.1 Right to access

The Board concluded that a licence that provides an entity with the right to access intellectual property is satisfied over time "because the customer simultaneously receives and consumes the benefit from the entity's performance as the performance occurs", including the related activities undertaken by entity. [IFRS 15.B60, IFRS 15.BC414]. This conclusion is based on the determination that when a licence is subject to change (and the customer is exposed to the positive or negative effects of that change), the customer is not able to fully gain control over the licence of intellectual property at any given point in time, but rather gains control over the licence period. Entities need to apply the general Step 5 requirements in IFRS 15.39-45 to determine the appropriate method to measure progress (see section 7.1.4 above) in addition to IFRS 15.B61 (i.e., the use and benefit requirement, which is discussed in section 8.3.3 below).

In performing this analysis, an entity would not default to a straight-line revenue attribution model. However, the customer often receives and consumes the benefits of a right-to-access licence evenly over the contract period and, therefore, a time-based measure of progress that results in a straight-line recognition of revenue would be appropriate.

The standard includes the following example of a right-to-access licence: [IFRS 15.IE Example 58, IFRS 15.IE297-IE302]

Extract from IFRS 15

Example 58-Access to intellectual property

An entity, a creator of comic strips, licenses the use of the images and names of its comic strip characters in three of its comic strips to a customer for a four-year term. There are main characters involved in each of the comic strips. However, newly created characters appear regularly and the images of the characters evolve over time. The customer, an operator of cruise ships, can use the entity's characters in various ways, such as in shows or parades, within reasonable guidelines. The contract requires the customer to use the latest images of the characters.

In exchange for granting the licence, the entity receives a fixed payment of CU1 million in each year of the four-year term.

In accordance with paragraph 27 of IFRS 15, the entity assesses the goods and services promised to the customer to determine which goods and services are distinct. The entity concludes that it has no other performance obligations other than the promise to grant a licence. That is, the additional activities associated with the licence do not directly transfer a good or service to the customer because they are part of the entity's promise to grant a licence.

The entity assesses the nature of the entity's promise to transfer the licence in accordance with paragraph B58 of IFRS 15. In assessing the criteria the entity considers the following:

- (a) the customer reasonably expects (arising from the entity's customary business practices) that the entity will undertake activities that will significantly affect the intellectual property to which the customer has rights (ie the characters). This is because the entity's activities (ie development of the characters) change the form of the intellectual property to which the customer has rights. In addition, the ability of the customer to obtain benefit from the intellectual property to which the customer has rights is substantially derived from, or dependent upon, the entity's ongoing activities (ie the publishing of the comic strip).
- (b) the rights granted by the licence directly expose the customer to any positive or negative effects of the entity's activities because the contract requires the customer to use the latest characters.
- (c) even though the customer may benefit from those activities through the rights granted by the licence, they do not transfer a good or service to the customer as those activities occur.

Consequently, the entity concludes that the criteria in paragraph B58 of IFRS 15 are met and that the nature of the entity's promise to transfer the licence is to provide the customer with access to the entity's intellectual property as it exists throughout the licence period. Consequently, the entity accounts for the promised licence as a performance obligation satisfied over time (ie the criterion in paragraph 35(a) of IFRS 15 is met).

The entity applies paragraphs 39-45 of IFRS 15 to identify the method that best depicts its performance in the licence. Because the contract provides the customer with unlimited use of the licensed characters for a fixed term, the entity determines that a time-based method would be the most appropriate measure of progress towards complete satisfaction of the performance obligation.

Frequently asked questions

Question 8-5: Is a licence that provides a right to access intellectual property a series of distinct goods or services that would be accounted for as a single performance obligation?

Step 2 of the model requires an entity to identify the performance obligations in a contract. This includes determining whether multiple distinct goods or services would be accounted for as a single performance obligation under the series requirement (see section 4.2.2 above). It is likely that many licences that provide a right to access intellectual property are a series of distinct goods or services that are substantially the same and have the same pattern of transfer to the customer (e.g., a series of distinct periods of access to intellectual property, such as monthly access or quarterly access).

A TRG agenda paper included an example of a licence that provides a right to access intellectual property that is accounted for as a series of distinct goods or services.¹³³ In the example, a franchisor grants a licence of intellectual property to a franchisee allowing the franchisee to use its trade name and sell its product for a period of 10 years. As discussed in Question 4-11 in section 4.2.2 above, if the nature of an entity's promise is to provide a single service for a period of time, the evaluation of whether goods or services are distinct and substantially the same considers whether each time increment of access to the intellectual property (e.g., hour, day) is distinct and substantially the same. In this example, the nature of the franchisor's promise is to provide a right to access the intellectual property throughout the licence period. Each time increment is distinct because the customer benefits from the right to access each day on its own (i.e., each time increment is capable of being distinct). In addition, each day is separately identifiable (i.e., each time increment is distinct in the context of the contract) because: there is no integration service provided between the days of access provided; no day modifies or customises another; and the days of access are not highly interdependent or highly interrelated. In addition, each distinct daily service is substantially the same because the customer receives access to the intellectual property each day.

If a licence meets the criteria to be accounted for as a series of distinct goods or services, an entity needs to consider whether any variable consideration in the contract (e.g., royalties, milestone payments) must be allocated to the distinct periods of access, if certain allocation criteria are met. See section 6.3 above for a discussion of the variable consideration allocation exception and section 8.5 below for a discussion of the accounting for sales-based or usage-based royalties.

¹³³ TRG Agenda paper no. 39, *Application of the Series Provision and Allocation of Variable Consideration*, dated 13 July 2015.

8.3.2 Right to use

In contrast, when the licence represents a right to use the intellectual property as it exists at a specific point in time, the customer gains control over that intellectual property at the beginning of the period for which it has the right to use the intellectual property. [IFRS 15.B61]. This timing might differ from when the licence was granted. For example, an entity could provide a customer with the right to use intellectual property but indicate that right to use does not start until 30 days after the agreement is finalised. For the purpose of determining when control transfers for the right-to-use licence, the Board was clear that the assessment is from the customer's perspective (i.e., when the customer can use the licensed intellectual property), rather than the entity's perspective (i.e., when the entity transfers the licence). Entities need to apply the general Step 5 requirements in IFRS 15.38 to determine the point in time that control of the licence transfers to the customer (see section 7.2 above) in addition to IFRS 15.B61 (i.e., the use and benefit requirement, which is discussed below in section 8.3.3 below).

The standard includes the following example of a right-to-use licence: [IFRS 15.IE Example 59, IFRS 15.IE303-IE306]

Extract from IFRS 15

Example 59-Right to use intellectual property

An entity, a music record label, licenses to a customer a 1975 recording of a classical symphony by a noted orchestra. The customer, a consumer products company, has the right to use the recorded symphony in all commercials, including television, radio and online advertisements for two years in Country A. In exchange for providing the licence, the entity receives fixed consideration of CU10,000 per month. The contract does not include any other goods or services to be provided by the entity. The contract is non-cancellable.

The entity assesses the goods and services promised to the customer to determine which goods and services are distinct in accordance with paragraph 27 of IFRS 15. The entity concludes that its only performance obligation is to grant the licence. The entity determines that the term of the licence (two years), its geographical scope (the customer's right to use the recording only in Country A), and the defined permitted use for the recording (in commercials) are all attributes of the promised licence in the contract.

In accordance with paragraph B58 of IFRS 15, the entity assesses the nature of the entity's promise to grant the licence. The entity does not have any contractual or implied obligations to change the licensed recording. The licensed recording has significant stand-alone functionality (ie the ability to be played) and, therefore, the ability of the customer to obtain the benefits of the recording is not substantially derived from the entity's ongoing activities. The entity therefore determines that the contract does not require, and the customer does not reasonably expect, the entity to undertake activities that significantly affect the licensed recording (ie the criterion in paragraph B58(a) is not met). Consequently, the entity concludes that the nature of its promise in transferring the licence is to provide the customer with a right to use the entity's intellectual property as it exists at the point in time that it is granted. Therefore, the promise to grant the licence is a performance obligation satisfied at a point in time. The entity recognises all of the revenue at the point in time when the customer can direct the use of, and obtain substantially all of the remaining benefits from, the licensed intellectual property.

Because of the length of time between the entity's performance (at the beginning of the period) and the customer's monthly payments over two years (which are non-cancellable), the entity considers the requirements in paragraphs 60-65 of IFRS 15 to determine whether a significant financing component exists.

8.3.3 Use and benefit requirement

IFRS 15 states that revenue from a right-to-use licence cannot be recognised before the beginning of the period during which "the customer is able to use and benefit from the licence". [IFRS 15.B61]. The IASB explained in the Basis for Conclusions that if the customer cannot use and benefit from the licensed intellectual property then, by definition, it does not control the licence. [IFRS 15.BC414]. See section 8.4 below for discussion on licence renewals.

Consider an example where an entity provides a customer with a right to use its software, but the customer requires a code before the software will function, which the entity will not provide until 30 days after the agreement is finalised. In this example, it is likely that the entity would conclude that control of the licence does not transfer until 30 days after the agreement is finalised because that is when the customer has the right to use and can benefit from the software.

8.4 Licence renewals

As discussed in section 8.3.3 above, IFRS 15 states that revenue cannot be recognised for a licence that provides a right to use the entity's intellectual property before the beginning of the period during which the customer is able to use and benefit from the licence. [IFRS 15.B61]. Some stakeholders questioned whether IFRS 15.B61 applies to the renewal of an existing licence or whether the entity could recognise revenue for the renewal when the parties agree to the renewal. Therefore, the TRG discussed the application of IFRS 15.B61 within the context of renewals or extensions of existing licences. [IFRS 15.BC414S]. The discussion at the TRG indicated that this is an area in which judgement is needed and, therefore, this topic was further discussed by the IASB.¹³⁴

The IASB decided that a clarification about the application of the contract modification requirements specifically for renewals of licensing arrangements was not necessary. The Board noted that, although some diversity might arise, IFRS 15 provides an extensive framework for applying judgement (see Question 8-1 in section 8.1.4 above for further discussion on modifications of licences).

Therefore, when an entity and a customer enter into a contract to renew (or extend the period of) an existing licence, the entity needs to evaluate whether the renewal or extension has to be treated as a new licence or as a modification of the existing contract. A modification would be accounted for in accordance with the contract modifications requirements in IFRS 15.18-21 (see section 3.4 above). [IFRS 15.BC414T].

FASB differences

Under ASC 606, revenue related to the renewal of a licence of intellectual property would not be recognised earlier than the beginning of the renewal period. IFRS 15 does not include a similar requirement. [IFRS 15.BC414U].

Frequently asked questions

Question 8-6: How do entities account for modifications and other changes to licences of intellectual property?

See response to Question 8-1 in section 8.1.4 above.

Question 8-7: How do entities account for an option to revoke licensing rights?

See response to Question 8-2 in section 8.1.4 above.

8.5 Sales-based or usage-based royalties on licences of intellectual property

The standard provides application guidance on the recognition of revenue for sales-based or usage-based royalties on licences of intellectual property, which differs from the requirements that apply to other revenue from licences. IFRS 15 requires that royalties received in exchange for licences of intellectual property are recognised at the later of when: [IFRS 15.B63]

(a) The subsequent sale or usage occurs

And

(b) The performance obligation to which some or all of the sales-based or usage-based royalty has been allocated is satisfied (or partially satisfied)

That is, an entity recognises the royalties as revenue for such arrangements when (or as) the customer's subsequent sales or usage occurs, unless that pattern of recognition accelerates revenue recognition ahead of the entity's satisfaction of the performance obligation to which the royalty solely or partially relates, based on an appropriate measure of progress (see section 7.1.4 above). [IFRS 15.BC421I].

The Board explained in the Basis for Conclusions that for a licence of intellectual property for which the consideration is based on the customer's subsequent sales or usage, an entity does not recognise any revenue for the variable amounts until the uncertainty is resolved (i.e., when a customer's subsequent sales or usage occurs). [IFRS 15.BC219].

The IASB also explained in the Basis for Conclusions that the application guidance in IFRS 15.B63-B63B addresses the *recognition* of sales-based or usage-based royalties received in exchange for a licence of intellectual property, rather than when such amounts are included in the transaction price of the contract. [IFRS 15.BC421I]. As a result, this exception is a recognition constraint and the constraint on variable consideration (see section 5.2.3 above) does not apply.

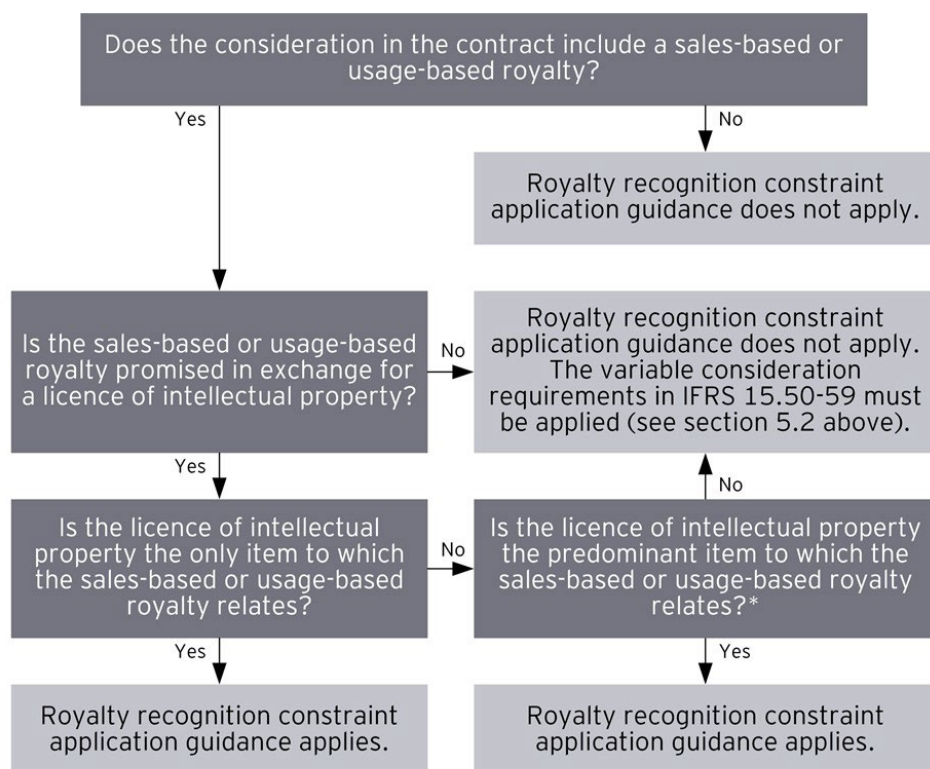

¹³⁴ TRG Agenda paper no. 45, *Licences - Specific Application Issues About Restrictions and Renewals*, dated 9 November 2015.

While the variable consideration constraint does not apply, the other requirements for variable consideration still apply (see section 5.2.2 above). However, as mentioned in Question 5-10 in section 5.2.2 above, this might be one of the situations where an entity would not need to estimate variable consideration at contract inception. This is because, in many cases, using this application guidance will result in the same pattern of revenue recognition as fully constraining the estimate of variable consideration associated with the future royalty stream (also see section 8.5.1 below for more information about recognition of royalties for a licence that provides a right to access the entity's intellectual property). However, in cases where an entity is required to allocate sales-based or usage-based royalties to separate performance obligations in a contract, it would need to include expected royalties in its estimate of the stand-alone selling price of one or more of the performance obligations. The Board explained that it added the royalty recognition constraint because both users and preparers of financial statements indicated that it would not be useful for entities to recognise a minimum amount of revenue for sales-based or usage-based royalties received in exchange for licences of intellectual property (following the requirements in the general model on estimating the transaction price). This is because that approach would inevitably require the entity to report significant adjustments to the amount of revenue recognised throughout the life of the contract as a result of changes in circumstances that are not related to the entity's performance. The Board observed that this would not result in relevant information, especially for contracts in which the sales-based or usage-based royalties are paid over a long period of time. [IFRS 15.BC415].

In some contracts, a sales-based or usage-based royalty might be related to both a licence of intellectual property and another good or service that is, or is not, be distinct. IFRS 15.B63A requires that the royalty recognition constraint be applied to the overall royalty stream when the sole or predominant item to which the royalty relates is a licence of intellectual property (including when no single licence of intellectual property is the predominant item to which the royalty relates, but the royalty predominantly relates to two or more licences of intellectual property in the contract). [IFRS 15.B63A, IFRS 15.BC421G]. That is, this application guidance is applicable to all licences of intellectual property, regardless of whether they have been determined to be distinct. The standard does not provide a bright line for determining the 'predominant' item in a contract that includes a licence of intellectual property. The Board acknowledged in the Basis for Conclusions that significant judgement is required to determine when a licence is the predominant item to which a royalty relates. However, the judgement for determining whether a licence is the predominant item is likely to be less than the judgement needed to apply the general requirements for variable consideration to such contracts. [IFRS 15.BC421E]. See Question 8-18 in section 8.5.1 below for further discussion.

It is important to note that the application guidance in IFRS 15.B63-B63B applies only to licences of intellectual property for which some or all of the consideration is in the form of a sales-based or usage-based royalty. The Board said in the Basis for Conclusions that the royalty recognition constraint was structured to apply only to a particular type of transaction (i.e., a licence of intellectual property). Therefore, other transactions that might be economically similar would be accounted for differently. [IFRS 15.BC416]. That is, entities cannot analogise to the royalty recognition constraint for other types of transactions. For example, it cannot be applied if consideration in a contract is in the form of a sales-based or usage-based royalty, but there is either: (a) no licence of intellectual property; or (b) the licence of intellectual property to which the sales-based or usage-based royalty relates is not the predominant item in the contract (e.g., the sale of a tangible good that includes a significant amount of intellectual property). When the royalty recognition constraint cannot be applied, an entity follows the requirements in the general model on estimating variable consideration and applying the constraint on variable consideration (see section 5.2 above). In some cases, it will not be obvious whether the arrangement is an in-substance sale of intellectual property (i.e., a promise that is in the form of a licence, but, in substance, has the characteristics of a sale) or a licence of intellectual property. In such instances, entities would have to exercise judgement to determine whether the control over the underlying intellectual property has been transferred from the entity to the customer and therefore, has been sold.

The following flow chart illustrates an entity's evaluation when determining whether the royalty recognition constraint must be applied to a royalty stream:

Figure 8-1: Determining whether the royalty recognition constraint applies to a royalty stream

* This includes situations in which no single licence is the predominant item to which the sales-based or usage-based royalty relates, but the sales-based or usage-based royalty predominantly relates to two or more licences in the contract.

The standard provides the following example of a contract that includes two performance obligations, including a licence that provides a right to use the entity's intellectual property and consideration in the form of sales-based royalties. In the example, the licence is determined to be the predominant item to which the royalty relates: [IFRS 15.IE Example 60, IFRS 15.IE307-IE308]

Extract from IFRS 15

Example 60-Sales-based royalty for a licence of intellectual property

An entity, a movie distribution company, licenses Movie XYZ to a customer. The customer, an operator of cinemas, has the right to show the movie in its cinemas for six weeks. Additionally, the entity has agreed to (a) provide memorabilia from the filming to the customer for display at the customer's cinemas before the beginning of the six-week screening period; and (b) sponsor radio advertisements for Movie XYZ on popular radio stations in the customer's geographical area throughout the six-week screening period. In exchange for providing the licence and the additional promotional goods and services, the entity will receive a portion of the operator's ticket sales for Movie XYZ (ie variable consideration in the form of a sales-based royalty).

The entity concludes that the licence to show Movie XYZ is the predominant item to which the sales-based royalty relates because the entity has a reasonable expectation that the customer would ascribe significantly more value to the licence than to the related promotional goods or services. The entity recognises revenue from the sales-based royalty, the only consideration to which the entity is entitled under the contract, wholly in accordance with paragraph B63. If the licence, the memorabilia and the advertising activities are separate performance obligations, the entity would allocate the sales-based royalty to each performance obligation.

As illustrated in the extract above (Example 60), IFRS 15.B63B states that, when the criteria for applying the royalty recognition constraint are applied, the royalty stream must be accounted for entirely under the royalty recognition constraint. [IFRS 15.B63B]. That is, an entity would not split a single royalty and apply the royalty recognition constraint to a portion of the sales-based royalty and the general constraint requirements for variable consideration (see section 5.2.3 above) to the remainder. The Board indicated in the Basis for Conclusions that it would be more complex to account for part of a royalty under the royalty recognition constraint and another part under the general requirements for variable consideration and that

doing so would not provide any additional useful information to users of financial statements. This is because splitting a royalty would result in an entity recognising an amount at contract inception that would reflect neither the amount to which the entity expects to be entitled, based on its performance, nor the amount to which the entity has become legally entitled during the period. [IFRS 15.BC421J].

Regardless of whether an entity applies the royalty recognition constraint or the general requirements for variable consideration, it is still required to allocate sales-based or usage-based royalties to separate performance obligations in a contract (as noted in Example 60 above) in a manner consistent with the allocation objective in IFRS 15.73. In order to perform such an allocation, an entity would need to include expected royalties in its estimate of the stand-alone selling price of one or more of the performance obligations. Example 35 from the standard (extracted in full in section 6.3.3 above) also illustrates the allocation of the transaction price (including sales-based or usage-based royalties) to the performance obligations in the contract. [IFRS 15.IE Example 35, IFRS 15.IE178, IFRS 15.IE187].

8.5.1 Recognition of royalties for a licence that provides a right to access intellectual property

The IASB explained in the Basis for Conclusions that the royalty recognition constraint is intended to align the recognition of sales or usage-based royalties with the standard's key principle that revenue is recognised when (or as) an entity satisfies a performance obligation. As discussed in section 8.5 above, IFRS 15 requires that royalties received in exchange for licences of intellectual property are recognised at the later of when: (1) the subsequent sales or usage occurs; and (2) the performance obligation to which the sales-based or usage-based royalties relate has been satisfied (or partially satisfied). That is, an entity recognises the royalties as revenue when (or as) the customer's subsequent sales or usage occurs, unless that pattern of recognition accelerates revenue recognition ahead of the entity's satisfaction of the performance obligation to which the royalty solely or partially relates, based on an appropriate measure of progress (see section 7.1.4 above). [IFRS 15.BC421J].

Consider the following Illustration, based on an example provided by the FASB, that is an example of when revenue recognition would be inappropriately accelerated ahead of an entity's performance, if revenue was recognised under IFRS 15.B63(a) for a right-to-access licence.¹³⁵

Illustration 8-2: Licensing contract with a declining royalty rate

A contract provides a customer with the right to access an entity's intellectual property and the entity receives royalties of 8% on total sales up to CU1 million, 4% on the next CU3 million in sales and 2% on all sales above CU4 million. The declining royalty rate does not reflect changing value to the customer.

In this example, the FASB noted that recognising royalties as they are due (i.e., according to the contractual formula) would not be aligned with the principle of recognising revenue only when (or as) an entity satisfies a performance obligation because the right to access the intellectual property is provided evenly over the licence term while the declining royalty rate does not reflect the value to the customer. However, the FASB stated that the existence of a declining royalty rate in a contract does not always mean that recognising revenue for sales-based or usage-based royalties as the customer's underlying sales or usage occur is inappropriate. In fact, it would be appropriate if the declining royalty rate reflects the changing value to the customer.

The above example notwithstanding, for many contracts with licences that provide a right to access an entity's intellectual property, applying the royalty recognition constraint results in an entity recognising revenue from sales-based or usage-based royalties when (or as) the customer's underlying sales or usage occurs in accordance with IFRS 15.B63(a). An output-based measure of progress that is the same as, or similar to, the application of the practical expedient in IFRS 15.B16 (i.e., when the right to consideration corresponds directly with the value to the customer of the entity's performance to date) is appropriate because the entity's right to consideration (i.e., the sales-based or usage-based royalties earned) often corresponds directly with the value to the customer of the entity's performance completed to date. The practical expedient in IFRS 15.B16 is discussed further in section 7.1.4 above.

In addition, an output-based measure could also be appropriate for a licence that provides a right to access intellectual property in which the consideration is in the form of a fixed fee and royalties. The following example from the standard illustrates this: [IFRS 15.IE Example 61, IFRS 15.IE309-IE313]

¹³⁵ ASU 2016-10, *Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing*, April 2016, paragraph BC71.

Extract from IFRS 15**Example 61-Access to intellectual property**

An entity, a well-known sports team, licenses the use of its name and logo to a customer. The customer, an apparel designer, has the right to use the sports team's name and logo on items including t-shirts, caps, mugs and towels for one year. In exchange for providing the licence, the entity will receive fixed consideration of CU2 million and a royalty of five per cent of the sales price of any items using the team name or logo. The customer expects that the entity will continue to play games and provide a competitive team.

The entity assesses the goods and services promised to the customer to determine which goods and services are distinct in accordance with paragraph 27 of IFRS 15. The entity concludes that its only performance obligation is to transfer the licence. The additional activities associated with the licence (ie continuing to play games and provide a competitive team) do not directly transfer a good or service to the customer because they are part of the entity's promise to grant the licence.

The entity assesses the nature of the entity's promise to transfer the licence in accordance with paragraph B58 of IFRS 15. In assessing the criteria the entity considers the following:

- (a) the entity concludes that the customer would reasonably expect that the entity will undertake activities that will significantly affect the intellectual property (ie the team name and logo) to which the customer has rights. This is on the basis of the entity's customary business practice to undertake activities that support and maintain the value of the name and logo such as continuing to play and providing a competitive team. The entity determines that the ability of the customer to obtain benefit from the name and logo is substantially derived from, or dependent upon, the expected activities of the entity. In addition, the entity observes that because some of its consideration is dependent on the success of the customer (through the sales-based royalty), the entity has a shared economic interest with the customer, which indicates that the customer will expect the entity to undertake those activities to maximise earnings.
- (b) the entity observes that the rights granted by the licence (ie the use of the team's name and logo) directly expose the customer to any positive or negative effects of the entity's activities.
- (c) the entity also observes that even though the customer may benefit from the activities through the rights granted by the licence, they do not transfer a good or service to the customer as those activities occur.

The entity concludes that the criteria in paragraph B58 of IFRS 15 are met and the nature of the entity's promise to grant the licence is to provide the customer with access to the entity's intellectual property as it exists throughout the licence period. Consequently, the entity accounts for the promised licence as a performance obligation satisfied over time (ie the criterion in paragraph 35(a) of IFRS 15 is met).

The entity then applies paragraphs 39-45 of IFRS 15 to determine a measure of progress that will depict the entity's performance. For the consideration that is in the form of a sales-based royalty, paragraph B63 of IFRS 15 applies because the sales-based royalty relates solely to the licence, which is the only performance obligation in the contract. The entity concludes that recognition of the CU2 million fixed consideration as revenue rateably over time plus recognition of the royalty as revenue as and when the customer's sales of items using the team name or logo occur reasonably depicts the entity's progress towards complete satisfaction of the licence performance obligation.

In Example 61 above, the fixed consideration of CU2 million is an explicit term in the contract with the customer. In some contracts, fixed consideration is implied, such as when a guaranteed minimum amount of royalties is part of the transaction price.

In addition, as discussed in Question 8-5 in section 8.3.1 above, many licences that provide a right to access intellectual property constitute a series of distinct goods or services that are substantially the same and have the same pattern of transfer to the customer (e.g., a series of distinct periods of access to intellectual property, such as monthly access or quarterly access). In cases where the criteria for a performance obligation to be accounted for as a series of distinct goods or services have been met, an entity needs to consider whether any variable consideration in the contract (e.g., sales-based or usage-based royalties) must be allocated directly to the distinct periods of access, if the criteria for the variable consideration allocation exception are met (see section 6.3 above). The allocation of sales-based or usage-based royalties in this manner generally results in the recognition of royalties as revenue when (or as) the customer's underlying sales or usage occurs.

An entity might need to apply significant judgement to determine the appropriate pattern of revenue recognition for royalties received on a licence that provides a right to access intellectual property.

Frequently asked questions

Question 8-8: Can the recognition constraint for sales-based or usage-based royalties be applied to royalties that are paid in consideration for sales of intellectual property (rather than just licences of intellectual property)?

As noted in the Basis for Conclusions, the Board discussed but decided not to expand the scope of the royalty recognition constraint to include sales of intellectual property. The Board also stated that the royalty recognition constraint is intended to apply only to limited circumstances (i.e., those circumstances involving licences of intellectual property) and, therefore, entities cannot apply it by analogy to other types of transactions. [IFRS 15.BC421, IFRS 15.BC421F].

Question 8-9: If a contract for a licence of intellectual property includes payments with fixed amounts (e.g., milestone payments) that are determined by reference to sales-based or usage-based thresholds, would the royalty recognition constraint need to be applied?

How we see it

We generally believe the royalty recognition constraint would apply to fixed amounts of variable consideration (i.e., fixed amounts of consideration that are contingent on the occurrence of a future event), such as milestone payments, provided the amounts are determined by reference to sales-based or usage-based thresholds. This is the case even if those payments are not referred to as 'royalties' under the terms of the contract. However, entities need to apply judgement and carefully evaluate the facts and circumstances of their contracts for licences of intellectual property to determine whether these types of payments need to be accounted for using the royalty recognition constraint.

Consider the following Illustration:

Illustration 8-3: Application of the royalty recognition constraint to a milestone payment

An entity enters into a contract to grant a customer a right to use the entity's intellectual property. The contract contains payment terms that include a CU10 million milestone payment that is payable to the entity once the customer has achieved sales of CU100 million associated with the licence.

The entity determines that the milestone payment is based on the customer's subsequent sales and represents variable consideration because it is contingent on the customer's sales reaching CU100 million. The entity accounts for the CU10 million milestone payment in accordance with the royalty recognition constraint and only recognises revenue for the milestone payment once the customer's sales reach CU100 million.

Question 8-10: If a contract for a licence of intellectual property includes a milestone payment based on the first commercial sale, would the royalty recognition constraint apply?

How we see it

We generally believe it would be acceptable for an entity to apply the royalty recognition constraint to a milestone payment that is contingent on the customer's first commercial sale of a product using the entity's intellectual property. This is because the milestone payment is linked to a sales-based or usage-based threshold (i.e., the milestone payment is based on the customer's sales).

Consider the following Illustration:

Illustration 8-4: Application of the royalty recognition constraint to a milestone payment based on the first commercial sale

An entity enters into a contract to grant a customer a right to use the entity's intellectual property. The contract contains payment terms that include a CU10 million milestone payment that is payable to the entity upon the customer's first commercial sale of a product that uses the entity's intellectual property.

The entity determines that the milestone payment is based on the customer's subsequent sales and represents variable consideration because it is contingent on the customer's first commercial sale. It accounts for the CU10 million milestone payment in accordance with the royalty recognition constraint and only recognises revenue for the milestone payment upon the customer's first commercial sale.

In contrast, if a milestone payment is contingent on metrics that are not determined by reference to sales-based or usage-based thresholds and that are substantive (e.g., regulatory approval), the royalty recognition constraint must not be applied (i.e., the milestone payment is not based on the customer's sales). Rather, the general variable consideration requirements need to be applied.

As discussed in Question 5-13 in section 5.2.3 above, we expect entities to conclude, in many instances, that milestone payments contingent on regulatory approval (e.g., regulatory approval of a new drug) are constrained, preventing them from recognising these payments until the uncertainty associated with the payments is resolved.

Question 8-11: Does the application of the royalty recognition constraint preclude the requirement to adhere to the allocation objective in IFRS 15.73?

If an entity applies the royalty recognition constraint, it still needs to adhere to the allocation objective in IFRS 15.73 if the contract contains multiple performance obligations. It is clear from paragraphs IFRS 15.BC421A and BC421G that allocation of sales-based or usage-based royalties to two or more different performance obligations was contemplated by the Board. This is also consistent with Example 60, which clarifies sales-based or usage-based royalties need to be allocated to each performance obligation. [IFRS 15.IE Example 60, IFRS 15.IE308]. Therefore, regardless of whether an entity applies the royalty recognition constraint or the general constraint on variable consideration, it is still required to allocate sales-based or usage-based royalties to separate performance obligations in a contract in a manner consistent with the allocation objective in IFRS 15.73. To perform such an allocation, an entity might need to include expected royalties in its estimate of the stand-alone selling price of one or more of the performance obligations.

Question 8-12: Can an entity recognise revenue for sales-based or usage-based royalties for licences of intellectual property on a lag if actual sales or usage data is not available at the end of a reporting period?

The standard requires that sales-based or usage-based royalties promised in exchange for licences of intellectual property be recognised as revenue at the later of when: (1) the subsequent sales or usage occurs and (2) the performance obligation to which the sales-based or usage-based royalties relate has been satisfied (or partially satisfied). [IFRS 15.B63].

How we see it

After the conditions in the royalty recognition constraint application guidance have been met (i.e., the underlying sales or usage has occurred and the performance obligation to which the royalties relate has been satisfied (or partially satisfied)), we believe that licensors without actual sales or usage data from the licensee need to make an estimate of royalties earned in the current reporting period.

Question 8-13: How does a minimum guarantee affect the recognition of sales-based or usage-based royalties promised in exchange for a licence of intellectual property that is satisfied at a point in time?

(FASB TRG meeting 7 November 2016 - Agenda paper no. 58)

The FASB TRG members generally agreed that a minimum guaranteed amount of sales based or usage-based royalties promised in exchange for a licence of intellectual property that is satisfied at a point in time (IFRS accounting standards: right-to-use licence; US GAAP: licence of functional intellectual property) would need to be recognised as revenue at the point in time that the entity transfers control of the licence to the customer (see section 8.3.2 above). Any royalties above the fixed minimum would be recognised in accordance with the royalty recognition constraint (i.e., at the later of when the sale or usage occurs or when the entity satisfies the performance obligation to which some or all of the royalty has been allocated).¹³⁶

Question 8-14: How does a minimum guarantee affect the recognition of sales-based or usage-based royalties promised in exchange for a licence of intellectual property that is satisfied over time?

(FASB TRG meeting 7 November 2016 - Agenda paper no. 58)

The FASB TRG members generally agreed that various recognition approaches could be acceptable for minimum guarantees promised in exchange for licences of intellectual property that are satisfied over time (IFRS accounting standards: right-to-access licences; US GAAP: licences of symbolic intellectual property, see section 8.3.1 above). This is because, as the FASB staff noted in the TRG agenda paper,

¹³⁶ FASB TRG Agenda paper no. 60, November 2016 Meeting - Summary of Issues Discussed and Next Steps, dated 31 January 2017.

this question is asking what is an appropriate measure of progress for such contracts and the standard permits reasonable judgement when selecting a measure of progress. Because the standard does not prescribe a single approach that must be applied in all circumstances in which a sales-based or usage-based royalty is promised in exchange for a licence of intellectual property and the contract includes a minimum guaranteed amount, an entity needs to consider the nature of its arrangements and make sure that the measure of progress it selects does not override the core principle of the standard that “an entity shall recognise revenue to depict the transfer of promised goods or services to customers in an amount that reflects the consideration to which the entity expects to be entitled in exchange for those goods or services”. [IFRS 15.2]. An entity would need to disclose the accounting policy it selects because it is likely that this would affect the timing of revenue recognised.

The agenda paper describes two approaches. Under one approach, an entity would estimate the total consideration (i.e., the fixed minimum and the variable consideration from future royalties) and apply an appropriate measure of progress to recognise revenue as the entity satisfies the performance obligation, subject to the royalty recognition constraint. Alternatively, under the other approach, an entity could apply a measure of progress to the fixed consideration and begin recognising the variable component after exceeding the fixed amount on a cumulative basis.

The first approach can be applied in two different ways, as follows:

- View A: If an entity expects royalties to exceed the minimum guarantee, the entity might determine that an output-based measure is an appropriate measure of progress and apply the right-to-invoice practical expedient (i.e., IFRS 15.B16, see section 7.1.4.B above) because the royalties due for each period correlate directly with the value to the customer of the entity’s performance each period. As a result of applying the practical expedient for recognising revenue, the entity would not need to estimate the expected royalties beyond determining whether it expects, at contract inception, that the royalties will exceed the minimum guarantee. However, the entity would be required to update that assessment at the end of each reporting period. It is important to note that this view is likely to be appropriate if the entity expects cumulative royalties to exceed the minimum guarantee.
- View B: An entity estimates the transaction price for the performance obligation (including both fixed and variable consideration) and recognises revenue using an appropriate measure of progress, subject to the royalty recognition constraint. If an entity does not expect cumulative royalties to exceed the minimum guarantee, the measure of progress is applied to the minimum guarantee since the transaction price will at least equal the fixed amount.

The second approach can be summarised, as follows:

- View C: An entity recognises the minimum guarantee (i.e., the fixed consideration) using an appropriate measure of progress and recognises royalties only when cumulative royalties exceed the minimum guarantee.

The FASB staff noted in the TRG agenda paper that, in order for an entity to apply View C, the over-time licence would have to be considered a series of distinct goods or services (i.e., a series of distinct time periods) and the variable consideration (i.e., the royalties in excess of the minimum guarantee) would have to be allocated to the distinct time periods to which they relate.

To illustrate the application of these views, the following Illustration has been adapted from an example included in the FASB TRG agenda paper:

Illustration 8-5: Accounting for a licence of intellectual property that is satisfied over time in exchange for a minimum guarantee and sales-based royalty

An entity enters into a five-year arrangement to licence a trademark. The trademark is determined to be a licence of intellectual property that is satisfied over time (IFRS accounting standards: right-to-access licence; US GAAP: licence of symbolic intellectual property). The licence requires the customer to pay a sales-based royalty of 5% of its gross sales associated with the trademark. However, the contract includes a guarantee that the entity will receive a minimum of CU5 million for the entire five-year period.

The customer’s actual gross sales associated with the trademark and the related royalties each year are, as follows (this information is not known at the beginning of the contract):

Year 1 - CU15 million (royalties equal CU750,000)
 Year 2 - CU30 million (royalties equal CU1.5 million)
 Year 3 - CU40 million (royalties equal CU2 million)
 Year 4 - CU20 million (royalties equal CU1 million)
 Year 5 - CU60 million (royalties equal CU3 million)
 Total royalties equal CU8.25 million.

View A: The entity expects total royalties to exceed the minimum guarantee. The entity determines that an output-based measure is an appropriate measure of progress and applies the right-to-invoice practical expedient because the royalties due for each period correlate directly with the value to the customer of the entity's performance for each period. The entity recognises revenue from the sales-based royalty when the customer's subsequent sales occur.

(in 000s)	Year 1	Year 2	Year 3	Year 4	Year 5
Royalties received	750	1,500	2,000	1,000	3,000
Annual revenue	750	1,500	2,000	1,000	3,000
Cumulative revenue	750	2,250	4,250	5,250	8,250

View B: The entity estimates the transaction price (including fixed and variable consideration) for the contract. The entity determines that time elapsed is an appropriate measure of progress and recognises revenue rateably over the five-year term of the contract, subject to the royalty recognition constraint (i.e., cumulative revenue recognised cannot exceed the cumulative royalties received once the minimum guarantee has been met).

(in 000s)	Year 1	Year 2	Year 3	Year 4	Year 5
Royalties received	750	1,500	2,000	1,000	3,000
Royalties (cumulative)	750	2,250	4,250	5,250	8,250
Fixed + Variable (rateable) ^a	1,650	1,650	1,650	1,650	1,650
Annual revenue	1,650	1,650	1,650	300	3,000
Cumulative revenue	1,650	3,300	4,950	5,250^b	8,250

- a. Assuming the entity's estimated transaction price (including both fixed and variable consideration) is CU8.25 million, the annual revenue that could be recognised is CU1.65 million (CU8.25 million divided by five years, being contract term).
- b. In Year 4, the cumulative revenue using a time-elapsed measure of progress of CU6.6 million (CU4.95 million plus CU1.65 million) exceeds the cumulative royalties received (CU5.25 million). As such, the total cumulative revenue recognised through to the end of Year 4 is constrained to the total cumulative royalties received of CU5.25 million.

View C: The entity recognises the minimum guarantee (i.e., the fixed consideration) using an appropriate measure of progress and recognises royalties only when cumulative royalties exceed the minimum guarantee. The entity determines that time elapsed is an appropriate measure of progress.

The entity applies the royalty recognition constraint to the sales-based royalties that are in excess of the minimum guarantee (i.e., recognise the royalties as revenue when the minimum guarantee is exceeded on a cumulative basis). The variable consideration (royalties in excess of the minimum guarantee) is allocated to the distinct periods using the variable consideration allocation exception (see section 6.3 above).

[IFRS 15.85].

As previously discussed, the FASB staff noted in the TRG agenda paper that, in order for an entity to apply View C, the over-time licence would have to be considered a series of distinct goods or services (i.e., a series of distinct time periods) and the variable consideration (i.e., the royalties that are in excess of the minimum guarantee) would have to be allocated to the distinct time periods to which they relate.

(in 000s)	Year 1	Year 2	Year 3	Year 4	Year 5
Royalties received	750	1,500	2,000	1,000	3,000
Royalties (cumulative)	750	2,250	4,250	5,250	8,250
Fixed (rateable) ^a	1,000	1,000	1,000	1,000	1,000
Annual revenue	1,000	1,000	1,000	1,250 ^b	4,000 ^c
Cumulative revenue	1,000	2,000	3,000	4,250	8,250

- a. Because the minimum guarantee is CU5 million over the contract term, the annual revenue (excluding royalties that are in excess of the minimum guarantee) is CU1 million (CU5 million divided by five years, being the contract term).
- b. In Year 4, the cumulative royalties received (CU5.25 million) exceed the total minimum guarantee (CU5 million) by CU250,000. As such, the annual revenue recognised in Year 4 is CU1.25 million (CU1 million annual revenue plus CU250,000 of royalties in excess of the minimum guarantee).
- c. In Year 5, the annual revenue recognised (CU4 million) is calculated as the CU1 million annual revenue plus the royalties for that year (CU3 million) since the royalties exceeded the minimum guarantee in Year 4.

The FASB staff noted in the TRG agenda paper that other measures of progress, in addition to those set out above, could be acceptable because the standard permits entities to use judgement in selecting an appropriate measure of progress and that judgement is not limited to the views in the TRG agenda paper. However, the staff emphasised that it would not be acceptable for entities to apply any measure of progress in any circumstance. For example, the FASB staff noted it would not be acceptable to apply multiple measures of progress to a single performance obligation, such as one measure for fixed consideration and a different one for variable consideration. The staff also thought it would not be appropriate for an entity to apply the breakage model in IFRS 15.B46 (see section 7.9 above) because it is likely that a customer would not have an unexercised right in a licence arrangement if the entity were providing the customer with access to its intellectual property over the entire term of the arrangement. [IFRS 15.B46]. Another approach that would not be appropriate, according to the FASB staff, is one that ignores the royalty recognition constraint application guidance in IFRS 15.B63, which requires revenue to be recognised at the later of when: (1) the subsequent sale or usage occurs; or (2) the performance obligation to which some or all of the sales-based or usage-based royalty has been allocated is satisfied (in whole or in part) (discussed in section 8.5 above). [IFRS 15.B63].

Question 8-15: Can entities apply the royalty recognition constraint for sales-based or usage-based royalties if they do not own the intellectual property or control the intellectual property as a principal in the arrangement?

How we see it

We generally believe entities can apply the royalty recognition constraint if their revenue is based on a sales-based or usage-based royalty from a licence of intellectual property, but they do not own or control the intellectual property as a principal in the arrangement.

It is important to note that this view applies only to licences of intellectual property for which some or all of the consideration received by both the licensor and the agent is in the form of a sales-based or usage-based royalty. Entities cannot analogise to this view for other situations.

Entities need to disclose their use of the royalty recognition constraint because it is likely to affect the amount and timing of revenue recognised.

Consider the following Illustration:

Illustration 8-6: Application of the royalty recognition constraint as an agent

University U has intellectual property for its logo. Company Z, acting as an agent for University U, identifies an apparel company looking to license University U's logo to put it on merchandise. University U is paid a royalty based on sales and usage of its intellectual property (the logo) by the licensee (the apparel company). Company Z receives a portion of the royalty earned by University U. Company Z does not control the intellectual property at any point during the arrangement and its ability to receive consideration from University U depends on the licensing of University U's intellectual property. We believe that application of the royalty recognition constraint would be appropriate in this example because the royalties earned by University U and, in effect, the amount Company Z expects to be entitled to receive, are directly tied to the usage of the intellectual property.

Question 8-16: Can entities recognise sales-based or usage-based royalties before the sale or usage of the intellectual property occurs if they have historical information that is highly predictive of future royalty amounts?

In accordance with IFRS 15.B63-B63B, revenue from a sales-based or usage-based royalty promised in exchange for a licence of intellectual property is recognised at the later of when: (1) the subsequent sale or usage occurs; or (2) the performance obligation to which some or all of the sales-based or usage-based royalty has been allocated has been satisfied (in whole or in part).

How we see it

Revenue recognition cannot be accelerated even if an entity has historical information that is highly predictive of future royalty amounts. That is, the use of the royalty recognition constraint is not optional.

Question 8-17: Must an entity apply the royalty recognition constraint when the royalty is calculated on a financial metric that is not solely based on sales or usage?

How we see it

In certain circumstances, we believe the royalty recognition constraint can be applied when the royalty is calculated on a financial metric that is not solely based on sales or usage.

We believe that a metric such as gross profit (commonly defined as sales less cost of goods sold) is largely attributable to sales. Judgement will be required to determine whether the royalty recognition constraint applies if the royalty is based on a different financial metric that is not solely based on sales or usage.

A licensor, for example, might be entitled to a fee based on a fixed percentage of gross profit generated by the licensee for the entire term of the contract. If the royalty is calculated using gross profit, the royalty recognition constraint might be applied.

Question 8-18: Does the royalty recognition constraint apply if the licence of intellectual property is not distinct from other goods or services in the contract?

If the licence of intellectual property is not distinct from other goods or services in the contract, the royalty recognition constraint applies only if the licence is the predominant item to which the royalty relates. As discussed in section 8.5 above, IFRS 15.B63A requires that the royalty recognition constraint be applied to the overall royalty stream when the sole or predominant item to which the royalty relates is a licence of intellectual property. For example, the licence of intellectual property may be the predominant item to which the royalty relates when the entity has a reasonable expectation that the customer would ascribe significantly more value to the licence than to the other goods or services to which the royalty relates. The royalty recognition constraint would also apply when there is no single licence of intellectual property is the predominant item to which the royalty relates, but the royalty predominantly relates to two or more licences of intellectual property in the contract. [IFRS 15.BC421G].

The Board noted in the Basis for Conclusions that applying the royalty recognition constraint only when the royalty solely relates to a licence that is a separate performance obligation would have excessively restricted its application. Furthermore, it noted that applying the royalty recognition constraint to those royalty arrangements in which the licence is the predominant feature to which the royalty relates provides more useful information to users that are likely to view those arrangements as licensing arrangements. [IFRS 15.BC421D].

The standard does not provide a bright line for determining the 'predominant' item in a contract that includes a licence of intellectual property. The Board acknowledged in the Basis for Conclusions that significant judgement is required to determine when a licence is the predominant item to which a royalty relates. However, the judgement for determining whether a licence is the predominant item is likely to be less than the judgement needed to apply the general requirements for variable consideration to such contracts. [IFRS 15.BC421E].

Question 8-19: Can an entity recognise revenue at an expected average rate when a licence of intellectual property has royalty rates that increase (or decrease) over time?

As discussed in section 8.5 above, IFRS 15.B63 requires that sales-based or usage-based royalties received in exchange for licences of intellectual property be recognised at the later of when: (1) the subsequent sale or usage occurs; or (2) the performance obligation to which some or all of the sales-based or usage-based royalty has been allocated is satisfied (wholly or partially). That is, an entity recognises the royalties as revenue when (or as) the customer's subsequent sales or usage occurs, unless that recognition pattern accelerates revenue recognition ahead of the entity's satisfaction of the performance obligation to which the royalty solely (or partially) relates based on an appropriate measure of progress. As discussed by the Board, an example of when revenue recognition might be accelerated ahead of the entity's performance is an arrangement in which the royalty rate decreases over the licence period. [IFRS 15.BC421I].

In contrast to the declining royalty rate scenario discussed by the FASB in the Basis for Conclusions to its revenue standard, and discussed above,¹³⁷ we would not expect an increasing royalty rate to cause revenue to be recognised ahead of an entity's performance if an entity's recognises revenue as the related sales or usage occurs at the contractual rate in place at the time. However, if an entity were to use an output measure based on an average expected royalty rate over the full contract term, it would be accelerating revenue recognition ahead of the related sales or usage, which would be counter to the principle of the royalty recognition constraint. In this case, it would be inappropriate to recognise revenue using an output measure based on an average expected royalty rate over the full contract term.

Question 8-20: How would an entity distinguish between a contract that contains an option to purchase additional licences and a contract in which additional licence usage may be subject to the royalty recognition constraint?

(TRG meeting 9 November 2015 - Agenda paper no. 45)

A technology entity might, for example, provide the customer with the option to purchase or use additional copies of software in exchange for additional consideration, and the customer may have the ability to replicate the software or download additional copies without further assistance from the technology entity. Questions have been raised about whether this type of option is an option to acquire additional software rights (i.e., an option for additional goods, as discussed in section 4.6 above) or whether the extra copies represent additional usage of the software licence and, therefore, whether the additional usage gives rise to a sales-based or usage-based royalty that is likely to be subject to the royalty recognition constraint.

The TRG generally agreed that the entity has to exercise judgement to determine whether the contract is for a single licence or for multiple licences. In doing so, the entity considers whether the additional copies are distinct goods or services. Additional licences are typically distinct because the customer can benefit from the additional licence on its own, providing it does not modify, customise or have an interdependency with existing licences. The TRG members also generally agreed that, while the customer may be able to replicate the software or download additional copies without the assistance of the technology entity, the entity might still be required to grant additional rights to the customer for the use of the additional copies of software.

An entity has provided a customer with an option if the customer can decide to purchase additional distinct copies of the software, and the entity is required to transfer those additional rights to the customer. See section 4.6 above for further discussion of the accounting for customer options for additional goods and services, including how to evaluate whether the option represents a material right. Conversely, if the contract requires the customer to pay usage-based fees to compensate the vendor for the rights to use the software that have already been transferred, these fees are treated as variable consideration (see section 5.2 above). This conclusion is consistent with the discussion in Question 4-20 in section 4.6 above. However, when the software licence is the sole or predominant item to which the usage-based fees relate, in accordance with IFRS 15.B63A, the fees are accounted for as sales-based and usage-based royalties (as discussed in section 8.5 above) rather than the general variable consideration requirements.

137 ASU 2016-10, *Revenue from Contracts with Customers (Topic 606): Identifying Performance Obligations and Licensing*, April 2016, paragraph BC71.

9 IFRS 15 - Other measurement and recognition topics

9.1 Warranties

Warranties are commonly included in arrangements to sell goods or services. They might be explicitly included in the contractual arrangement with a customer or might be required by law or regulation. In addition, an entity might have established an implicit policy of providing warranty services to maintain a desired level of satisfaction among its customers. Whether explicit or implicit, warranties extend an entity's obligations beyond the transfer of control of the good or service to the customer, requiring it to stand ready to perform under the warranty over the life of the warranty obligation.

Warranties will normally meet the definition of an insurance contract, which is a contract in which "one party (the issuer) accepts significant insurance risk from another party (the policyholder) by agreeing to compensate the policyholder if a specified uncertain future event (the insured event) adversely affects the policyholder". [IFRS 17 Appendix A]. Therefore, before assessing warranties under IFRS 15, an entity needs to consider whether the warranty might be within the scope of IFRS 17 (also see Chapter 51). To make this assessment, entities need to consider whether the scope exception in IFRS 17 applies for "warranties provided by a manufacturer, dealer or retailer in connection with the sale of its goods or services to a customer". [IFRS 17.7(a)].

How we see it

For some entities this assessment will be straightforward. For other entities, we believe judgement might be needed to determine whether the scope exception applies, and the following three considerations are relevant:

- What is considered a manufacturer, dealer or retailer? Even though these terms are not defined, we believe these terms are to be understood broadly, which also appears to have been the IASB's intention as described in the Basis for Conclusions on IFRS 17 (also see Chapter 51). [IFRS 17.BC89]. That is, use of these terms is not meant to be restrictive. Therefore, an entity can use its judgement to determine whether it broadly can be considered a manufacturer, dealer or retailer (e.g., a service provider might conclude it can apply the scope exception).
- How close does the connection to the sale of goods need to be? For example, it is likely that a warranty sold separately at or near the time that the goods or services are provided would be considered 'in connection', but what if the warranty is separately sold at a later date? In making the assessment about the IFRS 17 scope exclusion, we believe that time is generally a relevant, but not necessarily determinative, consideration. Furthermore, the guidance in IFRS 15 on contract combinations and contract modifications could be relevant for this assessment (see section 3.3 and section 3.4 above, respectively).
- What if there is more than one party involved in providing the goods or services and the warranty? Assume, for example, that a manufacturer's customer is a retailer for specific goods (i.e., the retailer is the principal for goods sold to end-consumers (see section 4.4 above for further discussion on principal versus agent assessments), but it provides warranties to the end-consumers (i.e., the retailer's customers) for which the retailer is an agent. In such a situation, an entity needs to assess whether it is the principal or an agent. If it is an agent, then it might conclude the scope exception in IFRS 17.7 does not apply because an agent's customer is the principal in the transaction (not the end-customer). However, judgement would be needed based on the specific facts and circumstances.

For further discussion on the requirements of IFRS 17, see Chapter 51.

The price of a warranty might be included in the overall purchase price or listed separately as an optional product. If the warranty is not separately purchased and it is within the scope of IFRS 17, the contract consideration will need to be allocated between the standards in accordance with IFRS 15.7 - see sections 2.5 and 6.6 above for further discussion.

For warranties within the scope of IFRS 15, while the standard notes that the nature of a warranty can vary significantly across industries and contracts, it identifies two types of warranties: [IFRS 15.B28]

- Warranties that promise the customer that the delivered product is as specified in the contract (called 'assurance-type warranties')
- Warranties that provide a service to the customer in addition to assurance that the delivered product is as specified in the contract (called 'service-type warranties')

9.1.1 Determining whether a warranty is an assurance-type or service-type warranty

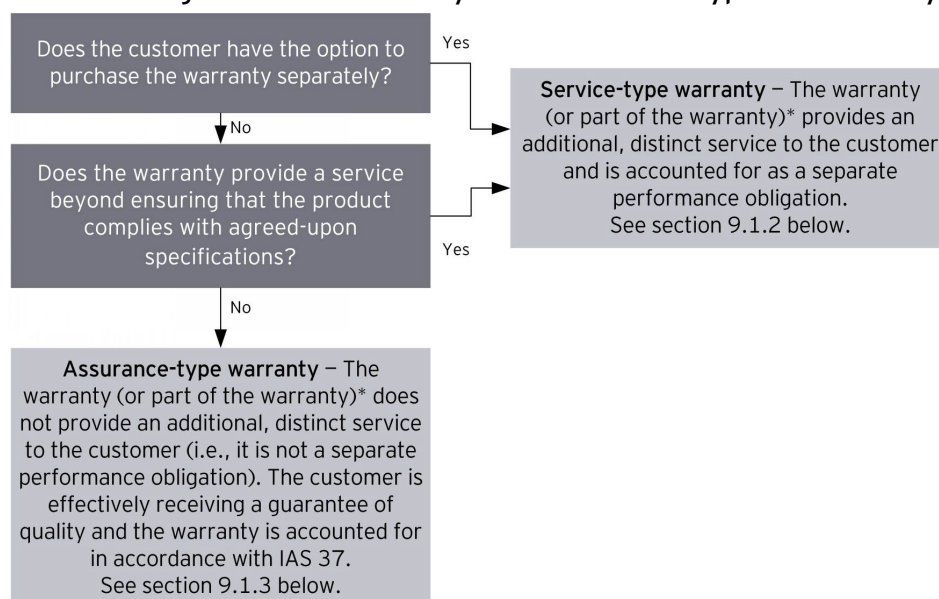

If the customer has the option to purchase the warranty separately or if the warranty provides a service to the customer, beyond ensuring that the product complies with agreed-upon specifications, IFRS 15.B29 states that the entity is providing a service-type warranty. [IFRS 15.B29]. Otherwise, it is an assurance-type warranty, which provides the customer with assurance that the product complies with agreed-upon specifications. [IFRS 15.B30]. In some cases, it might be difficult to determine whether a warranty provides a customer with a service in addition to the assurance that the delivered product is as specified in the contract. To help entities make that assessment, the standard provides the following application guidance: [IFRS 15.B31, IFRS 15.B33]

Extract from IFRS 15

- B31** In assessing whether a warranty provides a customer with a service in addition to the assurance that the product complies with agreed-upon specifications, an entity shall consider factors such as:
- (a) Whether the warranty is required by law—if the entity is required by law to provide a warranty, the existence of that law indicates that the promised warranty is not a performance obligation because such requirements typically exist to protect customers from the risk of purchasing defective products.
 - (b) The length of the warranty coverage period—the longer the coverage period, the more likely it is that the promised warranty is a performance obligation because it is more likely to provide a service in addition to the assurance that the product complies with agreed-upon specifications.
 - (c) The nature of the tasks that the entity promises to perform—if it is necessary for an entity to perform specified tasks to provide the assurance that a product complies with agreed-upon specifications (for example, a return shipping service for a defective product), then those tasks likely do not give rise to a performance obligation.
- B33** A law that requires an entity to pay compensation if its products cause harm or damage does not give rise to a performance obligation. For example, a manufacturer might sell products in a jurisdiction in which the law holds the manufacturer liable for any damages (for example, to personal property) that might be caused by a consumer using a product for its intended purpose. Similarly, an entity's promise to indemnify the customer for liabilities and damages arising from claims of patent, copyright, trademark or other infringement by the entity's products does not give rise to a performance obligation. The entity shall account for such obligations in accordance with IAS 37.

The following flow chart illustrates these requirements:

Figure 9-1: Determining whether a warranty is an assurance-type or service-type warranty

* Some contracts may include both assurance-type and service-type warranties. See section 9.1.4 below for further discussion.

How we see it

Entities might need to exercise significant judgement when determining whether a warranty is an assurance-type or service-type warranty. An entity's evaluation might be affected by several factors, including common warranty practices within its industry and the entity's business practices related to warranties. For example, consider an automotive manufacturer that provides a five-year warranty on a luxury vehicle and a three-year warranty on a standard vehicle. The manufacturer might conclude that the longer warranty period is not an additional service because it believes the materials used to construct the luxury vehicle are of a higher quality and that latent defects would take longer to appear. In contrast, the manufacturer might also consider the length of the warranty period and the nature of the services provided under the warranty and conclude that the five-year warranty period, or some portion of it, is an additional service that needs to be accounted for as a service-type warranty. The standard excludes assurance-type warranties, which are accounted for in accordance with IAS 37.

As a reminder (and as discussed in section 2.5 above), elements of a contract with a customer might be in the scope of other standards and not within the scope of IFRS 15. Certain entities, particularly those that act as an agent in a revenue transaction and provide quality assurance or similar promises to a customer's customer, will need to consider whether such promises are in the scope of other standards (e.g., IFRS 17, IFRS 9) before applying the warranty application guidance in IFRS 15.

Frequently asked questions

Question 9-1: How does an entity evaluate whether a product warranty is a service-type warranty (i.e., a performance obligation) when it is not separately priced?

(TRG meeting 30 March 2015 - Agenda paper no. 29)

TRG members generally agreed that the evaluation of whether a warranty provides a service (in addition to the assurance that the product complies with agreed specifications) requires judgement and depends on the facts and circumstances. There is no bright line in the standard on what constitutes a service-type warranty, beyond it being separately priced.

However, IFRS 15.B31 includes three factors that need to be considered in each evaluation: (1) whether the warranty is required by law; (2) the length of the warranty coverage; and (3) the nature of the tasks that the entity promises to perform. Consider the following Illustration, based on an example from the TRG agenda paper, which shows the factors an entity considers in assessing whether a product warranty is a service-type warranty:

Illustration 9-1: Consideration of service-type warranty factors

A luggage company provides a life-time warranty to repair broken or damaged baggage free of charge. The luggage company evaluates the three factors in IFRS 15.B31 and determines that the warranty is a performance obligation in addition to the assurance that the product complies with agreed-upon specifications because: (1) there is no law that requires the luggage company to make a promise for the lifetime of the product; (2) the length of the warranty is for the life of the baggage; and (3) the tasks include both repairs to baggage that does not meet the promised specifications and repairs for broken or damaged baggage.

Furthermore, the TRG agenda paper emphasised that entities need to evaluate each type of warranty offered to determine the appropriate accounting treatment.¹³⁸

Question 9-2: How would an entity account for a customary business practice of providing repairs outside the stated contractual warranty period?

An entity must consider all facts and circumstances, including the factors in IFRS 15.B31 (e.g., the nature of the services provided, the length of the implied warranty period) to determine whether a customary business practice of providing repairs outside the stated contractual warranty period needs to be accounted for as an implied assurance-type or service-type warranty. For example, an equipment manufacturer might give its customers a standard product warranty that provides assurance that the product complies with agreed-upon specifications for one year from the date of purchase. However, the entity might also provide an implied warranty by frequently repairing products for free after the one-year standard warranty period has ended. See section 4.1 above for a discussion of implied promises in a contract with a customer.

¹³⁸ TRG Agenda paper no. 29, *Warranties*, dated 30 March 2015 and TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015.

If the entity determines that the repairs made during the implied warranty period generally involve defects that existed when the product was sold and the repairs occur shortly after the assurance warranty period, it is likely that the entity would conclude that the repairs are covered by an assurance-type warranty. That is, the term of the assurance-type warranty might be longer than that stated in the contract. However, all facts need to be considered to reach a conclusion.

If the entity determines that the repairs made during the implied warranty period are covered by a service-type warranty (because the entity is providing a service to the customer beyond fixing defects that existed at the time of sale), it also needs to consider whether the term of the service-type warranty is longer than that stated in the contract.

Question 9-3: Does an entity account for a customer's return of a defective item in exchange for compensation (i.e., not for a replacement item) as a right of return or an assurance-type warranty?

How we see it

We believe that an entity that is the principal in the transaction must account for a customer's right to return a defective item in return for cash (instead of a replacement item) under the right of return application guidance in IFRS 15.B20-B27, rather than as an assurance-type warranty.

The Basis for Conclusions states that "... the boards decided that an entity should recognise an assurance-type warranty as a separate liability to replace or repair a defective product". [IFRS 15.BC376]. This description of an assurance-type warranty does not include defective products that are returned for a refund. It only contemplates defective products that are replaced or repaired. See section 5.4 above for a discussion of rights of return.

If an entity provides customers with an option to receive either a cash refund or a replacement product, the entity is required to estimate which options customers will choose and account for each option accordingly. That is, the entity needs to estimate the expected returns in exchange for cash as part of its accounting for estimated returns and account for the expected returns in exchange for a replacement product under the warranty application guidance.

However, there might be limited circumstances in which the cash paid to a customer for a defective item would need to be accounted for in accordance with the warranty application guidance, instead of as a right of return. For example, an entity might pay cash to a customer as reimbursement for third-party costs incurred to repair a defective item. In this case, the cash payment to the customer was incurred to fulfil the entity's warranty obligation. This assessment requires judgement and depends on the facts and circumstances.

Similarly, entities will need to apply judgement in determining the appropriate treatment for product recalls (also see Question 7-24 in section 7.3.1 above).

Question 9-4: Are liquidated damages, penalties or compensation from other similar clauses accounted for as variable consideration or as warranties under the standard?

See response to Question 5-4 in section 5.2.1 above.

9.1.2 Service-type warranties

The Board determined that a service-type warranty represents a distinct service and is a separate performance obligation. [IFRS 15.BC371]. Therefore, using the relative stand-alone selling price of the warranty, an entity allocates a portion of the transaction price to the service-type warranty (see section 6 above, also see section 6.1 above for a discussion on determining stand-alone selling prices, which might not be equal to the contractually stated price). The entity then recognises the allocated revenue over the period in which the service-type warranty service is provided. [IFRS 15.B29, IFRS 15.B32]. This is because it is likely that the customer receives and consumes the benefits of the warranty as the entity performs (i.e., it is likely that the warranty performance obligation is satisfied over time in accordance with IFRS 15.35(a), see section 7.1.1 above).

Judgement might be required to determine the appropriate pattern of revenue recognition associated with service-type warranties. For example, an entity might determine that it provides the warranty service continuously over the warranty period (i.e., the performance obligation is an obligation to 'stand ready to perform' during the stated warranty period). An entity that makes this determination is likely to recognise revenue rateably over the warranty period. An entity might also conclude that a different pattern of recognition is appropriate based on data it has collected about when it provides such services. For example, an entity might recognise little or no revenue in the first year of a three-year service-type warranty if its historical data indicates that it only provides warranty services in the second and third years of the warranty period.

The AICPA Audit and Accounting Guide, *Revenue Recognition*, provides non-authoritative guidance on how to determine the appropriate pattern of recognition for service-type warranties. The guidance says that, if an entity determines that it is standing ready to provide protection against damage, loss or malfunction of a product caused by various risks for the specified coverage period (i.e., provides assurance of use for the covered product for the coverage period that would include some level of involvement with the repair or replacement), it recognises revenue over the coverage period.

If an entity determines that it has promised to repair, arrange to repair or replace the product, it recognises revenue over the period in which it is expected to repair or replace the product. The period could extend beyond the coverage period if services to repair or replace the product are expected to be provided after the coverage period ends.

For example, a claim might be filed at the end of a one-year period, but it is fulfilled after the coverage period ends. While the activities in both instances might be similar, the nature of the promise to the customer determines the period of recognition.¹³⁹ Section 7.1.4 above describes considerations for determining the appropriate pattern of revenue recognition, including those for stand-ready obligations. If payment for the service-type warranty is received upfront, an entity must also evaluate whether a significant financing component exists (see section 5.5 above).

In some instances, entities that sell service-type warranties will buy insurance to protect themselves against the potential costs of performing under such warranties. Although the anticipated insurance proceeds might offset any costs that the entity might incur, immediate revenue recognition for the price of the service-type warranty is not appropriate. The entity has not been relieved of its obligation to perform under the terms of the warranty contract and, therefore, a liability still exists. Accordingly, the warranty obligation and any proceeds related to the insurance coverage need to be accounted for separately (unless the insurer has legally assumed the warranty obligation and the customer has acknowledged that fact).

As discussed in section 6.1 above, stand-alone selling prices are determined at contract inception and are not updated to reflect changes in the period between contract inception and when performance is complete (unless the contract has been modified and the contract modification is accounted for as a new or separate contract - see section 6.1.3 above). Accordingly, an entity generally would not change the amount of transaction price it originally allocated to the service-type warranty at contract inception. This would be the case even if, for example, an entity discovers two months after a product is shipped that the cost of a part acquired from a third-party manufacturer has tripled and that, as a result, it will cost the entity significantly more to replace that part if a warranty claim is made. However, for future contracts involving the same warranty, the entity would need to determine whether to revise the stand-alone selling price because of the increase in the costs to satisfy the warranty and, if so, use that revised price for future allocations (see section 6.1.3 above).

9.1.3 Assurance-type warranties

The Board concluded that assurance-type warranties do not provide an additional good or service to the customer (i.e., they are not separate performance obligations). By providing this type of warranty, the selling entity has effectively provided a guarantee of quality. In accordance with IFRS 15.B30, these types of warranties are accounted for as warranty obligations and the estimated cost of satisfying them is accrued in accordance with the requirements in IAS 37. [IFRS 15.BC376]. Once recorded, the warranty liability is assessed on an ongoing basis in accordance with IAS 37 (see Chapter 27).

An entity recognises revenue for sales of goods or services, including assurance-type warranties, when control of the goods or services is transferred to the customer, assuming that the arrangement meets the criteria to be considered a contract under IFRS 15 (see section 3.1 above).

Assurance-type warranties are accounted for outside of the scope of IFRS 15. Therefore, if an entity elects to use a costs incurred measure of progress for over-time revenue recognition of the related good or service, the costs of satisfying an assurance-type warranty are excluded (i.e., excluded from both the numerator and the denominator in the measure of progress calculation - see section 7.1.4 above for further discussion on measuring progress over time).

¹³⁹ See AICPA guide, *Revenue Recognition*, Chapter 1, *General Accounting Considerations*, paragraphs 1.63 - 1.75.

9.1.4 Contracts that contain both assurance and service-type warranties

If an entity provides both an assurance-type and service-type warranty within a contract and the entity cannot reasonably account for them separately, the warranties are accounted for as a single performance obligation (i.e., revenue would be allocated to the combined warranty and recognised over the period the warranty services are provided). [IFRS 15.B32]. The Board noted that this accounting would ensure the entity does not overstate the recognition of revenue at the time the product is transferred to the customer.

[IFRS 15.BC376].

When an assurance-type warranty and a service-type warranty are both present in a contract with a customer and can reasonably account for them separately, an entity is required to accrue for the expected costs associated with the assurance-type warranty and defer the revenue for the service-type warranty, as illustrated below:

Illustration 9-2: Service-type and assurance-type warranties

An entity manufactures and sells computers that include an assurance-type warranty for the first 90 days. The entity offers an optional 'extended coverage' plan under which it will repair or replace any defective part for three years from the expiration of the assurance-type warranty. Since the optional 'extended coverage' plan is sold separately, the entity determines that the three years of extended coverage represent a separate performance obligation (i.e., a service-type warranty).

The total transaction price for the sale of a computer and the extended warranty is CU3,600. The entity determines that the stand-alone selling prices of the computer and the extended warranty are CU3,200 and CU400, respectively. The inventory value of the computer is CU1,440. Furthermore, the entity estimates that, based on its experience, it will incur CU200 in costs to repair defects that arise within the 90-day coverage period for the assurance-type warranty. As a result, the entity will record the following entries:

Dr	Cash/Trade receivables	CU3,600	
Dr	Warranty expense	CU200	
	Cr	Accrued warranty costs (assurance-type warranty)	CU200
	Cr	Contract liability (service-type warranty)	CU400
	Cr	Revenue	CU3,200
<i>To record revenue and liabilities related to warranties.</i>			
Dr	Cost of goods sold	CU1,440	
	Cr	Inventory	CU1,440

To relieve inventory and recognise cost of goods sold.

The entity derecognises the accrued warranty liability associated with the assurance-type warranty as actual warranty costs are incurred during the first 90 days after the customer receives the computer. The entity recognises the contract liability associated with the service-type warranty as revenue during the contract warranty period and recognises the costs associated with providing the service-type warranty as they are incurred. The entity would need to be able to determine whether the repair costs incurred are applied against the warranty reserve it had already established for claims that occur during the first 90 days or recognised as an expense as incurred.

Accounting for both assurance-type warranties and service-type warranties in the same transaction can be complex. Entities might need to develop processes to match individual warranty claims with the specific warranty plans so that claims can be analysed for the appropriate accounting treatment. This individual assessment of warranty claims is necessary because the assurance-type warranty costs will have been accrued previously, while the service-type warranty costs are expenses that need to be recognised in the period in which they are incurred, as illustrated below:

Illustration 9-3: Service-type and assurance-type warranty costs

Assume the same facts as in Illustration 9-2 above, but assume the entity has sold 500 computers during the year. In January of the following year, CU10,000 of warranty claims are submitted by customers. The entity analyses each claim and identifies the specific computer sale to which the claims relate. The entity needs to do this in order to determine eligibility under the warranty plans and the appropriate accounting treatment.

The entity determines that a portion of the claims, costing CU2,500 for repair and replacement parts, are covered by the assurance-type warranty plan. As shown in Illustration 9-2 above, the expected cost of each assurance-type warranty was accrued at the time of the sale. The entity records the following entry to derecognise a portion of the warranty liability:

Dr	Accrued warranty costs (assurance-type warranty)	CU2,500	
Cr	Cash		CU2,500

To derecognise the assurance-type warranty liability as the costs are incurred.

The entity also determines that a portion of the claims, costing CU7,000 for repair and replacement parts, are eligible under the 'extended coverage' plan (i.e., the service-type warranty). The entity records the following entry to recognise the costs associated with the service-type warranty:

Dr	Warranty expense	CU7,000	
Cr	Cash		CU7,000

To record the costs of the service-type warranty as the costs are incurred.

The entity also determines that CU500 of the claims are not eligible under either warranty plan. This is because the claims relate to incidents that occurred after the 90-day coverage period for the assurance-type warranty and the customers in those transactions did not purchase the extended warranty coverage. The entity rejects these customer claims.

9.2 Onerous contracts

Entities are required to use the requirements in IAS 37 to identify and measure onerous revenue contracts. [IFRS 15.BC296]. IAS 37 requires the following in respect of onerous contracts: [IAS 37.66-69]

Extract from IAS 37

Onerous contracts

- 66** If an entity has a contract that is onerous, the present obligation under the contract shall be recognised and measured as a provision.
- 67** Many contracts (for example, some routine purchase orders) can be cancelled without paying compensation to the other party, and therefore there is no obligation. Other contracts establish both rights and obligations for each of the contracting parties. Where events make such a contract onerous, the contract falls within the scope of this Standard and a liability exists which is recognised. Executory contracts that are not onerous fall outside the scope of this Standard.
- 68** This Standard defines an onerous contract as a contract in which the unavoidable costs of meeting the obligations under the contract exceed the economic benefits expected to be received under it. The unavoidable costs under a contract reflect the least net cost of exiting from the contract, which is the lower of the cost of fulfilling it and any compensation or penalties arising from failure to fulfil it.
- 68A** The cost of fulfilling a contract comprises the costs that relate directly to the contract. Costs that relate directly to a contract consist of both:
- (a) the incremental costs of fulfilling that contract—for example, direct labour and materials; and
 - (b) an allocation of other costs that relate directly to fulfilling contracts—for example, an allocation of the depreciation charge for an item of property, plant and equipment used in fulfilling that contract among others.
- 69** Before a separate provision for an onerous contract is established, an entity recognises any impairment loss that has occurred on assets used in fulfilling the contract (see IAS 36).

The requirements in IAS 37 on onerous contracts and how they apply to onerous contracts with customers are discussed in Chapter 27.

If an entity determines a contract is onerous under IAS 37, the provision for the onerous contract will reflect the lower of the penalty for terminating the contract or the present value of the net cost of fulfilling the contract. Contracts need to be reviewed to determine whether there are any special terms that might relieve an entity of its obligations (e.g., *force majeure*). Contracts that can be cancelled without paying compensation to the other party do not become onerous as there is no obligation.

Frequently asked questions

Question 9-5: How does an entity account for an onerous contract with a customer when the contract includes more than one performance obligation that is satisfied over time consecutively?

How we see it

Since the requirements for onerous contracts are outside the scope of IFRS 15, an entity's accounting for onerous contracts does not affect the accounting for its revenue from contracts with customers in accordance with IFRS 15.

Therefore, we believe that entities must use an 'overlay' approach, which consists of two steps:

1. Apply the requirements of IFRS 15 to measure progress in satisfying each performance obligation over time and account for the related costs when incurred in accordance with the applicable standards.
2. At the end of each reporting period, apply IAS 37 to determine if the remaining contract as a whole is onerous (i.e., considering whether the revenue still to be recognised is less than the costs yet to be incurred). If an entity concludes that the remaining contract is onerous, it recognises a provision to the extent that the amount of the unavoidable costs under the contract exceed the economic benefits to be received under it.

The effect of the provision is recognised as an expense, not as an adjustment to revenue. A change in the provision is recognised in profit or loss in accordance with IAS 37.59. [IAS 37.59].

Since the definition of an onerous contract in IAS 37.10 refers only to a contract, the unit of account to determine whether an onerous contract exists is the contract itself, rather than the performance obligations identified in accordance with IFRS 15. [IAS 37.10, IFRS 15.BC295]. As a result, the entity must consider the entire remaining contract, including remaining revenue to be recognised for unsatisfied, or partially unsatisfied, performance obligations and the remaining costs to fulfil those performance obligations.

FASB differences

While requirements exist for some industries or for certain types of transactions, there is no general authoritative standard in US GAAP for when to recognise losses on onerous contracts and, if a loss is to be recognised, how to measure the loss. Accordingly, there is diversity in practice when such contracts are not within the scope of specific authoritative standards.

ASC 605-35, *Revenue Recognition - Provision for Losses on Construction-Type and Production-Type Contracts*, applies to situations in which an entity is expected to incur a loss on a contract within its scope and specifies that the assessment is performed at either the contract level or at the performance obligation level as an accounting policy election.

As the FASB's requirements on onerous contracts are not the same as those in IAS 37, the accounting treatment in this area is not converged.

9.3 Contract costs

IFRS 15 specifies the accounting treatment for costs an entity incurs to obtain and fulfil a contract to provide goods or services to customers as discussed below. An entity only applies those requirements to costs incurred that relate to a contract with a customer that is within the scope of IFRS 15 (see section 2 above). [IFRS 15.8].

It is important to note that IFRS 15 provides guidance on certain costs relating to contracts with customers in the scope of IFRS 15 (i.e., the incremental costs of obtaining a contract and costs incurred to fulfil a contract). However, it does not provide comprehensive cost guidance and must only be applied if the costs are not in the scope of other IFRS accounting standards. That is, if other IFRS accounting standards precludes the recognition of an asset for a particular cost, an asset cannot be recognised under IFRS 15. If the costs are not in the scope of other IFRS accounting standards, an entity would then evaluate whether the costs meet the criteria for capitalisation under IFRS 15. [IFRS 15.8, IFRS 15.BC307].

When an entity recognises capitalised contract costs under IFRS 15, any such assets must be presented separately from contract assets and contract liabilities (see section 10.1 below) in the statement of financial position or disclosed separately in the notes to the financial statements. Furthermore, entities

must consider the requirements in IAS 1 (or IFRS 18,¹⁴⁰ if adopted early) on classification of current assets when determining whether their contract cost assets are presented as current or non-current. See section 10.1.2 below for a discussion on classification as current or non-current.

9.3.1 Costs to obtain a contract

Before applying the cost requirements in IFRS 15, entities need to consider the scoping provisions of the standard. If a payment is made to a customer, an entity first needs to consider whether the requirements on consideration payable to a customer under IFRS 15 apply to the costs (see section 5.7 above for a discussion on accounting for consideration paid or payable to a customer). [IFRS 15.BC255, IFRS 15.BC256].

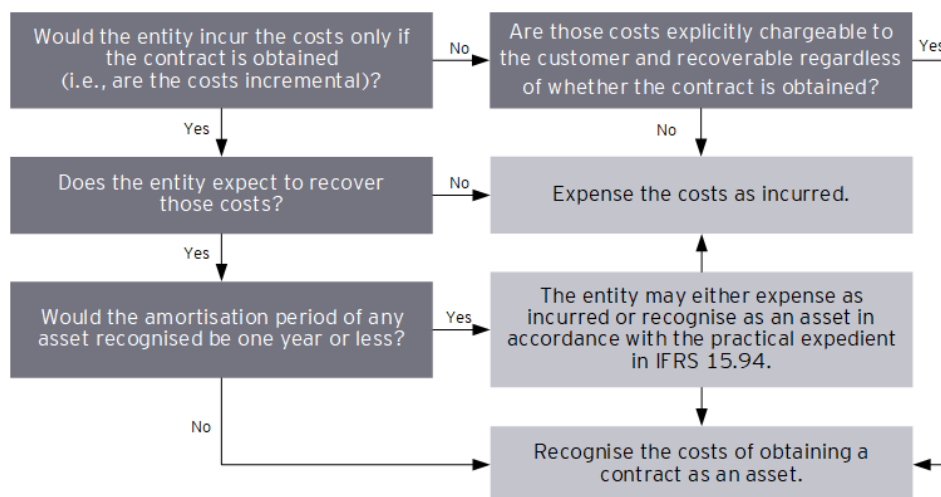

For costs that are within the scope of the cost requirements in IFRS 15, the standard requires that incremental costs of obtaining a contract with a customer are recognised as an asset if the entity expects to recover them. [IFRS 15.91, IFRS 15.92, IFRS 15.93]. An entity can expect to recover contract acquisition costs through direct recovery (i.e., reimbursement under the contract) or indirect recovery (i.e., through the margin inherent in the contract). Incremental costs are those that an entity would not have incurred if the contract had not been obtained. [IFRS 15.92].

To determine whether a cost is recoverable, an entity needs to include the future cash inflows and outflows associated with the contract renewal or extension periods if the period of benefit of the costs under assessment is expected to extend beyond the present contract (see section 9.3.3 below for further discussion on the period of benefit). Furthermore, when determining the amount it expects to receive as part of the recoverability assessment, an entity would not apply the requirements on constraining estimates of variable consideration. That is, if an entity were required to reduce the estimated transaction price because of the constraint on variable consideration, it would use the unconstrained transaction price to evaluate recoverability of the contract acquisition costs. The unconstrained transaction price also needs to be adjusted to reflect the customer's credit risk. This recoverability assessment for the costs to obtain a contract is similar to the impairment assessment discussed in section 9.3.4 below.

Costs incurred to obtain a contract that are not incremental costs must be expensed as incurred, unless they are explicitly chargeable to the customer (regardless of whether the contract is obtained).

The following flow chart illustrates the requirements in IFRS 15:

Figure 9-2: Costs to obtain a contract

In a FASB TRG agenda paper, the FASB staff suggested that, to determine whether a cost is incremental, an entity considers whether it would incur the cost if the customer (or the entity) decides, just as the parties are about to sign the contract, that it will not enter into the contract. If the costs would have been incurred even if the contract is not executed, the costs are not incremental to obtaining that contract. The FASB staff also noted that the objective of this requirement is not to allocate costs that are associated in some manner with an entity's marketing and sales activity, but only to identify those costs that an entity would not have incurred if the contract had not been obtained. For example, salaries and benefits of sales employees that are incurred regardless of whether a contract is obtained are not incremental costs.¹⁴¹

¹⁴⁰ IFRS 18 supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted). See Chapter 4 for further details on the requirements of IFRS 18.

¹⁴¹ FASB TRG Agenda paper no. 57, *Capitalization and Amortization of Incremental Costs of Obtaining a Contract*, dated 7 November 2016.

Consider the following Illustration based on an example from the FASB TRG agenda paper:¹⁴²

Illustration 9-4: Fixed employee salaries

An entity pays an employee an annual salary of CU100,000. The employee's salary is based on the number of contracts he or she signed for the prior year, as well as the number of contracts the employee is expected to sign for the current year. The employee's current year salary will not change if the number of contracts the employee actually signs differs from the projected number. However, any difference would affect the employee's salary in the following year.

FASB TRG members generally agreed that no portion of the employee's salary will be capitalised because it is not an incremental cost of obtaining a contract. The employee's salary would have been incurred regardless of the number of contracts the employee has actually signed during the current year.

The standard cites sales commissions as a type of an incremental cost that might require capitalisation under the standard. For example, commissions that are related to sales from contracts signed during the period might represent incremental costs that would require capitalisation. The standard does not explicitly address considerations for different types of commission programmes. Therefore, entities have to exercise judgement to determine whether sales commissions are incremental costs and, if so, the point in time when the costs would be capitalised. However, the FASB TRG members generally agreed that an employee's title or level in the organisation or how directly involved the employee is in obtaining the contract, are not factors in assessing whether a sales commission is incremental.¹⁴³ Consider the following Illustration based on an example from a FASB TRG paper:¹⁴⁴

Illustration 9-5: Commissions paid to different levels of employees

An entity's salesperson receives a 10% sales commission on each contract that he or she obtains. In addition, the following employees of the entity receive sales commissions on each signed contract negotiated by the salesperson: 5% to the manager and 3% to the regional manager.

FASB TRG members generally agreed that all of the commissions are incremental because the commissions would not have been incurred if the contract had not been obtained. IFRS 15 does not distinguish between commissions paid to the employee(s) based on the function or the title of the employee(s) that receives a commission. It is the entity that decides which employee(s) are entitled to a commission as a result of obtaining a contract.

How we see it

We believe that commissions that are paid to a third party in relation to sales from contracts that were signed during the period might also represent incremental costs that would require capitalisation. That is, commissions paid to third parties must be evaluated in the same manner as commissions paid to employees in order to determine whether they are required to be capitalised.

In addition, entities need to carefully evaluate all compensation plans, not just sales commission plans, to determine whether any plans contain incremental costs that need to be capitalised. For example, payments under a compensation 'bonus' plan might be solely tied to contracts that are obtained. Such costs would be capitalised if they are incremental costs of obtaining a contract, irrespective of the title of the plan.

Illustration 9-6: Commissions paid to a pool of funds

Assume that an entity has a compensation plan for support personnel in its sales department. As a group, the employees are entitled to a pool of funds calculated based on 2% of all new contracts signed during the monthly period. Once the amount of the pool is known, the amount paid to each individual employee is determined based on each employee's rating.

While the amount paid to each employee is discretionary (based on each employee's rating), the total amount of the pool is considered an incremental cost to obtain a contract because the entity owes that amount to the employees (as a group) simply because a contract was signed.

¹⁴² FASB TRG Agenda paper no. 57, *Capitalization and Amortization of Incremental Costs of Obtaining a Contract*, dated 7 November 2016.

¹⁴³ FASB TRG Agenda paper no. 60, *November 2016 Meeting - Summary of Issues Discussed and Next Steps*, dated 31 January 2017.

¹⁴⁴ FASB TRG Agenda paper no. 57, *Capitalization and Amortization of Incremental Costs of Obtaining a Contract*, dated 7 November 2016.

The TRG members discussed the underlying principle for capitalising costs under the standard and generally agreed that entities first need to refer to the applicable liability standard (e.g., IAS 37, IFRS 9) to determine when they are required to accrue for certain costs. Entities then use the requirements in IFRS 15 to determine whether the related costs need to be capitalised. TRG members acknowledged that certain aspects of the cost requirements require entities to apply significant judgement in analysing the facts and circumstances and determining the appropriate accounting treatment.¹⁴⁵

In addition, the IASB staff observed in a TRG agenda paper that incremental costs of obtaining a contract are not limited to initial incremental costs. Commissions recognised subsequent to contract inception (e.g., commissions paid on modifications, commissions subject to contingent events or clawback) because they did not meet the recognition criteria for liabilities at contract inception would still be considered for capitalisation as costs to obtain the contract when the liability is recognised. This would include costs related to contract renewals because, as mentioned in the TRG agenda paper, a renewal is a contract and there is nothing in the requirements for costs to obtain a contract that suggests a different treatment for contracts that are renewals of existing contracts. That is, the only difference between the two costs would be the timing of recognition based on when a liability has been incurred.¹⁴⁶ See Question 9-8 below for additional discussion of capitalising commissions paid on contract modifications.

Unlike many commissions, some incentive payments, such as bonuses and other compensation that are based on quantitative or qualitative metrics that are not related to contracts obtained (e.g., profitability, earnings per share (EPS), performance evaluations) are unlikely to meet the criteria for capitalisation, because they are not incremental to obtaining a contract. However, a legal contingency cost might be an incremental cost of obtaining a contract, for example, when a lawyer is entitled to be paid only upon the successful completion of a negotiation. Determining which costs must be capitalised under the standard might require judgement and it is possible that some contract acquisition costs are determined to be incremental and others are not. Consider the following Illustration based on an example from a FASB TRG agenda paper:¹⁴⁷

Illustration 9-7: Incremental and non-incremental costs for the same contract

An entity pays a 5% sales commission to its employees when they obtain contracts with customers. An employee begins negotiating a contract with a prospective customer and the entity incurs CU5,000 in legal and travel costs in the process of trying to obtain the contract. The customer ultimately enters into a CU500,000 contract and, as a result, the employee receives a sales commission of CU25,000.

The FASB TRG members generally agreed that the entity will only capitalise the commission paid to the employee of CU25,000. This cost is the only one that is incremental to obtaining the contract. While the entity incurs other costs that are necessary to facilitate a sale (e.g., legal, travel), those costs would have been incurred even if the contract had not been obtained.

The standard provides the following example regarding incremental costs of obtaining a contract: [IFRS 15.IE Example 36, IFRS 15.IE189-IE191]

Extract from IFRS 15

Example 36-Incremental costs of obtaining a contract

An entity, a provider of consulting services, wins a competitive bid to provide consulting services to a new customer. The entity incurred the following costs to obtain the contract:

	CU
External legal fees for due diligence	15,000
Travel costs to deliver proposal	25,000
Commissions to sales employees	10,000
Total costs incurred	50,000

In accordance with paragraph 91 of IFRS 15, the entity recognises an asset for the CU10,000 incremental costs of obtaining the contract arising from the commissions to sales employees because the entity expects to recover those costs through future fees for the consulting services. The entity also pays discretionary annual bonuses to sales supervisors based on annual sales targets, overall profitability of

145 TRG agenda paper no. 23, *Incremental costs of obtaining a contract*, dated 26 January 2015.

146 TRG agenda paper no. 23, *Incremental costs of obtaining a contract*, dated 26 January 2015.

147 FASB TRG Agenda paper no. 57, *Capitalization and Amortization of Incremental Costs of Obtaining a Contract*, dated 7 November 2016.

the entity and individual performance evaluations. In accordance with paragraph 91 of IFRS 15, the entity does not recognise an asset for the bonuses paid to sales supervisors because the bonuses are not incremental to obtaining a contract. The amounts are discretionary and are based on other factors, including the profitability of the entity and the individuals' performance. The bonuses are not directly attributable to identifiable contracts.

The entity observes that the external legal fees and travel costs would have been incurred regardless of whether the contract was obtained. Therefore, in accordance with paragraph 93 of IFRS 15, those costs are recognised as expenses when incurred, unless they are within the scope of another Standard, in which case, the relevant provisions of that Standard apply.

As a practical expedient, the standard permits an entity to immediately expense contract acquisition costs when the asset that would have resulted from capitalising such costs would have been amortised within one year or less. [IFRS 15.94]. It is important to note that the amortisation period for incremental costs is not always the initial contract term (see further discussion on this in Question 9-13 below). Also see section 9.3.3 below for discussion of the amortisation of capitalised contract costs.

Frequently asked questions

Question 9-6: Does the timing of commission payments affect whether they are incremental costs? (FASB TRG meeting 7 November 2016 - Agenda paper no. 57)

FASB TRG members generally agreed that the timing of commission payments does not affect whether the costs would have been incurred if the contract had not been obtained. However, there could be additional factors or contingencies that would need to be considered in different commission plans that could affect the determination of whether all (or a portion) of a cost is incremental.¹⁴⁸ Consider the following Illustration based on an example from a FASB TRG agenda paper:

Illustration 9-8: Timing of commission payments

An entity pays an employee a 4% sales commission on a CU50,000 signed contract with a customer. For cash flow management purposes, the entity pays the employee half of the commission (i.e., 2% of the total contract value) upon completion of the sale and the remainder in six months' time. The employee is entitled to receive the unpaid commission even if he or she is no longer employed by the entity when payment is due.

FASB TRG members generally agreed that the entity would capitalise the entire commission in this example (the timing of which would coincide with the recognition of the related liability). That is, the entity would not just capitalise the portion it paid immediately and expense the rest.

In this fact pattern, only the passage of time is required for the entity to pay the second half of the commission. For example, in some commission plans, the employee will only be entitled to the second half of the commission payment if the employee is still employed by the entity when the commission is due. For such plans, an entity needs to carefully evaluate whether the requirement to remain employed in order to receive the commission (i.e., the service vesting condition) is substantive.

How we see it

We believe that the second half of the commission payment would not be incremental if the service condition is substantive because other conditions are necessary, beyond simply obtaining the contract, for the entity to incur the cost.

If the entity's payment of a commission is only 'contingent' on a customer paying the amount due in the obtained contract, we do not believe this would influence the determination of whether the commission is an incremental cost, provided the contract meets the Step 1 criteria to be accounted for as a contract under the five-step model (see section 3.1 above). However, if there is an extended payment term (i.e., there is a significant amount of time between contract signing and the date in which the contract consideration is due), the entity needs to consider whether there is a service condition or other contingency, as discussed above.

¹⁴⁸ FASB TRG Agenda paper no. 60, November 2016 Meeting - Summary of Issues Discussed and Next Steps, dated 31 January 2017.

Question 9-7: Would commission payments subject to a threshold be considered incremental costs?

(FASB TRG meeting 7 November 2016 - Agenda paper no. 57)

FASB TRG members generally agreed that basing a commission on a pool of contracts, rather than paying a set percentage for each contract, would not affect the determination of whether the commissions would have been incurred if the entity did not obtain the contracts with those customers.¹⁴⁹ Consider the following example in a TRG agenda paper:

Illustration 9-9: Commission payments subject to a threshold

An entity has a commission programme that increases the amount of commission a salesperson receives based on how many contracts the salesperson has obtained during an annual period, as follows:

0-9 contracts	0% commission
10-19 contracts	2% of value of contracts 1-19
20+ contracts	5% of value of contracts 1-20+

FASB TRG members generally agreed that these costs are incremental costs of obtaining a contract with a customer. Therefore, the costs will be capitalised when the entity incurs a liability to pay these commissions. The costs are incremental because the entity will pay the commission under the programme terms as a result of entering into the contracts. See Question 9-25 in section 9.3.3 below for discussion about the period over which an entity would amortise a sales commission that is subject to a threshold and is considered an incremental cost of obtaining a contract.

Question 9-8: Would an entity capitalise commissions paid on contract modifications?

(TRG meeting 26 January 2015 - Agenda paper no. 23)

If commissions paid on contract modifications are incremental (i.e., they would not have been incurred if there had not been a modification) and recoverable, an entity would capitalise them. Contract modifications are accounted for in one of three ways: (1) as a separate contract; (2) as a termination of the existing contract and the creation of a new contract; or (3) as part of the existing contract (see section 3.4 above for further requirements on contract modifications). In all three cases, commissions paid on contract modifications are incremental costs of obtaining a contract and must be capitalised if they are recoverable. In the first two cases, a separate or new contract is created, so the costs of obtaining that contract would be incremental.

The TRG agenda paper said that commissions paid on the modification of a contract that is accounted for as part of the existing contract are incremental costs even though they are not initial incremental costs. Also see Question 9-11 below for further discussion of accounting for capitalised commissions upon a modification of the contract that is treated as the termination of an existing contract and the creation of a new contract.

Question 9-9: Would fringe benefits on commission payments be included in the capitalised amounts?

(TRG meeting 26 January 2015 - Agenda paper no. 23)

Fringe benefits must be capitalised as part of the incremental cost of obtaining a contract if the additional costs are based on the amount of commissions paid and the commissions qualify as costs to obtain a contract. However, if the costs of fringe benefits would have been incurred regardless of whether the contract had been obtained (e.g., health insurance premiums), the fringe benefits must not be capitalised. That is, an entity cannot allocate fringe benefits to the commission and, therefore, capitalise a portion of the costs of benefits it would provide regardless of whether the commission was paid.

Question 9-10: Must an entity apply the practical expedient to expense contract acquisition costs to all of its qualifying contracts across the entity or can it apply the practical expedient to individual contracts?

How we see it

We believe the practical expedient to expense contract acquisition costs (that would, otherwise, be amortised over a period of one year or less) must be applied consistently to contracts with similar characteristics and in similar circumstances.

¹⁴⁹ FASB TRG Agenda paper no. 60, *November 2016 Meeting - Summary of Issues Discussed and Next Steps*, dated 31 January 2017.

Question 9-10: Must an entity apply the practical expedient to expense contract acquisition costs to all of its qualifying contracts across the entity or can it apply the practical expedient to individual contracts?

How we see it

We believe the practical expedient to expense contract acquisition costs (that would, otherwise, be amortised over a period of one year or less) must be applied consistently to contracts with similar characteristics and in similar circumstances.

Question 9-11: How would an entity account for capitalised commissions upon a modification of the contract that is treated as the termination of an existing contract and the creation of a new contract?

How we see it

We believe an asset recognised for incremental costs to obtain a contract that exists when the related contract is modified must be carried forward into the new contract, if the modification is treated as the termination of an existing contract and the creation of a new contract and the goods or services to which the original contract cost asset relates are part of the new contract.

This is because the contract cost asset relates to goods or services that have not yet been transferred and the accounting for the modification is prospective. This conclusion is similar to the one reached by FASB TRG members in relation to the accounting for contract assets upon a contract modification, as discussed in Question 10-5 in section 10.1.5 below.

The contract cost asset that remains on the entity's statement of financial position at the date of modification would continue to be evaluated for impairment in accordance with IFRS 15 (see section 9.3.4 below). In addition, an entity must determine an appropriate amortisation period for the contract cost asset (see section 9.3.3 below).

Question 9-12: Can an entity choose whether to capitalise incremental costs to obtain a contract that it expects to recover?

An entity cannot choose whether to capitalise incremental costs to obtain a contract that it expects to recover. As discussed above, an entity is required to capitalise incremental costs to obtain a contract if it expects to recover those costs. However, as a practical expedient, entities are allowed to recognise the incremental costs of obtaining a contract as an expense only if the asset that would have resulted from capitalising these costs would have been amortised in one year or less.

Question 9-13: Would an entity consider contract renewals when assessing whether the practical expedient applies?

Contract renewals are considered when assessing whether the practical expedient for incremental costs to obtain a contract applies. As discussed above, as a practical expedient, entities are allowed to recognise the incremental costs of obtaining a contract as an expense only if the asset that would have resulted from capitalising these costs would have been amortised in one year or less. That is, the ability to apply the practical expedient depends on the amortisation period rather than the initial contract term.

As discussed further in section 9.3.3 below, in order to determine the amortisation period for capitalised incremental costs to obtain a contract, an entity needs to consider whether the capitalised contract costs only relate to goods or services that will be transferred under the initial contract or whether the costs also relate to goods or services that will be transferred under a specific anticipated contract.

If an entity's past experience indicates that a renewal is likely, the entity needs to determine whether the renewal commission is commensurate with the initial commission; if not, the amortisation period for the initial commission would be longer than the initial term. If the amortisation period extends beyond one year due to expected contract renewals, the practical expedient would not be available to the entity.

Question 9-14: If a contract contains more than one performance obligation, can an entity apply the practical expedient?

Whether the practical expedient for incremental costs to obtain a contract will apply when a contract contains more than one performance obligation will depend on the specific facts and circumstances. Entities are allowed to recognise the incremental costs of obtaining a contract as an expense only if the asset resulting from capitalising these costs would have been amortised in one year or less. As discussed further in Question 9-24 in section 9.3.3 below, we believe an entity can attribute capitalised contract costs to individual performance obligations in a contract, but it is not required to do so. That is, an entity can use multiple approaches to determine the amortisation period provided that the asset recognised is

amortised on a systematic basis that is consistent with the transfer to the customer of the goods or services to which the asset relates.

Reasonable approaches could include:

- Amortising a single capitalised contract cost using one measure of performance considering all of the performance obligations in the contract
 - Allocating the capitalised costs to all performance obligations in the contract on a relative basis and determining an appropriate amortisation period for each performance obligation
- Or
- Allocating specific capitalised contracts costs to individual performance obligations in the contract (but not all) when the costs relate specifically to certain goods or services (but not all) in the contract

Regardless of the approach used to determine the appropriate amortisation period for a capitalised contract cost related to a contract containing multiple performance obligations, all of the amortisation periods related to the contract would have to be one year or less for an entity to apply the practical expedient. If any amortisation period related to the contract extends beyond one year, the entity cannot apply the practical expedient.

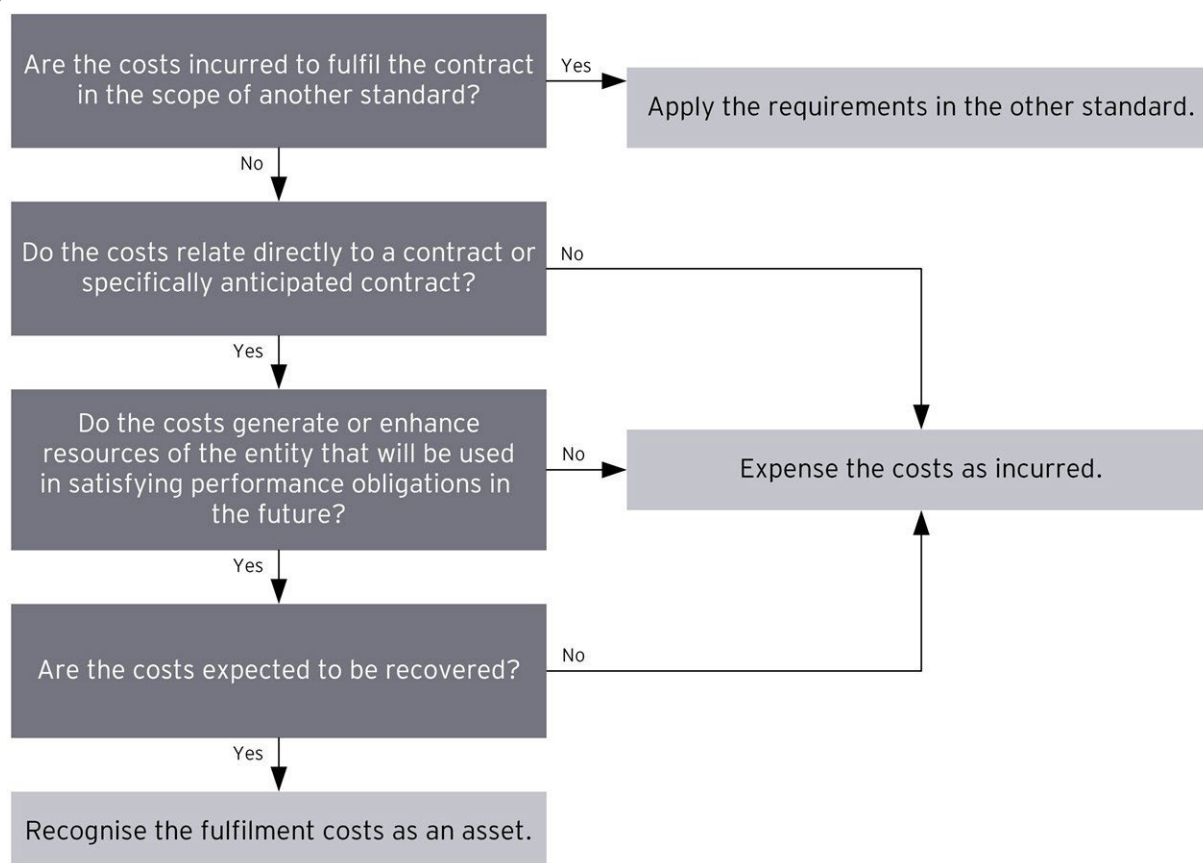

9.3.2 Costs to fulfil a contract

The standard divides contract fulfilment costs into two categories: (1) costs that give rise to an asset; and (2) costs that are expensed as incurred. When determining the appropriate accounting treatment for such costs, IFRS 15 makes it clear that any other applicable standards (e.g., IAS 2, IAS 16 and IAS 38) are considered first. That is, if costs incurred in fulfilling a contract are within the scope of another standard, an entity accounts for those costs in accordance with those other standards. [IFRS 15.95, IFRS 15.96]. If those other standards preclude capitalisation of a particular cost, then an asset cannot be recognised under IFRS 15. [IFRS 15.BC307]. If the costs incurred to fulfil a contract are not within the scope of another standard, an entity capitalises such costs only if they meet all of the following criteria: [IFRS 15.95]

- The costs directly relate to a contract or to a specifically identifiable anticipated contract (e.g., costs relating to services to be provided under renewal of an existing contract or costs of designing an asset to be transferred under a specific contract that has not yet been approved).
- The costs generate or enhance resources of the entity that will be used in satisfying (or in continuing to satisfy) performance obligations in the future.
- The costs are expected to be recovered.

If all of the criteria are met, an entity is required to capitalise the costs. The following flow chart illustrates these requirements:

Figure 9-3: Costs to fulfil a contract

Standards that might be applicable to costs to fulfil a contract with a customer include, but are not limited to, the following:

- Inventory costs within the scope of IAS 2
- Costs related to the acquisition of an intangible asset within the scope of IAS 38
- Costs attributable to the acquisition or construction of property, plant and equipment within the scope of IAS 16 or an investment property within the scope of IAS 40
- Costs related to biological assets or agricultural produce within the scope of IAS 41 *Agriculture* or bearer plants within the scope of IAS 16

Example 37 in the standard (included below) illustrates some costs that are accounted for under other standards.

The IFRS IC received a request about the recognition of training costs incurred to fulfil a contract with a customer in relation to an entity that supplies outsourced services and incurs costs to train its employees so that they understand the customer's equipment and processes. In March 2020, the IFRS IC concluded that, before assessing the criteria in IFRS 15.95, an entity first considers whether the training costs incurred to fulfil the contract are within the scope of another IFRS accounting standard. In relation to the request, since IAS 38 explicitly includes expenditure on training within its scope, the entity would apply the IAS 38 requirements and not IFRS 15. IAS 38 requires an entity to expense training costs as incurred and states that "an entity usually has insufficient control over the expected future economic benefits arising from a team of skilled staff and from training for these items to meet the definition of an intangible asset". [IAS 38.15, IAS 38.68, IAS 38.69]. The IFRS IC noted that the Basis for Conclusions on IFRS 15 states that "if the other Standards preclude the recognition of any asset arising from a particular cost, an asset cannot then be recognised under IFRS 15". [IFRS 15.BC307]. Therefore, since IAS 38 requires those costs to be expensed as incurred, they cannot be capitalised under IFRS 15. The IFRS IC concluded that IFRS 15 and IAS 38 provide an adequate basis for an entity to determine its accounting for training costs incurred to fulfil a contract with a customer and decided not to add the matter to its agenda.¹⁵⁰

¹⁵⁰ [IASB Staff Paper 2](#): Project: *Training Costs to Fulfil a Contract (IFRS 15)*, Paper topic: *Initial Consideration*, IFRS IC meeting, September 2019; and [IFRIC Update](#), March 2020. Available on the IFRS Foundation's website.

When determining whether costs to fulfil a contract with a customer meet the criteria for capitalisation in IFRS 15.95, an entity must consider its specific facts and circumstances.

With regard to the first criterion, IFRS 15 states that costs can be capitalised even if the contract with the customer is not yet finalised. However, rather than allowing costs to be related to any potential future contract, the standard requires that the costs relate directly to a specifically anticipated contract.

The standard provides examples of costs that meet the first criterion for capitalisation (i.e., costs that relate directly to the contract or a specifically anticipated contract) as follows: [IFRS 15.97]

Extract from IFRS 15

- 97 Costs that relate directly to a contract (or a specific anticipated contract) include any of the following:
- (a) direct labour (for example, salaries and wages of employees who provide the promised services directly to the customer);
 - (b) direct materials (for example, supplies used in providing the promised services to a customer);
 - (c) allocations of costs that relate directly to the contract or to contract activities (for example, costs of contract management and supervision, insurance and depreciation of tools, equipment and right-of-use assets used in fulfilling the contract);
 - (d) costs that are explicitly chargeable to the customer under the contract; and
 - (e) other costs that are incurred only because an entity entered into the contract (for example, payments to subcontractors).

Significant judgement might be required to determine whether costs meet the second criterion for capitalisation in IFRS 15.95(b) (i.e., the costs generate or enhance resources of the entity that will be used in satisfying performance obligations in the future). In the Basis for Conclusions, the IASB explained that the standard only results in the capitalisation of costs that meet the definition of an asset and precludes an entity from deferring costs merely to normalise profit margins throughout a contract (by allocating revenue and costs evenly over the contract term). [IFRS 15.BC308].

For costs to meet the third criterion (i.e., the 'expected to be recovered' criterion in IFRS 15.95(c)), they need to be either explicitly reimbursable under the contract or reflected through the pricing on the contract and recoverable through margin. Determining whether the costs are expected to be recovered might be challenging and require significant judgement if some, or all, of the transaction price is contingent (e.g., success-based fees).

Similar to the discussion related to incremental costs to obtain a contract in section 9.3.1 above, an entity needs to include all future cash inflows and outflows associated with fulfilling the contract to determine whether costs to fulfil a contract are recoverable. Furthermore, when determining the amount it expects to receive as part of the recoverability assessment, an entity would not apply the requirements for constraining estimates of variable consideration. That is, if an entity were required to reduce the estimated transaction price because of the constraint on variable consideration, it would use the unconstrained transaction price to evaluate recoverability of the contract fulfilment costs. The unconstrained transaction price also needs to be adjusted to reflect the customer's credit risk. This recoverability assessment for the costs to fulfil a contract is similar to the impairment assessment discussed in section 9.3.4 below.

How we see it

As discussed above, entities must first determine whether costs incurred to fulfil a contract with a customer are in the scope of other standards before determining whether capitalisation is required under IFRS 15. As an example, an entity might determine that fulfilment costs related to a service contract are not in the scope of other standards (e.g., IAS 2), so it evaluates the requirements in IFRS 15 to determine whether the fulfilment costs need to be capitalised or expensed. The type of costs that might be capitalised under IFRS 15 for the service contract are similar to the types of costs that might be capitalised under IAS 2 for a contract to sell goods.

As noted in IFRS 15.97, costs that are evaluated for capitalisation include direct costs and allocable overhead-type costs. However, an entity will also need to consider the types of costs that must be expensed as incurred in accordance with IFRS 15.98, as discussed further below.

If the criteria in IFRS 15.95 are not met, the costs incurred in fulfilling a contract do not give rise to an asset and must be expensed as incurred. The standard provides some common examples of costs that must be expensed as incurred, as follows: [IFRS 15.98]

Extract from IFRS 15

98 An entity shall recognise the following costs as expenses when incurred:

- (a) general and administrative costs (unless those costs are explicitly chargeable to the customer under the contract, in which case an entity shall evaluate those costs in accordance with paragraph 97);
- (b) costs of wasted materials, labour or other resources to fulfil the contract that were not reflected in the price of the contract;
- (c) costs that relate to satisfied performance obligations (or partially satisfied performance obligations) in the contract (ie costs that relate to past performance); and
- (d) costs for which an entity cannot distinguish whether the costs relate to unsatisfied performance obligations or to satisfied performance obligations (or partially satisfied performance obligations).

IFRS 15.98(c) specifies that, if a performance obligation (or a portion of a performance obligation that is satisfied over time) has been satisfied, fulfilment costs related to that performance obligation (or portion thereof) can no longer be capitalised. This is true even if the associated revenue has not yet been recognised (e.g., the contract consideration is variable and has been fully or partially constrained). Once an entity has begun satisfying a performance obligation that is satisfied over time, it only capitalises fulfilment costs that relate to future performance. Accordingly, it might be challenging for an entity to capitalise costs that are related to a performance obligation that an entity has already started to satisfy. Similarly, IFRS 15.98(d) specifies that, if an entity is unable to determine whether certain costs relate to past or future performance and the costs are not eligible for capitalisation under other IFRS accounting standards, the costs are expensed as incurred.

The IFRS IC received a request about the recognition of costs incurred to fulfil a contract in relation to a performance obligation that is satisfied over time. In June 2019, the IFRS IC concluded that IFRS 15 provides an adequate basis for an entity to determine how to recognise the costs in the fact pattern provided and decided not to add the matter to its agenda.¹⁵¹

The IFRS IC discussed this issue using the following example.¹⁵²

Illustration 9-10: Costs to fulfil a contract related to past performance

An entity enters into a contract with a customer to construct a building. It identifies a single performance obligation, being the promise to transfer the building to the customer, which it expects will take three years to complete. The entity satisfies this performance obligation (and recognises revenue) over time in accordance with IFRS 15.35(c) because its performance does not create an asset with alternative use and it has an enforceable right to payment (see section 7.1.3 above).

At the end of the reporting period, the entity has begun constructing the building and has incurred costs related to laying the foundation of the building.

The IFRS IC noted that the foundation costs relate to construction work done on the partly-constructed building, which has been transferred to the customer. Therefore, the costs relate to the entity's past performance in partially satisfying its performance obligation and in accordance with IFRS 15.98(c), must be expensed as incurred. That is, the costs do not meet the criteria to be recognised as an asset under IFRS 15.95.

¹⁵¹ [IFRIC Update](#), June 2019, available on the IFRS Foundation's website.

¹⁵² [IASB Staff Paper 2](#): Project: *Costs to Fulfil a Contract (IFRS 15)*, Paper topic: *Initial Consideration*, IFRS IC meeting, March 2019; and [IFRIC Update](#), June 2019. Available on the IFRS Foundation's website.

The standard provides the following example that illustrates costs that are capitalised under other IFRS accounting standards, costs that meet the capitalisation criteria and costs that do not: [IFRS 15.IE Example 37, IFRS 15.IE192-IE196]

Extract from IFRS 15

Example 37-Costs that give rise to an asset

An entity enters into a service contract to manage a customer's information technology data centre for five years. The contract is renewable for subsequent one-year periods. The average customer term is seven years. The entity pays an employee a CU10,000 sales commission upon the customer signing the contract. Before providing the services, the entity designs and builds a technology platform for the entity's internal use that interfaces with the customer's systems. That platform is not transferred to the customer, but will be used to deliver services to the customer.

Incremental costs of obtaining a contract

In accordance with paragraph 91 of IFRS 15, the entity recognises an asset for the CU10,000 incremental costs of obtaining the contract for the sales commission because the entity expects to recover those costs through future fees for the services to be provided. The entity amortises the asset over seven years in accordance with paragraph 99 of IFRS 15, because the asset relates to the services transferred to the customer during the contract term of five years and the entity anticipates that the contract will be renewed for two subsequent one-year periods.

Costs to fulfil a contract

The initial costs incurred to set up the technology platform are as follows:

	CU
Design services	40,000
Hardware	120,000
Software	90,000
Migration and testing of data centre	100,000
Total costs	350,000

The initial setup costs relate primarily to activities to fulfil the contract but do not transfer goods or services to the customer. The entity accounts for the initial setup costs as follows:

- (a) hardware costs-accounted for in accordance with IAS 16 *Property, Plant and Equipment*.
- (b) software costs-accounted for in accordance with IAS 38 *Intangible Assets*.
- (c) costs of the design, migration and testing of the data centre-assessed in accordance with paragraph 95 of IFRS 15 to determine whether an asset can be recognised for the costs to fulfil the contract. Any resulting asset would be amortised on a systematic basis over the seven-year period (ie the five-year contract term and two anticipated one-year renewal periods) that the entity expects to provide services related to the data centre.

In addition to the initial costs to set up the technology platform, the entity also assigns two employees who are primarily responsible for providing the service to the customer. Although the costs for these two employees are incurred as part of providing the service to the customer, the entity concludes that the costs do not generate or enhance resources of the entity (see paragraph 95(b) of IFRS 15). Therefore, the costs do not meet the criteria in paragraph 95 of IFRS 15 and cannot be recognised as an asset using IFRS 15. In accordance with paragraph 98, the entity recognises the payroll expense for these two employees when incurred.

Frequently asked questions

Question 9-15: Can an entity defer costs of a transferred good or service that would otherwise generate an upfront loss because variable consideration is fully or partially constrained?

An entity cannot defer the costs of a transferred good or service when the application of the constraint on variable consideration results in an upfront loss, even if the entity ultimately expects to recognise a profit on that good or service, unless other specific requirements allow or require a deferral of those costs. The criteria in IFRS 15 must be met to capitalise costs to fulfil a contract, including the criterion that the costs must generate or enhance resources of the entity that will be used in satisfying performance obligations in the future. An entity recognises such costs when control of a good or service transfers to the customer. As such, the cost of those sales would not generate or enhance resources of the entity used to satisfy future performance obligations.

Consider the following example:

Illustration 9-11: Recognise cost of sales when control is transferred

An entity sells goods with a cost of CU500,000 for consideration of CU600,000. The goods have a high risk of obsolescence, which might require the entity to provide price concessions in the future, resulting in variable consideration (see sections 5.2.1.A - 5.2.1.B above). The entity constrains the transaction price and concludes that it is highly probable that CU470,000 will not result in a significant revenue reversal, even though the entity reasonably expects the contract to ultimately be profitable. When control transfers, the entity recognises revenue of CU470,000 and costs of CU500,000. It would not capitalise the loss of CU30,000 because the loss does not generate or enhance resources of the entity that will be used in satisfying performance obligations in the future.

Question 9-16: How does an entity account for fulfilment costs incurred prior to the contract establishment date that are outside the scope of another standard (e.g., IAS 2)?

(TRG meeting 30 March 2015 - Agenda paper no. 33)

Entities sometimes begin activities on a specifically anticipated contract before the contract establishment date (e.g., before agreeing to the contract with the customer, before the contract satisfies the criteria to be accounted for under IFRS 15) that are not within the scope of another standard (e.g., IAS 2). The TRG members generally agreed that costs in respect of pre-contract establishment date activities that relate to a good or service that will transfer to the customer at or after the contract establishment date may be capitalised as costs to fulfil a specifically anticipated contract. However, the TRG members noted that such costs would still need to meet the criteria in IFRS 15.95 to be capitalised (e.g., they are expected to be recovered under the anticipated contract). Certain costs, such as general and administrative costs that are not explicitly chargeable to the customer under the contract, would not satisfy these criteria and would need to be expensed as incurred.

Subsequent to capitalisation, costs that relate to goods or services that are transferred to the customer at the contract establishment date would be expensed immediately. Any remaining capitalised contract costs would be amortised over the period that the related goods or services are transferred to the customer.¹⁵³

For requirements on recognising revenue for a performance obligation satisfied over time when activities are completed before the contract establishment date, see Question 7-20 in section 7.1.4.E above.

Question 9-17: How are the effects of learning curve costs addressed in IFRS 15?

As discussed in the Basis for Conclusions on IFRS 15, “a ‘learning curve’ is the effect of efficiencies realised over time when an entity’s costs of performing a task (or producing a unit) decline in relation to how many times the entity performs that task (or produces that unit)”. [IFRS 15.BC312].

Learning curve costs usually consist of materials, labour, overhead, rework or other costs that must be incurred to complete the contract (but do not include research and development costs). These types of efficiencies generally can be predicted at inception of an arrangement and are often considered in the pricing of a contract between an entity and a customer.

The IASB noted that in situations where learning curve costs are incurred in relation to a contract with a customer accounted for as a single performance obligation that is satisfied over time to deliver a specified number of units, IFRS 15 requires an entity to select a method of progress that depicts the transfer over time of the good or service to the customer (see section 7.1.4 above). [IFRS 15.BC313]. The IASB further noted that an entity would probably select a method (such as a costs incurred measure of progress) for these types of contracts, which would result in the entity recognising more revenue and expense at the beginning of the contract relative to the end. The IASB clarified that this would be appropriate as an entity would charge a higher price to a customer only purchasing one unit (rather than multiple units) in order to recover its learning curve costs.

Conversely, when learning curve costs are incurred for a performance obligation satisfied at a point in time (rather than over time), an entity needs to assess whether those costs are within the scope of another standard. The IASB noted that in situations in which an entity incurs cost to fulfil a contract without also satisfying a performance obligation over time, the entity is probably creating an asset that is within the scope of another standard (e.g., IAS 2). [IFRS 15.BC315]. For example, if within the scope of IAS 2, the costs of producing the components would accumulate as inventory in accordance with the requirements in IAS 2. The entity would then recognise revenue when control of the inventory transfers to the customer. In that situation, no learning curve costs would be capitalised under IFRS 15 as the costs would be in the scope of another standard.

¹⁵³ TRG Agenda paper no. 33, *Partial Satisfaction of Performance Obligations Prior to Identifying the Contract*, dated 30 March 2015 and TRG Agenda paper no. 34, *March 2015 Meeting - Summary of Issues Discussed and Next Steps*, dated 13 July 2015.

How we see it

If the learning curve costs are not within the scope of another standard, we believe they generally will not be eligible for capitalisation under IFRS 15 (e.g., because the costs relate to past (and not future) performance).

Question 9-18: How does an entity account for pre-contract or setup costs?

Pre-contract costs are often incurred in anticipation of a contract and will result in no future benefit unless the contract is obtained. Examples include: (1) engineering, design or other activities performed on the basis of commitments, or other indications of interest, by a customer; (2) costs for production equipment and materials relating to specifically anticipated contracts (e.g., costs for the purchase of production equipment, materials or supplies); and (3) costs incurred to acquire or produce goods in excess of contractual requirements in anticipation of subsequent orders for the same item.

Pre-contract costs that are incurred in anticipation of a specific contract must first be evaluated for capitalisation under other standards (e.g., IAS 2, IAS 16, IAS 38). For example, pre-contract costs incurred to acquire or produce goods in excess of contractual requirements for an existing contract in anticipation of subsequent orders for the same item would likely be evaluated under IAS 2. Some other examples include costs incurred to move newly acquired equipment to its intended location, which could be required to be capitalised under IAS 16 (see Question 9-19 below), and employee training costs that are expensed in accordance with IAS 38.¹⁵⁴ Pre-contract costs incurred in anticipation of a specific contract that are not addressed under other standards are capitalised under IFRS 15 only if they meet all of the criteria of a cost incurred to fulfil a contract. Pre-contract costs that are not in the scope of other IFRS accounting standards and do not meet the criteria under IFRS 15 are expensed as incurred.

Question 9-19: Can mobilisation costs be capitalised as costs to fulfil a contract with a customer under IFRS 15?

Entities incur mobilisation costs when moving personnel, equipment and supplies to a project site either before, at or after inception of a contract with a customer. They are incurred in order to ensure that the entity is in a position to fulfil its promise(s) in a contract (or specifically anticipated contract) with a customer, rather than transferring a good or service to a customer (i.e., they are not a promised good or service).

How we see it

The assessment of whether mobilisation costs can be capitalised depends on the specific facts and circumstances and might require significant judgement. Entities need to ensure that the costs are: (1) within the scope of IFRS 15; and (2) meet all of the criteria in IFRS 15.95 to be capitalised. We believe the considerations listed below are relevant to this assessment.

Are the costs within the scope of IFRS 15?

If the asset being moved (e.g., equipment in the scope of IAS 16, inventory in the scope of IAS 2) is in the scope of another standard, an entity must determine whether the mobilisation costs are specifically addressed by the other standard; if so, the cost is outside the scope of IFRS 15.

If the mobilisation costs are not specifically addressed in another standard, or it is not clear whether these are within the scope of another standard, an entity further analyses whether the mobilisation costs are:

- Specific to the asset being moved or applicable to more than one customer under unrelated contracts; in the latter case it is likely that they would not be within the scope of IFRS 15. For example, moving an asset between different premises of the entity to better utilise the asset in preparation for future contracts with many customers.
- Or
- Specific to the contract with the customer, in which case, it would be within the scope of IFRS 15. For example, moving an asset to a remote location at the customer's request, which does not provide a benefit to the entity beyond ensuring it is in a position to fulfil its obligation(s) to the customer under the contract.

¹⁵⁴ [IASB Staff Paper 2](#): Project: *Training Costs to Fulfil a Contract (IFRS 15)*, Paper topic: *Initial Consideration*, IFRS IC meeting, September 2019; and [IFRIC Update](#), March 2020. Available on the IFRS Foundation's website.

Do the costs meet the criteria in IFRS 15.95 to be capitalised?

As discussed above, IFRS 15 includes three criteria that must be met for costs to fulfil a contract within its scope can be capitalised:

- (a) Entities might need to use judgement to determine if costs relate directly to a contract (or a specifically anticipated contract, see section 9.3.2 above), as required in IFRS 15.95(a). Indicators that a cost, by function rather than by nature, might be directly related include, but are not limited to, the following:
 - The costs are explicitly or implicitly chargeable to the customer under the contract.
 - The costs are incurred only because the entity entered into the contract.
 - The contract explicitly or implicitly refers to mobilisation activities (e.g., that the entity must move equipment to a specific location).
 - The location in which the entity must perform is explicitly or implicitly specified in the contract and the mobilisation costs are incurred in order for the entity to fulfil its promise(s) to the customer.
- (b) Significant judgement might also be required to determine whether costs generate or enhance resources of the entity that will be used in satisfying performance obligations in the future as required by IFRS 15.95(b). This determination would include (but not be limited to) considering whether:
 - The costs are incurred in order for the entity to be able to fulfil the contract

And

 - Location is implicitly or explicitly an attribute of the contract

If a performance obligation (or a portion of a performance obligation that is satisfied over time) has been satisfied, fulfilment costs related to that performance obligation (or portion thereof) can no longer be capitalised (see section 9.3.2 above for further discussion).
- (c) For costs to meet the 'expected to be recovered' criterion as required by IFRS 15.95(c), they need to be either explicitly reimbursable under the contract or reflected through the pricing on the contract and recoverable through margin.

Determining whether mobilisation costs are directly related to a contract might be more challenging when they are incurred between two contracts. That is, when the costs are related to returning an entity's personnel, equipment and/or supplies to their original location or to another project site. In those situations, an entity will need to determine to which contract the costs relate. It will also need to determine whether the costs generate or enhance resources of the entity that will be used in satisfying performance obligations in the future. This is important because costs related to past performance cannot be capitalised under IFRS 15.

Question 9-20: Can an entity defer losses incurred on a contract by capitalising related fulfilment costs when it is expected to generate future profits on the sale of optional goods or services (i.e., loss leader)?

Certain contracts are executed as part of a loss leader strategy in which a good is sold at a loss with an expectation that future sales contracts will result in higher sales and/or profits. In determining whether these anticipated contracts would be part of the accounting for the existing loss leader contract, entities need to refer to the definition of a contract in IFRS 15, which is based on enforceable rights and obligations in the existing contract (see section 3.1 above). While it might be probable that the customer will enter into a future contract or the customer might even be economically compelled, or compelled by regulation to do so, it would not be appropriate to account for an anticipated contract when there is an absence of enforceable rights and obligations.

In addition, if the fulfilment costs incurred during satisfying the initial contract are within the scope of other IFRS accounting standards (e.g., IAS 2), the entity must account for those costs under that relevant standard. Even if the costs are not within the scope of another IFRS accounting standard, the costs would relate to a satisfied or partially satisfied performance obligation (i.e., the original contract priced at a loss) and, therefore, must be expensed as incurred. IFRS 15 does not permit an entity to defer fulfilment costs or losses incurred based on the expectation of profits in a future contract.

Question 9-21: How does an entity account for costs associated with installation or implementation services?

Entities that provide installation or implementation services to customers incur costs to fulfil the services. To determine the appropriate accounting for these costs, entities first need to determine whether the costs are within the scope of another IFRS accounting standard (e.g., property, plant and equipment, intangibles). [IFRS 15.96].

If they are not within the scope of another IFRS accounting standard, entities need to determine whether the installation or implementation service is a separate performance obligation that is satisfied over time (see section 4 above). If it is a performance obligation, then entities generally expense the costs associated with it as incurred because, as discussed in section 9.3.2 above, it might be challenging to conclude that the costs relate only to the entity's satisfaction of performance obligations in the future, which is required for capitalisation by IFRS 15.95(b). [IFRS 15.95(b)].

If the installation or implementation service is not a separate performance obligation, an entity needs to evaluate whether it is required to capitalise the costs to fulfil the contract under the IFRS 15 requirements mentioned above. That is, costs incurred to fulfil a contract are required to be capitalised only if they meet all of the criteria for capitalisation in IFRS 15.95. [IFRS 15.95].

The Illustrations below contrast an example of implementation services that are determined to be a separate performance obligation (and, therefore, are not capitalised as costs to fulfil a contract) with an example of implementation services that meet the criteria for capitalisation as costs to fulfil a contract under IFRS 15.

Illustration 9-12: Implementation services are not capitalised costs to fulfil a contract

Technology entity M enters into a three-year SaaS contract with a customer for CU4,000,000 for a subscription to an inventory management application beginning 1 June 20X3. The contract includes implementation services that will be performed at the beginning of the contract, starting on 1 June 20X3. The implementation services include data migration, creation of objects for the customer's products that will be inventoried, and customisation of the application's layout with the customer's logo and colour scheme. Several third-party service providers also sell implementation services for Technology entity M's application. Assume that the implementation services do not represent a significant integration service (i.e., the implementation services do not significantly modify or customise the SaaS) and the SaaS is fully functional without the implementation service. Under the contract, the customer receives access to the fully functional SaaS on 1 June 20X3.

Technology entity M determines that the costs incurred related to the implementation services are not within the scope of another IFRS accounting standard (e.g., property, plant and equipment, intangible assets).

Technology entity M then considers the implementation services and SaaS and determines that they are separate performance obligations that will be satisfied over time. This is because the implementation services and SaaS can be purchased separately. Technology entity M determines that it is able to fulfil its promise to transfer the SaaS separately from the implementation services, indicating that the two are not highly interdependent or interrelated. Therefore, Technology entity M determines that the costs incurred related to implementation services do not meet the criteria for capitalisation because they do not relate to the entity's satisfaction of performance obligations in the future (i.e., the costs are expensed as incurred in the process of performing the implementation services).

Illustration 9-13: Implementation services are capitalised costs to fulfil a contract

Technology entity N enters into a contract with a customer for CU2,000,000 for a one-year SaaS subscription to an enterprise software application beginning when the customer obtains access to the SaaS. The contract includes implementation services that will be performed at the beginning of the contract, starting on 1 January 20X5. The implementation services, which will take approximately two months to complete, must be performed in order for the customer to access the SaaS because the services involve the creation of customer-specific interfaces. Technology entity N does not sell the SaaS without these implementation services and no other vendors are able to perform the implementation services because they require the creation of code that will reside on Technology entity N's servers.

Technology entity N determines that the costs incurred related to the implementation services are not within the scope of another IFRS accounting standard (e.g., property, plant and equipment, intangible assets).

Technology entity N then determines that the implementation services are not capable of being distinct. This is because they cannot be purchased separately or provided by a third party and because the services do not provide benefit on their own or with other readily available resources (since the SaaS has not yet been provided and also cannot be sold separately). Therefore, the implementation services and SaaS subscription are a combined performance obligation.

Technology entity N also concludes that the combined performance obligation meets the requirements for recognition over time. It determines that revenue will be recognised over the contract term, beginning when the customer obtains access to the SaaS.

Therefore, Technology entity N considers whether the costs incurred related to the implementation services that will be provided at the outset of the contract (i.e., before the customer obtains access to the SaaS) meet the criteria to be capitalised as a cost to fulfil the contract, as follows:

- The costs relate specifically to the SaaS contract with this customer
- The costs generate a resource (i.e., the interfaces) that will be used in future performance (i.e., providing the SaaS, to the customer)
- The costs are expected to be recovered based on the margin included in the contract

As such, Technology entity N determines that the costs must be capitalised as a cost to fulfil as the implementation services are performed. The costs will then be amortised over the estimated period of benefit beginning when the customer gains access to the SaaS.

9.3.3 Amortisation of capitalised contract costs

Any capitalised contract costs are amortised, with the expense recognised on a systematic basis that is consistent with the entity's transfer of the related goods or services to the customer. [IFRS 15.99].

IFRS 15.99 states that capitalised contract costs are amortised on a systematic basis that is consistent with the transfer to the customer of the goods or services to which the asset relates. When the timing of revenue recognition (e.g., at a point in time, over time) aligns with the transfer of the goods or services to the customer, the amortisation of the capitalised contract costs in a reporting period will correspond with the revenue recognition in that reporting period. However, the timing of revenue recognition might not always align with the transfer of the goods and services to the customer (e.g., when variable consideration is constrained at the time the related performance obligation is satisfied). When this occurs, the amortisation of the capitalised contract costs will not correspond with the revenue recognition in a reporting period.

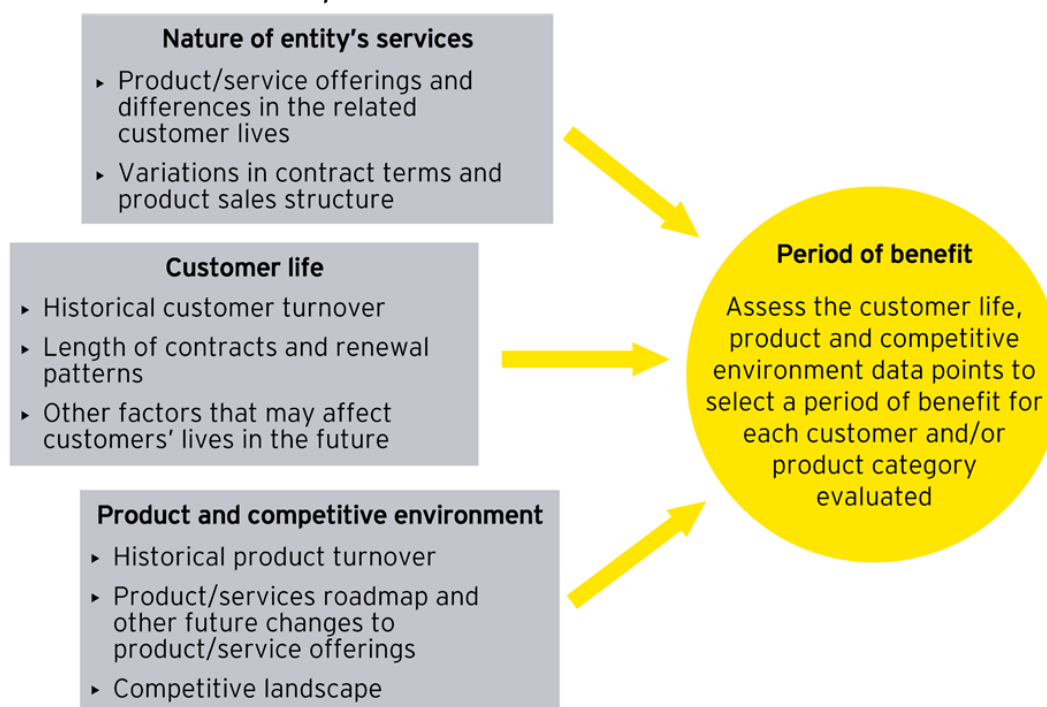

For example, consider an entity that enters into a contract with a customer with two performance obligations: (a) a right-to-use licence; and (b) a related service for three years. Further assume that payment from the customer is based on the customer's usage of the intellectual property (i.e., a usage-based royalty). Revenue in respect of the licence of intellectual property would be recognised at a point in time (see section 8.3.2 above) and revenue in respect of the related service would be recognised over time. The transaction price allocated to the performance obligation for the licence of intellectual property cannot be recognised at the point in time when control of the licence transfers to the customer due to the royalty recognition constraint (see section 8.5 above). Accordingly, any capitalised contract costs that relate to the licence need to be fully amortised upon the transfer of control of that licence (i.e., at a point in time), regardless of when the related revenue will be recognised. Any capitalised contract costs that relate to the services need to be amortised over the period of time consistent with the transfer of control of the service.

It is important to note that capitalised contract costs could relate to multiple goods or services (e.g., design costs to manufacture multiple distinct goods when design services are not a separate performance obligation) in a single contract. In such instances, the amortisation period could be the entire contract term. See Question 9-24 below for a discussion on how an entity might determine the appropriate amortisation period when capitalised contract costs relate to multiple performance obligations. The amortisation period could also extend beyond a single contract, if the capitalised contract costs relate to goods or services being transferred under multiple contracts or to a specifically anticipated contract (e.g., certain contract renewals). [IFRS 15.99].

In these situations, the capitalised contract costs would be amortised over a period that is consistent with the transfer to the customer of the goods or services to which the asset relates. This can also be thought of as the expected period of benefit of the asset capitalised. The expected period of benefit might be the expected customer relationship period, but that is not always the case. To determine the appropriate amortisation period, an entity needs to evaluate the type of capitalised contract costs, what the costs relate to and other facts and circumstances of the specific arrangement. Furthermore, before including estimated renewals in the period of benefit, an entity needs to evaluate its history with renewals, to conclude that such an estimate is supportable.

How we see it

We believe the following factors might be relevant for the evaluation of the period of benefit.

Figure 9-4: Evaluation of the period of benefit

An entity updates the amortisation period when there is a significant change in the expected timing of transfer to the customer of the goods or services to which the asset relates (and accounts for such a change as a change in accounting estimate in accordance with IAS 8), as shown in the following Illustration: [IFRS 15.100].

Illustration 9-14: Amortisation period

Entity A enters into a three-year contract with a new customer for transaction processing services. To fulfil the contract, Entity A incurred set-up costs of CU60,000, which it capitalised in accordance with IFRS 15.95-98 and will amortise over the term of the contract.

At the beginning of the third year, the customer renews the contract for an additional two years. Entity A will benefit from the initial set-up costs during the additional two-year period. Therefore, it changes the remaining amortisation period from one year to three years and adjusts the amortisation expense in the period of the change and future periods in accordance with the requirements in IAS 8 for changes in accounting estimates. The disclosure requirements of IAS 8 related to changes in accounting estimates are also applicable.

However, under IFRS 15, if Entity A had been in the position to anticipate the contract renewal at contract inception, Entity A would have amortised the set-up costs over the anticipated term of the contract including the expected renewal (i.e., five years).

Determining the amortisation period for incremental costs of obtaining a contract with a customer can be complicated, especially when contract renewals are expected and the commission rates are not constant throughout the entire life of the contract.

When evaluating whether the amortisation period for a sales commission extends beyond the original contract period, an entity would also evaluate whether an additional commission is paid for subsequent renewals. If so, it evaluates whether the renewal commission is considered 'commensurate' with the original commission. See Question 9-22 below for further discussion on whether a commission is commensurate. In the Basis for Conclusions, the IASB explained that amortising the asset over a longer period than the initial contract would not be appropriate if an entity pays a commission on a contract renewal that is commensurate with the commission paid on the initial contract. In that case, the costs of obtaining the initial contract do not relate to the subsequent contract. [IFRS 15.BC309]. An entity would also need to evaluate the appropriate amortisation period for any renewal commissions that are required to be capitalised under IFRS 15 in a similar manner. See Question 9-23 below for the FASB TRG's discussion of how an entity determines the amortisation period of an asset recognised for the incremental costs of obtaining a contract with a customer.

How we see it

Under IFRS 15, entities are required to evaluate whether the period of benefit is longer than the term of the initial contract. As discussed above, it is likely that an entity would be required to amortise the capitalised sales commission cost over a period longer than the initial contract, if a renewal commission is not paid or a renewal commission is paid that is not commensurate with the original commission. It is also important to note that the amortisation period affects whether the entity can apply the practical expedient allowing the incremental cost of obtaining a contract to be expensed immediately.

That expedient requires that the asset resulting from the capitalisation of these costs be amortised in one year or less. It is not dependent on the initial contract term.

In determining the appropriate amortisation period or the period of benefit for capitalised contract costs, an entity considers its facts and circumstances and might use judgement similar to that used when estimating the amortisation period for intangible assets (e.g., a customer relationship intangible acquired in a business combination). This could include considering factors such as customer retention and how quickly the entity's products and services change.

It is important for entities to document the judgements they make when determining the appropriate amortisation period and disclose the same in their financial statements. IFRS 15 disclosure requirements (see section 10.5.3 below) include judgements made in determining the amounts of costs that are capitalised, the amortisation method chosen and other quantitative disclosures.

Frequently asked questions

Question 9-22: How does an entity determine whether a commission on a renewal contract is commensurate with the commission on the initial contract?

(FASB TRG meeting 7 November 2016 - Agenda paper no. 57)

FASB TRG members generally agreed that the commissions would have to be reasonably proportional to the contract values (e.g., 5% of both the initial and renewal contract values) to be considered commensurate. The FASB TRG members also generally agreed that it would not be reasonable for an entity to use a 'level of effort' analysis to determine whether a commission is commensurate. For example, a 6% commission on an initial contract and a 2% commission on a renewal would not be commensurate even if the declining commission rate corresponds to the level of effort required to obtain the contracts.¹⁵⁵

As discussed above in this section, if the renewal commission is considered to be commensurate with the commission on the initial contract, it would not be appropriate to amortise any asset for the initial commission over a longer period than the initial contract. In contrast, it is likely that it would be appropriate to amortise the asset over a longer period than the initial contract if the commissions are not considered to be commensurate (such as in the example above with a 6% initial commission and 2% renewal commission). See Question 9-23 below for discussion of how an entity determines this longer amortisation period.

Although the TRG did not discuss this, entities would also need to evaluate whether any expected subsequent renewal commissions are commensurate with prior renewal commissions to determine the appropriate amortisation period for any renewal commissions that are required to be capitalised under IFRS 15. Continuing the above example, assume the original three-year contract (for which a 6% commission is paid) and each subsequent renewal contract (for which a 2% renewal commission is paid) is for a one-year term. If the entity expects to renew the contract in years two through four and continue to pay a constant 2% commission upon each renewal, each renewal commission would be considered commensurate. As a result, it is likely that the appropriate amortisation period for each renewal required to be capitalised would be one year. See Question 9-26 below for discussion of when an entity would begin to amortise an asset recognised for the incremental cost of obtaining a renewal contract.

¹⁵⁵ FASB TRG Agenda paper no. 60, *November 2016 Meeting - Summary of Issues Discussed and Next Steps*, dated 31 January 2017 and FASB TRG Agenda paper no. 57, *Capitalization and Amortization of Incremental Costs of Obtaining a Contract*, dated 7 November 2016.

Question 9-23: How does an entity determine the amortisation period of an asset recognised for the incremental costs of obtaining a contract with a customer?

(FASB TRG meeting 7 November 2016 - Agenda paper no. 57 and TRG meeting 26 January 2015 - Agenda paper no. 23)

The FASB TRG members generally agreed that when an entity determines an amortisation period that is consistent with the transfer to the customer of the goods or services to which the asset relates, it must determine whether the capitalised contract costs relate only to goods or services that will be transferred under the initial contract, or whether the costs also relate to goods or services that will be transferred under a specifically anticipated contract. For example, if an entity only pays a commission based on the initial contract and does not expect the customer to renew the contract (e.g., based on its past experience or other relevant information), amortising the asset over the initial term would be appropriate.

However, if the entity's past experience indicates that the customer is likely to renew the contract, the amortisation period would be longer than the initial term if the renewal commission is not 'commensurate' with the initial commission. See Question 9-22 above for a discussion of commensurate.

The FASB TRG members generally agreed that an entity needs to evaluate its facts and circumstances to determine an appropriate amortisation period if it determines that the period extends beyond the initial contract term, because the commission on the renewal contract is not commensurate with the commission on the initial contract. An entity might reasonably conclude that its average customer life is the best estimate of the amortisation period that is consistent with the transfer of the goods or services to which the asset relates (e.g., if the good or service does not change over time, such as a health club membership). However, FASB TRG members generally agreed that this approach is not required and that entities must not use this as a default. The FASB TRG members noted that entities would use judgement that is similar to judgement used when estimating the amortisation period for intangible assets (e.g., a customer relationship intangible acquired in a business combination) and could consider factors such as customer loyalty and how quickly their products and services change.¹⁵⁶

Consider a technology entity that capitalises a commission paid on the sale of software, which the entity estimates it will maintain and support for only the next five years, and the estimated customer life is seven years. In evaluating the period of benefit, the entity might reasonably conclude that the capitalised commission has to be amortised over the five-year life of the software to which the commission relates.

However, in a TRG agenda paper, the staff discussed two acceptable methods for amortising capitalised contract costs that relate to both the original contract and the renewals in cases in which the renewal commission is not commensurate with the initial commission:¹⁵⁷

- The initial capitalised amount is amortised over the period of benefit that includes expected renewals, while amounts capitalised that relate to renewals are amortised over the renewal period.
- The portion of the initial capitalised amount that is commensurate is amortised over the original contract term and the additional amount that is not commensurate is amortised over the period of benefit that includes expected renewals. Capitalised amounts that relate to renewals are amortised over the renewal period.

Both methods are acceptable because they each meet the objective of amortising the costs on a systematic basis that is consistent with the transfer to the customer of the goods or services to which the asset relates. However, an entity needs to select one method and apply it consistently in similar circumstances. Other amortisation methods might also be acceptable if they are consistent with the pattern of transfer to the customer of the goods or services to which the asset relates.

The following Illustration shows the two methods described in the TRG agenda paper:

Illustration 9-15: Methods for amortising capitalised contract costs

An entity has a commission plan that pays a 6% commission to a sales representative each time that sales representative obtains a new contract with a customer and a 2% commission each time that customer renews. Based on the entity's assessment of the requirements in IFRS 15 for contract costs, it has concluded that the commissions paid as part of this commission plan are incremental costs to obtain a contract that are required to be capitalised. Furthermore, the entity has determined that the 2% commission paid for renewals is not commensurate with the 6% commission paid for initial contracts and, therefore, the period of benefit for capitalised commissions extends beyond the initial contract term.

¹⁵⁶ FASB TRG Agenda paper no. 60, *November 2016 Meeting - Summary of Issues Discussed and Next Steps*, dated 31 January 2017 and FASB TRG Agenda paper no. 57, *Capitalization and Amortization of Incremental Costs of Obtaining a Contract*, dated 7 November 2016.

¹⁵⁷ TRG Agenda paper no. 23, *Incremental costs of obtaining a contract*, dated 26 January 2015.

The entity performs an assessment of average customer life, technology turnover and competitive factors and concludes that the period of benefit for capitalised commissions is five years.

The entity executes a three-year service contract with a customer for CU600,000 and pays a 6% commission to the sales representative. At the end of the three-year term, the customer renews the contract for two more years for CU400,000 and the entity pays a 2% commission to the sales representative.

The following are two acceptable methods for amortising the capitalised contract costs related to the CU36,000 commission paid on the initial contract and the CU8,000 commission paid on the renewal:

Method 1

The CU36,000 commission related to the initial contract that was capitalised is amortised over the five-year period of benefit. When the contract is renewed, the CU8,000 commission related to the renewal that was capitalised is amortised over the two-year renewal period. The commission would be amortised, as follows:

CU	Year 1	Year 2	Year 3	Year 4	Year 5
Initial commission	7,200	7,200	7,200	7,200	7,200
Renewal commission	-	-	-	4,000	4,000
Total amortisation expense	7,200	7,200	7,200	11,200	11,200

Method 2

The CU36,000 commission related to the initial contract that was capitalised is separated into two components: CU12,000 that is commensurate with the commission paid on renewal (i.e., the amount of commission that the CU600,000 initial contract earns at the commensurate rate of 2%); and CU24,000 that is not commensurate. The entity amortises the CU12,000 component over the three-year initial contract term and the CU24,000 component over the five-year period of benefit. When the contract is renewed, the CU8,000 commission related to the renewal that was capitalised is amortised over the two-year renewal period. The commission would be amortised, as follows:

CU	Year 1	Year 2	Year 3	Year 4	Year 5
Initial commission (not commensurate)	4,800	4,800	4,800	4,800	4,800
Initial commission (commensurate)	4,000	4,000	4,000	-	-
Renewal commission	-	-	-	4,000	4,000
Total amortisation expense	8,800	8,800	8,800	8,800	8,800

Question 9-24: Can an entity attribute the capitalised contract costs to the individual performance obligations in the contract to determine the appropriate amortisation period?

(TRG meeting 26 January 2015 - Agenda paper no. 23)

How we see it

We believe an entity can attribute the capitalised contract costs to individual performance obligations in the contract to determine the appropriate amortisation period, but it is not required to do so.

IFRS 15.99 states that the asset recognised is amortised on a systematic basis “that is consistent with the transfer to the customer of the goods or services to which the asset relates”. [IFRS 15.99]. The TRG agenda paper noted that an entity would meet this objective by allocating the capitalised contract costs to performance obligations on a relative basis (i.e., in proportion to the transaction price allocated to each performance obligation) to determine the period of amortisation.

Illustration 9-16: Allocation of capitalised contract costs

A technology entity executes a contract for CU600,000 for a perpetual software licence and one year of PCS. Based on the stand-alone selling prices, the entity allocates CU500,000 (83%) of the total transaction price to the licence and CU100,000 (17%) to the PCS. The entity pays a 4% commission to the sales representative and has determined that the commission is required to be capitalised under IFRS 15 because it is an incremental cost of obtaining the contract. The entity concludes that the CU24,000 sales commission needs to be allocated between the licence and the PCS and amortised over the expected period of benefit associated with each of those performance obligations. The entity allocates CU20,000 (83%) to the licence and CU4,000 (17%) to the PCS, consistent with the relative value of the performance obligations to the transaction price.

Other methods for allocating capitalised contract costs might be appropriate. For example, we believe an entity would also meet the objective by allocating specific capitalised contract costs to individual performance obligations when the costs relate specifically to certain goods or services.

An entity needs to have objective evidence to support a conclusion that a specified amount of the costs relates to a specific performance obligation and consistently apply any methods used for allocating capitalised contract costs to performance obligations.

In addition, as discussed in Question 9-23 above, an entity that attributes capitalised contract costs to individual performance obligations needs to consider whether the amortisation period for some or all of the performance obligations extends beyond the original contract (see discussion in this section above).

The TRG agenda paper also discussed another potentially acceptable amortisation pattern for capitalised contract costs. This pattern relates to multiple performance obligations that are satisfied over different periods that would not require allocation of the asset to individual performance obligations in the contract. That is, an entity might amortise a single capitalised contract cost using one measure of performance taking into consideration all of the performance obligations in the contract. The TRG paper noted that an entity that uses this method needs to select a measure that best reflects the 'use' of the asset as the goods and services are transferred to the customer. That is, the pattern of amortisation must meet the objective of IFRS 15.99 so that it is consistent with the transfer to the customer of the goods or services to which the asset relates.

Question 9-25: Over what period would an entity amortise a sales commission (that is only paid once a threshold is met) that is determined to be an incremental cost to obtain a contract?

(TRG meeting 26 January 2015 - Agenda paper no. 23)

The TRG agenda paper indicated that there are at least two alternatives that meet the objective of amortising the costs on a systematic basis that is consistent with the transfer to the customer of the goods or services to which the asset relates. However, either alternative must be applied consistently to similar circumstances. In the first alternative, an entity allocates the capitalised costs to all of the contracts that cumulatively result in the threshold being met and amortises the costs over the expected customer relationship period of each of those contracts. In the second alternative, an entity allocates the capitalised costs to the contract that results in the threshold being met and amortises the costs over the expected customer relationship period of that contract. The TRG agenda paper noted that the second alternative might result in a counterintuitive answer if the commission paid upon obtaining the contract that resulted in the threshold being met was large in relation to the transaction price for only that contract. While the first alternative might be easier to apply and result in a more intuitive answer than the second alternative in some situations, the TRG agenda paper noted that either approach is acceptable. The TRG agenda paper did not contemplate all possible alternatives, therefore, there could be other approaches that also are acceptable.

Consider the following example in the TRG agenda paper:

Illustration 9-17: Amortisation of capitalised commission payments subject to a threshold

An entity has a commission programme that increases the amount of commission a salesperson receives based on how many contracts the salesperson has obtained during an annual period. In this example, the first commission is paid when the first contract is signed. Subsequently, once a cumulative threshold number of contracts is reached, a commission is paid on that threshold contract as a fixed escalating amount, taking into account any commission already paid, as follows:

1 contract	CU3,000 commission
10 contracts	CU5,000 cumulative commission (including CU3,000 already paid)
15 contracts	CU10,000 cumulative commission (including CU5,000 already paid)

Assume 11 new contracts are signed by a specific employee in that period.

As discussed in Question 9-7 in section 9.3.1 above, FASB TRG members generally agreed that commission payments subject to a threshold are incremental costs of obtaining a contract with a customer and, therefore, the costs must be capitalised when the entity incurs a liability to pay these commissions.

In the first acceptable alternative, an entity estimates the total amount of commission that is expected to be paid for the period and capitalises an equal amount as each contract is signed. In this example, because the entity estimates that the employee will sign 11 new contracts during the period, it expects the total amount of commission to be paid will be CU5,000. The entity would capitalise CU455 when each contract is signed (i.e., CU5,000 cumulative commission divided by the 11 contracts). The capitalised amount would be amortised over the expected customer relationship period of each of those contracts. That is, the CU455 capitalised for the first contract would be amortised over the expected customer relationship period of the first contract and the CU455 capitalised for the second contract would be amortised over the expected customer relationship period of the second contract.

In the second acceptable alternative, an entity capitalises CU3,000 in commission costs upon signing the first contract. This amount would be amortised over the expected customer relationship period of that contract (i.e., the first contract). The entity would not capitalise any additional costs upon signing the second contract through to the ninth contract because the next commission 'tier' has not been met. Once the tenth contract is signed, the entity capitalises an additional CU2,000 in commission costs. This amount would be amortised over the expected customer relationship period for that contract (i.e., the tenth contract).

Question 9-26: When does an entity begin to amortise an asset recognised for the incremental cost of obtaining a renewal contract?

As discussed in Question 9-22 above, assets recognised for commensurate renewal commissions paid are amortised over the term of the contract renewal, with the expense recognised as the entity transfers the related goods or services to the customer.

How we see it

We believe that the amortisation of the renewal commission must not begin earlier than the beginning of the renewal period.

Consider the following Illustration:

Illustration 9-18: Amortisation of a capitalised contract costs

On 1 January 20X0, an entity enters into a three-year service contract with a customer that ends on 31 December 20X2. Upon the customer signing the contract, the entity pays a sales employee a CU50,000 sales commission for obtaining the contract. On 30 September 20X2, the entity negotiates a three-year renewal term that will begin on 1 January 20X3 and pays the sales employee a renewal commission that is commensurate with the initial sales commission paid. Since the entity does not begin to transfer services under the contract renewal until 1 January 20X3, the entity would not begin amortising the asset related to the renewal commission until 1 January 20X3.

Question 9-27: How are capitalised contract costs and their amortisation classified and presented in the statement of financial position and statement of profit or loss and other comprehensive income, respectively?

As discussed in sections 9.3.1 - 9.3.3 above, IFRS 15 requires incremental costs of obtaining a contract and certain costs to fulfil a contract to be recognised as an asset and that asset to be amortised on a systematic basis. IFRS 15.128 requires separate disclosure of closing balances and the amount of amortisation and impairment losses recognised during the period (see section 10.5.3 below). However, the standard is silent on the classification of that asset and the related amortisation.

Under legacy IFRS accounting standards, IAS 2 included the notion of work in progress (or 'inventory') of a service provider. However, references to service providers were consequentially removed from IAS 2 and replaced with the relevant requirements in IFRS 15. Furthermore, while these capitalised contract cost assets are intangible, in nature, IAS 38 specifically excludes from its scope intangible assets arising from contracts with customers that are recognised in accordance with IFRS 15. [IAS 38.3(i)]. In the absence of a standard that specifically deals with classification and presentation of contract costs, management would need to apply the requirements in IAS 8.10-12 to select an appropriate accounting policy (see Chapter 3).

How we see it

In developing such an accounting policy, we believe that costs to obtain a contract and costs to fulfil a contract need to be considered separately for the purpose of classification and presentation in the financial statements, as described in the bullets below.

- Considering the nature of *costs to obtain a contract* and the lack of guidance in IFRS accounting standards, we believe an entity can choose to classify and present these costs as either:
 - A separate class of asset (similar in nature to work in progress or 'inventory') in the statement of financial position and its amortisation within cost of goods sold, changes in contract costs or similar
 - Or
 - A separate class of intangible assets in the statement of financial position and its amortisation in the same line item as amortisation of intangible assets within the scope of IAS 38

In all cases, an entity needs to consider the aggregation requirements of IAS 1 (or IFRS 18,¹⁵⁸ if adopted early) when determining whether the separate classes of assets must be presented together with other assets (see Chapter 3).

In addition, the entity needs to consider the requirements in IAS 7, in particular IAS 7.16(a), when determining the classification of cash flows arising from costs to obtain a contract (i.e., either as cash flow from operating activities or investing activities). [IAS 7.16(a)].

- In contrast, the nature of *costs to fulfil a contract* is such that they directly impact the entity's performance under the contract. Therefore, costs to fulfil a contract are classified and presented as a separate class of asset in the statement of financial position and its amortisation within cost of goods sold, changes in contract costs or similar.

We do not believe it would be appropriate to analogise to the requirements for intangible assets in IAS 38. Instead, such costs are consistent in nature to costs incurred in the process of production, as is contemplated in IAS 2. That is, in nature, they are consistent with work in progress, or 'inventory', of a service provider. Therefore, whether costs to fulfil a contract meet the criteria for capitalisation in IFRS 15.95 or are expensed as incurred, we believe that classification and presentation of such costs in the statement of profit or loss and other comprehensive income, and the classification and presentation of related cash flows in the statement of cash flows needs to be consistent.

Capitalised contract costs are subject to impairment assessments (see section 9.3.4 below). Impairment losses are recognised in profit or loss, but the standard is silent on where to classify and present such amounts within the primary financial statements.

How we see it

We believe it would be appropriate for the classification and presentation of any impairment losses to be consistent with the classification and presentation of the amortisation expense.

9.3.4 Impairment of capitalised contract costs

Capitalised contract costs must be tested for impairment. This is because the costs that give rise to an asset must be recoverable throughout the contract period (or period of benefit, if longer), to meet the criteria for capitalisation.

An impairment exists if the carrying amount of the asset exceeds the amount of consideration the entity expects to receive in exchange for providing the associated goods or services, less the remaining costs that relate directly to providing those goods or services. Impairment losses are recognised in profit or loss.

[IFRS 15.101]. Refer to Question 9-27 in section 9.3.3 above for further discussion on classifying and presenting impairment losses within profit or loss.

TRG members generally agreed that an impairment test of capitalised contract costs must include future cash inflows and outflows associated with contract renewal or extension periods, if the period of benefit of the costs under assessment is expected to extend beyond the present contract.¹⁵⁹ In other words, an entity must consider the total period over which it expects to receive economic benefits relating to the asset, for the purpose of both determining the amortisation period and estimating cash flows to be used in the impairment test. The question was raised because of an inconsistency within IFRS 15. IFRS 15 indicates that costs capitalised under the standard could relate to goods or services to be transferred under 'a specific anticipated contract' (e.g., goods or services to be provided under contract renewals and/or extensions). [IFRS 15.99]. The standard also indicates that an impairment loss would be recognised when the carrying amount of the asset exceeds the remaining amount of consideration expected to be received (determined by using principles in IFRS 15 for determining the transaction price, see section 5 above).

[IFRS 15.101(a), IFRS 15.102]. However, the requirements for measuring the transaction price in IFRS 15 indicate that an entity does not anticipate that the contract will be "cancelled, renewed or modified" when determining the transaction price. [IFRS 15.49].

¹⁵⁸ IFRS 18 supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted). See Chapter 4 for further details on the requirements of IFRS 18.

¹⁵⁹ TRG Agenda paper no. 4, *Impairment testing of capitalised contract costs*, dated 18 July 2014 and TRG Agenda paper no. 5, *July 2014 Meeting-Summary of Issues Discussed and Next Steps*, dated 31 October 2014.

In some instances, excluding renewals or extensions would trigger an immediate impairment of a contract asset because the consideration an entity expects to receive would not include anticipated cash flows from contract extensions or renewal periods. However, the entity would have capitalised contract costs on the basis that they would be recovered over the contract extension or renewal periods. When an entity determines the amount it expects to receive (see section 5 above), it would not apply the requirements for constraining estimates of variable consideration. That is, if an entity were required to reduce the estimated transaction price because of the constraint on variable consideration, it would use the unconstrained transaction price for the impairment test. This would include any amounts expected to be received but not yet recognised because of the royalties recognition constraint (see section 8.5 above) or the 'right to invoice' practical expedient (see section 7.1.4.B above). While the amount expected to be received is unconstrained, it would still need to be adjusted to reflect the customer's credit risk before it is used in the impairment test. [IFRS 15.102]. However, before recognising an impairment loss on capitalised contract costs incurred to obtain or fulfil a contract, entities need to consider impairment losses recognised in accordance with other standards (e.g., IAS 2, IAS 16 and IAS 38). After applying the impairment test to the capitalised contract costs, an entity includes the resulting carrying amounts in the carrying amount of a cash-generating unit for purposes of applying the requirements in IAS 36. [IFRS 15.103].

Under IFRS accounting standards, IAS 36 permits the reversal of some or all of previous impairment losses on assets (other than goodwill) or cash-generating units if the estimates used to determine the assets' recoverable amount have changed. [IAS 36.109-125]. Consistent with IAS 36, IFRS 15 permits reversal of impairment losses when impairment conditions no longer exist or have improved. However, the increased carrying amount of the asset must not exceed the amount that would have been determined (net of amortisation) if no impairment loss had been recognised previously. [IFRS 15.104].

FASB differences

Under US GAAP, the reversal of previous impairment losses is prohibited.

Frequently asked questions

Question 9-28: How often does an entity need to assess its capitalised contract costs for impairment under IFRS 15?

IFRS 15 does not explicitly state how often an entity needs to assess its capitalised contract costs for impairment.

How we see it

We believe an entity needs to assess whether there is any indication that its capitalised contract costs might be impaired at the end of each reporting period.

This is consistent with the requirement in IAS 36.9 to assess whether there are indicators that assets within the scope of that standard are impaired. For example, a pandemic or natural disaster might affect customers' ability and intent to pay, and/or entities might be more willing to accept partial payment or extend payment terms. Such collectability concerns might indicate that entities need to assess related capitalised costs to obtain or fulfil a contract for impairment.

10 IFRS 15 - Presentation and disclosure

IFRS 15 provides explicit presentation and disclosure requirements, which are more detailed than under legacy IFRS accounting standards and increase the volume of required disclosures that entities have to include in their interim and annual financial statements.

While not part of the requirements in IFRS 15, entities also need to disclose material accounting policy information in accordance with IAS 1 (or IAS 8, if IFRS 18¹⁶⁰ is adopted early). [IAS 1.117, IAS 8(2027).27A]. It is likely that entities will conclude that accounting policy information about areas of IFRS 15 that are complex or require significant judgements are material. If so, entities will need to make entity-specific and tailored disclosures. [IAS 1.117B-117C].

The extracts in this section illustrate possible formats entities might use to disclose information required by IFRS 15, using real-life examples from entities that have applied the standard.

How we see it

As discussed more fully below, IFRS 15 requires extensive and detailed disclosures in entities' financial statements, particularly annual financial statements.

Entities might have to expend considerable effort when preparing the required disclosures for their interim and annual financial statements. For example, some entities operating in multiple segments with many different product lines might find it challenging to gather the data needed to provide the disclosures. Therefore, it is important for entities to have the appropriate systems, internal controls, policies and procedures in place to collect and disclose the required information.

FASB differences

For US GAAP preparers, the standard provides requirements on presentation and disclosure that apply to both public and non-public entities and provide some relief on disclosure requirements for non-public entities. IFRS 15 does not differentiate between public and non-public entities. Therefore, an entity that applies IFRS 15 must apply all of its requirements.¹⁶¹

10.1 Presentation requirements for contract assets and contract liabilities

The revenue model is based on the notion that a contract asset or contract liability is generated when either party to a contract performs, depending on the relationship between the entity's performance and the customer's payment. The standard requires that an entity present these contract assets or contract liabilities in the statement of financial position, as extracted below: [IFRS 15.105, IFRS 15.106, IFRS 15.107, IFRS 15.108]

Extract from IFRS 15

- | | |
|-----|--|
| 105 | When either party to a contract has performed, an entity shall present the contract in the statement of financial position as a contract asset or a contract liability, depending on the relationship between the entity's performance and the customer's payment. An entity shall present any unconditional rights to consideration separately as a receivable. |
| 106 | If a customer pays consideration, or an entity has a right to an amount of consideration that is unconditional (ie a receivable), before the entity transfers a good or service to the customer, the entity shall present the contract as a contract liability when the payment is made or the payment is due (whichever is earlier). A contract liability is an entity's obligation to transfer goods or services to a customer for which the entity has received consideration (or an amount of consideration is due) from the customer. |

¹⁶⁰ IFRS 18 supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted). Once effective, the consequential amendments resulting from IFRS 18 will change the scope and title of IAS 8 due to certain sections previously included within IAS 1 being moved (mostly unchanged) to IAS 8. See Chapter 4 for further details on the requirements of IFRS 18.

¹⁶¹ IFRS 19 *Subsidiaries without Public Accountability: Disclosures* was issued by the IASB in May 2024 to simplify the preparation of financial statements by eligible subsidiaries. Eligible subsidiaries that elect to apply IFRS 19 are allowed to provide reduced disclosures while still applying the recognition, measurement and presentation requirements in other IFRS accounting standards. IFRS 19 is effective for annual reporting periods beginning on or after 1 January 2027, with earlier application permitted (subject to jurisdictional endorsement). See Chapter 4 for further details on the requirements of IFRS 19.

- 107 If an entity performs by transferring goods or services to a customer before the customer pays consideration or before payment is due, the entity shall present the contract as a contract asset, excluding any amounts presented as a receivable. A contract asset is an entity's right to consideration in exchange for goods or services that the entity has transferred to a customer. An entity shall assess a contract asset for impairment in accordance with IFRS 9. An impairment of a contract asset shall be measured, presented and disclosed on the same basis as a financial asset that is within the scope of IFRS 9 (see also paragraph 113(b)).
- 108 A receivable is an entity's right to consideration that is unconditional. A right to consideration is unconditional if only the passage of time is required before payment of that consideration is due. For example, an entity would recognise a receivable if it has a present right to payment even though that amount may be subject to refund in the future. An entity shall account for a receivable in accordance with IFRS 9. Upon initial recognition of a receivable from a contract with a customer, any difference between the measurement of the receivable in accordance with IFRS 9 and the corresponding amount of revenue recognised shall be presented as an expense (for example, as an impairment loss).

The standard does not explicitly require an entity to present contract assets or contract liabilities as separate line items in the statement of financial position. Therefore, entities need to consider the requirements in IAS 1 (see Chapter 3), or IFRS 18,¹⁶² if adopted early (see Chapter 4), to determine whether to present them in separate line items. See Question 10-1 and Question 10-3 in section 10.1.5 below for further information on offsetting contract assets and contract liabilities. [IFRS 15.BC320, IAS 1.55, IAS 1.57].

In the following Practical example, Bombardier Inc. presents these amounts separately using the terminology from the standard.

162 IFRS 18 supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted).

IFRS 18 introduces new requirements for the aggregation and location of information in the financial statements based on the identified 'roles' of the primary financial statements and the notes, as well as guidance on providing informative labels.

See Chapter 4 for further details on the requirements of IFRS 18.

The following flowchart illustrates how an entity determines whether to recognise a receivable, a contract asset or a contract liability on the balance sheet:

Figure 10-1: Recognition of a receivable, a contract asset or a contract liability

* If the customer can cancel the contract and receive a refund of the advance payment, an entity would consider recognising a refund liability (separate from contract liabilities - see Question 10-4 below).

** This assumes the consideration received is equal to the amount to which the entity is entitled for the good or service already transferred. If the consideration received is less than this amount, an entity may need to recognise a contract asset or a receivable for the difference. If the consideration received is more than this amount, an entity may need to recognise a contract liability or a refund liability.

When an entity satisfies a performance obligation by transferring a promised good or service, the entity has earned a right to consideration from the customer and, therefore, has a contract asset. When the customer performs first, for example, by prepaying its promised consideration, the entity has a contract liability.

[IFRS 15.106, IFRS 15.107].

An entity could also have recognised other assets related to contracts with a customer (e.g., the incremental costs of obtaining the contract and other costs incurred that meet the criteria for capitalisation). The standard requires that any such assets be presented separately from contract assets and contract liabilities in the statement of financial position or disclosed separately in the notes to the financial statements (assuming that they are material). [IFRS 15.116(a)]. These amounts are also assessed for impairment separately (see section 9.3.4 above).

10.1.1 Distinction between contract assets and receivables

Contract assets represent conditional or unconditional rights to consideration. The right is conditional, for example, when an entity must first satisfy another performance obligation in the contract before it is entitled to payment from the customer. If an entity has an unconditional right to receive consideration from the customer, the contract asset is accounted for as a receivable and presented separately from other contract assets. [IFRS 15.105, IFRS 15.BC323, IFRS 15.BC324]. A right is unconditional if nothing other than the passage of time is required before payment of that consideration is due. [IFRS 15.108].

In the Basis for Conclusions on IFRS 15, the Board explains that in many cases an unconditional right to consideration (i.e., a receivable) arises when an entity satisfies a performance obligation, which could be before it invoices the customer (e.g., an unbilled receivable) if only the passage of time is required before payment of that consideration is due. It is also possible for an entity to have an unconditional right to consideration before it satisfies a performance obligation. [IFRS 15.107, IFRS 15.BC325]. In some industries, it is common for an entity to invoice its customers in advance of performance (and satisfaction of the performance obligation). For example, an entity that enters into a non-cancellable contract requiring payment a month before the entity provides the goods or services would recognise a receivable and a contract liability on the date the entity has an unconditional right to the consideration (see Question 10-6 in section 10.1.5 below for factors to consider when assessing whether an entity's right to consideration is considered unconditional). In this situation, revenue is not recognised until goods or services are transferred to the customer.

In December 2015, the IASB discussed application of IFRS 15 to contracts in which the entity has transferred control of a good to the customer at a point in time, but the consideration to which the entity is entitled is contingent upon a market price (e.g., a commodity price), which will be determined at a future date. The example assumed that there was no separable embedded derivative (i.e., the entire contract was within the scope of IFRS 15). In discussing this issue, the Board clarified the nature of conditions that might prevent recognition of a receivable. Specifically, the Board agreed that the variability arising solely from changes in the market price would not be a condition that prevents an entity to recognise a receivable. That is, since the entity has performed, "... nothing else (ie no future event) needs to happen before payment of the consideration is due. The existence of a price in the future requires no event to occur and depends solely on the passage of time. Changes in the price of Commodity do not affect the entity's right to consideration, even though the amount that the entity receives is known only on the payment date. In other words, there is no uncertainty with regards to the entity's entitlement to the consideration. The entity's right to consideration is therefore unconditional as understood by IFRS 15...". Therefore, when the entity performs by transferring control of the good to the customer, it recognises a receivable in accordance with IFRS 9 (and is no longer subject to the requirements in IFRS 15 for the variable consideration constraint).¹⁶³

In the Basis for Conclusions, the Board noted that making the distinction between a contract asset and a receivable is important because doing so provides users of financial statements with relevant information about the risks associated with the entity's rights in a contract. Although both are subject to credit risk, a contract asset is also subject to other risks (e.g., performance risk). [IFRS 15.BC323].

Under the standard, entities are not required to use the terms 'contract asset' or 'contract liability', but must disclose sufficient information so that users of the financial statements can clearly distinguish between unconditional rights to consideration (receivables) and conditional rights to receive consideration (contract assets). [IFRS 15.109].

The standard provides the following example of presentation of contract balances: [IFRS 15.IE Example 38, IFRS 15.IE198-IE200]

Extract from IFRS 15

Example 38-Contract liability and receivable

Case A-Cancellable contract

On 1 January 20X9, an entity enters into a cancellable contract to transfer a product to a customer on 31 March 20X9. The contract requires the customer to pay consideration of CU1,000 in advance on 31 January 20X9. The customer pays the consideration on 1 March 20X9. The entity transfers the product on 31 March 20X9. The following journal entries illustrate how the entity accounts for the contract:

- (a) The entity receives cash of CU1,000 on 1 March 20X9 (cash is received in advance of performance):

Cash	CU1,000	
	Contract liability	CU1,000

- (b) The entity satisfies the performance obligation on 31 March 20X9:

Contract liability	CU1,000	
	Revenue	CU1,000

Case B-Non-cancellable contract

The same facts as in Case A apply to Case B except that the contract is non-cancellable. The following journal entries illustrate how the entity accounts for the contract:

- (a) The amount of consideration is due on 31 January 20X9 (which is when the entity recognises a receivable because it has an unconditional right to consideration):

Receivable	CU1,000	
	Contract liability	CU1,000

- (b) The entity receives the cash on 1 March 20X9:

Cash	CU1,000	
	Receivable	CU1,000

163 [IASB Staff Paper 7H](#): Project: Revenue from Contracts with Customers, Paper topic: Constraining estimates of variable consideration when the consideration varies based on a future market price, IASB Meeting, December 2015; and [IASB Update](#), December 2015. Available on the IFRS Foundation's website.

(c) The entity satisfies the performance obligation on 31 March 20X9:

Contract liability	CU1,000
Revenue	CU1,000

If the entity issued the invoice before 31 January 20X9 (the due date of the consideration), the entity would not present the receivable and the contract liability on a gross basis in the statement of financial position because the entity does not yet have a right to consideration that is unconditional.

The standard includes another example of presentation of contract balances that illustrates when an entity has satisfied a performance obligation, but does not have an unconditional right to payment and, therefore, recognises a contract asset: *[IFRS 15.IE Example 39, IFRS 15.IE201-IE204]*

Extract from IFRS 15

Example 39-Contract asset recognised for the entity's performance

On 1 January 20X8, an entity enters into a contract to transfer Products A and B to a customer in exchange for CU1,000. The contract requires Product A to be delivered first and states that payment for the delivery of Product A is conditional on the delivery of Product B. In other words, the consideration of CU1,000 is due only after the entity has transferred both Products A and B to the customer. Consequently, the entity does not have a right to consideration that is unconditional (a receivable) until both Products A and B are transferred to the customer.

The entity identifies the promises to transfer Products A and B as performance obligations and allocates CU400 to the performance obligation to transfer Product A and CU600 to the performance obligation to transfer Product B on the basis of their relative stand-alone selling prices. The entity recognises revenue for each respective performance obligation when control of the product transfers to the customer.

The entity satisfies the performance obligation to transfer Product A:

Contract asset	CU400
Revenue	CU400

The entity satisfies the performance obligation to transfer Product B and to recognise the unconditional right to consideration:

Receivable	CU1,000
Contract asset	CU400
Revenue	CU600

Also consider the following Illustration, which shows an unbilled receivable (rather than a contract asset):

Illustration 10-1: Unbilled receivable

On 14 September 20X0, Entity L enters into a contract to sell 100 widgets to Customer F at CU10 per widget. All of the widgets are delivered to Customer F on 29 September 20X0. Entity L invoices Customer F on 12 October 20X0.

Entity L determines that revenue is recognised when control of the widgets transfers to Customer F on 29 September 20X0. Entity L records a corresponding receivable because only the passage of time is required before payment of that consideration is due. That is, Entity L has an unconditional right to consideration as at 29 September 20X0, even though Entity L has not yet issued an invoice. That is, even though the amount is 'unbilled', it is still considered a receivable, rather than a contract asset.

As noted in Question 5-6 in section 5.2.1 above, when an entity is entitled to receive consideration denominated in a foreign currency, it needs to apply IAS 21 and IFRIC 22 to appropriately translate a foreign denominated transaction on initial recognition. After initial recognition, receivables are retranslated using the spot exchange rate at each subsequent reporting date and on derecognition, with the exchange gains and losses being recognised in profit or loss. This is because receivables are monetary items as defined in IAS 21.8. *[IAS 21.8]*. Further analysis is needed for a contract asset to determine whether it is a monetary item that requires retranslation, or a non-monetary item that does not. Some (or all) of a contract asset will meet the definition of a monetary item to the extent the (conditional) right to consideration is to foreign denominated cash.¹⁶⁴ See Chapter 16 for further discussion.

¹⁶⁴ [IASB Staff Paper 2](#): Project: *IAS 21 The Effects of Changes in Foreign Exchange Rates*, Paper topic: *Draft Interpretation-Foreign Currency Transactions and Advance Consideration*, IFRS IC meeting, March 2015, paragraph 38. Available on the IFRS Foundation's website.

10.1.2 Current versus non-current

Unless an entity presents its statement of financial position on a liquidity basis, it needs to present contract assets or contract liabilities as current or non-current in the statement of financial position. Since IFRS 15 does not address this classification, entities need to consider the requirements in IAS 1 (or IFRS 18,¹⁶⁵ if adopted early).

The distinction between current and non-current items depends on the length of the entity's operating cycle. IAS 1 states that the operating cycle of an entity is the time between the acquisition of assets for processing and their realisation in cash or cash equivalents - this wording was carried over to IFRS 18 substantially unchanged. However, when the entity's normal operating cycle is not clearly identifiable, it is assumed to be 12 months. [IAS 1.68, IAS 1.70, IFRS 18.B95, IFRS 18.B96]. Neither IAS 1 nor IFRS 18 provides guidance on how to determine whether an entity's operating cycle is 'clearly identifiable'. For some entities, the time involved to produce goods or provide services might vary significantly from contracts with one customer to another. In such cases, it might be difficult to determine what is the normal operating cycle.

Therefore, entities need to consider all facts and circumstances and use judgement to determine whether it is appropriate to consider that the operating cycle is clearly identifiable, or whether to use the twelve-month default. [IAS 1.68, IAS 1.70, IFRS 18.B95, IFRS 18.B96]. This assessment is also relevant for other assets and liabilities arising from contracts with customers within the scope of IFRS 15 (e.g., capitalised contract costs to obtain and fulfil a contract).

Consequently, an entity assesses, based on the contract terms, facts and circumstances, whether a contract asset or contract liability is classified as current or non-current. It considers:

- For a contract asset: when payment is due (e.g., based on payment schedule agreed with client)
- For a contract liability: the timing of satisfaction of the performance obligation as a factor when applying the requirements of IAS 1 [IAS 1.69, IFRS 18.101]

This assessment might lead to a separation of the contract asset or contract liability into a current and a non-current portion.

In Practical example 10-2 below, Fédération Internationale de Football Association (FIFA) splits contract liabilities between current and non-current in its balance sheet and uses the terms from the standard.

Practical example 10-2: Fédération Internationale de Football Association (FIFA) (2023)

Switzerland

Total liabilities		1,925,661	2,824,283

¹⁶⁵ IFRS 18 supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted). See Chapter 4 for further details on the requirements of IFRS 18.

10.1.3 Impairment of contract assets

After initial recognition, contract assets, like receivables, are subject to impairment assessments in accordance with IFRS 9 (the impairment requirements are discussed in Chapter 47). [IFRS 15.107]. The Basis for Conclusions on IFRS 9 clarifies that contract assets are in scope of IFRS 9 impairment because the IASB considered “the exposure to credit risk on contract assets is similar to that of trade receivables”. [IFRS 9.BC5.154].

The expected credit loss model in IFRS 9 focuses on the difference between the contractual cash flows and expected cash flows. [IFRS 9.B5.5.29]. However, consider an example in which an entity is entitled to receive property, plant or equipment in the future in exchange for the satisfaction of performance obligations. The right to receive non-cash consideration does not give rise to cash inflows. As such, judgement might be needed when the consideration to which the entity is entitled is non-cash. Since the entity does not yet hold the non-cash consideration, the impairment requirements in IAS 36, for example, do not directly apply.

How we see it

When applying the impairment requirements of IFRS 9 to the contract asset, an entity considers the likelihood of not receiving the non-cash consideration (i.e., non-performance risk). However, this would not consider any potential impairment in the underlying asset to which the entity is entitled. As such, an entity might need to consider the value of the underlying non-cash consideration to which it is entitled to use as a proxy for the cash inflows when applying the impairment requirements of IFRS 9.

As discussed in section 5.5.5 above, impairment losses on receivables are presented in line with the requirements of IAS 1 (or IFRS 18,¹⁶⁶ if adopted early) and the disclosure requirements in IFRS 7 apply. [IFRS 7.35A(a)]. In addition, as discussed in section 10.2 below, IFRS 15 requires that such amounts are disclosed separately from impairment losses from other contracts. [IFRS 15.113(b)]. These requirements also apply to impairment losses on contract assets.

10.1.4 Derecognition of contract assets

Contract assets will generally be derecognised when an entity's right to consideration becomes unconditional, and it is able to recognise a receivable in accordance with IFRS 9. [IFRS 15.108]. IFRS 15 does not provide any additional requirements on derecognising contract assets and only the impairment requirements in IFRS 9 apply to contract assets (as discussed in section 10.1.3 above). [IFRS 15.107].

How we see it

In theory, entities could also apply the derecognition requirements in IFRS 9 by analogy to contract assets. However, in practice, we believe that it is very unlikely that many contract assets would meet the requirements for derecognition in IFRS 9, particularly if they are still conditional on the entity's future performance. See Chapter 48 for further discussion on the derecognition requirements of IFRS 9.

10.1.5 Initial measurement of receivables

IFRS 9 includes different initial measurement requirements for receivables arising from IFRS 15 contracts depending on whether there is a significant financing component.

- If there is a significant financing component, the receivable is initially measured at fair value. [IFRS 9.5.1.1].
- If there is no significant financing component (or the entity has used the practical expedient in IFRS 15.63 - see section 5.5.1 above), the receivable is initially recognised at the amount determined by applying IFRS 15. [IFRS 9.5.1.3]. The *Annual Improvements* issued by the Board in July 2024, amended IFRS 9.5.1.3 to replace its previous reference to “transaction price (as defined in IFRS 15)” with “the amount determined by applying IFRS 15”. The use of the term ‘transaction price’ in relation to IFRS 15 was potentially confusing and so it was removed by the amendment. The term was also deleted from Appendix A of IFRS 9. This amendment became effective for annual periods beginning on or after 1 January 2026 and earlier application was permitted. [IFRS 9(2026).5.1.3, IFRS 9(2026).BC5.10A-BC5.10B].

¹⁶⁶ IFRS 18 supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted). See Chapter 4 for further details on the requirements of IFRS 18.

If upon initial measurement there is a difference between the measurement of the receivable under IFRS 9 and the corresponding amount of revenue, that difference is presented immediately in profit or loss (e.g., as an impairment loss). [IFRS 15.108]. See Chapter 45 for further discussion on recognition and initial measurement under IFRS 9.

If the initial measurement of a receivable is at fair value, there might be a number of reasons why differences from the IFRS 15 transaction price could arise (e.g., changes in the fair value of non-cash consideration not yet received, changes in market interest rates or inflation, etc.). This is the case when the difference is attributable to customer credit risk, rather than an implied price concession. Implied price concessions are deducted from the contract price to derive the transaction price, which is the amount recognised as revenue. Distinguishing between implied price concessions and expense due to customer credit risk requires judgement (see sections 5.2.1.A - 5.2.1.B above). Impairment losses resulting from contracts with customers are presented separately from other impairment losses (see section 10.5.1 below for further discussion). [IFRS 15.113(b)].

Further analysis of the reason for such a difference might be needed if an entity has an unconditional right to payment (i.e., a receivable) even though that amount is subject to refund in the future. This could occur because, for example, a customer might be entitled to a retrospective volume rebate. Assume, for example, that an entity has invoiced a customer CU100 for the sale of goods, but expects to refund CU25 because the customer will meet the conditions for an agreed volume rebate. The entity recognises CU75 because it has constrained the consideration (in accordance with the variable consideration requirements, see section 5.2 above). However, it has an unconditional right to receive payment for the full invoice price of CU100. Therefore, the entity recognises a receivable of CU100 and the refund obligation of CU25 (on a gross basis), unless the offsetting requirements in IAS 32.42 are met (see Chapter 50 for the requirements in IAS 32 on offsetting financial assets and financial liabilities). This is consistent with Example 40 in the standard. [IFRS 15.IE Example 40, IFRS 15.IE205-IE208]. Careful analysis of the facts will be important including expectations about when any conditions for refund will be met and when the entity has an unconditional right to payment.

Frequently asked questions

Question 10-1: How would an entity determine the presentation of contract assets and liabilities for contracts that contain multiple performance obligations?

(TRG meeting 31 October 2014 - Agenda paper no. 7)

TRG members generally agreed that contract assets and liabilities would be determined at the contract level and not at the performance obligation level. That is, an entity does not separately recognise an asset or liability for each performance obligation within a contract, but aggregates them into a single contract asset or liability.¹⁶⁷

Under the standard, the amount and timing of revenue recognition is determined based on progress toward complete satisfaction of *each* performance obligation. Therefore, this question addresses whether an entity could have a contract asset and a contract liability for a single contract. An example is when the entity has satisfied (or partially satisfied) one performance obligation in a contract for which consideration is not yet due but has received a prepayment for another unsatisfied performance obligation in the contract. Members of the TRG generally agreed that the discussion in the Basis for Conclusions was clear that contract asset or contract liability positions are determined for each contract on a net basis. This is because the rights and obligations in a contract with a customer are interdependent - the right to receive consideration from a customer depends on the entity's performance and, similarly, the entity performs only as long as the customer continues to pay. The Board decided that those interdependencies are best reflected by accounting and presenting contract assets or liabilities on a net basis. [IFRS 15.BC317].

Consider the following Illustration:

Illustration 10-2: Presentation of contract assets and liabilities

Entity A has a contract with Customer B to transfer a licence on 1 January 20X0 for the right to use Entity A's intellectual property in exchange for a CU200,000 milestone payment that is contingent upon Customer B achieving a specific outcome. The contract also includes a one-year service to be provided by Entity A for fixed consideration of CU100,000 that is paid upfront by Customer B at contract inception.

¹⁶⁷ TRG Agenda paper no. 7, *Presentation of a contract as a contract asset or a contract liability*, dated 31 October 2014 and TRG Agenda paper no. 11, *October 2014 Meeting - Summary of Issues Discussed and Next Steps*, dated 26 January 2015.

Assume Entity A concludes there are two performance obligations: one for the right to use licence of intellectual property that will be satisfied when the licence is delivered and one for the service that will be recognised over time using a time-elapsed measure of progress. On 1 January 20X0, the licence is delivered and the service commences.

Entity A determines that the milestone payment is variable consideration. Because of the binary nature of the outcome (i.e., the entity will either receive the milestone payment or not), Entity A determines that the most likely amount method (discussed in section 5.2.2 above) is the better predictor of the amount to which it expects to be entitled. Entity A believes it is 90% probable that it will receive the CU200,000 milestone payment. Therefore, using the most likely amount method, Entity A estimates that it will receive the full CU200,000. Entity A then allocates the total transaction price of CU300,000 (variable consideration of CU200,000 plus the fixed consideration of CU100,000) to the licence and the service based on their relative stand-alone selling prices (assume this arrangement does not meet the variable consideration allocation exception). Further assume that CU200,000 is allocated to the licence and CU100,000 is allocated to the service, i.e., the components were priced at their stand-alone selling price.

On 1 January 20X0, when Entity A satisfies the performance obligation related to the licence, it recognises revenue and a contract asset of CU200,000. A contract asset is recorded (rather than a receivable) because Entity A's right to the consideration is contingent upon something other than the passage of time (i.e., Customer B achieving a specific outcome). The performance obligation associated with the service results in the recognition of a contract liability of CU100,000 as at 1 January 20X0 because Entity A paid upfront for the service.

On 31 March 20X0, related to the contract with Customer B, Entity A has a contract asset of CU200,000 (because the condition to receive consideration for the licence still has not been met) and a contract liability of CU75,000 (because CU25,000 of revenue has been recognised for one quarter of service). For presentation purposes as at 31 March 20X0, Entity A nets the contract asset of CU200,000 and the contract liability of CU75,000, and presents a net contract asset of CU125,000.

After determining the net contract asset or contract liability position for a contract, entities consider the requirements in IAS 1 (or IFRS 18,¹⁶⁸ if adopted early) on classification as current or non-current in the statement of financial position, unless an entity presents its statement of financial position on a liquidity basis.

Question 10-2: How would an entity determine the presentation of two or more contracts that are required to be combined under the standard?

(TRG meeting 31 October 2014 - Agenda paper no. 7)

TRG members generally agreed that the contract asset or liability would be combined (i.e., presented net) for different contracts with the same customer (or a related party of the customer) if an entity is otherwise required to combine those contracts under the standard (see section 3.3 above for discussion of the criteria for combining contracts).¹⁶⁹ When two or more contracts are required to be combined under the standard, the rights and obligations in the individual contracts are interdependent. Therefore, as discussed in Question 10-1 above, this interdependency is best reflected by combining the individual contracts as if they were a single contract. However, TRG members acknowledged that this analysis might be operationally difficult for some entities because their systems might capture data at the performance obligation level in order to comply with the recognition and measurement aspects of the standard.

Question 10-3: When would an entity offset contract assets and liabilities against other statement of financial position items (e.g., accounts receivable)?

(TRG meeting 31 October 2014 - Agenda paper no. 7)

TRG members generally agreed that, because the standard does not provide requirements for offsetting, entities need to apply the requirements of other standards to determine whether offsetting is appropriate (e.g., IAS 1, IAS 32, IFRS 18).¹⁷⁰ For example, if an entity has recorded a contract asset (or a receivable) and a contract liability (or refund liability) from separate contracts with the same customer (that are not required to be combined under the standard), the entity needs to look to requirements outside IFRS 15 to determine whether offsetting is appropriate.

¹⁶⁸ IFRS 18 supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted). See Chapter 4 for further details on the requirements of IFRS 18.

¹⁶⁹ TRG Agenda paper no. 7, *Presentation of a contract as a contract asset or a contract liability*, dated 31 October 2014 and TRG Agenda paper no. 11, *October 2014 Meeting - Summary of Issues Discussed and Next Steps*, dated 26 January 2015.

¹⁷⁰ TRG Agenda paper no. 7, *Presentation of a contract as a contract asset or a contract liability*, dated 31 October 2014 and TRG Agenda paper no. 11, *October 2014 Meeting - Summary of Issues Discussed and Next Steps*, dated 26 January 2015.

Question 10-4: Is a refund liability a contract liability (and, thus, subject to the presentation and disclosure requirements of a contract liability)?

How we see it

An entity needs to determine whether a refund liability is characterised as a contract liability based on the specific facts and circumstances of the arrangement. We believe the following are relevant considerations in making that determination.

We believe that a refund liability typically does not meet the definition of a contract liability. When an entity concludes that a refund liability is not a contract liability, it presents the refund liability separately from any contract liability (or asset) and the refund liability is not subject to the disclosure requirements in IFRS 15.116-118 discussed in section 10.5.1.B below.

When a customer pays consideration (or consideration is unconditionally due) and the entity has an obligation to transfer *goods or services* to the customer, the entity recognises a contract liability. When the entity expects to refund some or all of the *consideration* received (or receivable) from the customer, it recognises a refund liability. A refund liability generally does not represent an obligation to transfer goods or services in the future. Similar to receivables (which are considered a subset of contract assets), refund liabilities could be considered a subset of contract liabilities.

We believe refund liabilities are also similar to receivables in that they are extracted from the net contract position and presented separately (if material). This conclusion is consistent with the standard's specific requirement to present the corresponding asset for expected returns separately (see section 5.4 above).

If an entity concludes, based on its specific facts and circumstances, that a refund liability represents an obligation to transfer goods or services in the future, the refund liability is a contract liability subject to the disclosure requirements in IFRS 15.116-118. In addition, in that situation, the entity presents a single net contract liability or asset (i.e., including the refund liability) determined at the contract level, as discussed in Question 10-1 above.

Question 10-5: How would an entity account for a contract asset that exists when a contract is modified if the modification is treated as the termination of an existing contract and the creation of a new contract? (FASB TRG meeting 18 April 2016 - Agenda paper no. 51)

FASB TRG members generally agreed that a contract asset that exists when a contract is modified would be carried forward into the new contract if the modification is treated as the termination of an existing contract and the creation of a new contract (see section 3.4.1 above).

This question addresses this type of modification because the termination of the old contract could indicate that any remaining balances associated with the old contract must be written off.

FASB TRG members generally agreed that it is appropriate to carry forward the related contract asset in such modifications because the asset relates to a right to consideration for goods or services that have already been transferred and are distinct from those to be transferred in the future. As such, the revenue recognised to date is not reversed and the contract asset continues to be realised as amounts become due from the customer and are presented as a receivable. The contract asset that remains on the entity's statement of financial position at the date of modification continues to be subject to evaluation for impairment.

Consider the following Illustration based on the example included in the TRG agenda paper:

Illustration 10-3: Accounting for an existing contract asset when the contract is modified

Vendor A enters into a contract to provide a good and one year of service. The transaction price is CU4,200. The good and service are separate performance obligations, and the service is considered a series of distinct goods or services (see section 4.2.2 above). The stand-alone selling price for the good is CU3,000 and the stand-alone selling price for the services is CU100 per month (CU1,200 for one year). Therefore, Vendor A allocates CU3,000 to the good and CU1,200 to the services. Customer B will pay 12 equal instalments of CU350. Vendor A will invoice Customer B at the end of each month.

At the beginning of the first month, the good is transferred to Customer B and the revenue allocated to that performance obligation (CU3,000) is recognised. Vendor A also recognises a contract asset for CU3,000 because payment of that CU3,000 is conditional upon Vendor A's performance of future services.

At the end of the first month, Vendor A recognises revenue of CU100 for progress toward complete satisfaction of the performance obligation related to the services (assuming the entity is using a time-based measure of progress). Vendor A also recognises accounts receivable of CU350 because that amount is not conditional. The contract asset, which had a balance of CU3,000 at the beginning of the month, would have a balance of CU2,750 (CU3,000 - (CU350 - CU100)) at the end of the first month.

Vendor A continues to make similar entries for the first nine months of the contract. After nine months, CU3,900 of revenue has been recognised for the contract (CU900 of revenue for the services and CU3,000 for the good). Vendor A has a receivable for CU350 (assuming Customer B already paid the first eight instalments). In addition, Vendor A has a contract asset for CU750 (CU3,000 - (9 × (CU350 - CU100))).

At the end of nine months, the contract is modified to include one additional year of service. The fee for the last three months of the initial one-year contract is unchanged, but the agreed fee for the additional one year of services is CU50 per month, which is significantly below the stand-alone selling price of the services. In addition, because the remaining services are a series of distinct services, Vendor A determines that the remaining services are distinct from the goods or services transferred prior to the modification. Therefore, the modification would be accounted for under IFRS 15.21(a) (i.e., as a termination of the existing contract and the creation of a new contract, as discussed in section 3.4.2.A above).

At the modification date, Vendor A retains the existing contract asset of CU750 that relates to revenue previously recognised, but which has not been paid by the customer (and is not presented as a receivable since it is not yet unconditional). Vendor A also determines the total consideration to be allocated to the remaining performance obligations. The consideration promised by Customer B that was included in the transaction price, but not yet recognised as revenue under the original contract, is CU300 (equal to CU4,200 transaction price - CU3,900 already recognised as revenue). The additional consideration promised as part of the contract modification is CU600 (equal to 12 additional months × CU50 per month). Therefore, the total amount of consideration allocated to the remaining distinct services is CU900 (CU300 + CU600). Vendor A would allocate the CU900 to the remaining performance obligations and recognise revenue over the remaining modified contract duration. Subsequent to the contract modification, the contract asset would be evaluated and accounted for in the same manner as any other contract asset.

How we see it

While the FASB TRG members did not discuss this point, we believe a similar conclusion would be appropriate when accounting for an asset created under IFRS 15, such as capitalised commissions, which exists immediately before a contract modification that is treated as if it were a termination of the existing contract and creation of a new contract. Refer to Question 9-11 in section 9.3.1 above for further discussion.

Question 10-6: If an entity has not transferred a good or service, when does it have an unconditional right to payment?

The standard states in IFRS 15.108 that a receivable is an entity's right to consideration that is unconditional.

How we see it

In general, we believe it might be difficult to assert that the entity has an unconditional right to payment when it has not transferred a good or service.

However, an entity might enter into non-cancellable contracts that provide unconditional rights to payment from the customer for services that the entity has not yet completed providing or services it will provide in the near future (e.g., amounts invoiced in advance related to a service or maintenance arrangement).

When determining whether an entity is required to recognise accounts receivable and a corresponding contract liability, the contractual terms and specific facts and circumstances supporting the existence of an unconditional right to payment need to be evaluated, including the factors outlined below.

- (a) Does the entity have a contractual (or legal) right to invoice and receive payment from the customer for services being provided currently (and not yet completed) or being provided in the near future (e.g., amounts invoiced in advance related to a service or maintenance arrangement)?
- (b) Is the advance invoice consistent with the entity's normal invoicing terms?
- (c) Will the entity commence performance within a relatively short time frame of the invoice date?
- (d) Is there more than one year between the advance invoice and performance?

10.2 Presentation requirements for revenue from contracts with customers

The Board decided to require entities to separately present or disclose the amount of revenue related to contracts with customers, as follows: [IFRS 15.113, IFRS 15.BC332]

- IFRS 15.113(a) requires an entity to disclose (or present in the statement of comprehensive income) the amount of revenue recognised from contracts with customers under IFRS 15 separately from other sources of revenue. For example, a large equipment manufacturer that both sells and leases its equipment is required to present (or disclose) amounts from these transactions separately.
- IFRS 15.113(b) also requires an entity to disclose impairment losses from contracts with customers separately from other impairment losses if they are not presented in the statement of comprehensive income separately. As noted in the Basis for Conclusions, the Board felt that separately disclosing the impairment losses on contracts with customers provides the most relevant information to users of financial statements. [IFRS 15.BC334].

In the following extract, Slater and Gordon Limited presents revenue from contracts with customers that are within the scope of IFRS 15, separately from other income, on the face of its consolidated statement of comprehensive income in its 2022 annual financial statements.

Practical example 10-3: Slater and Gordon Limited (2022)		Australia	
Annual Report 2022 [extract]			
Consolidated statement of profit or loss and other comprehensive income [extract]			
For the year ended 30 June 2022 [extract]			
	Note	30 June 2022 \$'000	30 June 2021 \$'000
Revenue			
Fee revenue		155,421	154,245
Net movement in work in progress		26,620	48,096
Revenue from contracts with customers	3	182,041	202,341
Other income		576	1,460
Total revenue and other income		182,617	203,801

In the following extract, A.P. Møller - Mærsk A/S presents a combined revenue number on the face of the consolidated income statement which includes revenue recognised from contracts with customers in accordance with IFRS 15 and other revenue (e.g., vessel-sharing and slot charter income, lease income and other income) in the same line item. It then presents customer contract revenues separately from other sources of revenue, in note 2.1.

Practical example 10-4: A.P. Møller - Mærsk A/S (2022)

Denmark

Annual Report 2022 [extract]

Consolidated financial statements

Consolidated income statement [extract]

Note		2022	2021
2.1	Revenue	81,529	61,787
2.2	Operating costs	44,882	37,748
	Other income	319	166
	Other costs	153	169
2.1	Profit before depreciation, amortisation and impairment losses, etc. (EBITDA)	36,813	24,036

Notes [extract]**2. Operating profit [extract]****Note 2.1 Segment information [extract]**

	2022	2021
Revenue from contracts with customers	80,179	60,632
<i>Revenue from other sources</i>		
Vessel-sharing and slot charter income	1,229	1,060
Lease income	14	19
Others	107	76
Total revenue	81,529	61,787

Ferrovial, S.A. has applied a different approach by disclosing the amounts relating to contracts with customers in a narrative within the notes.

Practical example 10-5: Ferrovial SE (2024)**Netherlands****Integrated Annual Report [extract]****Consolidated Financial Statements [extract]****F. NOTES TO THE CONSOLIDATED ANNUAL ACCOUNTS FOR 2024, 2023 AND 2022 [extract]****SECTION 2: PROFIT/(LOSS) FOR THE YEARS ENDED DECEMBER 31, 2024, 2023 AND 2022 [extract]****NOTES ON PROFIT/(LOSS) FOR CONTINUING OPERATIONS [extract]****2.1. OPERATING INCOME [extract]**

The Group's revenue as of and for the years ended December 31, 2024, 2023 and 2022 reached EUR 9,147 million, EUR 8,514 and EUR 7,551 million, respectively.

The Group's revenue from contracts with customers, as interpreted by IFRS 15, amounted to EUR 9,024 million, EUR 8,339 million and EUR 7,385 million, respectively (Note 4.4), for the years ended December 31, 2024, 2023 and 2022.

Revenue includes financial income from services provided by the concession operators that apply the financial asset model, totaling EUR 9 million, EUR 10 million and EUR 10 million in 2024, 2023 and 2022, respectively.

Set out below is a breakdown of revenue by segment and comparative figures for 2024, 2023 and 2022:

For the year ended December 31, 2024:

(Million euro)	External sales	Inter-segment sales	Total	Var. %
Construction	6,919	315	7,234	5 %
Toll Roads	1,246	10	1,256	16 %
Airports	82	9	91	14 %
Energy	268	2	270	30 %
Other activities (*)	348	172	520	3 %
Adjustments	-	(224)	(224)	(4) %
Total	8,864	283	9,147	7 %

(*) Corresponds to support services provided by the Corporation Division to the rest of the Group's businesses, which are eliminated in the consolidation process.

...

Unless required, or permitted, by another standard, IAS 1 (or IFRS 18,¹⁷¹ if adopted early) does not permit offsetting of income and expenses within profit or loss or the statement of comprehensive income. [IAS 1.32, IFRS 18.44].

After applying the requirements for determining the transaction price in IFRS 15, revenue recognised by an entity might include offsets, for example, for any trade discounts given and volume rebates paid by the entity to its customers. Similarly, in the ordinary course of business, an entity might undertake other transactions that do not generate revenue, but are incidental to the main revenue-generating activities. When this presentation reflects the substance of the transaction or other event, IAS 1 permits an entity to

¹⁷¹ IFRS 18 supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted). See Chapter 4 for further details on the requirements of IFRS 18.

present “the results of such transactions ... by netting any income with related expenses arising on the same transaction”. [IAS 1.34, IFRS 18.B27]. An example given in IAS 1 is the presentation of gains and losses on the disposal of non-current assets by deducting from the amount of consideration on disposal the carrying amount of the asset and related selling expenses. [IAS 1.34(a), IFRS 18.B27(a)].

Frequently asked questions

Question 10-7: Can income outside the scope of IFRS 15 be presented as revenue in the income statement?

How we see it

Entities need to consider the definition of revenue to determine whether income outside the scope of IFRS 15 can be presented as revenue in the income statement. We believe an entity needs to consider the discussion below as part of its determination.

IFRS 15 defines revenue as “Income arising in the course of an entity’s ordinary activities”, but the standard excludes some revenue contracts from its scope (e.g., leases). [IFRS 15 Appendix A, IFRS 15.5]. According to the 2010 *Conceptual Framework for Financial Reporting* (which applied when IFRS 15 was issued), revenue arises in the course of the ordinary activities of an entity and is referred to by a variety of different names including “sales, fees, interest, dividends, royalties and rent”. [CF(2010) 4.29]. The 2018 *Conceptual Framework for Financial Reporting* (which became effective in 2020) no longer contains a discussion about revenue and gains and losses. However, the definition of revenue in IFRS 15 remains unchanged. The Board does not expect the removal of that discussion to cause any changes in practice. [CF BC4.96].

While ‘ordinary activities’ is not defined, if the transaction involves the sale of an asset, the nature of the asset and the purpose for which it was held by the entity could be informative. For example, inventory accounted for under IAS 2 is, by definition, held for use in production or sale in the ordinary course of business. [IAS 2.6]. Therefore, the sale of that inventory is typically part of an entity’s ordinary activities. Conversely, property, plant and equipment accounted for under IAS 16 is, by definition, held for use by the entity for more than one period. [IAS 16.6]. Likewise, IAS 38 excludes from its scope intangible assets held for sale in the ordinary course of business. [IAS 38.3(a)]. Therefore, their disposal is not typically part of an entity’s ordinary activities and the difference between the net disposal proceeds and the carrying amount of the asset is not recognised as revenue under IFRS 15, but as a gain or loss on disposal. This was reiterated by the IFRS IC in June 2020, as is discussed in section 2.6.3 above.¹⁷²

If an entity receives consideration in the course of its ordinary activities that is outside the scope of IFRS 15, it might present that income as revenue in the income statement. This view is consistent with the Basis for Conclusions on IFRS 15, which says that an entity can present interest income as revenue only when interest income represents income from an entity’s ordinary activities (also discussed in section 5.5.5 above). [IFRS 15.BC247]. However, any revenue recognised that is outside the scope of IFRS 15 will need to be presented either separately from revenue from contracts with customers within the income statement or disclosed separately within the notes. This is because, as mentioned above, entities are required to present in the statement of comprehensive income, or disclose within the notes, the amount of revenue recognised from contracts with customers separately from other sources of revenue. [IFRS 15.113(a), IFRS 15 Appendix A].

IFRS 15 does not explicitly require an entity to use the term ‘revenue from contracts with customers’. Therefore, entities might use a different terminology in their financial statements to describe revenue arising from transactions that are within the scope of IFRS 15. However, entities need to ensure the terms used are not misleading and allow users to distinguish revenue from contracts with customers from other sources of revenue. [IFRS 15.113(a)].

¹⁷² [IFRIC Update](#), June 2020, available on the IFRS Foundation’s website.

10.3 Other presentation considerations

The standard also includes presentation requirements for products expected to be returned and for those that contain a significant financing component. Refer to section 5.4 and section 5.5.5 above for presentation considerations related to rights of return and significant financing components, respectively. Also refer to Question 9-27 in section 9.3.3 above for classification and presentation considerations related to capitalised contract costs to obtain and fulfil a contract.

Frequently asked questions

Question 10-8: How are shipping and handling costs incurred in relation to a revenue contract presented in the income statement?

How an entity presents shipping and handling costs in the income statement will depend upon how it presents expenses in accordance with IAS 1 (or IFRS 18,¹⁷³ if adopted early), by nature (e.g., purchases of materials or transportation costs) or by function (e.g., cost of sales, costs of distribution or administrative activities). [IAS 1.102, IAS 1.103]. When an entity presents expenses by function, it also needs to disclose further analysis of expenses by their nature in accordance with IAS 1 -see Chapter 3 (or IFRS 18 if adopted early - see Chapter 4). [IAS 1.104].

An entity might be involved with a variety of shipping and handling activities. Prior to a revenue contract, for example, an entity might transport inventory it has purchased to its warehouse or move it between warehouses. In such cases, the related costs will be within the scope of IAS 2 (discussed in Chapter 23). An entity might also incur shipping and handling costs not related to a promised good or service to the customer (e.g., distribution costs) that are outside the scope of IAS 2 and IFRS 15. An entity might need to apply judgement to distinguish such costs from those within the scope of IAS 2 or IFRS 15, and to determine where to present such costs.

Under IFRS 15, an entity needs to determine whether shipping and handling is a separate promised service to the customer or if they are activities to fulfil the promise to transfer the good (see section 4.1 above). Shipping and handling activities that are performed before the customer obtains control of the related good are activities to fulfil its promise to transfer control of the good. If shipping and handling activities are performed after a customer obtains control of the related good, shipping and handling is a separate promised service to that customer and an entity needs to determine whether it acts as a principal or an agent in providing those services.

If an entity determines that the shipping and handling activities are related to a promised good or service to the customer (either the promise to transfer control of the good or the promise to provide shipping and handling services) and the entity is the principal (rather than the agent), the costs are incurred to fulfil its promise to provide those services.

How we see it

If the entity determines that the shipping and handling activities are related either to the promise to transfer control of the good or the promise to provide shipping and handling services and the entity is the principal, we believe it is appropriate to present the related costs as cost of sales, changes in contract costs, or similar, because the costs would be incurred to fulfil a revenue obligation (i.e., fulfilment costs). In determining the presentation of shipping and handling costs, entities might also need to consider the views of local regulators.¹⁷⁴

Entities need to consider whether disclosure of the amount of shipping and handling costs and the line items in the income statement that include them is required. [IAS 1.17(c), IAS 1.104].

If the entity determines that shipping and handling is a separate promised service to the customer and it is acting as an agent in providing those services, the related revenue to be recognised for shipping and handling services would be net of the related costs. [IFRS 15.47, IFRS 15.B34-B38].

173 IFRS 18 supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted).

IFRS 18 introduces new requirements relating to the presentation of expenses classified in the operating category, while these expenses will still be presented by 'function' or by 'nature', it introduces additional disclosure requirements for entities choosing to present these items by function. See Chapter 4 for further details on the requirements of IFRS 18.

174 Foreign Private Issuers are encouraged to consider the views of the US SEC and the guidance in [EY's Financial Reporting Developments - Revenue from contracts with customers \(ASC 606\)](#), section 4.1.2, Question 4-7.

Question 10-9: How are capitalised contract costs and their amortisation classified and presented in the statement of financial position and statement of profit or loss and other comprehensive income, respectively?

See response to Question 9-27 in section 9.3.3 above.

Question 10-10: How would entities determine the presentation of amounts billed to customers (e.g., shipping and handling, expenses or cost reimbursements and taxes) under the standards (i.e., as revenue or as a reduction of costs)?

(TRG meeting 18 July 2014 - Agenda paper no. 2)

See response to Question 4-16 in section 4.4.4 above.

10.4 Disclosure objective and general requirements

IFRS 15 requires a comprehensive and coherent set of revenue recognition disclosures. The IASB described the overall objective of the disclosures, as follows: [IFRS 15.110]

Extract from IFRS 15

- 110** The objective of the disclosure requirements is for an entity to disclose sufficient information to enable users of financial statements to understand the nature, amount, timing and uncertainty of revenue and cash flows arising from contracts with customers. To achieve that objective, an entity shall disclose qualitative and quantitative information about all of the following:
- (a) its contracts with customers (see paragraphs 113-122);
 - (b) the significant judgements, and changes in the judgements, made in applying this Standard to those contracts (see paragraphs 123-126); and
 - (c) any assets recognised from the costs to obtain or fulfil a contract with a customer in accordance with paragraph 91 or 95 (see paragraphs 127-128).

Each of these disclosure requirements is discussed further below.

The standard requires that an entity consider the level of detail necessary to satisfy the disclosure objective and how much emphasis to place on each of the various requirements. The level of aggregation or disaggregation of disclosures requires judgement. Entities are required to ensure that useful information is not obscured (by either the inclusion of a large amount of insignificant detail or the aggregation of items that have substantially different characteristics). [IFRS 15.111]. An entity does not need to disclose information in accordance with IFRS 15 if it already discloses that information in accordance with another standard. [IFRS 15.112].

As explained in the Basis for Conclusions, many preparers raised concerns that they would need to provide voluminous disclosures at a cost that might outweigh any potential benefits. [IFRS 15.BC327, IFRS 15.BC331].

As summarised above, the Board clarified the disclosure objective and indicated that the disclosures described in the standard are not meant to be a checklist of minimum requirements. That is, entities do not need to include disclosures that are not relevant or are not material to them. In addition, the Board decided to require qualitative disclosures instead of tabular reconciliations for certain disclosures.

How we see it

Entities need to continually review their disclosures in each reporting period to determine whether they have met the standard's disclosure objective to enable users to understand the nature, amount, timing and uncertainty of revenue and cash flows arising from contracts with customers. If an entity enters into new, material revenue arrangements, or the facts and circumstances of its existing revenue arrangements change, it needs to update its disclosures in a timely manner.

The disclosures are required for (and as at) each annual period for which a statement of comprehensive income and a statement of financial position are presented.

Certain interim revenue disclosures are also required for entities preparing interim financial statements (see section 10.6 below). When it issued IFRS 15, the IASB amended IAS 34 *Interim Financial Reporting* to require disclosure of disaggregated revenue information. However, none of the other annual disclosures are required for interim financial statements (see Chapter 37 for further discussion on interim financial reporting).

10.5 Specific disclosure requirements

The following Illustration depicts the disclosure requirements, which are discussed further below by category:

Figure 10-2: Specific disclosure requirements

Category	Sub-category/type	Required disclosure*
Contracts with customers	Contracts with customers (see section 10.5.1 below) <i>Quantitative</i>	If not presented separately in the statement of comprehensive income: <ul style="list-style-type: none"> ▪ The amount of revenue recognised from contracts with customers (i.e., IFRS 15) separately from other sources of revenue ▪ Any impairment losses from contract with customers separately from other impairment losses
	Disaggregation of revenue (see section 10.5.1.A below) <i>Quantitative and qualitative</i>	<ul style="list-style-type: none"> ▪ Disaggregation of revenue from contracts with customers into categories that depict how the nature, amount, timing and uncertainty of revenue and cash flows are affected by economic factors ▪ Sufficient information to enable users of financial statements to understand the relationship between the disclosure of disaggregated revenue and revenue information that is disclosed for each reportable segment, if the entity applies IFRS 8 <i>Operating Segments</i>
	Contract balances (see section 10.5.1.B below) <i>Quantitative and qualitative</i>	<ul style="list-style-type: none"> ▪ Opening and closing balances of receivables, contract assets and contract liabilities ▪ Revenue recognised in the reporting period that was included in the contract liability balance at the beginning of the period ▪ Explanation of how the timing of satisfaction of performance obligations relates to the typical timing of payment and the effect thereof on contract assets and liabilities ▪ Explanation of the significant changes in the contract asset and contract liability balances during the reporting period
	Performance obligations (see section 10.5.1.C below) <i>Quantitative and qualitative</i>	<ul style="list-style-type: none"> ▪ Descriptive information about an entity's performance obligations (i.e., when typically satisfied, significant payment terms, nature of goods and services, obligations for returns, refunds, and other similar obligations, and types of warranties and related obligations) ▪ Revenue recognised in the reporting period from performance obligations satisfied (or partially satisfied) in previous periods ▪ Aggregate amount of the transaction price allocated to performance obligations that are unsatisfied (or partially satisfied) as of the end of the reporting period and explanation of when the related revenue is expected to be recognised (subject to certain optional exemptions)

Category	Sub-category/type	Required disclosure*
Significant judgements (see section 10.5.2 below)	<i>Qualitative</i>	<ul style="list-style-type: none"> Judgements (and changes in judgements) made in determining the timing of satisfaction of performance obligations, the transaction price and amounts allocated to performance obligations, including: <ul style="list-style-type: none"> For performance obligations satisfied over time, the method used to recognise revenue and why the method faithfully depicts the transfer of goods and services For performance obligations satisfied at a point in time, significant judgements made in evaluating when control transfers to a customer Methods, inputs and assumptions used to estimate variable consideration, adjust consideration for the effects of time value of money, measure non-cash consideration and apply the constraint Methods, inputs and assumptions used to estimate stand-alone selling prices and the use of any allocation exceptions Methods, inputs and assumptions used to measure obligations for returns, refunds and other similar obligations
Costs to obtain or fulfil a contract (see section 10.5.3 below)	<i>Quantitative and qualitative</i>	<ul style="list-style-type: none"> Judgements made in determining the amount of costs to obtain or fulfil a contract Method used to determine amortisation for each reporting period Closing balances of capitalised contract costs Amount of amortisation and any impairment losses recognised in the period
Practical expedients (see section 10.5.4 below)	<i>Qualitative</i>	<ul style="list-style-type: none"> Use of the following practical expedients: <ul style="list-style-type: none"> Practical expedient on the existence of a significant financing component Practical expedient on expensing incremental costs of obtaining a contract.

* As discussed in section 10.4 above, the IASB decided to include disclosure requirements in IFRS 15 to help an entity meet the standard's disclosure objective. However, these disclosures must not be viewed as a checklist of minimum requirements. Refer to section 10.6 below for information on interim disclosure requirements.

10.5.1 Contracts with customers

The majority of the standard's disclosures relate to an entity's contracts with customers. These disclosures include disaggregation of revenue, information about contract asset and liability balances and information about an entity's performance obligations.

10.5.1.A Disaggregation of revenue

Entities are required to disclose disaggregated revenue information to illustrate how the nature, amount, timing and uncertainty about revenue and cash flows are affected by economic factors. [IFRS 15.114]. This is the only revenue disclosure requirement that is required in both an entity's interim and annual financial statements.

As noted above, an entity is required to separately disclose any impairment losses recognised in accordance with IFRS 9 on receivables or contract assets arising from contracts with customers. However, IFRS 15 does not require entities to further disaggregate such losses for uncollectible amounts.

While the standard does not specify precisely how revenue needs to be disaggregated, the application guidance suggests categories for entities to consider. The application guidance indicates that the most appropriate categories for a particular entity depend on its facts and circumstances, but an entity needs to consider how it disaggregates revenue in other communications (e.g., press releases, information regularly reviewed by the chief operating decision maker) when determining which categories are most relevant and useful.

The standard includes the following application guidance on the required disaggregation of revenue disclosures: [IFRS 15.B88, IFRS 15.B89]

Extract from IFRS 15

- B88** When selecting the type of category (or categories) to use to disaggregate revenue, an entity shall consider how information about the entity's revenue has been presented for other purposes, including all of the following:
- (a) disclosures presented outside the financial statements (for example, in earnings releases, annual reports or investor presentations);
 - (b) information regularly reviewed by the chief operating decision maker for evaluating the financial performance of operating segments; and
 - (c) other information that is similar to the types of information identified in paragraph B88(a) and (b) and that is used by the entity or users of the entity's financial statements to evaluate the entity's financial performance or make resource allocation decisions.
- B89** Examples of categories that might be appropriate include, but are not limited to, all of the following:
- (a) type of good or service (for example, major product lines);
 - (b) geographical region (for example, country or region);
 - (c) market or type of customer (for example, government and non-government customers);
 - (d) type of contract (for example, fixed-price and time-and-materials contracts);
 - (e) contract duration (for example, short-term and long-term contracts);
 - (f) timing of transfer of goods or services (for example, revenue from goods or services transferred to customers at a point in time and revenue from goods or services transferred over time); and
 - (g) sales channels (for example, goods sold directly to consumers and goods sold through intermediaries).

As noted in the Basis for Conclusions, the Board decided not to prescribe a specific characteristic of revenue to be used as the basis for disaggregation because it intended for entities to make this determination based on entity-specific and/or industry-specific factors that are the most meaningful for their businesses. The Board acknowledged that an entity might need to use more than one type of category to disaggregate its revenue. [IFRS 15.B87, IFRS 15.BC336].

We believe that, when determining categories for disaggregation of revenue, entities need to analyse specific risk factors for each of their revenue streams to determine the appropriate level of revenue disaggregation that will be beneficial to users of the financial statements. If certain risk factors could lead to changes in the nature, amount, timing and uncertainty of revenue recognition and cash flows, those factors will need to be considered as part of the evaluation. [IFRS 15.B87, IFRS 15.B88]. Different risk factors associated with each revenue streams might indicate when disaggregation is required.

IFRS 15.112 clarifies that an entity does not have to duplicate disclosures required by another standard. [IFRS 15.112]. For example, an entity that provides disaggregated revenue disclosures as part of its segment disclosures, in accordance with IFRS 8, does not need to separately provide disaggregated revenue disclosures if the segment-related disclosures are sufficient to illustrate how the nature, amount, timing and uncertainty about revenue and cash flows from contracts with customers are affected by economic factors and are presented on a basis consistent with IFRS accounting standards.

However, segment disclosures might not be sufficiently disaggregated to achieve the disclosure objectives of IFRS 15. The IASB noted in the Basis for Conclusions that segment disclosures on revenue might not always provide users of financial statements with enough information to help them understand the composition of revenue recognised in the period. [IFRS 15.BC340]. If an entity applies IFRS 8, it is required under IFRS 15.115 to explain the relationship between the disaggregated revenue information and revenue information that is disclosed for each reportable segment. [IFRS 15.115]. Users of the financial statements believe this information is critical to their ability to understand not only the composition of revenue, but also how revenue relates to other information provided in the segment disclosures. Entities can provide this information in a tabular or a narrative form.

How we see it

Regulators might review publicly provided information (e.g., investor presentations, press releases) in order to evaluate whether entities have met the objectives of this disclosure requirement. In accordance with IFRS 15.B88, an entity needs to consider how information about its revenue has been presented for other purposes, including information disclosed outside the financial statements, information regularly reviewed by the chief operating decision maker (e.g., chief executive officer or chief operating officer) and other similar information used by the entity or users of the financial statements to evaluate the entity's financial performance or to make resource allocation decisions.

As discussed above, to help determine the appropriate level of revenue disaggregation that is beneficial to users of the financial statements, entities would analyse specific risk factors for each revenue stream. Different risk factors for revenue streams might indicate when disaggregation is required.

It is important to note that IFRS 15 and IFRS 8 have different objectives. The objective of the segment reporting requirements in IFRS 8 is to enable users of the financial statements to evaluate the nature and financial effects of the business activities in which an entity engages and the economic environment in which it operates. [IFRS 8.20]. These disclosure requirements are largely based on how the chief operating decision maker allocates resources to the operating segments of the entity and assesses their performance. [IFRS 8.5(b)]. They also permit aggregation in certain situations and could, therefore, result in such disclosures not meeting the disclosure requirements under IFRS 15. In contrast, IFRS 15 disclosure requirements focus on how the revenues and cash flows from contracts with customers are affected by economic factors and do not have similar aggregation criteria. As noted above, if an entity concludes that it is necessary to provide disaggregated revenue disclosures along with the segment disclosures required under IFRS 8, it is required under IFRS 15 to explain the relationship between the disclosures.

The Board provided an example of the disclosures for disaggregation of revenue, as follows: [IFRS 15.IE Example 41, IFRS 15.IE210-IE211]

Extract from IFRS 15

Example 41-Disaggregation of revenue-quantitative disclosure

An entity reports the following segments: consumer products, transportation and energy, in accordance with IFRS 8 *Operating Segments*. When the entity prepares its investor presentations, it disaggregates revenue into primary geographical markets, major product lines and timing of revenue recognition (ie goods transferred at a point in time or services transferred over time).

The entity determines that the categories used in the investor presentations can be used to meet the objective of the disaggregation disclosure requirement in paragraph 114 of IFRS 15, which is to disaggregate revenue from contracts with customers into categories that depict how the nature, amount, timing and uncertainty of revenue and cash flows are affected by economic factors. The following table illustrates the disaggregation disclosure by primary geographical market, major product line and timing of revenue recognition, including a reconciliation of how the disaggregated revenue ties in with the consumer products, transportation and energy segments, in accordance with paragraph 115 of IFRS 15.

Segments	Consumer products	Transport	Energy	Total
	CU	CU	CU	CU
<u>Primary geographical markets</u>				
North America	990	2,250	5,250	8,490
Europe	300	750	1,000	2,050
Asia	700	260	-	960
	<u>1,990</u>	<u>3,260</u>	<u>6,250</u>	<u>11,500</u>
<u>Major goods/service lines</u>				
Office supplies	600	-	-	600
Appliances	990	-	-	990
Clothing	400	-	-	400
Motorcycles	-	500	-	500
Automobiles	-	2,760	-	2,760
Solar panels	-	-	1,000	1,000
Power plant	-	-	5,250	5,250
	<u>1,990</u>	<u>3,260</u>	<u>6,250</u>	<u>11,500</u>
<u>Timing of revenue recognition</u>				
Goods transferred at a point in time	1,990	3,260	1,000	6,250
Services transferred over time	-	-	5,250	5,250
	<u>1,990</u>	<u>3,260</u>	<u>6,250</u>	<u>11,500</u>

Since entities are encouraged to tailor their disclosure of disaggregated revenue, they are unlikely to follow a single approach.

Consistent with the approach illustrated in Example 41 from the standard above, some entities provide disaggregated revenue information within their segment reporting disclosure. As shown in Practical example 10-6 below, Capita plc discloses both revenue by major product line and segment revenue by contract type and geographical location in its segment note (Note 2.2.1). The disaggregation per geographical location has been provided in accordance with the requirements in IFRS 8.33(a). In the summary of significant accounting policies (Note 2), it specifically states that this approach is consistent with the objective of the IFRS 15 disclosure requirement.

Entities that are required to apply IFRS 8 might already provide adequate information that allows users to understand the composition of revenue. However, this information might be based on non-GAAP information (i.e., the revenue that is reported to the chief operating decision maker might be calculated on a basis that is not in accordance with IFRS 15). In such a situation, an entity might need to disclose additional information to meet the objective in IFRS 15.114.

Practical example 10-6: Capita plc (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]

Notes to the consolidated financial statements [extract]

Section 2: Results for the year [extract]

2.2 Revenue including segmental revenue [extract]

Contract types

The Group disaggregates revenue from contracts with customers by contract type, because management believe this best depicts how the nature, amount, timing, and uncertainty of the Group's revenue and cash flows are affected by economic factors. Categories are: long-term contractual – greater than two years; short-term contractual – less than two years; and transactional. The years being measured from the service commencement date.

...

2.2.1 Segmental revenue

The Group's operations are managed separately according to the nature of the services provided, with each segment representing a strategic business division offering a different package of client services across the markets the Group serves. Capita plc is a reconciling item and not an operating segment. A description of the service provision for each segment can be found in the strategic report on pages 14 to 21. Inter-segmental pricing is based on set criteria and is either charged on an arm's length basis or at cost.

The tables below present revenue for the Group's business segments as reported to the Chief Operating Decision Maker. The Group now comprises two divisions - Capita Public Service and Capita Experience - following the completion of the Group's exit of the non-core businesses in the Capita Portfolio division. Comparative information has been re-presented to reflect businesses exited during 2023, and accordingly the Capita Portfolio division is no longer disclosed as a division. Comparative information has also been re-presented to reflect the move of businesses between segments during 2023 to enable comparability.

Adjusted revenue, excluding results from businesses exited in both years (adjusting items), was £2,642.1m (2022: £2,609.0m), an increase of 1.3% (2022: increase 1.7%).

Year ended 31 December 2023	Notes	Capita Public Service £m	Capita Experience £m	Total adjusted £m	Adjusting items £m	Total reported £m
Continuing operations						
Long-term contractual		1,206.6	875.9	2,082.5	21.5	2,104.0
Short-term contractual		195.9	288.4	484.3	19.1	503.4
Transactional (point-in-time)		56.1	19.2	75.3	131.9	207.2
Total segment revenue		1,458.6	1,183.5	2,642.1	172.5	2,814.6
Trading revenue		1,507.9	1,221.9	2,729.8	194.4	2,924.2
Inter-segment revenue		(49.3)	(38.4)	(87.7)	(21.9)	(109.6)
Total adjusted segment revenue		1,458.6	1,183.5	2,642.1	—	2,642.1
Business exits – trading	2.8	—	—	—	172.5	172.5

Inter-segment revenue		(42.2)	(40.2)	(82.4)	(84.4)	(166.8)
Total adjusted segment revenue		1,454.8	1,154.2	2,609.0	—	2,609.0
Business exits – trading	2.8	—	—	—	405.6	405.6
Total segment revenue		1,454.8	1,154.2	2,609.0	405.6	3,014.6

Geographical location

The Group generates revenue largely in the UK and Europe. The table below presents revenue by geographical location.

	2023				2022			
	United Kingdom £m	Europe £m	Other £m	Total £m	United Kingdom £m	Europe £m	Other £m	Total £m
Revenue	2,526.0	282.5	6.1	2,814.6	2,731.2	270.8	12.6	3,014.6

In Practical example 10-7 below, Société nationale SNCF discloses disaggregated revenue by main types of services provided, by type of customer, and by timing of transfer of services in the revenue note (Note 3.2) of its 2022 annual financial statements. The disaggregated revenue table below includes a column for Société nationale SNCF's reportable segments and the amount of total revenue reconciles with the total revenue disclosed in the segment note. This is important because it helps users to understand the relationship between the disclosure of disaggregated revenue in the revenue note and the revenue information that is disclosed for each reportable segment in the segment note.

Practical example 10-7: Société nationale SNCF (2022)
France
SNCF GROUP ANNUAL FINANCIAL REPORT [extract]
NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]
3. PERFORMANCE FOR THE PERIOD [extract]
3.2 REVENUE [extract]

The SNCF Group derives revenue from providing services, at a point in time or continuously over a period of time, to private individuals and to public and private sector customers in the following main service lines:

<i>In € millions</i>	31/12/2022	31/12/2021	Change	Segment
Passenger transport revenue	7,251	4,342	2,909	TGV - Intercites
Freight transport revenue	11,723	9,433	2,290	Freight & Logistics business line
Other services ancillary to transport	3,541	2,855	686	TGV - Intercites, Freight & Logistics business line
Fees from Transport Organising Authorities (TOA) for regulated operations	15,065	14,115	951	Transilien, TER, Keolis
Rail network management fees	2,440	2,348	91	SNCF Réseau
Station management revenue	299	239	61	SNCF Gares & Connexions
Real estate rental revenue (excluding rent generated)	95	93	3	Freight & Logistics, TGV - Intercites, Corporate business line
Transport equipment leasing revenue	42	320	-279	Freight & Logistics, Transilien, TER, Keolis business line
Upkeep and maintenance services	172	284	-112	All segments
Other revenue	820	723	97	All segments
Revenue by main service line	41,449	34,752	6,697	
Public sector (public bodies)	17,718	16,643	1,075	
Private individuals	7,271	4,482	2,789	
Private sector companies	16,460	13,627	2,833	
Revenue by customer type	41,449	34,752	6,697	
Immediate or one-day transfer	9,779	7,137	2,642	
Point-in-time transfer over a period of less than one year (logistics, freight transport and compensation from OA)	31,295	27,384	3,911	
Services provided continuously over more than one year (real estate, some station management operations, etc.)	375	231	144	
Revenue by recognition rate	41,449	34,752	6,697	

In Practical example 10-8 below, Fédération Internationale de Football Association (FIFA) splits its disclosure of disaggregated revenue between the primary financial statements and the notes. In the statement of comprehensive income, FIFA presents revenue on a disaggregated basis, by the type of service. In the notes, FIFA further disaggregates each type of revenue into different categories, depending on the nature of the revenue. For example, in Note 1, FIFA disaggregates 'Revenue from television broadcasting rights' by geographical region, while presenting 'Revenue from marketing rights' by type of customer. Since FIFA does not need to comply with IFRS 8, it provides all disaggregation disclosures in accordance with IFRS 15.114 and the requirements in IFRS 15.115 do not apply.

Practical example 10-8: Fédération Internationale de Football Association (FIFA) (2023) **Switzerland**

10.5.1.B Contract balances

The Board noted in the Basis for Conclusions that users of the financial statements need to understand the relationship between the revenue recognised and changes in the overall balances of an entity's total contract assets and liabilities during a particular reporting period. [IFRS 15.BC341]. As a result, the Board included the following disclosure requirements for an entity's contract balances and changes in the balances: [IFRS 15.116, IFRS 15.117, IFRS 15.118]

Extract from IFRS 15**Contract balances**

- 116 An entity shall disclose all of the following:
- (a) the opening and closing balances of receivables, contract assets and contract liabilities from contracts with customers, if not otherwise separately presented or disclosed;
 - (b) revenue recognised in the reporting period that was included in the contract liability balance at the beginning of the period; and
 - (c) revenue recognised in the reporting period from performance obligations satisfied (or partially satisfied) in previous periods (for example, changes in transaction price).
- 117 An entity shall explain how the timing of satisfaction of its performance obligations (see paragraph 119(a)) relates to the typical timing of payment (see paragraph 119(b)) and the effect that those factors have on the contract asset and the contract liability balances. The explanation provided may use qualitative information.
- 118 An entity shall provide an explanation of the significant changes in the contract asset and the contract liability balances during the reporting period. The explanation shall include qualitative and quantitative information. Examples of changes in the entity's balances of contract assets and contract liabilities include any of the following:
- (a) changes due to business combinations;
 - (b) cumulative catch-up adjustments to revenue that affect the corresponding contract asset or contract liability, including adjustments arising from a change in the measure of progress, a change in an estimate of the transaction price (including any changes in the assessment of whether an estimate of variable consideration is constrained) or a contract modification;
 - (c) impairment of a contract asset;
 - (d) a change in the time frame for a right to consideration to become unconditional (ie for a contract asset to be reclassified to a receivable); and
 - (e) a change in the time frame for a performance obligation to be satisfied (ie for the recognition of revenue arising from a contract liability).

Entities are permitted to disclose information about contract balances, and changes therein, as they deem to be most appropriate, which would include a combination of tabular and narrative information. The IASB explained in the Basis for Conclusions that these disclosures are intended to provide financial statement users with information they requested on when contract assets are typically transferred to accounts receivable or collected as cash and when contract liabilities are recognised as revenue. [IFRS 15.BC346].

How we see it

Although the standard does not specifically require disclosure of balances related to consideration paid to a customer, an entity might need to disclose qualitative and/or quantitative information about those arrangements to meet the objective of the standard's disclosure requirements if the amounts are material. For example, some entities might make large payments to customers that do not represent payment for a distinct good or service which would reduce the transaction price and affect the amount and timing of revenue recognised.

In addition to the disclosures on contract balances and changes, the standard requires entities to disclose the amount of revenue recognised in the period that relates to amounts allocated to performance obligations that were satisfied (or partially satisfied) in previous periods (e.g., due to a change in transaction price or in estimates related to the constraint on revenue recognised). This disclosure requirement applies to sales-based and usage-based royalties received from a customer in exchange for a licence of intellectual property that are recognised as revenue in a reporting period, but relate to performance obligations satisfied (or partially satisfied) in previous periods (e.g., sales-based royalties recognised in the current period that are related to a right-to-use licence previously transferred to a customer). As noted in the Basis for Conclusions, the Board noted that this information is not required elsewhere in the financial statements and provides relevant information about the timing of revenue recognised that was not a result of performance in the current period. [IFRS 15.BC347].

The Illustration below is an example of how an entity might fulfil these requirements:

Illustration 10-4: Contract asset and liability disclosures

Company A discloses receivables from contracts with customers separately in the statement of financial position. To comply with the other disclosure requirements for contract assets and liabilities, Company A includes the following information in the notes to the financial statements:

	20X2	20X1	20X0
Contract asset	CU1,500	CU2,250	CU1,800
Contract liability	CU(200)	CU(850)	CU(500)
Revenue recognised in the period from:			
Amounts included in contract liability at the beginning of the period	CU650	CU200	CU100
Performance obligations satisfied in previous periods	CU200	CU125	CU200

We receive payments from customers based on a billing schedule, as established in our contracts. Contract asset relates to our conditional right to consideration for our completed performance under the contract. Accounts receivable are recognised when the right to consideration becomes unconditional. Contract liability relates to payments received in advance of performance under the contract. Contract liabilities are recognised as revenue as (or when) we perform under the contract. In addition, contract asset decreased in 20X2 due to a contract asset impairment of CU400.

How we see it

IFRS 15.116(a) requires entities to separately disclose contract balances from contracts with customers. Therefore, it is necessary for entities that have material receivables from non-IFRS 15 contracts to separate these balances for disclosure purposes. For example, an entity might have accounts receivable relating to leasing contracts that would need to be disclosed separately from accounts receivable related to contracts with customers.

Entities need to make sure they have appropriate systems, policies and procedures and internal controls in place to collect and disclose the required information.

Before providing its disclosure of significant changes in contract balances, Airbus SE provides the accounting policies for its contract balances in Practical example 10-9 below. It then provides in a table the significant changes in the contract asset and the contract liability balances during the reporting period. The opening and closing balances are included in the primary financial statements.

Practical example 10-9: Airbus SE (2023)

Netherlands

Airbus Annual Report 2023 [extract]

Financial Statements 2023 [extract]

2 Notes to the IFRS Consolidated Financial Statements [extract]

2.5 Operational Assets and Liabilities [extract]

22. Contract Assets and Contract Liabilities, Trade Receivables and Trade Liabilities [extract]

Contract assets represent the Company's right to consideration in exchange for goods or services that the Company has transferred to a customer when that right is conditioned by something other than the passage of time (e.g. revenue recognised from the application of the PoC method before the Company has a right to invoice).

Contract liabilities represent the Company's obligation to transfer goods or services to a customer for which the Company has received consideration, or for which an amount of consideration is due from the customer (e.g. advance payments received).

Net contract assets and contract liabilities are determined for each contract separately. For serial contracts, contract liabilities are presented in current contract liabilities, if revenues are expected within the next twelve months or material expenses for the manufacturing process have already occurred. For long-term production contracts (e.g.

governmental contracts such as A400M, Tiger, NH90), contract liabilities are classified as current when the relating inventories or receivables are expected to be recognised within the normal operating cycle of the long-term contract.

Trade receivables arise when the Company provides goods or services directly to a customer with no intention of trading the receivable. Trade receivables include claims arising from revenue recognition that are not yet settled by the debtor. Trade receivables are initially recognised at their transaction prices and are subsequently measured at amortised cost less any allowances for impairment. Gains and losses are recognised in the Consolidated Income Statement when the receivables are derecognised and impaired.

Impairment and allowances of trade receivables and contract assets are measured at an amount equal to the life-time expected loss as described in "– Note 37: Financial Instruments".

Contract Assets, Contract Liabilities and Trade Receivables

Significant changes in contract assets and contract liabilities during the period are as follows:

	2023		2022	
	Contract assets	Contract liabilities	Contract assets	Contract liabilities
(In € million)				
Revenue recognised that was included in the contract liability balance at 1 January	-	(26,175)	-	(23,494)
Increases due to cash received, excluding amounts recognised as revenue ⁽¹⁾	-	29,198	-	26,797
Transfers from contract assets recognised at 1 January	(2,168)	-	(2,798)	-
Increase as a result of changes in the measure of progress	2,509	-	3,034	-

(1) Including final payments received from customers and others parties in anticipation.

As of 31 December 2023, trade receivables amounting to €227 million (2022: €301 million) will mature after more than one year.

ProSiebenSat.1 Media SE explains, in Practical example 10-10 below, the nature of its contract assets and contract liabilities. In Note 6, it discloses the opening and closing balances of contract assets and contract liabilities in a table. Below the table, it explains significant changes in the contract asset and contract liability balances during the reporting period using a narrative format. In the same note, ProSiebenSat.1 Media SE discloses revenue recognised that was included in the contract liability balance at the beginning of the period.

Practical example 10-10: ProSiebenSat.1 Media SE (2022)
Germany
ANNUAL REPORT 2022 [extract]
Consolidated Financial Statements [extract]
NOTES TO THE CONSOLIDATED INCOME STATEMENT [extract]
6/Revenues [extract]
CONTRACT ASSETS AND LIABILITIES

in EUR m

	12/31/2022	12/31/2021
Contract assets	32	34
Contract liabilities	97	131

Contract assets, i.e. positive balances from contracts with customers, primarily relate to claims for consideration resulting from work completed under commissioned productions still to be invoiced as of the reporting date. These contract assets will be reclassified as trade receivables upon invoicing. Furthermore, the contract assets mainly include services already rendered but not yet billable in the Dating & Video segment.

In connection with the sale of the US production business of Red Arrow Studios, contract assets of EUR 17 million were disposed of in the third quarter of 2022.

Contract liabilities mainly relate to advance payments received for service productions, the sale of programming rights and media services not yet provided, as well as advance services from customers in the Dating & Video segment.

Of the contract liabilities existing as of January 1, 2022, EUR 93 million (previous year: EUR 96 million) were recognized as revenues in 2022. In addition, contract liabilities of EUR 15 million were deconsolidated as a result of the sale of the US production business of Red Arrow Studios in the third quarter of 2022.

As permitted by IFRS 15, no information is provided on the remaining performance obligations as of December 31, 2022 that have an expected original term of one year or less. Performance obligations with an expected original term beyond the period of more than one year after December 31, 2022 exist only to an immaterial extent.

Inventories of EUR 41 million (previous year: EUR 49 million) primarily comprise merchandise. Impairment losses on inventories amounting to EUR 7 million (previous year: EUR 10 million) were recognized in the financial year 2022. The Beauty & Lifestyle revenue category includes revenues from the sale of goods of EUR 291 million (previous year: EUR 354 million).

As shown in Practical example 10-11 below, ASML Holding N.V. included a roll-forward of contract assets and contract liabilities to disclose significant changes in the balances during the reporting period. Although such a roll-forward is not required under IFRS 15, it might be an effective way to provide the disclosures required by IFRS 15.118. The requirement of the standard to disclose the 'revenue recognised in the reporting period that was included in the contract liability balance at the beginning of the period' was incorporated in the roll-forward. In addition, ASML Holding N.V. also provided a narrative explanation of the significant changes in the net contract balances during the reporting period.

Practical example 10-11: ASML Holding N.V. (2024)
Netherlands
Annual Report 2024 [extract]
Notes to the Consolidated Financial Statements [extract]
2. Revenue from contracts with customers [extract]
Contract assets and liabilities

The contract assets relate to our right to a consideration in exchange for goods or services delivered, when that right is conditional on something other than the passage of time. The contract assets are transferred to the receivables when the receivables become unconditional. The contract liabilities primarily relate to remaining performance obligations for which consideration has been received for goods and services not yet recognized in revenue, as well as deferred revenue from goods and services delivered, based on the allocation of the consideration to the related performance obligations in the contract.

The majority of our customer contracts result in both asset and liability positions. At the end of each reporting period, these positions are netted on a contract basis and presented as either an asset or a liability in the Consolidated statement of financial position. Consequently, a contract balance can change between periods from a net contract asset balance to a net contract liability balance in the balance sheet, and vice versa.

Significant changes in the contract assets and the contract liabilities balances during the periods are as follows.

Year ended December 31 (€, in millions)	2023		2024	
	Contract assets	Contract liabilities	Contract assets	Contract liabilities
Balance at beginning of the year	131.9	17,750.9	240.1	16,266.5
Transferred from contract assets to accounts receivables	(402.0)	—	(213.2)	—
Revenue recognized during the year ending in contract assets	135.1	—	275.9	—
Revenue recognized that was included in contract liabilities	—	(11,106.1)	—	(9,047.5)
Changes as a result of cumulative catch-up adjustments arising from changes in estimates	—	(24.9)	—	(61.3)
Remaining performance obligations for which considerations have been received, or for which we have an unconditional right to consideration	—	9,416.3	—	11,483.4
Transfer between contract assets and liabilities	375.1	375.1	17.8	17.8
Other	—	(144.8)	—	(462.7)
Total	240.1	16,266.5	320.6	18,196.2

The increase in the net contract liabilities to €17.9 billion as of December 31, 2024 compared to €16.0 billion as of December 31, 2023 is mainly driven by systems shipped for which revenue has not yet been recognized, as well as an increase in payments for goods and services which will be delivered in the future. Cumulative catch-up adjustments recognized in our current year's revenue are due to updated estimates for system volume, discounts and credits included in our volume purchase agreements. The increase in "Other", compared to 2023, is mainly due to an increase of down payments reclassified to refund liabilities. Refund liabilities are presented as accrued and other liabilities in the Consolidated statement of financial position.

10.5.1.C Performance obligations

To help users of financial statements analyse the nature, amount, timing and uncertainty about revenue and cash flows arising from contracts with customers, the Board decided to require disclosures about an entity's performance obligations. As noted in the Basis for Conclusions, while IAS 1.10(e) requires entities to disclose their accounting policies for recognising revenue, users of financial statements told the Board that many entities provided a 'boilerplate' description that did not explain how the policy related to the contracts they entered into with customers. [IFRS 15.BC354]. To address this criticism, IFRS 15 requires an entity to provide more descriptive information about its performance obligations.

An entity is also required to disclose information about remaining performance obligations and the amount of the transaction price allocated to such obligations, including an explanation of when it expects to recognise the amount(s) in its financial statements. Entities need to make sure they have appropriate systems, policies and procedures and internal controls in place to collect and disclose the required information.

Both quantitative and qualitative information are required as follows: [IFRS 15.119, IFRS 15.120, IFRS 15.121, IFRS 15.122]

Extract from IFRS 15

Performance obligations

- 119 An entity shall disclose information about its performance obligations in contracts with customers, including a description of all of the following:
- (a) when the entity typically satisfies its performance obligations (for example, upon shipment, upon delivery, as services are rendered or upon completion of service), including when performance obligations are satisfied in a bill-and-hold arrangement;
 - (b) the significant payment terms (for example, when payment is typically due, whether the contract has a significant financing component, whether the consideration amount is variable and whether the estimate of variable consideration is typically constrained in accordance with paragraphs 56-58);
 - (c) the nature of the goods or services that the entity has promised to transfer, highlighting any performance obligations to arrange for another party to transfer goods or services (ie if the entity is acting as an agent);
 - (d) obligations for returns, refunds and other similar obligations; and
 - (e) types of warranties and related obligations.

Transaction price allocated to the remaining performance obligations

- 120 An entity shall disclose the following information about its remaining performance obligations:
- (a) the aggregate amount of the transaction price allocated to the performance obligations that are unsatisfied (or partially unsatisfied) as of the end of the reporting period; and
 - (b) an explanation of when the entity expects to recognise as revenue the amount disclosed in accordance with paragraph 120(a), which the entity shall disclose in either of the following ways:
 - (i) on a quantitative basis using the time bands that would be most appropriate for the duration of the remaining performance obligations; or
 - (ii) by using qualitative information.
- 121 As a practical expedient, an entity need not disclose the information in paragraph 120 for a performance obligation if either of the following conditions is met:
- (a) the performance obligation is part of a contract that has an original expected duration of one year or less; or
 - (b) the entity recognises revenue from the satisfaction of the performance obligation in accordance with paragraph B16.
- 122 An entity shall explain qualitatively whether it is applying the practical expedient in paragraph 121 and whether any consideration from contracts with customers is not included in the transaction price and, therefore, not included in the information disclosed in accordance with paragraph 120. For example, an estimate of the transaction price would not include any estimated amounts of variable consideration that are constrained (see paragraphs 56-58).

In Practical example 10-12 below, Spotify Technology S.A. highlighted in its revenue note that the disclosures of its performance obligations are included in its significant accounting policy disclosures. In its summary of significant accounting policies, Spotify Technology S.A. discloses information about its performance obligations for subscription and advertising services. It describes when it typically satisfies its performance obligations and the significant payment terms.

Practical example 10-12: Spotify Technology S.A. (2024)

4. Revenue recognition [extract]
Revenue from contracts with customers [extract]
(ii) Performance obligations

The Group discloses its policies for how it identifies, satisfies, and recognizes its performance obligations associated with its contracts with customers in Note 2.

2. Summary of significant accounting policies [extract]
(d) Revenue recognition
Premium revenue

The Group generates revenue through the sale of subscriptions to the Premium Service and other subscription offerings (together with the Premium Service, "Subscription Offerings"). As part of our Subscription Offerings, we also offer a Basic plan to eligible users in select markets that provides certain benefits of the Premium Service without the monthly audiobook listening time and an Audiobook Access Tier in the U.S. that provides specified hours of audiobook access a month without all of the benefits of the Premium Service. Revenue from our Premium segment is a function of the price of our Subscription Offerings and the number of subscribers to our Subscription Offerings ("Premium Subscribers"). The Subscription Offerings are primarily sold directly to end users. The Premium Service is also sold through partners who are generally telecommunications companies that bundle the subscription with their own services or collect payment for the stand-alone subscriptions from their end customers. Typically, the Subscription Offerings are paid for on a monthly basis in advance. The Group satisfies its performance obligation to provide Premium streaming services, and revenue from these services is recognized, on a straight-line basis over the subscription period.

Sometimes the Group bundles the Premium Service with other services and products. Additionally, in certain markets the specified monthly allocation of audiobook access within the Premium Service is considered to be a separate performance obligation to the customer. In arrangements where the Group has multiple performance obligations to the customer, the transaction price is allocated to each performance obligation based on the relative stand-alone selling price. The Group generally determines stand-alone selling prices based on the prices charged to customers; but where stand-alone selling prices are not directly observable, estimation techniques are used which may include competitor pricing and other observable inputs. In the markets where the Group offers audiobook listening time as part of the Premium subscription, the Group satisfies its performance obligation to provide a monthly entitlement to specified hours of audiobook content as these hours are consumed and recognize revenue over time using an output method based on the proportion of hours consumed. Additionally, the Group estimates how many hours of audiobook content will not be used by eligible Premium Subscribers and recognizes the revenue attributable to the unexercised rights in proportion to the pattern of audiobook consumption. For other bundles, revenue is recognized either on a straight-line basis over the subscription period or at a point in time when control of the service or product is transferred to the customer.

Premium partner subscription revenue is based on a per-subscriber rate in a negotiated partner agreement. Under these arrangements, a premium partner may bundle the Premium Service with its existing product offerings or offer the Premium Service as an add-on. Payment is remitted to the Group through the premium partner. The Group assesses the facts and circumstances, including whether the partner is acting as a principal or agent, of all partner revenue arrangements and then recognizes revenues either gross or net. Premium partner services, may either be recognized gross or net, and may have multiple performance obligations to the customer, including an obligation to provide Premium streaming services and a monthly entitlement to specified hours of audiobook content.

Ad-Supported revenue

The Group's advertising revenue is generated primarily from the sale of display, audio, and video advertising delivered through advertising impressions. The Group enters into arrangements with advertising agencies that purchase advertising on our platform on behalf of their clients. The Group also enters into arrangements directly with some large advertisers. These advertising arrangements are typically sold on a cost-per-thousand-impressions ("CPM") basis and are evidenced by contracts that specify the terms of the arrangement such as the type of advertising product, pricing, insertion dates, and number of impressions in a stated period ("Insertion Order"). Revenue is recognized based on the number of impressions delivered.

Additionally, the Group generates Ad-Supported revenue through arrangements with certain advertising automated exchanges, an internal self-serve platform, and advertising marketplace programs to distribute advertising inventory for purchase on an auction or fixed CPM basis. These orders are evidenced through submission of order placements through the platform and online acceptance of terms and conditions. Revenue is recognized when impressions are delivered on the platform.

As part of its disclosure of information about its performance obligations, as presented in Practical example 10-13 below, Koninklijke Philips N.V. provides information about the nature of its goods and services (e.g., consumer type-products), the timing of satisfaction of their performance obligations and the significant payment terms. It also provides information about the existence of sales returns and assurance-type warranties.

Practical example 10-13: Koninklijke Philips N.V. (2022)

Netherlands

Annual Report 2022 [extract]**10 Group financial statements [extract]****10.9 Notes to the Consolidated financial statements [extract]****6. Income from operations [extract]****Accounting policies [extract]****Revenue recognition**

The company recognizes revenue when it transfers control over a good or service to a customer, in an amount that reflects the consideration (i.e., transaction price) to which the company expects to be entitled to in exchange for the good or service. The consideration expected by the company may include fixed and/or variable amounts which can be impacted by sales returns, trade discounts and volume rebates. The company adjusts the consideration for the time value of money if the period between the transfer of the promised goods or services to the customer and payment by the customer exceeds six months.

Transfer of control varies depending on the individual terms of the contract of sale. For consumer-type products in the segment Personal Health businesses, control is transferred when the product is shipped and delivered to the customer and title and risk have passed to the customer (depending on the delivery conditions) and acceptance of the product has been obtained.

Revenues from transactions relating to distinct goods or services are accounted for separately based on their relative stand-alone selling prices. The stand-alone selling price is the price that would be charged for the goods or service in a separate transaction under similar conditions to similar customers. The transaction price is determined (considering variable considerations) and allocated to performance obligations based on their relative stand-alone selling prices. These transactions mainly occur in the segments Diagnosis & Treatment businesses and Connected Care businesses and include arrangements that require subsequent installation and training activities to make distinct goods operable for the customer. As such, the related installation and training activities are part of equipment sales rather than separate performance obligations. Revenue is recognized when the performance obligation is satisfied, i.e., when the installation has been completed and the equipment is ready to be used by the customer in the way contractually agreed.

Variable consideration is included in the transaction price to the extent that it is highly probable that a significant reversal in the amount of cumulative revenue recognized will not occur once associated uncertainties are resolved. Such assessment is performed on each reporting date to check whether it is constrained. For products for which a right of return exists during a defined period, revenue recognition is determined based on the historical pattern of actual returns, or in cases where such information is not available, revenue recognition is postponed until the return period has lapsed. Return policies are typically based on customary return arrangements in local markets. A provision is recognized for assurance-type product warranty at the time of revenue recognition and reflects the estimated costs of replacement and free-of-charge services that will be incurred by the company with respect to the products sold. For certain products, the customer has the option to purchase the warranty separately, which is considered a separate performance obligation on top of the assurance-type product warranty. For such warranties which provide distinct service, revenue recognition occurs on a straight-line basis over the extended warranty contract period.

In the case of loss under a sales agreement, the loss is recognized immediately.

Sale of goods

Revenues are recognized at a point in time when control of the goods passes to the buyer, based on the allocation of the transaction price to the performance obligation.

Revenue from services

Revenues are recognized over time as the company transfers control of the services to the customer which is demonstrated by the customer simultaneously receiving and consuming the benefits provided by the company. The amount of revenues is measured by reference to the progress made towards complete satisfaction of the performance obligation, which in general is evenly over time. Service revenue related to repair and maintenance activities for goods sold is recognized ratably over the service period or as services are rendered.

Income from royalties

Royalty income from brand license arrangements and from intellectual property rights, such as technology licenses or patents, is recognized on an accrual basis in accordance with the substance of the relevant agreement.

Shipping and handling

Expenses incurred for shipping and handling are mainly recorded as cost of sales. When shipping and handling are part of a project and billed to the customer, then the related expenses are recorded as cost of sales. Shipping and handling related to sales to third parties are partly recorded as selling expenses. When shipping and handling billed to customers are considered a distinct and separate performance obligation, the fees are recognized as revenue and costs included in cost of sales.

In its annual financial statements, ASML Holding N.V. provides a table that includes information about its performance obligations as shown in Practical example 10-14 below. The first column details the various performance obligations. The second column provides information about the nature and satisfaction of these performance obligations and details of payment terms.

Practical example 10-14: ASML Holding NV (2024)**Netherlands****Annual Report 2024 [extract]****4. Financial statements [extract]****Consolidated financial statements [extract]****Notes to the Consolidated Financial Statements [extract]****2. Revenue from contracts with customers [extract]****Accounting policy [extract]**

Goods or services	Nature, timing of satisfying the performance obligations and significant payment terms
New systems	<p>New systems sales include i-line, KrF, ArF dry, ArF immersion, NXE and EXE-related systems, along with the related factory options ordered with the base system, as well as metrology and inspection systems.</p> <p>Prior to shipment, the majority of our systems undergo a factory acceptance test (FAT) in our cleanroom facilities, effectively replicating the operating conditions that will be present on the customer's site, in order to verify whether the system meets its standard specifications and any additional technical and performance criteria agreed with the customer.</p> <p>A system undergoing FAT is shipped only after all contractual specifications are met or discrepancies from agreed-upon specifications are waived and customer sign-off is received for delivery. Each system's performance is re-tested through a site acceptance test (SAT) after installation at the customer site. We have never failed to successfully complete installation of a system at a customer's premises; therefore, acceptance at FAT is considered to be proven for established technologies with a history of successful customer acceptances at SAT (equal or better than FAT).</p> <p>Transfer of control and recognition of revenue of a system undergoing a FAT, and for which customer acceptance at FAT is proven, will occur upon delivery of the system.</p> <p>Transfer of control and recognition of revenue of a system not undergoing a FAT, or for which customer acceptance at FAT is not proven, will occur after successful installation upon customer acceptance of the system at SAT.</p> <p>New system sales do not meet the requirements for over time revenue recognition because our customers do not simultaneously receive and consume the benefits provided by our performance, or control the asset throughout any stage of our production process, or the systems are considered to have alternative use.</p>
Used systems	<p>We have no repurchase commitments in our general sales terms and conditions; however, we occasionally repurchase systems that we previously manufactured and sold, in order to refurbish and resell the system to a different customer. This repurchase decision is mainly driven by market demand expressed by other customers.</p> <p>Transfer of control of a used system, and recognition of revenue, follow the same logic as for our 'New systems'.</p>

Goods or services	Nature, timing of satisfying the performance obligations and significant payment terms
Field upgrades and options (system enhancements)	<p>Field upgrades and options mainly relate to goods and services that are delivered for systems already installed in the customer factories. Certain upgrades require significant installation efforts, enhancing an asset the customer controls, and therefore resulting in transfer of control over the period of installation. The method of measuring progress is based on what best depicts the satisfaction of our obligation in transferring control. This is generally based on either the cost incurred method, which is estimated using labor hours, or the value transferred method, which is estimated using system performance measurements. For the options and other upgrades for which the customer receives and consumes the benefit at the moment of delivery, the transfer of control and recognition of revenue will occur upon delivery.</p> <p>As long as we are not able to make a reliable estimate of the total efforts needed to complete the upgrade, we only recognize revenue to cover costs incurred. Margin will be realized at the earlier of us being able to make a reliable estimate or completion of the upgrade.</p>
New product introduction	<p>If the installation of new products is determined not to be a separate performance obligation or if there is not a sufficient established history of acceptance on FAT, a new product is considered to be a "new product introduction".</p> <p>Transfer of control and revenue recognition for new product introductions occurs after successful installation and customer acceptance at SAT. Once there is an established history of successful installation and customer acceptance, revenue will be recognized consistent with other systems and goods after transfer of control.</p>
Installation	<p>Installation is provided within the selling price of a system. Installation is considered to be distinct if it does not significantly modify the system being purchased and the customer or a third party could be capable of performing the installation themselves, if desired. Transfer of control takes place over the period of installation from delivery through SAT, measured on a straight-line basis, as our performance is satisfied evenly over this period of time. Installation is not considered to be distinct when recognition of revenue related to a system occurs upon customer acceptance of the system at SAT after installation is complete.</p>
Warranties	<p>We provide standard warranty coverage on our systems for 12 months, providing labor and non-consumable parts necessary to repair our systems during these warranty periods. These standard warranties cannot be purchased and do not provide a service in addition to the general assurance the system will perform as promised. As a result, no revenue is allocated to these standard warranties.</p> <p>Both the extended and enhanced warranties on our systems are accounted for as a separate performance obligation, with transfer of control taking place over the warranty period, measured on a straight-line basis, as this is a stand-ready obligation.</p>

Goods or services	Nature, timing of satisfying the performance obligations and significant payment terms
Time-based licenses and related services	Time-based licenses relate to software licenses and the related services which are sold for a period of time. The licenses and the related services are not considered to be individually distinct, as the support services are integral to the customer's ability to continue to use the software license in the rapidly changing technological environment. The transfer of control takes place over the license term, measured on a straight-line basis, as our performance is satisfied evenly over this period of time. Payments are generally made in installments throughout the license term.
Application projects	Application projects are node transition and consulting projects which at times may be provided as free service within a volume purchase agreement. Measuring satisfaction of this performance obligation is performed through an input method based on the labor hours expended relative to the estimated total labor hours, as this best depicts the transfer of control of these kind of services.
Service contracts	Service contracts are entered into with our customers to support our systems used in their ongoing operations during the systems life cycle, typically in the form of full-service agreements, limited manpower agreements, other labor agreements, parts availability or parts usage agreements. These services are for a specified period of time and typically have a fixed price. Control transfers over this period of time, measured on a straight-line basis, as these are stand-ready obligations. For service contracts where the price is not fixed, the transaction price has a variable component that is based on the performance of the system.
Billable parts and labor	<p>Billable labor represents maintenance services to our systems installed in the customer's factories while in operation, through purchase orders from our customer. Control over these services is transferred to the customer upon receipt of customer sign-off.</p> <p>Billable parts represent spare parts including optical components relating to our systems installed in the customer's factories while in operation, through purchase orders from our customer.</p> <p>Billable parts can be:</p> <ul style="list-style-type: none"> • Sold as direct spare parts, for which control transfers point in time upon delivery; or • Sold as part of maintenance services, where control transfers point in time upon receipt of customer sign-off.
Field projects (relocations)	Field projects represent mainly relocation services. Measuring satisfaction of this performance obligation is performed through an input method based on the labor hours expended relative to the estimated total labor hours, as this best depicts the transfer of control of our service.
OnPulse maintenance	OnPulse maintenance services are provided over a specified period of time on our light source systems. Payment is determined by the amount of pulses counted from each light source system, which is variable. Invoicing is monthly based on the pulses counted. Revenue is recognized in line with invoicing using the practical expedient in EU-IFRS 15.B16.

During the development of the standard, many users of financial statements commented that information about the amount and timing of revenue that an entity expects to recognise from its existing contracts would be useful in their analyses of revenue, especially for long-term contracts with significant unrecognised revenue. [IFRS 15.BC348, IFRS 15.BC349]. In addition, the Board observed that a number of entities often voluntarily disclose such 'backlog' information. However, this information is typically presented outside the financial statements and might not be comparable across entities because there is no common definition of backlog.

As summarised in the Basis for Conclusions, the Board's intention in including the disclosure requirements in IFRS 15.120 is to "provide users of an entity's financial statements with additional information about the following:

- “(a) the amount and expected timing of revenue to be recognised from the remaining `performance obligations in existing contracts.
- “(b) trends relating to the amount and expected timing of revenue to be recognised from the remaining performance obligations in existing contracts.
- “(c) risks associated with expected future revenue (for example, some observe that revenue is more uncertain if an entity does not expect to satisfy a performance obligation until a much later date); and
- “(d) the effect of changes in judgements or circumstances on an entity's revenue.” [IFRS 15.BC350].

This disclosure can be provided on either a quantitative basis (e.g., amounts to be recognised in given time bands, such as between one and two years and between two and three years) or by disclosing a mix of quantitative and qualitative information. In addition, this disclosure would only include amounts related to performance obligations in the current contract. For example, expected contract renewals that have not been executed and do not represent material rights are not performance obligations in the current contract. As such, an entity does not disclose amounts related to such renewals. However, if an entity concludes that expected contract renewals represents a material right to acquire goods or services in the future (and, therefore, was a separate performance obligation - see section 4.6 above), the entity includes in its disclosure the consideration attributable to the material right for the options that have not yet been exercised (i.e., the unsatisfied performance obligation(s)).

Also consider the following Illustration:

Illustration 10-5: Transaction price allocated to remaining performance obligations in an MSA with a minimum purchase requirement

An entity sells equipment and consumables under a two-year MSA. Both the equipment and the consumables are determined to be distinct performance obligations that are recognised at a point in time. The stand-alone selling price of the equipment and each consumable is CU10,000 and CU100, respectively. The equipment costs CU8,000 and each consumable costs CU60. The entity sells the equipment for CU6,000 (a 40% discount from the stand-alone selling price) with a customer option to purchase each consumable for CU100 (equal to its stand-alone selling price). The customer will incur a penalty if it does not purchase at least 200 consumables over the next two years. The entity concludes that the penalty is substantive and it creates a minimum purchase commitment. The option to purchase the consumables does not represent a material right because it is priced at the stand-alone selling price for the consumable.

As at the entity's reporting date, the customer has purchased 80 consumables during the first six months of the two-year contract. While the entity expects to sell quantities in excess of the remaining 120 units that are subject to the minimum purchase commitment, it only includes the transaction price for the remaining 120 committed consumables in the disclosure of the transaction price allocated to remaining performance obligations. This is because the MSA only commits the parties to the purchase and sale of these minimum units. The entity does not include the transaction price for any expected units in excess of the required minimum because the additional optional purchases are not within the enforceable rights and obligations of the current contract with the customer.

The disclosure of the transaction price allocated to the remaining performance obligations does not include consideration that has been excluded from the transaction price (e.g., amounts subject to termination without penalty). However, the standard requires entities to disclose qualitatively whether any consideration is not included in the transaction price and, therefore, is not included in the disclosure of the remaining performance obligations (e.g., variable consideration amounts that are constrained and, therefore, excluded from the transaction price).

Bombardier Inc. uses time bands to disclose information about remaining performance obligations. In Practical example 10-15, it also explicitly discloses that constrained variable consideration is excluded from the amounts disclosed. This is a helpful reminder for users of financial statements and it indicates amounts recognised in future periods might be higher than those included in the table.

Practical example 10-15: Bombardier Inc. (2023)

Canada

2023 Financial Report [extract]

CONSOLIDATED FINANCIAL STATEMENTS [extract]

NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]

16. BACKLOG

The following table presents the aggregate amount of the revenues expected to be realized in the future from partially or fully unsatisfied performance obligations as we perform under contracts at delivery or recognized over time. The amounts disclosed below represent the value of firm orders only. Such orders may be subject to future modifications that might impact the amount and/or timing of revenue recognition. The amounts disclosed below do not include unexercised options or letters of intent.

Revenues from continuing operations expected to be recognized in:

(In billions of \$)	December 31, 2023	December 31, 2022
Less than 24 months	\$ 10.0	\$ 10.5
Thereafter	4.2	4.3
Total	\$ 14.2	\$ 14.8

In contrast to the previous extract, SAP SE uses a non-tabular approach when disclosing information about remaining performance obligations. Practical example 10-16 below illustrates this. SAP SE provides information about its remaining performance obligations to provide 'software support or cloud subscriptions and support'.

Practical example 10-16: SAP SE (2024)

Germany

SAP Integrated Report 2024 [extract]

Consolidated Financial Statements IFRS [extract]

Notes [extract]

Section A - Customers [extract]

(A.1) Revenue [extract]

Remaining Performance Obligations [extract]

Amounts of a customer contract's transaction price that are allocated to the remaining performance obligations represent contracted revenue that has not yet been recognized. They include amounts recognized as contract liabilities and amounts that are contracted but not yet due.

The transaction price allocated to performance obligations that were unsatisfied or partially unsatisfied as at December 31, 2024, was €78.4 billion (December 31, 2023: €58.7 billion). The prior-year's figure was corrected to reflect an increase of €0.7 billion to include the transaction price from premium engagement contracts previously classified as having a termination-for-convenience-right. The transaction price thereof allocated to cloud performance obligations that were unsatisfied or partially unsatisfied (total cloud backlog) as at December 31, 2024, was €63.3 billion (December 31, 2023: €44.3 billion). The remaining amount mostly comprises obligations to provide software support services. The vast majority of software support contracts are contracts in the renewal phase that typically have a one-year contract term, while cloud subscription contracts typically are multiple-year contracts. The portion of remaining performance obligations related to services consists of non-cancelable revenue from contracts for projects with a predefined output and from premium engagements. Overall, approximately 40% of the total remaining performance obligations is expected to be recognized over the next 12 months following the respective balance sheet date.

The transaction price allocated to remaining performance obligations varies between reporting periods, primarily due to the recognition of revenue for performance obligations outstanding at the end of the prior year and the addition of new contracts within SAP's cloud, maintenance, and services business. Other contributing factors include contract modifications, upsells, renewals, currency exchange rate fluctuations, and pricing adjustments.

Optional exemptions

The Board also provided a practical expedient under which an entity need not disclose the amount of the remaining performance obligations for contracts with an original expected duration of one year or less or those that meet the requirements of the right to invoice practical expedient in IFRS 15.B16. [IFRS 15.121]. As explained in section 7.1.4.B above, the right to invoice practical expedient permits an entity that is recognising revenue over time to recognise revenue as invoiced if the entity's right to payment is an amount that corresponds directly with the value to the customer of the entity's performance to date. For example, an entity is not required to make the disclosure for a three-year service contract under which it has a right to invoice the customer a fixed amount for each hour of service provided. If an entity uses this disclosure practical expedient, it is required to qualitatively disclose that fact. [IFRS 15.122].

FASB differences

ASC 606 contains optional exemptions that are consistent with the optional practical expedients included in IFRS 15.121. However, ASC 606 includes additional optional exemptions (that IFRS 15 does not) to allow entities not to make quantitative disclosures about remaining performance obligations in certain cases and require entities that use any of the new or existing optional exemptions to expand their qualitative disclosures.

The standard provides the following examples of the required disclosures on remaining performance obligations: [IFRS 15.IE Example 42, IFRS 15.IE212-IE219]

Extract from IFRS 15

Example 42-Disclosure of the transaction price allocated to the remaining performance obligations

On 30 June 20X7, an entity enters into three contracts (Contracts A, B and C) with separate customers to provide services. Each contract has a two-year non-cancellable term. The entity considers the requirements in paragraphs 120-122 of IFRS 15 in determining the information in each contract to be included in the disclosure of the transaction price allocated to the remaining performance obligations at 31 December 20X7.

Contract A

Cleaning services are to be provided over the next two years typically at least once per month. For services provided, the customer pays an hourly rate of CU25.

Because the entity bills a fixed amount for each hour of service provided, the entity has a right to invoice the customer in the amount that corresponds directly with the value of the entity's performance completed to date in accordance with paragraph B16 of IFRS 15. Consequently, no disclosure is necessary if the entity elects to apply the practical expedient in paragraph 121(b) of IFRS 15.

Contract B

Cleaning services and lawn maintenance services are to be provided as and when needed with a maximum of four visits per month over the next two years. The customer pays a fixed price of CU400 per month for both services. The entity measures its progress towards complete satisfaction of the performance obligation using a time-based measure.

The entity discloses the amount of the transaction price that has not yet been recognised as revenue in a table with quantitative time bands that illustrates when the entity expects to recognise the amount as revenue. The information for Contract B included in the overall disclosure is, as follows:

	20X8	20X9	Total
	CU	CU	CU
Revenue expected to be recognised on this contract as of 31 December 20X7	4,800 ^(a)	2,400 ^(b)	7,200

(a) CU4,800 = CU400 × 12 months.

(b) CU2,400 = CU400 × 6 months.

Contract C

Cleaning services are to be provided as and when needed over the next two years. The customer pays fixed consideration of CU100 per month plus a one-time variable consideration payment ranging from CU0-CU1,000 corresponding to a one-time regulatory review and certification of the customer's facility (ie a performance bonus). The entity estimates that it will be entitled to CU750 of the variable consideration. On the basis of the entity's assessment of the factors in paragraph 57 of IFRS 15, the entity includes its estimate of CU750 of variable consideration in the transaction price because it is highly probable that a significant reversal in the amount of cumulative revenue recognised will not occur. The entity measures its progress towards complete satisfaction of the performance obligation using a time-based measure.

The entity discloses the amount of the transaction price that has not yet been recognised as revenue in a table with quantitative time bands that illustrates when the entity expects to recognise the amount as revenue. The entity also includes a qualitative discussion about any significant variable consideration that is not included in the disclosure. The information for Contract C included in the overall disclosure is as follows:

	20X8	20X9	Total
	CU	CU	CU
Revenue expected to be recognised on this contract as of 31 December 20X7	1,575 ^(a)	788 ^(b)	2,363

(a) Transaction price = CU3,150 (CU100 × 24 months + CU750 variable consideration) recognised evenly over 24 months at CU1,575 per year.

(b) CU1,575 ÷ 2 = CU788 (ie for 6 months of the year).

In addition, in accordance with paragraph 122 of IFRS 15, the entity discloses qualitatively that part of the performance bonus has been excluded from the disclosure because it was not included in the transaction price. That part of the performance bonus was excluded from the transaction price in accordance with the requirements for constraining estimates of variable consideration.

The standard also provides an example of how an entity could make the disclosure required by IFRS 15.120(b) using qualitative information (instead of quantitatively, using time bands), as follows: [IFRS 15.IE Example 43, IFRS 15.IE220-IE221]

Extract from IFRS 15

Example 43-Disclosure of the transaction price allocated to the remaining performance obligations-qualitative disclosure

On 1 January 20X2, an entity enters into a contract with a customer to construct a commercial building for fixed consideration of CU10 million. The construction of the building is a single performance obligation that the entity satisfies over time. As of 31 December 20X2, the entity has recognised CU3.2 million of revenue. The entity estimates that construction will be completed in 20X3, but it is possible that the project will be completed in the first half of 20X4.

At 31 December 20X2, the entity discloses the amount of the transaction price that has not yet been recognised as revenue in its disclosure of the transaction price allocated to the remaining performance obligations. The entity also discloses an explanation of when the entity expects to recognise that amount as revenue. The explanation can be disclosed either on a quantitative basis using time bands that are most appropriate for the duration of the remaining performance obligation or by providing a qualitative explanation. Because the entity is uncertain about the timing of revenue recognition, the entity discloses this information qualitatively as follows:

'As of 31 December 20X2, the aggregate amount of the transaction price allocated to the remaining performance obligation is CU6.8 million and the entity will recognise this revenue as the building is completed, which is expected to occur over the next 12-18 months.'

Frequently asked questions

Question 10-11: If an entity does not meet the criteria to use the 'right to invoice' practical expedient, can it still use the disclosure practical expedient regarding the amount of transaction price allocated to remaining performance obligations?

(TRG meeting 13 July 2015 - Agenda paper no. 40)

Stakeholders had questioned whether an entity can still use this disclosure practical expedient if it determines that it has not met the criteria to use the right to invoice practical expedient (e.g., because there is a substantive contractual minimum payment or a volume discount).

Members of the TRG generally agreed that the standard is clear that an entity can only use the practical expedient to avoid disclosing the amount of the transaction price allocated to remaining performance obligations for contracts: (a) with an original expected duration of less than one year; or (b) that qualify for the 'right to invoice' practical expedient. [IFRS 15.121]. If a contract does not meet either of these criteria, an entity must disclose the information about remaining performance obligations that is required by IFRS 15.120. [IFRS 15.120]. However, under these requirements, an entity is able to qualitatively describe any consideration that is not included in the transaction price (e.g., any estimated amount of variable consideration that is constrained).

10.5.2 Significant judgements

The standard specifically requires disclosure of significant accounting estimates and judgements (and changes in those judgements) made in determining the transaction price, allocating the transaction price to performance obligations and determining when performance obligations are satisfied. [IFRS 15.123].

IFRS accounting standards have general requirements requiring disclosures about significant accounting estimates and judgements made by an entity. Because of the importance placed on revenue by users of financial statements, as noted in the Basis for Conclusions on IFRS 15, the Board decided to require specific disclosures about the estimates used and the judgements made in determining the amount and timing of revenue recognition. [IFRS 15.BC355]. These requirements exceed those in the general requirements for significant judgements and accounting estimates required by IAS 1 (or IAS 8, if IFRS 18¹⁷⁵ is adopted early) and are discussed in more detail below. [IAS 1.122-133, IAS 8(2027).27G-27I, IAS 8(2027).31A-31I].

¹⁷⁵ IFRS 18 supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted). Once effective, the consequential amendments resulting from IFRS 18 will change the scope and title of IAS 8 due to certain sections previously included within IAS 1 being moved (mostly unchanged) to IAS 8. See Chapter 4 for further details on the requirements of IFRS 18.

10.5.2.A Determining the timing of satisfaction of performance obligations

IFRS 15 requires entities to provide disclosures about the significant judgements made in determining the timing of satisfaction of performance obligations. The disclosure requirements for performance obligations that are satisfied over time differ from those satisfied at a point in time, but the objective is similar - to disclose the judgements made in determining the timing of revenue recognition. Entities must disclose the following information: [IFRS 15.124, IFRS 15.125]

Extract from IFRS 15

Determining the timing of satisfaction of performance obligations

- | | |
|-----|--|
| 124 | For performance obligations that an entity satisfies over time, an entity shall disclose both of the following: <ul style="list-style-type: none"> (a) the methods used to recognise revenue (for example, a description of the output methods or input methods used and how those methods are applied); and (b) an explanation of why the methods used provide a faithful depiction of the transfer of goods or services. |
| 125 | For performance obligations satisfied at a point in time, an entity shall disclose the significant judgements made in evaluating when a customer obtains control of promised goods or services. |

When an entity has determined that a performance obligation is satisfied over time, IFRS 15 requires the entity to select a single revenue recognition method for each performance obligation that best depicts the entity's performance in transferring the goods or services. Entities must disclose the method used to recognise revenue.

For example, assume an entity enters into a contract to refurbish a multi-level building for a customer and the work is expected to take two years. The entity concludes that the promised refurbishment service is a single performance obligation satisfied over time and it decides to measure progress using a percentage of completion method, based on the costs incurred. The entity discloses the method used, how it has been applied to the contract and why the method selected provides a faithful depiction of the transfer of goods or services.

When an entity has determined that a performance obligation is satisfied at a point in time, the standard requires the entity to disclose the significant judgements made in evaluating when the customer obtains control of the promised goods or services. For example, an entity needs to consider the indicators of the transfer of control listed in IFRS 15.38 to determine when control transfers and disclose the significant judgements made in reaching that conclusion.

In Practical example 10-14 in section 10.5.1.C above, ASML Holding N.V. describes the methods used to recognise its revenue over time and explains the relationship between the methods and the different types of services it provides. Koninklijke Philips N.V. recognises revenue at a point in time in relation its consumer type-products sales. In Practical example 10-13 in section 10.5.1.C above Koninklijke Philips N.V. provides a description of when control transfers to the customer for these sales.

In Practical example 10-17 below, SAP SE provides disclosure of the significant judgement involved in determining the satisfaction of its performance obligations. It explains how it determines whether its software offerings provide customers with a right to use or a right to access its intellectual property. It also describes the judgement involved in identifying the appropriate method to measure the progress of its performance obligations satisfied over time.

SAP Integrated Report 2024 [extract]

Consolidated Financial Statements IFRS [extract]

Notes [extract]

Section A - Customers [extract]

(A.1) Revenue [extract]

Accounting for Revenue from Contracts with Customers [extract]

– Recognition of Revenue

Cloud revenue is recognized over time as the services are performed. For cloud business models where we grant rights to continuously access and use one or more cloud offerings for a certain term, revenue is recognized based on time elapsed and thus ratably over this term. For cloud business models provisioned on a consumption basis where a customer commits to a fixed value of spend on cloud services throughout the contract term, but with the discretion to call off cloud services during the contract term, we recognize revenue based on consumption as it best reflects our measure towards satisfaction of that performance obligation. In limited scenarios where the transaction price is entirely variable and determined by the customer's consumption, we recognize revenue based on usage in the period in which it was earned.

Software license revenue is recognized at a point in time or over time depending on whether we deliver standard software, customer-specific software, or software subscription contracts that combine the delivery of software and the obligation to deliver, in the future, unspecified software products:

- Licenses for our standard on-premise software products are typically delivered by providing the customer with access to download the software. We recognize revenue for these on-premise licenses at the point in time when we grant the license rights to the customer and the customer has access to and thus control over the software. In judging whether our on-premise software offerings grant customers a right to use, rather than a right to access, our intellectual property, we have considered the usefulness of our software without subsequent updates to it.
- Typically, our customer-specific on-premise software development agreements:
 - Represent software developed for specific needs of individual customers and therefore do not have any use for us
 - Provide us with an enforceable right to payment for performance completed to date

For such development agreements, we recognize revenue over time as the software development progresses. Judgment is required in identifying an appropriate method to measure the progress toward complete satisfaction of such performance obligations. We typically measure progress of our development agreements based on the direct costs incurred to date in developing the software as a percentage of the total reasonably estimated direct costs to fully complete the development work (input-based percentage-of-completion method). This method of measuring progress faithfully depicts the transfer of the development services to the customer, as substantially all of these costs are cost of the staff or third parties performing the development work. In estimating the total cost to fully complete the development work, we consider our history with similar projects.

- For agreements that combine the delivery of software and the obligation to deliver, in the future, unspecific software products, we recognize revenue at a point in time for licenses that are made immediately accessible to the customer. We recognize revenue ratably over the term of the software subscription contract for the unspecified software products, as our performance obligation is to stand ready to deliver such products on a when-and-if-available basis.

Software support revenue is typically recognized based on time elapsed and thus ratably over the term of the support arrangement. Under our standardized support services, our performance obligation is to stand ready to provide technical product support and unspecified updates, upgrades, and enhancements on a when-and-if-available basis. Our customers simultaneously receive and consume the benefits of these support services as we perform.

Service revenue is typically recognized over time. Where we stand ready to provide the service (such as access to learning content), we recognize revenue based on time elapsed and thus ratably over the service period. Consumption-based services (such as separately identifiable consulting services and premium support services and classroom training services) are recognized over time as the services are utilized, typically following the percentage-of-completion method or ratably. We apply judgment in determining whether a service qualifies as a stand-ready service or as a consumption-based service.

Revenue for combined performance obligations is recognized over the longest period of all promises in the combined performance obligation.

Judgment is also required in determining whether revenue is to be recognized at a point in time or over time. For performance obligations satisfied over time, we need to measure progress using the method that best reflects SAP's performance. When using cost incurred as a measure of progress for recognizing revenue over time, we apply judgment in estimating the total cost to satisfy the performance obligation.

All of the judgments and estimates mentioned above can significantly impact the timing and amount of revenue to be recognized.

10.5.2.B Determining the transaction price and the amounts allocated to performance obligations

Entities often exercise significant judgement when estimating the transaction prices of their contracts, especially when those estimates involve variable consideration.

Furthermore, significant judgement might be required when allocating the transaction price, including estimating stand-alone selling prices; for example, it is likely that entities will need to exercise judgement when determining whether a customer option gives rise to a material right (see section 4.6 above) and in estimating the stand-alone selling price for those material rights.

Given the importance placed on revenue by financial statement users, the standard requires entities to disclose qualitative information about the methods, inputs and assumptions used in their annual financial statements, as follows: [IFRS 15.126, IFRS 15.BC355]

Extract from IFRS 15**Determining the transaction price and the amounts allocated to performance obligations**

- 126 An entity shall disclose information about the methods, inputs and assumptions used for all of the following:
- (a) determining the transaction price, which includes, but is not limited to, estimating variable consideration, adjusting the consideration for the effects of the time value of money and measuring non-cash consideration;
 - (b) assessing whether an estimate of variable consideration is constrained;
 - (c) allocating the transaction price, including estimating stand-alone selling prices of promised goods or services and allocating discounts and variable consideration to a specific part of the contract (if applicable); and
 - (d) measuring obligations for returns, refunds and other similar obligations.

How we see it

Entities with diverse contracts need to ensure they have the processes and procedures in place to capture all of the different methods, inputs and assumptions used in determining the transaction price and allocating it to performance obligations.

In Practical example 10-13 in section 10.5.1.C above, Koninklijke Philips N.V. explains the need to estimate variable consideration in relation to returns.

Since fee arrangements often include contingencies (e.g., 'No Win-No Fee' arrangements), Slater and Gordon Limited estimated variable consideration when determining the transaction price as presented in Practical example 10-18 below. Therefore, it discloses information about the method (i.e., most likely amount approach), inputs and assumptions (i.e., management's assessment and the probability of success of each case). Furthermore, Slater and Gordon Limited discloses information about the assessment of whether a significant financing component exists. The entity concludes that contracts generally comprise only one performance obligation. As such, Slater and Gordon Limited does not disclose information about the allocation of the transaction price.

Practical example 10-18: Slater and Gordon Limited (2022)**Australia****Annual Report 2022 [extract]****Notes to the consolidated financial statements [extract]****For the Year Ended 30 June 2022 [extract]****Note 3: Revenue from Contracts with Customers [extract]****3.1 Accounting Policies [extract]****Provision of Legal Services – Litigation and Emerging Services**

The Group earns revenue from the provision of general legal services, including project litigation. Revenue for general legal services is recognised over time in the accounting period when services are rendered. Revenue recognised is carried as 'Work in progress' until the matter is finalised and a client invoice is raised.

Fee arrangements from general legal services include NWNF arrangements, contingency fee arrangements, fixed fee arrangements, and partially or fully funded litigation.

NWNF arrangements: Revenue is estimated using a most likely amount approach on a contract by contract basis. Management makes a detailed assessment of the amount of revenue expected to be received and the probability of success of each case. Variable consideration is included in revenue only to the extent that it is highly probable that a significant reversal will not occur.

Contingency fee arrangements: During the period, one of the Group's Project Litigation cases converted from a NWNF arrangement to a Group Cost Order ("GCO") which operates on the basis of contingency fee arrangements. The *Justice Legislation Miscellaneous Amendments Act 2000*, effective on 1 July 2020, amended the Victorian Supreme Court Act 1956 to enable contingency fee arrangements. A contingency fee arrangement entitles the Group to receive a percentage share of the damages awarded to the plaintiffs. As with existing NWNF arrangements, the revenue will only be recognised if it is highly probable that a significant reversal will not occur.

Partially or fully funded litigation: The Group enters into arrangements with third party funders to provide a portion of the fees on a matter over time as services are performed. In such arrangements, the funded portion of fees, referred to as time and materials, is billed regularly over time and is not contingent on the successful outcome of the litigation. The remaining portion of fees is variable consideration which is conditional on the successful resolution of the litigation. The variable consideration is included in revenue as services are performed only to the extent that it is highly probable that the amount will not be subject to significant reversal when the uncertainty is resolved.

Fixed fee arrangements: Revenue is recognised based on the stage of completion tracked on a contract by contract basis using a milestone-based approach, similar to Personal Injury Law Claims as explained above.

As in the case of personal injury claims, estimates of revenues, costs or extent of progress toward completion are revised if circumstances change. Any resulting increases or decreases in estimated revenues or costs are reflected in profit or loss in the period in which the circumstances that give rise to the revision become known by management.

The Group has determined that no significant financing component exists in respect of all its revenue streams. This is because:

- a substantial amount of the consideration promised by the client is variable subject to the occurrence or non-occurrence of a future event that is not substantially within the control of the client or the Group; and
- for fixed and funded fee arrangements, the period between when the entity transfers a promised good or service to a client and when the client pays for that good or service is expected to be one year or less.

A receivable in relation to the Group's services is recognised when a bill has been invoiced, as this is the point in time that the consideration is unconditional because only the passage of time is required before the payment is due. When an invoice is raised, the amount receivable is transferred from 'Work in progress' to 'Accounts receivable'.

Contract Costs

Applying the practical expedient in paragraph 94 of AASB 15 *Revenue from Contracts with Customers*, the Group recognises the incremental costs of obtaining contracts as an expense when incurred.

10.5.3 Assets recognised from the costs to obtain or fulfil a contract

As discussed in section 9.3 above, the standard specifies the accounting for costs an entity incurs to obtain and fulfil a contract to provide goods or services to customers. IFRS 15 requires entities to disclose information about the assets recognised to help users understand the types of costs recognised as assets and how those assets are subsequently amortised or impaired. These disclosure requirements are as follows: [IFRS 15.127, IFRS 15.128]

Extract from IFRS 15

Assets recognised from the costs to obtain or fulfil a contract with a customer

- 127 An entity shall describe both of the following:
- (a) the judgements made in determining the amount of the costs incurred to obtain or fulfil a contract with a customer (in accordance with paragraph 91 or 95); and
 - (b) the method it uses to determine the amortisation for each reporting period.
- 128 An entity shall disclose all of the following:
- (a) the closing balances of assets recognised from the costs incurred to obtain or fulfil a contract with a customer (in accordance with paragraph 91 or 95), by main category of asset (for example, costs to obtain contracts with customers, pre-contract costs and setup costs); and
 - (b) the amount of amortisation and any impairment losses recognised in the reporting period.

Entities are required to disclose the judgements made in determining the amount of costs that were incurred to obtain or fulfil contracts with customers that meet the criteria for capitalisation, as well as the method the entity uses to amortise the assets recognised. For example, for costs to obtain a contract, an entity that capitalises commission costs upon the signing of each contract needs to describe the judgements used to determine the commission costs that qualified as costs incurred to obtain a contract with a customer, as well as the determination of the amortisation period.

In addition, entities are required to disclose closing balances of assets recognised for costs to obtain or fulfil contracts with customers, as well as any amortisation or impairment losses recognised during the reporting period.

In Practical example 10-19 below, Capita plc discloses its accounting policy on assets recognised from costs to fulfil and costs to obtain a contract in Note 3 on 'Operating assets and liabilities' in its annual financial statements. This is followed by a description of how it determines the amortisation period and assesses the assets for impairment. In the same Note, Capita plc provides quantitative disclosures of 'contract fulfilment assets', separately disclosing the closing balance, the amount that was utilised (i.e., amortisation expense) and the amount of impairment losses for each reporting period.

Practical example 10-19: Capita plc (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]

Notes to the consolidated financial statements [extract]

Section 3: Operating assets and liabilities [extract]

3.1 Working Capital [extract]

3.1.3 Contract fulfilment assets (non-current) [extract]

AP Accounting policies

The Group regularly incurs costs to deliver its outsourcing services in a more efficient way (often referred to as 'transformation' costs). These costs may include process mapping and design, system development, project management, hardware (generally within the scope of the Group's accounting policy for property, plant and equipment), software licence costs (generally within the scope of the Group's accounting policy for intangible assets), recruitment costs and training.

Contract fulfilment costs are divided into: (i) costs that give rise to an asset; and (ii) costs that are expensed as incurred.

When determining the appropriate accounting treatment for such costs, the Group firstly considers any other applicable standards. If those other standards preclude capitalisation of a particular cost, then an asset is not recognised under IFRS 15 *Revenue from Contracts with Customers*.

If other standards are not applicable to contract fulfilment costs, the Group applies the following criteria which, if met, result in capitalisation of costs that: (i) directly relate to a contract or to a specifically identifiable anticipated contract; (ii) generate or enhance resources that will be used in satisfying (or in continuing to satisfy) performance obligations in the future; and (iii) are expected to be recovered.

The Group has determined that, where the relevant specific criteria are met, the costs for (i) process mapping and design; (ii) system development; and (iii) project management; are likely to qualify to be capitalised as contract fulfilment assets.

The incremental costs of obtaining a contract with a customer are recognised as a contract fulfilment asset if the Group expects to recover them. The Group incurs costs such as bid costs, legal fees to draft a contract and sales commissions when it enters into a new contract.

The Group has determined that the following costs may be capitalised as contract fulfilment assets: (i) legal fees to draft a contract after the Group has been selected as preferred supplier; and (ii) sales commissions directly related to winning a specific contract.

Costs incurred prior to selection as preferred supplier are not capitalised but expensed when incurred.

Utilisation: The utilisation charge is included within cost of sales. The Group utilises non-current contract fulfilment assets over the expected contract period on a systematic basis that mirrors the pattern in which the Group transfers control of the service to the customer.

Derecognition: A non-current contract fulfilment asset is derecognised either when it is disposed of or when no further economic benefits are expected to flow from its use or disposal.

Impairment: At each balance sheet date, the Group determines whether or not the non-current contract fulfilment assets are impaired by comparing the carrying amount of the asset with the remaining amount of consideration that the Group expects to receive less the costs that relate to providing services under the relevant contract. In determining the estimated amount of consideration, the Group uses the same principles as it does to determine the contract transaction price, except that any constraints used to reduce the transaction price are removed for the impairment test.

J Significant accounting judgements

Judgement is applied by the Group when determining what costs qualify to be capitalised, in particular when considering whether these costs are incremental and when considering if costs generate or enhance resources to be used to satisfy future performance obligations and whether costs are expected to be recoverable. For example, the Group considers which type of sales commissions are incremental to the cost of obtaining specific contracts and the point in time when the costs will be capitalised. See note 2.1 for further information.

Movements in non-current contract fulfilment assets were as follows¹:

	2023 £m	2022 £m
At 1 January	263.0	286.7
Impact of change in accounting standards – amendments to IAS 37 ²	—	(2.4)
At 1 January 2022 on adoption of IAS 37	263.0	284.3
Additions	79.5	67.1
Transfer to disposal group assets held for sale ³	(0.9)	—
Disposal of businesses	—	(2.8)
Impairment - included in adjusted profit	(3.3)	(3.8)
Impairment - included in business exits	(0.1)	—
Derecognition - included in adjusted profit	(4.1)	(0.4)
Derecognition - included in business exits	(8.2)	—
Utilisation - included in adjusted profit	(68.4)	(79.3)
Utilisation - included in business exits	(0.4)	(2.2)
Exchange movement	(0.1)	0.1
At 31 December	257.0	263.0

1. Refer to note 3.1.1 for current contract fulfilment assets.

2. The Group initially applied the amendments to IAS 37 at 1 January 2022 and the cumulative effect of applying the amendments was recognised as an opening balance adjustment to retained earnings.

3. Transfers to disposal group assets held for sale in the year ended 31 December 2023 includes £0.9m that was transferred at 30 June 2023 and subsequently sold during the second half of the year.

Impairment: In 2023, the Group recognised an impairment of £3.4m (2022: £3.8m) in cost of sales, of which, £nil (2022: £0.5m) relates to contract fulfilment assets added during the year.

Derecognition: In 2023, £12.3m (2022: £0.4m) was derecognised, primarily in relation to a contract in Capita Public Service following the termination of a customer contract and the Group having no further use for the assets (£8.2m). Subsequently the Group decided to exit the business this contract was within and therefore the derecognition of the contract fulfilment asset has been included within business exits (refer to note 2.8). In 2022 the derecognition related to a contract in Capita Experience where the scope of services changed due to termination of contracts and the Group had no further use for the assets.

Frequently asked questions

Question 10-12: How are capitalised contract costs and their amortisation classified and presented in the statement of financial position and statement of profit or loss and other comprehensive income, respectively?

See response to Question 9-27 in section 9.3.3 above.

10.5.4 Practical expedients

The standard allows entities to use several practical expedients. IFRS 15.129 requires entities to disclose their use of two practical expedients: (a) the practical expedient in IFRS 15.63 associated with the determination of whether a significant financing component exists (see section 5.5 above); and (b) the expedient in IFRS 15.94 for recognising an immediate expense for certain incremental costs of obtaining a contract with a customer (see section 9.3.1 above). [IFRS 15.129].

In addition, entities are required to disclose the use of the disclosure practical expedient in IFRS 15.121 (which permits an entity not to disclose information about remaining performance obligations if one of the conditions in the paragraph are met, see section 10.5.1.C above). IFRS 15 provides other practical expedients. Entities need to carefully consider the disclosure requirements of any other practical expedients it uses.

In Practical example 10-10 in section 10.5.1.B above, ProSiebenSat.1 Media SE discloses that it elected to use the practical expedient in IFRS 15.121(a) in relation to the remaining performance obligation disclosure requirement. Slater and Gordon Limited discloses its application of IFRS 15.94 relating to incremental costs of obtaining a contract in Practical example 10-18 in section 10.5.2.B above. In Practical example 10-14 in section 10.5.1.C above, ASML Holding N.V. discloses that it uses the 'right to invoice' practical expedient in IFRS 15.B16 for its performance obligations relating to 'OnPulse maintenance'.

10.6 Disclosures in interim financial statements

IAS 34 requires disclosure of disaggregated revenue information, consistent with the requirement included in IFRS 15 for annual financial statements. [IAS 34.16A(I)]. See section 10.5.1.A above for further discussion on this disclosure requirement.

Although none of the other annual IFRS 15 disclosure requirements apply to condensed interim financial statements, entities need to comply with the general requirements in IAS 34. For example, an entity is required to include sufficient information to explain events and transactions that are significant to an understanding of the changes in the entity's financial position and performance since the end of the last annual reporting period. [IAS 34.15]. Information disclosed in relation to those events and transactions must update the relevant information presented in the most recent annual financial report. IAS 34 includes a non-exhaustive list of events and transactions for which disclosure would be required if they are significant, and which includes recognition of impairment losses on assets arising from contracts with customers, or reversals of such impairment losses. [IAS 34.15B].

FASB differences

The FASB requires all quantitative disclosures about revenue required for annual financial statements to also be disclosed in interim financial statements.

11 Future developments

In March 2025, the IASB began work on its fourth agenda consultation.¹⁷⁶ The agenda consultation process will contribute to setting the IASB's agenda and priorities for the years from 2027 through 2031. The IASB staff initially proposed several IFRS 15-related topics to be shortlisted for inclusion in the request for information based on issues identified during the PIR of IFRS 15. These topics include applying IFRS 15 together with IFRIC 12, collaborative arrangements, corporate wrappers, consideration payable to a customer and principal versus agent considerations.¹⁷⁷ At the time of writing, the IASB had expressed support for initiating the agenda consultation process in late 2026 and publish a request for information in 2027.¹⁷⁸

176 News release, [IASB begins work on its next agenda consultation](#), March 2025, available on the IFRS Foundation's website.

177 [IASB Agenda Paper 24](#), *Proposed Approach*, March 2025, available on the IFRS Foundation's website.

178 [Fourth Agenda Consultation project page](#), available on the IFRS Foundation's website.

Appendix B - Index of Frequently asked questions

Question 2-1:	Before applying the financial instruments standards, are deferred-payment transactions that are part of Sharia-compliant instruments and transactions within the scope of the revenue standard?	2042
Question 2-2:	Are certain fee-generating activities of financial institutions in the scope of the revenue standard (i.e., servicing and sub-servicing financial assets, providing financial guarantees and providing deposit-related services)?	2042
Question 2-3:	Are contracts in which the consideration is in the form of incentive-based capital allocations within the scope of IFRS 15?	2043
Question 2-4:	Are credit card fees in the scope of the revenue standard?	2043
Question 2-5:	Are rewards programmes linked to financial instruments (e.g., credit cards) in the scope of the revenue standard?	2044
Question 2-6:	Are fixed-odds wagering contracts within the scope of the revenue standard?	2044
Question 2-7:	Are pre-production activities in the scope of the revenue standard?	2044
Question 2-8:	Are sales of by-products or scrap materials in the scope of the revenue standard?	2045
Question 2-9:	Are the sales of prepaid gift cards within the scope of IFRS 15?	2045
Question 2-10:	How does a utility entity determine whether a contract that includes a non-refundable upfront fee received for establishing a connection to a network (i.e., a connection fee) is within the scope of IFRS 15?	2046
Question 2-11:	Does an entity apply IFRS 10 or IFRS 15 to the sale of a corporate wrapper to a customer?	2046
Question 2-12:	Can a joint operator under IFRS 11 recognise as revenue under IFRS 15 amounts to which it is entitled as a joint operator that have not yet been sold to customers?	2048
Question 2-13:	Are equity instruments issued by an entity to a customer in connection with a revenue arrangement within the scope of the revenue standard?	2049
Question 2-14:	Are litigation settlements with customers in the scope of IFRS 15?	2049
Question 3-1:	Does a master supply arrangement (MSA) create enforceable rights and obligations to be considered a contract within the scope of the model in IFRS 15?	2054
Question 3-2:	How would an entity determine whether a contract exists within the scope of the model during a free trial period?	2054
Question 3-3:	Do entities need to consider side agreements when determining whether a contract exists within the scope of the model?	2055
Question 3-4:	How would an entity assess collectability for a portfolio of contracts?	2059
Question 3-5:	When would an entity reassess collectability?	2060
Question 3-6:	How do termination clauses and termination payments affect the duration of a contract (i.e., the contractual period)?	2061
Question 3-7:	How would an entity evaluate the contract term when only the customer has the right to cancel the contract without cause and how do termination penalties affect this analysis?	2062
Question 3-8:	If an entity has a past practice of not enforcing termination payments, does this affect the duration of the contract (i.e., the contractual period)?	2063
Question 3-9:	How would an entity account for a partial termination of a contract (e.g., a change in the contract term from three years to two years prior to the beginning of year two)?	2063
Question 3-10:	How is consideration that was received from a customer, but not yet recognised as revenue, accounted for when the contract is cancelled?	2064
Question 3-11:	How does an entity account for services provided during a period after contract expiration in which enforceable rights and obligations do not exist until the contract is renewed?	2065

Question 3-12:	How would an entity assess collectability for a portfolio of contracts?	2067
Question 3-13:	When would an entity evaluate a contract under the contract modification requirements?	2071
Question 3-14:	When an arrangement that has already been determined to meet the standard's contract criteria is modified, would an entity need to reassess whether that arrangement still meets the criteria to be considered a contract within the scope of the five-step model and/or the stand-alone selling prices of the underlying goods and services?	2072
Question 3-15:	How would an entity distinguish between a contract modification and a change in the estimated transaction price due to variable consideration after contract inception?	2073
Question 3-16:	How would an entity distinguish between a contract modification and a marketing offer when an entity provides customer incentives?	2073
Question 3-17:	How would an entity account for the exercise of a material right? That is, would an entity account for it as: a contract modification, a continuation of the existing contract or variable consideration?	2074
Question 3-18:	How do entities account for modifications and other changes to licences of intellectual property?	2074
Question 3-19:	How would an entity account for a partial termination of a contract (e.g., a change in the contract term from three years to two years prior to the beginning of year two)?	2078
Question 3-20:	How would an entity account for a contract modification that decreases the scope of a contract?	2078
Question 3-21:	How would an entity account for a 'blend-and-extend' contract modification?	2079
Question 3-22:	How would an entity account for a contract asset that exists when a contract is modified if the modification is treated as the termination of an existing contract and the creation of a new contract? (FASB TRG meeting 18 April 2016 - Agenda paper no. 51)	2080
See response to	Question 10-5 in section 10.1.5 below.	2080
Question 3-23:	When is a contract considered terminated for purposes of applying IFRS 15.15(b)?	2082
Question 4-1:	How would an entity assess whether pre-production activities are a promised good or service?	2089
Question 4-2:	What is the nature of the promise in a 'typical' stand-ready obligation?	2090
Question 4-3:	Do all contracts with a stand-ready element include a single performance obligation that is satisfied over time?	2091
Question 4-4:	How would an entity evaluate whether an exclusivity provision in a contract with customer represents a promised good or service?	2092
Question 4-5:	Does a guarantee to defend or maintain a patent represent a promised good or service?	2092
A guarantee to defend or maintain a patent does not represent a promised good or service. This is consistent with IFRS 15.B62(b) (discussed in section 8.1.4 below). [IFRS 15.B62(b)].		2092
Question 4-6:	How does an entity determine whether 'connected' hardware sold with cloud services represent one or more performance obligations?	2101
Question 4-7:	How would entities determine whether implementation services are distinct?	2102
Question 4-8:	Does a licence to a content library include more than one performance obligation?	2103
Question 4-9:	In order to apply the series requirement, must the goods or services be consecutively transferred?	2106
Question 4-10:	In order to apply the series requirement, does the accounting result need to be the same as if the underlying distinct goods or services were accounted for as separate performance obligations?	2106

Question 4-11:	In order to apply the series requirement, how does an entity consider whether a performance obligation consists of distinct goods or services that are 'substantially the same'?	2107
Question 4-12:	Can an entity choose whether to apply the series requirement?	2109
Question 4-13:	Do all stand-ready obligations meet the criteria to be accounted for as a series?	2109
Question 4-14:	Can an entity make an accounting policy choice to report revenue from contracts with customers on a gross or net basis?	2116
Question 4-15:	How would an entity determine whether it is a principal or an agent in a transaction for a specified good for which it only takes title momentarily or never has physical possession?	2129
Question 4-16:	How would entities determine the presentation of amounts billed to customers (e.g., shipping and handling, expenses or cost reimbursements and taxes) under the standards (i.e., as revenue or as a reduction of costs)?	2130
Question 4-17:	How does an entity allocate the transaction price in a contract with multiple performance obligations in which the entity acts as both a principal and an agent?	2131
See response to	Question 6-10 in section 6.2 below.	2131
Question 4-18:	Would entities consider only the current transaction or would they consider past and future transactions with the same customer when determining whether an option for additional goods or services provides the customer with a material right?	2134
Question 4-19:	Is the material right evaluation solely a quantitative evaluation or does the evaluation also consider qualitative factors?	2134
Question 4-20:	How would an entity distinguish between a contract that contains an option to purchase additional goods or services and a contract that includes variable consideration (see section 5.2 below) based on a variable quantity (e.g., a usage-based fee)?	2134
Question 4-21:	When, if ever, would an entity consider the goods or services underlying a customer option as a separate performance obligation?	2137
Question 4-22:	How does an entity consider the class of customer when evaluating whether a customer option is a material right?	2138
Question 4-23:	Are volume rebates and/or discounts on goods or services accounted for as variable consideration or as customer options to acquire additional goods or services at a discount?	2139
Question 4-24:	How does an entity consider whether prospective volume discounts determined to be customer options are material rights?	2139
Question 4-25:	How would an entity consider whether a renewal option is a material right?	2141
Question 4-26:	How would an entity consider whether a loyalty or reward programme is a material right?	2141
Question 4-27:	How would an entity account for the exercise of a material right? That is, would an entity account for it as: a contract modification, a continuation of the existing contract or variable consideration?	2141
Question 4-28:	Is an entity required to evaluate whether a customer option that provides a material right includes a significant financing component? If so, how would entities perform this evaluation?	2142
Question 4-29:	How would revenue be recognised for customer options for additional goods or services that represent a material right but do not have an expiration date (i.e., can an entity recognise breakage for these options)?	2142
Question 5-1:	How would entities determine the presentation of amounts billed to customers (e.g., shipping and handling, expenses or cost reimbursements and taxes) under the revenue standards (i.e., as revenue or as a reduction of costs)?	2145

Question 5-2:	Are volume rebates and/or discounts on goods or services accounted for as variable consideration or as customer options to acquire additional goods or services at a discount?	2149
Question 5-3:	How would an entity distinguish between a contract that contains an option to purchase additional goods or services and a contract that includes variable consideration based on a variable quantity (e.g., a usage-based fee)?	2149
Question 5-4:	Are liquidated damages, penalties or compensation from other similar clauses accounted for as variable consideration or as warranties under the standard?	2149
Question 5-5:	If a contract includes an undefined quantity of outputs, but the contractual rate per unit is fixed, is the consideration variable?	2149
Question 5-6:	If a contract is denominated in a currency other than the entity's functional currency, would changes in the contract price due to exchange rate fluctuations be accounted for as variable consideration?	2150
Question 5-7:	How would an entity account for price protection or price matching clauses included in a contract with a customer?	2150
Question 5-8:	Do early payment (or prompt payment) discounts represent a form of variable consideration?	2151
Question 5-9:	How does an entity account for a dispute related to a contract accounted for in accordance with IFRS 15 that might result in consideration received or receivable from a customer?	2151
Question 5-10:	Are there any situations in which an entity would not have to estimate variable consideration at contract inception under IFRS 15?	2157
Question 5-11:	Is the constraint on variable consideration applied at the contract or performance obligation level?	2162
Question 5-12:	Would an entity be required to follow a two-step approach to estimate variable consideration (i.e., first estimate the variable consideration and then apply the constraint to that estimate)?	2162
Question 5-13:	How does an entity apply the constraint on variable consideration to milestone payments?	2162
Question 5-14:	How would an entity distinguish between a contract modification and a change in the estimated transaction price due to variable consideration after contract inception?	2164
Question 5-15:	Is a refund liability a contract liability (and, thus, subject to the presentation and disclosure requirements of a contract liability)?	2164
Question 5-16:	Is an entity applying the portfolio approach practical expedient when accounting for rights of return?	2167
Question 5-17:	How does an entity account for restocking fees for goods that are expected to be returned?	2167
Question 5-18:	How does an entity account for restocking costs related to expected returns (e.g., shipping or repackaging costs)?	2168
Question 5-19:	How can an entity evaluate a conditional call option to repurchase an asset?	2168
Question 5-20:	Does an entity account for a customer's return of a defective item in exchange for compensation (i.e., not for a replacement item) as a right of return or an assurance-type warranty?	2168
Question 5-21:	The standard states that a significant financing component does not exist if the difference between the promised consideration and the cash selling price of the good or service arises for reasons other than the provision of finance. How broadly would this factor be applied?	2176
Question 5-22:	If the promised consideration is equal to the cash selling price, does a financing component exist?	2177
Question 5-23:	Does the standard preclude accounting for financing components that are not significant?	2177

Question 5-24:	How do entities consider whether the significant financing component practical expedient applies to contracts with a single payment stream for multiple performance obligations?	2177
Question 5-25:	If a significant financing component exists in a contract, how does an entity calculate the adjustment to revenue?	2178
Question 5-26:	How does an entity allocate a significant financing component when there are multiple performance obligations in a contract?	2178
Question 5-27:	Is an entity required to evaluate whether a customer option that provides a material right includes a significant financing component? If so, how would entities perform this evaluation?	2178
Question 5-28:	Can an entity consider an interest expense arising from a customer contract with a significant financing component as borrowing costs eligible for capitalisation?	2178
Question 5-29:	Who is considered to be an entity's customer when applying the requirements for consideration payable to a customer?	2185
Question 5-30:	How does an entity that acts as an agent account for incentive payments made to end-consumers that are not the entity's customers and are outside the distribution chain?	2185
Given the judgement involved with such arrangements, an entity needs to consider the disclosure requirements in IFRS 15.123 and IFRS 15.126 (see section 10.5.2 below).		2186
Question 5-31:	Which payments to a customer are within the scope of the requirements for consideration payable to a customer?	2187
Question 5-32:	Do litigation settlements payable by an entity to its customer represent consideration payable to a customer?	2187
Question 5-33:	How does an entity evaluate payments made to third parties on behalf of a customer?	2188
Question 5-34:	How does an entity account for upfront payments to a customer or a potential customer?	2191
Question 5-35:	How does an entity present 'negative revenue' resulting from consideration paid or payable to a customer that exceeds the amount to which the entity expects to be entitled?	2192
Question 5-36:	When does an entity determine the effect of a variable amount of consideration payable to a customer on the transaction price?	2193
Question 5-37:	Over what period would an entity recognise a non-refundable upfront fee (e.g., fees paid for membership to a club, activation fees for phone, cable or internet services) that does not relate to the transfer of a good or service?	2195
Question 5-38:	How does a utility entity determine whether a contract that includes a non-refundable upfront fee received for establishing a connection to a network (i.e., a connection fee) is within the scope of IFRS 15?	2195
Question 5-39:	What factors might be relevant when a utility entity applies the application guidance to non-refundable upfront fees for establishing a connection to a network?	2195
Question 5-40:	How is consideration that was received from a customer, but not yet recognised as revenue, accounted for when the contract is cancelled?	2196
Question 6-1:	When estimating the stand-alone selling price, does an entity have to consider its historical pricing for the sale of the good or service involved?	2204
Question 6-2:	When using an expected cost plus margin approach to estimate a stand-alone selling price, how would an entity determine an appropriate margin?	2205
Question 6-3:	When estimating the stand-alone selling price of a good or service, can an entity estimate a range of prices or does it have to identify a point estimate?	2205
Question 6-4:	How does an entity evaluate a contract where the total transaction price exceeds the sum of the stand-alone selling prices?	2207

Question 6-5:	Can an entity use the residual method to estimate stand-alone selling prices if none of the distinct goods or services in the contract have an observable price?	2207
Question 6-6:	Can an entity use the stated contract price as the stand-alone selling price of a good or service?	2207
Question 6-7:	How does an entity consider transactions in which the entity sells distinct goods or services in a bundled (i.e., multiple element) contract when determining the stand-alone selling price?	2207
Question 6-8:	Could the form of an option (e.g., a gift card versus a coupon) affect how an option's stand-alone selling price is estimated?	2210
Question 6-9:	Can an entity use the practical alternative when some, but not all, of the goods or services in the original contract are subject to a renewal option?	2210
Question 6-10:	How does an entity allocate the transaction price in a contract with multiple performance obligations in which the entity acts as both a principal and an agent?	2211
Question 6-11:	How does an entity allocate the transaction price in a contract with optional purchases using the relative stand-alone selling price method?	2212
Question 6-12:	How does an entity allocate a significant financing component when there are multiple performance obligations in a contract?	2213
Question 6-13:	In order to meet the criteria to allocate variable consideration entirely to a specific part of a contract, must the allocation be made on a relative stand-alone selling price basis?	2219
Question 6-14:	If a discount also meets the definition of variable consideration (because it is variable in amount and/or contingent on a future event), which allocation exception would an entity apply?	2222
Question 6-15:	How would an entity distinguish between a contract modification and a change in the estimated transaction price due to variable consideration after contract inception?	2224
Question 7-1:	Can an entity elect to recognise revenue at a point in time under IFRS 15?	2227
Question 7-2:	Do all contracts with a stand-ready element include a single performance obligation that is satisfied over time?	2227
Question 7-3:	What factors does an entity consider when evaluating whether a customer simultaneously receives and consumes the benefits of a commodity (e.g., electricity, natural gas or heating oil) as the entity performs?	2229
Question 7-4:	How does an entity evaluate a customer's right to sell (or pledge) a right to obtain an asset when determining whether the customer controls the asset as it is created or enhanced under IFRS 15.35(b)?	2230
Question 7-5:	Does an entity consider the completed asset or the work in progress when assessing whether its performance creates an asset with no alternative use under IFRS 15.35(c)? (FASB TRG meeting 7 November 2016 - Agenda paper no. 56)	2232
Question 7-6:	How does an entity determine whether it has an enforceable right to payment under IFRS 15.35(c)? (FASB TRG meeting 7 November 2016 - Agenda paper no. 56)	2237
Question 7-7:	To have an enforceable right to payment for performance completed to date, does an entity need to have a present unconditional right to payment?	2237
Question 7-8:	Does an entity have a right to payment for performance completed to date if the entity receives a non-refundable upfront payment that represents the full transaction price?	2238
Question 7-9:	Can an entity conclude it has an enforceable right to payment for performance completed to date when a contract is priced at a loss?	2238
Question 7-10:	Can an entity have an enforceable right to payment for performance completed to date if it is not entitled to a reasonable profit margin on	

	standard inventory materials that were purchased but not yet used in completing the performance obligation?	2238
Question 7-11:	What does an entity consider when assessing the over-time criteria for the sale of a real estate unit?	2239
Question 7-12:	Does an entity contemplate consideration it might receive from the potential resale of the asset to determine whether an enforceable right to payment for performance completed to date exists?	2240
Question 7-13:	How are the effects of learning curve costs addressed in IFRS 15?	2249
Question 7-14:	How would an entity measure progress towards satisfaction of a stand-ready obligation that is satisfied over time?	2249
Question 7-15:	Can multiple measures of progress be used to depict an entity's performance in transferring a performance obligation comprised of two or more goods and/or services that is satisfied over time (i.e., a combined performance obligation)?	2250
Question 7-16:	How would an entity determine the appropriate single measure of progress for a combined performance obligation that is satisfied over time?	2250
Question 7-17:	Can control of a good or service underlying a performance obligation satisfied over time be transferred at discrete points in time? (FASB TRG meeting 18 April 2016 - Agenda paper no. 53)	2251
Question 7-18:	Can an entity use the 'right to invoice' practical expedient for a contract that includes rates that change over the contractual term?	2251
Question 7-19:	If an entity does not meet the criteria to use the 'right to invoice' practical expedient, can it still use the disclosure practical expedient regarding the amount of transaction price allocated to remaining performance obligations?	2251
Question 7-20:	If an entity begins activities on a specifically anticipated contract either: (1) before it agrees to the contract with the customer; or (2) before the arrangement meets the criteria to be considered a contract under the standard, how would revenue for those activities be recognised at the date a contract exists?	2251
Question 7-21:	How do entities consider costs subject to volatility caused by factors such as foreign exchange rates and commodity prices in a measure of progress if an entity applies an input method based on costs incurred?	2252
Question 7-22:	How does an entity account for fulfilment costs incurred prior to the contract establishment date that are outside the scope of another standard (e.g., IAS 2)?	2252
Question 7-23:	How do shipping terms affect when an entity has transferred control of a good to a customer?	2257
Question 7-24:	How can an entity evaluate a conditional call option to repurchase an asset?	2261
Question 7-25:	How would an entity account for the exercise of a material right? That is, would an entity account for it as: a contract modification, a continuation of the existing contract or variable consideration?	2267
Question 7-26:	Are customers' unexercised rights (i.e., breakage) a form of variable consideration?	2269
Question 7-27:	How would revenue be recognised for customer options for additional goods or services that represent a material right, but do not have an expiration date (i.e., can an entity recognise breakage for these options)?	2269
Question 8-1:	How do entities account for modifications and other changes to licences of intellectual property?	2275
Question 8-2:	How do entities account for an option to revoke licensing rights?	2277
Question 8-3:	How does an entity account for contracts that grant both permission for past use of intellectual property and a licence to use the intellectual property in the future?	2278
Question 8-4:	Does a licence to a content library include more than one performance obligation?	2278

Question 8-5:	Is a licence that provides a right to access intellectual property a series of distinct goods or services that would be accounted for as a single performance obligation?	2284
Question 8-6:	How do entities account for modifications and other changes to licences of intellectual property?	2286
Question 8-7:	How do entities account for an option to revoke licensing rights?	2286
Question 8-8:	Can the recognition constraint for sales-based or usage-based royalties be applied to royalties that are paid in consideration for sales of intellectual property (rather than just licences of intellectual property)?	2291
Question 8-9:	If a contract for a licence of intellectual property includes payments with fixed amounts (e.g., milestone payments) that are determined by reference to sales-based or usage-based thresholds, would the royalty recognition constraint need to be applied?	2291
Question 8-10:	If a contract for a licence of intellectual property includes a milestone payment based on the first commercial sale, would the royalty recognition constraint apply?	2291
Question 8-11:	Does the application of the royalty recognition constraint preclude the requirement to adhere to the allocation objective in IFRS 15.73?	2292
Question 8-12:	Can an entity recognise revenue for sales-based or usage-based royalties for licences of intellectual property on a lag if actual sales or usage data is not available at the end of a reporting period?	2292
Question 8-13:	How does a minimum guarantee affect the recognition of sales-based or usage-based royalties promised in exchange for a licence of intellectual property that is satisfied at a point in time?	2292
Question 8-14:	How does a minimum guarantee affect the recognition of sales-based or usage-based royalties promised in exchange for a licence of intellectual property that is satisfied over time?	2292
Question 8-15:	Can entities apply the royalty recognition constraint for sales-based or usage-based royalties if they do not own the intellectual property or control the intellectual property as a principal in the arrangement?	2295
Question 8-16:	Can entities recognise sales-based or usage-based royalties before the sale or usage of the intellectual property occurs if they have historical information that is highly predictive of future royalty amounts?	2295
Question 8-17:	Must an entity apply the royalty recognition constraint when the royalty is calculated on a financial metric that is not solely based on sales or usage?	2296
Question 8-18:	Does the royalty recognition constraint apply if the licence of intellectual property is not distinct from other goods or services in the contract?	2296
Question 8-19:	Can an entity recognise revenue at an expected average rate when a licence of intellectual property has royalty rates that increase (or decrease) over time?	2296
Question 8-20:	How would an entity distinguish between a contract that contains an option to purchase additional licences and a contract in which additional licence usage may be subject to the royalty recognition constraint?	2297
Question 9-1:	How does an entity evaluate whether a product warranty is a service-type warranty (i.e., a performance obligation) when it is not separately priced?	2300
Question 9-2:	How would an entity account for a customary business practice of providing repairs outside the stated contractual warranty period?	2300
Question 9-3:	Does an entity account for a customer's return of a defective item in exchange for compensation (i.e., not for a replacement item) as a right of return or an assurance-type warranty?	2301
Question 9-4:	Are liquidated damages, penalties or compensation from other similar clauses accounted for as variable consideration or as warranties under the standard?	2301

Question 9-5:	How does an entity account for an onerous contract with a customer when the contract includes more than one performance obligation that is satisfied over time consecutively?	2305
Question 9-6:	Does the timing of commission payments affect whether they are incremental costs?	2309
Question 9-7:	Would commission payments subject to a threshold be considered incremental costs?	2310
Question 9-8:	Would an entity capitalise commissions paid on contract modifications?	2310
Question 9-9:	Would fringe benefits on commission payments be included in the capitalised amounts?	2310
Question 9-10:	Must an entity apply the practical expedient to expense contract acquisition costs to all of its qualifying contracts across the entity or can it apply the practical expedient to individual contracts?	2310
Question 9-10:	Must an entity apply the practical expedient to expense contract acquisition costs to all of its qualifying contracts across the entity or can it apply the practical expedient to individual contracts?	2311
Question 9-11:	How would an entity account for capitalised commissions upon a modification of the contract that is treated as the termination of an existing contract and the creation of a new contract?	2311
Question 9-12:	Can an entity choose whether to capitalise incremental costs to obtain a contract that it expects to recover?	2311
Question 9-13:	Would an entity consider contract renewals when assessing whether the practical expedient applies?	2311
Question 9-14:	If a contract contains more than one performance obligation, can an entity apply the practical expedient?	2311
	Regardless of the approach used to determine the appropriate amortisation period for a capitalised contract cost related to a contract containing multiple performance obligations, all of the amortisation periods related to the contract would have to be one year or less for an entity to apply the practical expedient. If any amortisation period related to the contract extends beyond one year, the entity cannot apply the practical expedient.	2312
Question 9-15:	Can an entity defer costs of a transferred good or service that would otherwise generate an upfront loss because variable consideration is fully or partially constrained?	2316
Question 9-16:	How does an entity account for fulfilment costs incurred prior to the contract establishment date that are outside the scope of another standard (e.g., IAS 2)?	2317
Question 9-17:	How are the effects of learning curve costs addressed in IFRS 15?	2317
Question 9-18:	How does an entity account for pre-contract or setup costs?	2318
Question 9-19:	Can mobilisation costs be capitalised as costs to fulfil a contract with a customer under IFRS 15?	2318
Question 9-20:	Can an entity defer losses incurred on a contract by capitalising related fulfilment costs when it is expected to generate future profits on the sale of optional goods or services (i.e., loss leader)?	2319
Question 9-21:	How does an entity account for costs associated with installation or implementation services?	2319
Question 9-22:	How does an entity determine whether a commission on a renewal contract is commensurate with the commission on the initial contract?	2323
Question 9-23:	How does an entity determine the amortisation period of an asset recognised for the incremental costs of obtaining a contract with a customer?	2324
Question 9-24:	Can an entity attribute the capitalised contract costs to the individual performance obligations in the contract to determine the appropriate amortisation period?	2325

Question 9-25: Over what period would an entity amortise a sales commission (that is only paid once a threshold is met) that is determined to be an incremental cost to obtain a contract?	2326
Question 9-26: When does an entity begin to amortise an asset recognised for the incremental cost of obtaining a renewal contract?	2327
Question 9-27: How are capitalised contract costs and their amortisation classified and presented in the statement of financial position and statement of profit or loss and other comprehensive income, respectively?	2327
Question 9-28: How often does an entity need to assess its capitalised contract costs for impairment under IFRS 15?	2329
Question 10-1: How would an entity determine the presentation of contract assets and liabilities for contracts that contain multiple performance obligations?	2337
Question 10-2: How would an entity determine the presentation of two or more contracts that are required to be combined under the standard?	2338
Question 10-3: When would an entity offset contract assets and liabilities against other statement of financial position items (e.g., accounts receivable)?	2338
Question 10-4: Is a refund liability a contract liability (and, thus, subject to the presentation and disclosure requirements of a contract liability)?	2339
Question 10-5: How would an entity account for a contract asset that exists when a contract is modified if the modification is treated as the termination of an existing contract and the creation of a new contract? (FASB TRG meeting 18 April 2016 - Agenda paper no. 51)	2339
Question 10-6: If an entity has not transferred a good or service, when does it have an unconditional right to payment?	2340
Question 10-7: Can income outside the scope of IFRS 15 be presented as revenue in the income statement?	2343
Question 10-8: How are shipping and handling costs incurred in relation to a revenue contract presented in the income statement?	2344
Question 10-9: How are capitalised contract costs and their amortisation classified and presented in the statement of financial position and statement of profit or loss and other comprehensive income, respectively?	2345
Question 10-10: How would entities determine the presentation of amounts billed to customers (e.g., shipping and handling, expenses or cost reimbursements and taxes) under the standards (i.e., as revenue or as a reduction of costs)?	2345
Question 10-11: If an entity does not meet the criteria to use the 'right to invoice' practical expedient, can it still use the disclosure practical expedient regarding the amount of transaction price allocated to remaining performance obligations?	2368
Question 10-12: How are capitalised contract costs and their amortisation classified and presented in the statement of financial position and statement of profit or loss and other comprehensive income, respectively?	2375

Appendix C - Defined terms

Extract from IFRS 15

Appendix A Defined terms

This appendix is an integral part of the Standard.

contract	An agreement between two or more parties that creates enforceable rights and obligations.
contract asset	An entity's right to consideration in exchange for goods or services that the entity has transferred to a customer when that right is conditioned on something other than the passage of time (for example, the entity's future performance).
contract liability	An entity's obligation to transfer goods or services to a customer for which the entity has received consideration (or the amount is due) from the customer.
customer	A party that has contracted with an entity to obtain goods or services that are an output of the entity's ordinary activities in exchange for consideration.
income	Increases in economic benefits during the accounting period in the form of inflows or enhancements of assets or decreases of liabilities that result in an increase in equity, other than those relating to contributions from equity participants.
performance obligation	A promise in a contract with a customer to transfer to the customer either: (a) a good or service (or a bundle of goods or services) that is distinct; or (b) a series of distinct goods or services that are substantially the same and that have the same pattern of transfer to the customer.
revenue	Income arising in the course of an entity's ordinary activities.
stand-alone selling price (of a good or service)	The price at which an entity would sell a promised good or service separately to a customer .
transaction price (for a contract with a customer)	The amount of consideration to which an entity expects to be entitled in exchange for transferring promised goods or services to a customer , excluding amounts collected on behalf of third parties.

Appendix D - Illustrative examples included in the standard and references in this chapter

<i>Identifying the contract</i>		
Example 1	Collectability of the consideration	Section 3.1.5.B
Example 2	Consideration is not the stated price - implicit price concession	Section 5.2.1.A
Example 3	Implicit price concession	Not included
Example 4	Reassessing the criteria for identifying a contract	Not Included
<i>Contract modifications</i>		
Example 5	Modification of a contract for goods	
	<i>Case A-Additional products for a price that reflects the stand-alone selling price</i>	Section 3.4.1
	<i>Case B-Additional products for a price that does not reflect the stand-alone selling price</i>	Section 3.4.2.A
Example 6	Change in the transaction price after a contract modification	Not Included
Example 7	Modification of a services contract	Not Included
Example 8	Modification resulting in a cumulative catch-up adjustment to revenue	Section 3.4.2.B
Example 9	Unapproved change in scope and price	Section 3.4
<i>Identifying performance obligations</i>		
Example 10	Goods and services are not distinct	
	<i>Case A-Significant integration service</i>	Section 4.2.3
	<i>Case B-Significant integration service</i>	Section 4.2.3
Example 11	Determining whether goods or services are distinct	
	<i>Case A-Distinct goods or services</i>	Section 4.2.3
	<i>Case B-Significant customisation</i>	Section 4.2.3
	<i>Case C-Promises are separately identifiable (installation)</i>	Section 4.2.3
	<i>Case D-Promises are separately identifiable (contractual restrictions)</i>	Section 4.2.3
	<i>Case E-Promises are separately identifiable (consumables)</i>	Section 4.2.3
Example 12	Explicit and implicit promises in a contract	
	<i>Case A-Explicit promise of service</i>	Section 4.1
	<i>Case B-Implicit promise of service</i>	Section 4.1
	<i>Case C-Services are not a promised service</i>	Section 4.1
<i>Performance obligations satisfied over time</i>		
Example 13	Customer simultaneously receives and consumes the benefits	Section 7.1.1
Example 14	Assessing alternative use and right to payment	Section 7.1.3.B
Example 15	Asset has no alternative use to the entity	Section 7.1.3.A
Example 16	Enforceable right to payment for performance completed to date	Section 7.1.3.B
Example 17	Assessing whether a performance obligation is satisfied at a point in time or over time	

	<i>Case A-Entity does not have an enforceable right to payment for performance completed to date</i>	Section 7.1.3.B
	<i>Case B-Entity has an enforceable right to payment for performance completed to date</i>	Section 7.1.3.B
	<i>Case C-Entity has an enforceable right to payment for performance completed to date</i>	Section 7.1.3.B
<i>Measuring progress toward complete satisfaction of a performance obligation</i>		
Example 18	Measuring progress when making goods or services available	Section 7.1.4.E
Example 19	Uninstalled materials	Section 7.1.4.D
<i>Variable consideration</i>		
Example 20	Penalty gives rise to variable consideration	Not Included
Example 21	Estimating variable consideration	Not Included
<i>Constraining estimates of variable consideration</i>		
Example 22	Right of return	Section 5.4
Example 23	Price concessions	
	<i>Case A-Estimate of variable consideration is not constrained</i>	Section 5.2.3
	<i>Case B-Estimate of variable consideration is constrained</i>	Section 5.2.3
Example 24	Volume discount incentive	Section 5.2.1
Example 25	Management fees subject to the constraint	Not Included
<i>The existence of a significant financing component in the contract</i>		
Example 26	Significant financing component and right of return	Section 5.5.4
Example 27	Withheld payments on a long-term contract	Section 5.5.4
Example 28	Determining the discount rate	
	<i>Case A-Contractual discount rate reflects the rate in a separate financing transaction</i>	Section 5.5.4
	<i>Case B-Contractual discount rate does not reflect the rate in a separate financing transaction</i>	Section 5.5.4
Example 29	Advance payment and assessment of the discount rate	Section 5.5.4
Example 30	Advance payment	Section 5.5.4
<i>Non-cash consideration</i>		
Example 31	Entitlement to non-cash consideration	Section 5.6
<i>Consideration payable to a customer</i>		
Example 32	Consideration payable to a customer	Section 5.7.3
<i>Allocating the transaction price to performance obligations</i>		
Example 33	Allocation methodology	Section 6.1.2
Example 34	Allocating a discount	
	<i>Case A-Allocating a discount to one or more performance obligations</i>	Section 6.4
	<i>Case B-Residual approach is appropriate</i>	Section 6.4
	<i>Case C-Residual approach is inappropriate</i>	Section 6.4
Example 35	Allocation of variable consideration	

	<i>Case A-Variable consideration allocated entirely to one performance obligation</i>	Section 6.3.3
	<i>Case B-Variable consideration allocated on the basis of stand-alone selling prices</i>	Section 6.3.3
Contract costs		
Example 36	Incremental costs of obtaining a contract	Section 9.3.1
Example 37	Costs that give rise to an asset	Section 9.3.2
Presentation		
Example 38	Contract liability and receivable	
	<i>Case A-Cancellable contract</i>	Section 10.1.1
	<i>Case B-Non-cancellable contract</i>	Section 10.1.1
Example 39	Contract asset recognised for the entity's performance	Section 10.1.1
Example 40	Receivable recognised for entity's performance	Not Included
Disclosure		
Example 41	Disaggregation of revenue - quantitative disclosure	Section 10.5.1.A
Example 42	Disclosure of the transaction price allocated to the remaining performance obligations	Section 10.5.1.C
Example 43	Disclosure of the transaction price allocated to the remaining performance obligations - qualitative disclosure	Section 10.5.1.C
Warranties		
Example 44	Warranties	Not Included
Principal versus agent considerations		
Example 45	Arranging for the provision of goods or services (entity is an agent)	Not Included
Example 46	Promise to provide goods or services (entity is a principal)	Not Included
Example 46A	Promise to provide goods or services (entity is a principal)	Section 4.4.4
Example 47	Promise to provide goods or services (entity is a principal)	Section 4.4.4
Example 48	Arranging for the provision of goods or services (entity is an agent)	Section 4.4.4
Example 48A	Entity is a principal and an agent in the same contract	Not Included
Customer options for additional goods or services		
Example 49	Option that provides the customer with a material right (discount voucher)	Section 4.6
Example 50	Option that does not provide the customer with a material right (additional goods or services)	Not Included
Example 51	Option that provides the customer with a material right (renewal option)	Not Included
Example 52	Customer loyalty programme	Section 7.9
Non-refundable upfront fees		
Example 53	Non-refundable upfront fee	Not Included
Licensing		
Example 54	Right to use intellectual property	Not Included

Example 55	Licence of intellectual property	Not Included
Example 56	Identifying a distinct licence	
	<i>Case A-Licence is not distinct</i>	Section 8.2.1
	<i>Case B-Licence is distinct</i>	Section 8.1.1
Example 57	Franchise rights	Not Included
Example 58	Access to intellectual property	Section 8.3.1
Example 59	Right to use intellectual property	Section 8.3.2
Example 60	Access to intellectual property	Section 8.5
Example 61	Access to intellectual property	Section 8.5.1
<i>Repurchase arrangements</i>		
Example 62	Repurchase agreements	
	<i>Case A-Call option: financing</i>	Section 7.3.1
	<i>Case B-Put option: lease</i>	Section 7.3.2
<i>Bill-and-hold arrangements</i>		
Example 63	Bill-and-hold arrangement	Section 7.5

Appendix E - TRG discussions and references in this chapter

This appendix includes topics discussed by the TRG and where they are discussed within this chapter.

The FASB staff has compiled publicly available TRG memos and other educational resources previously issued on the implementation of the US GAAP revenue standard, ASC 606, into a document called [Revenue Recognition Implementation Q&As](#) (FASB staff Q&As).¹⁷⁹ The staff's objective in compiling this material, which is organised by subject matter (e.g., step of the revenue model), was to make the available educational resources easier to navigate and not to issue any new application guidance.

Date of TRG meeting	Agenda paper no.	Topic discussed	Section
18 July 2014	1	Gross versus net revenue	TRG discussions led to amendments to IFRS 15 that are discussed in sections 4.4 & 6.2
	2	Gross versus net revenue: amounts billed to customers	Section 4.4.4
	3	Sales-based and usage-based royalties in contracts with licences and goods or services other than licences	TRG discussions led to amendments to IFRS 15 that are discussed in section 8.5
	4	Impairment testing of capitalised contract costs	Section 9.3.4
31 October 2014	5	July 2014 meeting - summary of issues discussed and next steps	Section 9.3.4
	6	Customer options for additional goods and services and non-refundable upfront fees	Section 4.6
	7	Presentation of a contract as a contract asset or a contract liability	Section 10.1.5
	8	Determining the nature of a licence of intellectual property	TRG discussions led to amendments to IFRS 15 that are discussed in section 8
	9	Distinct in the context of the contract	TRG discussions led to amendments to IFRS 15 that are discussed in sections 4.2.1.B - 4.2.1.H
	10	Contract enforceability and termination clauses	Section 3.2
26 January 2015	11	October 2014 meeting - summary of issues discussed and next steps	Not applicable
	12	Identifying promised goods or services	TRG discussions led to amendments to IFRS 15 that are discussed in section 4.1
	13	Collectability	Sections 3.1.5.B & 5.2.1.B
	14	Variable consideration	Section 5.2.3
	15	Non-cash consideration	Section 5.6.1
	16	Stand-ready obligations	Sections 4.1.1, 7.1.4.E
	17	Islamic finance transactions	Section 2.5

¹⁷⁹ Available on the [FASB's website](#).

	18	Material right	Questions in this paper were brought forward to agenda paper no. 32 for TRG discussion
	19	Consideration payable to a customer	Questions in this paper were brought forward to agenda paper no. 28 for TRG discussion
	20	Significant financing component	Questions in this paper were brought forward to agenda paper no. 30 for TRG discussion
	21	Licences research update	No TRG discussion - update only
	22	Performance obligations research update	No TRG discussion - update only
	23	Costs to obtain a contract	Sections 9.3.1 & 9.3.3
	24	Contract modifications prior to the date of initial application	Not included
30 March 2015	25	January 2015 meeting - summary of issues discussed and next steps	Sections 3.1.5.B & 4.1.1
	26	Contributions	Not included
	27	Series of distinct goods or services	Section 4.2.2
	28	Consideration payable to a customer	Sections 5.7 & 5.7.1
	29	Warranties	Section 9.1.1
	30	Significant financing component	Sections 5.5.2.A & 5.5.4
	31	Variable discounts	Section 6.4
	32	Exercise of material right	Sections 4.6 & 5.8
13 July 2015	33	Partially satisfied performance obligations	Sections 3.5, 7.1.4.E & 9.3.2
	34	March 2015 meeting - summary of issues discussed and next steps	Not applicable
	35	Accounting for restocking fees and related costs	Section 5.4
	36	Credit cards	Section 2.5
	37	Consideration payable to a customer	Sections 5.7, 5.7.1 & 5.7.3
	38	Portfolio practical expedient and application of variable consideration constraint	Sections 5.2.2, 5.2.3 & 5.4
	39	Application of the series provision and allocation of variable consideration	Sections 4.2.2, 5.2.1, 6.3 & 8.3.1
	40	Practical expedient for measuring progress toward complete satisfaction of a performance obligation	Sections 7.1.4.A, 7.1.4.B, 7.1.4.E & 10.5.1.C
	41	Measuring progress when multiple goods or services are included in a single performance obligation	Section 7.1.4.E
	42	Completed contracts at transition	Not included
	43	Determining when control of a commodity transfers	Section 7.1.1

9 November 2015	44	July 2015 meeting - summary of issues discussed and next steps	Section 5.7.3 & 7.1.4.B
	45	Licences - specific application issues about restrictions and renewals	TRG discussions led to amendments to IFRS 15 that are discussed in sections 8.1.3, 8.4 & 8.5.1
	46	Pre-production activities	Section 4.1.1
	47	Whether fixed odds wagering contracts are included or excluded from the scope of the new standard	Not included
	48	Customer options for additional goods and services	Sections 3.2, 4.1.1, 4.6 & 6.2
	49	November 2015 meeting - summary of issues discussed and next steps	Not applicable
18 April 2016 (FASB TRG meeting only)	50	Scoping considerations for incentive-based capital allocations	Not included
	51	Contract asset treatment in contract modifications	Section 10.1.5
	52	Scoping considerations for financial institutions	Section 2.5
	53	Evaluating how control transfers over time	Section 7.1.4.E
	54	Class of customer	Section 4.6
	55	April 2016 Meeting - Summary of Issues Discussed and Next Steps	Not applicable
7 November 2016	56	Over Time Revenue Recognition	Sections 7.1.3.A & 7.1.3.B
	57	Capitalization and Amortization of Incremental Costs of Obtaining a Contract	Sections 9.3.1 & 9.3.3
	58	Sales-Based or Usage-Based Royalty with Minimum Guarantee	Section 8.5.1
	59	Payments to Customers	Section 5.7.3
	60	November 2016 Meeting - Summary of Issues Discussed and Next Steps	Not applicable

Appendix F - IFRS IC discussions and references in this chapter

This appendix includes topics discussed by the IFRS IC that are discussed within this chapter. Applicable IFRS accounting standards referenced exclude any standards that were superseded at the time of writing.

Topic discussed (and applicable IFRS accounting standards)	Date(s) discussed by IFRS IC	Agenda paper no.	Status at the time of writing	IFRIC Update	Section
Recognition of Revenue from Tuition Fees	11 March 2025 10 September 2024	3 3	Final agenda decision	March 2025	Not discussed
Guarantees Issued on Obligations of Other Entities	11 March 2025 10 September 2024	2 2	Final agenda decision	March 2025	Question 2-2 in section 2.5 and Section 7.3.3
Principal versus Agent: Software reseller (IFRS 15)	30 November-1 December 2021 20 April 2022	2 2	Final agenda decision	April 2022	Sections 4.1.1 and 4.4.2
Configuration or Customisation Costs in a Cloud Computing Arrangement (IAS 38)	1-2 December 2020 16 March 2021 27 April 2021 approved by the IASB	5 2 12A	Final agenda decision	March 2021 (Addendum)	Section 8
Presentation of Player Transfer Payments (IAS 38)	26 November 2019 16 June 2020	6 5	Final agenda decision	June 2020	Section 2.6.3 and Question 10- 7 in section 10.2
Sale of a Single Asset Entity Containing Real Estate (IFRS 10 and IFRS 15)/ Sale of a Subsidiary to a Customer	11-12 June 2019 IASB discussion 23-25 June	6 12A	Issue considered as part of the post- implementatio n review of IFRS 10. The IASB assessed this matter as a low priority and agreed to explore further if identified as a priority in the next agenda consultation.	June 2019 <i>IASB Update</i> June 2020	Question 2-11 in section 2.5
Training Costs to Fulfil a Contract (IFRS 15)	17 September 2019 3 March 2020	2 5	Final agenda decision	March 2020	Section 9.3.2 and Question 9- 18 in section 9.3.2
Compensation for Delays or Cancellations (IFRS 15)	17 September 2019 11-12 June 2019	6 8	Final agenda decision	September 2019	Question 5-4 in section 5.2.1 and Question 5-34 in section 5.7.3

Costs to Fulfil a Contract (IFRS 15)	11-12 June 2019 5-6 March 2019	10 2	Final agenda decision	June 2019	Section 9.3.2
Sale of Output by a Joint Operator (IFRS 11 and IFRS 15)	5-6 March 2019 27 November 2018	8 2	Final agenda decision	March 2019	Question 2-12 in section 2.5
Over time transfer of constructed good (IAS 23 and IFRS 15)	5-6 March 2019 27 November 2018	3 4	Final agenda decision	March 2019	Question 5-28 in section 5.5.4
Assessment of promised goods or services (IFRS 15)	16 January 2019 11-12 September 2018	3 2	Final agenda decision	January 2019	Section 4.1.1
Revenue recognition in a real estate contract (IFRS 15)	13 March 2018 12 September 2017	2C 2	Final agenda decision	March 2018	Question 7-4 in section 7.1.2, Question 7-11 in section 7.1.3.B and section 7.2
Revenue recognition in a real estate contract that includes the transfer of land (IFRS 15)	13 March 2018 20 November 2017	2D 2A	Final agenda decision	March 2018	Section 4.2.1.G and Question 7-11 in section 7.1.3.B
Right to payment for performance completed to date (IFRS 15)	13 March 2018 20 November 2017	2E 2B	Final agenda decision	March 2018	Questions 7-10 and 7-11 in section 7.1.3.B

Appendix G - Summary of significant differences from US GAAP

Below are significant differences between IFRS accounting standards and US GAAP related to revenue recognition under IFRS 15. This list is not exhaustive.

	IFRS	US GAAP
Fixed-odds wagering contracts (section 2.5, Question 2-6)	Fixed-odds wagering contracts that meet the definition of a derivative are within the scope of IFRS 9; otherwise, they are within the scope of IFRS 15.	Fixed-odds wagering arrangements are within the scope of ASC 606.
Sale of a corporate wrapper (section 2.5, Question 2-11)	Whether an entity needs to apply IFRS 10 or IFRS 15 to the sale of a corporate wrapper to a customer depends on facts and circumstances and might require significant judgement.	The sale of a corporate wrapper to a customer generally will be in the scope of ASC 606. ASC 810, <i>Consolidation</i> , indicates that its deconsolidation and derecognition guidance does not apply to a loss of control of a subsidiary that is a business if that transaction is within the scope of ASC 606. Loss of control of a subsidiary that is not a business is equally excluded from the scope of ASC 810 if the substance of the transaction is within the scope of another standard (e.g., ASC 606, ASC 610-20, <i>Other Income - Gains and Losses from Derecognition of Nonfinancial Assets</i>). However, the sale of a corporate wrapper to a counterparty that is not a customer might be in the scope of ASC 610-20.
Consideration paid or payable to a customer - equity instruments (section 2.5, Question 2-13 and section 5.7)	IFRS 15 does not address whether equity instruments issued by an entity to a customer are a type of consideration paid or payable to a customer, nor does the standard address the accounting for the initial and subsequent measurement of equity instruments granted to customers in a revenue arrangement. IFRS 2 also does not address such transactions. Depending on the facts and circumstances, several IFRS accounting standards (or a combination of IFRS accounting standards) might be applicable (e.g., IFRS 2, IFRS 15, IAS 32).	Share-based consideration granted to a customer in conjunction with selling goods or services (e.g., shares, options) are a form of consideration paid or payable to a customer and accounted for under ASC 606. Entities are required to measure such share-based consideration in accordance with ASC 718. That is, an entity must measure the share-based consideration using the grant-date fair value for both equity- and liability-classified awards. ASC 606 also includes guidance on how to measure variability of share-based consideration granted to a customer in conjunction with selling goods or services. After the adoption of ASU 2025-04, the guidance on constraining estimates of variable consideration does not apply to share-based consideration payable to a customer that is measured and classified under ASC 718.
Disposals of non-financial assets not in the ordinary course of business (section 2.6.3)	IAS 16, IAS 38 and IAS 40 require entities to use certain of the requirements of IFRS 15 when recognising and measuring gains or losses arising from the sale or disposal of non-financial assets when it is not in the ordinary course of business. Changes in a parent's ownership interest in a subsidiary (including loss of control through sale or disposal) are generally	ASC 610-20 provides guidance on how to account for any gain or loss resulting from the sale of non-financial assets or in-substance non-financial assets that are not an output of an entity's ordinary activities and are not a business. This includes the sale of intangible assets and property, plant and equipment, including real estate, as well as materials and supplies. ASC 610-20 requires entities to apply certain recognition and measurement principles of

	accounted for under IFRS 10. IFRS accounting standards do not address requirements regarding the sale of in-substance non-financial assets	ASC 606. Thus, under US GAAP, the accounting for a contract that includes the sale of a non-financial asset to a non-customer will generally be consistent with a contract to sell a non-financial asset to a customer, except for financial statement presentation and disclosure. Sales or transfers of businesses or subsidiaries that do not contain solely non-financial assets and in-substance non-financial assets to non-customers are accounted for using the deconsolidation guidance in ASC 810.
Collectability threshold (section 3.1.5)	<p>An entity must assess whether it is <i>probable</i> that it will collect the consideration to which it will be entitled in exchange for the goods or services that will be transferred to the customer.</p> <p>For purposes of this analysis, the term 'probable' is defined as "more likely than not", consistent with its definition elsewhere in IFRS accounting standards.</p> <p>IFRS 15 does not include the additional guidance on the intention of the collectability assessment that is in ASC 606. However, the IASB stated that it does not expect differences in outcomes under IFRS accounting standards and US GAAP in relation to the evaluation of the collectability criterion. [IFRS 15.BC46E].</p>	<p>An entity must assess whether it is <i>probable</i> that it will collect <i>substantially all</i> of the consideration to which it will be entitled in exchange for the goods or services that will be transferred to the customer.</p> <p>For purposes of this analysis, the term 'probable' is defined as "the future event or events are likely to occur", consistent with its definition elsewhere in US GAAP.</p> <p>ASC 606 also includes additional guidance to clarify the intention of the collectability assessment.</p>
Arrangements that do not meet the definition of a contract (section 3.5)	<p>When an arrangement does not meet (and continues not to meet) the criteria to be a contract under the five-step model in IFRS 15, the entity is required to recognise non-refundable consideration received as revenue only when one of the following two events has occurred:</p> <ul style="list-style-type: none"> ▪ The entity has fully performed and substantially all of the consideration has been received. ▪ The contract has been terminated. <p>Until one of these events happens, any consideration received from the customer is initially accounted for as a liability (not revenue), and the liability is measured at the amount of consideration received from the customer.</p> <p>However, the IASB noted that contracts often specify that an entity has a right to terminate the contract in the event of non-payment. Furthermore, such clauses would not generally affect the entity's legal rights to recover any</p>	<p>When an arrangement does not meet (and continues not to meet) the criteria to be a contract under the five-step model in ASC 606, the entity is required to recognise non-refundable consideration received as revenue only when one of the following three events has occurred:</p> <ul style="list-style-type: none"> ▪ The entity has fully performed and substantially all of the consideration has been received. ▪ The contract has been terminated. ▪ The entity has transferred control of the goods or services and has stopped transferring (and has no obligation under the contract to transfer) additional goods or services to the customer, if applicable. <p>Until one of these events happens, any consideration received from the customer is initially accounted for as a liability (not revenue), and the liability is measured at the amount of consideration received from the customer.</p>

	amounts due. Therefore, the IASB concluded that the requirements in IFRS 15 would allow an entity to conclude that a contract is terminated when it stops providing goods or services to the customer. <i>[IFRS 15.BC46H]</i> .	
Promises that are immaterial in the context of the contract (section 4.1.1)	IFRS 15 does not include explicit language to indicate that an entity can disregard promised goods or services that are immaterial in the context of the contract. However, the IASB noted that it did not intend for entities to identify every possible promised good or services in a contract and that entities need to consider materiality and the overall objective of IFRS 15 when assessing promised goods or services and identifying performance obligations. <i>[IFRS 15.BC116D]</i> .	ASC 606 permits entities to disregard items that are immaterial at the contract level and does not require that the items be aggregated and assessed for materiality at the entity level. However, ASC 606 also emphasises that entities still need to evaluate whether customer options for additional goods or services are material rights to be accounted for in accordance with the related requirements.
Shipping and handling activities (section 4.1.1)	The IASB has not permitted a policy choice in IFRS 15 similar to that in US GAAP. The IASB noted that IFRS 15.22 requires an entity to assess the goods or services promised in a contract with a customer in order to identify performance obligations. Such a policy choice would override that requirement. Furthermore, a policy choice is applicable to all entities and it is possible that entities with significant shipping operations might make different policy choices. Therefore, it could also reduce comparability between entities, including those within the same industry. <i>[IFRS 15.BC116U]</i> .	ASC 606 allows entities to elect to account for shipping and handling activities performed after the control of a good has been transferred to the customer as fulfilment activities, and not as a promised service to the customer. If revenue is recognized for the good prior to the shipping and handling activities occurring, then those related costs are accrued.
Estimation of gross transaction price by a principal (section 4.4.4)	The IASB did not specifically consider how the transaction price requirements would be applied when an entity that is a principal does not know, and expects not to know, the price charged to its customer by an agent. However, the IASB noted that an entity that is a principal would generally be able to apply judgement and determine the consideration to which it is entitled using all information available to it. <i>[IFRS 15.BC385Z]</i> .	An entity that is a principal cannot estimate its gross transaction price when it does not know (or expects not to know) the price charged to its customer for its goods and services by an intermediary.
Presentation of sales (and other similar) taxes (section 5.1)	The IASB decided not to include an accounting policy election in IFRS 15 similar to that in US GAAP. The IASB noted that the requirements of IFRS 15 are consistent with legacy requirements in IFRS accounting standards. <i>[IFRS 15.BC188D]</i> .	An entity can make an accounting policy election to present revenue net of certain types of taxes (including sales, use, value-added and some excise taxes) with a requirement for preparers to disclose the policy. As a result, entities that make this election do not need to evaluate taxes that they collect (e.g., sales, use, value-added, some excise taxes) in all jurisdictions in

		which they operate in order to determine whether a tax is levied on the entity or the customer.
Confidence threshold for the constraint on variable consideration (section 5.2.3)	IFRS 15 uses the term 'highly probable', which is defined as "significantly more likely than probable". However, the meaning of 'probable' under US GAAP is intended to be the same as 'highly probable' under IFRS accounting standards. [IFRS 15.BC211].	ASC 606 uses the term 'probable' as the confidence threshold for applying the constraint, which is defined as "the future event or events are likely to occur" in the master glossary of the US Accounting Standards Codification.
Non-cash consideration - measurement date (section 5.6.1)	IFRS 15 does not specify the measurement date for non-cash consideration. The IASB observed that this issue has important interactions with other IFRS accounting standards (including IFRS 2 and IAS 21) and there was a concern about the risk of unintended consequences. Therefore, the Board decided that, if needed, these issues would be considered more comprehensively in a separate project. [IFRS 15.BC254C]. Furthermore, the use of a measurement date other than contract inception would not be precluded under IFRS 15. [IFRS 15.BC254E].	An entity is required to measure the estimated fair value of non-cash consideration at contract inception.
Non-cash consideration - types of variability (section 5.6.1)	IFRS 15 does not address how the constraint is applied when the non-cash consideration is variable due to both its form and other reasons. The IASB noted that, in practice, it might be difficult to distinguish between variability in the fair value due to the form of the consideration and other reasons, in which case applying the variable consideration constraint to the whole estimate of the non-cash consideration might be more practical. [IFRS 15.BC252]. However, for reasons similar to those on the measurement date for non-cash consideration, the IASB decided not to have a similar requirement to that of the FASB's standard. [IFRS 15.BC254H].	When the variability of non-cash consideration is due to both the form (e.g., changes in share price) of the consideration and for other reasons (e.g., a change in the exercise price of a share option because of the entity's performance), the constraint on variable consideration applies only to the variability for reasons other than its form.
Licences of intellectual property - contractual restrictions (section 8.1.3)	IFRS 15 includes language on contractual restrictions that differs from the language in US GAAP. It does state, similar to US GAAP, that restrictions of time, geography or use do not affect the licensor's determination of whether the promise to transfer a licence is satisfied over time or at a point in time. However, IFRS 15 is less specific than US GAAP about whether particular types of contractual restrictions would affect	ASC 606 requires that entities distinguish between contractual provisions that define the attributes of a single promised licence (e.g., restrictions of time, geography or use) and contractual provisions that require them to transfer additional goods or services to customers (e.g., additional rights to use or access intellectual property). Contractual provisions that are attributes of a promised licence define the scope of a customer's rights to intellectual property and do not affect whether a performance obligation is satisfied at a

	<p>the identification of promised goods or services in the contract. The IASB decided not to clarify the requirements for identifying performance obligations in a contract containing one or more licences since it had clarified the general requirements for identifying performance obligations. <i>[IFRS 15.BC414P]</i>.</p> <p>The IASB noted that, consistent with ASC 606, an entity needs to apply the requirements in Step 2 of the general model on identifying performance obligations when distinguishing between contractual provisions that create promises to transfer additional rights from those that are merely attributes of a licence that establish when, where and how the right might be used. <i>[IFRS 15.BC414P]</i>. Under both IFRS 15 and ASC 606, an entity might need to apply significant judgement to distinguish between a single promised licence with multiple attributes and a licence that contains multiple promises to the customer that might be separate performance obligations.</p>	<p>point in time or over time. Nor do they affect the number of performance obligations in the contract.</p>
<p>Licences of intellectual property - determining the nature of an entity's promise (section 8.2)</p>	<p>IFRS 15 does not require an entity to classify licences as either functional or symbolic. IFRS 15 requires three criteria to be met to recognise the revenue related to the licence over time. If the licence does not meet those criteria, the related revenue is recorded at a point in time.</p> <p>The IASB and FASB agreed that their approaches will generally result in consistent answers, but they acknowledged that different outcomes might arise due to the different approaches when entities license brand names that no longer have any related ongoing activities (e.g., the licence to the brand name of a defunct sports team, such as the Brooklyn Dodgers). Under the FASB's approach, a licence of a brand name would be classified as symbolic intellectual property and revenue would be recognised over time, regardless of whether there are any related ongoing activities. Under the IASB's approach, revenue is recognised at a point in time if there are no ongoing activities that significantly affect the intellectual property. <i>[IFRS 15.BC414K, IFRS 15.BC414N]</i>.</p>	<p>ASC 606 requires entities to classify intellectual property in one of two categories to determine the nature of the entity's promise in granting a licence:</p> <p>(a) <i>Functional</i>: This intellectual property has significant stand-alone functionality (e.g., many types of software, completed media content such as films, television shows and music). Revenue for these licences is generally recognised at the point in time when the intellectual property is made available for the customer's use and benefit if the functionality is not expected to change substantively as a result of the licensor's ongoing activities that do not transfer another good or service to the customer.</p> <p>(b) <i>Symbolic</i>: This intellectual property does not have significant stand-alone functionality (e.g., brands, team and trade names, character images). The utility of symbolic intellectual property is derived from the licensor's ongoing or past activities (e.g., activities that support the value of character images licensed from an animated film) that does not transfer a promised good or service to a customer. Revenue from these licences is recognised over time as the performance obligation is satisfied (e.g., over the licence period).</p>

<p>Licences of intellectual property - applying the guidance to bundled performance obligations (section 8.2.1)</p>	<p>IFRS 15 does not state that an entity needs to consider the licences guidance to help determine the nature of its promise to the customer when a licence is bundled with other goods or services. However, the IASB clarified that an entity need to consider the nature of its promise in granting the licence if the licence is the primary or dominant component (i.e., the predominant item) of a single performance obligation.</p>	<p>ASC 606 states that an entity considers the nature of its promise in granting a licence when applying the general revenue recognition model to a single performance obligation that includes a licence and other goods or services (i.e., when applying the general requirements, consistent with those in IFRS 15.31-45, to assess whether the performance obligations are satisfied at a point in time or over time).</p> <p>Consequently, when the licence is not the predominant item in a single performance obligation, this might result in a US GAAP preparer considering the nature of its promise in granting a licence in a greater number of circumstances than a preparer applying IFRS accounting standards. [IFRS 15.BC414Y].</p>
<p>Licences of intellectual property - renewals (section 8.4)</p>	<p>IFRS 15 does not include similar requirements to US GAAP for renewals. When an entity and a customer enter into a contract to renew (or extend the period of) an existing licence, the entity needs to evaluate whether the renewal or extension would be treated as a new contract or as a modification of the existing contract. Entities that report under IFRS accounting standards might recognise revenue for contract renewals or extensions earlier than entities that report under US GAAP. [IFRS 15.BC414U].</p>	<p>Under ASC 606, revenue related to the renewal of a licence of intellectual property might not be recognised earlier than the beginning of the renewal period. This is the case even if the entity provides a copy of the intellectual property in advance or the customer has a copy of the intellectual property from another transaction. The FASB also provided an additional example to illustrate this point.</p>
<p>Onerous contracts (section 9.2)</p>	<p>IAS 37 applies to onerous revenue contracts.</p> <p>Since the definition of an onerous contract in IAS 37 only refers to a contract, the unit of account to determine whether an onerous contract exists is the contract itself, rather the performance obligations determined in accordance with IFRS 15.</p> <p>As the FASB's requirements on onerous contracts are not the same as those in IAS 37, the accounting treatment in this area is not converged.</p>	<p>While requirements exist for some industries or for certain types of transactions, there is no general authoritative standard in US GAAP for when to recognise losses on onerous contracts and, if a loss is to be recognised, how to measure the loss. Accordingly, there is diversity in practice when such contracts are not within the scope of specific authoritative standards. ASC 605-35, <i>Revenue Recognition - Provision for Losses on Construction-Type and Production-Type Contracts</i>, applies to situations in which an entity is expected to incur a loss on a contract within its scope and specifies that the assessment in ASC 605-35 is performed at either the contract level or at the performance obligation level as an accounting policy election.</p>
<p>Reversal of impairment losses (section 9.3.4)</p>	<p>IFRS 15 permits the reversal of some or all of previous impairment losses when impairment conditions no longer exist or have improved. However, the increased carrying value of the asset must not exceed the amount that would have been determined (net of amortisation) if</p>	<p>The reversal of previous impairment losses is prohibited.</p>

	no impairment had been recognised previously.	
Disclosure requirements for public and non-public entities (section 10)	IFRS 15 does not differentiate between public and non-public entities. Therefore, an entity that applies IFRS 15 must apply all of its requirements.	<p>ASC 606 provides requirements on presentation and disclosure that apply to both public and non-public entities and provide some relief on disclosure requirements for non-public entities. The FASB's standard defines a public entity as one of the following:</p> <ul style="list-style-type: none"> (i) A public business entity, as defined (ii) A not-for-profit entity that has issued, or is a conduit bond obligor for, securities that are traded, listed or quoted on an exchange or an over-the-counter market (iii) An employee benefit plan that files or furnishes financial statements with the SEC <p>An entity that does not meet any of the criteria above is considered a non-public entity for purposes of the FASB's standard.</p>
Disclosure of the transaction price related to remaining performance obligations (section 10.5.1.C)	IFRS 15 does have some optional exemptions to this disclosure requirement that are consistent with ASC 606 (discussed in section 10.5.1.C), but they do not include the two optional exemptions (or the related disclosures) discussed in the US GAAP column.	<p>ASC 606 contains optional exemptions that are consistent with the optional practical expedients included in IFRS 15.121. However, ASC 606 includes additional optional exemptions (that IFRS 15 does not) to allow entities not to make quantitative disclosures about remaining performance obligations when variable consideration in the contract is:</p> <ul style="list-style-type: none"> ▪ Due to a sales-based or usage-based royalty promised in exchange for a licence of intellectual property ▪ Allocated entirely to a wholly unsatisfied performance obligation or a wholly unsatisfied promise to transfer a distinct good or service that forms part of a series <p>An entity that elects to use any of the optional exemptions to this disclosure requirement must disclose, among other things, the nature of the performance obligations, the remaining duration of the contract and a description of the variable consideration (e.g., the nature of the variability, how that variability will be resolved) that has been excluded from the information disclosed.</p>
Interim disclosures (section 10.6)	The IASB requires only disaggregated revenue information to be disclosed for interim financial statements.	The FASB requires the quantitative disclosures about revenue required for annual financial statements to also be disclosed in interim financial statements.

Chapter 29

Income taxes

Contents

Overview	2415
1 Introduction	2416
1.1 The nature of taxation	2416
1.2 Allocation between periods	2416
1.2.1 Deferred tax not recognised ('flow through')	2417
1.2.2 Accounting for deferred tax (the temporary difference approach)	2417
1.3 The development of IAS 12	2418
2 Objective of IAS 12	2420
3 Definitions	2421
4 Scope	2422
4.1 What is an 'income tax'?	2422
4.1.1 Levies	2423
4.1.2 Hybrid taxes (including minimum taxes)	2423
4.2 Withholding and similar taxes	2424
4.2.1 Withholding taxes on distributions	2424
4.2.2 Withholding taxes on royalty payments	2425
4.3 Investment tax credits	2425
4.4 Interest and penalties	2427
4.5 Hybrid taxes (including minimum taxes)	2429
4.5.1 Hybrid taxes - minimum based on a measure other than taxable profits	2429
4.5.2 Tax is the higher of measures based on taxable profits and revenues	2430
4.5.3 Tax is based on revenues, unless a profit measure gives a lower result	2431
4.6 Global Anti-Base Erosion Rules	2432
4.6.1 The GloBE Rules	2433
4.6.1.A Five step process to apply the GloBE Rules	2434
4.6.2 International Tax Reform-Pillar Two Model Rules - Amendments to IAS 12	2435
4.6.2.A Mandatory temporary exception from recognition and disclosure of deferred taxes	2435
4.6.2.B Pillar Two taxes and the scope of IAS 12	2435
4.6.2.C Disclosure of application of the exception	2436
4.6.2.D Disclosure of current tax	2436
4.6.2.E Disclosure in periods after (substantive) enactment but before the legislation is effective	2436
4.6.2.F Transition and effective date	2437

4.6.3	Deferred tax liability recapture	2437
4.6.4	Accounting for Pillar Two income taxes in separate financial statements	2438
4.6.5	Other accounting considerations related to Pillar Two income taxes	2438
4.6.5.A	Accounting for Pillar Two income taxes before IAS 12 amendments are endorsed	2438
4.6.5.B	Substantive enactment	2439
4.7	Effectively tax-free entities	2439
5	Current tax	2440
5.1	Enacted or substantively enacted tax legislation	2440
5.1.1	Meaning of substantive enactment in various jurisdictions	2441
5.1.2	Changes to tax rates and laws enacted before the reporting date	2441
5.1.3	Changes to tax rates and laws enacted after the reporting date	2442
5.2	Uncertain tax treatments	2442
5.3	'Prior year adjustments' of previously presented tax balances and expense (income)	2442
5.4	Discounting of current tax assets and liabilities	2443
5.5	Intra-period allocation, presentation and disclosure	2443
6	Deferred tax - Tax bases and temporary differences	2444
6.1	Tax base	2445
6.1.1	Tax base of assets	2445
6.1.2	Tax base of liabilities	2445
6.1.3	Assets and liabilities whose tax base is not immediately apparent	2446
6.1.4	Tax base of items not recognised as assets or liabilities in financial statements	2446
6.1.5	Equity items with a tax base	2447
6.1.6	Items with more than one tax base	2447
6.1.7	Tax bases disclaimed or with no economic value	2447
6.2	Examples of temporary differences	2448
6.2.1	Taxable temporary differences	2448
6.2.1.A	Transactions that affect profit or loss	2448
6.2.1.B	Transactions that affect the statement of financial position	2449
6.2.1.C	Revaluations	2450
6.2.1.D	Tax re-basing	2450
6.2.1.E	Business combinations and consolidation	2450
6.2.1.F	Foreign currency differences	2450
6.2.1.G	Hyperinflation	2451
6.2.2	Deductible temporary differences	2451
6.2.2.A	Transactions that affect profit or loss	2451
6.2.2.B	Transactions that affect the statement of financial position	2452
6.2.2.C	Revaluations	2452
6.2.2.D	Tax re-basing	2452
6.2.2.E	Business combinations and consolidation	2452
6.2.2.F	Foreign currency differences	2453
6.2.3	Assets and liabilities with no temporary difference (because tax base equals carrying amount)	2453

7	Deferred tax - Recognition	2454
7.1	The basic principles	2454
7.1.1	Taxable temporary differences (deferred tax liabilities)	2454
7.1.2	Deductible temporary differences (deferred tax assets)	2454
7.1.3	Interpretation issue - taxable profit 'at the time of the transaction'	2455
7.2	The initial recognition exception	2455
7.2.1	Acquisition of tax losses	2456
7.2.2	Initial recognition of goodwill	2456
7.2.2.A	Taxable temporary differences	2456
7.2.2.B	Deductible temporary differences	2457
7.2.2.C	Tax deductible goodwill	2458
7.2.3	Initial recognition of other assets or liabilities	2458
7.2.4	Changes to temporary differences after initial recognition	2459
7.2.4.A	Depreciation, amortisation or impairment of initial carrying value	2460
7.2.4.B	Change in carrying value due to revaluation	2460
7.2.4.C	Change in tax base due to deductions in tax return	2462
7.2.4.D	Temporary difference altered by legislative change	2462
7.2.5	Intragroup transfers of assets with no change in tax base	2464
7.2.6	Partially deductible and super-deductible assets	2464
7.2.7	Initial recognition of compound financial instruments by the issuer	2467
7.2.8	Acquisition of subsidiary that does not constitute a business	2468
7.2.9	Acquisition of an investment in a subsidiary, associate, branch or joint arrangement	2470
7.3	Transactions involving the initial recognition of an asset and liability	2470
7.3.1	Deferred Tax related to Assets and Liabilities arising from a Single Transaction - Amendments to IAS 12	2470
7.3.1.A	Determining the tax base of assets and liabilities	2473
7.3.1.B	Changes to the initial recognition exception	2473
7.3.1.C	When the deferred tax asset and deferred tax liability are not equal	2476
7.3.1.D	Advance lease payments and initial direct costs	2476
7.4	Assets carried at fair value or revalued amount	2478

Overview

This chapter discusses the requirements of IAS 12 *Income Taxes*. IAS 12 applies to taxes that are “based on taxable profits”. [IAS 12.2].

The standard, and this chapter, does not address the accounting for other taxes and levies such as sales taxes, payroll taxes, duties and other taxes related to specific items of revenue or expenditure. These non-income taxes often fall within the scope of IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* and in particular IFRIC 21 *Levies* (see Chapter 27) and in some cases by reference to the accounting standard most closely related to the item subject to the non-income tax, such as IFRS 15 *Revenue from Contracts with Customers* in the case of sales taxes (see Chapter 28) and IAS 19 *Employee Benefits* in the case of payroll taxes (see Chapter 31).

The requirements of IFRS accounting standards for accounting for income taxes in interim financial statements are discussed in Chapter 37.

What you need to know

The overall requirements of IAS 12 can be summarised as follows:

- Determine whether a tax is an ‘income tax’ (see section 4 below).
- Recognise income tax due or receivable in respect of the current and prior periods (current tax), measured using enacted or substantively enacted legislation (see section 5 below), and having regard to any uncertain tax treatments (see section 9 below).
- Determine whether there are temporary differences between the carrying amount of assets and liabilities and their tax bases (see section 6 below), having regard to the expected manner of recovery of assets or settlement of liabilities (see section 8 below).
- Determine whether there are unused tax losses or investment tax credits (see section 7 below).
- Determine whether IAS 12 prohibits or restricts recognition of deferred tax on any deductible temporary differences or unused tax losses or investment tax credits (see section 7 below).
- Recognise deferred tax on all temporary differences, unused tax losses or investment tax credits not subject to such a prohibition or restriction (see section 7 below), measured using enacted or substantively enacted legislation (see section 8 below), and having regard to:
 - The expected manner of recovery of assets and settlement of liabilities (see section 8 below).
And
 - Any uncertain tax treatments (see section 9 below).
- Allocate any income tax charge or credit for the period to profit or loss, other comprehensive income or equity as appropriate (see section 10 below).
- Present income tax in the financial statements as required by IAS 12 (see section 13 below).
- Disclose information required by IAS 12 (see section 14 below).

1 Introduction

1.1 The nature of taxation

Taxation has certain characteristics which set it apart from other business expenses and which might justify a different treatment, in particular, tax payments are not:

- Typically made in exchange for goods or services specific to the business (as opposed to access to generally available national infrastructure assets and services).
- An optional expense for the business.

1.2 Allocation between periods

The most significant accounting question which arises in relation to taxation is how to allocate tax expense between accounting periods. The recognition of transactions in the financial statements in a particular period is governed by the application of IFRS accounting standards. However, the timing of the recognition of transactions for the purposes of measuring taxable profit is governed by the application of tax law, which sometimes prescribes a treatment different from that used in the financial statements. The generally accepted view is that it is necessary for the financial statements to seek some reconciliation between these different treatments.

Accordingly, IAS 12 requires an entity to recognise, at each reporting date, the tax consequences expected to arise in future periods in respect of the recovery of its assets and settlement of its liabilities recognised at that date. Broadly speaking, those tax consequences that are legal assets or liabilities at the reporting date are referred to as current tax. The other consequences, which are expected to become, or form part of, legal assets or liabilities in a future period, are referred to as deferred tax.

This is explained in Illustration 1-1 below, which considers the treatment of tax deductions received against the cost of property, plant and equipment (PP&E), and in the further discussion in sections 1.2.1 and 1.2.2 below.

Illustration 1-1: PP&E attracting tax deductions in advance of accounting depreciation

An item of equipment is purchased on 1 January 20X3 for CU50,000 and is estimated to have a useful life of five years, at the end of which it will be scrapped. The estimated residual amount is zero and this estimate does not change over the life of the equipment. The depreciation charge will therefore be CU10,000 per year for five years.

The entity is tax-resident in a jurisdiction where the corporate tax rate is 30%. No tax deductions are given for depreciation charged in the financial statements. Instead, the cost of the asset may be deducted from taxes payable in the year that the asset is purchased. The entity's profit before tax, after deducting the depreciation charge, for each of the five years ended 31 December 20X3 to 31 December 20X7 is CU100,000. All components of pre-tax profit, other than the accounting depreciation, are taxable or tax-deductible.

The entity's tax computations for each year would show the following (all figures in currency units):

	20X3	20X4	20X5	20X6	20X7
Accounting profit	100,000	100,000	100,000	100,000	100,000
Accounting depreciation	10,000	10,000	10,000	10,000	10,000
Tax depreciation	(50,000)	-	-	-	-
Taxable profit	60,000	110,000	110,000	110,000	110,000
Tax payable @ 30%	18,000	33,000	33,000	33,000	33,000

1.2.1 Deferred tax not recognised ('flow through')

If the entity in Illustration 1-1 above were to account only for the tax legally due in respect of each year ('current tax'), it would report the amounts in the table below in profit or loss. Accounting for current tax only is generally known as the 'flow through' method.

CUs	20X3	20X4	20X5	20X6	20X7	Total
Profit before tax	100,000	100,000	100,000	100,000	100,000	500,000
Current tax	18,000	33,000	33,000	33,000	33,000	150,000
Profit after tax	82,000	67,000	67,000	67,000	67,000	350,000
Effective tax rate (%)	18	33	33	33	33	30

The 'effective tax rate' in the last row of the table above is the ratio, expressed as a percentage, of the tax expense to the profit before tax in the financial statements. As can be seen from the table above, over the full five-year life of the asset, the entity pays tax at the statutory rate of 30% on its total profits of CU500,000, but with considerable variation in the effective rate in individual accounting periods.

The generally held view is that simply to account for the tax legally payable as above is distortive, and that the tax must therefore be allocated between periods. Under IAS 12 this allocation is achieved by means of deferred taxation (see section 1.2.2 below).

However, the flow-through method attracts the support of a number of commentators. They argue that the tax authorities impose a single annual tax assessment on the entity based on its profits as determined for tax purposes, not on accounting profits. That assessment is the entity's only liability to tax for that period, and any tax to be assessed in future years is not a present obligation and therefore not a liability as defined in the IASB's *Conceptual Framework for Financial Reporting*. Supporters of flow-through acknowledge the distortive effect of transactions such as that in Illustration 1-1 above, but argue that this is better remedied by disclosure than by creating what they see as an 'imaginary' liability for deferred tax.

1.2.2 Accounting for deferred tax (the temporary difference approach)

The approach required by IAS 12 is known as the temporary difference approach, which focuses on the difference between the carrying amount of an asset or liability in the financial statements and the amount attributed to it for tax purposes, known as its 'tax base' (see section 6.1 below).

In Illustration 1-1 above, the carrying value of the PP&E in the financial statements at the end of each reporting period is:

CUs	20X3	20X4	20X5	20X6	20X7
PP&E	40,000	30,000	20,000	10,000	-

If the tax authority were to prepare financial statements based on tax law rather than IFRS accounting standards, it would record PP&E of nil at the end of each period, since the full cost of CU50,000 was written off in 20X3 for tax purposes. There is therefore a difference, at the end of 20X3, of CU40,000 between the carrying amount of CU40,000 of the asset in the financial statements and its tax base of nil. This difference is referred to as a 'temporary' difference because, by the end of 20X7, the carrying value of the PP&E in the financial statements and its tax base are both nil, so that there is no longer a difference between them.

As discussed in more detail later in this Chapter, IAS 12 requires an entity to recognise a liability for deferred tax on the temporary difference arising on the asset (at 30%), as follows:

CUs	20X3	20X4	20X5	20X6	20X7
Net book value	40,000	30,000	20,000	10,000	-
Tax base	-	-	-	-	-
Temporary difference	40,000	30,000	20,000	10,000	-
Deferred tax @ 30%	12,000	9,000	6,000	3,000	-
Movement in deferred tax in period	12,000	(3,000)	(3,000)	(3,000)	(3,000)

IAS 12 argues that, taking the position as at 31 December 20X3 as an example, the carrying amount of the PP&E of CU40,000 implicitly assumes that the asset will ultimately be recovered or realised by a cash inflow of at least CU40,000. Any tax that will be paid on that inflow represents a present liability. In this case, the entity pays tax at 30% and will be unable to make any deduction in respect of the asset for tax purposes in a future period. It will therefore pay tax of CU12,000 (30% of (CU40,000 - nil)) as the asset is realised. This tax is as much a liability as the PP&E is an asset, since it would be inconsistent for the financial statements simultaneously to represent that the asset will be recovered at CU40,000 while ignoring the tax consequences of doing so. [IAS 12.16].

The deferred tax liability is recognised in the statement of financial position and any movement in the deferred tax liability during the period is recognised as deferred tax income or expense in profit or loss, with the following impact:

CU\$	20X3	20X4	20X5	20X6	20X7	Total
Profit before tax	100,000	100,000	100,000	100,000	100,000	500,000
Current tax	18,000	33,000	33,000	33,000	33,000	150,000
Deferred tax	12,000	(3,000)	(3,000)	(3,000)	(3,000)	-
Total tax	30,000	30,000	30,000	30,000	30,000	150,000
Profit after tax	70,000	70,000	70,000	70,000	70,000	350,000
Effective tax rate (%)	30	30	30	30	30	30

It can be seen that in this example the effect of accounting for deferred tax is to present an effective tax rate of 30% in profit or loss for each period. This might not be the result in all cases where IAS 12 is applied, but it is the outcome in this example because the asset is fully deductible for tax purposes and is fully depreciated over its useful life for accounting purposes. The only difference between the tax treatment and the accounting treatment is the timing of the deduction being recognised.

In fact, earlier methods of accounting for income tax, which explicitly focused on tax income and expense ('income statement/timing difference approaches') rather than tax assets and liabilities ('balance sheet/temporary difference approaches'), remain common in national GAAPs and a focus on understanding and managing an entity's effective tax rate is still an objective of many preparers and users.

1.3 The development of IAS 12

The current version of IAS 12 was published in October 1996 and has been amended by a number of subsequent pronouncements.

In July 2000, the SIC issued an interpretation of IAS 12, SIC-25 *Income Taxes - Changes in the Tax Status of an Entity or its Shareholders* (see section 10.9 below).

In March 2009, the IASB issued an exposure draft (ED/2009/2 *Income Tax*) of a standard to replace IAS 12. This was poorly received by stakeholders and the project was halted. Nevertheless, the IASB continues to consider possible limited changes to IAS 12 with the aim of improving it or clarifying its existing requirements.

In December 2010, the IASB issued an amendment to IAS 12 *Deferred Tax: Recovery of Underlying Assets*. The amendment addressed the measurement of deferred tax associated with non-depreciable revalued property, plant and equipment and investment properties accounted for at fair value (see sections 8.4.6 and 8.4.7 below). *Recognition of Deferred Tax Assets for Unrealised Losses (Amendments to IAS 12)* was issued in January 2016 in relation to the recognition of deferred tax assets for unrealised losses, for example on debt securities measured at fair value and related clarifications to the guidance on determining future taxable profits (see section 7.5.5 below).

In June 2017, the IFRS IC issued IFRIC 23 *Uncertainty over Income Tax Treatments*, on the recognition and measurement of uncertain tax treatments. *Annual Improvements to IFRS Standards 2015-2017 Cycle*, issued in December 2017, clarified that the income tax consequences of distributions relating to equity instruments must always be allocated to profit or loss, other comprehensive income or equity according to where the entity originally recognised the past transactions or events that generated distributable profits, and not only in situations where differential tax rates apply to distributed or undistributed earnings. This required adjustment by those entities that previously allocated the related income tax to equity on the basis that it was linked more directly to the distribution to owners. The treatment of uncertain tax positions is discussed in section 9 below, with the allocation of tax on equity distributions set out in section 10.3.5 below.

In May 2021, the IASB issued *Deferred Tax related to Assets and Liabilities arising from a Single Transaction (Amendments to IAS 12)*, to reduce diversity in the way that entities account for deferred tax on transactions and events, such as leases and decommissioning obligations, that lead to the initial recognition of both an asset and a liability. These amendments are discussed in section 7.3.1 below.

In May 2023, the IASB issued *International Tax Reform-Pillar Two Model Rules - Amendments to IAS 12*, to address concerns from stakeholders regarding the implications for income tax accounting resulting from the jurisdictional implementation of the Pillar Two model rules published by the Organisation for Economic Co-operation and Development/G20 Inclusive Framework on Base Erosion and Profit Shifting. The Amendments introduce a mandatory exception to recognising and disclosing information about deferred tax assets and liabilities related to Pillar Two income taxes, that is applicable with immediate effect. In addition, the Amendments introduce certain disclosure requirements for affected entities to help users of the financial statements better understand an entity's exposure to Pillar Two income taxes arising from that legislation, particularly in the period between legislation being (substantive) enacted and the date from which the tax first applies to the entity. These amendments are discussed in section 4.6.2 below.

2 Objective of IAS 12

Extract from IAS 12

Objective

The objective of this Standard is to prescribe the accounting treatment for income taxes. The principal issue in accounting for income taxes is how to account for the current and future tax consequences of:

- (a) the future recovery (settlement) of the carrying amount of assets (liabilities) that are recognised in an entity's statement of financial position; and
- (b) transactions and other events of the current period that are recognised in an entity's financial statements.

...

IAS 12 asserts that it is inherent in the recognition of an asset or liability that the reporting entity expects to recover or settle the carrying amount of that asset or liability. The standard requires an entity to consider whether it is probable that recovery or settlement of that carrying amount will make future tax payments larger (or smaller) than they would be if such recovery or settlement had no tax consequences. *[IAS 12 Objective]*. If it is probable that such a larger or smaller tax payment will arise, IAS 12 requires an entity, with certain limited exceptions, to recognise a deferred tax liability or deferred tax asset. *[IAS 12.10, IAS 12.16, IAS 12.25]*. This is often referred to as the 'temporary difference approach' and is discussed further in sections 3 to 9 and section 11 below.

IAS 12 also requires an entity to account for the tax consequences of transactions and other events in a manner consistent with the accounting treatment of the transactions and other events themselves. *[IAS 12 Objective]*. In other words:

- Tax effects of transactions and other events recognised in profit or loss are also recognised in profit or loss.
- Tax effects of transactions and other events recognised in other comprehensive income are also recognised in other comprehensive income.
- Tax effects of transactions and other events recognised directly in equity are also recognised directly in equity.
- Deferred tax assets and liabilities recognised in a business combination affect:
 - The amount of goodwill arising in that business combination.
 - Or
 - The amount of the bargain purchase gain recognised.

This is discussed in more detail in sections 10 and 12 below.

The standard also deals with:

- The recognition of deferred tax assets arising from unused tax losses or unused tax credits (see section 7.5.6 below).
- The presentation of income taxes in financial statements (see section 13 below).
- The disclosure of information relating to income taxes (see section 14 below).

IAS 12 requires an entity to account for the tax consequences of recovering assets or settling liabilities at their carrying amount in the statement of financial position, not for the total tax expected to be paid (which will reflect the amount at which the asset or liability is actually settled, not its carrying amount at the reporting date).

IAS 12 may require an entity to recognise tax even on an accounting transaction that is not itself directly taxable, where the transaction gives rise to an asset (or liability) whose recovery (or settlement) will have tax consequences. For example, an entity might revalue a property. If (as is the case in many tax jurisdictions) no tax is payable on the revaluation, one might conclude that it has no tax effect. However, this is not the correct analysis under IAS 12, which focuses not on whether the revaluation itself is directly taxed, but rather on whether the profits out of which the increased carrying value of the property will be recovered will be subsequently taxed. This is discussed further in section 8.4 below.

3 Definitions

Income taxes include all domestic and foreign taxes which are based on taxable profits. Income taxes also include taxes, such as withholding taxes, which are payable by a subsidiary, associate or joint arrangement on distributions to the reporting entity. [IAS 12.2].

IAS 12 uses the following terms with the meanings specified below. [IAS 12.5].

Extract from IAS 12

- 5 The following terms are used in this Standard with the meanings specified:
- Accounting profit* is profit or loss for a period before deducting tax expense.
- Taxable profit (tax loss)* is the profit (loss) for a period, determined in accordance with the rules established by the taxation authorities, upon which income taxes are payable (recoverable).
- Tax expense (tax income)* is the aggregate amount included in the determination of profit or loss for the period in respect of current tax and deferred tax.
- Current tax* is the amount of income taxes payable (recoverable) in respect of the taxable profit (tax loss) for a period.
- Deferred tax liabilities* are the amounts of income taxes payable in future periods in respect of taxable temporary differences.
- Deferred tax assets* are the amounts of income taxes recoverable in future periods in respect of:
- (a) deductible temporary differences;
 - (b) the carryforward of unused tax losses; and
 - (c) the carryforward of unused tax credits.
- Temporary differences* are differences between the carrying amount of an asset or liability in the statement of financial position and its tax base.
- Temporary differences may be either:
- (a) *taxable temporary differences*, which are temporary differences that will result in taxable amounts in determining taxable profit (tax loss) of future periods when the carrying amount of the asset or liability is recovered or settled; or
 - (b) *deductible temporary differences*, which are temporary differences that will result in amounts that are deductible in determining taxable profit (tax loss) of future periods when the carrying amount of the asset or liability is recovered or settled.
- The *tax base* of an asset or liability is the amount attributed to that asset or liability for tax purposes.

IFRIC 23 uses the following terms in addition to those defined in IAS 12: [IFRIC 23.3]

Extract from IFRIC 23

- 3 In this Interpretation:
- (a) 'tax treatments' refers to the treatments used by an entity or that it plans to use in its income tax filings.
 - (b) 'taxation authority' refers to the body or bodies that decide whether tax treatments are acceptable under tax law. This might include a court.
 - (c) an 'uncertain tax treatment' is a tax treatment for which there is uncertainty over whether the relevant taxation authority will accept the tax treatment under tax law. For example, an entity's decision not to submit any income tax filing in a tax jurisdiction, or not to include particular income in taxable profit, is an uncertain tax treatment if its acceptability is uncertain under tax law.

4 Scope

IAS 12 must be applied in accounting for income taxes. That includes:

- All domestic and foreign taxes which are based on taxable profits
- Taxes, such as withholding taxes, which are payable by a subsidiary, associate or joint arrangement on distributions to the reporting entity [IAS 12.1, IAS 12.2]

IAS 12 does not apply to accounting for government grants, which fall within the scope of IAS 20 *Accounting for Government Grants and Disclosure of Government Assistance*, or investment tax credits. However, it does deal with the accounting for any temporary differences that may arise from grants or investment tax credits. [IAS 12.4].

A tax classified as an income tax is accounted for under IAS 12. Taxes other than income taxes are often accounted for under IAS 37 and, in particular, IFRIC 21 and in some cases by reference to the accounting standard most closely related to the item subject to such a non-income tax (such as IAS 19, in the case of payroll taxes, or IFRS 15 in the case of sales taxes). The classification of a tax as an income tax affects its accounting treatment in several key respects:

- *Deferred tax*
IAS 12 requires an entity to account for deferred tax in respect of income taxes. IAS 37 has no equivalent requirement for other taxes, recognising only legal or constructive obligations.
- *Recognition and measurement*
IAS 12 requires tax to be recognised and measured according to a relatively tightly-defined accounting model, based on legislation enacted or substantively enacted as at the end of the reporting period. IAS 37 requires a provision to be recognised only where it is more likely than not that an outflow of resources will occur as a result of a past obligating event and measured at the best estimate of the amount expected to be paid. In the case of uncertain tax treatments (discussed in section 9 below) an approach distinct from that in IAS 37 is required when IFRIC 23 is applied.
- *Presentation*
IAS 1 *Presentation of Financial Statements* requires income tax assets, liabilities, income and expense to be presented in separate headings in profit or loss and the statement of financial position. There is no requirement for separate presentation of other taxes, but neither can they be included within the captions for 'income taxes'.
- *Disclosure*
IAS 12 requires disclosures for income taxes significantly more detailed than those required by IAS 37 for other taxes.

4.1 What is an 'income tax'?

For the purposes of IAS 12, income tax includes all taxes based on 'taxable profits', which are in turn defined as profits 'upon which income taxes are payable'. [IAS 12.5]. Accordingly, it seems clear that those taxes that take as their starting point the reported net profit or loss of an entity are income taxes. However, several jurisdictions raise 'taxes' on sub-components of net profit. These include:

- Sales taxes
- Goods and services taxes
- Value added taxes
- Levies on the sale or extraction of minerals and other natural resources
- Taxes on certain goods as they reach a given state of production or are moved from one location to another
- Taxes on gross production margins

Taxes that are simply collected by the entity from a third party (such as a customer or employee) on behalf of a local or national government are generally not regarded as 'income taxes' for the purposes of IAS 12. This view is supported by the requirement of IFRS 15 that amounts which are collected from customers by the entity on behalf of third parties (for example, some sales taxes) do not form part of the entity's revenue, [IFRS 15.47], (and, by implication, are not an expense of the entity either).

In cases where such taxes are a liability of the entity, they may often have some characteristics both of production or sales taxes (in that they are payable at a particular stage in the production or extraction process and may well be allowed as an expense in arriving at the tax on net profits) and of income taxes (in that they may be determined after deduction of certain allowable expenditure). This makes the classification of such taxes (as income taxes or not) difficult.

Frequently asked questions

Question 4-1: Which taxes are in the scope of IAS 12?

In March 2006, the IFRS IC considered whether to give guidance on which taxes are within the scope of IAS 12. The IFRS IC noted that the definition of 'income tax' in IAS 12 (i.e., taxes that are based on taxable profit) implies that:

- Not all taxes are within the scope of IAS 12
- But
- Because taxable profit is not the same as accounting profit, taxes do not need to be based on a figure that is exactly accounting profit to be within the scope of IAS 12

The latter point is also implied by the requirement in IAS 12 to disclose an explanation of the relationship between tax expense and accounting profit - see section 14.2 below. [IAS 12.81(c)]. The IFRS IC further noted that the term 'taxable profit' implies a notion of a net rather than gross amount, and that any taxes that are not in the scope of IAS 12 are in the scope of IAS 37 (see Chapter 27).

The IFRS IC drew attention to the variety of taxes that exist across the world and the need for judgement in determining whether some taxes are income taxes. The IFRS IC therefore believed that guidance beyond the observations noted above could not be developed in a reasonable period of time and decided not to take a project on this issue onto its agenda.¹ This decision was confirmed in May 2009, when the IFRS IC concluded that taxes based on tonnage transported or tonnage capacity or on notional income derived from tonnage capacity, being based on a gross amount, are not based on 'taxable profit' and, consequently, would not be considered income taxes in accordance with IAS 12.²

The IFRS IC's deliberations reinforce the difficulty of formulating a single view as to the treatment of taxes. The appropriate treatment will need to be addressed on a case-by-case basis depending on the particular terms of the tax concerned and the entity's own circumstances.

How we see it

Where a tax is levied on multiple components of net income, we believe it is more likely that the tax must be viewed as substantially a tax on income and therefore subject to IAS 12.

Even where such taxes are not income taxes, if they are deductible against current or future income taxes, they may nevertheless give rise to tax assets which fall within the scope of IAS 12.

4.1.1 Levies

Several governments have introduced levies on certain types of entity, including those in the financial services sector. In many cases the levies are expressed as a percentage of a measure of revenue or net assets, or some component(s) of revenue or net assets, at a particular date. Such levies are not income taxes and must be accounted for in accordance with IAS 37 and IFRIC 21 (see Chapter 27).

4.1.2 Hybrid taxes (including minimum taxes)

Some jurisdictions impose income taxes which are charged as a percentage of taxable profits in the normal way, but are subject to a requirement that a minimum amount of tax must be paid. This minimum may be an absolute amount or a proportion of one or more components of the statement of financial position - for example, total equity as reported in the financial statements, or total share capital and additional paid-in capital (share premium). Another form of arrangement is where the amount of tax payable is the higher of one measure (based on profits) and another (for example based on: revenues; net assets; on total debt and equity).

¹ [IFRIC Update](#), March 2006, available on the IFRS Foundation's website.

² [IFRIC Update](#), May 2009, available on the IFRS Foundation's website.

Such 'hybrid taxes' raise the issue of how they must be accounted for; in particular whether they fall in the scope of IAS 12 or another standard. This issue is discussed in section 4.5 below.

In other circumstances a tax may be levied on a measure based primarily on revenue but incorporating deductions for certain items, some of which might be described as 'costs'. In such situations the entity would need to assess whether the amount assessed for the tax is a measure of profit (and, therefore, in scope of IAS 12), or whether the tax is applied to a measure of adjusted revenue and is therefore a levy not in scope of IAS 12, as discussed in section 4.1 above.

4.2 Withholding and similar taxes

4.2.1 Withholding taxes on distributions

As noted in section 4.1 above, IAS 12 also includes in its scope those taxes, such as withholding taxes, which are payable by a subsidiary, associate or joint arrangement on distributions to the reporting entity. [IAS 12.2]. This gives rise to further questions of interpretation.

The most basic issue is what is meant by a 'withholding tax'. This is discussed in sections 10.3.2 and 10.3.4 below.

A second issue is whether the scope of IAS 12 covers only taxes on distributions from a subsidiary, associate or joint arrangement, or whether it extends to tax on distributions from other entities in which the reporting entity has an investment. Such an investment is typically accounted for at fair value under IFRS 9 *Financial Instruments*.

The rationale for the treatment as income taxes of taxes payable by a subsidiary, associate or joint arrangement on distributions to the investor is discussed further in section 7.6 below. Essentially, the reason for considering withholding taxes within the scope of income tax accounting derives from the accounting treatment of the investments themselves. The accounting treatment for such investments - whether by full consolidation or the equity method - results in the investor recognising profit that may be taxed twice: once as it is earned by the investee entity concerned, and again as that entity distributes the profit as dividend to the investor. IAS 12 ensures that the financial statements reflect both tax consequences.

Some argue that this indicates a general principle that an entity must account for all the tax consequences of realising the income of an investee as that income is recognised. On this analysis withholding taxes suffered on any investment income must be treated as income taxes. Others argue that the reference in IAS 12 to distributions from 'a subsidiary, associate or joint arrangement' must be read restrictively, and that no wider general principle is implied. In addition, because the amount of the tax relates to a single component of the investor entity's income, it can be argued that (without the specific reference to a 'withholding tax') such amounts are not within the scope of IAS 12 because they are not 'based on taxable profits', [IAS 12.2], (see section 4.1 above).

How we see it

We believe that judgement is required to decide whether a tax deducted from investment income at the source of the income is a withholding tax in the scope of IAS 12. As well as the considerations noted above, the decision requires consideration of all the relevant facts and circumstances of the jurisdiction that levies the tax, especially the national tax legislation and the design of the investor entity.

If it is determined that the tax withheld from investment income is a tax within the scope of IAS 12, any non-refundable portion of such withholding taxes is recognised as a tax expense in the statement of comprehensive income. In addition, the entity must apply all the provisions of IAS 12 for current and deferred taxes, including recognition, measurement, presentation and disclosure. An entity that determines that a withholding tax is in the scope of IAS 12 presents its related income as an amount gross of withholding taxes in the statement of comprehensive income.

Accordingly, an entity may determine that it must treat as income taxes the withholding taxes that could potentially be suffered on distributions from all investments, not just subsidiaries, associates and joint arrangements. Whether or not any tax liability is recognised will depend on an analysis of the facts and circumstances in each case, in particular whether the investment concerned is expected to be recovered through receipt of dividend income or through sale (see section 8.4 below).

4.2.2 Withholding taxes on royalty payments

Governments often require deduction of tax at source on payments other than dividends, particularly when such payments are made to entities outside the home country of the paying entity, for example in respect of royalties. As discussed at section 4.1 above, the determination of whether such withholding taxes are in scope of IAS 12 requires the entity to consider whether the taxes are based on a measure of taxable profits.

Illustration 4-1: Withholding taxes on royalty payments

Entity A is domiciled in Country X. Entity A develops and sells software licences to customers in the telecommunications industry. Entity A receives revenue in the form of royalties from licences. The royalties are determined as a fixed percentage of revenue. Entity A has a customer in Country Z from which it receives royalties. The royalties are paid by the customer net of withholding taxes determined as per regulations applicable in Country Z.

In Country Z, a tax is charged on entities that do not have a sufficient presence in Country Z to be required to register a business (branch) in Country Z and to be liable to pay local income tax.

Taxable profit for Entity A's income tax return in its home country (Country X) includes the gross amount of the royalty income (i.e., the amount invoiced by Entity A to the customer in Country Z). The withholding tax on royalties that is paid in Country Z is, however, deductible against income taxes payable in Country X.

How should Entity A account for the tax withheld by the customer in Country Z?

How we see it

In fact patterns similar to Illustration 4-1 above, the withholding tax is normally treated as a non-income tax outside the scope of IAS 12 as the tax is based on the royalty amount invoiced to the customer rather than based on taxable profits. However, in limited circumstances there may be a combination of other factors that are sufficiently distinctive to result in a judgement that such a withholding tax is an income tax within the scope of IAS 12, in a particular jurisdiction. Such factors may include, for example, the fact that Entity A receives a foreign tax credit for tax paid in Country Z that reduces its income tax liability in Country X and because the gross amount of royalty income is equal to the net profit earned by Entity A from this activity in Country Z.

Even if the withholding tax is determined not to be in scope of IAS 12, it might give rise to temporary differences in relation to Entity A's own tax return in its home jurisdiction, for example where the withholding tax incurred is not deductible until a later period. Such temporary differences would be in scope of IAS 12.

4.3 Investment tax credits

Investment tax credits are not defined in IAS 12, but for the purposes of the following discussion they are taken to comprise government assistance and incentives for specific kinds of business activity and investment delivered through the tax system. Investment tax credits can take different forms and be subject to different conditions. Sometimes a tax credit is given as a deductible expense in computing the entity's tax liability, and sometimes as a deduction from the entity's tax liability, rather than as a deductible expense. In some cases, the value of the credit is chargeable to income taxes and in others it is not.

Entitlement to receive investment tax credits can be determined in a variety of ways. Some investment tax credits may relate to direct investment in property, plant and equipment. Other entities may receive investment tax credits relating to research and development or other specific activities. Some credits may be realisable only through a reduction in current or future income taxes payable, while others may be settled directly in cash if the entity does not have sufficient income taxes payable to offset the credit within a certain period. Access to the credit may be limited according to total taxes paid (i.e., including taxes such as payroll and sales taxes remitted to government in addition to income taxes). There may be other conditions associated with receiving the investment tax credit, for example with respect to the conduct and continuing activities of the entity, and the credit may become repayable if ongoing conditions are not met.

As noted in section 4 above, IAS 12 states that it does not deal with the methods of accounting for government grants or investment tax credits although any temporary differences that arise from them are in the scope of the standard. [IAS 12.4]. At the same time, government assistance that is either provided in the form of benefits that are available in determining taxable profit or tax loss, or determined or limited according to an entity's income tax liability, is excluded from the scope of IAS 20. That standard lists income tax holidays, investment tax credits, accelerated depreciation allowances and reduced income tax rates as examples of such benefits. [IAS 20.2]. Accordingly, if government assistance is described as an investment tax credit, but it is neither determined nor limited by reference to an entity's liability to income taxes, it falls within the scope of IAS 20 and must therefore be accounted for as a government grant (see Chapter 25).

The fact that both IAS 20 and IAS 12 use the term 'investment tax credits' to describe items excluded from their scope requires entities to carefully consider the nature of such incentives and the conditions attached to them to determine which standard the particular tax credit is excluded from and, therefore, whether they fall in the scope of IAS 12 or IAS 20.

How we see it

In our view, the determination of which standard to apply to a particular investment tax credit (IAS 12 or IAS 20) is a matter of judgement and all facts and circumstances relating to the specific incentive need to be considered in assessing the substance of the arrangement.

The following factors will often be relevant, but this list of factors must not be considered exhaustive, and entities may identify other factors which they consider to be more important than those listed below.

Feature of credit	Indicator of IAS 12 treatment	Indicator of IAS 20 treatment
Method of realisation	Only available as a reduction in income taxes payable (i.e., benefit is forfeited if there are insufficient income taxes payable). However, a lengthy period allowed for carrying forward unused credits may make this indicator less relevant.	Directly settled in cash where there are insufficient taxable profits to allow credit to be fully recovered, or available for set off against non-income taxes, such as payroll taxes, sales taxes or other amounts owed to government.
Number of non-tax conditions attached to the initial receipt of grant (e.g., minimum employment, ongoing use of purchased assets)	None or few	Many
Restrictions as to nature of expenditure required to receive the grant	Broad criteria encompassing many different types of qualifying expenditure	Highly specific
Tax treatment of grant income	Not taxable	Taxable

In group accounts, in which entities from several different jurisdictions may be consolidated, it may be desirable that all 'investment tax credits' must be consistently accounted for, either as an IAS 12 income tax or as a government grant under IAS 20. However, the judgement as to which standard applies is made by reference to the nature of each type of investment tax credit and the conditions attached to it. This may mean that the predominant practice among IFRS reporters in a particular jurisdiction for a specific type of investment tax credit has evolved differently from the consensus in another jurisdiction for what could appear to be a substantially similar credit. We believe that, in determining whether the arrangement is of a type that falls within the scope of IAS 12 or IAS 20, an entity considers the following factors in the order listed below:

- If there is a predominant local treatment among IFRS reporters for a specific investment tax credit as to whether that specific credit in the relevant tax jurisdiction falls within the scope of IAS 12 or IAS 20, this must take precedence.
- If there is no predominant local treatment among IFRS reporters, the group-wide approach to determining the standard that applies to such a credit must be applied.
- In the absence of a predominant local treatment by IFRS reporters or a group-wide approach to making the determination, the indicators listed in the table above must provide guidance.

This may mean that an entity operating in several territories adopts different accounting treatments for apparently similar arrangements in different countries, but it at least ensures a measure of comparability between different entities operating in the same tax jurisdiction. Similar considerations apply in determining the meaning of 'substantively enacted' legislation in different jurisdictions (see section 5.1 below).

How we see it

In our view this is not an accounting policy choice. Accordingly, an entity operating in several territories could be required to adopt different accounting treatments for apparently similar arrangements in different countries if predominant local practice among IFRS reporters for a specific type of investment tax credit has evolved differently from the consensus in another jurisdiction.

Where a tax credit is determined to be in the nature of an income tax, the incentive should be recognised as an asset and a reduction in current income tax (to the extent of the incentive that has already been used) as soon as the entity can demonstrate it complies with the substantive conditions of the tax credit and the tax credit thereby becomes allowable against the income tax base of the current or preceding year.

A deferred tax asset will be recognised for any unused tax credits (up to the amount of incentive to which the entity is already entitled) to the extent that the entity can demonstrate that it complies with the conditions of the tax credit as at the end of the reporting period and it is probable that future taxable profit will be available against which the unused tax credits can be utilised. [IAS 12.34]. For incentives related to the initial recognition of assets (i.e., not relating to items expensed for accounting purposes), an entity could either reflect the associated income tax effect immediately in profit or loss, or treat the tax credit as an adjustment to the tax base of the asset. If regarded as an adjustment to the tax base of the asset, the initial recognition exception would apply to prohibit recognition of the excess of the tax base over the accounting carrying value. The subsequent accounting would then be similar to the accounting followed for a super-deductible asset. The treatment of super-deductible assets is discussed further in section 7.2.6 below.

How we see it

In our view, it would be acceptable to adopt either of these approaches for incentives determined to be in the scope of IAS 12 and related to the initial recognition of assets, provided that it is applied consistently.

Even if investment tax credits are recorded which will be realised in future periods, the related deferred tax asset must not be discounted.

4.4 Interest and penalties

Many tax regimes require interest and/or penalties to be paid on late payments of tax. This raises the question of whether or not such penalties fall within the scope of IAS 12. The answer can have consequences not only for the presentation of interest and penalties in the income statement; but also for the timing of recognition and for the measurement of amounts recognised. If such penalties and interest fall within the scope of IAS 12, they are presented as part of tax expense and measured in accordance with the requirements of IAS 12. Further, IFRIC 23 on uncertain tax treatments would be relevant where uncertainty exists as to whether interest and penalties will be applied by the tax authorities (see section 9.1 below). If interest and penalties do not fall within the scope of IAS 12, they must be included in profit before tax, with recognition and measurement determined in accordance with another IFRS accounting standard, most likely to be IAS 37.

Some argue that penalties and interest have the characteristics of an income tax - they are paid to the tax authorities under specific tax legislation that has already been deemed to give rise to an IAS 12 income tax and therefore must be treated consistently. Others contend that penalties and interest are distinct from the main income tax liability, are not 'based on taxable profits' as required in IAS 12.2 and must not therefore form part of tax expense. Those who hold this view would point out, for example, that under IFRS accounting standards the unwinding of the interest on discounted items is generally accounted for separately from the discounted expense.

Frequently asked questions

Question 4-2: How do you determine whether interest and penalties related to income taxes are in the scope of IAS 12?

The IFRS IC considered this issue most recently in 2017, as a result of comments received from respondents regarding the scope of what is now IFRIC 23. Notwithstanding their decision to exclude a specific reference to interest and penalties in IFRIC 23 and their decision in September 2017 not to add a project on interest and penalties to its agenda, the Committee observed that:³

- (a) The determination of whether IAS 12 or IAS 37 should be applied is not an accounting policy choice. Instead, if an entity determines that a particular amount payable or receivable for interest and penalties is an income tax, then the entity applies IAS 12 to that amount. If an entity does not apply IAS 12 to interest and penalties, then it applies IAS 37 to those amounts.
- (b) Paragraph 79 of IAS 12 requires an entity to disclose the major components of tax expense (income); for each class of provision, IAS 37.84 and 85 require a reconciliation of the carrying amount at the beginning and end of the reporting period as well as various other pieces of information. Accordingly, regardless of whether an entity applies IAS 12 or IAS 37 when accounting for interest and penalties related to income taxes, the entity would disclose information about those interest and penalties if it is material.
- (c) Paragraph 122 of IAS 1 requires disclosure of the judgements that management has made in the process of applying the entity's accounting policies and that have the most significant effect on the amounts recognised in the financial statements.

The IFRS IC also observed that it had previously published agenda decisions discussing the scope of IAS 12 in March 2006 and May 2009 (as noted in section 4.1 above).

The IFRS IC did not give any specific guidance as to how one might decide whether interest and penalties should be regarded as an IAS 12 income tax.

How we see it

In our view, the judgement of whether IAS 12 or IAS 37 applies must be determined on a country-by-country and a tax-by-tax basis. The agenda decision is clear that this is not an accounting policy choice whereby an entity has 'free rein' to choose the standard that is applied. Instead, an entity must make a determination of the nature of the particular interest and penalties in question based on its understanding of the operation of the specific tax law and the way in which the charge or credit is calculated.

The following factors are relevant in determining whether an item is in scope of IAS 12, although we believe that no particular order must be applied and that no single factor is conclusive:

- Whether there is a predominant local consensus in evidence or specific guidance issued locally by regulators as to the nature of interest and penalties applied to a specific tax in the relevant tax jurisdiction, leading to a predominant practice of accounting for these as income tax or not. Where a treatment may not otherwise be clear, entities often refer to local practice in determining whether a tax is an income tax; whether legislation has been substantively enacted; and in the treatment of investment tax credits. Determining whether interest and penalties are part of income tax requires careful consideration of the local legislation and hence entities would usually defer to local consensus where it exists. Since the judgement depends on the circumstances of the tax laws in a particular country, it must be accepted that an international group could encounter different conclusions in relation to interest and penalties arising in different jurisdictions. In particular, we would normally not expect a conclusion based on local consensus to be reversed in a subsequent consolidation by an overseas parent.
- Whether the amounts are clearly identifiable as 'interest' or as 'penalty' making it more appropriate to not account for these as income tax. Does the tax legislation have specific rules and requirements that allow an entity to identify the amounts that are to be regarded as 'interest' and as 'penalties'? That is, if an entity pays a single lump sum to settle existing tax positions, it would only identify interest and penalty components to the extent that communications from the tax authorities and/or tax legislation allow the entity to identify such components. An entity would not bifurcate such a single payment to identify notional interest and penalty amounts as this would be too judgemental, but rather account for the whole as an income tax.

³ [IFRIC Update](#), September 2017, available on the IFRS Foundation's website.

- The degree to which an entity believes it is certain that interest and penalties will be applied. A certain payment of interest for example may indicate it being a financing expense rather than an income tax. In some cases, an entity might decide to wait until a tax enquiry is concluded before settling an expected obligation. In others, the entity could be confident of recovering an overpayment of tax, with interest added to the expected refund. In these circumstances, it could be argued that interest and penalties result from an entity's conscious decision not to pay taxes due earlier or to secure the later receipt of interest. Hence, those interest and penalties might be regarded as not directly related to taxable income, but rather the result of the entity's financing decisions.
- Whether the amount is based on net taxable profit, indicating it is an income tax. As noted in section 4.1 above, IAS 12 only applies to income taxes, which are based on 'taxable profits'. However, in many jurisdictions income tax legislation contains elements that, when looked at in isolation, are not strictly based on a notion of taxable profits. Examples include tax exempt amounts, deductibility caps and super-deductions for certain eligible expenditure. As a practical matter it is normally not considered helpful or necessary to account for such elements as a separate unit of account, unless not doing so would significantly misrepresent the underlying substance of the arrangements.
- Whether the interest rate applied by the tax authorities reflects current market assessments of the time value of money, indicating it being a financing expense rather than income tax. If the applied rate clearly reflects the time value of money, it must be treated as interest. If the rate is largely punitive, the interest must be considered together with penalties. However, it would not be sensible to attempt to identify a notional time value component as this would be too judgemental.

Where the amounts involved are material, it will be appropriate for the entity to consider whether the judgements made and the amounts involved must be disclosed in accordance with the requirements of IAS 1.122 (see Chapter 3).

4.5 Hybrid taxes (including minimum taxes)

The term 'hybrid taxes' is applied to arrangements in which:

- (a) An entity's liability to tax is assessed on both a measure of its taxable profits and a non-profit measure
- (b) The amount of tax to be paid in any period depends on the interaction between those two measures

Examples of non-profit measures would include amounts based on particular types of revenue; on components of the statement of financial position, such as total equity, net assets or net debt; or to a non-financial measure such as physical output. Tax authorities might require entities to use the alternative measures to determine a minimum amount of tax to be paid in any period. Hybrid taxes do not include arrangements where an entity can elect to operate within one of a number of alternative tax regimes, for example to choose to be assessed on the basis of its taxable profits, or to have its profits exempt from tax and instead be assessed according to a non-profit measure such as revenues, net assets or physical output. In this case there is no interaction between taxable profits and the non-profit measure in determining the actual tax to be paid in a given period.

Such 'hybrid taxes' (where the tax to be paid depends on the interaction of a profit and a non-profit measure) raise the issue of how they must be accounted for. Does IAS 12 apply simply because one of the measures referred to in the tax legislation is based on taxable profits, or must a determination be made based on an assessment of which measure is most likely to influence the actual amount of tax to be incurred by the entity? Alternatively, should the tax charge be bifurcated between the component based on profits and the component based on another measure, with the former accounted as an income tax and the other as a levy under IAS 37 and IFRIC 21? This section considers some of the different arrangements seen in practice.

4.5.1 Hybrid taxes - minimum based on a measure other than taxable profits

In the case of a minimum tax, the authorities impose income taxes which are charged as a percentage of taxable profits in the normal way, but subject to a requirement that a minimum amount of tax must be paid. This minimum may be an absolute amount.

One approach would be to account for the fixed minimum element as a non-income tax under IAS 37 and IFRIC 21, with any excess above the fixed minimum element treated as an income tax under IAS 12.

An alternative approach would be to consider the overall substance of the tax. If it is apparent that the overall intention of the legislation is to charge taxes based on net profit, but subject to a floor, the tax must be accounted for as an income tax in its entirety, even if the floor would not be an income tax if considered in isolation.

This second approach appears to have some advantages over the first. A determination that the tax, in its entirety, is either in scope of IAS 12 or not is consistent with the IFRS IC's agenda decision in relation to interest and penalties (see section 4.4 above). Having established the overall intention of the legislation, a consistent basis can be applied from period to period, for example to the identification of a tax rate for measuring deferred tax (should the entity have determined that IAS 12 must apply).

Under the first approach, an entity might have to account for current and deferred tax in periods where net profit results in a higher liability than the non-profit measure and apply a different basis when taxable profits give an assessment lower than the non-profit measure. Another practical disadvantage is that the effective rate of the element accounted for as income tax is unpredictable, as it will depend on the level of profit in future periods relative to the established minimum level of tax, as shown in the following illustration.

Illustration 4-2: Minimum tax based on a specified amount - minimum treated as a levy

Entity A is required to pay tax at 30% on its taxable profit, but subject to a minimum tax of CU90,000 per year. No income tax relief is available for the minimum tax. If its taxable profits were less than or equal to CU300,000, it would pay the minimum tax of CU90,000. If taxable profits were CU1 million, it would pay total tax of CU300,000 (CU1,000,000 at 30%). If the entity's taxable profits were CU2,000,000 it would pay tax of CU600,000 (CU2,000,000 at 30%). Entity A applies the first approach above, treating the minimum amount as a levy under IAS 37 and IFRIC 21 and accounting for any excess as an income tax under IAS 12. On this basis, the effective rate of tax, for the purpose of measuring any deferred tax balances, would be derived as follows in each scenario:

Total tax charge	CU	CU	CU
Taxable profit before minimum tax	300,000	1,000,000	2,000,000
Total tax (@ 30% or CU90,000)	90,000	300,000	600,000
Minimum tax	90,000	90,000	90,000
Income tax (remainder)	-	210,000	510,000
Effective income tax rate			
Taxable profit before minimum tax	300,000	1,000,000	2,000,000
Minimum tax	90,000	90,000	90,000
Profit before income tax (A)	210,000	910,000	1,910,000
Income tax (B)	-	210,000	510,000
Profit after tax	210,000	700,000	1,400,000
Effective income tax rate (B/A)	n/a	23.1%	26.7%

In the circumstances illustrated above, in order to calculate deferred income taxes for the purposes of IAS 12, any future income tax rate would be subject to constant re-estimation, even if the 'headline' enacted rate had not changed.

How we see it

In our view, either of these two approaches can be adopted so long as it is applied consistently.

4.5.2 Tax is the higher of measures based on taxable profits and revenues

Another form of hybrid tax is where the amount of tax payable is the higher of one measure (based on profits) and another (for example based on: revenues; net assets; or total debt and equity).

Treating the tax on an 'all-or-nothing' basis, e.g., wholly as a non-income tax could be problematic, especially in situations where the basis giving rise to the amount of total tax payable changes from period to period.

Alternatively, an entity could determine either that the tax is primarily a non-income tax, with amounts in excess of that basis accounted under IAS 12; or that the tax is primarily an IAS 12 income tax, with any excess accounted as a non-income tax under IAS 37 and IFRIC 21. These two approaches are shown in Illustration 4-3 below.

Illustration 4-3: Tax is the higher of measures based on taxable profits or revenues

Entity B is required to pay tax at the higher of 40% on its taxable profit or 2% of its reported revenue. Income tax relief is not available for the revenue tax. The entity must therefore determine how much tax would be paid on each basis and incur the higher amount. The effective rate of income tax, for the purpose of measuring any deferred tax balances, would be derived as follows in the various scenarios below:

Total tax charge	CU	CU	CU	CU
Revenue (A)	20,000,000	20,000,000	20,000,000	20,000,000
Profit before tax (B)	500,000	900,000	1,200,000	2,400,000
Charge based on revenue (A @ 2%)	400,000	400,000	400,000	400,000
Charge based on profit (B @ 40%)	200,000	360,000	480,000	960,000
Tax charge under legislation	400,000	400,000	480,000	960,000
Approach 1 - Excess is IAS 12 tax				
Profit before revenue tax	500,000	900,000	1,200,000	2,400,000
Revenue tax	400,000	400,000	400,000	400,000
Profit before income tax (C)	100,000	500,000	800,000	2,000,000
Income tax (D)	-	-	80,000	560,000
Profit after tax	100,000	500,000	720,000	1,440,000
Effective income tax rate (D/C)	0%	0%	10%	28%
Approach 2 - Excess is revenue tax				
Profit before revenue tax	500,000	900,000	1,200,000	2,400,000
Revenue tax	200,000	40,000	-	-
Profit before income tax (E)	300,000	860,000	1,200,000	2,400,000
Income tax (F)	200,000	360,000	480,000	960,000
Profit after tax	100,000	500,000	720,000	1,040,000
Effective income tax rate (F/E)	66.7%	41.8%	40%	40%

In the Illustration above, when the excess is accounted as an IAS 12 income tax, the effective income tax rate varies once the minimum tax threshold is exceeded (see the last two columns under Approach 1 above). This variability requires the entity to reassess its estimate for measuring deferred taxes in the future even when the enacted rate of income tax is unchanged. When the excess is treated as a revenue tax, the effective rate of income tax varies initially and then stabilises at the enacted rate (40%) when the minimum tax threshold is exceeded. Until that point, the entity would have to consider the variability in the effective tax rate when measuring deferred taxes (see the first two columns under Approach 2 above).

How we see it

In our view, either of these approaches can be adopted so long as it is applied consistently.

4.5.3 Tax is based on revenues, unless a profit measure gives a lower result

As businesses have increasingly operated across international boundaries, national governments have sought to evolve their tax systems to ensure that the profit of a multinational group is taxed in the countries in which it creates value. The need for this development has become more urgent with the advent of the digital revolution, whereby companies can earn profits in a particular country without having any physical presence there.

As a result, individual governments might introduce taxes based primarily on measures of revenue earned in their jurisdiction by these entities. However, at the same time, governments do not wish to discourage local investment and innovation by businesses operating internationally or in the digital space, so they introduce reliefs and incentives. For example, the tax might be levied only on revenues above a certain threshold, or an entity might be permitted to elect to be taxed on its profits from that activity if it has a presence in the jurisdiction and it can show that a measure based on profits would give rise to a lower liability.

This is shown in the following Illustration.

Illustration 4-4: Tax based on revenues, unless a profit measure gives a lower result

A government introduces a tax on the revenues of certain digital businesses (DST). A charge of 2% is levied on the digital revenues earned from customers in that country above an annual threshold. Where the local revenues received in connection with digital services activities exceed the annual threshold, the entity must submit DST returns to the local tax authority and will have to pay DST. No tax is payable for revenues up to the annual threshold.

Because the entities subject to this tax often have little or no physical presence in the country in question, DST normally applies at the rate of 2% on local digital services revenues above the annual threshold. However, an entity can elect to calculate its tax liability using an alternative basis. The alternative basis gives rise to a lower DST liability for entities making a loss or operating at a low margin on their local digital services activity.

This election is voluntary, applies for one year, and entities must make or renew the election at the time they submit their tax return for the period they wish to calculate their DST liability using the alternative method. Under the alternative basis, the DST is calculated by reference to the operating margin of the local digital services activity at a rate of 80% of that margin. In cases where the local digital services activity is loss making and the alternative basis is being applied, no DST needs to be paid on revenues attributable to that activity, but at the same time no relief is given in respect of those losses. That is, the DST is set at zero for the current period, but no losses are carried forward or back into other accounting periods.

How should entities account for this tax?

How we see it

In these circumstances we believe that this type of arrangement must be treated wholly as a non-income tax outside the scope of IAS 12. In our view, it would not be appropriate to account for the tax as a non-income tax in those years when tax is paid on digital services revenues, and as an IAS 12 income tax when an election is taken to apply the alternative basis, using a measure of profit. It would also be inappropriate to try to bifurcate the tax between a component based on revenue and a component based on the alternative profit measure regardless of whether the election is taken. Such bifurcation is only effective where the tax liability is the higher of one measure or another, as discussed in section 4.5.2 above.

The nature of the arrangement in the Illustration above, in both design and operation, is a revenue-based tax that would fall outside the scope of IAS 12. The tax is designed to achieve a higher level of tax for entities that do not have a physical presence in the country in which revenues are generated; and in most cases it is this basis that will determine the amount of tax payable. The election to apply the alternative basis represents a relief for those particular entities with a low operating margin in the local jurisdiction (for example because they have a physical presence, employ staff or have other activities that would attract a liability to local taxes). In the Illustration above, only if the entity's operating margin were below 2.5% ($2\% \div 0.8$) would the alternative basis give rise to a lower charge than the levy on revenue.

Governments are also co-operating internationally to establish ways to ensure that the profits of multinational groups are taxed appropriately. An example of such international co-operation and the accounting challenges it presents is discussed in section 4.6 below.

4.6 Global Anti-Base Erosion Rules

The Organisation for Economic Co-operation and Development (OECD)/G20 Inclusive Framework on Base Erosion and Profit Shifting (BEPS) addresses the tax challenges arising from the digitalisation of the global economy. To restore confidence in the international tax system and with the aim that profits are taxed where economic activities take place and value is created, the Inclusive Framework on BEPS proposes two "pillars":

- Pillar One applies to multinational enterprises (MNEs) with global turnover above EUR20 billion and profitability above 10% (i.e., profit before tax/revenue).
- Pillar Two applies to MNEs with revenue in excess of EUR750 million per their consolidated financial statements.

The Pillar Two Global anti-Base Erosion rules (GloBE Rules or Pillar Two Model Rules) represent the first substantial overhaul of the international tax rules in almost a century. The GloBE Rules introduce four new taxing mechanisms under which MNEs would pay a minimum level of tax (Minimum Tax):

- the Subject to Tax Rule is a tax treaty-based rule that generally proposes a Minimum Tax on certain cross-border intercompany transactions that otherwise are not subject to a minimum level of tax.
- the Income Inclusion Rule (IIR).
- the Under Taxed Payments Rule (UTPR).
- the Qualified Domestic Minimum Top-up Tax (QDMTT).

The new taxing mechanisms can impose a Minimum Tax on the income arising in each jurisdiction in which an MNE operates. The IIR, UTPR and QDMTT do so by imposing a Top-up Tax in a jurisdiction whenever the effective tax rate (ETR), determined on a jurisdictional basis under the GloBE Rules, is below a 15% minimum rate (Minimum Rate). The GloBE Rules set out the mechanics for determining which entity (or entities) in an MNE Group (i.e., a group in which the ultimate parent entity has, directly or indirectly, at least one foreign subsidiary or a permanent establishment) would apply the IIR, the UTPR, and/or the QDMTT, and the portion of Minimum Tax that is charged to each relevant entity. While the framework for the GloBE Rules is global, the GloBE Rules would be implemented through legislation enacted in jurisdictions that adopt the rules.

The GloBE Rules raise a number of accounting questions. In particular, whether the Minimum Tax is an income tax in the scope of IAS 12 and, if so, when and how entities should account for the new taxes.

The GloBE Rules are complex and contain complicated terminology that is not discussed in detail in this publication. The OECD has published GloBE Model Rules, GloBE Model Rules Commentary, and GloBE Model Rules Examples, which can be found on their website.⁴ In addition, the OECD has published a summary, fact sheets, frequently asked questions, and press releases that provide additional information on the GloBE Rules. EY has published an executive summary and discussion of GloBE Model Rules, Commentary and Examples, which provides helpful context and further explanation of the GloBE Rules.⁵ There remain numerous areas of uncertainty in the application of the GloBE Rules that require additional interpretive guidance.

4.6.1 The GloBE Rules

The OECD notes that “The GloBE Rules apply a system of Top-up Taxes - that is, an IIR and a UTPR - that brings the total amount of taxes paid on an MNE’s Excess Profit in a jurisdiction up to the Minimum Rate. This Top-up Tax does not operate as a typical direct tax on income of an Entity. Rather it applies to the Excess Profits calculated on a jurisdictional basis and only applies to the extent those profits are subject to tax in a given year below the Minimum Rate. Rather than a typical direct tax on income, the tax imposed under the GloBE Rules is closer in design to an international alternative minimum tax, that uses standardised base and tax calculation mechanics to identify pools of low-taxed income within an MNE Group and imposes a co-ordinated tax charge that brings the Group’s ETR on that income in each jurisdiction up to the Minimum Rate”.⁶

4 OECD website, www.oecd.org, (accessed on 30 September 2022).

5 [Tax Alert](#), OECD releases Commentary and illustrative examples on Pillar Two Model Rules, EY Global, 21 March 2022.

4.6.1.A Five step process to apply the GloBE Rules

At the simplest level, the GloBE Rules impose a Top-up Tax that is calculated and applied at a jurisdictional level involving five steps: 1) identify MNE Groups in scope of the GloBE Rules; 2) determine GloBE income or loss for each constituent entity; 3) determine adjusted covered taxes; 4) compute GloBE ETR and Top-up Tax; and 5) determine the entities liable to pay taxes under the IIR, UTPR and/or QDMTT. These elements are shown in Illustration 4-5 below.

Illustration 4-5: Application of GloBE Rules

The diagram below sets out the holding structure and location of the members of the ABC Group and illustrates the application of GloBE Rules.

Entities A, B1 and B2 have a GloBE ETR above the 15% Minimum Rate, but Entity C1 and Entity C2 are located in a low-tax jurisdiction with a GloBE ETR below 15%. Only Country Y has enacted an IIR.

Step 1: Identify MNE groups in scope of the GloBE Rules

Entity A, located in Country X, is the ultimate parent entity (UPE) of the consolidated group (ABC Group). ABC Group has determined it is an MNE Group in scope of the GloBE Rules. Accordingly, ABC Group has identified its constituent entities and their locations according to the diagram above. As Countries X and Z have not enacted GloBE Rules, any Top-up Taxes due by the entities located in those jurisdictions will be payable by entities in Country Y to Country Y (see Step 5).

Step 2: Determine GloBE income or loss for each constituent entity

ABC Group has determined GloBE income for each constituent entity in the MNE Group based on the group financial accounting net income of each constituent entity adjusted to the GloBE tax base. Only the results for C1 and C2 are given in this example, as they operate in a low-tax jurisdiction. Assume GloBE income is CU600 for C1 and CU1,800 for C2.

Step 3: Determine adjusted covered taxes

ABC Group has determined adjusted covered taxes for each constituent entity in the MNE Group based on group financial accounting tax expense/benefit adjusted to the GloBE covered taxes. Assume adjusted covered taxes are CU30 for Entity C1 and CU240 for Entity C2.

Step 4: Compute GloBE ETR and Top-up Tax

The GloBE ETR of the constituent entities located in Country Z is $(CU30 + CU240) \div (CU600 + CU1,800) = 11.25\%$ and thus, the Top-up Tax rate is 3.75% (i.e., minimum rate of 15% less GloBE ETR of 11.25%). The Excess Profit (amount of profit upon which the Top-up Tax is levied) is assumed to be equal to GloBE income, so the Top-up Tax is $(CU600 + CU1,800) \times 3.75\% = CU90$. The example assumes the Group does not have any substance-based income exclusion (i.e., exclusion of a fixed return for substantive activities within a jurisdiction from the application of the GloBE Rules).

Step 5: Determine the entities liable for payment of the Top-up Tax

In applying the IIR, a parent entity pays its allocable share of the Top-up Tax with respect to a low-taxed constituent entity. The IIR operates on a top-down approach, starting with the UPE. If the UPE is not located in a jurisdiction that has enacted an IIR, the highest parent entity in the ownership chain that is located in a jurisdiction that has enacted an IIR pays its allocable share of the Top-up Tax. (Note: an exception to the top-down approach applies in split-ownership situations).

In this example, only Country Y has enacted an IIR and thus, the intermediate parent Entities B1 and B2 are required to pay any Top-up Taxes. Entity B1 is liable for 100% of any Top-up Tax attributable to its wholly-owned subsidiary C1 and 20% of the Top-up Tax for C2, as a result of its 20% indirect shareholding interest in C2. Entity B2 is liable for 100% of any Top-up Tax attributable to its wholly-owned subsidiary C2.

As Entity B2 is liable for 100% of any Top-up Tax of C2, Entity B1's allocable share (i.e., 20%) of C2's Top-up Tax due to its indirect interest in C2 via B2 would result in double-taxation. To avoid double taxation, Entity B1 reduces its Top-up Tax attributable to its indirect ownership in C2 that is paid by B2.

In summary, Entity B1 pays Top-up Tax of CU22.5, calculated as follows: Entity C1: CU22.5 (i.e., $3.75\% \times \text{CU}600$), plus Entity C2: CU13.5 (20% of $3.75\% \times \text{CU}1,800$), less CU13.5 paid by Entity B2. Entity B2 pays Top-up Tax of CU67.5, calculated as follows: Entity C2: CU67.5 (i.e., $3.75\% \times \text{CU}1,800$).

The above simple example demonstrates the application of only an IIR. In practice, if a UTPR and QDMTT are enacted with an IIR, an MNE Group would first calculate the Top-up Tax under QDMTT, then apply the IIR to capture residual Top-up Tax not included in the QDMTT, and finally apply the UTPR to capture residual Top-up Tax not included in the IIR.

4.6.2 International Tax Reform-Pillar Two Model Rules - Amendments to IAS 12

On 23 May 2023, the IASB issued *International Tax Reform-Pillar Two Model Rules - Amendments to IAS 12 (the Amendments)*. The Board amended the standard for the following reasons:

- Provide timely relief for affected entities.
- Avoid diverse interpretations of IAS 12 developing in practice.
- Improve the information provided to users of financial statements before and after Pillar Two legislation comes into effect.

The Amendments have introduced:

- A mandatory temporary exception to the accounting for deferred taxes arising from the jurisdictional implementation of the Pillar Two model rules. See sections 4.6.2.A and 4.6.2.B below.
- Disclosure requirements for affected entities to help users of the financial statements better understand an entity's exposure to Pillar Two income taxes arising from that legislation, particularly before its effective date. See sections 4.6.2.C and 4.6.2.D below.

4.6.2.A Mandatory temporary exception from recognition and disclosure of deferred taxes

The Amendments clarify that IAS 12 applies to income taxes arising from tax law enacted or substantively enacted to implement the Pillar Two Model Rules published by the OECD, including tax law that implements qualified domestic minimum top-up taxes. Such tax legislation, and the income taxes arising from it, are referred to as 'Pillar Two legislation' and 'Pillar Two income taxes', respectively.

The Amendments have introduced a mandatory exception in IAS 12 from recognising and disclosing deferred tax assets and liabilities related to Pillar Two income taxes. [IAS 12.4A]. The Board did not expand the scope of the temporary exception to include the measurement of deferred taxes recognised under domestic tax regimes. The Board concluded that an entity would not remeasure such deferred taxes to reflect Pillar Two income taxes it expects to pay when recovering or settling a related asset or liability because the temporary exception applies to deferred tax assets and liabilities related to such income taxes. [IAS 12.BC104].

The Amendments note that the temporary exception provides entities with relief from accounting for deferred taxes in relation to this complex new tax legislation allowing stakeholders time to assess the implications. It also avoids entities developing diverse interpretations of IAS 12 that could result in inconsistent application of the standard. [IAS 12.BC101].

The Board did not include a sunset date for the temporary exception, but will monitor the implementation of the Pillar Two Model rules to determine when to undertake further work. [IAS 12.BC106].

4.6.2.B Pillar Two taxes and the scope of IAS 12

The Board did not provide further clarifications about when a Pillar Two top-up tax is considered to be an income tax in the scope of IAS 12, nor to require entities to treat all top-up taxes as if they were income taxes. [IAS 12.BC103]. An entity is, therefore, required to apply judgement in determining which top-up taxes it considers to be income taxes in the entity's circumstances.

The Board noted that stakeholders were generally of the view that Pillar Two top-up tax is an income tax and, therefore, within the scope of IAS 12 in the consolidated financial statements of the ultimate parent entity of a group subject to the Pillar Two model rules. However, stakeholders noted that this view does not necessarily apply in the financial statements of intermediate parents and subsidiaries of an MNE group that is subject to the Pillar Two model rules. For example, when those subsidiaries may need to pay top-up taxes under the UTPR mechanism in respect to a fellow subsidiary's profits and the top-up tax allocation is not necessarily in direct proportion to the intermediate parent's ownership interest in its investees.

How we see it

We believe that intermediate parents and subsidiaries of an MNE group need to apply judgement in determining whether or not in a particular situation a top-up tax meets the definition of an income tax in IAS 12 and disclose those judgements in accordance with IAS 1.

If an entity concludes that Pillar Two taxes are outside the scope of IAS 12, it needs to consider disclosing information, applying IAS 1, that is helpful to other users of the financial statements in understanding how such Pillar Two taxes have been accounted for.

4.6.2.C Disclosure of application of the exception

An entity is required to disclose that it has applied the exception to recognising and disclosing information about deferred tax assets and liabilities related to Pillar Two income taxes. [IAS 12.88A].

4.6.2.D Disclosure of current tax

An entity is required to separately disclose its current tax expense (income) related to Pillar Two income taxes in the periods when the legislation is effective, as this helps users of financial statements understand the relative level of those taxes. [IAS 12.88B].

Current tax related to Pillar Two income taxes is presented (or disclosed) as current or non-current applying the general requirements of IAS 1 (see Chapter 3). See section 5.4 below regarding discounting of current tax assets and liabilities that is also applicable to Pillar Two income taxes.

4.6.2.E Disclosure in periods after (substantive) enactment but before the legislation is effective

The Amendments require, for periods in which Pillar Two legislation is (substantively) enacted but not yet effective, disclosure of known or reasonably estimable information that helps users of financial statements understand the entity's exposure arising from Pillar Two income taxes. [IAS 12.88C]. To comply with these requirements, an entity is required to disclose qualitative and quantitative information about its exposure to Pillar Two income taxes at the end of the reporting period. [IAS 12.88D]. For example, an entity could disclose the following information to meet these requirements:

- Qualitative information such as how an entity is affected by Pillar Two legislation and the main jurisdictions in which exposures to Pillar Two income taxes might exist.
- Quantitative information such as:
 - An indication of the proportion of an entity's profits that risks being subject to Pillar Two income taxes and the average effective tax rate applicable to those profits.
 - An indication of how the entity's overall effective tax rate would have changed if Pillar Two legislation had been effective.

The above information does not need to reflect all the specific requirements of the legislation and could be provided in the form of an indicative range. The IASB notes in the Basis for Conclusions '... that an entity would not have to disclose information about possible future transactions and other possible future events (forward-looking information) to meet this requirement. For example, an entity would not be required to forecast future profits, reflect mitigation actions it expects to take in future periods, or consider possible future changes in tax legislation.' [IAS 12.BC112(b)]. Further, to the extent information is not known or reasonably estimable, an entity is instead required to disclose a statement to that effect and information about its progress in assessing its exposure. [IAS 12.88D].

Gradually, countries are enacting Pillar Two legislation with legislation in certain countries becoming effective in 2024 or 2025. An MNE group may find that it operates in some jurisdictions where Pillar Two legislation is both enacted and in effect, while in other jurisdictions Pillar Two legislation is (substantively) enacted but not yet in effect. In some cases (e.g., when the ultimate parent entity is already in scope of Pillar Two tax legislation), the (substantive) enactment of Pillar Two tax legislation in additional jurisdictions might shift the Pillar Two tax liability within the group, but not materially affect the group's overall exposure. However, in other cases, the (substantive) enactment of Pillar Two tax legislation in additional jurisdictions may bring more group entities within scope of Pillar Two and affect the group's overall exposure.

How we see it

The requirements of paragraph 88C of IAS 12 apply in periods when Pillar Two legislation is enacted or substantively enacted but not yet in effect. If an MNE group finds that it operates in some jurisdictions where Pillar Two legislation is both enacted and in effect, while in other jurisdictions, Pillar Two legislation is (substantively) enacted but not yet in effect, the disclosure of qualitative and quantitative information about an entity's exposure to Pillar Two income taxes will continue to apply. If the (substantive) enactment of Pillar Two tax legislation in additional jurisdictions brings more group entities within scope of Pillar Two and materially affects the group's overall exposure, the entity would need to disclose qualitative and quantitative information about its exposure to Pillar Two income taxes because of group entities operating in such additional jurisdictions.

4.6.2.F Transition and effective date

The mandatory temporary exception from the recognition and disclosure of information about deferred taxes and the requirement to disclose the application of that exception, applied immediately upon issuance and retrospectively in accordance with IAS 8 *Accounting Policies, Changes in Accounting Estimates and Errors* (see Chapter 3). [IAS 12.98M(a)].

The requirements to disclose separately the current tax expense related to Pillar Two income taxes and to provide additional information in periods in which Pillar Two legislation is enacted but is not yet effective for the reporting entity are required for annual reporting periods beginning on or after 1 January 2023. [IAS 12.98M(b)].

Refer Chapter 37 regarding disclosures in a set of interim financial statements for any period ending on or after 1 January 2024).

4.6.3 Deferred tax liability recapture

Article 4.4.4 of the Pillar Two GloBE rules requires entities to recapture certain deferred tax liabilities if such amount is not paid within five subsequent fiscal years. The recapture rule requires entities to recompute the GloBE effective tax rate (ETR) for the year in which the DTL arose (i.e., year 1 of the existence of the DTL) to assess whether additional top-up tax is needed. If the DTL is paid subsequently (after the five fiscal years), adjusted covered taxes in that year are increased by the amount of the previously recaptured DTL.

How we see it

As a result of the DTL recapture provision, the timing of recognition of a liability for top-up tax must be included in the Pillar Two GloBE computation upfront in year 1 of the DTL's existence based on the amount the entity expects to pay upon recapture. If recapture is expected, we believe that a liability exists, and the entity has an obligation to make a payment in the period the DTL arises, as the DTL is expected to be recaptured (provided that the entity does not intend to sell or otherwise dispose of its assets). This will result in incremental tax to be paid. The entity must record a non-current tax liability in the year in which the DTL arises reflecting the amount it expects to pay upon recapture. The non-current tax liability must be adjusted if new information arises at a later period indicating the DTL will reverse within the five subsequent fiscal years (such as an asset that becomes held for sale).

4.6.4 Accounting for Pillar Two income taxes in separate financial statements

As discussed in section 4.6.2.B above, intermediate parents and subsidiaries of an MNE group might need to apply judgement in determining whether or not in a particular situation a top-up tax meets the definition of an income tax in IAS 12. Accordingly, parent entities including the ultimate parent entity and subsidiary entities within an MNE group might have to apply judgement to determine whether or not top up tax, in their separate financial statements, are in scope of IAS 12. For the purpose of separate financial statements, entities within the group may account for the top-up tax that is triggered in a low tax subsidiary as an income tax in scope of IAS 12 or as a non-income tax expense applying relevant standards. However, the appropriate accounting for top-up taxes in the separate financial statements of the parent and the subsidiaries depends on whether or not a recharge agreement is in place.

How we see it

We believe that where there is no recharge agreement between a parent, that is liable to pay top up tax, and a subsidiary, in the low tax jurisdiction that has triggered the top up tax, the subsidiary is not required to recognise such top-up tax in its financial statements. This is because, in the absence of a recharge agreement the subsidiary does not have an obligation to settle the top up tax arising from the implementation of Pillar Two Model Rules.

Where a recharge agreement is in place, the parent would recharge the top-up tax, which it is liable to pay to the tax authorities in its jurisdiction, to the subsidiary that triggered the top-up tax. In such a situation, one approach is for the parent entity that is legally liable for the top-up tax to treat it as an income tax in scope of IAS 12. Consequently, the top-up tax is recognised as an income tax expense in the statement of comprehensive income and as an income tax liability on the balance sheet. The reimbursement from the subsidiary arising from the recharge is recognised as other income in the statement of comprehensive income and as an inter-company receivable on the balance sheet.

The subsidiary would recognise the recharge as a non-income tax expense and recognise an inter-company liability to the parent entity.

How we see it

In our view, the approach described above is one way of accounting for recharges. An entity is not precluded from adopting another suitable approach provided that it is applied consistently.

The guidance described above might also be relevant in situations where a fellow subsidiary is liable to Pillar Two income taxes under UTPR.

Further, in jurisdictions where QDMTT is effective and more than one entity in the group operates, the local rules and regulations may be similar to those applied to tax consolidated group in that jurisdiction. In such cases, guidance provided in section 11 below regarding consolidated tax returns might be relevant.

4.6.5 Other accounting considerations related to Pillar Two income taxes

4.6.5.A Accounting for Pillar Two income taxes before IAS 12 amendments are endorsed

Some jurisdictions have a process of formally adopting the accounting standards, interpretations and amendments issued by the IASB. In such jurisdictions the IAS 12 amendments will only take effect when endorsed by the respective local authority. Consequently, the amendments to IAS 12 may not be endorsed until after an MNE becomes subject to Pillar Two income taxes. Entities that need to prepare IFRS annual or interim financial statements before these amendments are endorsed in their jurisdiction, will therefore need to develop an accounting policy to provide relevant and reliable information to the users of their annual or interim financial statements.

Before the amendments were issued, IAS 12 did not offer specific guidance on accounting for Pillar Two income taxes. IAS 8 requires that, in the absence of an IFRS accounting standard that specifically applies to a transaction, other event or condition, an entity is required to use its judgement in developing and applying an accounting policy that results in information that is relevant and reliable (see Chapter 3).

In the Basis for Conclusions, the IASB notes that stakeholders had said that it is unclear whether the Pillar Two model rules create additional temporary differences, whether to remeasure deferred taxes recognised under domestic tax regimes and which tax rate to use to measure deferred taxes. It was further noted that the tax rate that will apply to an entity's excess profit in future periods depends on a number of factors that are difficult, if not impossible, to forecast reliably. [IAS 12.BC99(b)]. As a result, the application of the requirements of IAS 12 to Pillar Two income taxes prior to the amendments is unclear.

How we see it

In our view it would be acceptable for an entity to apply judgement and conclude - in accordance with paragraphs 10 and 11 of IAS 8 - that not accounting for deferred taxes related to Pillar Two income taxes would result in the most relevant and reliable accounting policy.

Such an accounting policy results in an approach that is consistent with the mandatory temporary exception in the amendments to IAS 12 and would avoid otherwise unnecessary changes in accounting policies should the amendments be later endorsed.

While the above accounting policy choice is considered acceptable, it would not preclude an entity from developing an accounting policy that does result in the recognition of deferred taxes in respect of Pillar Two income taxes. However, it should be noted that, in that case, an entity will be required to change its accounting significantly once the IAS 12 amendments are endorsed, which will prescribe a mandatory temporary exception from accounting for deferred taxes in respect of Pillar Two income taxes.

4.6.5.B Substantive enactment

Under IAS 12, a new tax law impacts the financial statements when it is enacted or substantively enacted in a particular jurisdiction. The date a tax law is enacted or substantively enacted is key to the measurement of current and deferred tax assets and liabilities. [IAS 12.46, IAS 12.47]. In the case of Pillar Two taxes, MNEs need to monitor regulatory developments in respect of (substantive) enactment in all of the jurisdictions where they operate either through wholly- or partially-owned subsidiaries, joint ventures, flow-through entities or permanent establishments (such as branches). Different countries may (substantively) enact the Pillar Two tax rules on different dates and with variations to the GloBE Model Rules, potentially adding more complexity to the accounting. In this context, the discussion on substantive enactment of tax legislation in section 5.1 below is relevant to the assessment of the date from which Pillar Two legislation should apply in the financial statements.

4.7 Effectively tax-free entities

In several jurisdictions, certain classes of entity are exempt from income tax, and accordingly are not within the scope of IAS 12.

However, a more common, and more complex, situation is that tax legislation has the effect that certain classes of entities, whilst not formally designated as 'tax-free' in law, are nevertheless exempt from tax provided that they meet certain conditions that, in practice, they are almost certain to meet. A common example is that, in many jurisdictions, investment vehicles pay no tax, provided that they distribute all, or a minimum percentage, of their earnings to investors.

Accounting for the tax affairs of such entities raises a number of challenges, as discussed further in section 8.5.1 below.

5 Current tax

Current tax is the amount of income taxes payable (recoverable) in respect of the taxable profit (tax loss) for a period. [IAS 12.5].

Current tax for current and prior periods must, to the extent unpaid, be recognised as a liability. If the amount already paid in respect of current and prior periods exceeds the amount due for those periods, the excess is recognised as an asset. [IAS 12.12].

The benefit relating to a tax loss that can be carried back to recover current tax of a previous period must be recognised as an asset. When a tax loss is used to recover current tax of a previous period, an entity recognises the benefit as an asset in the period in which the tax loss occurs because it is probable that the benefit will flow to the entity and the benefit can be reliably measured. [IAS 12.13, IAS 12.14].

Current tax must be measured at the amount expected to be paid to or recovered from the tax authorities by reference to tax rates and laws that have been enacted or substantively enacted by the end of the reporting period. [IAS 12.46].

5.1 Enacted or substantively enacted tax legislation

Extract from IAS 12

46 Current tax liabilities (assets) for the current and prior periods shall be measured at the amount expected to be paid to (recovered from) the taxation authorities, using the tax rates (and tax laws) that have been enacted or substantively enacted by the end of the reporting period.

IAS 12 requires current tax to be measured using tax rates or laws enacted 'or substantively enacted' at the end of the reporting period. [IAS 12.46]. The standard comments that, in some jurisdictions, announcements of tax rates (and tax laws) by the government have the substantive effect of actual enactment, which may follow the announcement by a period of several months. In these circumstances, current tax assets and liabilities are measured using the announced tax rate (and tax laws). [IAS 12.48].

IAS 12 gives no guidance as to how this requirement is to be interpreted in different jurisdictions. In most jurisdictions, however, a consensus has emerged as to the meaning of 'substantive enactment' for that jurisdiction (see section 5.1.1 below). Nevertheless, apparently similar legislative processes in different jurisdictions may give rise to different treatments under IAS 12. For example, in most jurisdictions, tax legislation requires the formal approval of the head of state in order to become law. However, in some jurisdictions, the head of state has real executive power (and could potentially not approve the legislation), whereas in others the head of state has a more ceremonial role (and cannot practically fail to approve the legislation).

The general principle tends to be that in those jurisdictions where the head of state has executive power, legislation is not substantively enacted until actually approved by the head of state. Where, however, the head of state's powers are more ceremonial, substantive enactment is generally regarded as occurring at the stage of the legislative process where no further amendment is possible.

How we see it

Substantive enactment is a legal process rather than a concept for the purposes of applying the requirements in IAS 12. As such the substantive enactment of new tax legislation is specific to a jurisdiction, its legislative processes and traditions. The assessment for a particular new tax must be consistent with the assessment applied to other taxes in that jurisdiction. Accordingly, the determination of the stage of the legislative process that constitutes substantive enactment would not vary because of the complexity of the tax legislation in question. Further, although it might appear that the legislative process in one jurisdiction is similar to that of another, it is possible that the conclusion as to the stage of the process that constitutes substantive enactment is different.

5.1.1 Meaning of substantive enactment in various jurisdictions

The following table summarises the meaning of ‘substantive enactment’ in various jurisdictions as generally understood in those jurisdictions.⁷

Country	Point of substantive enactment
United Kingdom	A Finance Bill has been passed by the House of Commons (after the ‘third reading’) and is awaiting only passage through the House of Lords and Royal Assent. Alternatively, a resolution having statutory effect has been passed under the Provisional Collection of Taxes Act 1968.
Canada	If there is a majority government, substantive enactment generally occurs with respect to proposed amendments to the Federal Income Tax Act when detailed draft legislation has been tabled for first reading in Parliament. If there is a minority government, proposed amendments to the Federal Income Tax Act would not normally be considered to be substantively enacted until the proposals have passed the third reading in the House of Commons.
Australia	The Bill has passed through both Houses of Parliament (but before Royal Assent).
France	Signature of the legislation by the President.
Germany	The Bundestag and Bundesrat pass the legislation.
Japan	The Diet passes the legislation.
United States	The legislation is signed by the President or there is a successful override vote by both houses of Congress.
South Africa	Changes in tax rates not inextricably linked to other changes in tax law are substantively enacted when announced in the Minister of Finance’s Budget statement. Other changes in tax rates and tax laws are substantively enacted when approved by Parliament and signed by the President.

5.1.2 Changes to tax rates and laws enacted before the reporting date

Current tax must be measured at the amount expected to be paid to or recovered from the tax authorities by reference to tax rates and laws that have been enacted, or substantively enacted, by the end of the reporting period. [IAS 12.46]. Accordingly, the effects of changes in tax rates and laws on current tax balances are required to be recognised in the period in which the legislation is substantively enacted. There is no relief from this requirement under IAS 12, even in circumstances when complex legislation is substantively enacted shortly before the end of an annual or interim reporting period. In cases where the effective date of any rate changes is not the first day of the entity’s annual reporting period, current tax would be calculated by applying a blended rate to the taxable profits for the year.

Where complex legislation is enacted shortly before the end of the period, entities might encounter two distinct sources of uncertainty:

- Uncertainty about the requirements of the law, which may give rise to uncertain tax treatments as defined by IFRIC 23 and discussed in sections 5.2 and 9 below
- Uncertainties arising from incomplete information because entities may not have all the data required to process the effects of the changes in tax laws

It is not necessary for entities to have a complete understanding of every aspect of the new tax law to arrive at reasonable estimates, and provided that entities make every effort to obtain and take into account all the information they could reasonably be expected to obtain up to the date when the financial statements for the period are authorised for issue, subsequent changes to those estimates would not be regarded as a prior period error under IAS 8. [IAS 8.5]. We expect that only in rare circumstances would it not be possible to determine a reasonable estimate. However, these uncertainties may require additional disclosure in the financial statements. IAS 1 requires entities to disclose information about major sources of estimation uncertainty at the end of the reporting period that have a significant risk of resulting in a material adjustment to the carrying amounts of assets and liabilities within the next financial year (see Chapter 3). [IAS 1.125, IAS 1.129].

⁷ Based on a summary in the [IASB Update](#), February 2005. Available on the IFRS Foundation’s website.

Whilst the effect of changes in tax laws enacted after the end of the reporting period are not taken into account (see section 5.1.3 below), information and events that occur between the end of the reporting period and the date when the financial statements are authorised for issue are adjusting events after the reporting period if they provide evidence of conditions that existed as at the reporting date. [IAS 10.3]. Updated tax calculations, collection of additional data, clarifications issued by the tax authorities and gaining more experience with the tax legislation before the authorisation of the financial statements must be treated as adjusting events if they pertain to the position at the balance sheet date. Events that are indicative of conditions that arose after the reporting period must be treated as non-adjusting events. Judgement needs to be applied in determining whether technical corrections and regulatory guidance issued after year-end are to be considered adjusting events.

Where the effect of changes in the applicable tax rates compared to the previous accounting period are material, an explanation of those effects is required to be provided in the notes to the financial statements (see section 14.1 below). [IAS 12.81(d)].

5.1.3 Changes to tax rates and laws enacted after the reporting date

The requirement for substantive enactment by the end of the reporting period is quite clear in the literature. IAS 10 *Events after the Reporting Period* identifies the enactment or announcement of a change in tax rates and laws after the end of the reporting period as an example of a non-adjusting event. [IAS 10.22(h)]. For example, an entity with a reporting period ending on 31 December issuing its financial statements on 20 April the following year would measure its tax assets and liabilities by reference to tax rates and laws enacted or substantively enacted as at 31 December even if these had changed significantly before 20 April and even if those changes had retrospective effect. However, in these circumstances the entity would have to disclose the nature of those changes and provide an estimate of the financial effect of those changes if the impact is expected to be significant (see section 14.2 below). [IAS 10.21].

5.2 Uncertain tax treatments

In recording the 'amount expected to be paid or recovered' as required by IAS 12, the entity will need to have regard to any uncertain tax treatments. 'Uncertain tax treatment' is defined as a tax treatment over which there is uncertainty concerning its acceptance under the law by the relevant taxation authority. For example, an entity's decision not to submit any tax filing in a particular tax jurisdiction or not to include specific income in taxable profit would be an uncertain tax treatment, if its acceptability is unclear under tax law. [IFRIC 23.3]. Entities might also have to address uncertainty in applying new tax legislation, especially when it is enacted shortly before the end of the reporting period, as discussed in section 5.1.2 above.

Accounting for uncertain tax treatments is a particularly challenging aspect of accounting for tax. The requirements of IFRIC 23 are discussed in section 9 below.

5.3 'Prior year adjustments' of previously presented tax balances and expense (income)

The determination of the tax liability for all but the most straightforward entities is a complex process. It may be several years after the end of a reporting period before the tax liability for that period is finally agreed with the tax authorities and settled. Therefore, the tax liability initially recorded at the end of the reporting period to which it relates is no more than a best estimate at that time, which will usually require revision in subsequent periods until the liability is finally settled.

Tax practitioners often refer to such revisions as 'prior year adjustments' and regard them as part of the overall tax charge or credit for the current reporting period whatever their nature. However, for financial reporting purposes, the normal provisions of IAS 8 (see Chapter 3) apply to tax balances and the related expense (income). Therefore, the nature of any revision to a previously stated tax balance must be considered to determine whether the revision represents:

- A correction of a material prior period error (in which case it must be accounted for retrospectively, with a restatement of comparative amounts and, where applicable, the opening balance of assets, liabilities and equity at the start of the earliest period presented). [IAS 8.42].
- Or
- A refinement in the current period of an estimate made in a previous period (in which case it must be accounted for in the current period). [IAS 8.36].

In some cases, the distinction is clear. If, for example, the entity used an incorrect substantively enacted tax rate (see section 5.1 above) to calculate the liability in a previous period, the correction of that rate would - subject to materiality - be a prior year adjustment. A more difficult area is the treatment of accounting changes to reflect the resolution of uncertain tax treatments (see section 5.2 above). These have in practice almost always been treated as measurement adjustments in the current period. However, a view could be taken that the eventual denial, or acceptance, by the tax authorities of a position taken by the taxpayer indicates that one or other party (or both) were previously misinterpreting the tax law. As with other aspects of accounting for uncertain tax treatments, this is an area where judgement may be required. IFRIC 23 suggests that entities would reassess judgements and estimates in response to a change in facts and circumstances, and that the financial effect would be recognised as a change in estimate under IAS 8, i.e., in the period of change (see section 9.5 below). [IFRIC 23.13, IFRIC 23.14].

5.4 Discounting of current tax assets and liabilities

In some jurisdictions, entities are permitted to settle current tax liabilities on deferred terms. Similarly, refunds of current tax might be receivable more than 12 months after the reporting date. IAS 12 specifically prohibits discounting of deferred tax assets and liabilities. [IAS 12.53]. However, the standard is silent on the discounting of current tax assets and liabilities. In June 2004, the IFRS IC decided not to add this issue to its agenda, but expressed a general view that current taxes payable should be discounted when the effects are material. However, the IFRS IC also noted a potential conflict with the requirements of IAS 20, which at the time was intended to be withdrawn.⁸

How we see it

The lack of explicit guidance in the current version of IAS 12 has led to diversity in practice and it remains that entities are permitted, but not required, to discount current tax assets and liabilities. Accordingly, entities need to make an accounting policy choice and apply it consistently to all current taxes in all jurisdictions.

5.5 Intra-period allocation, presentation and disclosure

The allocation of current tax income and expense to components of total comprehensive income and equity is discussed in section 10 below. The presentation and disclosure of current tax income expense and assets and liabilities are discussed in sections 13 and 14 below.

⁸ [IFRIC Update](#), June 2004, available on the IFRS Foundation's website.

6 Deferred tax - Tax bases and temporary differences

All deferred tax liabilities and many deferred tax assets represent the tax effects of temporary differences. Therefore, the first step in measuring deferred tax is to identify all temporary differences. The discussion below addresses only whether a temporary difference exists. It does not necessarily follow that deferred tax is recognised in respect of that difference, since there are a number of situations, discussed in section 7 below, in which IAS 12 prohibits the recognition of deferred tax on a temporary difference. [IAS 12.5].

Extract from IAS 12

5 The following terms are used in this Standard with the meanings specified:

...

Temporary differences are differences between the carrying amount of an asset or liability in the statement of financial position and its tax base.

Temporary differences may be either:

- (a) **taxable temporary differences**, which are temporary differences that will result in taxable amounts in determining taxable profit (tax loss) of future periods when the carrying amount of the asset or liability is recovered or settled; or
- (b) **deductible temporary differences**, which are temporary differences that will result in amounts that are deductible in determining taxable profit (tax loss) of future periods when the carrying amount of the asset or liability is recovered or settled.

The **tax base** of an asset or liability is the amount attributed to that asset or liability for tax purposes.

In consolidated financial statements, temporary differences are determined by comparing the carrying amounts of an asset or liability in the consolidated financial statements with the appropriate tax base. The appropriate tax base is determined:

- In those jurisdictions in which a consolidated tax return is filed, by reference to that return.
- In other jurisdictions, by reference to the tax returns of each entity in the group. [IAS 12.11].

As the definition of tax base is the one on which all the others relating to deferred tax ultimately depend, understanding it is key to a proper interpretation of IAS 12. A more detailed discussion follows in sections 6.1 and 6.2 below. However, the overall effect of IAS 12 can be summarised as follows:

A **taxable** temporary difference will arise when:

- *The carrying amount of an asset is higher than its tax base*
For example, an item of PP&E is recorded in the financial statements at CU8,000, but has a tax base of only CU7,000. In future periods, tax will be paid on CU1,000 more profit than will be recognised in the financial statements (since CU1,000 of the remaining accounting depreciation is not tax-deductible).
- *The carrying amount of a liability is lower than its tax base*
For example, a loan payable of CU100,000 is recorded in the financial statements at CU99,000, net of issue costs of CU1,000 which have already been allowed for tax purposes (so that the loan is regarded as having a tax base of CU100,000 - see section 6.2.1.B below). In future periods, tax will be paid on CU1,000 more profit than is recognised in the financial statements (since the CU1,000 issue costs will be charged to the income statement but not be eligible for further tax deductions).

Conversely, a **deductible** temporary difference will arise when:

- *The carrying amount of an asset is lower than its tax base*
For example, an item of PP&E is recorded in the financial statements at CU7,000, but has a tax base of CU8,000. In future periods, tax will be paid on CU1,000 less profit than is recognised in the financial statements (since tax deductions will be claimed in respect of CU1,000 more depreciation than is charged to the income statement in those future periods).
- *The carrying amount of a liability is higher than its tax base*
For example, the financial statements record a liability for unfunded pension costs of CU2 million. A tax deduction is available only as cash is paid to settle the liability (so that the liability is regarded as having a tax base of nil - see section 6.2.2.A below). In future periods, tax will be paid on CU2 million less profit than is recognised in the financial statements (since tax deductions will be claimed in respect of CU2 million more expense than is charged to the income statement in those future periods).

This may be summarised in the following table.

Asset/liability	Carrying amount higher or lower than tax base?	Nature of temporary difference	Resulting deferred tax (if recognised)
Asset	Higher	Taxable	Liability
Asset	Lower	Deductible	Asset
Liability	Higher	Deductible	Asset
Liability	Lower	Taxable	Liability

6.1 Tax base

6.1.1 Tax base of assets

The tax base of an asset is the amount that will be deductible for tax purposes against any taxable economic benefits that will flow to an entity when it recovers the carrying amount of the asset. If those economic benefits will not be taxable, the tax base of the asset is equal to its carrying amount. [IAS 12.7].

In some cases, the 'tax base' of an asset is relatively obvious. In the case of a tax-deductible item of PP&E, it is the tax-deductible amount of the asset at acquisition less tax depreciation already claimed (see Illustration 1-1 in section 1.2 above). Other items, however, require more careful analysis.

For example, an entity may have accrued interest receivable of CU1,000 that will be taxed only on receipt. When the asset is recovered, all the cash received is subject to tax. In other words, the amount deductible for tax on recovery of the asset, and therefore its tax base, is nil. Another way of arriving at the same conclusion might be to consider the amount at which the tax authority would recognise the receivable in notional financial statements for the entity prepared under tax law. At the end of the reporting period the receivable would not be recognised in such notional financial statements, since the interest has not yet been recognised for tax purposes.

Conversely, an entity may have a receivable of CU1,000 the recovery of which is not taxable. In this case, the tax base is CU1,000 on the rule above that, where realisation of an asset will not be taxable, the tax base of the asset is equal to its carrying amount. This applies irrespective of whether the asset concerned arises from:

- A transaction already recognised in total comprehensive income and already subject to tax on initial recognition (e.g., in most jurisdictions, a sale).
 - A transaction already recognised in total comprehensive income and exempt from tax (e.g., tax-free dividend income).
- Or
- A transaction not affecting total comprehensive income at all (e.g., the principal of a loan receivable).
- [IAS 12.7].

The effect of deeming the tax base of the CU1,000 receivable to be equal to its carrying amount will be that the temporary difference associated with it is nil, and that no deferred tax is recognised in respect of it. This is appropriate given that, in the first case, the debtor represents a sale that has already been taxed and, in the second and third cases, the debtors represent items that are outside the scope of tax.

6.1.2 Tax base of liabilities

The tax base of a liability is its carrying amount, less any amount that will be deductible for tax purposes in respect of that liability in future periods. In the case of revenue which is received in advance, the tax base of the resulting liability is its carrying amount, less any amount of the revenue that will not be taxable in future periods. [IAS 12.8].

As in the case of assets, the tax base of some items is relatively obvious. For example, an entity may have recognised a provision for environmental damage of CU5 million, which will be deductible for tax purposes only on payment. The liability has a tax base of nil. Its carrying amount is CU5 million, which is also the amount that will be deductible for tax purposes on settlement in future periods. The difference between these two (equal) amounts - the tax base - is nil. Another way of arriving at the same conclusion might be to consider the amount at which the tax authority would recognise the liability in notional financial statements for the entity prepared under tax law. At the end of the reporting period the liability would not be recognised in such notional financial statements, since the expense has not yet been recognised for tax purposes.

Likewise, if the entity records revenue of CU1,000 received in advance that was taxed on receipt, its tax base is nil. Under the definition above, the carrying amount is CU1,000, none of which is taxable in future periods. The tax base is the difference between the CU1,000 carrying amount and the amount not taxed in future periods (CU1,000) - i.e., nil.

Again, if we were to consider a notional statement of financial position of the entity drawn up by the tax authorities under tax law, this liability would not be included, since the relevant amount would, in the notional tax financial statements, have already been taken to income.

An entity may have a liability of (say) CU1,000 that will attract no tax deduction when it is settled. In this case, the tax base is CU1,000 (on the analogy with the rule in section 6.1.1 above that where, realisation of an asset will not be taxable, the tax base of the asset is equal to its carrying amount). This applies irrespective of whether the liability concerned arises from:

- A transaction already recognised in total comprehensive income and already subject to a tax deduction on initial recognition (e.g., in most jurisdictions, the cost of goods sold or accrued expenses).
- A transaction already recognised in total comprehensive income and outside the scope of tax (e.g., non tax-deductible fines and penalties).

Or

- A transaction not affecting total comprehensive income at all (e.g., the principal of a loan payable).

[IAS 12.8].

This is appropriate given that, in the first case, the liability represents a cost that has already been deducted for tax purposes and, in the second and third cases, the liabilities represent items that are outside the scope of tax.

6.1.3 Assets and liabilities whose tax base is not immediately apparent

IAS 12 indicates that where the tax base of an asset or liability is not immediately apparent, it is helpful to consider the fundamental principle on which the standard is based: an entity must, with certain limited exceptions, recognise a deferred tax liability (asset) wherever recovery or settlement of the carrying amount of an asset or liability would make future tax payments larger (smaller) than they would be if such recovery or settlement were to have no tax consequences. [IAS 12.10]. In other words: provide for the tax that would be payable or receivable if the assets and liabilities in the statement of financial position were to be recovered or settled at book value.

The implication of this is that in the basic 'equation' of IAS 12, i.e.,

carrying amount - tax base = temporary difference,

the true unknown is not in fact the temporary difference (as implied by the definitions of tax base and temporary difference) but the tax base (as implied by IAS 12.10).

It will be apparent from the more detailed discussion in section 6.2 below that this clarification is particularly relevant to determining the tax bases of certain financial liabilities, which often do not fit the general 'formula' of carrying amount less amount deductible on settlement.

6.1.4 Tax base of items not recognised as assets or liabilities in financial statements

Certain items are not recognised as assets or liabilities in financial statements, but may nevertheless have a tax base. Examples may include:

- Research costs (which are required to be expensed immediately by IAS 38 *Intangible Assets* see Chapter 18)
- The cost of equity-settled share-based payment transactions (which under IFRS 2 *Share-based Payment* give rise to an increase in equity and not a liability - see Chapter 30)
- Goodwill deducted from equity under previous IFRS accounting standard or national GAAP

Where such items are tax-deductible, their tax base is the difference between their carrying amount (i.e., nil) and the amount deductible in future periods. [IAS 12.9]. This may seem somewhat contrary to the definition of tax base, in which it is inherent that, in order for an item to have a tax base, that item must be an asset or liability, whereas none of the items above was ever recognised as an asset.⁹ The implicit argument is that all these items were initially (and very briefly) recognised as assets before being immediately written off in full.

⁹ In some cases, research and share-based payment costs may be included as part of the cost of other assets, such as inventories or PP&E.

Local tax legislation sometimes gives rise to liabilities that have a tax base but no carrying amount. For example, a subsidiary of the reporting entity may receive a tax deduction for a provision that has been recognised in the individual financial statements of that subsidiary prepared under local accounting principles. For the purposes of the entity's consolidated financial statements, however, the provision does not satisfy the recognition requirements of IAS 37. In such situations, we consider it appropriate to regard the tax deduction received as giving rise to a deferred tax liability in the consolidated financial statements (by virtue of there being a provision with a tax base but no carrying amount) in addition to the current tax income recorded for the subsidiary.

Similar situations may arise where local tax legislation permits deductions for certain expenditure determined according to tax legislation without reference to any financial statements. Again, in those cases where an equivalent amount of expenditure is likely to be recognised in the financial statements at a later date, we would regard it as appropriate to regard the tax deduction received as giving rise to a deferred tax liability in the consolidated financial statements.

6.1.5 Equity items with a tax base

The definition of 'tax base' refers to the tax base of an 'asset or liability'. This begs the question of whether IAS 12 regards equity items as having a tax base and therefore whether deferred tax can be recognised in respect of equity instruments (since deferred tax is the tax relating to temporary differences which, by definition, can only arise on items with a tax base - see above).

In February 2003, the IFRS IC considered this issue. It drew attention to the IASB's proposal at that time to amend the definition of 'tax base' so as to refer not only to assets and liabilities but also equity instruments as supporting the view that deferred tax must be recognised where appropriate on equity instruments. This was effectively the approach proposed in the exposure draft ED/2009/2 (see section 1.3 above) which, as noted in section 1.3 above, was withdrawn.¹⁰

An alternative analysis might be that equity items do not have a tax base, but that any tax effects of them are to be treated as items that are not recognised as assets or liabilities but nevertheless have a tax base (see section 6.1.4 above).

How we see it

Given the lack of explicit guidance in the current version of IAS 12, either analysis may be acceptable, provided that it is applied consistently. This is reflected in a number of the Illustrations in the remainder of this Chapter.

6.1.6 Items with more than one tax base

Some assets and liabilities have more than one tax base, depending on the manner in which they are realised or settled. These are discussed further in section 8.4 below.

6.1.7 Tax bases disclaimed or with no economic value

In some situations, an entity may choose not to claim an available deduction for an item as part of an overall tax planning strategy. In other cases, a deduction available as a matter of tax law may have no real economic effect - for example because the deduction will increase a pool of brought forward tax losses which the entity does not expect to recover in the foreseeable future.

How we see it

In our view, the fact that the entity chooses not to take advantage of a potential tax deduction, or that such a deduction would have no real economic effect in the foreseeable future, does not mean that the asset to which the deduction relates has no tax base. While such considerations will be relevant to determining whether a deductible temporary difference gives rise to a recoverable deferred tax asset (see section 7.5 below), the tax base of an asset is determined by reference to the amount attributed to the item by tax law.

¹⁰ Exposure draft [ED/2009/2: Income Tax](#), IASB, March 2009, Appendix A, definition of 'tax basis'. Available on the IFRS Foundation's website.

6.2 Examples of temporary differences

The following are examples of taxable temporary differences, deductible temporary differences and items where the tax base and carrying value are the same so that there is no temporary difference. The examples are mostly based on those given in IAS 12, [IAS 12.17, IAS 12.18, IAS 12.20, IAS 12.26, IAS 12.IE.A-C], but include several others that are encountered in practice. It will be seen that a number of categories of assets and liabilities may give rise to either taxable or deductible temporary differences.

A temporary difference will not always result in a deferred tax asset or liability being recorded under IAS 12, since the difference may be subject to other provisions of the standard restricting the recognition of deferred tax assets and liabilities, which are discussed in section 7 below. Moreover, even where deferred tax is recognised, it does not necessarily create tax income or expense, but may instead give rise to additional goodwill or bargain purchase gain in a business combination, or to a movement in equity.

6.2.1 Taxable temporary differences

6.2.1.A Transactions that affect profit or loss

- ***Interest received in arrears***

An entity with a financial year ending on 31 December 20X3 holds a medium-term cash deposit on which interest of CU10,000 is received annually on 31 March. The interest is taxed in the year of receipt. At 31 December 20X3, the entity recognises a receivable of CU7,000 in respect of interest accrued but not yet received. The receivable has a tax base of nil, since its recovery has tax consequences and no tax deductions are available in respect of it. The temporary difference associated with the receivable is CU7,000 (CU7,000 carrying amount less nil tax base).

- ***Sale of goods taxed on a cash basis***

An entity has recorded revenue from the sale of goods of CU40,000, together with a cost of the goods sold of CU35,000, since the goods have been delivered. However, the transaction is taxed in the following financial year when the cash from the sale is collected.

The entity will have recognised a receivable of CU40,000 for the sale. The receivable has a tax base of nil, since its recovery has tax consequences and no tax deductions are available in respect of it. The temporary difference associated with the receivable is CU40,000 (CU40,000 carrying amount less nil tax base).

There is also a deductible temporary difference of CU35,000 associated with the (now derecognised) inventory, which has a carrying amount of zero but a tax base of CU35,000 (since it will attract a tax deduction of CU35,000 when the sale is taxed) - see section 6.2.2.A below.

- ***Depreciation of an asset accelerated for tax purposes***

An entity has an item of PP&E whose cost is fully tax deductible, but with deductions being given over a period shorter than the period over which the asset is being depreciated under IAS 16 *Property, Plant and Equipment*. At the reporting date, the asset has been depreciated to CU500,000 for financial reporting purposes but to CU300,000 for tax purposes.

Recovery of the PP&E has tax consequences since, although there is no deduction for accounting depreciation in the tax return, the PP&E is recovered through future taxable profits. There is a taxable temporary difference of CU200,000 between the carrying value of the asset (CU500,000) and its tax base (CU300,000).

- ***Capitalised development costs already deducted for tax***

An entity incurred development costs of CU1 million during the year ended 31 December 20X3. The costs were fully deductible for tax purposes in the tax return for that period, but were recognised as an intangible asset under IAS 38 in the financial statements. The amount carried forward at 31 December 20X3 is CU800,000.

Recovery of the intangible asset through use has tax consequences since, although there is no deduction for accounting amortisation in the tax return, the asset is recovered through future profits which will be taxed. There is a taxable temporary difference of CU800,000 between the carrying value of the asset (CU800,000) and its tax base (nil). Although the expenditure to create the asset is tax-deductible in the current period, its tax base is the amount deductible in future periods, which is nil, since all deductions were made in the tax return for 20X3.

A similar analysis would apply to prepaid expenses that have already been deducted on a cash basis in determining the taxable profit of the current or previous periods.

6.2.1.B Transactions that affect the statement of financial position

- ***Non-deductible and partially deductible assets***

An entity acquires a building for CU1 million. Any accounting depreciation of the building is not deductible for tax purposes, and no deduction will be available for tax purposes when the asset is sold or scrapped.

Recovery of the building, whether in use or on sale, nevertheless has tax consequences since the building is recovered through future taxable profits of CU1 million. There is a taxable temporary difference of CU1 million between the carrying value of the asset (CU1 million) and its tax base of zero.

A similar analysis applies to an asset which, when acquired, is deductible for tax purposes, but for an amount lower than its cost. The difference between the cost and the amount deductible for tax purposes is a taxable temporary difference.

- ***Deductible loan transaction costs***

A borrowing entity records a loan at CU9.5 million, being the proceeds received of CU10 million (which equal the amount due at maturity), less transaction costs of CU500,000, which are deducted for tax purposes in the period when the loan was first recognised. For loans carried at amortised cost, IFRS 9 requires the costs, together with interest and similar payments, to be accrued over the period to maturity using the effective interest method.

Inception of the loan gives rise to a taxable temporary difference of CU500,000, being the difference between the carrying amount of the loan (CU9.5 million) and its tax base (CU10 million). This tax base does not conform to the general definition of the tax base of a liability - i.e., the carrying amount, less any amount that will be deductible for tax purposes in respect of that liability in future periods (see section 6.1.2 above).

The easiest way to derive the correct tax base is to construct a notional statement of financial position prepared by the tax authorities according to tax law. This would show a liability for the full CU10 million (since the amortisation of the issue costs that has yet to occur in the financial statements has already occurred in the notional tax authority financial statements). This indicates that the tax base of the loan is CU10 million.

A far simpler analysis for the purposes of IAS 12 might have been that the CU9.5 million carrying amount comprises a loan of CU10 million (with a tax base of CU10 million, giving rise to temporary difference of zero) offset by prepaid transaction costs of CU500,000 (with a tax base of zero, giving rise to a taxable temporary difference of CU500,000). However, this is inconsistent with the analysis in IFRS 9 that the issue costs are an integral part of the carrying value of the loan.

The consequence of recognising a deferred tax liability in this case is that the tax deduction for the transaction costs is recognised in profit or loss, not on inception of the loan, but as the costs are recognised through the effective interest method in future periods.

- ***Non-deductible loan transaction costs***

As in the immediately preceding example, a borrowing entity records a loan at CU9.5 million, being the proceeds received of CU10 million (which equal the amount due at maturity), less transaction costs of CU500,000. In this case, however, the transaction costs are not deductible in determining the taxable profit of future, current or prior periods. For loans carried at amortised cost, IFRS 9 requires the costs to be accrued over the period to maturity using the effective interest method.

Just as in the preceding example (and perhaps rather counter-intuitively, given that the costs are non-deductible) inception of the loan gives rise to a taxable temporary difference of CU500,000, being the difference between the carrying amount of the loan (CU9.5 million) and its tax base (CU10 million). This is because a notional statement of financial position prepared by the tax authorities according to tax law would show a liability for the full CU10 million, since the transaction costs would never have been recorded (as they never occurred for tax purposes).

- ***Liability component of compound financial instrument***

An entity issues a convertible bond for CU5 million which, in accordance with the requirements of IAS 32 *Financial Instruments: Presentation*, is analysed as comprising a liability component of CU4.6 million and a residual equity component of CU400,000. If the entity were to settle the liability for CU4.6 million it would be liable to tax on CU400,000 (CU5 million less CU4.6 million). Therefore, the tax base of the liability is CU5 million and there is a taxable temporary difference of CU400,000 between this and the carrying amount of the liability component. This is discussed further in section 7.2.7 below.

6.2.1.C Revaluations

- **Financial assets and property carried at valuation**

An entity holds investments, accounted for at fair value through profit or loss, with a carrying amount of CU2 million and an original cost (and tax base) of CU1.3 million. There is a taxable temporary difference of CU700,000 associated with the investments, being the amount on which the entity would pay tax if the investments were realised at their carrying value.

A similar analysis would apply to investment property or PP&E carried at a value that exceeds cost, where no equivalent adjustment is made for tax purposes.

6.2.1.D Tax re-basing

- **Withdrawal of tax depreciation for classes of PP&E**

An entity holds buildings with a carrying amount of CU15 million and a tax base of CU12 million, giving rise to a taxable temporary difference of CU3 million. As part of a general fiscal reform package introduced by the government, future tax deductions for the buildings (their tax base) are reduced to CU1 million. This increases the taxable temporary difference by CU11 million to CU14 million.

6.2.1.E Business combinations and consolidation

- **Fair value adjustments**

Where the carrying amount of an asset is increased to fair value in a business combination, but no equivalent adjustment is made for tax purposes, a taxable temporary difference arises just as on the revaluation of an asset (see section 6.2.1.C above).

- **Non-deductible or partially deductible goodwill**

Where goodwill is not deductible, or only partially deductible, in determining taxable profit there will be a taxable temporary difference between the carrying amount of the goodwill and its tax base, similar to that arising on a non-deductible or partially deductible asset (see section 6.2.1.B above).

- **Intragroup transactions**

Although intragroup transactions are eliminated in consolidated financial statements, they may give rise to temporary differences. An entity in a group (A) might sell inventory with a cost and tax base of CU1,000 to another group entity (B) for CU900, which becomes the cost and tax base to B. If the carrying value in the consolidated financial statements remains CU1,000 (i.e., the inventory is not actually impaired, notwithstanding the intragroup sale at a loss), a new taxable temporary difference of CU100 emerges in the consolidated financial statements between the carrying value of CU1,000 and the new tax base of CU900.

- **Undistributed earnings of group investments**

A parent entity P holds an investment in subsidiary S. Retained earnings of CU1 million relating to S are included in the consolidated financial statements of P. S must pay a non-refundable withholding tax on any distribution of earnings to P. There is therefore a taxable temporary difference in the consolidated financial statements of CU1 million associated with the net assets representing the retained earnings, since their recovery (in the form of distribution to the parent) has tax consequences, with no offsetting tax deductions.

Similar temporary differences may arise on the retained earnings of branches, associates and joint arrangements.

6.2.1.F Foreign currency differences

- **Translation of foreign subsidiary to presentation currency**

A UK entity acquires the equity of a French entity, which therefore becomes its subsidiary, for €10 million. For UK tax purposes, the tax base of the investment is £8 million (the spot-rate equivalent of €10 million at the date of acquisition). The presentation currency of the UK entity's consolidated financial statements is sterling.

Between the date of acquisition and the first reporting date, the French entity makes no gains or losses, such that its net assets and goodwill as included in the consolidated financial statements, expressed in euros, remain €10 million. However, the exchange rate has moved, so that the sterling equivalent of €10 million at the reporting date, included in the consolidated statement of financial position, is £9 million.

This gives rise to a £1 million taxable temporary difference between the £9 million carrying value of the investment and its £8 million tax base.

- **Functional currency different from currency used to compute tax**

On 1 January 20X3 an entity which, under IAS 21 *The Effects of Changes in Foreign Exchange Rates*, has determined its functional currency as Currency CU (see Chapter 16), purchases plant for CU1 million, which will be depreciated to its estimated residual value of zero over 10 years. The entity is taxed in the local currency LC, and is entitled to receive tax deductions for the depreciation charged in the financial statements. The exchange rate is CU1=LC2 at 1 January 20X3 (so that the cost of the asset for local tax purposes is LC2 million). The exchange rate at 31 December 20X3 is CU1=LC2.5.

At 31 December 20X3 there is a taxable temporary difference of CU180,000, being the difference between the net book value of the plant of CU900,000 (cost CU1,000,000 less depreciation CU100,000) and its tax base of CU720,000 (cost LC2,000,000 less depreciation LC200,000 = LC1,800,000 translated at year end rate of CU1=LC2.5).

6.2.1.G Hyperinflation

A taxable temporary difference (similar to those in section 6.2.1.F above) arises when non-monetary assets are restated in terms of the measuring unit current at the end of the reporting period under IAS 29 *Financial Reporting in Hyperinflationary Economies* - but no equivalent adjustment is made for tax purposes.

6.2.2 Deductible temporary differences

6.2.2.A Transactions that affect profit of loss

- **Expenses deductible for tax on cash basis**

An entity records a liability of CU1 million for retirement benefit costs which are tax deductible only when paid. The tax base of the liability is zero, being its carrying amount (CU1 million) less the amount deductible for tax purposes when the liability is settled (also CU1 million). There is therefore a deductible temporary difference of CU1 million (CU1 million carrying amount less zero tax base) associated with the liability.

- **Depreciation of an asset delayed for tax purposes**

An entity has an item of PP&E that originally cost CU1 million. The cost is fully tax deductible, with deductions being given over a period longer than the period over which the asset is being depreciated under IAS 16. At the reporting date, the asset has been depreciated to CU300,000 for financial reporting purposes but to only CU500,000 for tax purposes.

Recovery of the PP&E has tax consequences since, although there is no deduction for accounting depreciation in the tax return, the PP&E is recovered through future taxable profits of CU300,000. There is a deductible temporary difference of CU200,000 between the carrying value of the asset (CU300,000) and its tax base (CU500,000).

- **Sale of goods taxed on a cash basis**

An entity has recorded revenue from the sale of goods of CU40,000, together with a cost of the goods sold of CU35,000, since the goods have been delivered. However, the transaction is taxed in the following financial year when the cash from the sale is collected.

There is a deductible temporary difference of CU35,000 associated with the (now derecognised) inventory, which has a carrying amount of zero but a tax base of CU35,000 (since it will attract a tax deduction of CU35,000 when the sale is taxed).

There is also a taxable temporary difference of CU40,000 associated with the receivable (see section 6.2.1.A above).

- **Write-down of asset not deductible for tax purposes until realised**

An entity purchases inventory for CU1,000, which is also its tax base. The inventory is later written down to a net realisable value of CU800. However, no loss is recognised for tax purposes until the inventory is sold. There is a deductible temporary difference of CU200 between the CU800 carrying amount of the inventory and its CU1,000 tax base.

- **Deferred income taxed on receipt**

In the year ended 31 December 20X3, an entity received CU2 million, being 5 years' rent of an investment property received in advance. In the statement of financial position as at 31 December, CU1,800,000 is carried forward as deferred income. However, the whole CU2 million is taxed in the tax return for the period.

There is a deductible temporary difference of CU1,800,000 associated with the deferred income, being its carrying amount (CU1,800,000), less its tax base of zero, computed as the carrying amount (CU1,800,000) less the amount not taxable in future periods (also CU1,800,000 since the income has already been taxed).

- **Deferred non-taxable income**

An entity receives a non-taxable government grant of CU1 million, of which CU700,000 is carried forward in the statement of financial position as at the period end.

There is a deductible temporary difference of CU700,000 associated with the deferred income, being its carrying amount (CU700,000), less its tax base of zero, computed as the carrying amount (CU700,000) less the amount of income not taxable in future periods (also CU700,000 since the income is tax free). In this case, while there is a deductible temporary difference, no deferred tax asset would be recognised, as discussed in Illustration 7-6 in section 7.2.3 below. [IAS 12.24, IAS 12.33].

6.2.2.B Transactions that affect the statement of financial position

- **Asset deductible for more than cost**

An entity invests CU10 million in PP&E for which tax deductions of CU13 million may be claimed. There is a deductible temporary difference of CU3 million between the CU10 million carrying value of the PP&E and its tax base of CU13 million.

6.2.2.C Revaluations

- **Financial assets and property carried at valuation**

An entity holds investments, accounted for at fair value through profit or loss, with a carrying amount of CU2 million and an original cost (and tax base) of CU2.5 million. There is a deductible temporary difference of CU500,000 associated with the investments, being the amount for which the entity would receive a tax deduction if the investments were realised at their carrying value.

A similar analysis would apply to investment property or PP&E carried at a value below cost, where no equivalent adjustment is made for tax purposes.

6.2.2.D Tax re-basing

- **Indexation of assets for tax purposes**

An entity acquires land for CU5 million, which is also its tax base at the date of purchase. A year later, as part of a general fiscal reform package introduced by the government, future tax deductions for the land (its tax base) are increased to CU6 million. This creates a deductible temporary difference of CU1 million in respect of the land.

6.2.2.E Business combinations and consolidation

- **Fair value adjustments**

Where a liability is recognised at fair value in a business combination, but the liability is deductible for tax purposes only on settlement, a deductible temporary difference arises similar to that arising on the initial recognition of a liability for an expense deductible for tax on a cash basis (see section 6.2.2.A above).

- **Intragroup transactions**

Although intragroup transactions are eliminated in consolidated financial statements, they may give rise to deductible temporary differences. An entity in a group (A) might sell inventory with a cost and tax base of CU1,000 to another group entity (B) for CU1,200, which becomes the cost and tax base to B. Since the carrying value in the consolidated financial statements remains CU1,000, a new deductible temporary difference of CU200 emerges in the consolidated financial statements between the carrying value of CU1,000 and the new tax base of CU1,200.

6.2.2.F Foreign currency differences

- **Translation of foreign subsidiary to presentation currency**

A UK entity acquires the equity of a French entity, which therefore becomes its subsidiary, for €10 million. For UK tax purposes, the tax base of the investment is £8 million (the spot-rate equivalent of €10 million at the date of acquisition). The presentation currency of the UK entity's consolidated financial statements is sterling.

Between the date of acquisition and the first reporting date, the French entity makes no gains or losses, such that its net assets and goodwill as included in the consolidated financial statements, expressed in euros, remain €10 million. However, the exchange rate has moved, so that the sterling equivalent of €10 million at the reporting date, included in the consolidated statement of financial position, is £7 million.

This gives rise to a £1 million deductible temporary difference between the £7 million carrying value of the investment and its £8 million tax base.

- **Functional currency different from currency used to compute tax**

On 1 January 20X3 an entity which, under IAS 21 has determined its functional currency as Currency CU (see Chapter 16), purchases plant for CU1 million, which will be depreciated to its estimated residual value of zero over 10 years. The entity is taxed in the local currency LC, and is entitled to receive tax deductions for the depreciation charged in the financial statements. The exchange rate is CU1=LC2 at 1 January 20X3 (so that the cost of the asset for local tax purposes is LC2 million). The exchange rate at 31 December 20X3 is CU1=LC1.8.

At 31 December 20X3 there is a deductible temporary difference of CU100,000, being the difference between the net book value of the plant of CU900,000 (cost CU1,000,000 less depreciation CU100,000) and its tax base of CU1,000,000 (cost LC2,000,000 less depreciation LC200,000 = LC1,800,000 translated at year end rate of CU1=LC1.8).

6.2.3 Assets and liabilities with no temporary difference (because tax base equals carrying amount)

- **Liability for expense already deducted for tax**

An entity accrues CU200,000 for electricity costs in the year ended 31 March 20X3. The expense is deductible for tax in that period. The temporary difference associated with the liability is zero. This is calculated as the carrying amount of CU200,000 less the tax base of CU200,000, being the carrying amount (CU200,000) less amount deductible for tax in future periods (zero).

- **Liability for expense never deductible for tax**

An entity accrues CU400,000 for a fine for environmental pollution, which is not deductible for tax. The temporary difference associated with the liability is zero. This is calculated as the carrying amount of CU400,000 less the tax base of CU400,000, being the carrying amount (CU400,000) less amount deductible for tax in future periods (zero).

- **Loan repayable at carrying amount**

An entity borrows CU2 million. This is the carrying amount of the loan on initial recognition, which is the same as the amount repayable on final maturity of the loan. The temporary difference associated with the liability is zero. This is calculated as the carrying amount of CU2 million less the tax base of CU2 million, being the carrying amount (CU2 million) less amount deductible for tax in future periods (zero).

- **Receivable for non-taxable income**

In its separate financial statements, an entity records a receivable for a CU1 million dividend due from a subsidiary accounted for at cost. The dividend is not taxable. Accordingly, it gives rise to a temporary difference of zero, since the tax base of any asset, the recovery of the carrying amount of which is not taxable, is taken to be the same as its carrying amount.

7 Deferred tax - Recognition

7.1 The basic principles

7.1.1 Taxable temporary differences (deferred tax liabilities)

Extract from IAS 12

- 15** A deferred tax liability shall be recognised for all taxable temporary differences, except to the extent that the deferred tax liability arises from:
- (a) the initial recognition of goodwill; or
 - (b) the initial recognition of an asset or liability in a transaction which:
 - (i) is not a business combination;
 - (ii) at the time of the transaction, affects neither accounting profit nor taxable profit (tax loss); and
 - (iii) at the time of the transaction, does not give rise to equal taxable and deductible temporary differences.
- However, for taxable temporary differences associated with investments in subsidiaries, branches and associates, and interests in joint arrangements, a deferred tax liability shall be recognised in accordance with paragraph 39.

The above exceptions to the recognition principles do not apply to taxable temporary differences associated with investments in subsidiaries, branches and associates, and interests in joint arrangements, which are subject to further detailed provisions of IAS 12 (see section 7.6 below). [IAS 12.15].

Examples of taxable temporary differences are given in section 6.2.1 above.

7.1.2 Deductible temporary differences (deferred tax assets)

Extract from IAS 12

- 24** A deferred tax asset shall be recognised for all deductible temporary differences to the extent that it is probable that taxable profit will be available against which the deductible temporary difference can be utilised, unless the deferred tax asset arises from the initial recognition of an asset or liability in a transaction that:
- (a) is not a business combination;
 - (b) at the time of the transaction, affects neither accounting profit nor taxable profit (tax loss); and
 - (c) at the time of the transaction, does not give rise to equal taxable and deductible temporary differences.
- However, for deductible temporary differences associated with investments in subsidiaries, branches and associates, and interests in joint arrangements, a deferred tax asset shall be recognised in accordance with paragraph 44.

IAS 12 does not define 'probable' in this context. [IAS 12.24]. However, it is generally understood that, for example in IFRS 5 *Non-current Assets Held for Sale and Discontinued Operations* and IAS 37, it must be taken to mean 'more likely than not'. [IFRS 5 Appendix A, IAS 37.23]. The exposure draft ED/2009/2 (see section 1.3 above) effectively clarified that this is the intended meaning.¹¹

These exceptions to the recognition principles do not apply to deductible temporary differences associated with investments in subsidiaries, branches and associates, and interests in joint arrangements, which are subject to further detailed provisions of IAS 12 (see section 7.6 below).

As noted above, IAS 12 restricts the recognition of deferred tax assets to the extent that it is probable that taxable profit will be available against which the underlying deductible temporary differences can be utilised. [IAS 12.24, IAS 12.27]. This restriction is discussed in section 7.5 below.

Examples of deductible temporary differences are given in section 6.2.2 above.

¹¹ Exposure draft [ED/2009/2: Income Tax](#), IASB, March 2009, paras. 20 and 23. Available on the IFRS Foundation's website.

7.1.3 Interpretation issue - taxable profit 'at the time of the transaction'

The provisions of IAS 12 summarised above also refer to a transaction which affects taxable profit 'at the time of the transaction'. Strictly speaking, no transaction affects taxable profit 'at the time of the transaction', since the taxable profit is affected only when the relevant item is included (some time later) in the tax return for the period. It is clear, however, that the intended meaning is that the transaction that gives rise to the initial recognition of the relevant asset or liability affects the current tax liability for the accounting period in which the initial recognition occurs.

Suppose that, in the year ended 31 December 20X2, an entity received CU2 million, being 5 years' prepaid rent of an investment property. In the statement of financial position as at 31 December, CU1,800,000 is carried forward as deferred income. The whole CU2 million is taxed on receipt and will therefore be included in the tax return for 20X2, which is filed with the tax authorities in 20X3. For the purposes of IAS 12, the transaction is regarded as affecting taxable profit during 20X2 (since it affects the current tax for that period), even though the tax return for 20X2 is not filed with the tax authorities until 20X3. This gives rise to the recognition in the 20X2 financial statements, subject to the restrictions discussed in section 7.5 below, of a deferred tax asset based on a deductible temporary difference of CU1,800,000 (see section 6.2.2.A above).

7.2 The initial recognition exception

The exceptions (summarised in section 7.1 above) from recognising the deferred tax effects of certain temporary differences arising on the initial recognition of some assets and liabilities are generally referred to as the 'initial recognition exception' or 'initial recognition exemption', sometimes abbreviated to 'IRE'. 'Exception' is the more accurate description, since a reporting entity is required to apply it, rather than having the option to do so implicit in the term 'exemption'.

The initial recognition exception has its origins in the now superseded 'income statement' approaches to accounting for deferred tax. Under these approaches, deferred tax was not recognised on so-called 'permanent differences' - items of income or expense that appeared in either the financial statements or the tax return, but not in both. The majority of transactions to which the initial recognition exception applies would have been regarded as permanent differences under income statement approaches of accounting for deferred tax. For entities applying the temporary difference approach of IAS 12, the IRE avoids the need for entities to recognise an initial deferred tax liability or asset and adjust the carrying amount of the asset or liability by the same amount. The standard argues that such adjustments would make the financial statements less transparent. Therefore, IAS 12 does not allow an entity to recognise the resulting deferred tax liability or asset, either on initial recognition or subsequently. [IAS 12.22(c)]. It would also be inappropriate to recognise any adjustment as a gain or loss in profit or loss, given that the transaction itself has no effect on profit or loss.

The purpose of the initial recognition exception is most easily understood by considering the accounting consequences that would follow if it did not exist, as shown in Illustration 7-1 below.

Illustration 7-1: Rationale for initial recognition exception

An entity acquires an asset for CU1,000 which it intends to use for five years and then scrap (i.e., the residual value is nil). The tax rate is 40%. Depreciation of the asset is not deductible for tax purposes. On disposal, any capital gain would not be taxable and any capital loss would not be deductible.

Although the asset is non-deductible, its recovery has tax consequences, since it will be recovered out of taxable income of CU1,000 on which tax of CU400 will be paid. The tax base of the asset is therefore zero, and a temporary difference of CU1,000 arises on initial recognition of the asset.

Absent the initial recognition exception, the entity would recognise a deferred tax liability of CU400 on initial recognition of the asset, being the taxable temporary difference of CU1,000 multiplied by the tax rate of 40%. A debit entry would then be required to balance the credit for the liability.

One possibility might be to recognise tax expense of CU400 in the statement of total comprehensive income. This would be meaningless, since the entity has clearly not suffered a loss simply by purchasing a non-deductible asset in an arm's length transaction for a price that (economically) must reflect the asset's non-deductibility.

A second possibility would be to gross up the asset by CU400 to CU1,400. However, IAS 12 states that to make such adjustments to the carrying value of the asset would make the financial statements 'less transparent'. [IAS 12.22(c)].

A third possibility would be to gross up the asset to the amount that would rationally have been paid for it, had it been fully tax-deductible, and recognise a corresponding amount of deferred tax. As the asset is non-deductible, the CU1,000 cost must theoretically represent the anticipated minimum *post-tax* return from the asset. In order to achieve a post-tax return of CU1,000, an entity paying tax at 40% needs to earn pre-tax profits of CU1,667 ($\text{CU1,000} \div [1 - 0.4]$). Therefore, the cost of an equivalent fully-deductible asset would, all else being equal, be CU1,667. On this analysis, the entity would gross up the asset to CU1,667 and recognise deferred tax of CU667 ($\text{CU1,667} @ 40\%$).

The fourth possibility, which is what is actually required by IAS 12, is not to provide for deferred tax at all, where to do so would lead to one of the three outcomes above. However, in cases where provision for the deferred tax on a temporary difference arising on initial recognition of an asset or liability would not lead to one of the outcomes above, the initial recognition exception does not apply. This is the case in a business combination or a transaction affecting taxable profit or accounting profit (or both).

- **Business combination**

In a business combination, the corresponding accounting entry for a deferred tax asset or liability forms part of the goodwill arising or the bargain purchase gain recognised. No deferred tax income or expense is recorded.

- **Transaction affecting taxable profit or accounting profit**

In a transaction affecting taxable profit or accounting profit (or both), the corresponding accounting entry for a deferred tax asset or liability is recorded as deferred tax income or expense.

This ensures that the entity recognises all future tax consequences of recovering the assets, or settling the liabilities, recognised in the transaction. The effect of this on the statement of total comprehensive income is broadly to recognise the tax effects of the various components of income and expenditure in the same period(s) in which those items are recognised for financial reporting purposes (as illustrated in section 1.2.2 above).

In short, the initial recognition exception may simply be seen as the least bad of the four theoretically possible options for dealing with 'day one' temporary differences.

7.2.1 Acquisition of tax losses

The initial recognition exception applies only to deferred tax relating to temporary differences. It does not apply to tax assets, such as purchased tax losses, that do not arise from deductible temporary differences. The definition of 'deferred tax assets' (see section 3 above) explicitly distinguishes between deductible temporary differences and unused losses and tax credits. [IAS 12.5]. There is therefore no restriction on the recognition of acquired tax losses other than the general criteria of IAS 12 for recognition of tax assets (see section 7.5 below).

Under the general principles of IAS 12, acquired tax losses are initially recognised at the amount paid, subsequently re-assessed for recoverability (see section 7.5.6 below) and remeasured accordingly (see section 8 below). Changes in the recognised amount of acquired tax losses are generally recognised in profit or loss as a tax expense (income), on the basis that, as acquired losses, they do not relate to any pre-tax transaction previously accounted for by the entity (see section 10 below). However, in some limited circumstances, changes to tax losses acquired as part of a business combination are required to be treated as an adjustment to goodwill (see section 12.1.2 below).

7.2.2 Initial recognition of goodwill

7.2.2.A Taxable temporary differences

In many jurisdictions, goodwill is not tax-deductible either as it is impaired or on ultimate disposal, such that it gives rise to a temporary difference equal to its carrying amount (representing its carrying amount less its tax base of zero).

It may well be that the shares in the acquired entity have a tax base equal to their cost so that, economically, an amount equal to the goodwill is deductible on disposal of those shares. However, accounting for the tax effects of the shares in an acquired subsidiary (or other significant group investment) is subject to separate provisions of IAS 12, which are discussed in section 7.6 below.

The initial recognition exception for taxable temporary differences on goodwill prevents the grossing-up of goodwill that would otherwise occur. Goodwill is a function of all the net assets of the acquired business, including deferred tax. If deferred tax is provided for on goodwill, the goodwill itself is increased, which means that the deferred tax on the goodwill is increased further, which means that the goodwill increases again, and so on. Equilibrium is reached when the amount of goodwill originally recorded is grossed up by the fraction $1 / (1 - t)$, where t is the entity's tax rate, expressed as a decimal fraction. For example, an entity that pays tax at 30% and recognises CU1,400 of goodwill before recognising deferred tax would (absent the initial recognition exception) increase the goodwill to CU2,000 and recognise a deferred tax liability of CU600 (which is 30% of the restated goodwill of CU2,000).

IAS 12 takes the view that this would not be appropriate, since goodwill is intended to be a residual arising after fair values have been determined for the assets and liabilities acquired in a business combination, and recognition of deferred tax liability would increase that goodwill. [IAS 12.21]. Subsequent reductions in a deferred tax liability that is unrecognised because it arises from the initial recognition of goodwill are also regarded as arising from the initial recognition of goodwill and are therefore not recognised. [IAS 12.21A]. This is shown in Illustration 7-7 in section 7.2.4.A below.

7.2.2.B Deductible temporary differences

Where the carrying amount of goodwill arising in a business combination is less than its tax base, a deductible temporary difference arises. In this case, IAS 12 requires a deferred tax asset to be recognised as part of the accounting for a business combination, to the extent that it is probable that taxable profit will be available against which the temporary difference could be utilised. [IAS 12.32A]. This contrasts with the prohibition against recognising a deferred tax liability on any taxable temporary difference on initial recognition of goodwill (see section 7.2.2.A above). Refer section 7.5 below for a more general discussion of the criteria in IAS 12 for assessing the recoverability of deferred tax assets.

IAS 12 gives no guidance on the method to be used in calculating the resulting deferred tax asset, which is not entirely straightforward, as demonstrated by the following Illustration.

Illustration 7-2: Deferred tax asset on initial recognition of goodwill

An entity that pays tax at 40% recognises, in the initial accounting for a business combination, goodwill of CU1,000 before recognising any related deferred tax asset. Tax deductions of CU1,250 are given for the goodwill over a 5-year period.

One approach would be to adopt an iterative method similar to that described in section 7.2.2.A above, whereby recognition of a deferred tax asset on goodwill leads to a reduction of the goodwill, which in turn will lead to a further increase in the deferred tax asset, and so on. Equilibrium is reached when the goodwill is adjusted to an amount equal to $(g - bt) / (1 - t)$, where:

- g is the amount of goodwill originally recorded (before recognising a deferred tax asset)
- b is the tax base of the goodwill
- And
- t is the tax rate, expressed as a decimal fraction

Under this method, the entity would record goodwill of CU833 (being $[CU1,000 - 0.4 \times CU1,250] \div 0.6$) and a deferred tax asset of CU167. This represents a deductible temporary difference of CU417 (comprising the tax base of CU1,250 less the adjusted carrying amount of CU833), multiplied by the tax rate of 40%. On any subsequent impairment or disposal of the goodwill, the entity would report an effective tax rate of 40% (the statutory rate), comprised of pre-tax expense of CU833 and tax income of CU333 (the real tax deduction of CU500 (CU1,250 @ 40%), less the write-off of the deferred tax asset of CU167).

An alternative approach might be to record a deferred tax asset based on the carrying amount of goodwill before calculating the deferred tax asset, and adjust the goodwill only once, rather than undertaking the iterative reduction in the goodwill described in the previous paragraph. In the Illustration above this would lead to the entity recording a deferred tax asset of CU100 (representing 40% of the deductible temporary difference of CU250 between the tax base of the goodwill of CU1,250 and its original carrying amount of CU1,000) and goodwill of CU900. On any subsequent impairment or disposal of the goodwill the entity would report an effective tax rate of 44% (higher than the statutory rate), comprised of pre-tax expense of CU900 and tax income of CU400 (the real tax deduction of CU500 (CU1,250 @ 40%), less the write-off of the deferred tax asset of CU100).

7.2.2.C Tax deductible goodwill

Where goodwill is tax-deductible, new temporary differences will arise after its initial recognition as a result of the interaction between tax deductions claimed and impairments (if any) of the goodwill in the financial statements. These temporary differences do not relate to the initial recognition of goodwill, and therefore deferred tax must be recognised on them, as demonstrated by Illustration 7-13 in section 7.2.4.C below.

[IAS 12.21B].

7.2.3 Initial recognition of other assets or liabilities

Where a temporary difference arises on initial recognition of an asset or liability, its treatment depends on the circumstances which give rise to the recognition of the asset or liability.

If the temporary difference arises as the result of a business combination, deferred tax is recognised on the temporary difference with a corresponding adjustment to goodwill or any bargain purchase gain.

If the temporary difference arises in a transaction that gives rise to an accounting or taxable profit or loss, deferred tax is recognised on the temporary difference, giving rise to deferred tax expense or deferred tax income.

If the temporary difference arises in any other circumstances (i.e., neither in a business combination nor in a transaction that gives rise to an accounting or taxable profit or loss) no deferred tax is recognised.

[IAS 12.22].

The application of the initial recognition exception to assets and liabilities is explained in Illustration 7-3 to Illustration 7-6 below.

Illustration 7-3: Non-deductible PP&E

An entity acquires a building for CU1 million. Any accounting depreciation of the building is not deductible for tax purposes, and no deduction will be available for tax purposes when the asset is sold or demolished.

Recovery of the building, whether in use or on sale, has tax consequences since the building is recovered through future taxable profits. There is a taxable temporary difference of CU1 million between the CU1 million carrying value of the asset and its tax base of zero.

Under the initial recognition exception, no deferred tax liability is provided for. The non-deductibility of the asset is reflected in an effective tax rate higher than the statutory rate (assuming that all other components of pre-tax profit are taxed at the statutory rate) as the asset is depreciated in future periods.

If the asset had been acquired as part of a business combination, the initial recognition exception would not have applied. Deferred tax would have been provided for, with a corresponding increase in goodwill. As the asset is depreciated, the reduction in the deferred tax liability is released to deferred tax in the income statement, as shown in Illustration 1-1 above. This results in an effective tax rate equal to the statutory rate (assuming that all other components of pre-tax profit are taxed at the statutory rate).

Illustration 7-4: Inception of loan with tax-deductible issue costs

A borrowing entity records a loan at CU9.5 million, being the proceeds received of CU10 million (which equal the amount due at maturity), less transaction costs of CU500,000, which are deducted for tax purposes in the period when the loan is first recognised. For financial reporting purposes, under IFRS 9 the costs, together with interest and similar payments, are accrued over the period to maturity using the effective interest method.

Inception of the loan gives rise to a taxable temporary difference of CU500,000, being the difference between the carrying amount of the loan (CU9.5 million) and its tax base (CU10 million). This analysis is explained in more detail in section 6.2.1.B above.

Initial recognition of the transaction costs gives rise to no accounting loss (because they are included in the carrying amount of the loan). However, there is a tax loss (since the costs are included in the tax return for the period of inception). Accordingly, the initial recognition exception does not apply, and a deferred tax liability is recognised on the taxable temporary difference of CU500,000.

Illustration 7-5: Inception of loan with non-deductible issue costs

A borrowing entity records a loan at CU9.5 million, being the proceeds received of CU10 million (which equal the amount due at maturity), less transaction costs of CU500,000, which are not deductible for tax purposes either in the period when the loan is first recognised or subsequently. For financial reporting purposes, under IFRS 9 the costs, together with interest and similar payments, are accrued over the period to maturity using the effective interest method.

Inception of the loan gives rise to a taxable temporary difference of CU500,000, being the difference between the carrying amount of the loan (CU9.5 million) and its tax base (CU10 million). This analysis is explained in more detail in section 6.2.1.B above.

Initial recognition of the transaction costs gives rise to no accounting loss (because they are included in the carrying amount of the loan) or tax loss (because in this case there is no deduction for the issue costs). Accordingly, the initial recognition exception applies and no deferred tax liability is recognised.

If the same loan (including the unamortised transaction costs) had been recognised as part of a larger business combination, the initial recognition exception would not have applied. Deferred tax would have been recognised on the taxable temporary difference of CU500,000, with a corresponding increase in goodwill (or decrease in any bargain purchase gain).

Illustration 7-6: Purchase of PP&E subject to tax-free government grant

An entity acquires an item of PP&E for CU1 million subject to a tax-free government grant of CU350,000. The asset is also fully-tax deductible (at CU1 million). IAS 20 permits the grant to be accounted for either as deferred income or by deduction from the cost of the asset. Whichever treatment is followed, a deductible temporary difference arises:

- If the grant is accounted for as deferred income, there is a deductible temporary difference between the liability of CU350,000 and its tax base of nil (carrying amount CU350,000 less amount not taxed in future periods, also CU350,000).
- If the grant is accounted for as a reduction in the cost of the PP&E, there is a deductible temporary difference between the carrying amount of the PP&E (CU650,000) and its tax base (CU1 million).

IAS 12 emphasises that the initial recognition exception applies, and a deferred tax asset must not be recognised. [IAS 12.33].

7.2.4 Changes to temporary differences after initial recognition

The initial recognition exception applies only to temporary differences arising on initial recognition of an asset or liability. It does not apply to new temporary differences that arise on the same asset or liability after initial recognition. When the exception has been applied to the temporary difference arising on initial recognition of an asset or liability, and there is a different temporary difference associated with that asset or liability at a subsequent date, it is necessary to analyse the temporary difference at that date between:

- Any amount relating to the original temporary difference (on which no deferred tax is recognised)
- And
- The remainder, which has implicitly arisen after initial recognition of the asset or liability (on which deferred tax is recognised)

IAS 12 does not set out comprehensive guidance to be followed in making this analysis, but it does give a number of examples, from which the following general principles may be inferred:

- The new temporary difference is treated as part of the temporary difference arising on initial recognition to the extent that any change from the original temporary difference is due to:
 - The write-down (through depreciation, amortisation or impairment) of the original carrying amount of an asset with no corresponding change in the tax base (see section 7.2.4.A below).
 - Or
 - The increase in the original carrying amount of a liability arising from the amortisation of any discount recognised at the time of initial recognition of that liability, with no corresponding change in the tax base (see section 7.2.4.A below).
- The new temporary difference is regarded as arising after initial recognition to the extent that any change from the original temporary difference is due to:
 - A change in the carrying value of the asset or liability, other than for the reasons set out above (see section 7.2.4.B below).
 - Or
 - A change in the tax base due to items being recorded on the tax return (see section 7.2.4.C below).
- Where the change in the temporary difference results from a change in the tax base due to legislative change, IAS 12 provides no specific guidance, and more than one treatment may be possible (see section 7.2.4.D below).

7.2.4.A Depreciation, amortisation or impairment of initial carrying value

The following are examples of transactions where the initial temporary difference changes as the result of the amortisation of the original carrying amount, so that the adjusted temporary difference is regarded as part of the temporary difference arising on initial recognition, rather than a new difference.

Illustration 7-7: Impairment of non-deductible goodwill

Goodwill of CU10 million (not tax-deductible) arose on a business combination over ten years ago. In accordance with IAS 12 no deferred tax liability was recognised on the taxable temporary difference of CU10 million that arose on initial recognition of the goodwill. During the year ended 31 December 20X3, following an impairment test, the carrying amount of the goodwill is reduced to CU6 million.

No deferred tax is recognised on the new temporary difference of CU6 million, because it has the effect of decreasing the value of the previously unrecognised deferred tax liability relating to the initial recognition of the goodwill. [IAS 12.21A].

Illustration 7-8: Depreciation of non-deductible PP&E

During the year ended 31 March 20X3 an entity acquires an item of PP&E for CU1 million which it intends to use for 20 years, with no anticipated residual value. No tax deductions are available for the asset. In accordance with IAS 12 no deferred tax liability was recognised on the taxable temporary difference of CU1 million that arises on initial recognition of the PP&E.

The entity's accounting policy is to charge a full year's depreciation in the year of purchase, so that the carrying amount of the asset at 31 March 20X3 is CU950,000. No deferred tax is recognised on the reduction to the temporary difference of CU50,000, because IAS 12 prohibits the recognition of subsequent changes in the unrecognised deferred tax liability that arose on the initial recognition of the PP&E as the asset is depreciated. [IAS 12.22(c)].

Illustration 7-9: Amortisation of non-deductible loan issue costs

A borrowing entity records a loan at CU9.5 million, being the proceeds received of CU10 million (which equal the amount due at maturity), less transaction costs of CU500,000, which are not deductible for tax purposes either in the period when the loan is first recognised or subsequently. For financial reporting purposes, under IFRS 9 the costs, together with interest and similar payments, are accrued over the period to maturity using the effective interest method.

Inception of the loan gives rise to a taxable temporary difference of CU500,000, being the difference between the carrying amount of the loan (CU9.5 million) and its tax base (CU10 million). This analysis is explained in more detail in section 6.2.1.B above.

In accordance with IAS 12, no deferred tax liability was recognised on the taxable temporary difference of CU10 million that arose on initial recognition of the loan.

One year later, the carrying amount of the loan is CU9.7 million, comprising the proceeds received of CU10 million (which equal the amount due at maturity), less unamortised transaction costs of CU300,000. This gives rise to a current temporary difference of CU300,000. No deferred tax is recognised on the current temporary difference, because it is part of the temporary difference arising on the initial recognition of the loan.

7.2.4.B Change in carrying value due to revaluation

As shown in Illustration 7-3 in section 7.2.3 above, a temporary difference arises when a non tax-deductible asset is acquired. Where the asset is acquired separately (i.e., not as part of a larger business combination) in circumstances giving rise to neither an accounting nor a taxable profit or loss, no deferred tax liability is recognised for that temporary difference.

If such an asset is subsequently revalued, however, deferred tax is recognised on the new temporary difference arising as a result of the revaluation, since this does not arise on initial recognition of the asset, as shown in Illustration 7-10 and Illustration 7-11.

Illustration 7-10: Revaluation of non-deductible and non-depreciable asset

On 1 January 20X3 an entity paying tax at 30% acquires a non tax-deductible office building for CU1,000,000 in circumstances in which IAS 12 prohibits recognition of the deferred tax liability associated with the temporary difference of CU1,000,000.

Application of IAS 16 results in no depreciation being charged on the building.

On 1 January 20X3 the entity revalues the building to CU1,200,000. The temporary difference associated with the building is now CU1,200,000, only CU1,000,000 of which arose on initial recognition. Accordingly, the entity recognises a deferred tax liability based on the remaining temporary difference of CU200,000 giving deferred tax expense at 30% of CU60,000. This tax expense would be recognised in other comprehensive income (see section 10 below).

Illustration 7-11: Revaluation of non-deductible and depreciable asset

On 1 January 20X2 an entity paying tax at 30% acquires a non tax-deductible office building for CU100,000 in circumstances in which IAS 12 prohibits recognition of the deferred tax liability associated with the temporary difference of CU100,000. The building is depreciated over 10 years at CU10,000 per year to a residual value of zero. The entity's financial year ends on 31 December.

At 1 January 20X3, the carrying amount of the building is CU90,000, and it is revalued upwards by CU45,000 to its current market value of CU135,000. As there is no change to the estimated residual value of zero, or to the life of the building, this will be depreciated over the next 9 years at CU15,000 per year.

Following the revaluation, the temporary difference associated with the building is CU135,000. Of this amount, only CU90,000 arose on initial recognition, since CU10,000 of the original temporary difference of CU100,000 arising on initial recognition of the asset has been eliminated through depreciation of the asset (see section 7.2.4.A above). The carrying amount (which equals the temporary difference, since the tax base is zero) and depreciation during the year ended 31 December 20X3 and thereafter may then be analysed as follows:

Year	Carrying amount	Tax base	Gross temporary difference	Unrecognised temporary difference ¹	Recognised temporary difference	Deferred tax liability
	a	b	c (=a-b)	d	e (=c-d)	e @ 30%
0	100,000	-	100,000	100,000	-	-
1	90,000	-	90,000	90,000	-	-
Reval	135,000	-	135,000	90,000	45,000	13,500
2	120,000	-	120,000	80,000	40,000	12,000
3	105,000	-	105,000	70,000	35,000	10,500
4	90,000	-	90,000	60,000	30,000	9,000
5	75,000	-	75,000	50,000	25,000	7,500
6	60,000	-	60,000	40,000	20,000	6,000
7	45,000	-	45,000	30,000	15,000	4,500
8	30,000	-	30,000	20,000	10,000	3,000
9	15,000	-	15,000	10,000	5,000	1,500
10	-	-	-	-	-	-

¹ The depreciation is allocated *pro rata* to the cost element and revalued element of the total carrying amount.

On 1 January 20X4 the entity recognises a deferred tax liability based on the temporary difference of CU45,000 arising on the revaluation (i.e., after initial recognition) giving a deferred tax expense of CU13,500 (CU45,000 @ 30%), recognised in other comprehensive income (see section 10 below). This has the result that the effective tax rate shown in the financial statements for the revaluation is 30% (CU45,000 gain with deferred tax expense of CU13,500).

As can be seen from the table above, as at 31 December 20X4 (year 2), CU40,000 of the total temporary difference arose after initial recognition. The entity therefore provides for deferred tax of CU12,000 (CU40,000 @ 30%), and a deferred tax credit of CU1,500 (the reduction in the liability from CU13,500 to CU12,000) is recognised in profit or loss.

The deferred tax credit can be explained as the tax effect at 30% of the additional CU5,000 depreciation relating to the revalued element of the building (see table above).

7.2.4.C Change in tax base due to deductions in tax return

The following are examples of transactions where a new temporary difference emerges after initial recognition as the result of claiming tax deductions.

Illustration 7-12: Tax deduction for land

An entity that pays tax at 35% acquires land with a fair value of CU5 million. Tax deductions of CU100,000 per year may be claimed for the land for the next 30 years (i.e., the tax base of the land is CU3 million). In accordance with IAS 12, no deferred tax liability is recognised on the taxable temporary difference of CU2 million that arises on initial recognition of the land.

In the period in which the land is acquired, the entity claims the first CU100,000 annual tax deduction, and the original cost of the land is not depreciated or impaired. The taxable temporary difference at the end of the period is therefore CU2.1 million (cost CU5.0 million less tax base CU2.9 million). Of this, CU2 million arose on initial recognition and no deferred tax is recognised on this. However, the remaining CU100,000 of the gross temporary difference arose after initial recognition. Accordingly, the entity recognises a deferred tax liability of CU35,000 (CU100,000 @ 35%).

In subsequent years, the deferred tax liability is increased for the new temporary differences arising as a result of changes to the tax base as a result of claiming tax deductions, as illustrated in the following table:

Year	Carrying amount	Tax base	Gross temporary difference	Unrecognised temporary difference	Recognised temporary difference	Deferred tax liability
	a	b	c (=a-b)	d	e (=c-d)	e @ 35%
0	5,000,000	3,000,000	2,000,000	2,000,000	-	-
1	5,000,000	2,900,000	2,100,000	2,000,000	100,000	35,000
2	5,000,000	2,800,000	2,200,000	2,000,000	200,000	70,000
3	5,000,000	2,700,000	2,300,000	2,000,000	300,000	105,000
4	5,000,000	2,600,000	2,400,000	2,000,000	400,000	140,000
5	5,000,000	2,500,000	2,500,000	2,000,000	500,000	175,000

The analysis if the land had later been impaired would be rather more complicated. The general issue of the treatment of assets that are tax-deductible, but for less than their cost, is discussed in section 7.2.6 below.

Illustration 7-13: Tax-deductible goodwill

On 1 January 20X3 an entity with a tax rate of 35% acquires goodwill in a business combination with a cost of CU1 million, which is deductible for tax purposes at a rate of 20% per year, starting in the year of acquisition. During 20X3 the entity claims the full 20% tax deduction and writes off CU120,000 of the goodwill as the result of an impairment test. Thus, at the end of 20X3 the goodwill has a carrying amount of CU880,000 and a tax base of CU800,000. This gives rise to a taxable temporary difference of CU80,000 that does not relate to the initial recognition of goodwill, and accordingly the entity recognises a deferred tax liability at 35% of CU28,000.

If, during 20X3, there had been no impairment of the goodwill, but the full tax deduction had nevertheless been claimed, at the end of the year the entity would have had goodwill with a carrying amount of CU1 million and a tax base of CU800,000. This would have given rise to a taxable temporary difference of CU200,000 that does not relate to the initial recognition of goodwill, and accordingly the entity would have recognised a deferred tax liability at 35% of CU70,000.

7.2.4.D Temporary difference altered by legislative change

Any change to the basis on which an item is treated for tax purposes alters the tax base of the item concerned. For example, if the government decides that an item of PP&E that was previously tax-deductible is no longer eligible for tax deductions, the tax base of the PP&E is reduced to zero. Under IAS 12, any change in tax base normally results in an immediate adjustment of any associated deferred tax asset or liability, and the recognition of a corresponding amount of deferred tax income or expense.

However, where such an adjustment to the tax base occurs in respect of an asset or liability for which no deferred tax has previously been recognised because of the initial recognition exception, the treatment required by IAS 12 is not entirely clear. The issue is demonstrated by Illustration 7-14 below.

Illustration 7-14: Asset non-deductible at date of acquisition later becomes deductible

At the beginning of the year ended 31 March 20X3, an entity acquired an item of PP&E for CU1 million which it intends to use for 20 years, with no anticipated residual value. No tax deductions were available for the asset. In accordance with IAS 12 no deferred tax liability was recognised on the taxable temporary difference of CU1 million that arose on initial recognition of the PP&E. Then standard rate of income tax is 20%.

During the year ended 31 March 20X4, the government announces that it will allow the cost of such assets to be deducted in arriving at taxable profit. The deductions will be allowed in equal annual instalments over a 10-year period. As at 31 March 20X4, the carrying amount of the asset and its tax base are both CU900,000. The carrying amount is the original cost of CU1 million less two years' depreciation at CU50,000 per year. The tax base is the original cost of CU1 million less one year's tax deduction at CU100,000 per year.

Prima facie, therefore, there is now no temporary difference associated with the asset, because its carrying amount and tax base are equal. However, the treatment applied in Illustration 7-12 and Illustration 7-13 above would lead to the conclusion that this net temporary difference of nil must be analysed into:

- An original taxable temporary difference of CU900,000 arising on initial recognition of the asset (being the CU1 million difference arising on initial recognition less the CU100,000 depreciation charged).
- A new deductible temporary difference of CU900,000 arising after initial recognition (representing the fact that, since initial recognition, the government increased the tax base by CU1 million which has been reduced to CU900,000 by the CU100,000 tax deduction claimed in the current period).

This approach would indicate that a deferred tax liability must not be recognised on the original taxable temporary difference (since this arose on initial recognition), but a deferred tax asset must be recognised on the new deductible temporary difference of CU900,000 identified above, subject to confirming that there are sufficient future taxable profits available against which those deductions are expected to be utilised. The effect is illustrated as follows:

End of Year	Carrying amount	Tax base	Net temporary difference	Unrecognised temporary difference	Recognised temporary difference	Deferred tax liability/(asset)
	A	b	c (=a-b)	d	e (=c-d)	e @ 20%
Acquisition	1,000,000	-	1,000,000	1,000,000	-	-
20X3	950,000	-	950,000	950,000	-	-
20X4	900,000	900,000	-	900,000	(900,000)	(180,000)
20X5	850,000	800,000	50,000	850,000	(800,000)	(160,000)
20X6	800,000	700,000	100,000	800,000	(700,000)	(140,000)
20X7	750,000	600,000	150,000	750,000	(600,000)	(120,000)

An alternative approach would be that there is now no temporary difference as the granting of the tax base by the government simply eliminates a previously unrecognised temporary difference:

- The change in tax law does not give rise to a 'new' temporary difference as would be the case for a revaluation of the asset (which is accompanied by the recognition of a gain in the financial statements) or a claim for tax deductions (which attracts a reduction to the tax charge for the period). Instead, the effect of the change in legislation is to reduce the original taxable temporary difference that arose on initial recognition of the asset. Such a reduction in the original temporary difference would not be recognised under IAS 12. [IAS 12.21A].
- To account for only the deferred tax asset is effectively recognising a gain on the elimination of an income tax liability that was never previously recognised.

As far as the income tax charge or credit in profit or loss is concerned, the difference between the two approaches is one of timing. Where the overall temporary difference of zero is 'bifurcated' into an amount arising on initial recognition and an amount arising later, the change in legislation reduces income tax expense and the effective tax rate in the year of change. In the case where the net temporary difference of zero is considered as a whole, the reduction in income tax expense and the effective tax rate is recognised prospectively over the remaining life of the asset as those tax deductions are realised.

How we see it

In our view, in the absence of specific guidance in the standard, either approach is acceptable, provided that it is applied consistently.

7.2.5 Intragroup transfers of assets with no change in tax base

In many tax jurisdictions the tax deductions for an asset are generally related to the cost of that asset to the legal entity that owns it. However, in some jurisdictions, where an asset is transferred between members of the same group within that jurisdiction, the tax base remains unchanged, irrespective of the consideration paid.

Therefore, where the consideration paid for an asset in such a case differs from its tax base, a temporary difference arises in the acquiring entity's separate financial statements on transfer of the asset. The initial recognition exception applies to any such temporary difference. A further complication can arise when the acquiring entity acquires an asset that is deductible for tax purposes, but for an amount different from its cost. The treatment of such assets in the context of the initial recognition exception is discussed more generally in section 7.2.6 below.

In the consolidated financial statements of any parent of the buying entity, however, there is no change to the amount of deferred tax recognised provided that the tax rate of the buying and selling entity is the same. Where the tax rate differs, the deferred tax will be remeasured using the buying entity's tax rate.

Where an asset is transferred between group entities and the tax base of the asset changes as a result of the transaction, there will be deferred tax income or expense in the consolidated financial statements. This is discussed further in section 8.7 below.

7.2.6 Partially deductible and super-deductible assets

In many tax jurisdictions the tax deductions for an asset are generally based on the cost of that asset to the legal entity that owns it. However, in some jurisdictions, certain categories of asset are deductible for tax but for an amount either less than the cost of the asset ('partially deductible') or more than the cost of the asset ('super-deductible').

IAS 12 provides no specific guidance on the treatment of partially deductible and super-deductible assets acquired in a transaction to which the initial recognition exception applies. The issues raised by such assets are shown in Illustration 7-15 and Illustration 7-16 below.

Illustration 7-15: Partially deductible asset

An entity acquires an asset with a cost of CU100,000 and a tax base of CU60,000 in a transaction where IAS 12 prohibits recognition of deferred tax on the taxable temporary difference of CU40,000 arising on initial recognition of the asset. The asset is depreciated to a residual value of zero over 10 years and qualifies for tax deductions of 20% per year over 5 years. The temporary differences associated with the asset over its life will therefore be as follows:

Year	Carrying amount	Tax base	Temporary difference
	CU	CU	CU
0	100,000	60,000	40,000
1	90,000	48,000	42,000
2	80,000	36,000	44,000
3	70,000	24,000	46,000
4	60,000	12,000	48,000
5	50,000	-	50,000
6	40,000	-	40,000
7	30,000	-	30,000
8	20,000	-	20,000
9	10,000	-	10,000
10	-	-	-

These differences are clearly a function both of:

- The CU40,000 temporary difference arising on initial recognition relating to the non-deductible element of the asset
- And
- The emergence of temporary differences arising from the claiming of tax deductions for the CU60,000 deductible element in advance of its depreciation

Whilst IAS 12 does not explicitly mandate the treatment to be followed here, the general requirement to distinguish between these elements of the gross temporary difference (see section 7.2.4 above) suggests the following approach.

On initial recognition, the entity pro-rates the total carrying amount of the asset into a 60% deductible element and a 40% non-deductible element. The taxable temporary difference on the non-deductible element is not recognised (under the initial recognition exception). The 60% deductible element has a tax base equal to its carrying amount, such that there is no temporary difference for the deductible element on initial recognition. In subsequent periods, the entity would provide for deferred tax only on the temporary difference that subsequently emerges between the 60% deductible element and its tax base. On this basis, the temporary differences would be calculated as follows:

Year	Carrying amount	40% non-deductible element	60% deductible element	Tax base	Temporary difference
	a	b (40% of a)	c (60% of a)	d	c - d
0	100,000	40,000	60,000	60,000	-
1	90,000	36,000	54,000	48,000	6,000
2	80,000	32,000	48,000	36,000	12,000
3	70,000	28,000	42,000	24,000	18,000
4	60,000	24,000	36,000	12,000	24,000
5	50,000	20,000	30,000	-	30,000
6	40,000	16,000	24,000	-	24,000
7	30,000	12,000	18,000	-	18,000
8	20,000	8,000	12,000	-	12,000
9	10,000	4,000	6,000	-	6,000
10	-	-	-	-	-

Assuming that the entity pays tax at 30%, the amounts recorded for this transaction during year 1 (assuming that there are sufficient other taxable profits to absorb the tax loss created) would be as follows:

CU	
Depreciation of asset	(10,000)
Current tax income ¹	3,600
Deferred tax charge ²	(1,800)
Net tax credit	1,800
Post tax depreciation	(8,200)

1 CU100,000 [cost of asset] × 60% [deductible element] × 20% [tax depreciation rate] × 30% [tax rate]

2 CU6,000 [temporary difference] × 30% [tax rate] - brought forward balance [nil]

If this calculation is repeated for all 10 years, the following would be reported in the financial statements.

Year	Depreciation	Current tax credit	Deferred tax (charge)/credit	Total tax credit	Effective tax rate
	a	b	c	d (=b+c)	e (=d/a)
1	(10,000)	3,600	(1,800)	1,800	18%
2	(10,000)	3,600	(1,800)	1,800	18%
3	(10,000)	3,600	(1,800)	1,800	18%
4	(10,000)	3,600	(1,800)	1,800	18%
5	(10,000)	3,600	(1,800)	1,800	18%
6	(10,000)	-	1,800	1,800	18%
7	(10,000)	-	1,800	1,800	18%
8	(10,000)	-	1,800	1,800	18%
9	(10,000)	-	1,800	1,800	18%
10	(10,000)	-	1,800	1,800	18%

This methodology has the result that the effective tax rate in each period corresponds to the effective tax rate for the transaction as a whole - i.e., cost of CU100,000 attracting total tax deductions of CU18,000 (CU60,000 at 30%), an overall rate of 18%.

How we see it

Whilst we believe that the approach shown above results in an appropriate effective tax rate in each period, it cannot be said to be required by IAS 12 and other methodologies could well be appropriate, provided that they are applied consistently in similar circumstances.

Illustration 7-16: Super-deductible asset

The converse situation to that in Illustration 7-15 exists in some jurisdictions which seek to encourage certain types of investment by giving tax allowances for an amount in excess of the expenditure actually incurred. Suppose that an entity invests CU1,000,000 in PP&E with a tax base of CU1,200,000 in circumstances where IAS 12 prohibits recognition of deferred tax on the deductible temporary difference of CU200,000 arising on initial recognition of the asset. The asset is depreciated to a residual value of zero over 10 years and qualifies for five annual tax deductions of 20% of its deemed tax cost of CU1,200,000.

The approach adopted in Illustration 7-15 considered the deductible and non-deductible elements separately and recognised deferred tax on the temporary difference between the deductible element and its tax base. If a similar approach is applied, on initial recognition the entity would split the tax base of the asset into a 'cost' element and a 'super deduction' element, and recognise deferred tax on only the temporary difference between the 'cost' element of the tax base and its carrying amount. Based on the fact pattern above the temporary differences associated with the 'super-deductible' asset would arise as follows:

Year	Carrying amount	Tax base	'Super deduction' element	Cost element	Temporary difference
	a	b	c (=2/12 of b)	d (=10/12 of b)	a - d
S0	1,000,000	1,200,000	200,000	1,000,000	-
1	900,000	960,000	160,000	800,000	100,000
2	800,000	720,000	120,000	600,000	200,000
3	700,000	480,000	80,000	400,000	300,000
4	600,000	240,000	40,000	200,000	400,000
5	500,000	-	-	-	500,000
6	400,000	-	-	-	400,000
7	300,000	-	-	-	300,000
8	200,000	-	-	-	200,000
9	100,000	-	-	-	100,000
10	-	-	-	-	-

Assuming that the entity pays tax at 30%, the amounts recognised for this transaction during year 1 (assuming that there are sufficient other taxable profits to absorb the tax loss created) are as follows:

CU	
Depreciation of asset	(100,000)
Current tax income ¹	72,000
Deferred tax charge ²	(30,000)
Net tax credit	42,000
Profit after tax	(58,000)

1 CU1,200,000 [deemed tax cost of asset] × 20% [tax depreciation rate] × 30% [tax rate]

2 CU100,000 [temporary difference] × 30% [tax rate] - brought forward balance [nil]

If this calculation is repeated for all 10 years, the following would be recognised in the financial statements.

Year	Depreciation	Current tax credit	Deferred tax (charge)/credit	Total tax credit	Effective tax rate
	a	b	c	d (=b+c)	e (=d/a)
1	(100,000)	72,000	(30,000)	42,000	42%
2	(100,000)	72,000	(30,000)	42,000	42%
3	(100,000)	72,000	(30,000)	42,000	42%
4	(100,000)	72,000	(30,000)	42,000	42%
5	(100,000)	72,000	(30,000)	42,000	42%
6	(100,000)	-	30,000	30,000	30%
7	(100,000)	-	30,000	30,000	30%
8	(100,000)	-	30,000	30,000	30%
9	(100,000)	-	30,000	30,000	30%
10	(100,000)	-	30,000	30,000	30%

This accounting results in an effective 42% tax rate for this transaction being reported in years 1 to 5, and a rate of 30% in years 6 to 10, in contrast to the true effective rate of 36% for the transaction as a whole - i.e., cost of CU1,000,000 attracting total tax deductions of CU360,000 (CU1,200,000 at 30%). This is because, whilst in the case of a partially deductible asset as in Illustration 7-15 above there is an accounting mechanism (i.e., depreciation) for allocating the non-deductible cost on a straight-line basis, in the case of a super-deductible asset there is no ready mechanism for spreading the additional CU60,000 tax deductions on a straight-line basis.

In specific cases, the additional tax deductions might have sufficient characteristics of a government grant (e.g., if it were subject to conditions more onerous than those normally associated with tax deductions in the jurisdiction concerned) to allow application of the principles of IAS 20 which results in the allocation of the additional tax deductions over the life of the asset (see section 4.4 above). However, such circumstances are rare.

Again, as in Illustration 7-15 above, no single approach can be said to be required by IAS 12 and other methodologies could well be appropriate, provided that they are applied consistently in similar circumstances.

7.2.7 Initial recognition of compound financial instruments by the issuer

IAS 32 requires 'compound' financial instruments (those with both a liability feature and an equity feature, such as convertible bonds) to be accounted for by the issuer using so-called split accounting. This is discussed in more detail in Chapter 43, but in essence an entity is required to split the proceeds of issue of such an instrument (say CU1 million) into a liability component, measured at its fair value based on real market rates for non-convertible debt rather than the nominal rate on the bond (say CU750,000), with the balance being treated as an equity component (in this case CU250,000).

Over the life of the instrument, the CU750,000 carrying value of the liability element will be accreted back up to CU1,000,000 (or such lower or higher sum as might be potentially repayable), so that the cumulative income statement interest charge will comprise:

- (a) Any actual cash interest payments made (which are tax-deductible in most jurisdictions)
- (b) The CU250,000 accretion of the liability from CU750,000 to CU1,000,000 (which is not tax-deductible in most jurisdictions)

Where such an instrument is issued, IAS 12 requires the treatment in Illustration 7-17 to be adopted.

[IAS 12.IE Example 4].

Illustration 7-17: Compound financial instrument

An entity issues a zero-coupon convertible loan of CU1,000,000 on 1 January 20X3 repayable at par on 1 January 20X6. In accordance with IAS 32, the entity assigns an initial carrying amount of CU750,000 to the liability component of the convertible loan and CU250,000 to the equity component. Subsequently, the entity recognises the imputed discount of CU250,000 as interest expense at the effective annual rate of 10% on the carrying amount of the liability component at the beginning of the year. The tax authorities do not allow the entity to claim any deduction for the imputed discount on the liability component of the convertible loan. The tax rate is 40%.

Temporary differences arise on the liability element as follows (all figures in CU thousands).

	1.1.20X3	31.12.20X3	31.12.20X4	31.12.20X5
Carrying value of liability component ¹	750	825	908	1,000
Tax base	1,000	1,000	1,000	1,000
Taxable temporary difference	250	175	92	-
Deferred tax liability @ 40%	100	70	37	-

¹ Balance carried forward at end of previous period plus 10% accretion of notional interest less repayments.

The deferred tax arising at 1 January 20X3 is deducted from equity. Subsequent reductions in the deferred tax balance are recognised in the income statement, resulting in an effective tax rate of 40%. For example, in 20X3, the entity will accrete notional interest of CU75,000 (closing loan liability CU825,000 less opening balance CU750,000) with deferred tax income of CU30,000 (closing deferred tax liability CU70,000 less opening liability CU100,000).

This treatment causes some confusion in practice because it appears to contravene the prohibition on recognition of deferred tax on temporary differences arising on the initial recognition of assets and liabilities (other than in a business combination) that do not give rise to accounting or taxable profit or loss. [IAS 12.15(b)]. IAS 12 states that this temporary difference does not arise on initial recognition of a liability but as a result of the initial recognition of the equity component as a result of the requirement in IAS 32 to separate the instrument between its equity and liability components. [IAS 12.23].

7.2.8 Acquisition of subsidiary that does not constitute a business

Occasionally, an entity may acquire a subsidiary which is accounted for as the acquisition of an asset rather than as a business combination. This will most often be the case where the subsidiary concerned is a 'single asset entity' holding a single item of property, plant and equipment which is not considered to constitute a business. The question then arises as to whether any deferred tax must be recognised for the property in the financial statements of the acquiring entity.

The IFRS IC considered this issue in March 2017 and determined that no deferred tax must be recognised, as follows:

Frequently asked questions

Question 7-1: How, in its consolidated financial statements, does an entity account for a transaction in which it acquires all the shares of another entity that has an investment property as its only asset?

The IFRS IC considered this issue in March 2017. In the fact pattern submitted, the acquiree had measured its investment property at fair value and recognised a deferred tax liability for the excess over cost (tax base). The amount paid for the shares was less than the fair value of the investment property because of the associated deferred tax liability. It was determined that the transaction does not meet the definition of a business combination in IFRS 3 *Business Combinations* because the acquired entity is not a business. The acquiring entity applies the fair value model in IAS 40 *Investment Property*.

The submitter asked whether the requirements in IAS 12.15(b) permit the acquiring entity to recognise a deferred tax liability on initial recognition of the transaction. If this is not the case, the submitter asked the Committee to consider whether the requirements in IAS 12.15(b) should be amended so that, in these circumstances, the acquiring entity would not recognise a gain on measuring the investment property at fair value immediately after initial recognition of the transaction.

The IFRS IC noted that:¹²

- (a) Because the transaction is not a business combination, IFRS 3.2(b) requires the acquiring entity, in its consolidated financial statements, to allocate the purchase price to the assets acquired and liabilities assumed.
- (b) Paragraph 15(b) of IAS 12 says that an entity does not recognise a deferred tax liability for taxable temporary differences that arise from the initial recognition of an asset or liability in a transaction that is not a business combination and that, at the time of the transaction, affects neither accounting profit or loss nor taxable profit (tax loss).

Accordingly, on acquisition, the acquiring entity recognises only the investment property and not a deferred tax liability in its consolidated financial statements. [IAS 12.15(b)]. The acquiring entity therefore allocates the entire purchase price to the investment property. [IFRS 3.2(b)].

The conclusion of the IFRS IC, that when an asset is acquired in such circumstances, the initial recognition exception applies, can be demonstrated by the following Illustration.

Illustration 7-18: Acquired subsidiary accounted for as asset purchase

An entity (P) acquires all the shares of a subsidiary (S), whose only asset is an investment property, for CU9 million. The transaction is accounted for as the acquisition of a property rather than as a business combination. The tax base of the property is CU4.5 million and its carrying value (fair value) in the financial statements of S (under IFRS accounting standards) is CU12 million. The taxable temporary difference of CU7.5 million in the financial records of S arose after the initial recognition by S of the property, and accordingly a deferred tax liability of CU3 million has been recognised by S at its tax rate of 40%.

The question then arises as to whether any deferred tax should be recognised for the property in the financial statements of P.

Having determined that the acquisition does not constitute a business combination, the purchase price of CU9 million is allocated to the assets acquired and liabilities assumed. [IFRS 3.2(b)]. The initial recognition exception applies to the difference between the cost of the property in the financial statements of P of CU9 million and its tax base of CU4.5 million, in exactly the same way as if the property had been legally acquired as a separate asset rather than through acquisition of the shares of S. [IAS 12.15(b)]. Therefore, no deferred tax is recognised by P in respect of the property at the time of its acquisition. At this point, P has an unrecognised taxable temporary difference of CU4.5 million (CU9 million less CU4.5 million).

If P applies the fair value model in IAS 40, the investment property is subsequently remeasured at its fair value of CU12 million. This creates a new temporary difference in P of CU3 million (CU12 million less CU9 million), in respect of which a taxable temporary difference of CU1.2 million is recognised in profit and loss (CU3 million @ 40%).

¹² [IFRIC Update](#), March 2017, available on the IFRS Foundation's website.

7.2.9 Acquisition of an investment in a subsidiary, associate, branch or joint arrangement

The initial recognition exception does not apply to temporary differences associated with investments in subsidiaries, branches and associates, and interests in joint arrangements, which are subject to further detailed provisions of IAS 12 (see section 7.6 below). [IAS 12.15, IAS 12.24].

7.3 Transactions involving the initial recognition of an asset and liability

As noted in section 7.2 above, the initial recognition exception is essentially a pragmatic remedy to avoid accounting problems that would arise without it, particularly in transactions where one asset is exchanged for another (such as the acquisition of PP&E for cash).

However, experience has shown that the exception creates new difficulties of its own. For example, there was no guidance on how entities must account for the tax effects of transactions involving the initial recognition of an equal and opposite asset and liability which subsequently unwind on different bases.

Examples of such transactions include:

- Recording a liability for decommissioning costs, for which the corresponding debit entry is an increase in PP&E.
- The commencement of a lease by a lessee, which involves the recording of an asset and a corresponding liability.

In the absence of any guidance, three alternative approaches had developed in practice:

- (i) Apply the initial recognition exception. Recognise nothing in respect of temporary differences arising at the time the asset and liability are first recognised. No deferred tax arises for any changes in those initial temporary differences.
- (ii) Recognise deferred tax on initial recognition and consider the asset and the liability separately. The entity recognises a deferred tax liability for any taxable temporary differences related to the asset component and a deferred tax asset for any deductible temporary differences related to the liability component. On initial recognition, the taxable temporary difference and the deductible temporary differences are equal and offset to zero. Deferred tax is recognised on subsequent changes to the taxable and deductible temporary differences.

Or

- (iii) Recognise deferred tax on initial recognition but consider the asset and the liability as in substance linked to each other. Consider any temporary differences on a net basis and recognise deferred tax on that net amount. In this approach, the non-deductible asset and the tax-deductible liability are regarded as being economically the same as a tax-deductible asset that is acquired on deferred terms (where the repayment of the loan does not normally give rise to tax). On this basis, the net carrying value of the asset and liability is zero on initial recognition, as is the tax base. There is therefore no temporary difference and the initial recognition exception does not apply. Deferred tax is recognised on subsequent temporary differences that arise when the net asset or liability changes from zero.

In June 2018, the IFRS IC acknowledged the three approaches that were applied in the circumstances noted above and decided to recommend that the Board should develop a narrow-scope amendment to IAS 12.¹³ The amendments to IAS 12 were issued in May 2021 and are discussed in section 7.3.1 below.

7.3.1 Deferred Tax related to Assets and Liabilities arising from a Single Transaction - Amendments to IAS 12

On 7 May 2021, the IASB issued *Deferred Tax related to Assets and Liabilities arising from a Single Transaction - Amendments to IAS 12* (the Amendments). The Board amended the standard to reduce diversity in the way that entities account for deferred tax on transactions and events, such as leases and decommissioning obligations, that lead to the initial recognition of both an asset and a liability.

The Amendments narrow the scope of the initial recognition exception under IAS 12 so that it no longer applies to transactions that give rise to equal taxable and deductible temporary differences. [IAS 12.BC71]. The Amendments also clarify that where payments that settle a liability are deductible for tax purposes, it is a matter of judgement (having considered the applicable tax law) whether such deductions are attributable for tax purposes to the liability recognised in the financial statements (and interest expense) or to the related asset component (and interest expense). [IAS 12.BC75]. This judgement is important in determining whether any temporary differences exist on initial recognition of the asset and liability.

¹³ [IFRIC Update](#), June 2018, available on the IFRS Foundation's website.

The Amendments were effective to annual reporting periods beginning on or after 1 January 2023, with earlier application permitted. [IAS 12.98J]. Entities had to apply the Amendments to transactions that occurred on or after the beginning of the earliest comparative period presented [IAS 12.98J]. In addition, at the beginning of the earliest comparative period presented, it had to recognise a deferred tax asset (subject to deferred tax asset recognition criteria in IAS 12) and a deferred tax liability for all deductible and taxable temporary differences as required by paragraph 98L of IAS 12 and recognise the cumulative effect of initially applying the Amendments as an adjustment to the opening balance of retained earnings (or other component of equity, as appropriate) at that date. [IAS 12.98L].

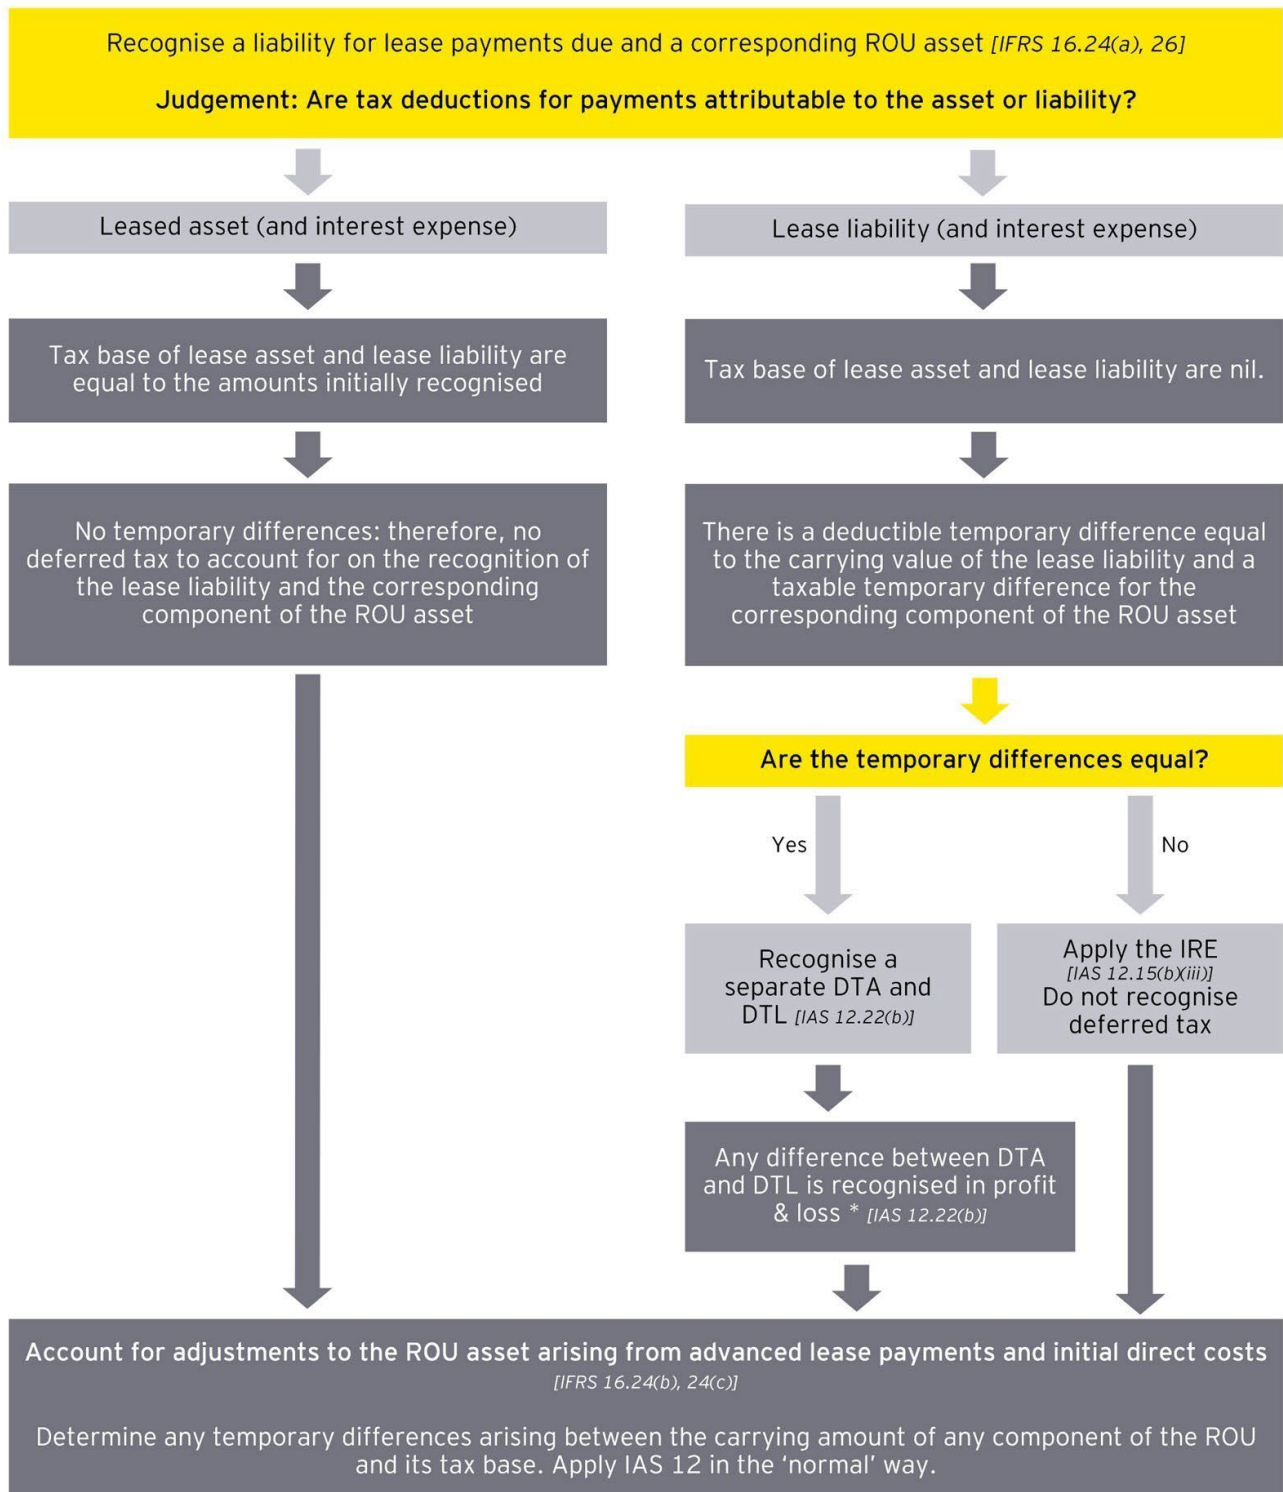

The transitional provisions also apply to first-time adopters at the date of their transition to IFRS accounting standards. [IFRS 1.B14].

How we see it

The Amendments could, in some cases, lead to the recognition of unequal amounts of deferred tax assets and liabilities, despite the gross deductible and taxable temporary differences being equal. In such cases, an entity would need to account for the difference between the deferred tax asset and liability in profit or loss.

For simplicity, the basis for the Amendments is explained using leases as an example. This explanation applies equally to similar transactions and events, such as decommissioning obligations. [IAS 12.BC73].

The following diagram illustrates the process applied in the Amendments for determining the tax consequences of a transaction that gives rise to the recognition of both an asset and a liability.

Figure 7-1: Deferred tax related to assets and liabilities arising from a single transaction decision tree**DEFERRED TAX RELATED TO ASSETS AND LIABILITIES ARISING FROM A SINGLE TRANSACTION
DECISION TREE**

* The DTA and DTL recognised may not be equal because different tax rates apply to the deductible and taxable temporary differences; or the DTA does not qualify for recognition in full under IAS 12.28 and 29

7.3.1.A Determining the tax base of assets and liabilities

An entity that applies IFRS 16 *Leases* recognises a right-of-use asset (lease asset) and a lease liability at the commencement date of a lease. On initial recognition, the entity needs to assess the tax base of the lease asset and liability by identifying the amounts attributable to them for tax purposes. In a jurisdiction where an entity receives tax deductions when it makes lease payments, it applies judgement in determining whether those tax deductions are attributable to:

- The lease asset (and interest expense) because the deductions relate to the expenses (i.e., depreciation and interest expense) arising from the lease
- Or
- The lease liability (and interest expense) because the deductions relate to the repayment of the lease liability and interest expense [IAS 12.BC74]

If the tax deductions are attributed to the lease asset, the tax bases of the lease asset and lease liability equal their carrying amounts, and no temporary differences arise on initial recognition. However, if the tax deductions are attributed to the lease liability, the tax bases of the lease asset and lease liability are nil, giving rise to taxable and deductible temporary differences in respect of the asset and the liability, respectively. [IAS 12.BC76]. If those gross temporary differences are equal, the Amendments require that a deferred tax liability and a deferred tax asset are recognised. [IAS 12.22A].

The Board decided not to provide application guidance to help entities assess whether tax deductions are attributable to the lease asset or lease liability as the costs of doing so would outweigh the benefits. The Board was satisfied that the Amendments will result in entities recognising deferred tax for temporary differences that arise on leases (either on initial recognition or subsequently) regardless of whether tax deductions were attributed to the asset or liability. An entity will need to make a judgement, having considered the applicable tax law, whether tax deductions relate to the lease asset or lease liability.

[IAS 12.BC89].

In the absence of guidance from the IASB, some preparers and users may find it difficult to determine that tax deductions made available at the time when lease payments or decommissioning costs are incurred can be allocated to anything other than the liability component of the transaction. Others will be keen to justify allocation of the tax deductions to the asset, so as to determine that there are no temporary differences on initial recognition of the asset and liability.

In the absence of explicit guidance, practice will no doubt develop. In considering applicable tax law, entities might refer to implementation guidance issued to tax inspectors and other officers in interpreting the nature of the deductions provided. In some jurisdictions, a predominant local determination may evolve for a particular tax deduction. Others might look to other indicators; for example, whether tax deductions for decommissioning costs can be carried back to the same period(s) as those in which the asset is consumed. Some of these considerations are shown in Illustration 7-19 below.

How we see it

Despite any difficulty that entities might find in determining whether the deductions relate to the consumption of the related asset, rather than to the settlement of the lease or decommissioning liability, the Board has concluded that this judgement is required to be made, having considered the applicable tax law and that, as such, it is not an accounting policy choice.

All of the factors noted above will be relevant in making that determination.

7.3.1.B Changes to the initial recognition exception

As noted in section 7.3 above, before the Amendments were issued, views differed on whether (and to what extent) the IRE applied to transactions and events, such as leases, that lead to the recognition of an asset and a liability. To address this problem, the IASB decided to narrow the scope of the recognition exception so that it does not apply to transactions that, on initial recognition, give rise to equal taxable and deductible temporary differences. [IAS 12.BC80].

Only if the recognition of a lease asset and lease liability (or decommissioning liability and decommissioning asset component) give rise to taxable and deductible temporary differences that are not equal, would the IRE be applied. [IAS 12.15(b)(iii)].

The Amendments do not change the fact that the initial recognition exception applies only to temporary differences arising on initial recognition of an asset or liability. It does not apply to new temporary differences that arise on the same asset or liability after initial recognition. When the exception has been applied to the temporary difference arising on initial recognition of an asset or liability, and there is a different temporary difference associated with that asset or liability at a subsequent date, it is necessary to analyse the temporary difference at that date between:

- Any amount relating to the original temporary difference (on which no deferred tax is recognised) [IAS 12.22(c)]
And
- The remainder, which has implicitly arisen after initial recognition of the asset or liability (on which deferred tax is recognised)

Illustration 7-19 below applies the requirements of the Amendments. A key judgement required is the determination of whether the tax relief provided when decommissioning payments are made is attributable to the liability or to the decommissioning component of the asset is a matter of judgement. [IAS 12.BC75].

Illustration 7-19: Asset and liability giving rise to equal temporary differences on initial recognition - applying the Amendments to IAS 12

On 1 January 20X3 an entity paying tax at 40% recognises a provision for the clean-up costs of a mine that will require expenditure of CU10 million at the end of 20X7. A tax deduction for the expenditure will be given when it is incurred (i.e., as a reduction in the current tax liability for 20X7).

In accordance with IAS 37, this provision is discounted (at a rate of 6%) to CU7.5m, giving rise to the following accounting entry (see Chapter 27):

	CU m	CU m
Dr PP&E	7.5	
Cr Provision for clean-up costs		7.5

Under local tax legislation, no deductions are available for depreciation of the decommissioning component of the PP&E asset. However, payments made for decommissioning expenses are deductible for tax and capable of being carried forward or carried back against taxable profits.

Scenario 1: The entity determines that the tax deductions are attributable to the related asset

In this scenario, the entity determines that the tax deduction for decommissioning expenses is attributable to the asset recognised alongside the decommissioning liability and the payment of interest. The entity considers a number of factors in making this judgement, perhaps with emphasis that while the timing of obtaining tax relief is linked to the date on which the decommissioning expenses are incurred, deductions can be carried back in a manner that allows the deductions to be applied against the taxable profits generated as the asset is consumed.

In this scenario, the tax base of the decommissioning component added to the carrying value of PP&E is equal to its carrying amount, since the CU7.5 million carrying value of the asset is regarded as fully deductible for tax purposes. The tax base of the provision is also CU7.5 million (carrying amount of CU7.5 million, less the amount determined to be deductible in future periods, in this case nil). Although deductions of CU10 million are expected to be received in 20X7 when the decommissioning costs are incurred, the tax base is determined by reference to the carrying amount of the asset of CU7.5 million and to the interest expense to be recognised on the liability of CU2.5 million.

On this basis, there are no temporary differences to recognise on 1 January 20X3. In subsequent years, the entity recognises depreciation of CU1.5 million ($CU7.5m \div 5$) and interest on the decommissioning liability, which in 20X3 is CU0.45 million ($CU7.5m \times 6\%$). Given that the decommissioning expense of CU10 million is fully tax-deductible, the entity expects to be entitled to a CU4 million reduction in its current tax liability when the obligation for decommissioning costs is settled.

This would result in the following amounts being included in subsequent income statements (all figures in CU millions):

	20X3	20X4	20X5	20X6	20X7	Total
Depreciation	1.50	1.50	1.50	1.50	1.50	7.50
Finance costs	0.45	0.47	0.50	0.53	0.55	2.50
Cost before tax	1.95	1.97	2.00	2.03	2.05	10.00
Current tax (income)					(4.00)	(4.00)
Deferred tax (income)/charge ¹	(0.78)	(0.79)	(0.80)	(0.81)	3.18	-
Cost after tax	1.17	1.18	1.20	1.22	1.23	6.00
Effective tax rate	40.0%	40.0%	40.0%	40.0%	40.0%	40.0%

- 1 In 20X3, the depreciation of CU1.50 creates a deductible temporary difference in relation to the asset (as its carrying value of CU6 million is less than its tax base of CU7.5 million) and in relation to the accrued interest there is a deductible temporary difference of CU0.45 million because its tax base is nil (carrying amount of CU0.45 million, less the amount deductible in future periods, also CU0.45 million). This results in a deferred tax asset CU0.78 million (CU1.95 million @ 40%) - similarly for 20X4-20X6. The charge in 20X7 represents the release of the remaining net deferred tax asset (equal to cumulative income statement credits in 20X3-20X6).

Scenario 2: The entity determines that the tax deductions are attributable to the liability

In this scenario, the entity determines that the tax deduction for decommissioning expenses is attributable to the settlement of the decommissioning liability and the payment of interest. The entity considers a number of factors in making this judgement, perhaps with emphasis that the timing of obtaining tax relief is linked to the date on which the decommissioning expenses are incurred, which coincides with the settlement of the liability recognised under IAS 37.

In this case, the tax base of the decommissioning component added to the carrying value of PP&E is nil, since no deductions have been attributed to the asset and the CU7.5 million carrying value of the asset is recovered through future taxable profits. The tax base of the provision is also nil (carrying amount of CU7.5 million, less the tax deductions attributed for future periods, also CU7.5 million). Although deductions of CU10 million are expected to be received in 20X7 when the decommissioning costs are incurred, the tax base is determined by reference to the consequences of the liability being settled at its carrying amount of CU7.5 million, with CU2.5 million attributed to the future interest expense.

There is therefore a taxable temporary difference of CU7.5 million associated with the decommissioning component of the PP&E asset and a deductible temporary difference of the same amount associated with the provision.

Having first confirmed that the deductible temporary difference is recoverable, it would, on initial recognition of the provision and the addition to PP&E, establish a deferred tax asset of CU3 million in respect of the provision (CU7.5m @ 40%) and an equal liability in respect of the decommissioning component of PP&E. This would result in the following amounts being included in subsequent income statements (all figures in CU millions):

	20X3	20X4	20X5	20X6	20X7	Total
Depreciation	1.50	1.50	1.50	1.50	1.50	7.50
Finance costs	0.45	0.47	0.50	0.53	0.55	2.50
Cost before tax	1.95	1.97	2.00	2.03	2.05	10.00
Current tax (income)					(4.00)	(4.00)
Deferred tax (income)/charge ¹	(0.78)	(0.79)	(0.80)	(0.81)	3.18	-
Cost after tax	1.17	1.18	1.20	1.22	1.23	6.00
Effective tax rate	40.0%	40.0%	40.0%	40.0%	40.0%	40.0%

- 1 In 20X3, the sum of the reduction in deferred tax liability in respect of the decommissioning component of PP&E CU0.6m (CU1.5 million @ 40%) and increase in deferred tax asset in respect of provision CU0.18 million (CU0.45 million @ 40%) - similarly for 20X4-20X6. The charge in 20X7 represents the release of the remaining net deferred tax asset (equal to cumulative income statement credits in 20X3-20X6).

In the statement of financial position, the related assets and liabilities would be recognised as follows:

	20X3	20X4	20X5	20X6	20X7
PP&E - decommissioning asset	6.00	4.50	3.00	1.50	-
Decommissioning liability	(7.95)	(8.42)	(8.92)	(9.45)	-
Net decommissioning liability	(1.95)	(3.92)	(5.92)	(7.95)	-
Deferred tax asset	3.18	3.37	3.57	3.78	-
Deferred tax liability	(2.40)	(1.80)	(1.20)	(0.60)	-
Current tax recoverable					4.00

How we see it

Under the Amendments, on initial recognition of a right-of-use asset and lease liability (or a decommissioning liability and related asset component), temporary differences would either:

- Not arise, because the tax deductions are determined by the entity to relate to the right-of-use asset or decommissioning asset
- Or
- Be equal and offsetting (that is, the resulting taxable and deductible temporary differences would be of the same amount), because the tax deductions are determined by the entity to relate to the liability

7.3.1.C When the deferred tax asset and deferred tax liability are not equal

The Amendments require entities to recognise a separate deferred tax asset (DTA) and deferred tax liability (DTL) when the temporary differences arising on the initial recognition of an asset and liability are equal. Nevertheless, it is possible that resulting DTAs and DTLs are not equal, for example, because:

- An entity may recognise a deferred tax liability, but is unable to recognise an equal and offsetting deferred tax asset if it is unable to benefit from the tax deductions
- Or
- Different tax rates may apply to the taxable and deductible temporary differences

In the above scenarios, which the Board expects to occur infrequently, an entity would need to account for the difference between the deferred tax asset and liability in profit or loss. [IAS 12.BC86, IAS 12.BC87, IAS 12.BC88].

7.3.1.D Advance lease payments and initial direct costs

Having initially measured a lease liability at the present value of the lease payments not yet made at the commencement date and recognised a related component of the lease asset, entities will adjust the measurement of the lease asset for any advance lease payments or initial direct costs incurred. The Board notes that these adjustments could result in additional taxable temporary differences associated with the lease asset, to which an entity would apply the relevant requirements in IAS 12. In response to requests to do so, the Board included the following example to illustrate the accounting for deferred tax on advance lease payments and initial direct costs. [IAS 12.BC91, IAS 12.IE Example 8].

Extract from IAS 12 - Illustrative Examples

Example 8 - Leases

Lease

An entity (Lessee) enters into a five-year lease of a building. The annual lease payments are CU100 payable at the end of each year. Before the commencement date of the lease, Lessee makes a lease payment of CU15 (advance lease payment) and pays initial direct costs of CU5. The interest rate implicit in the lease cannot be readily determined. Lessee's incremental borrowing rate is 5% per year.

At the commencement date, applying IFRS 16 *Leases*, Lessee recognises a lease liability of CU435 (measured at the present value of the five lease payments of CU100, discounted at the interest rate of 5% per year). Lessee measures the right-of-use asset (lease asset) at CU455, comprising the initial measurement of the lease liability (CU435), the advance lease payment (CU15) and the initial direct costs (CU5).

Tax law

The tax law allows tax deductions for lease payments (including those made before the commencement date) and initial direct costs when an entity makes those payments. Economic benefits that will flow to Lessee when it recovers the carrying amount of the lease asset will be taxable.

A tax rate of 20% is expected to apply to the period(s) when Lessee will recover the carrying amount of the lease asset and will settle the lease liability.

After considering the applicable tax law, Lessee concludes that the tax deductions it will receive for lease payments relate to the repayment of the lease liability.²

Deferred tax on the advance lease payment and initial direct costs

Lessee recognises the advance lease payment (CU15) and initial direct costs (CU5) as components of the lease asset's cost. The tax base of these components is nil because Lessee already received tax deductions for the advance lease payment and initial direct costs when it made those payments. The difference between the tax base (nil) and the carrying amount of each component results in taxable temporary differences of CU15 (related to the advance lease payment) and CU5 (related to the initial direct costs).

The exemption from recognising a deferred tax liability in paragraph 15 does not apply because the temporary differences arise from transactions that, at the time of the transactions, affect Lessee's taxable profit (that is, the tax deductions Lessee received when it made the advance lease payment and paid initial direct costs reduced its taxable profit). Accordingly, Lessee recognises a deferred tax liability of CU3 ($\text{CU15} \times 20\%$) and CU1 ($\text{CU5} \times 20\%$) for the taxable temporary differences related to the advance lease payment and initial direct costs, respectively.

Deferred tax on the lease liability and related component of the lease asset's cost

At the commencement date, the tax base of the lease liability is nil because Lessee will receive tax deductions equal to the carrying amount of the lease liability (CU435). The tax base of the related component of the lease asset's cost is also nil because Lessee will receive no tax deductions from recovering the carrying amount of that component of the lease asset's cost (CU435).

The differences between the carrying amounts of the lease liability and the related component of the lease asset's cost (CU435) and their tax bases of nil result in the following temporary differences at the commencement date:

- (a) a taxable temporary difference of CU435 associated with the lease asset; and
- (b) a deductible temporary difference of CU435 associated with the lease liability.

The exemption from recognising a deferred tax asset and liability in paragraphs 15 and 24 does not apply because the transaction gives rise to equal taxable and deductible temporary differences. Lessee concludes that it is probable that taxable profit will be available against which the deductible temporary difference can be utilised. Accordingly, Lessee recognises a deferred tax asset and a deferred tax liability, each of CU87 ($\text{CU435} \times 20\%$), for the deductible and taxable temporary differences.

Summary of recognised deferred tax

The table below summarises the deferred tax that Lessee recognises on initial recognition of the lease (including the advance lease payment and initial direct costs):

	Carrying amount	Tax base	Deductible / (taxable) temporary difference	Deferred tax asset / (liability)
Lease asset				
- advance lease payment	15	-	(15)	(3)
- initial direct costs	5	-	(5)	(1)
- the amount of the initial measurement of the lease liability	435	-	(435)	(87)
Lease liability	435	-	435	87

Applying paragraph 22(b) of IAS 12, Lessee recognises deferred tax assets and liabilities as illustrated in this example and recognises the resulting deferred tax income or expense in profit or loss.

2. Depending on the applicable tax law, an entity might alternatively conclude that the tax deductions it will receive for lease payments relate to the lease asset, in which case temporary differences would not arise on initial recognition of the lease liability and the related component of the lease asset's cost. Accordingly, the entity would not recognise deferred tax on initial recognition but would do so if and when temporary differences arise after initial recognition.

7.4 Assets carried at fair value or revalued amount

IAS 12 notes that certain IFRS accounting standards permit or require assets to be carried at fair value or to be revalued. These include: [IAS 12.20]

- IAS 16 *Property, Plant and Equipment*
- IAS 38 *Intangible Assets*
- IAS 40 *Investment Property*
- IFRS 9 *Financial Instruments*
- IFRS 16 *Leases*

In many jurisdictions, the revaluation or restatement of an asset does not affect taxable profit in the period of the revaluation or restatement. Nevertheless, the future recovery of the carrying amount will result in a taxable flow of economic benefits to the entity and the amount that will be deductible for tax purposes (i.e., the original tax base) will differ from the amount of those economic benefits.

The difference between the carrying amount of a revalued asset and its tax base is a temporary difference and gives rise to a deferred tax liability or asset. IAS 12 clarifies that this is the case even if:

- The entity does not intend to dispose of the asset. In such cases, the revalued carrying amount of the asset will be recovered through use and this will generate taxable income which exceeds the depreciation that will be allowable for tax purposes in future periods.
 - Tax on capital gains is deferred if the proceeds of the disposal of the asset are invested in similar assets. In such cases, the tax will ultimately become payable on sale or use of the similar assets.
- [IAS 12.20]. A discussion of the accounting for deferred taxable gains can be found in section 7.8 below.

In some jurisdictions, the revaluation or other restatement of an asset to fair value affects taxable profit (tax loss) for the current period. In such cases, the tax base of the asset may be raised by an amount equivalent to the revaluation gain, so that no temporary difference arises.

7.5 Restrictions on recognition of deferred tax assets

There is an essential difference between deferred tax liabilities and deferred tax assets. An entity's deferred tax liabilities will crystallise if the entity recovers its existing net assets at their carrying amount. However, in order to realise its net deferred tax assets in full, an entity must earn profits in excess of those represented by the carrying amount of its net assets in order to generate sufficient taxable profits against which the deductions represented by deferred tax assets can be offset. Accordingly, IAS 12 restricts the recognition of deferred tax assets to the extent that it is probable that taxable profit will be available against which the underlying deductible temporary differences can be utilised. [IAS 12.27].

7.5.1 Restrictions imposed by relevant tax laws

When an entity assesses whether a deductible temporary difference is capable of being utilised, it must consider whether tax law restricts the sources of taxable profits against which deductions for this type of temporary difference are permitted. If tax law imposes no such restrictions, an entity can assess a deductible temporary difference in combination with all its other deductible temporary differences. However, if tax law restricts the utilisation of losses to deduction against a specific type of income, the recovery of a deductible temporary difference is assessed in combination only with other deductible temporary differences of the appropriate type. [IAS 12.27A].

The sources of taxable profits considered in determining the deferred tax asset can be broadly categorised:

- Taxable income in prior carryback years, if carryback is permitted under the tax law.
- Deferred tax liabilities the entity has already recognised at the reporting date (see section 7.5.2).
- Estimate of future taxable profits ignoring the origination of new future deductible temporary differences and the reversal of existing deductible temporary differences (see section 7.5.3).
- Tax planning opportunities available to the entity that will create taxable profit (see section 7.5.4).

7.5.2 Sources of 'probable' taxable profit - taxable temporary differences

Before considering forecasts of future taxable profits, an entity must look to the deferred tax liabilities it has already recognised at the reporting date as a source of probable taxable profits that would allow any deductible temporary differences to be utilised. IAS 12 states that it is 'probable' that there will be sufficient taxable profit if a deductible temporary difference can be offset against a taxable temporary difference (deferred tax liability) relating to the same tax authority and the same taxable entity which will reverse in the same period as the asset, or in a period into which a loss arising from the asset may be carried back or forward. In such circumstances, a deferred tax asset is recognised. [IAS 12.28].

There is no need at this stage to estimate the future taxable profits of the entity. If there are sufficient taxable temporary differences to justify the recognition of a deferred tax asset for deductible temporary differences, then the asset is recognised. The only condition to apply, as noted in section 7.5.1 above, is that any deferred tax liability used as the basis for recognising a deferred tax asset represents a future tax liability against which the deductible temporary difference can actually be offset under the relevant tax law. [IAS 12.27A]. For example, in a tax jurisdiction where revenue and capital items are treated separately for tax purposes, a deferred tax asset representing a capital loss cannot be recognised by reference to a deferred tax liability relating to tax allowances received on PP&E in advance of the related depreciation expense.

7.5.3 Sources of 'probable' taxable profit - estimates of future taxable profits

Estimates of future taxable profits are only required to justify the recoverability of those deductible temporary differences in excess of the amounts already 'matched' against deferred tax liabilities recognised at the reporting date in the manner described in section 7.5.2 above. [IAS 12.29]. When this is the case, the following requirements apply:

Extract from IAS 12

- 29 When there are insufficient taxable temporary differences relating to the same taxation authority and the same taxable entity, the deferred tax asset is recognised to the extent that:
- (a) it is probable that the entity will have sufficient taxable profit relating to the same taxation authority and the same taxable entity in the same period as the reversal of the deductible temporary difference (or in the periods into which a tax loss arising from the deferred tax asset can be carried back or forward). In evaluating whether it will have sufficient taxable profit in future periods, an entity:
 - (i) compares the deductible temporary differences with future taxable profit that excludes tax deductions resulting from the reversal of those deductible temporary differences. This comparison shows the extent to which the future taxable profit is sufficient for the entity to deduct the amounts resulting from the reversal of those deductible temporary differences; and
 - (ii) ignores taxable amounts arising from deductible temporary differences that are expected to originate in future periods, because the deferred tax asset arising from these deductible temporary differences will itself require future taxable profit in order to be utilised; or
 - (b) tax planning opportunities are available to the entity that will create taxable profit in appropriate periods.

Where an entity has a history of recent losses it must also consider the guidance in IAS 12 for recognition of such losses (see section 7.5.6 below). [IAS 12.31].

7.5.3.A Ignore the origination of new future deductible temporary differences

In assessing the availability of future taxable profits, an entity must ignore taxable amounts arising from deductible temporary differences expected to originate in future periods. This is because those new deductible differences will themselves require future taxable profit in order to be utilised. [IAS 12.29(a)(ii)]. For example, suppose that in 20X3 an entity charges CU100 to profit or loss for which a tax deduction is not available until 20X4, when the amount is settled. However, in 20X4 a further CU100 is expected to be charged to profit or loss, for which a deduction will be available in 20X5, and so on for the foreseeable future. This will have the effect that, in 20X3, the entity will pay tax on the CU100 for which no deduction is made on the 20X3 tax return. In the tax return for 20X4, there will be a deduction for that CU100, but this will be offset by the add-back in the same tax return for the equivalent CU100 charged for accounting purposes in 20X4. If this cycle of 'CU100 deduction less CU100 add-back' is expected to be perpetuated in each tax return for the foreseeable future, there is never any real recovery of the tax paid on the CU100 in 20X3 and, in the absence of any other taxable profits, no deferred tax asset would be recognised.

7.5.3.B Ignore the reversal of existing deductible temporary differences

In 2016, the IASB added text to the standard to clarify that the estimate of probable future taxable profit must exclude the tax deductions resulting from the reversal of the deductible temporary differences that are themselves being assessed for recognition as an asset. [IAS 12.29(a)(i)]. This amendment was made following the IASB's deliberations on the recognition of deferred tax assets for unrealised losses, as discussed in section 7.5.5 below. The effect of the amendment is to clarify that the measure of taxable profit used for assessing the utilisation of deductible temporary differences is different from the taxable profit on which income taxes are payable. [IAS 12.BC56].

The former is calculated before any allowances or deductions arising from the reversal of deductible temporary differences. The latter is the amount determined after the application of all applicable tax laws that gives rise to an entity's liability to pay income tax. [IAS 12.5].

7.5.3.C Include the effect of (substantively) enacted changes to future tax rates and laws

As explained in section 8.1 below, deferred tax is measured by reference to the tax rates and laws, as enacted or substantively enacted by the end of the reporting period. [IAS 12.47]. Changes enacted after the end of the reporting period are ignored for measurement purposes and the effect is disclosed as a non-adjusting event. [IAS 10.22(h)]. However, in cases where changes have been (substantively) enacted before the end of the reporting period but are not effective until a later date, deferred tax would be calculated by applying the new rates and laws to the deductible and taxable temporary differences that are expected to reverse after that later effective date. [IAS 12.47]. Illustration 7-20 below shows how estimates of future taxable profits must also reflect any future changes to tax rates and laws that have been enacted by the end of the reporting period.

Illustration 7-20: Including the effect of enacted changes to future tax rates and laws

At the end of 20X3, Entity A has deductible temporary differences in excess of its taxable temporary differences of CU200,000. Entity A expects to generate annual profits of CU30,000 per year for the foreseeable future, after deducting costs of CU10,000 per annum which are currently not deductible for tax purposes. However, in December 20X3, legislation is enacted to the effect that these costs will be deductible from 20X5 onwards.

As a result, Entity A estimates future taxable profits of CU40,000 in 20X3 and 20X4 and revises its estimate of taxable profits from 20X5 onwards to CU30,000.

7.5.4 Tax planning opportunities and the recognition of deferred tax assets

'Tax planning opportunities' are actions that the entity would take in order to create or increase taxable income in a particular period before the expiry of a tax loss or tax credit carryforward. IAS 12 notes that, in some jurisdictions, taxable profit may be created or increased by:

- Electing to have interest income taxed on either a received or receivable basis
- Deferring the claim for certain deductions from taxable profit
- Selling, and perhaps leasing back, assets that have appreciated but for which the tax base has not been adjusted to reflect such appreciation
- Selling an asset that generates non-taxable income (such as, in some jurisdictions, a government bond) in order to purchase another investment that generates taxable income

Where tax planning opportunities advance taxable profit from a later period to an earlier period, the utilisation of a tax loss or tax credit carryforward still depends on the existence of future taxable profit from sources other than future originating temporary differences. [IAS 12.30].

The requirement to have regard to future tax planning opportunities applies only to the measurement of deferred tax assets. It does not apply to the measurement of deferred tax liabilities. Thus, for example, it would not be open to an entity subject to tax at 30% to argue that it must provide for deferred tax liabilities at some lower rate on the grounds that it intends to invest in assets attracting investment tax credits that will allow it to pay tax at that lower rate (see section 8.4.1 below).

IAS 12 describes tax planning opportunities as actions that the entity 'would' take - not those it 'could' take. In other words, they are restricted to future courses of action that the entity would actually undertake to realise such a deferred tax asset, and do not include actions that are theoretically possible but practically implausible, such as the sale of an asset essential to the ongoing operations of the entity. Only if such actions are both capable of being taken as at the end of the reporting period and are intended to be taken by the entity before the related tax loss or credit expires can it be said that the resulting tax planning would give rise to a 'probable' future taxable profit.

Implementation of a tax planning opportunity may well entail significant direct costs or the loss of other tax benefits or both. Accordingly, any deferred tax asset recognised on the basis of a tax planning opportunity must be reduced by any cost of implementing that opportunity (measured, where applicable, on an after-tax basis).

How we see it

The requirement to have regard to future tax planning opportunities applies only to the measurement of deferred tax assets.

IAS 12 describes tax planning opportunities as actions that the entity 'would' take - not those it 'could' take, i.e., both capable of being taken as at the end of the reporting period and are intended to be taken by the entity.

Moreover, IAS 12 regards tax planning opportunities as a component of future net taxable profits. Thus, where a tax planning opportunity exists, but the entity is expected to remain loss-making (such that the opportunity effectively will simply reduce future tax losses), we believe that such an opportunity does not generally form the basis for recognising a deferred tax asset, except to the extent that it will create net future taxable profits (see also section 7.5.6 below).

7.5.4.A Changes in tax laws not yet enacted and future circumstances are not anticipated

Paragraph 29 of IAS 12 separates the consideration of probable future taxable profits [IAS 12.29(a)] from the assessment of whether tax planning opportunities are available to the entity. [IAS 12.29(b)]. Accordingly, the evaluation of whether tax planning opportunities are available is made as at the end of the reporting period rather than in contemplation of future possible events outside the entity's control. In this context, the general principle applies that deferred taxes are determined on the basis of tax rates and laws that are (substantively) enacted as at the end of the reporting period. [IAS 12.47]. Therefore, an entity must not take into consideration any tax planning that relies on the effect of an actual or probable change in tax law becoming (substantively) enacted after the end of the reporting period. However, it would be appropriate to consider a tax planning opportunity that cannot be implemented until the effective date of a future change to a rate or regulation that has been enacted as at the end of the reporting period.

Similarly, in assessing which tax planning opportunities 'are available', the entity can only consider its circumstances as they exist at the end of the reporting period, including the result of actions within the entity's control as at that date. For example, when an entity is contemplating the acquisition of a business and, as a result of the business combination, the probability of realising a pre-acquisition deferred tax asset of the acquirer is expected to change, IAS 12 requires that any change in the deferred tax asset is recognised in the period of the business combination. [IAS 12.67]. The change in probability must not be anticipated, because the forecast profits of the target acquiree are not available to the acquirer until the business combination is completed. This is also discussed in section 12.1.2.A below. Conversely, the sale of assets already held by the entity (or even the acquisition of assets freely available in the market) to achieve a tax advantage is an example of a tax planning opportunity that could be taken into account, because the action is in the entity's control as at the end of the reporting period. [IAS 12.30].

7.5.5 Unrealised losses on debt securities measured at fair value

In January 2016, the IASB issued *Recognition of Deferred Tax Assets for Unrealised Losses (Amendments to IAS 12)*. These amendments concluded deliberations started by the IFRS IC in May 2010 on the recognition of deferred tax assets for unrealised losses, for example on debt instruments measured at fair value. [IAS 12.BC1A].

The IFRS IC had been asked to provide guidance on how an entity determines whether to recognise a deferred tax asset under IAS 12 in the following circumstances: [IAS 12.BC37]

- (a) The entity has a debt instrument measured at fair value under IAS 39 *Financial Instruments: Recognition and Measurement* and changes in market interest rates result in a decrease in the fair value of the debt instrument below its cost.
- (b) It is probable that the issuer of the debt instrument will make all the contractual payments.
- (c) The tax base of the debt instrument is its cost.
- (d) Tax law does not allow a loss to be deducted on a debt instrument until the loss is realised for tax purposes.
- (e) The entity has the ability and intention to hold the debt instrument until the unrealised loss reverses (which may be at its maturity).

- (f) Tax law distinguishes between capital gains and losses and ordinary income tax losses. While capital losses can only be offset against capital gains, ordinary losses can be offset against both capital gains and ordinary income.
- (g) The entity has insufficient taxable temporary differences and no other probable taxable profits against which the entity can utilise those deductible temporary differences.

The IFRS IC had identified diversity in practice because of uncertainty about the application of some of the principles in IAS 12, in particular in relation to the following:

- (a) The existence of a deductible temporary difference, when there are no tax consequences to the recovery of the principal on maturity; the holder of the debt instrument expects to hold it to maturity; and it is probable that the issuer will pay all the contractual cash flows. [IAS 12.BC38, IAS 12.BC39].
- (b) Whether it is appropriate for an entity to determine deductible temporary differences and taxable temporary differences on the basis of the asset's carrying amount when at the same time it assumes that the asset is recovered for more than its carrying amount for the purposes of estimating probable future taxable profit against which deductible temporary differences are assessed for utilisation. This question is relevant when taxable profit from other sources is insufficient for the utilisation of the deductible temporary differences arising when the asset is measured at fair value. [IAS 12.BC38, IAS 12.BC47].
- (c) Whether the estimate of probable future taxable profit must include or exclude the effects of reversing the deductible temporary differences that are being assessed for recognition as an asset. [IAS 12.BC38, IAS 12.BC55].
- (d) The basis for assessing the recoverability of deductible temporary differences, i.e., for each deductible temporary difference separately, or in combination with other deductible temporary differences. This question is relevant, for example, when tax law distinguishes capital gains and losses from other taxable gains and losses and capital losses can only be offset against capital gains. [IAS 12.BC38, IAS 12.BC57].

Whilst the amendments to IAS 12 were framed around the above example of a fixed-rate debt instrument measured at fair value, the Board noted that the principle on which the amendments are based is not limited to any specific type or class of assets. [IAS 12.BC52]. However, as noted in section 7.5.5.B below, the IASB acknowledged the concerns raised by respondents that the amendments could be applied too broadly and highlighted the need for particular caution where assets are measured at fair value. In response to that concern, the Board noted that entities will need to have sufficient evidence on which to base their estimate of probable future taxable profit, including when that estimate involves the recovery of an asset for more than its carrying amount. [IAS 12.BC53].

7.5.5.A The existence of a deductible temporary difference

Because, in the case of many debt instruments, the collection of the principal on maturity does not give rise to any liability for tax, some believed that the collection of the principal is a non-taxable event. Consequently, proponents of this view argued that a deductible temporary difference cannot exist when an entity asserts that the contractual payments will be received, because any difference between the debt instrument's carrying amount and its higher tax base results from a loss that the entity expects never to realise for tax purposes. [IAS 12.BC40].

The IASB rejected this argument. IAS 12 already states that a deductible temporary difference arises if the tax base of an asset exceeds its carrying amount. [IAS 12.20, IAS 12.26(d)]. The calculation of a temporary difference is based on the premise that the carrying amount of the asset will be recovered. [IAS 12.5, IAS 12.BC42]. The calculation of the temporary difference is not affected by possible future changes in the carrying amount of the asset. The Board considered that the economic benefit embodied in the related deferred tax asset results from the ability of the holder of the debt instrument to achieve future taxable gains in the amount of the deductible temporary difference without paying tax on those gains. This is the case where a previous impairment reverses, such that the entity recovers the original principal on the debt instrument. [IAS 12.BC44]. Accordingly, the amendments added an example after IAS 12.26 to illustrate how a deductible temporary difference exists under IAS 12.26(d).

Illustration 7-21: Deductible temporary difference when the asset is valued below cost

At the beginning of Year 1, Entity A purchases for CU1,000 a debt instrument with a nominal value of CU1,000 payable at the end of Year 5 and with an interest rate of 2% payable at the end of each year. The effective interest rate is determined to be 2% and the debt instrument is measured at fair value.

At the end of year 2, market interest rates have increased to 5%, causing the fair value of the debt instrument to decrease to CU918. It is probable that Entity A will collect all the contractual cash flows if it continues to hold the debt instrument.

Any gains or losses on the debt instrument are taxable or deductible only when realised. Gains or losses arising on the sale or maturity of the instrument are calculated for tax purposes as the difference between the amount collected and the original cost of the debt instrument. Accordingly, the tax base of the debt instrument is its original cost.

The Illustration concludes that the difference between the carrying amount of the debt instrument of CU918 and its tax base of CU1,000 gives rise to a deductible temporary difference of CU82 at the end of Year 2, [IAS 12.20, IAS 12.26(d)], irrespective of whether Entity A expects to recover the carrying amount of the debt instrument by sale or by use, i.e., by holding it and collecting contractual cash flows, or a combination of both. Whether the asset is realised on sale or on maturity (i.e., through use), Entity A will obtain a tax deduction equivalent to the tax base of CU1,000 in determining any resultant taxable profit.

7.5.5.B Recovering an asset for more than its carrying amount

The Board concluded that the estimate of probable future taxable profit may include the recovery of some of an entity's assets for more than their carrying amount, but only if there is sufficient evidence that it is probable that the entity will achieve this. In the case of a fixed-rate debt instrument measured at fair value, recovery for more than the carrying amount is probable if the entity expects to collect the contractual cash flows. [IAS 12.29A].

The determination of temporary differences and the estimation of probable future taxable profit are two separate steps, and the IASB concluded that the carrying amount of an asset is relevant only to determining the temporary differences. [IAS 12.BC49]. Indeed, the Board identified scenarios where an inappropriate outcome can arise if the possibility of realising a profit in excess of the carrying amount were limited. For example, a profitable manufacturing company relies on a business model that involves the sale of inventories and the recovery of property, plant and equipment for amounts exceeding their cost. Therefore, where such assets are recorded using the cost model, it may be inconsistent to assume that the entity will only recover these assets for their carrying amount. [IAS 12.BC50]. Nevertheless, in response to concerns raised by respondents that the amendment could be applied inappropriately, the Board acknowledged the need for caution where assets are measured at fair value. The risk of arbitrary estimates of future taxable profit is reduced where entities rely on evidence, such as the existence of contractual cash flows and an expectation of their recovery. [IAS 12.BC53]. For example, it would not be appropriate to assume recovery greater than an asset's carrying amount at fair value on the basis of an arbitrary assertion that fair value will inevitably recover in line with a longer-term improvement in the related market for the asset in question.

7.5.5.C Excluding the reversal of existing deductible temporary differences

During its deliberations, the IFRS IC observed uncertainty about how entities should calculate the measure of taxable profit that is used for assessing the amounts available for the future utilisation of deductible temporary differences. In particular, there seemed to be diversity of opinion relating to whether entities must include or exclude deductions that will arise when those deductible temporary differences reverse. [IAS 12.BC55]. As discussed above in section 7.5.3.B, the IASB concluded that the estimate of future taxable profit used to assess whether deductions can be utilised is not the same as 'taxable profit' (which is the amount determined after the application of all applicable tax laws that gives rise to an entity's liability to pay income tax). [IAS 12.5].

Therefore, entities must exclude the effect of deductions arising from the reversal of the deductible temporary differences being assessed for recoverability, or they would be counted twice. [IAS 12.29(a)(i), IAS 12.BC56].

7.5.5.D The basis for assessing the recoverability of deductible temporary differences

As noted in section 7.5 above, IAS 12 restricts the recognition of deferred tax assets to the extent that it is probable that taxable profit will be available against which the underlying deductible temporary differences can be utilised. [IAS 12.27].

The Board noted that this is a matter for tax law; that IAS 12 defines taxable profit by reference to the application of the rules determined by tax authorities; and that no deferred tax is recognised if the reversal of the temporary difference will not lead to tax deductions. [IAS 12.BC58]. Therefore, the assessment of whether a deductible temporary difference can be utilised considers on a combined basis all deductible temporary differences relating to the same taxation authority and same taxable entity that are treated in a

similar way under tax law. However, if tax law offsets specific types of losses against particular categories of income (for example when tax law allows capital losses to be deducted only against capital gains) such temporary differences are segregated according to their treatment under the relevant tax law. [IAS 12.BC59].

IAS 12 was amended to clarify that entities making the assessment of the availability of taxable profits against which a deductible temporary difference can be utilised must do so in combination with all other deductible temporary differences, unless tax law restricts the sources of taxable profits against which that deductible temporary difference can be utilised. Where restrictions exist, the assessment is made together only with deductible temporary differences recoverable from the same sources. [IAS 12.27A].

The amendments to IAS 12 add an example to show how these requirements are applied to debt instruments measured at fair value, on which Illustration 7-22 below is based. [IAS 12.IE Example 7].

Illustration 7-22: Debt instruments measured at fair value

At 31 December 20X3 an entity holds a portfolio of three debt instruments, which are measured at fair value through other comprehensive income:

Debt instrument (All amounts in CU)	Cost	Fair value	Contractual interest rate
Debt instrument A	2,000,000	1,942,857	2.00%
Debt instrument B	750,000	778,571	9.00%
Debt instrument C	2,000,000	1,961,905	3.00%

All the debt instruments were acquired for their nominal value. All three debt instruments mature on 31 December 20X4, on which date repayment of the nominal value is due. Interest is paid at the end of each year. When the instruments were acquired, the contractually fixed interest rates were equal to the relevant market rates. However, at 31 December 20X3 the market interest rate is 5%, resulting in the fair value of instruments A and C to be below their cost and the fair value of instrument B to be above its cost. It is probable that the entity would receive all the contractual cash flows if it continues to hold the debt instruments.

The entity expects to hold instruments A and B to maturity, collecting the cash flows as they fall due, and to sell instrument C in early 20X4 for its fair value of CU1,961,905.

The tax base of the debt instruments is cost, which is deductible either on maturity when the principal is paid or against any sale proceeds when the instruments are sold. Tax law specifies that gains (losses) on the debt instruments are taxable (deductible) only when realised. Tax law distinguishes ordinary gains and losses from capital gains and losses. Ordinary losses can be offset against both ordinary gains and capital gains. Capital losses can only be offset against capital gains. Capital losses can be carried forward for 5 years and ordinary losses can be carried forward for 20 years.

Ordinary gains are taxed at 30% and capital gains are taxed at 10%.

Tax law classifies interest income from the debt instruments as 'ordinary' and gains and losses arising on the sale of the debt instruments as 'capital'. Losses that arise if the issuer of the debt instrument fails to pay the principal on maturity are classified as ordinary by tax law.

In addition to the above, there are other taxable temporary differences of CU50,000 and deductible temporary differences of CU430,000 which are expected to reverse in ordinary taxable profit in 20X4.

In summary, the following temporary differences are identified at 31 December 20X3:

Temporary differences (All amounts in CU)	Carrying amount	Tax base	Taxable temporary differences	Deductible temporary differences
Debt instrument A	1,942,857	2,000,000		57,143
Debt instrument B	778,571	750,000	28,571	
Debt instrument C	1,961,905	2,000,000		38,095
Other sources (not specified)			50,000	430,000
Total temporary differences			78,571	525,238
Expected to reverse in ordinary gains or losses			78,571	487,143
Expected to reverse as capital losses				38,095

The entity expects to report an ordinary tax loss of CU200,000 for the year ending 31 December 20X4. The deductible temporary difference on instrument C is classified as a capital loss because it is expected to be realised by sale. There are no other capital gains against which the entity could utilise capital losses in the current or future periods. What is the entity's deferred tax asset or liability as at 31 December 20X3?

The entity assesses the availability of probable future taxable profits in two steps:

- Step 1: Determine the availability of taxable temporary differences at the reporting date. [IAS 12.28].
- Step 2: Determine the availability of probable future taxable profits. [IAS 12.29].

Step 1: Determine the availability of taxable temporary differences at the reporting date

All of the taxable temporary differences are expected to reverse in ordinary gains or losses and must therefore be compared to the deductible temporary differences of CU487,143 that are capable of being utilised against ordinary gains. Accordingly, a deferred tax asset of CU78,571 is justified at this stage, with CU408,572 (487,143 - 78,571) of deductible temporary differences remaining to be utilised against ordinary gains or losses.

Step 2: Determine the availability of probable future taxable profits

The fact pattern states that the entity expects to report an ordinary tax loss of CU200,000 for 20X4. As noted in section 7.5.5.C above, this figure is the amount determined after the application of all applicable tax laws that gives rise to an entity's liability to pay income tax. In order to calculate the available profits against which the deductible temporary differences can be utilised, the effect of deductions arising from the reversal of the deductible temporary differences must be excluded. This gives a probable future taxable profit of CU208,572, as follows:

	Amount CU
Excluding the reversal of existing temporary differences	
Expected tax loss reported for 20X4	(200,000)
Reversal of taxable temporary differences (ordinary gains and losses)	(78,571)
Reversal of deductible temporary differences (ordinary gains and losses)	487,143
Probable taxable profit for 20X4 excluding the effect of reversals	<u>208,572</u>

Accordingly, the entity recognises a deferred tax asset in respect of deductible temporary differences of CU287,143, comprising CU78,571 justified by reference to taxable temporary differences existing at the reporting date and CU208,572 expected to be utilised against probable taxable profits in 20X4. All of these deductible temporary differences are expected to reverse in ordinary gains or losses, for which the applicable tax rate is 30%.

Therefore, at 31 December 20X3, the entity reports a deferred tax liability of CU23,571, a deferred tax asset of CU86,143 and unrecognised deductible temporary differences of CU238,095, as follows:

Temporary differences (All amounts in CU)	Amount	Tax rate	Deferred tax liability	Deferred tax asset
Taxable temporary differences	78,571	30%	23,571	
Total deductible temporary differences	525,238			
Less: eligible for recognition	(287,143)	30%		86,143
Unrecognised	<u>238,095</u>			

The unrecognised deductible temporary differences comprise CU38,095 expected to reverse in capital gains and losses and CU200,000 (487,143 - 287,143) expected to reverse in ordinary gains and losses.

7.5.6 Unused tax losses and unused tax credits

A deferred tax asset must be recognised for the carryforward of unused tax losses and unused tax credits to the extent that it is probable that future taxable profit will be available against which the unused tax losses and unused tax credits can be utilised. [IAS 12.34].

The criteria for recognition are essentially the same as those for deductible temporary differences, as set out in sections 7.5.1 to 7.5.4 above, in particular that it is 'probable' that there will be sufficient taxable profit against which a deductible temporary difference can be utilised when there are sufficient taxable temporary differences relating to the same taxation authority and the same taxable entity which are expected to reverse in the same period as the asset, or in a period into which a loss arising from the asset may be carried back or forward. [IAS 12.28].

However, IAS 12 emphasises that the existence of unused tax losses is strong evidence that taxable profits (other than those represented by deferred tax liabilities) may not be available. Therefore, an entity with a history of recent losses recognises a deferred tax asset arising from unused tax losses or tax credits only to the extent that: [IAS 12.35]

- It has sufficient taxable temporary differences
- Or
- There is other convincing evidence that sufficient taxable profit will be available against which the unused tax losses or unused tax credits can be utilised by the entity

Frequently asked questions

Question 7-2: How does an entity justify the recognition of deferred tax assets on the basis of taxable temporary differences as at the reporting date, when it expects to incur tax losses in the future?

In May 2014, the IFRS IC confirmed that the consideration of available reversing taxable temporary differences is made independently of the assessment of an entity's expectations of future tax losses. Accordingly, a deferred tax asset is recognised for the carryforward of unused tax losses to the extent of the existing taxable temporary differences, of an appropriate type, that reverse in an appropriate period. The reversal of those taxable temporary differences enables the utilisation of the unused tax losses and justifies the recognition of deferred tax assets. Consequently, future tax losses are not considered.¹⁴

In addition to the question noted above, the IFRS IC was asked to clarify how the guidance in IAS 12 is applied when tax laws limit the extent to which tax losses brought forward can be recovered against future taxable profits. In the tax systems considered for this issue, the amount of tax losses brought forward that can be recovered in each tax year is limited to a specified percentage of the taxable profits of that year.

In these circumstances, the IFRS IC noted that the amount of deferred tax assets recognised from unused tax losses as a result of suitable existing taxable temporary differences should be restricted as specified by the tax law. This is because when the suitable taxable temporary differences reverse, the amount of tax losses that can be utilised by that reversal is reduced as specified by the tax law. Also, the IFRS IC noted that in this case future tax losses are not considered.

Consequently, the availability of future taxable profits is only required to be considered if the unused tax losses exceed the amount of suitable existing taxable temporary differences (after taking into account any restrictions).¹⁵

The IFRS IC also confirmed in May 2014 that an additional deferred tax asset is recognised only to the extent that the requirements in IAS 12.36 are met, as follows:¹⁶ [IAS 12.36]

Extract from IAS 12

- 36 An entity considers the following criteria in assessing the probability that taxable profit will be available against which the unused tax losses or unused tax credits can be utilised:
- (a) whether the entity has sufficient taxable temporary differences relating to the same taxation authority and the same taxable entity, which will result in taxable amounts against which the unused tax losses or unused tax credits can be utilised before they expire;
 - (b) whether it is probable that the entity will have taxable profits before the unused tax losses or unused tax credits expire;
 - (c) whether the unused tax losses result from identifiable causes which are unlikely to recur; and
 - (d) whether tax planning opportunities (see paragraph 30) are available to the entity that will create taxable profit in the period in which the unused tax losses or unused tax credits can be utilised.
- To the extent that it is not probable that taxable profit will be available against which the unused tax losses or unused tax credits can be utilised, the deferred tax asset is not recognised.

¹⁵ [IFRIC Update](#), May 2014, available on the IFRS Foundation's website.

¹⁶ [IFRIC Update](#), May 2014, available on the IFRS Foundation's website.

Additional disclosures are required when an entity recognises a deferred tax asset on the assumption that there will be future taxable profits available in excess of the amount of existing taxable temporary differences, and the entity has suffered a loss in either the current or preceding period in the tax jurisdiction to which the deferred tax asset relates (see section 14.3 below). [IAS 12.35].

Some have suggested that the IASB should set time limits on the foresight period used. We consider that such generalised guidance would be inappropriate, particularly in the context of an international standard, which must address the great variety of tax systems that exist worldwide, and which impose a wide range of restrictions on the carryforward of tax losses or tax credits. In any event, it may well be the case that a deferred tax asset recoverable in twenty years from profits from a currently existing long-term supply contract with a creditworthy customer may be more robust than one recoverable in one year from expected future trading by a start-up company.

In the context of assessing the probability that future taxable profit will be available and the availability of other convincing evidence, reference can be made to observations made by European Securities and Markets Authority (ESMA) in its enforcement report issued in June 2025.¹⁷ This relates to an entity in the pharmaceutical industry. ESMA noted that using a period of eight years to estimate future taxable profits is inconsistent with the practice followed in the pharmaceutical industry where two to five years period was used. Further, ESMA noted that the negative evidence indicating sufficient future taxable profits might not be available outweighed the positive evidence. Accordingly, ESMA concluded that it was inappropriate to recognise deferred tax assets.

7.5.6.A Where taxable temporary differences were recognised outside profit or loss

As noted above, where an entity has a history of recent losses, or even where it expects to continue to incur trading losses in the future, it still recognises a deferred tax asset for the carryforward of unused tax losses or tax credits to the extent that it has sufficient taxable temporary differences against which those tax losses and tax credits can be utilised. [IAS 12.35]. This will be the case for taxable temporary differences that relate to the same taxation authority and the same taxable entity, and which are expected to reverse in the same period as the asset, or in a period into which a loss arising from the asset may be carried back or forward. [IAS 12.28].

It is irrelevant whether the taxable temporary differences were recognised in profit or loss, other comprehensive income or directly in equity, provided that offset is not restricted under local tax law. For example, a taxable temporary difference arises when assets are carried at fair value. [IAS 12.20]. For debt instruments classified as fair value through other comprehensive income and for property, plant and equipment the related taxable temporary difference is recognised in other comprehensive income together with the revaluation gain or loss. Deferred tax is also recorded outside profit and loss when the initial carrying value of a compound financial instrument is split between its liability and equity components, and a related taxable temporary difference is recognised in equity (see section 7.2.7 above).

If local tax laws do not restrict the tax losses and tax credits to be utilised against the reversal of those taxable temporary differences, then a deferred tax asset is recognised. The deferred tax asset is recognised through profit or loss, except in those circumstances where the losses are related to transactions that were originally recognised outside profit or loss. [IAS 12.61A]. Illustration 10-7 in section 10.5 below demonstrates the recognition of a deferred tax asset in profit or loss on the basis of a deferred tax liability accounted for outside profit or loss.

7.5.7 Reassessment of deferred tax assets

An entity must review its deferred tax assets, both recognised and unrecognised, at each reporting date.

7.5.7.A Previously recognised assets

An entity must reduce the carrying amount of a deferred tax asset to the extent that it is no longer probable that sufficient taxable profit will be available to enable the asset to be recovered. Any such reduction must be reversed if it subsequently becomes probable that sufficient taxable profit will be available. [IAS 12.56].

17 [ESMA, 30th Extract from the EECS's Database of Enforcement, Decision ref EECS/0126-03 - Recognition of deferred tax assets on tax losses](#)

7.5.7.B Previously unrecognised assets

An entity recognises a previously unrecognised deferred tax asset to the extent that it has become probable that sufficient taxable profit will be available to enable the asset to be recovered. For example, an improvement in trading conditions may make it more probable that the entity will be able to generate sufficient taxable profit in the future for the deferred tax asset to meet the recognition criteria. Special considerations apply when an entity re-appraises deferred tax assets of an acquired business at the date of the business combination or subsequently (see section 12.1.2 below). [IAS 12.37].

7.5.8 Effect of disposals on recoverability of tax losses

The measurement provisions of IFRS 5 do not apply to deferred taxes. [IFRS 5.5]. Therefore, the general requirements in IAS 12 including those related to the recognition of deferred tax assets apply to the disposal group that is classified as held for sale.

In consolidated financial statements, the disposal of a subsidiary may lead to the derecognition of a deferred tax asset in respect of tax losses because either:

- The entity disposed of had incurred those tax losses itself
Or
- The entity disposed of was the source of probable future taxable profits against which the tax losses of another member of the group could be offset, allowing the group to recognise a deferred tax asset

It is clear that, once the disposal has been completed, those tax losses will no longer appear in the disposing entity's statement of financial position. What is less clear is whether those tax losses must be derecognised before the disposal itself is accounted for and, if so, when. IAS 12 does not give any explicit guidance on this point, beyond the general requirement to recognise tax losses only to the extent that their recoverability is probable (see section 7.5 above).

How we see it

In our view, three broad circumstances need to be considered:

- The entity has recognised a deferred tax asset in respect of tax losses of the subsidiary to be disposed of, the recoverability of which is dependent on future profits of that subsidiary (see section 7.5.8.A below).
- The entity has recognised a deferred tax asset in respect of tax losses of a subsidiary that is to remain in the group, the recoverability of which is dependent on future profits of the subsidiary to be disposed of (see section 7.5.8.B below).
- The entity has recognised a deferred tax asset in respect of tax losses of the subsidiary to be disposed of, the recoverability of which is dependent on future profits of one or more entities that are to remain in the group (see section 7.5.8.C below).

7.5.8.A Tax losses of a subsidiary disposed of recoverable against profits of that subsidiary

In this situation, we believe that the deferred tax asset for the losses must remain recognised until the point of disposal, provided that the expected proceeds of the disposal are expected at least to be equal to the total consolidated net assets of the entity to be disposed of, including the deferred tax asset. Whilst the group will no longer recover the tax losses through a reduction in its future tax liabilities, it will effectively recover their value through the disposal. Moreover, it would be expected that the disposal price would reflect the availability of usable tax losses in the disposed of entity, albeit that any price paid would reflect the fair value of such tax losses, rather than the undiscounted value required to be recorded by IAS 12 (see section 8.6 below).

7.5.8.B Tax losses of a retained entity recoverable against profits of a subsidiary disposed of

In this case, we believe that IAS 12 requires the deferred tax asset to be derecognised once the disposal of the profitable subsidiary is probable (effectively meaning that the recoverability of losses by the retained entity is no longer probable). This derecognition threshold may be reached before the subsidiary to be disposed of is classified as held for sale under IFRS 5 (see Chapter 5). This is because the threshold for derecognising the deferred tax asset under IAS 12 (i.e., that the sale of the subsidiary is probable) is lower than the threshold for accounting for the net assets of the subsidiary under IFRS 5 (i.e., that the subsidiary is ready for sale, and the sale is highly probable).

7.5.8.C Tax losses of a subsidiary disposed of recoverable against profits of a retained entity

In this situation, we believe that more than one analysis is possible. One view would be that - as in section 7.5.8.A above - a deferred tax asset for the losses must remain recognised until the point of disposal, provided that the expected proceeds of the disposal are at least equal to the total consolidated net assets of the entity to be disposed of, including the deferred tax asset. Another view would be that the asset must be derecognised. In contrast to the situation in section 7.5.8.A above, it is not the case that the losses are of any benefit to the acquiring entity since they are recognised by virtue of the expected profits of other entities in the group which are not being sold. Rather, as in section 7.5.8.B above, the likely separation of the subsidiary from the profits available in one or more retained entities means that the utilisation of those losses by the retained subsidiary is no longer probable. A third view would be that it is necessary to determine whether or not the losses would be of value to the acquirer. If so, they must continue to be recognised to the extent that they are being recovered by the disposing entity through the sales proceeds (as in section 7.5.8.A above). If not, they must be derecognised on the grounds that they will not be recovered either through a reduction in future taxable profits of the disposing entity, or through sale (as in section 7.5.8.B above).

7.6 'Outside' temporary differences relating to subsidiaries, branches, associates and joint arrangements

Investments in subsidiaries, branches and associates or interests in joint arrangements can give rise to two types of temporary difference:

- Differences between the tax base of the investment or interest and its carrying amount. 'Tax base' refers to the amount that will be deductible for tax purposes against any taxable benefits arising when the carrying value of the asset is recovered. [IAS 12.7]. The tax base will be determined by the rules set in the relevant tax jurisdiction. It may be the original cost of the equity held in that investment or interest or its current fair value or even an historic amount excluding unremitted earnings. That will be determined by the local tax laws. 'Carrying amount' in this context means:
 - In separate financial statements, the carrying amount of the relevant investment or interest.
 - In financial statements other than separate financial statements, the carrying amount of the net assets (including goodwill) relating to the relevant investment or interest, whether accounted for by consolidation or equity accounting.

These differences are generally referred to in practice as 'outside' temporary differences, and normally arise in the tax jurisdiction of the entity that holds the equity in the investment or interest. Accordingly, in general they directly affect the taxable profit of the investor entity.

- In financial statements other than separate financial statements, differences between the tax bases of the individual assets and liabilities of the investment or interest and the carrying amounts of those assets and liabilities (as included in those financial statements through consolidation or equity accounting).

These differences are generally referred to in practice as 'inside' temporary differences. They normally arise in the tax jurisdiction of the investment or interest and affect the taxable profit of the investee entity.

This section is concerned with 'outside' temporary differences, the most common source of which is the undistributed profits of the investee entities, where distribution to the investor would trigger a tax liability. 'Outside' temporary differences may also arise from a change in the carrying value of an investment due to exchange movements, provisions, or revaluations; or from a change in the tax base of the investee in the jurisdiction of the investor.

The reversal of most 'inside' temporary differences is essentially inevitable as assets are recovered or liabilities settled at their carrying amount in the normal course of business. However, an entity may be able to postpone the reversal of some or all of its 'outside' differences more or less permanently. For example, if a distribution of the retained profits of a subsidiary would be subject to withholding tax, the parent may effectively be able to avoid such a tax by making the subsidiary reinvest all its profits into the business. IAS 12 recognises this essential difference in the nature of 'outside' and 'inside' temporary differences by setting different criteria for the recognition of 'outside' temporary differences.

As noted in section 7.2.9 above, the initial recognition exception does not apply to temporary differences associated with investments in subsidiaries, branches and associates, and interests in joint arrangements. [IAS 12.15, IAS 12.24]. The provisions of IAS 12 applicable to these temporary differences are set out in sections 7.6.2 and 7.6.3 below.

7.6.1 Calculation of 'outside' temporary differences

As noted above, 'outside' temporary differences arise in both consolidated and separate financial statements and may well be different, due to the different bases used to account for subsidiaries, branches and associates or interests in joint arrangements in consolidated and separate financial statements. [IAS 12.38]. This is shown in Illustration 7-23 below.

Illustration 7-23: Temporary differences associated with subsidiaries, branches, associates and joint arrangements

On 1 January 20X3 entity H acquired 100% of the shares of entity S, whose functional currency is different from that of H, for CU600m. The tax rate in H's tax jurisdiction is 30% and the tax rate in S's tax jurisdiction is 40%.

The fair value of the identifiable assets and liabilities (excluding deferred tax assets and liabilities) of S acquired by H is set out in the following table, together with their tax base in S's tax jurisdiction and the resulting temporary differences (all figures in CU millions).

	Fair value	Tax base	(Taxable)/ Deductible temporary difference
PP&E	270	155	(115)
Accounts receivable	210	210	-
Inventory	174	124	(50)
Retirement benefit obligations	(30)	-	30
Accounts payable	(120)	(120)	-
Fair value of net assets acquired excluding deferred tax	504	369	(135)
Deferred tax (135 @ 40%)	(54)		
Fair value of identifiable assets acquired and liabilities assumed	450		
Goodwill (balancing figure)	150		
Carrying amount	600		

No deferred tax is recognised on the goodwill, in accordance with the requirements of IAS 12 as discussed in section 7.2.2.A above.

At the date of combination, the tax base, in H's tax jurisdiction, of H's investment in S is CU600 million. Therefore, in H's jurisdiction, no temporary difference is associated with the investment, either in the consolidated financial statements of H (where the investment is represented by net assets and goodwill of CU600 million), or in its separate financial statements, if prepared (where the investment is shown as an investment at cost of CU600 million).

During 20X3:

- S makes a profit after tax, as reported in H's consolidated financial statements, of CU150 million, of which CU80 million is paid as a dividend (after deduction of withholding tax) before 31 December 20X3, leaving a net retained profit of CU70 million.
- In accordance with IAS 21, H's consolidated financial statements record a loss of CU15 million on retranslation to the closing exchange rate of S's opening net assets and profit for the period.
- In accordance with IAS 36 *Impairment of Assets*, H's consolidated financial statements record an impairment loss of CU10 million in respect of goodwill.

Thus, in H's consolidated financial statements the carrying value of its investment in S is CU645 million, comprising:

	CU m
Carrying amount at 1.1.20X3	600
Retained profit	70
Exchange loss	(15)
Impairment of goodwill	(10)
Carrying amount at 31.12.20X3	645

7.6.1.A Consolidated financial statements

Assuming that the tax base in H's jurisdiction remains CU600 million, there is a taxable temporary difference of CU45 million (carrying amount CU645m less tax base CU600m) associated with S in H's consolidated financial statements. Whether or not any deferred tax is required to be provided for on this difference is determined in accordance with the principles discussed in section 7.6.2 below. Any tax provided for would be allocated to profit or loss, other comprehensive income or equity in accordance with the general provisions of IAS 12 (see section 10 below). In this case, the foreign exchange loss, as a presentational rather than a functional exchange difference, would be recognised in other comprehensive income (see Chapter 16), as would any associated tax effect. The other items, and their associated effects, would be recognised in profit or loss.

Irrespective of whether provision is made for deferred tax, H would be required to make disclosures in respect of this difference (see section 14.2.2 below).

7.6.1.B Separate financial statements of investor

The amount of any temporary difference in H's separate financial statements would depend on the accounting policy adopted in those statements. IAS 27 *Separate Financial Statements* allows entities the choice of accounting for investments in group companies at either cost (less impairment), using the equity method or at fair value - see Chapter 9. Suppose that, notwithstanding the impairment of goodwill required to be recognised in the consolidated financial statements, the investment in S taken as a whole is not impaired, and indeed its fair value at 31 December 20X3 is CU660 million.

If, in its separate financial statements, H accounts for its investment at cost of CU600 million, there would be no temporary difference associated with S in H's separate financial statements, since the carrying amount and tax base of S would both be CU600 million.

If, however, in its separate financial statements, H accounts for its investment at its fair value of CU660 million, there would be a taxable temporary difference of CU60 million (carrying amount CU660m less tax base CU600m) associated with S in H's separate financial statements. Whether or not any deferred tax is required to be provided for on this difference is determined in accordance with the principles discussed in section 7.6.2 and in section 7.6.3 below. Any tax provided for would be allocated to profit or loss, other comprehensive income or equity of the investor in accordance with the general provisions of IAS 12 (see section 10 below). Irrespective of whether provision is made for deferred tax, H would be required to make disclosures in respect of this difference (see section 14.2.2 below).

IAS 27 also allows entities to use the equity method as described in IAS 28 *Investments in Associates and Joint Ventures* to account for investments in subsidiaries, joint ventures and associates in their separate financial statements. [IAS 27.10(c)]. Where the equity method is used, dividends from those investments are to be recognised as a reduction from the carrying value of the investment. [IAS 27.12].

For taxation, the same principles apply as those discussed above. Any difference between the carrying value of the entity's interest in its subsidiaries, joint ventures and associates, in this case determined using the equity method, and the tax base in the investor's jurisdiction gives rise to a temporary difference. Whether or not any deferred tax is required to be recognised on this difference is determined in accordance with the principles discussed in section 7.6.2 below. Any tax provided for would be allocated to profit or loss, other comprehensive income or equity of the investor in accordance with the general provisions of IAS 12 (see section 10 below). This tax must not be offset against the carrying value of the investors' interest in its equity-accounted investee, since this is the investor's tax provision, not the investee's.

7.6.2 Taxable temporary differences

Extract from IAS 12

- 39** An entity shall recognise a deferred tax liability for all taxable temporary differences associated with investments in subsidiaries, branches and associates, and interests in joint arrangements, except to the extent that both of the following conditions are satisfied:
- (a) the parent, investor, joint venturer or joint operator is able to control the timing of the reversal of the temporary difference; and
 - (b) it is probable that the temporary difference will not reverse in the foreseeable future.

[IAS 12.39].

How we see it

IAS 12 does not define the meaning of 'probable' in this context. However, we consider that, as in other IFRS accounting standards, it must be taken to mean 'more likely than not' (see section 7.1.2 above).

IAS 12 also does not elaborate on the meaning of 'foreseeable'. In our view, the period used will be a matter of judgement in individual circumstances and not limited by the setting of any arbitrary period.

What this means in practice is best illustrated by reference to its application to the retained earnings of subsidiaries, branches and joint arrangements on the one hand, and those of associates on the other.

In the case of a subsidiary or a branch, the parent is able to control when and whether the retained earnings are distributed. Therefore, no provision need be made for the tax consequences of distribution of profits that the parent has determined will not be distributed in the foreseeable future. [IAS 12.40]. In the case of a joint arrangement, provided that the joint venturer or joint operator can control the distribution policy, for example because any decision requires the consent of all or a group of the parties, similar considerations apply. [IAS 12.43].

In the case of an associate, however, the investor cannot usually control the distribution policy. Therefore, provision must be made for the tax consequences of the distribution of the retained earnings of an associate, except to the extent that there is a shareholders' agreement that those earnings will not be distributed. [IAS 12.42].

Some might consider this a counter-intuitive result. In reality, it is extremely unusual for any entity (other than one set up for a specific project) to pursue a policy of full distribution. To the extent that it occurs at all, it is much more likely in a wholly-owned subsidiary than in an associate; and yet IAS 12 seems to treat full distribution by associates as the norm and that by subsidiaries as the exception. Moreover, it seems to ignore the fact that equity accounting was developed as a regulatory response to the perceived ability of investors in associates to exert some degree of control over the amount and timing of dividends from them. However, the 'default' position in IAS 12 is that a deferred tax liability is recognised for *all* taxable temporary differences associated with investments in subsidiaries, branches and associates and interests in joint arrangements, with the exception applying only if the entity *both* controls the timing of reversal *and* it is probable that there will be no such reversal in the foreseeable future. [IAS 12.39].

In some jurisdictions, some or all of the temporary differences associated with such investments in subsidiaries, branches and associates or interests in joint arrangements are taxed on disposal of that investment or interest. Clearly, where the entity is contemplating such a disposal, it would no longer be able to assert that it is probable that the relevant temporary difference will not reverse in the foreseeable future.

The measurement of any deferred tax liability recognised is discussed in section 8.4.9 below.

7.6.3 Deductible temporary differences

Extract from IAS 12

- 44** An entity shall recognise a deferred tax asset for all deductible temporary differences arising from investments in subsidiaries, branches and associates, and interests in joint arrangements, to the extent that, and only to the extent that, it is probable that:
- (a) the temporary difference will reverse in the foreseeable future; and
 - (b) taxable profit will be available against which the temporary difference can be utilised.

IAS 12 does not define the meaning of 'probable' in this context. [IAS 12.44]. However, we consider that, as in other IFRS accounting standards, it must be taken to mean 'more likely than not' (see section 7.1.2 above).

The guidance discussed in section 7.5 above is used to determine whether or not a deferred tax asset can be recognised for such deductible temporary differences. [IAS 12.45].

Any analysis of whether a deductible temporary difference gives rise to an asset must presumably make the same distinction between controlled and non-controlled entities as is required when assessing whether a taxable temporary difference gives rise to a liability (see section 7.6.2 above). This may mean, in practical terms, that it is never possible to recognise a deferred tax asset in respect of a non-controlled investment (such as an associate), unless either the investee entity is committed to a course of action that would realise the asset or, where the asset can be realised by disposal, that it is probable that the reporting entity will undertake such a disposal.

The measurement of any deferred tax asset recognised is discussed in section 8.4.9 below.

7.6.4 Foreseeable future - anticipated intragroup dividends

Under IAS 10, a dividend may be recognised as a liability of the paying entity and revenue of the receiving entity only if it has been declared by the paying entity before the end of the reporting period. [IAS 10.12]. This raises the question of when a reporting entity must account for the tax consequences of a dividend expected to be paid by a subsidiary or other investee out of its retained profits as at the reporting date.

7.6.4.A Consolidated financial statements of receiving entity

IAS 12 requires an investor to make provision for the taxes payable on the retained profits of its subsidiaries, branches, associates, and interests in joint arrangements as at each reporting date based on the best evidence available to it at the reporting date, subject only to the exception discussed in section 7.6.2 above. [IAS 12.39]. For example, if in preparing its financial statements for 31 December 20X3, an entity believes that, in order to meet the dividend expectations of its shareholders in 20X4 and 20X5, it will have to cause the retained earnings of certain overseas subsidiaries (as included in the group accounts at 31 December 20X3) to be distributed, the group must provide for any tax consequences of such distributions in its consolidated financial statements for the period ended 31 December 20X3. In these circumstances, the entity would be unable to assert that it is probable that the temporary difference associated with the retained earnings of these subsidiaries will not reverse in the foreseeable future. [IAS 12.39(b)]. Similarly, if the ability of the entity to settle financial liabilities as at the reporting date depends on the future receipt of dividends from other entities in the group, it must recognise the tax consequences of making those distributions in its consolidated financial statements for the current period.

It is not relevant that such dividends have not yet been recognised in the separate financial statements of the relevant members of the group. Indeed, such intragroup dividends will never be recognised in the group financial statements, as they will be eliminated on consolidation. IAS 12 requires recognition of the tax consequences of temporary differences as at the end of the reporting period, in this case the taxes ultimately payable on recovering the net assets of the group as at 31 December 20X3. However, for this reason it would not be appropriate to recognise any liability for the tax anticipated to be paid out of an intragroup dividend in a future period that is likely to be covered by profits generated in future periods, since such profits do not form part of the carrying amount of the net assets of the group as at 31 December 20X3.

This requirement was confirmed by the IFRS IC in June 2020, when it considered a question about how an entity, in its consolidated financial statements, accounts for deferred tax related to its investment in a subsidiary.¹⁸ See section 8.4.9 below.

7.6.4.B Separate financial statements of paying entity

Irrespective of whether a provision is made in the consolidated financial statements for the tax effects of an expected future intragroup dividend of the retained earnings of a subsidiary, the paying subsidiary would not recognise a liability for the tax effects of any distribution in its individual or separate financial statements until the liability to pay the dividend was recognised in those individual or separate financial statements. IAS 12 requires current and deferred taxes to be measured using the rate applicable to undistributed profits until a liability to pay a dividend is recognised, as discussed in section 8.5 below.

[IAS 12.52A, IAS 12.57A].

7.6.5 Unpaid intragroup interest, royalties, management charges, etc.

It is common for groups of companies to access the earnings of subsidiaries not only through distribution by way of dividend, but also by levying charges on subsidiaries such as interest, royalties or general management charges for central corporate services. In practice, such charges are often not settled but left outstanding on the intercompany account between the subsidiary and the parent. In some jurisdictions, such income is taxed only on receipt.

This has led some to argue that, where settlement of such balances is within the control of the reporting entity, and it can be demonstrated that there is no foreseeable intention or need to settle outstanding amounts, such balances are economically equivalent to unremitted earnings, so that there is no need to provide for the tax consequences of settlement.

¹⁸ [IFRIC Update](#), June 2020, available on the IFRS Foundation's website.

In February 2003, the IFRS IC considered the issue and indicated that it believes that the exemption from provision for deferred taxes on 'outside' temporary differences arising from subsidiaries, branches, associates and interests in joint arrangements is intended to address the temporary differences arising from the undistributed earnings of such entities. The exception does not apply to the 'inside' temporary differences that exist between the carrying amount and the tax base of individual assets and liabilities within the subsidiary, branch, associate or interest in a joint arrangement. Accordingly, the IFRS IC concluded that a deferred tax liability must be provided for the tax consequences of settling unpaid intragroup charges.¹⁹

7.7 'Tax-transparent' ('flow-through') entities

In many tax jurisdictions certain entities are not taxed in their own right. Instead, the income of such entities is taxed in the hands of their owners as if it were income of the owners. An example might be a partnership which does not itself pay tax, but whose partners each pay tax on their share of the partnership's profits. Such entities are sometimes referred to as 'tax-transparent' or 'flow-through' entities. The tax status of such an entity is of no particular relevance to the accounting treatment, in the investor's financial statements, of the current tax on the income of the entity. An investor in such an entity will determine whether the entity is a subsidiary, associate, joint arrangement, branch or a financial asset investment and account for it accordingly. The investor then accounts for its own current tax payable as it arises under the relevant tax legislation.

The investor will also determine whether the basis on which the investment has been accounted for (e.g., through consolidation or equity accounting) has led to the recognition of assets or liabilities which give rise to temporary differences and recognise deferred tax on these in the normal way.

Finally, the investor will also determine whether there are 'outside' temporary differences associated with the investment as a whole and account for these as above. However, in situations where the income from the investment is, under tax law, automatically regarded as income of the investor (for example, regardless of whether such income is distributed or not), there would be no 'outside' temporary differences associated with undistributed profits. As such, the criteria in IAS 12.39 that allow non-recognition of certain taxable temporary differences would not apply (see section 7.6.2 above). [IAS 12.39].

Illustration 7-24 and Illustration 7-25 show the accounting treatment for, respectively, a consolidated and an equity-accounted tax-transparent entity.

Illustration 7-24: Tax-transparent entity (consolidated)

An entity (A) acquires 60% of a tax-transparent partnership (P) for CU100 million in a transaction accounted for as a business combination. The aggregate fair value of the identifiable net assets of the partnership is CU80 million and their tax base is CU60m. A is directly liable to tax at 25% on 60% of the taxable profits of the partnership, in computing which it is entitled to offset 60% of the tax base of the assets. A elects to measure the non-controlling interest at its proportionate share of the net assets of the partnership.

The accounting entry to record the business combination is:

		CU m	CU m
Dr	Net assets	80	
Dr	Goodwill (balancing figure)	55	
	Cr Consideration paid		100
	Cr Deferred tax*		3
	Cr Non-controlling interest†		32

* In recovering the carrying value of the net assets (CU80m),
A will pay tax on 60% of CU20m (CU80m - CU60m) = CU12m at 25% = CU3m.

† 40% of CU80m.

19 [IFRIC Update](#), February 2003, available on the IFRS Foundation's website.

By contrast, if the partnership were a tax-paying entity, the accounting entry would be:

	CU m	CU m
Dr Net assets	80	
Dr Goodwill (balancing figure)	55	
Cr Consideration paid		100
Cr Deferred tax*		5
Cr Non-controlling interest†		30

* In recovering the carrying value of the net assets (CU80m), P will pay tax on CU20m (CU80m - CU60m) at 25% = CU5m.

† 40% of CU75m (net assets excluding deferred tax CU80m less deferred tax (as above) CU5m).

Illustration 7-25: Tax-transparent entity (equity-accounted)

The facts are the same as in Illustration 7-24 above, except that, due to an agreement between A and the other partners, P is a jointly-controlled entity, rather than a subsidiary, of A, which accounts for P using the equity method. In this case it is less clear how to account for the deferred tax liability, which, it must be remembered, is not a liability of P, but of A and therefore does not form part of the net assets and goodwill underlying A's investment in P.

Analysis 1

One analysis might be that the deferred tax relates to a temporary difference arising on the initial recognition of the investment in P in a transaction that gives rise to no accounting or taxable profit, and therefore is not recognised under the initial recognition exception (see section 7.2.3 above). On this view, the initial accounting entry is simply:

	CU m	CU m
Dr Investment in P	100	
Cr Consideration		100

Analysis 2

Another analysis might be that the true cost of the investment in P comprises both the consideration paid to the vendor and the assumption by A of the deferred tax liability associated with its share of the underlying assets (other than goodwill) of the investment. On this view the initial accounting entry is:

	CU m	CU m
Dr Investment in P	103	
Cr Deferred tax (see Illustration 7-24 above)		3
Cr Consideration		100

This second method has the merit that it results in the same implied underlying goodwill as arises on full consolidation in Illustration 7-24 above: CU103m - CU48m [60% of CU80m] = CU55m. However, it does raise the issue of an apparent 'day one' impairment, as discussed in more detail in section 12.3 below.

How we see it

In our view, either analysis is acceptable so long as it is applied consistently.

Any income tax relating to a tax-transparent entity accounted for using equity accounting forms part of the investor's tax charge. It is therefore included in the income tax line in profit or loss and not shown as part of the investor's share of the results of the tax-transparent entity.

7.8 Deferred taxable gains

Some tax regimes mitigate the tax impact of significant asset disposals by allowing some or all of the tax liability on such transactions to be deferred, usually subject to conditions, such as a requirement to reinvest the proceeds from the sale of the asset disposed of in a similar 'replacement' asset. The postponement of tax payments achieved in this way may either be for a fixed period (e.g., the liability must be paid in any event no later than ten years after the original disposal) or for an indefinite period (e.g., the liability crystallises when, and only when, the 'replacement' asset is subsequently disposed of).

As noted in section 7.4 above, IAS 12 makes it clear that the ability to postpone payment of the tax liability arising on disposal of an asset - even for a considerable period - does not extinguish the liability. In many cases, the effect of such deferral provisions in tax legislation is to reduce the tax base of the 'replacement' asset. This will increase any taxable temporary difference, or reduce any deductible temporary difference, associated with the asset.

7.9 Corporate interest restriction

In many jurisdictions, tax legislation restricts the amount of tax relief an entity can obtain from deducting interest expense for tax purposes. Although legislation between jurisdictions might differ, generally, tax rules specify a limit on deduction of interest expense each year. Such limitation may be based on, for example, a specific percentage of EBITDA earned in the year. The interest expense in excess of the specified limit is disallowed. However, tax rules generally permit an entity to deduct carried forward interest in future periods as long as the limit in future periods is not breached. Some jurisdictions may impose further restrictions on the number of years into the future such disallowed interest could be carried forward and deducted. As part of the Inclusive Framework on BEPS, OECD has issued guidance regarding limiting base erosion involving interest deductions and other financial payments.²⁰ Under the best practice approach, there is no requirement for a jurisdiction to allow an entity to carry forward or carry back disallowed interest expense or unused interest capacity. However, as per the OECD guidance, a country may choose to allow an entity to carry forward disallowed interest expense only, to carry forward disallowed interest expense and unused interest capacity or to carry forward and carry back disallowed interest expense.

The Illustration below demonstrates how interest carry forward and deduction in future years typically works.

Illustration 7-26: Restriction on interest deduction

Entity A is domiciled in Country Z where there is a limitation on interest deduction for tax purposes. The tax legislation in Country Z allows interest deduction up to 40% of EBITDA in a year. However, the tax legislation allows entities to indefinitely carry forward disallowed interest that can be deducted in the future years subject to the prescribed limit. The tax rate in the jurisdiction is 25%.

At the end of 20X5, Entity A has disallowed carried forward interest of CU75. Entity A expects an EBITDA of CU200 in 20X6 (the forecast period). Entity A forecasts interest expense in 20X6 of CU60.

In this instance Entity A has an interest capacity of CU80 in 20X6 (i.e., 40% of CU200). It first deducts interest expense of CU60 for the year 20X6 leaving an excess capacity of CU20. The excess interest capacity is used to offset the carry forward disallowed interest that would reduce to CU55.

The existence of such disallowed interest for tax purposes, applying paragraph 9 of IAS 12, results in a deductible temporary difference. Accordingly, an entity with disallowed interest that can be carried forward and deducted in future years would apply the requirements in paragraph 24 of IAS 12 to recognise deferred tax assets to the extent that it is probable taxable profit will be available against which the deductible temporary difference can be utilised. The assessment of recoverability becomes more challenging for an entity that is highly leveraged and expects to remain so in the foreseeable future.

The deferred tax asset recognition assessment must consider the requirements discussed in section 7.5 above related to restrictions on recognition of deferred tax assets.

20 [Limiting Base Erosion Involving Interest Deductions and Other Financial Payments, Action 4 - 2016 Update | OECD](#)

An entity is likely to consider all four sources of taxable profits listed in section 7.5.1 above when determining the amount of deferred tax assets arising from disallowed interest that could be recognised. However, before considering the availability of future taxable profits, the entity considers whether there are sufficient relevant deferred tax liabilities at the reporting date that reverse in the same period as the disallowed interest carried forward. [IAS 12.28]. Where an entity has recognised such suitable deferred tax liabilities at the reporting date, the entity would recognise deferred tax assets to the extent of available deferred tax liabilities and considering the interest deduction limit, in the forecast period, as prescribed in the legislation (i.e., as in the above example, a DTL of CU1 can only support recognition of a DTA of CU0.40 given the deductibility cap of 40% of EBITDA).

When the deferred tax liabilities recognised at the reporting date are insufficient compared with carry forward disallowed interest, the entity must consider available future taxable profits as discussed in section 7.5.3 above. As discussed in section 7.5.3.A above, in assessing the availability of future taxable profits, an entity must ignore taxable amounts arising from deductible temporary differences expected to originate in future periods. This is because those new deductible differences will themselves require future taxable profit in order to be utilised. [IAS 12.29(a)(ii)].

Entities with different types of taxable and deductible differences including interest restrictions must apply the requirements in paragraph 27A of IAS 12 to consider whether tax law restricts the sources of taxable profits against which it may make deductions on the reversal of that deductible temporary difference (see section 7.5.2 above). Further, entities must consider the existence of taxable losses carried forward that might add complexity around the recognition of deferred tax assets related to interest restrictions.

Lastly, in determining the amount of deferred tax assets arising from disallowed interest that can be recognised the entity needs to consider scheduling the taxable and deductible temporary differences. Such scheduling could be more challenging where the entity has different types of deferred tax assets and liabilities, and the tax laws do not prescribe an order to offset. In such situations entities would need to consider the requirements in IAS 1 (see Chapter 3) to disclose significant judgement and critical estimation uncertainty, if any, involved in scheduling such reversals.

8 Deferred tax - Measurement

8.1 Legislation at the end of the reporting period

Deferred tax must be measured by reference to the tax rates and laws, as enacted or substantively enacted by the end of the reporting period: [IAS 12.47, IAS 12.49]

Extract from IAS 12

47 Deferred tax assets and liabilities shall be measured at the tax rates that are expected to apply to the period when the asset is realised or the liability is settled, based on tax rates (and tax laws) that have been enacted or substantively enacted by the end of the reporting period.

IAS 12 comments that, in some jurisdictions, announcements of tax rates (and tax laws) by the government have the substantive effect of actual enactment, which may follow the announcement by a period of several months. In these circumstances, deferred tax assets and liabilities are measured using the announced tax rate (and tax laws). [IAS 12.48].

However, IAS 12 gives no guidance as to how this requirement is to be interpreted in different jurisdictions. The determination of the stage of the legislative process that constitutes substantive enactment, as discussed in section 5.1 above in relation to current tax, also applies to the measurement of deferred tax assets and liabilities.

Some examples of the interpretation of 'substantive enactment' in particular jurisdictions are given in section 5.1.1 above.

8.1.1 Changes to tax rates and laws enacted before the reporting date

Deferred tax must be measured by reference to the tax rates and laws, as enacted or substantively enacted by the end of the reporting period. [IAS 12.47]. This requirement for substantive enactment is clear. Changes that have not been enacted by the end of the reporting period are ignored, but changes that are enacted before the reporting date must be applied, even in circumstances when complex legislation is substantively enacted shortly before the end of an annual or interim reporting period.

In cases where the effective date of any enacted changes is after the end of the reporting period, deferred tax must still be calculated by applying the new rates and laws to the deductible and taxable temporary differences that are expected to reverse in those later periods. [IAS 12.47]. When the effective date of any rate changes is not the first day of the entity's annual reporting period, deferred tax would be calculated by applying a blended rate to the taxable profits for each year.

In implementing any amendment to enacted tax rates and laws there will be matters to consider that are specific to the actual changes being made to the tax legislation. However, the following principles from IAS 12 and other standards are relevant in all cases where new tax legislation has been enacted before the end of the reporting period.

8.1.1.A Managing uncertainty in determining the effect of new tax legislation

Where complex legislation is enacted, especially if enactment is shortly before the end of the reporting period, entities might encounter two distinct sources of uncertainty:

- Uncertainty about the requirements of the new law, which may give rise to uncertain tax treatments as defined by IFRIC 23 and discussed in sections 8.2 and 9 below
- Incomplete information because entities may not have all the data required to process the effects of the changes in tax laws

It is not necessary for entities to have a complete understanding of every aspect of the new tax law to arrive at reasonable estimates, and provided that entities make every effort to obtain and take into account all the information they could reasonably be expected to obtain up to the date when the financial statements for the period are authorised for issue, subsequent changes to those estimates would not be regarded as a prior period error under IAS 8. [IAS 8.5]. Only in rare circumstances would it not be possible to determine a reasonable estimate. However, these uncertainties may require additional disclosure in the financial statements. IAS 1 requires entities to disclose information about major sources of estimation uncertainty at the end of the reporting period that have a significant risk of resulting in a material adjustment to the carrying amounts of assets and liabilities within the next financial year (see Chapter 3). [IAS 1.125, IAS 1.129].

Whilst the effect of changes in tax laws enacted after the end of the reporting period are not taken into account (see section 8.1.2 below), information and events that occur between the end of the reporting period and the date when the financial statements are authorised for issue are adjusting events after the reporting period if they provide evidence of conditions that existed as at the reporting date. [IAS 10.3]. Updated tax calculations, collection of additional data, clarifications issued by the tax authorities and gaining more experience with the previously enacted tax legislation before the authorisation of the financial statements must be treated as adjusting events if they pertain to the position at the balance sheet date. Events that are indicative of conditions that arose after the reporting period must be treated as non-adjusting events. Judgement needs to be applied in determining whether technical corrections and regulatory guidance issued after year-end pertain to the position as at the balance sheet date.

Where the effect of changes in the applicable tax rates compared to the previous accounting period are material, an explanation of those effects is required to be provided in the notes to the financial statements (see section 14.1 below). [IAS 12.81(d)].

8.1.1.B Backward tracing of changes in deferred taxation

IAS 12 requires tax relating to items not accounted for in profit or loss, whether in the same period or a different period, to be recognised:

- (a) In other comprehensive income if it relates to an item accounted for in other comprehensive income
Or
- (b) Directly in equity if it relates to an item accounted for directly in equity [IAS 12.61A]

If current and deferred taxes change as a result of new tax legislation, IAS 12 requires the impact to be attributed to the items in profit or loss, other comprehensive income and equity that gave rise to the tax in the first place. The requirement to have regard to the previous history of a transaction in accounting for its tax effects is commonly referred to as 'backward tracing' and is discussed in section 10 below. The backward tracing requirements also apply to any subsequent changes in accounting estimates.

8.1.1.C Disclosures relating to changes in enacted tax rates and laws

In addition to the disclosures noted in section 8.1.1.A above concerning major sources of estimation uncertainty at the end of the reporting period, the following disclosures are required by IAS 12 (see section 14 below):

- The amount of deferred tax expense (or income) relating to changes in tax rates or the imposition of new taxes. [IAS 12.80(d)].
- An explanation of changes in the applicable tax rate(s) compared to the previous accounting period. [IAS 12.81(d)].
- Information about tax-related contingent liabilities and contingent assets in accordance with the requirements of IAS 37 (see section 9.6 below and Chapter 27). [IAS 12.88].

8.1.2 Changes to tax rates and laws enacted after the reporting date

The requirement for substantive enactment as at the end of the reporting period is clear. IAS 10 identifies the enactment or announcement of a change in tax rates and laws after the end of the reporting period as an example of a non-adjusting event. [IAS 10.22(h)]. For example, an entity with a reporting period ending on 31 December issuing its financial statements on 20 April the following year would measure its tax assets and liabilities by reference to tax rates and laws enacted or substantively enacted as at 31 December even if these had changed significantly before 20 April and even if those changes have retrospective effect. However, in these circumstances the entity would have to disclose the nature of those changes and provide an estimate of the financial effect of those changes if the impact is expected to be significant (see section 14.2 below). [IAS 10.21].

8.2 Uncertain tax treatments

'Uncertain tax treatment' is defined as a tax treatment over which there is uncertainty concerning its acceptance under the law by the relevant taxation authority. For example, an entity's decision not to submit any tax filing in a particular tax jurisdiction or not to include specific income in taxable profit would be an uncertain tax treatment, if its acceptability is unclear under tax law. [IFRIC 23.3].

Accounting for uncertain tax treatments is a particularly challenging aspect of accounting for tax. The requirements of IFRIC 23, which was issued in June 2017, are mandatory for annual reporting periods beginning on or after 1 January 2019 and are discussed in section 9 below.

8.3 'Prior year adjustments' of previously presented tax balances and expense (income)

This is discussed in the context of current tax in section 5.3 above. The comments there apply equally to adjustments to deferred tax balances and expense (income). Accordingly, for accounting purposes, the normal provisions of IAS 8 apply, which require an entity to determine whether the revision represents a correction of a material prior period error or a refinement in the current period of an earlier estimate.

8.4 Expected manner of recovery of assets or settlement of liabilities

Deferred tax must be measured by reference to the tax consequences that would follow from the manner in which the entity expects, at the end of the reporting period, to recover or settle the carrying amount of the asset or liability to which it relates. [IAS 12.51].

8.4.1 Tax planning strategies to reduce liabilities are not anticipated

As discussed in section 7.5.4 above, IAS 12 allows tax planning strategies to be taken into account in determining whether a deductible temporary difference as at the reporting date can be recognised as a deferred tax asset, provided that the entity will create taxable profit in appropriate periods. [IAS 12.29(b)]. This raises the question of the extent to which tax planning strategies may be taken into account more generally in applying IAS 12.

For example, some jurisdictions may offer incentives in the form of a significantly reduced tax rate for entities that undertake particular activities, or invest in particular plant, property and equipment, or create a certain level of employment.

Some have argued that, where an entity has the ability and intention to undertake transactions in the future that will lead to it being taxed at a lower rate, it may take this into account in measuring deferred tax liabilities relating to temporary differences that exist at the reporting date and will reverse in future periods when the lower rate is expected to apply.

How we see it

We believe that it is not appropriate to anticipate the effect of tax planning strategies in the measurement of deferred tax liabilities. IAS 12 only allows entities to consider tax planning opportunities available to the entity that will create taxable profits in appropriate periods for the purpose of determining whether deferred tax assets qualify for recognition. However, entities are not permitted to take into account future tax planning opportunities in relation to the measurement of deferred tax liabilities as at the reporting date, nor are entities allowed to anticipate future tax deductions that are expected to become available. Such opportunities do not impact on the measurement of deferred tax until the entity has undertaken them, or is at least irrevocably committed to doing so.

8.4.2 Carrying amount

IAS 12 requires an entity to account for the tax consequences of recovering an asset or settling a liability at its carrying amount, and not, for example, the tax that might arise on a disposal at the current estimated fair value of the asset. This is illustrated by the example below.

Illustration 8-1: Measurement of deferred tax based on carrying amount of asset

During 20X3 an entity, which has an accounting date of 31 December and pays tax at 40%, purchased a business and assigned CU3 million of the purchase consideration to goodwill. The goodwill originally had a tax base of CU3 million, deductible only on disposal of the goodwill. Thus there was no temporary difference on initial recognition of the goodwill (and, even if there had been, no deferred tax would have been recognised under the initial recognition exception - see section 7.2.2 above). During 20X4 the entity disposed of another business giving rise to a taxable gain of CU500,000. The tax law of the relevant jurisdiction allowed the gain to be deferred by deducting it from the tax base of the goodwill, which therefore became CU2.5 million.

How we see it

Since IFRS accounting standards prohibits the amortisation of goodwill, but instead requires it to be measured at cost less impairment, in our view IAS 12 effectively requires any deferred tax to be measured at the amount that would arise if the goodwill were sold at its carrying amount.

At the end of 20X4, the goodwill was still carried at CU3 million. The decrease in the tax base during the period through deferral of the taxable gain gave rise to a taxable temporary difference of CU500,000 (CU3 million carrying amount less CU2.5 million tax base), which, since it arose after the initial recognition of the goodwill (see section 7.2.4 above), gave rise to the recognition of a deferred tax liability of CU200,000 (CU500,000 @ 40%).

During 20X5, the acquired business suffered a severe downturn in trading, such that the goodwill of CU3 million was written off in its entirety. This gave rise to a deductible temporary difference of CU2.5 million (carrying amount of zero less CU2.5 million tax base). The deferred tax liability of CU200,000 recognised at the end of 20X4 was released. However, no deferred tax asset was recognised since it did not meet the criteria in IAS 12 for recognition of deferred tax assets, since there was no expectation of suitable taxable profits sufficient to enable recovery of the asset (see section 7.5 above).

During 20X6, a new trading opportunity arises in the acquired business, with the result that, at the end of 20X6, the value of the goodwill of that business is once more CU3 million. However, in accordance with IAS 36, which prohibits the reinstatement of previously impaired goodwill (see Chapter 21), no accounting adjustment is made to the carrying value of goodwill.

If the goodwill were disposed of for its current fair value of CU3 million, tax of CU200,000 would arise. However, the entity recognises no deferred tax liability at the end of 20X6, since IAS 12 requires the entity to recognise the tax (if any) that would arise on disposal of the goodwill for its carrying amount of zero. If the asset were sold for zero, a tax loss of CU2.5 million would arise but, in accordance with the general provisions of IAS 12 discussed in section 7.5 above, a deferred tax asset could be recognised in respect of this deductible temporary difference only if there were an expectation of suitable taxable profits sufficient to enable that tax loss to be utilised.

This may mean that any deferred tax asset or liability recognised under IAS 12 will reflect the expected manner of recovery or settlement, but not the expected amount of recovery or settlement, where this differs from the current carrying amount.

8.4.3 Assets and liabilities with more than one tax base

Assets which are treated differently for tax purposes depending on whether their value is recovered through use or sale are commonly referred to as 'dual-based assets'. [IAS 12.51A].

Extract from IAS 12

- 51A In some jurisdictions, the manner in which an entity recovers (settles) the carrying amount of an asset (liability) may affect either or both of:
- (a) the tax rate applicable when the entity recovers (settles) the carrying amount of the asset (liability); and
 - (b) the tax base of the asset (liability).
- In such cases, an entity measures deferred tax liabilities and deferred tax assets using the tax rate and the tax base that are consistent with the expected manner of recovery or settlement.
- ...

The basic requirements of IAS 12 for dual-based assets can be illustrated with an example.

Illustration 8-2: Calculation of deferred tax depending on method of realisation of asset

A building, which is fully tax-deductible, originally cost CU1 million. At the end of the reporting period it is carried at CU1,750,000, but tax allowances of CU400,000 have been claimed in respect of it. If the building were sold the tax base of the building would be CU1.5 million due to inflation-linked increases in its tax base.

Any gain on sale (calculated as sale proceeds less tax base of CU1.5 million) would be taxed at 40%. If the asset is consumed in the business, its depreciation will be charged to profits that are taxed at 30%.

If the intention is to retain the asset in the business, its carrying amount will be recovered out of future income of CU1.75 million, on which tax of CU345,000 will be paid, calculated as:

	CU000
Gross income (carrying amount of asset)	1,750
Future tax allowances for asset (CU1m less CU400,000 claimed to date)	(600)
	<u>1,150</u>
Tax at 30%	<u>345</u>

If, however, the intention is to sell the asset without further use, the required deferred tax liability is only CU100,000 calculated as:

	CU000
Sales proceeds (carrying amount of asset)	1,750
Tax base	(1,500)
	<u>250</u>
Tax at 40%	<u>100</u>

8.4.4 Determining the expected manner of recovery of assets

Illustration 8-2 above, like the various similar examples in IAS 12, assumes that an asset will either be used in the business or sold. In practice, however, many assets are acquired, used for part of their life and then sold before the end of that period. This is particularly the case with long-lived assets such as property. We set out below the approach which we believe must be adopted in assessing the manner of recovery of:

- Depreciable PP&E, investment properties and intangible assets (see section 8.4.5 below)
- Non-depreciable PP&E, investment properties and intangible assets (see sections 8.4.6 and 8.4.7 below)
- Other assets and liabilities (see section 8.4.8 below)

8.4.5 Depreciable PP&E and intangible assets

Depreciable PP&E and investment properties are accounted for in accordance with IAS 16. Amortisable intangibles are accounted for in accordance with IAS 38. IAS 16 and IAS 38, which are discussed in detail in Chapters 18 and 19, require the carrying amount of a depreciable asset to be separated into a 'residual value' and a 'depreciable amount'.

'Residual value' is defined as:

"... the estimated amount that an entity would currently obtain from disposal of the asset, after deducting the estimated costs of disposal, if the asset were already of the age and condition expected at the end of its useful life".

And 'depreciable amount' as:

"... the cost of an asset, or other amount substituted for cost, less its residual value". [IAS 16.6, IAS 38.8].

It is inherent in the definitions of residual value and depreciable amount that, in determining residual value, an entity is effectively asserting that it expects to recover the depreciable amount of an asset through use and its residual value through sale. If the entity does not expect to sell an asset, but to use and scrap it, then the residual value (i.e., the amount that would be obtained from sale) must be nil.

How we see it

Accordingly, we believe that, in determining the expected manner of recovery of a depreciable asset for the purposes of IAS 12, an entity must assume that, in the case of an asset accounted for under IAS 16 or IAS 38, it will recover the residual value of the asset through sale and the depreciable amount through use. This view is reinforced by the Basis for Conclusions on IAS 12 which notes that “recognition of depreciation implies that the carrying amount of a depreciable asset is expected to be recovered through use to the extent of its depreciable amount, and through sale at its residual value”.

Such an analysis is also consistent with the requirement of IAS 8 to account for similar transactions consistently (see Chapter 3). This suggests that consistent assumptions must be used in determining both the residual value of an asset for the purposes of IAS 16 and IAS 38 and the expected manner of its recovery for the purposes of IAS 12.

The effect of this treatment is demonstrated as follows:

Illustration 8-3: Dual-based asset

As part of a business combination an entity purchases an opencast mine to which there is assigned a fair value of CU10 million. The tax system of the jurisdiction where the mine is located provides that, if the site is sold (with or without the minerals *in situ*), CU9 million will be allowed as a deduction in calculating the taxable profit on sale. The profit on sale of the land is taxed as a capital item. If the mine is exploited through excavation and sale of the minerals, no tax deduction is available.

The entity intends fully to exploit the mine and then to sell the site for retail development. Given the costs that any developer will need to incur in preparing the excavated site for development, the ultimate sales proceeds are expected to be CU6 million. Thus, for the purposes of IAS 16, the quarry is treated as having a depreciable amount of CU4 million and a residual value of CU6 million.

On the analysis above, there is a taxable temporary difference of CU4 million associated with the depreciable amount of the asset (carrying amount of CU4 million less tax base in use of nil), and a deductible temporary difference of CU3 million associated with the residual value (carrying amount of CU6 million less tax base on disposal of CU9 million).

The entity will therefore provide for a deferred tax liability on the taxable temporary difference. The extent to which a deferred tax asset is recognised in respect of the deductible temporary difference will depend on whether it is probable that taxable profits will be available against which that deductible temporary difference can be utilised (see section 7.5 above). In some tax regimes, capital profits and losses are treated more or less separately from revenue profits and losses to a greater or lesser degree, so that it may be difficult to recognise such an asset due to a lack of suitable taxable profits.

This has not been the only interpretation of IAS 12 adopted in practice and there has been diversity as a result. However, in response to a request for guidance on this matter, the IFRS IC issued an agenda decision in April 2020 that supports the above analysis, as follows:²¹

²¹ [IFRIC Update](#), April 2020, available on the IFRS Foundation's website.

Frequently asked questions

Question 8-1: How do you determine the tax base of an asset under IAS 12, when for tax purposes no deductions are available through use; but its cost is fully deductible when sold?

The IFRS IC was asked to consider an example in which an entity acquires an intangible asset with a finite useful life (a licence) as part of a business combination. The entity intends to recover the carrying amount of the licence through use, and the expected residual value of the licence at expiry is nil. Under the applicable tax law, two tax regimes are prescribed: an income tax regime and a capital gains tax regime. Any tax arising under each regime is not permitted to be offset in determining taxable profit. Tax paid under both regimes meets the definition of income taxes in IAS 12. Recovering the licence's carrying amount has both of the following tax consequences:

- Under the income tax regime - the entity pays income tax on the economic benefits it receives from recovering the licence's carrying amount through use, but receives no tax deductions in respect of amortisation of the licence (taxable economic benefits from use).
- Under the capital gains tax regime - the entity receives a tax deduction when the licence expires that is equal to its initial carrying value (capital gain deduction). The capital gain deduction cannot be used to offset the taxable economic benefits from use in determining taxable profits.

In reaching its conclusion, the IFRS IC cited the fundamental principle on which IAS 12 is based, that "an entity shall, with certain limited exceptions, recognise a deferred tax liability (asset) whenever recovery or settlement of the carrying amount of an asset or liability would make future tax payments larger (smaller) than they would be if such recovery or settlement were to have no tax consequences".

[IAS 12.10]. The IFRS IC determined that the entity should separately identify the temporary differences in a manner that reflects the distinct tax consequences under the two tax regimes of recovering the asset's carrying amount, by comparing:

- (a) The portion of the asset's carrying amount that will be recovered under one tax regime
To
- (b) The tax deductions the entity will receive under that same tax regime (which are reflected in the asset's tax base)

In the fact pattern described in the request, the IFRS IC concluded that the entity identifies both:

- (a) A taxable temporary difference under the income tax regime, reflecting the fact that it will receive no tax deductions as it recovers the asset through use
And
- (b) A deductible temporary difference under the capital gains tax regime, representing the deduction received upon expiry of the licence

The entity should then apply the requirements in IAS 12 considering the applicable tax law in recognising and measuring deferred tax for the identified temporary differences.

On this basis, the IFRS IC concluded that the principles and requirements in IAS 12 provide an adequate basis for an entity to recognise and measure deferred tax in the fact pattern described in the request and consequently decided not to add the matter to its standard-setting agenda.²²

8.4.6 Non-depreciable PP&E and intangible assets

During 2009 and 2010, the IASB received representations from various entities and bodies that it was often difficult and subjective to determine the manner of recovery of certain categories of asset for the purposes of IAS 12. This was particularly the case for investment properties accounted for at fair value under IAS 40 which are often traded opportunistically, without a specific business plan, but yield rental income until disposed of. In many jurisdictions rental income is taxed at the standard rate, while gains on asset sales are tax-free or taxed at a significantly lower rate. The principal difficulty was that the then extant guidance (SIC-21 *Income Taxes - Recovery of Revalued Non-Depreciable Assets*) effectively required entities to determine what the residual amount of the asset would be if it were depreciated under IAS 16 rather than accounted for at fair value, which many regarded as resulting in nonsensical tax effect accounting.

²² [IFRIC Update](#), April 2020, available on the IFRS Foundation's website.

To deal with these concerns, in December 2010, the IASB amended IAS 12 so as to give more specific guidance on determining the expected manner of recovery for non-depreciable assets measured using the revaluation model in IAS 16 (see section 8.4.6.A below) and for investment properties measured using the fair value model in IAS 40 (see section 8.4.7 below). As noted in section 8.4.6.B below, an indefinite-life intangible asset (that is not amortised because its useful economic life cannot be reliably determined) is not the same as a non-depreciable asset to which this amendment would apply.

8.4.6.A PP&E accounted for using the revaluation model

IAS 16 allows property, plant and equipment (PP&E) to be accounted for using a revaluation model under which PP&E is regularly revalued to fair value (see Chapter 19). IAS 12 clarifies that where a non-depreciable asset is revalued, any deferred tax on the revaluation must be calculated by reference to the tax consequences that would arise if the asset were sold at book value irrespective of the basis on which the carrying amount of the asset is measured. [IAS 12.51B]. The rationale for this treatment is that, in accounting terms, the asset is never recovered through use, as it is not depreciable. [IAS 12.BC6].

IAS 12 clarifies that these requirements are subject to the general restrictions on the recognition of deferred tax assets (see section 7.5 above). [IAS 12.51E].

An issue not explicitly addressed in IAS 12 is whether the term 'non-depreciable' asset refers to an asset that is not currently being depreciated or to one that does not have a limited useful life. This is explored further in the discussion of non-amortised intangible assets immediately below.

8.4.6.B Non-amortised or indefinite-life intangible assets

Under IAS 38 an intangible asset with an indefinite life is not subject to amortisation.

The analysis in sections 8.4.5 and 8.4.6.A above would appear to lead to the conclusion that, where an intangible asset is not amortised, any deferred tax related to that asset must be measured on an 'on sale' basis. IAS 12 requires tax to be provided for based on the manner in which the entity expects to recover the 'carrying amount' of its assets. In this case it could be argued that if the asset is not amortised under IAS 38, the financial statements are asserting that the carrying amount is not recovered through use.

However, an alternative analysis would be that the fact that an intangible asset is not being amortised does not necessarily indicate that the expected manner of recovery is by sale or through use. The determination of an indefinite life under IAS 38 means that there is no foreseeable limit to the period over which the asset is expected to generate net cash inflows for the entity. [IAS 38.88]. This could still indicate an expectation of recovery through use.

Frequently asked questions

Question 8-2: How do you determine the expected manner of recovery for an intangible asset that is not being amortised because it has an indefinite useful life?

This question was considered by the IFRS IC, which issued an agenda decision in November 2016, as follows:²³

The requirements in IAS 12.51B do not apply to indefinite-life intangible assets. An indefinite-life intangible asset is not a non-depreciable asset as envisaged by IAS 12.51B. This is because a non-depreciable asset has an unlimited (or infinite) life. IAS 38 is clear that the term 'indefinite' does not mean 'infinite'. [IAS 38.91].

- The reason for not amortising an indefinite-life intangible asset is not because there is no consumption of the future economic benefits embodied in the asset. When the IASB amended IAS 38 in 2004, it observed that an indefinite-life intangible asset is not amortised because there is no foreseeable limit on the period during which the entity expects to consume the future economic benefits embodied in the asset and, hence, amortisation over an arbitrarily determined maximum period would not be representationally faithful. [IAS 38.BC74].
- The fact that an entity does not amortise an indefinite-life intangible asset does not necessarily mean that its carrying amount will be recovered only through sale and not through use. An entity recovers the carrying amount of an asset in the form of economic benefits that flow to the entity in future periods, which could be through use or sale of the asset.
- Accordingly, an entity should determine its expected manner of recovery of the carrying value of the indefinite-life intangible asset in accordance with the principle and requirements in IAS 12.51 and 51A (as discussed in section 8.4.3 above) and reflect the tax consequences that follow from that expected manner of recovery.

Whilst the agenda decision required entities to review cases where they have previously applied IAS 12.51B to indefinite-life intangible assets, it does not imply a presumption that the carrying amount of an indefinite-life intangible asset is always recovered through use (or for that matter through sale). The agenda decision emphasises that entities must apply the principle and requirements in IAS 12.51 and 51A that the tax consequences follow the expected manner of recovery of the asset.

How we see it

As noted above, this is a judgement made by reference to the entity's specific circumstances including its business model. Therefore, it remains possible that an entity could determine recovery through sale by applying the requirements of IAS 12.51 and 51A. However, such a conclusion would require an entity to be able to demonstrate that the facts and circumstances, including the entity's business model, support a realistic expectation that the specific intangible asset would be disposed of before any material recovery of its carrying amount had occurred through use.

It is possible that an entity applies the principle and requirements in IAS 12.51 and 51A and determines that, in its opinion, a portion of the indefinite-life intangible asset is expected to be recovered through use and another component is expected to be recovered through sale. In this case, the entity must challenge its original conclusion that the asset has an indefinite-life, in particular, that 'there is no foreseeable limit to the period over which the asset is expected to generate net cash inflows for the entity'. [IAS 38.88].

Another question that often arises in the context of expected manner of recovery of an indefinite-life intangible asset is whether an entity must have a formal plan to sell the asset in order to determine an expected recovery through sale. Unlike other Standards (such as IFRS 5), IAS 12 does not require there to be a formal plan to sell the asset. Accordingly, judgement is required in deciding whether recovery is through sale if there are no immediate plans to sell the asset.

²³ [IFRIC Update](#), July 2016, available on the IFRS Foundation's website.

An impairment of an indefinite-life intangible asset or non-depreciable asset previously determined to be recovered through sale does not automatically change the expected manner of recovery of the asset. The recoverable amount under IAS 36 is defined as the higher of an asset's or cash-generating unit's fair value less costs to sell and its value in use regardless of the intent of management, whereas the expected manner of recovery will take management intent into account. Accordingly, an impairment charge can arise simply because of a change in the entity's estimate of the asset's recoverable amount. If an indefinite-life intangible asset is impaired, it is appropriate to challenge the validity of the entity's original determination that the asset life was indefinite. If it is determined that the asset is now depreciable, there is a change in the expected manner of recovery of at least the depreciable portion of the asset under IAS 12.51. When an entity starts to amortise the indefinite-life intangible asset, the asset ceases to be an indefinite life intangible asset, and the change is accounted as a change in estimate under IAS 8. [IAS 38.109].

8.4.7 Investment properties

IAS 40 allows investment properties to be accounted for at fair value (see Chapter 20). IAS 12 requires any deferred tax asset or liability associated with such a property to be measured using a rebuttable presumption that the carrying amount of the investment property will be recovered through sale. [IAS 12.51C]. The same rebuttable presumption is used when measuring any deferred tax asset or liability associated with an investment property acquired in a business combination if the entity intends to adopt the fair value model in accounting for the property subsequently. [IAS 12.51D].

The presumption is rebutted if the investment property is depreciable and the entity's business model is to consume substantially all the economic benefits embodied in the investment property over time, rather than through sale. The IFRS IC has clarified that the presumption can be rebutted in other circumstances, provided that sufficient evidence is available to support that rebuttal. However, the IFRS IC neither gave any indication of, nor placed any restriction on, what those other circumstances might be.²⁴ If the presumption is rebutted, the entity applies the normal requirements of IAS 12 for determining the manner of recovery of assets (see sections 8.4.1 to 8.4.5 above). [IAS 12.51C].

IAS 12 clarifies that these requirements are subject to the general restrictions on the recognition of deferred tax assets (see section 7.5 above). [IAS 12.51E].

8.4.8 Other assets and liabilities

In a number of areas of accounting IFRS accounting standards effectively requires a transaction to be accounted for in accordance with an assumption as to the ultimate settlement of that transaction that may not reflect the entity's expectation of the actual outcome.

For example, if the entity enters into a share-based payment transaction with an employee that gives the employee the right to require settlement in either shares or cash, IFRS 2 requires the transaction to be accounted for on the assumption that it will be settled in cash, however unlikely this may be. IAS 19 may assert that an entity has a surplus on a defined benefit pension scheme on an accounting basis, when in reality it has a deficit on a funding basis. Similarly, if an entity issues a convertible bond that can also be settled in cash at the holder's option, IAS 32 requires the bond to be accounted for on the assumption that it will be repaid, however probable it is that the holders will actually elect for conversion. It may well be that such transactions have different tax consequences depending on the expected manner of settlement, as shown in Illustration 8-4 below.

Illustration 8-4: Convertible bond deductible if settled

An entity issues a convertible bond for CU1 million. After three years, the holders can elect to receive CU1.2 million or 100,000 shares of the entity. If the bond were settled in cash, the entity would receive a tax deduction for the CU200,000 difference between its original issue proceeds and the amount payable on redemption. If the bond is converted, no tax deduction is available.

Under IAS 32, the bond would be accreted from CU1 million to CU1.2 million over the three-year issue period. The tax base remains at CU1 million throughout, so that a deductible temporary difference of CU200,000 emerges over the issue period. It is assumed that the deferred tax asset relating to this difference would meet the recognition criteria in IAS 12 (see section 7.5 above).

For various reasons, it is extremely unlikely that the bond will be redeemed in cash.

24 [IFRIC Update](#), November 2011, available on the IFRS Foundation's website.

Illustration 8-4 raises the issue of whether any deferred tax asset must be recognised in respect of the CU200,000 temporary difference.

One view would be that no deferred tax asset must be recognised on the basis that there is no real expectation that the transaction will be settled in cash, thus allowing the entity to claim a tax deduction. The contrary view would be that the underlying rationale of IAS 12 is that, in order for the financial statements to be internally consistent, the tax effects of recognised assets and liabilities must also be recognised (see section 2 above). Accordingly, a deferred tax asset must be recognised.

How we see it

In the absence of guidance in the standard, the exercise of judgement is required, based on the particular facts and circumstances.

8.4.9 'Outside' temporary differences relating to subsidiaries, branches, associates and joint arrangements

In this section, an 'outside' temporary difference means a difference between the tax base in the jurisdiction of the investor of an investment in a subsidiary, associate or branch or an interest in a joint arrangement and carrying amount of that investment or interest (or the net assets and goodwill relating to it) included in the financial statements. Such differences, and the special recognition criteria applied to them by IAS 12, are discussed in more detail in section 7.6 above.

Where deferred tax is required to be recognised on such a temporary difference (see sections 7.6.2 to 7.6.4 above), the question arises as to how it should be measured. Broadly speaking, investors can realise an investment in one of two ways - either indirectly (by remittance of retained earnings or capital) or directly (through sale of the investment to a third party or by receiving residual assets upon liquidation of the associate). In many jurisdictions, the two means of realisation have very different tax consequences.

Having determined that a temporary difference must be recognised, the entity must apply the general rule (discussed in more detail above) that, where there is more than one method of recovering an investment, the entity must measure any associated deferred tax asset or liability by reference to the tax consequences associated with the expected manner of recovery of the investment. [IAS 12.51A]. In other words, to the extent that the investment is expected to be realised through sale, the deferred tax is measured according to the tax rules applicable on sale, but to the extent that the temporary difference is expected to reverse through a distribution of earnings or capital, the deferred tax is measured according to the tax rules applicable on distribution. In its decision in March 2015 not to take a question on this matter to its agenda, the IFRS IC confirmed this view. Accordingly, if one part of the temporary difference is expected to be received as dividends, and another part is expected to be recovered upon sale or liquidation (for example, an investor has a plan to sell the investment later and expects to receive dividends until the sale of the investment), different tax rates would be applied to the parts of the temporary difference in order to be consistent with the expected manner of recovery.²⁵

Where the expected manner of recovery is through distribution, IAS 12 requires this to be reflected in the measurement of any related deferred tax assets and liabilities. [IAS 12.51A]. This includes proper consideration of the requirements of the standard where the rate at which tax is paid depends on whether profits are distributed or retained (see section 8.5 below). This was confirmed in June 2020, when the IFRS IC considered the following case where an entity and its subsidiary operate in a jurisdiction where profits are taxable only when distributed (i.e., the income tax rate applicable to undistributed profits is nil).

²⁵ [IFRIC Update](#), March 2015, available on the IFRS Foundation's website.

Frequently asked questions

Question 8-3: When an investee operates in a jurisdiction where profits are only taxed when distributed, how does its investor determine whether to recognise deferred tax related to its investment in a subsidiary and, if it does, on what basis is it measured?

In June 2020, the IFRS IC issued an agenda decision in response to a question based on the following fact pattern:²⁶

Entity A has determined that the undistributed profits of its subsidiary give rise to a taxable temporary difference associated with the entity's investment in the subsidiary and that it cannot rely on the recognition exemption in IAS 12.39 because it expects the subsidiary to distribute its profits (which are available for distribution) in the foreseeable future.

Both Entity A and its subsidiary operate in a jurisdiction in which:

- (a) Profits are taxable only when distributed, i.e., the income tax rate applicable to undistributed profits is nil (undistributed tax rate).
- (b) A 20% tax rate applies to profit distributions (distributed tax rate). However, profit distributions made by the entity are not taxable to the extent that the subsidiary has already been taxed on that profit, i.e., profit distributions are taxed only once.

The IFRS IC was asked whether Entity A recognises a deferred tax liability for the taxable temporary difference associated with its investment in the subsidiary.

The IFRS IC concluded that, in the fact pattern described, Entity A should recognise the deferred tax liability related to its investment in the subsidiary and measure it using the distributed tax rate of 20%. In making this determination, the Committee observed that:

- There is a taxable temporary difference associated with the entity's investment in the subsidiary. The entity has also determined that the recognition exception in IAS 12.39 does not apply because it is probable that the temporary difference will reverse in the foreseeable future when the subsidiary distributes its undistributed profits. [IAS 12.39].
- Paragraph 51 of IAS 12 requires an entity to reflect, in the measurement of deferred tax assets and deferred tax liabilities, "the tax consequences that would follow from the manner in which the entity expects, at the end of the reporting period, to recover or settle the carrying amount of its assets and liabilities". [IAS 12.51].
- The entity expects to recover the carrying amount of its investment in the subsidiary through distributions of profits by the subsidiary, which would be taxed at the distributed tax rate.
- It is not appropriate to use the undistributed rate in IAS 12.57A to measure the deferred tax liability, because that paragraph applies only in the context of dividends payable by the reporting entity. Further, IAS 12.52A does not apply to the measurement of a current or deferred tax asset or liability that itself reflects the tax consequences of a distribution of profits.
- The IFRS IC concluded that the principles and requirements in IAS 12 provide an adequate basis for an entity to account for deferred tax in the fact pattern described in the request and consequently decided not to add the matter to its standard-setting agenda.

How we see it

In other cases, there may be tax consequences for more than one entity in the group when a distribution is made. For example, the paying company may suffer a withholding tax on the dividend paid and the receiving company may suffer income tax on the dividend received. In such cases, provision must be made for the cumulative effect of all tax consequences.

As discussed further in section 10.3.3 below, a withholding tax on an intragroup dividend is not accounted for in the consolidated financial statements as a withholding tax (i.e., within equity), but as a tax expense in profit or loss, since the group is not making a distribution but transferring assets from a group entity to a parent of that entity.

²⁶ [IFRIC Update](#), June 2020, available on the IFRS Foundation's website.

8.4.10 'Single asset' entities

In many jurisdictions it is common for certain assets (particularly properties) to be bought and sold by transferring ownership of a separate legal entity formed to hold the asset (a 'single asset' entity) rather than the asset itself.

A 'single asset' entity may be formed for a number of reasons. For example, the insertion of a 'single asset' entity between the 'real' owner and the property may limit the 'real' owner's liability for obligations arising from ownership of the property. It may also provide shelter from tax liabilities arising on disposal of the property since, in many jurisdictions, the sale of shares is taxed at a lower rate than the sale of property.

Frequently asked questions

Question 8-4: When determining the expected manner of recovery of an asset for the purposes of IAS 12, can an entity have regard to the fact that an asset held by a 'single asset' entity can be disposed of by selling the shares of the entity rather than the asset itself?

The IFRS IC has discussed this matter on a number of occasions since September 2011. In May 2012, the IFRS IC noted the following significant diversity in practice:

- Some preparers recognise deferred tax on both the asset within, and the shares of, the 'single asset' entity.
- Some preparers recognise tax on the shares only.
- Some preparers provide deferred tax on the difference between the asset within the entity and the tax base of its shares, using the tax rate applicable to a disposal of the shares.

The IFRS IC noted that IAS 12 requires the parent to recognise deferred tax on both the asset within, and the shares of, the 'single asset' entity, if tax law considers the asset and the shares as two separate assets and if no specific exemptions in IAS 12 apply. At that time, the IFRS IC asked its staff to undertake more research with the possible outcome of an amendment to IAS 12 addressing this specific type of transaction. Such an amendment would, in the Committee's view, be beyond the scope of the Annual Improvements project.

Following further deliberations, the IFRS IC decided in July 2014 not to take the issue onto its agenda but instead to recommend to the IASB that it should analyse and assess the concerns raised about the current requirements in IAS 12 in its research project on Income Taxes. In issuing its agenda decision, the Committee noted that:

- a) Paragraph 11 of IAS 12 requires the entity to determine temporary differences in the consolidated financial statements by comparing the carrying amounts of assets and liabilities in the consolidated financial statements with the appropriate tax base. In the case of an asset or a liability of a subsidiary that files separate tax returns, this is the amount that will be taxable or deductible on the recovery (settlement) of the asset (liability) in the tax returns of the subsidiary.
- b) The requirement in IAS 12.11 is complemented by the requirement in IAS 12.38 to determine the temporary difference related to the shares held by the parent in the subsidiary by comparing the parent's share of the net assets of the subsidiary in the consolidated financial statements, including the carrying amount of goodwill, with the tax base of the shares for purposes of the parent's tax returns.

The IFRS IC also noted that these paragraphs require a parent to recognise both the deferred tax related to the asset inside and the deferred tax related to the shares, if:

- a) Tax law attributes separate tax bases to the asset inside and to the shares
- b) In the case of deferred tax assets, the related deductible temporary differences can be utilised as specified in IAS 12.24 to 31
And
- c) No specific exceptions in IAS 12 apply

Accordingly, in determining the expected manner of recovery of an asset for the purposes of IAS 12, the entity should have regard to both the asset itself and the shares (subject to the exemption relating to investments in subsidiaries in IAS 12.39 (see section 7.6.2 above)).

8.4.11 Change in expected manner of recovery of an asset or settlement of a liability

A change in the expected manner of recovery of an asset or settlement of a liability must be dealt with as an item of deferred tax income or expense for the period in which the change of expectation occurs, and recognised in profit or loss or in other comprehensive income or movements in equity for that period as appropriate (see section 10 below).

This may have the effect, in certain situations, that some tax consequences of a disposal transaction are recognised before the transaction itself. For example, an entity might own an item of PP&E which has previously been held for use but which the entity now expects to sell.

How we see it

In our view, any deferred tax relating to that item of PP&E must be measured on a 'sale' rather than a 'use' basis from the point when the entity's expected manner of recovery changes, even though the disposal itself, and any related current tax, will not be accounted for until the disposal occurs.

As noted in section 7.5.8 above, which discusses the effect of disposals on the recoverability of tax losses, the change in measurement will be required even if the asset does not yet meet the criteria for being classified as held for sale in IFRS 5 (see Chapter 5). This is because those criteria set a higher hurdle for reclassification ('highly probable') than the requirement in IAS 12 to use the entity's expected manner of recovery of an asset. The extent to which deferred tax assets and liabilities are classified within a disposal group under IFRS 5 is discussed in Chapter 5.

8.5 Different tax rates applicable to retained and distributed profits

In some jurisdictions, the rate at which tax is paid depends on whether profits are distributed or retained. In other jurisdictions, distribution may lead to an additional liability to tax, or a refund of tax already paid. IAS 12 requires current and deferred taxes to be measured using the rate applicable to undistributed profits. [IAS 12.52A]. Only when an entity recognises a liability to pay a dividend should the tax consequences of that dividend also be recognised, as shown in Illustration 8-5 below. [IAS 12.57A].

Illustration 8-5: Different tax rates applicable to retained and distributed profits

An entity operates in a jurisdiction where income taxes are payable at a higher rate on undistributed profits (50%) with an amount being refundable when profits are distributed. The tax rate on distributed profits is 35%. At the end of the reporting period, 31 December 20X3, the entity does not recognise a liability for dividends proposed or declared after the end of the reporting period. As a result, no dividends are recognised in the year 20X3. Taxable income for 20X3 is CU100,000. Net taxable temporary differences have increased during the year ended 31 December 20X3 by CU40,000.

The entity recognises a current tax liability and a current income tax expense of CU50,000 (CU100,000 taxable profit @ 50%). No asset is recognised for the amount potentially recoverable as a result of future dividends. The entity also recognises a deferred tax liability and deferred tax expense of CU20,000 (CU40,000 @ 50%) representing the income taxes that the entity will pay when it recovers or settles the carrying amounts of its assets and liabilities based on the tax rate applicable to undistributed profits.

Subsequently, on 15 March 20X4 the entity declares, and recognises as a liability, dividends of CU10,000 from previous operating profits. At that point, the entity recognises the recovery of income taxes of CU1,500 (CU10,000 @ [50% - 35%]), representing the refund of tax due in respect of the dividends recognised as a liability, as a current tax asset and as a reduction of current income tax expense for the year ended 31 December 20X4.

As discussed in section 10.3.5 below, the tax benefit of CU1,500 in the Illustration above will be recognised in profit or loss.

8.5.1 Effectively tax-free entities

In a number of jurisdictions certain types of entity, such as investment vehicles, are generally exempt from corporate income tax provided that they fulfil certain criteria, which generally include a requirement to distribute all, or a minimum percentage, of their annual income as a dividend to investors. This raises the question of how such entities should measure income taxes.

One view would be that, under the basic principle set out above, such an entity has a liability to tax at the undistributed rate until the dividend for a year becomes a liability. The liability for a dividend for an accounting period usually arises after the end of that period (as in Illustration 8-5 above). Under this analysis, therefore, such an entity would be required, at each period end, to record a liability for current tax at the standard corporate rate. That liability would be released in full when the dividend is recognised as a liability in the following period. This would mean that, on an ongoing basis, the income statement would show a current tax charge or credit comprising:

- A charge for a full liability for the current period
- A credit for the reversal of the corresponding liability for the prior period

In addition, deferred tax would be recognised at the standard tax rate on all temporary differences.

A second view would be that the provisions of IAS 12 regarding different tax rates for distributed and undistributed tax rates are intended to apply where the only significant factor determining the differential tax rate is the retention or distribution of profit. By contrast, the tax status of an investment fund often depends on many more factors than whether or not profits are distributed, including restrictions on its activities and the nature of its investments. On this view, the analysis would be that such an entity can choose to operate within one of two tax regimes (a 'full tax' regime or a 'no tax' regime), rather than that it operates in a single tax regime with a dual tax rate depending on whether profits are retained or distributed. In these circumstances, it would be appropriate to infer a tax-free status for the entity until such time as it was evident that it no longer meets the conditions for retaining that status.

The IASB previously appeared to regard IAS 12 as favouring the first analysis, while accepting that the resulting accounting treatment - a cycle of raising full tax provisions and then reversing them - does not reflect economic reality. Accordingly, the exposure draft ED/2009/2 proposed that the measurement of tax assets and liabilities must include the effect of expected future distributions, based on the entity's past practices and expectations of future distributions.²⁷ Following the withdrawal of the exposure draft, the IASB intended to consider this issue further. However, no formal decision has been taken, nor proposals issued for comment.

8.5.2 Withholding tax or distribution tax?

In practice, it is sometimes difficult to determine whether a particular transaction should be accounted for under the provisions of IAS 12 relating to different tax rates for distributed and undistributed profits, or in accordance with the provisions of the standard relating to withholding taxes.

The classification can significantly affect tax expense because IAS 12 requires a withholding tax to be accounted for as a deduction from equity, whereas a higher tax rate for distributed profits is usually accounted for as a charge to profit or loss.

This issue is discussed further in section 10.3 below.

²⁷ Exposure draft [ED/2009/2: Income Tax](#), IASB, March 2009, paras. 27(d), B31-B32. Available on the IFRS Foundation's website.

8.6 Discounting

IAS 12 prohibits discounting of deferred tax. [IAS 12.53, IAS 12.54].

Extract from IAS 12

53 Deferred tax assets and liabilities shall not be discounted.

54 The reliable determination of deferred tax assets and liabilities on a discounted basis requires detailed scheduling of the timing of the reversal of each temporary difference. In many cases such scheduling is impracticable or highly complex. Therefore, it is inappropriate to require discounting of deferred tax assets and liabilities. To permit, but not to require, discounting would result in deferred tax assets and liabilities which would not be comparable between entities. Therefore, this Standard does not require or permit the discounting of deferred tax assets and liabilities.

Moreover, IAS 12 notes that when deferred tax is recognised in relation to an item that is itself discounted (such as a liability for post-employment benefits or a lease liability), the deferred tax, being based on the carrying amount of that item, is also effectively discounted. [IAS 12.55].

8.7 Unrealised intragroup profits and losses in consolidated financial statements

As noted in sections 6.2.1 and 6.2.2 above, an unrealised intragroup profit or loss eliminated on consolidation will give rise to a temporary difference where the profit or loss arises on a transaction that alters the tax base of the item(s) subject to the transaction. Such an alteration in the tax base creates a temporary difference because there is no corresponding change in the carrying amount of the assets or liabilities in the consolidated financial statements, due to the intragroup eliminations.

IAS 12 does not specifically address the measurement of such items. However, IAS 12 generally requires an entity, in measuring deferred tax, to have regard to the expected manner of recovery or settlement of the tax. It would be consistent with this requirement to measure deferred tax on temporary differences arising from intragroup transfers at the tax rates and laws applicable to the 'transferee' company rather than those applicable to the 'transferor' company, since the 'transferee' company will be taxed when the asset or liability subject to the transfer is realised or sold.

There are some jurisdictions where the tax history of an asset or liability subject to an intragroup transfer remains with the 'transferor' company. In such cases, the general principles of IAS 12 must be used to determine whether any deferred tax should be measured at the tax rate of the 'transferor' or the 'transferee' company in the consolidated financial statements.

The effect of the treatment required by IAS 12 is that tax income or expense may be recognised on transactions eliminated on consolidation, as demonstrated by Illustration 8-6 and Illustration 8-7.

Illustration 8-6: Elimination of intragroup profit (1)

H, an entity taxed at 30%, has a subsidiary S, which is taxed at 34%. On 15 December 20X3 S sells inventory with a cost of CU100,000 to H for CU120,000, giving rise to a taxable profit of CU20,000 and current tax at 34% of CU6,800. In the consolidated financial statements of H group for the year ended 31 December 20X3, the profit made by S on the sale to H would be eliminated. However, whilst the carrying value of the inventory in the consolidated balance sheet is unchanged at CU100,000, its tax base in H is now CU120,000.

Under IAS 12, a deferred tax asset would be recognised in the consolidated financial statements on the unrealised profit of CU20,000, based on H's 30% tax rate, i.e., CU6,000. The additional CU800 tax actually paid by S would be recognised in profit or loss for the period ended 31 December 20X3, the accounting entry being:

Dr	Current tax (profit or loss)	CU6,800	
	Cr Current tax (statement of financial position)		CU6,800
Dr	Deferred tax (statement of financial position)	CU6,000	
	Cr Deferred tax (profit or loss)		CU6,000

The net CU800 tax charge to profit or loss (current tax charge CU6,800 less deferred tax credit CU6,000) reflects the fact that, by transferring the inventory from one tax jurisdiction to another with a lower tax rate, the group has effectively denied itself a tax deduction of CU800 (i.e., CU20,000 at the tax rate differential of 4%) for the inventory that would have been available had the inventory been sold by S, rather than H, to the ultimate third party customer.

Illustration 8-7: Elimination of intragroup profit (2)

H, an entity taxed at 34%, has a subsidiary S, which is taxed at 30%. On 15 December 20X3 S sells inventory with a cost of CU100,000 to H for CU120,000, giving rise to a taxable profit of CU20,000 and current tax at 30% of CU6,000. In the consolidated financial statements of H group for the year ended 31 December 20X3, the profit made by S on the sale to H would be eliminated. However, whilst the carrying value of the inventory in the consolidated balance sheet is unchanged at CU100,000, its tax base in H is now CU120,000.

In this case, the consolidated financial statements would record current tax paid by S of CU6,000 and a deferred tax asset measured at H's effective tax rate of 34% of CU6,800, giving rise to the following entry:

Dr	Current tax (profit or loss)	CU6,000	
	Cr	Current tax (statement of financial position)	CU6,000
Dr	Deferred tax (statement of financial position)	CU6,800	
	Cr	Deferred tax (profit or loss)	CU6,800

In this case there is a net CU800 tax credit to profit or loss (current tax charge CU6,000 less deferred tax credit CU6,800). This reflects the fact that, by transferring the inventory from one tax jurisdiction to another with a higher tax rate, the group has put itself in the position of being able to claim a tax deduction for the inventory of CU800 (i.e., CU20,000 at the tax rate differential of 4%) in excess of that which would have been available had the inventory been sold by S, rather than H, to the ultimate third party customer.

8.7.1 Intragroup transfers of goodwill and intangible assets

It is common in some jurisdictions to sell goodwill and intangible assets from one entity in a group to another in the same group, very often in order to either increase tax deductions on an already recognised asset or to obtain deductions for a previously unrecognised asset. This raises the issue of how the tax effects of such transactions should be accounted for in the financial statements both of the individual entities concerned and in the consolidated financial statements, as demonstrated by Illustration 8-8 below.

Illustration 8-8: Intragroup transfer of goodwill

A parent company P has two subsidiaries - A, which was acquired some years ago and B, which was acquired during the period ended 31 December 20X2 at a cost of CU10 million. For the purposes of this discussion, it is assumed that B had negligible identifiable assets and liabilities. Accordingly, P recorded goodwill of CU10 million in its consolidated financial statements.

During 20X3, B sells its business to A for its then current fair value of CU12.5 million. As the goodwill inherent in B's business was internally generated, it was not recognised in the financial statements of B. Hence, the entire consideration of CU12.5 million represents a profit to B, which is subject to current tax at 20% (i.e., CU2.5 million). However, as a result of this transaction, A will be entitled to claim tax deductions (again at 20%) for its newly-acquired goodwill of CU12.5 million. The deductions will be received in ten equal annual instalments from 20X3 to 20Y0. For the purposes of this discussion, it is assumed that A will have sufficient suitable taxable profits to be able to recover these deductions in full.

8.7.1.A Individual financial statements of buyer

The buyer (A) accounts for the acquisition of B's business using acquisition accounting. As the business still has negligible identifiable assets and liabilities, this gives rise to goodwill of CU12.5 million within A's own financial statements. A has acquired an asset for CU12.5 million with a tax base of the same amount. There is therefore no temporary difference (and thus no deferred tax) to be accounted for in the financial statements of A.

8.7.1.B Individual financial statements of seller

As described above, the individual financial statements of the seller (B) reflect a profit of CU12.5 million and current tax of CU2.5 million.

8.7.1.C Consolidated financial statements

In the consolidated financial statements of P, the sale of the business from B to A will be eliminated on consolidation. However, the CU2.5 million current tax suffered by B will be reflected in the consolidated financial statements, since this is a transaction with a third party (the tax authority), not an intragroup transaction. The question is what, if any, deferred tax arises as the result of this transaction.

Analysis 1

One analysis would be that the tax base of the consolidated goodwill has effectively been increased from nil to CU12.5 million. Compared to its carrying amount of CU10 million, this creates a deductible temporary difference of CU2.5 million on which a deferred tax asset at 20% (CU500,000) may be recognised. It could also be argued that there is an analogy here with the general treatment of deferred tax on intragroup profits and losses eliminated on consolidation (see Illustration 8-6 and Illustration 8-7 above).

Under this analysis, the consolidated income statement would show a net tax charge of CU2.0 million (CU2.5 million current tax expense arising in B, less CU0.5 million deferred tax income arising on consolidation). However, this is arguably inconsistent with the fact that the entity is not in an overall tax-paying position (since it has incurred a current tax loss of CU2.5 million, but expects to receive tax deductions of the same amount over the next ten years). Clearly, there is an economic loss since the entity has effectively made an interest free loan equal to the current tax paid to the tax authority, but this is not relevant, since tax is not measured on a discounted basis under IAS 12 (see section 8.6 above).

Analysis 2

An alternative analysis might therefore be to argue that the goodwill reflected in the consolidated statement of financial position still has no tax base. Rather, the tax base attaches to the goodwill recognised in the separate financial statements of A, which is eliminated on consolidation, and therefore has no carrying amount in the consolidated financial statements. Thus, applying the general principle shown in Illustration 8-6 and Illustration 8-7 above, there is a deductible temporary difference of CU12.5 million, being the difference between the carrying value of the goodwill (zero in the consolidated statement of financial position) and its tax base (CU12.5 million). Alternatively, as noted in section 6.1.4 above, certain items may have a tax base, but no carrying amount, and thus give rise to deferred tax.

This analysis would allow recognition of a deferred tax asset of CU2.5 million on a temporary difference of CU12.5 million, subject to the recognition criteria for deferred tax assets. This would result in a net tax charge of nil (CU2.5 million current tax expense arising in B less CU2.5 million deferred tax income arising on consolidation).

How we see it

In our view, there are arguments for either analysis above and entities need to take a view on their accounting policy for such transactions and apply it consistently.

8.7.1.D When the tax base of goodwill is retained by the transferor entity

In May 2014, the IFRS IC considered another example involving the internal reorganisation of a previously acquired business, as set out below.²⁸

²⁸ [IFRIC Update](#), May 2014, available on the IFRS Foundation's website.

Frequently asked questions

Question 8-5: How does a group account in its consolidated financial statements for an intragroup transfer of goodwill when the tax base is retained by the transferor entity?

A parent company, H, recognised goodwill that had resulted from the acquisition of a group of assets (Business C) that meets the definition of a business in IFRS 3. Entity H subsequently recorded a deferred tax liability relating to goodwill deducted for tax purposes. Against this background, Entity H effects an internal reorganisation in which:

- Entity H set up a new wholly-owned subsidiary (Subsidiary A).
- Entity H transfers Business C, including the related (accounting) goodwill to Subsidiary A.
- For tax purposes, however, the (tax) goodwill is retained by Entity H and not transferred to Subsidiary A.

How should Entity H calculate deferred tax following this internal reorganisation transaction in its consolidated financial statements in accordance with IAS 12?

The IFRS IC noted that when entities in the same consolidated group file separate tax returns, separate temporary differences will arise in those entities. Consequently, when an entity prepares its consolidated financial statements, deferred tax balances would be determined separately for those temporary differences, using the applicable tax rates for each entity's tax jurisdiction. [IAS 12.11]. The IFRS IC also noted that when calculating the deferred tax amount for the consolidated financial statements:

- (a) The amount used as the carrying amount by the 'receiving' entity (in this case, Subsidiary A that receives the (accounting) goodwill) for an asset or a liability is the amount recognised in the consolidated financial statements.
- (b) The assessment of whether an asset or a liability is being recognised for the first time for the purpose of applying the initial recognition exception (see section 7.2 above) is made from the perspective of the consolidated financial statements.

The IFRS IC noted that transferring the goodwill to Subsidiary A would not meet the initial recognition exception in the consolidated financial statements. [IAS 12.15, IAS 12.24]. Consequently, deferred tax would be recognised in the consolidated financial statements for any temporary differences arising in each separate entity by using the applicable tax rates for each entity's tax jurisdiction (subject to meeting the recoverability criteria for recognising deferred tax assets described in section 7.5 above).

To the extent that there is a temporary difference between the carrying amount of the investment in Subsidiary A and the tax base of the investment (a so-called 'outside basis difference') in the consolidated financial statements, deferred tax for such a temporary difference would also be recognised subject to the limitations and exceptions discussed in sections 7.6.2 and 7.6.3 above.

The IFRS IC also noted that transferring assets between the entities in the consolidated group would affect the consolidated financial statements in terms of recognition, measurement and presentation of deferred tax, if the transfer affects the tax base of assets or liabilities, or the tax rate applicable to the recovery or settlement of those assets or liabilities. Such a transfer could also affect:

- (a) The recoverability of any related deductible temporary differences and thereby affect the recognition of deferred tax assets
And
- (b) The extent to which deferred tax assets and liabilities of different entities in the group are offset in the consolidated financial statements

9 Uncertain tax treatments

The terms ‘uncertain tax treatment’ or ‘uncertain tax position’ refer to an item, the tax treatment of which is either unclear or is a matter of unresolved dispute between the reporting entity and the relevant tax authority. Uncertain tax treatments generally occur where there is an uncertainty as to the meaning of the law, or to the applicability of the law to a particular transaction, or both. For example, the tax legislation may allow the deduction of research and development expenditure, but there may be disagreement as to whether a specific item of expenditure falls within the definition of eligible research and development costs in the legislation. In some cases, it may not be clear how tax law applies to a particular transaction, if at all. In other situations, a tax return might have been submitted to the tax authorities, who are yet to opine on the treatment of certain transactions, or may even have indicated that they disagree with the entity’s interpretation of tax law.

Estimating the outcome of an uncertain tax treatment is often one of the most complex and subjective areas in accounting for tax. However, IAS 12 does not specifically address the measurement of uncertain tax treatments, which are therefore implicitly subject to the general requirement of the standard to measure current tax and deferred tax at the amount expected to be paid or recovered, [IAS 12.46, IAS 12.47], (see section 5 above).

Uncertain liabilities are generally accounted for under IAS 37 and historically entities have been drawn to this standard for guidance. However, IAS 37 does not apply to income taxes (see Chapter 27). [IAS 37.5]. In 2014, the IFRS IC was asked to consider the interaction between IAS 12 and IAS 37 in the situation where entities are required to make advance payments on account to the tax authorities before an uncertain tax treatment is resolved (see section 9.7 below). The IFRS IC concluded that IAS 12, not IAS 37, provides the relevant guidance on the recognition of current tax, in particular that probability of recovery (rather than virtual certainty) was the threshold for recognition of an asset for the advance payment.²⁹ It then embarked on a project to give guidance on the recognition and measurement of income tax assets and liabilities in circumstances where there is uncertainty, in particular in relation to how probability and detection risk should be reflected.³⁰

In June 2017, the IFRS IC issued IFRIC 23 that has been effective since annual reporting periods beginning on or after 1 January 2019. [IFRIC 23.B1]. On initial application, entities could either apply the Interpretation with full retrospective effect, in accordance with IAS 8, provided that this was possible without the use of hindsight, or by an adjustment to the opening balance of equity at the beginning of the first annual reporting period of application and without restating comparative information. [IFRIC 23.B2].

9.1 Scope of IFRIC 23 and definitions used

The Interpretation clarifies how to apply the recognition and measurement requirements of IAS 12 when there is uncertainty over income tax treatments. Those requirements must be applied after determining the relevant taxable profit (tax loss), tax bases, unused tax losses, unused tax credits and tax rates for the entity. [IFRIC 23.4].

The following issues are addressed by the Interpretation: [IFRIC 23.5]

- a) Whether an entity must consider uncertain tax treatments separately
- b) The assumptions an entity must make about the examination of tax treatments by taxation authorities
- c) How an entity must determine taxable profit (tax loss), tax bases, unused tax losses, unused tax credits and tax rates
- d) How an entity must consider changes in facts and circumstances

The Interpretation applies only to income taxes within the scope of IAS 12 and therefore does not apply to levies and other taxes not within the scope of that Standard. [IFRIC 23.BC6]. Despite a request from a number of respondents to the Draft Interpretation to do so, IFRIC 23 does not include requirements relating to interest and penalties associated with uncertain tax treatments. Instead, the IFRS IC noted that an entity may or may not regard a particular amount for interest and penalties as an income tax within the scope of IAS 12 and apply the Interpretation only to those determined to be in scope. [IFRIC 23.BC8, IFRIC 23.BC9]. In September 2017, the IFRS IC decided not to add a project on interest and penalties to its agenda, but nevertheless observed that the determination of whether interest and penalties are within the scope of

²⁹ [IFRIC Update](#), July 2014, available on the IFRS Foundation’s website.

³⁰ [IFRIC Update](#), July 2014, available on the IFRS Foundation’s website.

IAS 12 is a judgement and not an accounting policy choice for entities.³¹ We discuss in section 4.4 above the attributes that might be relevant to determining whether interest and penalties fall within the scope of IAS 12. The Interpretation uses the following terms in addition to those defined in IAS 12. [IFRIC 23.3].

Extract from IFRIC 23

- 3 In this Interpretation:
- (a) 'tax treatments' refers to the treatments used by an entity or that it plans to use in its income tax filings.
 - (b) 'taxation authority' refers to the body or bodies that decide whether tax treatments are acceptable under tax law. This might include a court.
 - (c) an 'uncertain tax treatment' is a tax treatment for which there is uncertainty over whether the relevant taxation authority will accept the tax treatment under tax law. For example, an entity's decision not to submit any income tax filing in a tax jurisdiction, or not to include particular income in taxable profit, is an uncertain tax treatment if its acceptability is uncertain under tax law.

In determining 'uncertainty', the entity only needs to consider whether a particular tax treatment is probable, rather than highly likely or certain, to be accepted by the taxation authorities. As explained in section 9.4 below, if the entity determines it is probable that a tax treatment will be accepted, then it must measure its income taxes on that basis. Only if the entity believes the likelihood of acceptance is not probable, would there be an uncertain tax treatment to be addressed by IFRIC 23.

9.1.1 Business combinations

The IFRS IC considered whether the Interpretation should address the accounting for tax assets and liabilities acquired or assumed in a business combination when there is uncertainty over income tax treatments. It noted that IFRS 3 applies to all assets acquired and liabilities assumed in a business combination and concluded that on this basis the Interpretation should not explicitly address tax assets and liabilities acquired or assumed in a business combination. [IFRIC 23.BC23].

Nonetheless, IFRS 3 requires an entity to account for deferred tax assets and liabilities that arise as part of a business combination by applying IAS 12. [IFRS 3.24]. Accordingly, the Interpretation applies to such assets and liabilities when there is uncertainty over income tax treatments that affect deferred tax. [IFRIC 23.BC24].

How we see it

IFRS 3 suggests that current tax must be measured at fair value, which differs from the subsequent measurement required by IFRIC 23. Entities must consider whether the application of IFRS 3 fair value requirements to current tax assets and liabilities (which may result in possible Day 2 gains and losses) takes precedence over the requirements of IFRIC 23 for the measurement of current tax assets and liabilities. We believe either approach is acceptable, provided that it is applied consistently (see also Chapter 10).

9.2 Whether to consider uncertain tax treatments separately (unit of account)

A key input to any estimation process is to determine the unit of account for uncertain tax treatments. In practice this might be an entire tax computation, individual uncertain treatments, or a group of related uncertain treatments (e.g., all positions in a particular tax jurisdiction, or all positions of a similar nature or relating to the same interpretation of tax legislation).

The Interpretation requires that entities determine whether to consider tax uncertainties separately or grouped together on the basis of which approach provides a better prediction of the resolution of the uncertainty. For example, if the entity prepares and supports tax treatments as a group or if the entity expects the taxation authority to assess items collectively during a tax examination, it would be appropriate to consider those uncertain tax treatments together. [IFRIC 23.6]. This implies that material tax uncertainties would be considered separately if there was no such inter-dependency as to the expected outcome.

³¹ [IFRIC Update](#), September 2017, available on the IFRS Foundation's website.

9.3 Assumptions about the examination of tax treatments ('detection risk')

'Detection risk' is a term commonly used to refer to the likelihood that the taxation authority examines the amounts reported to it by the entity. The IFRS IC concluded that in cases where the taxation authority has a right to examine amounts reported to it, the entity must assume that it will do so; and that when it performs those examinations, the taxation authority will have full knowledge of all related information. [IFRIC 23.8].

The IFRS IC noted that this position is consistent with the requirement in IAS 12.46 and 47 to measure the amount of a tax liability or asset based on the tax laws that have been enacted or substantively enacted at the reporting date. [IFRIC 23.BC11]. The IFRS IC also rejected a suggestion by a few respondents to the Draft Interpretation that the consideration of probability of examination must be taken into account and would be particularly important if there was no time limit on the right of the taxation authority to examine income tax filings. It determined that no exception would be appropriate and noted that the threshold for reflecting the effects of uncertainty is whether it is probable that the taxation authority will accept an uncertain tax treatment and not based on whether the taxation authority will examine a tax treatment. [IFRIC 23.12, IFRIC 23.BC13]. Indeed, in many jurisdictions, the tax law imposes a legal obligation on an entity operating in that jurisdiction to disclose its full liability to tax, or to assess its own liability to tax, and to make all relevant information available to the taxation authorities. In such a tax jurisdiction it might be difficult, as a matter of corporate governance, for an entity to argue that it can calculate its tax liability on the basis that the taxation authority will not become aware of information regarding a particular treatment which the entity has a legal obligation to disclose to that authority.

9.4 Determining the effect of an uncertain tax treatment or group of tax treatments

A variety of methodologies had been applied in the past for determining the effect of uncertain tax treatments on estimates of taxable profit (tax loss), tax bases, unused tax losses, unused tax credits and tax rates. These included a weighted average probability of outcomes, the most likely single outcome and an 'all or nothing approach' (i.e., no liability is recognised for an uncertain tax treatment with a probability of occurrence below the selected recognition threshold and a full liability for a position with a probability of occurrence above the threshold). IFRIC 23 established the following requirements. [IFRIC 23.9, IFRIC 23.10, IFRIC 23.11].

Extract from IFRIC 23

- | | |
|----|--|
| 9 | An entity shall consider whether it is probable that a taxation authority will accept an uncertain tax treatment. |
| 10 | If an entity concludes it is probable that the taxation authority will accept an uncertain tax treatment, the entity shall determine the taxable profit (tax loss), tax bases, unused tax losses, unused tax credits or tax rates consistently with the tax treatment used or planned to be used in its income tax filings. |
| 11 | <p>If an entity concludes it is not probable that the taxation authority will accept an uncertain tax treatment, the entity shall reflect the effect of uncertainty in determining the related taxable profit (tax loss), tax bases, unused tax losses, unused tax credits or tax rates. An entity shall reflect the effect of uncertainty for each uncertain tax treatment by using either of the following methods, depending on which method the entity expects to better predict the resolution of the uncertainty:</p> <ul style="list-style-type: none"> (a) the most likely amount - the single most likely amount in a range of possible outcomes. The most likely amount may better predict the resolution of the uncertainty if the possible outcomes are binary or are concentrated on one value. (b) the expected value - the sum of the probability-weighted amounts in a range of possible outcomes. The expected value may better predict the resolution of the uncertainty if there is a range of possible outcomes that are neither binary nor concentrated on one value. |

How we see it

The Interpretation does not define probable, but this is generally referred to in other IFRS accounting standards as meaning more likely than not (see section 7.1.2 above).

If the entity concludes that it is probable that the taxation authority will accept the tax treatment used or planned to be used in its tax filings, the entity determines its tax position on that basis. This is consistent with the requirement that current tax is measured at the amount expected to be paid or recovered from the taxation authorities, and that deferred tax is measured using the rates and tax laws expected to apply when the related asset is realised or liability is settled. This means that all likelihoods beyond the probable threshold are treated in the same way. That is, any likelihood of acceptance by the taxation authority beyond 50% is treated in the same way as 100% likelihood of acceptance. Therefore, it is not necessary to distinguish between outcomes that are probable, highly likely or virtually certain.

If the entity concludes that acceptance of the uncertain tax treatment by the taxation authorities is not probable, it must apply one of the following two methods for reflecting the effect of uncertainty in its estimate of the amount it expects to pay or recover from the tax authorities: [IFRIC 23.11]

(a) The most likely amount - the single most likely amount in a range of possible outcomes

Or

(b) The expected value - the sum of the probability-weighted amounts in a range of possible outcomes

The entity is required to use the method that it expects to better predict the resolution of the uncertainty. The Interpretation suggests that the most likely amount may be a better method if the outcomes are binary (for example where an item might be deductible or disallowed for tax purposes) or are concentrated on one value (that is clearly more likely than the alternative outcomes). The expected value method may be more appropriate if possible outcomes are widely dispersed with low individual probabilities (where a number of individual but related uncertainties have been combined into a single unit of account). [IFRIC 23.11].

The Interpretation includes two examples to illustrate how an entity might apply its requirements for hypothetical situations and based on the limited facts presented, as follows:

- When multiple tax treatments are considered together and when the expected value is used to reflect the effect of uncertainty [IFRIC 23.IE Example 1] (Illustration 9-1 below).
- When current and deferred tax is recognised and measured based on the most likely amount for a tax base that reflects the effect of uncertainty [IFRIC 23.IE Example 2] (Illustration 9-2 below).

In both of these examples, the entities have assumed that the taxation authority will examine the amounts reported to it and have full knowledge of all related information, as discussed in section 9.3 above.

[IFRIC 23.IE1].

Illustration 9-1: Multiple treatments, expected value method

Entity A's tax filing included a number of deductions related to transfer pricing. The taxation authority in its jurisdiction may challenge those tax treatments. Entity A notes that the taxation authority's decision on one transfer pricing matter would affect, or be affected by, the other transfer pricing matters. Entity A determines that the tax treatments must be considered together, because this better predicts the resolution of the uncertainty. At the end of the reporting period, Entity A concludes, on the basis of an evaluation of all available evidence, that it is not probable that the taxation authority will accept all of the tax treatments.

Entity A estimates the probabilities of what would be added to its taxable profits (in currency units), as follows:

	Estimated additional amount	Probability	Expected value
Outcome 1	-	5%	-
Outcome 2	200	5%	10
Outcome 3	400	20%	80
Outcome 4	600	20%	120
Outcome 5	800	30%	240
Outcome 6	1,000	20%	200
		100%	650

Outcome 5 is the most likely outcome, with a probability of 30%. However, entity A observes that the possible outcomes are neither binary nor concentrated in one value. Entity A therefore concludes that the expected value (CU650) better predicts the resolution of the uncertainty. Accordingly, Entity A adds CU650 to its estimate of the taxable profit, in addition to the amount reported in its tax filing.

Illustration 9-2: Treatment relates to deferred tax asset, most likely amount is applied

Entity B acquired a separately identifiable intangible asset for CU100 that has an indefinite life and is, therefore, not amortised in accordance with IAS 38. Tax law specifies that the full amount of the intangible asset is deductible for tax purposes, but the timing of deductibility (i.e., period of amortisation under the tax law) is uncertain. Entity B has no similar intangible assets and it therefore decides that this tax treatment must be considered separately.

Entity B deducted CU100 (the cost of the intangible asset) in calculating its taxable profit for Year 1 in its income tax filing. At the end of Year 1, Entity B concludes, on the basis of an evaluation of all available evidence (e.g., information about disputes for other entities' similar transactions), that it is not probable that this tax treatment will be accepted. Entity B estimates that the most likely deduction that the tax authority will accept for Year 1 is CU10, and that the most likely amount better predicts the resolution of the tax uncertainty. Accordingly, at the end of Year 1, Entity B recognises and measures a deferred tax liability based on the amount of the temporary difference between the carrying amount of the intangible asset in its financial statements and the most likely amount of the tax base (i.e., the difference between CU100 and CU90).

Entity B also concludes that it must make similar judgements in estimating the most likely amount for its current tax for Year 1, because this uncertain tax treatment also affects the taxable profit. Entity B recognises and measures its current tax liability, based on the taxable profit that includes CU90, in addition to the amount in its tax filing. (This is because Entity B deducted CU100 from taxable income for Year 1, whereas the most likely amount is now estimated to be CU10. Entity B concluded that it is not probable that the tax treatment used in its filing will be accepted.)

Where the uncertain tax treatment affects both current tax and deferred tax, an entity is required to make estimates and judgements on a consistent basis. [IFRIC 23.12].

9.5 Consideration of changes in facts and circumstances

An entity is required to reassess its judgements about the acceptability of tax treatments or its estimates of the effect of uncertainty, or both, if facts and circumstances change or if new information becomes available. [IFRIC 23.13]. In such a situation, the entity reflects the effect as a change in accounting estimate, applying the requirements of IAS 8 to its measure of the taxable profit (tax loss), tax bases, unused tax losses, unused tax credits and tax rates. Where circumstances change or new information becomes available after the end of the reporting period, the entity must apply the guidance in IAS 10 to determine whether the change is an adjusting or non-adjusting event. [IFRIC 23.14].

The Application Guidance in Appendix A to the Interpretation provides some examples of changes that can result in the reassessment of judgements or estimates previously made by the entity. [IFRIC 23.A2].

- (a) The results of examinations or actions taken by a taxation authority. For example:
 - (i) Agreement or disagreement by the taxation authority with the tax treatment or a similar tax treatment used by the entity
 - (ii) Information that the taxation authority has agreed or disagreed with a similar tax treatment used by another entity
 - (iii) Information about the amount received or paid to settle a similar tax treatment
- (b) Changes in rules established by the taxation authority
- (c) The expiry of a taxation authority's right to examine or re-examine a tax treatment

An uncertain tax treatment is resolved when the treatment is accepted or rejected by the taxation authorities. The Interpretation does not discuss the manner of acceptance (i.e., implicit or explicit) of an uncertain tax treatment by the taxation authorities. In practice, a taxation authority might accept a tax return without commenting explicitly on any particular treatment in it. Alternatively, it might raise some questions in an examination of a tax return. Unless such clearance is provided explicitly, it is not always clear if a taxation authority has accepted an uncertain tax treatment.

An entity may consider the following to determine whether a taxation authority has implicitly or explicitly accepted an uncertain tax treatment:

- The tax treatment is explicitly mentioned in a report issued by the taxation authorities following an examination.
- The treatment was specifically discussed with the taxation authorities (e.g., during an on-site examination) and the taxation authorities verbally agreed with the approach.

Or

- The treatment was specifically highlighted in the income tax filings, but not subsequently queried by the taxation authorities in their examination.

The Application Guidance goes on to say that the absence of agreement or disagreement by a taxation authority with a tax treatment, in isolation, is unlikely to constitute a change in facts and circumstances or new information that affects the judgements and estimates required by the Interpretation. [IFRIC 23.A3]. In such situations, an entity has to consider other available facts and circumstances before concluding that a reassessment of the judgements and estimates is required.

9.5.1 The expiry of a taxation authority's right to examine or re-examine a tax treatment

As noted above, the expiry of a taxation authority's right to examine or re-examine a tax treatment is one example of a change in facts and circumstances cited in the guidance to IFRIC 23. Where this right expires between the end of the reporting period and the date when the financial statements are authorised for issue, the entity must apply the guidance in IAS 10 to determine whether the change is an adjusting or non-adjusting event. [IFRIC 23.14].

IAS 10 defines adjusting events as "those that provide evidence of conditions that existed at the end of the reporting period". Non-adjusting events are "those that are indicative of conditions that arose after the reporting period". [IAS 10.3].

If the right of the tax authority to examine or re-examine a tax treatment does not expire until a date falling after the end of the reporting period, it is clearly indicative of conditions that arose after the reporting period and would therefore be regarded as a non-adjusting event. In addition, because the Interpretation requires an entity to reflect the effect of a change in facts and circumstances or of new information as a change in accounting estimate applying IAS 8, [IFRIC 23.14], the effect of such a change would be recognised prospectively in the period of the change, with no restatement of any estimates made as at the end of the (previous) reporting period. [IAS 8.36].

9.6 Disclosures relating to uncertain tax treatments

IFRIC 23 does not propose any new disclosures. Instead, the Application Guidance requires entities to consider whether the following existing disclosure requirements are relevant in these circumstances:

- To disclose judgements made in the process of applying the entity's accounting policies in accordance with IAS 1.122 (see Chapter 3). [IFRIC 23.A4(a)]. Such judgements might include the decision to consider uncertain tax treatments separately or together (see section 9.2 above); the determination as to whether acceptance by the taxation authorities is probable; or the decision to apply the 'most likely amount' or 'expected value' method to reflect uncertainty (see section 9.4 above).
- To disclose information about the assumptions and estimates made in determining taxable profit or loss, tax bases, unused tax losses, unused tax credits and tax rates in accordance with IAS 1.125 to 129 regarding the sources of significant estimation uncertainty (see Chapter 3). [IFRIC 23.A4(b)].

As discussed in section 9.4 above, if an entity determines that it is probable that a taxation authority will accept the tax treatment used or planned to be used in its tax filings, it determines its tax position on that basis. [IFRIC 23.10]. Nevertheless, the entity must still consider whether to disclose the potential effect of the uncertainty as a tax-related contingency applying IAS 12.88. [IFRIC 23.A5].

As noted above, uncertain tax treatments generally relate to the estimate of the entity's liability for current tax. Any amount recognised for an uncertain current tax treatment must therefore normally be classified as current tax, and presented (or disclosed) as current or non-current in accordance with the general requirements of IAS 1 (see Chapter 3).

However, there are circumstances where an uncertain tax treatment affects the tax base of an asset or liability and therefore relates to deferred tax, as shown in Illustration 9-2 in section 9.4 above. For example, there might be doubt as to the amount of tax depreciation that can be deducted in respect of a particular asset, which in turn would lead to doubt as to the tax base of the asset. There may sometimes be an equal and opposite uncertainty relating to current and deferred tax. For example, there might be uncertainty as to whether a particular item of income is taxable, but - if it is - any tax payable will be reduced to zero by a loss carried forward from a prior period. As discussed in section 13.1.1.C below, it is not appropriate to offset current and deferred tax items.

9.7 Presentation of liabilities or assets for uncertain tax treatments

Neither IAS 12 nor IFRIC 23 contain requirements on the presentation of uncertain tax liabilities or assets in the statement of financial position. Before the Interpretation was issued, there was diversity in practice between entities that presented uncertain tax liabilities as current (or deferred) tax liabilities and those that included these balances within another line item such as provisions.

Frequently asked questions

Question 9-1: Is an entity required to present uncertain tax liabilities as current (or deferred) tax liabilities or, instead, can such liabilities be presented within another line item such as provisions?

In response to a request for clarification on this matter, the IFRS IC issued an agenda decision in September 2019 that, applying IAS 1, an entity is required to present uncertain tax liabilities as current tax liabilities [IAS 1.54(n)] or deferred tax liabilities [IAS 1.54(o)] and that uncertain tax assets are presented as current tax assets [IAS 1.54(n)] or deferred tax assets. [IAS 1.54(o)].

This conclusion had been reached based on the following considerations:

- When there is uncertainty over income tax treatments, IFRIC 23 requires an entity to “recognise and measure its current or deferred tax asset or liability applying the requirements in IAS 12 based on taxable profit (tax loss), tax bases, unused tax losses, unused tax credits and tax rates determined applying this Interpretation”. [IFRIC 23.4].
- Current tax is defined as the amount of income taxes payable (recoverable) in respect of the taxable profit (tax loss) for a period; and deferred tax liabilities (or assets) are defined as the amounts of income taxes payable (recoverable) in future periods in respect of taxable (deductible) temporary differences and, in the case of deferred tax assets, the carryforward of unused tax losses and credits. [IAS 12.5].
- Because no specific requirements are set out in IAS 12 or IFRIC 23, the presentation requirements in IAS 1 apply, which “lists items that are sufficiently different in nature or function to warrant separate presentation in the statement of financial position”. [IAS 1.57]. This list includes line items for “liabilities and assets for current tax, as defined in IAS 12” and for “deferred tax liabilities and deferred tax assets, as defined in IAS 12”. [IAS 1.54]. In addition, IAS 1 requires an entity to “present separately items of a dissimilar nature or function unless they are immaterial”. [IAS 1.29].

On this basis, the IFRS IC proposed not to add the matter to its standard-setting agenda.

9.8 Recognition of an asset for payments on account

Extract from IAS 12

12 Current tax for current and prior periods shall, to the extent unpaid, be recognised as a liability. If the amount already paid in respect of current and prior periods exceeds the amount due for those periods, the excess shall be recognised as an asset.

In some jurisdictions, entities are required to make payments to the tax authorities before an uncertain tax treatment is resolved. [IAS 12.12]. If an entity considers its liability to be lower than the assessment made by the tax authorities, it would record an asset for a payment in excess of its estimated liability for current tax, but recovery of that excess would be contingent upon the successful resolution of the uncertainty.

In these circumstances, some had argued that the ‘virtually certain’ threshold in IAS 37 must be applied before allowing recognition of such a ‘contingent’ asset. [IAS 37.35]. Others argued that the requirement in IAS 12 to measure current tax assets at the amount expected to be recovered from the tax authorities requires only a ‘probable’ assessment of recovery to be sufficient for recognising an asset. [IAS 12.46]. As a result, there had been diversity in the approach used to determine whether an asset should be recognised for the amount potentially recoverable from the tax authority.

Frequently asked questions

Question 9-2: Can an asset be recognised for the amount paid to settle a tax assessment arising from a tax examination when the entity is still challenging the charge and expects, but is not certain, to recover some, or all, of the amount paid?

In 2014, the IFRS IC considered this question and noted that:

- a) Paragraph 12 of IAS 12 provides guidance on the recognition of current tax assets and current tax liabilities. In particular, it states that:
 - i) Current tax for current and prior periods shall, to the extent unpaid, be recognised as a liability
 - And
 - ii) If the amount already paid in respect of current and prior periods exceeds the amount due for those periods, the excess shall be recognised as an asset *[IAS 12.12]*
- b) In the specific fact pattern described in the submission, an asset is recognised if the amount of cash paid (which is a certain amount) exceeds the amount of tax expected to be due (which is an uncertain amount)
- c) The timing of payment should not affect the amount of current tax expense recognised

The IFRS IC acknowledged that the reference to IAS 37 in IAS 12.88 in respect of tax-related contingent liabilities and contingent assets may have been understood by some to mean that IAS 37 applied to the recognition of such items. However, the IFRS IC noted that this paragraph provides guidance only on disclosures required for such items. Accordingly, the IFRS IC determined that IAS 12, not IAS 37, provides the relevant guidance on recognition.³²

It was this determination in 2014 that led to the development of IFRIC 23. *[IFRIC 23.BC4]*.

In January 2019, the Committee confirmed a similar conclusion regarding the recoverability of payments relating to uncertain tax treatments that are outside the scope of IAS 12 (i.e., payments on account for taxes other than income tax). It concluded that, on making the payment, the entity has the right to receive future economic benefits either in the form of a cash refund or by using the payment to settle the tax liability. As such, an asset exists as defined in the Conceptual Framework, as opposed to a contingent asset as defined in IAS 37, and it is recognised when the payment is made to the tax authority.³³ This agenda decision is discussed in Chapter 27.

10 Allocation of tax charge or credit

Current and deferred tax is normally recognised as income or an expense in the profit or loss for the period, except to the extent that it arises from:

- An item that has been recognised directly outside profit or loss, whether in the same period or in a different period (see sections 10.1 to 10.7 below). [IAS 12.57, IAS 12.58, IAS 12.61A].
- Certain share-based payment transactions (see section 10.8 below). [IAS 12.68A, IAS 12.68C].

Or

- A business combination (see section 12 below). [IAS 12.66].

Extract from IAS 12

- 58** Current and deferred tax shall be recognised as income or an expense and included in profit or loss for the period, except to the extent that the tax arises from:
- (a) a transaction or event which is recognised, in the same or a different period, outside profit or loss, either in other comprehensive income or directly in equity (see paragraphs 61A-65); or
 - (b) a business combination (other than the acquisition by an investment entity, as defined in IFRS 10 *Consolidated Financial Statements*, of a subsidiary that is required to be measured at fair value through profit or loss) (see paragraphs 66-68).
- 61A** Current tax and deferred tax shall be recognised outside profit or loss if the tax relates to items that are recognised, in the same or a different period, outside profit or loss. Therefore, current tax and deferred tax that relates to items that are recognised, in the same or a different period:
- (a) in other comprehensive income, shall be recognised in other comprehensive income (see paragraph 62).
 - (b) directly in equity, shall be recognised directly in equity (see paragraph 62A).

Where a deferred tax asset or liability is remeasured subsequent to its initial recognition, the change must be accounted for in profit or loss, unless it relates to an item originally recognised outside profit or loss, in which case the change must also be accounted for outside profit or loss. Such remeasurement might result from:

- A change in tax law.
 - A reassessment of the recoverability of deferred tax assets (see section 7.5 above).
- Or
- A change in the expected manner of recovery of an asset or settlement of a liability (see section 8.4.11 above). [IAS 12.60].

Whilst IAS 12 as drafted refers only to remeasurement of 'deferred' tax, it seems clear that these principles must also be applied to any remeasurement of current tax.

Any current tax or deferred tax on items recognised outside profit or loss, whether in the same period or a different period, is also recognised directly outside profit or loss. Such items include:

- Revaluations of property, plant and equipment under IAS 16 (see section 10.1 below).
- Retrospective restatements or retrospective applications arising from corrections of errors and changes in accounting policy under IAS 8 (see section 10.2 below).
- Exchange differences arising on translation of the financial statements of a foreign operation under IAS 21 (see section 7.6 above).
- Amounts taken to equity on initial recognition of a compound financial instrument by its issuer (so-called 'split accounting') under IAS 32 (see section 7.2.7 above). [IAS 12.61A, IAS 12.62, IAS 12.62A].

IAS 12 acknowledges that, in exceptional circumstances, it may be difficult to determine the amount of tax that relates to items recognised in other comprehensive income and/or equity. In these cases, an entity may use a reasonable *pro rata* method, or another method that achieves a more appropriate allocation in the circumstances. IAS 12 gives the following examples of situations where such an approach may be appropriate:

- There are graduated rates of income tax and it is impossible to determine the rate at which a specific component of taxable profit (tax loss) has been taxed.
- A change in the tax rate or other tax rules affects a deferred tax asset or liability relating (in whole or in part) to an item that was previously recognised outside profit or loss.

Or

- An entity determines that a deferred tax asset must be recognised, or must no longer be recognised in full, and the deferred tax asset relates (in whole or in part) to an item that was previously recognised outside profit or loss. [IAS 12.63].

IAS 12 requires tax relating to items not accounted for in profit or loss, whether in the same period or a different period, to be recognised:

- In other comprehensive income, if it relates to an item accounted for in other comprehensive income.
- Directly in equity, if it relates to an item accounted for directly in equity. [IAS 12.61A].

This requirement to have regard to the previous history of a transaction in accounting for its tax effects is commonly referred to as 'backward tracing' (see section 8.1.1.B above).

10.1 Revalued and rebased assets

Where an entity depreciates a revalued item of PP&E, it may choose to transfer the depreciation in excess of the amount that would have arisen on a historical cost basis from revaluation surplus to retained earnings. In such cases, the relevant portion of any deferred tax liability recognised on the revaluation must also be transferred to retained earnings. A similar treatment must be adopted by an entity which has a policy of transferring revaluation gains to retained earnings on disposal of a previously revalued asset. [IAS 12.64].

When an asset is revalued for tax purposes and that revaluation is related to an accounting revaluation of an earlier period, or to one that is expected to be carried out in a future period, the tax effects of both the asset revaluation and the adjustment of the tax base are credited or charged to equity in the periods in which they occur.

However, if the revaluation for tax purposes is not related to an accounting revaluation of an earlier period, or to one that is expected to be carried out in a future period, the tax effects of the adjustment of the tax base are recognised in profit or loss. [IAS 12.65]. For example, when tax law gives additional deductions to reflect the indexation of assets for tax purposes (see section 6.2.2.D above) the tax base of the asset changes without any corresponding change to the asset's carrying amount in the financial statements. Because the carrying amount has not changed, there is no gain or loss in relation to indexation in profit and loss or in other comprehensive income. Accordingly, the effect of the change in tax base is recorded in profit or loss. [IAS 12.65].

10.1.1 Non-monetary assets or liabilities with a tax base determined in a different currency

Another example arises when the tax base of a non-monetary asset or liability is determined in a different currency to the entity's functional currency for accounting purposes. This can be the case in oil and gas producing entities that have a functional currency of US dollars but operate (and are accountable for income taxes) in various local jurisdictions under different currencies (see Chapter 39).

IAS 12 notes that in this situation the entity measures its non-monetary asset or liability using its functional currency as at the date of initial recognition, as required by IAS 21. However, if the tax base of its non-monetary assets and liabilities is determined in a different currency, changes in the exchange rate will give rise to temporary differences that result in a recognised deferred tax liability or deferred tax asset (if recoverable). Because this retranslation has no effect on carrying values recognised in the financial statements, there is no corresponding gain or loss against which the tax can be allocated. As a result, the movement in deferred tax is recorded in profit or loss. [IAS 12.41].

Frequently asked questions

Question 10-1: When the tax bases of an entity's non-monetary assets are determined in a currency that is different from its functional currency, where must deferred tax be recognised?

The IFRS IC issued an agenda decision relating to this question in January 2016 which determined that:³⁴

- When the tax base of a non-monetary asset or liability is determined in a currency that is different from the functional currency, temporary differences arise resulting in a deferred tax asset or liability. [IAS 12.41].
- Such deferred tax does not arise from a transaction or event that is recognised outside profit or loss and is therefore charged or credited to profit or loss in accordance with IAS 12.58.
- Such a deferred tax charge or credit would be presented with other deferred taxes, instead of with foreign exchange gains or losses, in the statement of profit or loss.
- Paragraph 79 of IAS 12 requires the disclosure of the major components of tax expense (income). When changes in the exchange rate are the cause of a major component of the deferred tax charge or credit, an explanation of this in accordance with IAS 12.79 would help explain the tax expense (income) to the users of the financial statements.

In the light of requirements in the existing IFRS accounting standards, the IFRS IC determined that neither an Interpretation nor an amendment to a Standard was necessary.

10.2 Retrospective restatements or applications

IAS 8 requires retrospective restatements or retrospective applications arising from corrections of errors and changes in accounting policy to be accounted for by adjusting the amounts presented in the financial statements of comparative periods and restating the opening balances of assets, liabilities and equity for the earliest prior period presented as if the new accounting policy had always been applied. [IAS 8.23]. IFRS 1 *First-time Adoption of International Financial Reporting Standards* - requires first-time adopters to recognise the adjustments resulting from the application of IFRS accounting standards to the opening IFRS statement of financial position directly in retained earnings (or, if appropriate, another category of equity), on the basis that those adjustments 'arise from events and transactions before the date of transition to IFRS'. [IFRS 1.11].

Because IAS 12 requires tax relating to an item that has been recognised outside profit or loss to be treated in the same way, any tax effect of a retrospective restatement or retrospective application on the opening comparative statement of financial position is dealt with as an adjustment to equity also. [IAS 12.58]. The standard identifies the adjustment to the opening balance of retained earnings under IAS 8 as an example where IFRS accounting standards requires or permits particular items to be charged or credited directly to equity. [IAS 12.62A(a)].

However, the fact that IAS 12 states that tax arising in a different period, but relating to a transaction or event arising outside profit or loss must also be recognised in other comprehensive income or equity (as applicable) is taken by some to mean that any subsequent remeasurement of tax originally recognised in equity as part of a prior year adjustment must be accounted for in equity also.

How we see it

In our view, such an assertion fails to reflect the true nature of retrospective application, which as noted above is defined in IAS 8 as the application of a new accounting policy 'to transactions, other events and conditions as if that policy had always been applied' (our emphasis), and under IFRS 1 'arise from events and transactions before the date of transition to IFRS'. This is demonstrated by Illustration 10-1 below.

³⁴ [IFRIC Update](#), January 2016, available on the IFRS Foundation's website.

Illustration 10-1: Remeasurement of deferred tax liability recognised as the result of retrospective application

Entity A applied IAS 19 when it first became effective and recognised a pension asset of CU3 million and a corresponding deferred tax liability, which was accounted for as a prior year adjustment in retained earnings under IAS 8. At that time, the effective tax rate applicable to Entity A was 40%, resulting in a deferred tax liability of CU1,200,000.

Entity B's date of transition to IFRS was 1 January 20X4. As a result of the adoption of IAS 37, its first IFRS financial statements (prepared for the year ended 31 December 20X5) showed an additional liability for environmental rectification costs of CU5 million as an adjustment to opening reserves, together with an associated deferred tax asset at 40% of CU2 million.

The pension asset in Entity A and the environmental liability in Entity B do not change substantially over the following accounting periods, but during the year ended 31 December 20X3 the tax rate falls to 30%. This requires Entity A to remeasure to CU900,000 its deferred tax liability relating to the pension asset, giving rise to a tax benefit of CU300,000. For Entity B, the deferred tax asset is remeasured to CU1.5 million, giving rise to a tax expense of CU500,000. Should this expense be recognised in profit or loss for the period or in equity?

When the carrying amount of deferred tax assets and liabilities change because of a change in tax rates, the resulting deferred tax is recorded in profit or loss, 'except to the extent that it relates to items previously recognised outside profit or loss'. [IAS 12.60]. Paragraph 61A of IAS 12 also requires an entity to recognise in other comprehensive income or directly in equity the tax effect of items that are recognised, in the same or a different period, outside profit or loss. If read in isolation, IAS 12 could be construed as requiring the amounts arising on the remeasurement of deferred tax in the Illustration above to be accounted for in equity, as being a remeasurement of amounts originally recognised in equity. However, as discussed above, this interpretation fails to reflect the true nature of what is meant by retrospective restatement.

IAS 8 defines retrospective application as the application of a new accounting policy 'to transactions, other events or conditions as if that policy had always been applied' and the treatment required by IFRS 1 is based on the fact that an entity is restating amounts that arise from events and transactions before the date of transition to IFRS. Accordingly, if the item that gave rise to the deferred tax would have been recognised in profit or loss in the normal course of events had the new accounting policies (or IFRS) always been applied, the effect of subsequent re-measurement is also recognised in profit or loss. In the fact patterns for both entities A and B in Illustration 10-1 above, the changes in the tax rate relating to the pension asset and the environmental liability are recognised in profit or loss.

Where the retrospective restatement giving rise to a deferred tax asset or liability directly in equity represented the cumulative total of amounts that would have been recognised ordinarily in other comprehensive income or directly in equity in previous periods if the new accounting policy had always been applied (e.g., deferred tax relating to the revaluation of property, plant, or equipment), any subsequent re-measurement of the deferred tax is also accounted for in the same manner, i.e., in other comprehensive income or directly in equity.

10.3 Dividends and transaction costs of equity instruments

10.3.1 Dividend subject to differential tax rate

In some jurisdictions, the rate at which tax is paid depends on whether profits are distributed or retained. In other jurisdictions, distribution may lead to an additional liability to tax, or a refund of tax already paid. IAS 12 requires current and deferred taxes to be measured using the rate applicable to undistributed profits until a liability to pay a dividend is recognised, at which point the tax consequences of that dividend must also be recognised. This is discussed further in section 8.5 above.

Where taxes are remeasured on recognition of a liability to pay a dividend, the difference must normally be recognised in profit or loss rather than directly in equity, even though the dividend itself is recognised directly in equity under IFRS accounting standards. IAS 12 takes the view that any additional (or lower) tax liability relates to the original profit now being distributed rather than to the distribution itself. Where, however, the dividend is paid out of profit arising from a transaction that was originally recognised in other comprehensive income or equity, the adjustment to the tax liability must also be recognised in other comprehensive income or equity. [IAS 12.57A].

10.3.2 Dividend subject to withholding tax

Where dividends are paid by the reporting entity subject to withholding tax, the withholding tax must be included as part of the dividend charged to equity. [IAS 12.65A].

It is noteworthy that there may be little economic difference, from the paying entity's perspective, between a requirement to pay a 5% 'withholding tax' on all dividends and a requirement to pay an additional 5% 'income tax' on distributed profit. Yet, the accounting treatment varies significantly depending on the analysis. If the tax is considered a withholding tax, it is treated as a deduction from equity in all circumstances. If, however, it is considered as an additional income tax, it will generally be treated as a charge to profit or loss (see section 10.3.1 above). This distinction therefore relies on a clear definition of withholding tax, which IAS 12 unfortunately does not provide.

IAS 12 describes a withholding tax as a "portion of the dividends [paid] to taxation authorities on behalf of shareholders". [IAS 12.65A]. However, it is not clear whether the determination of whether the tax is being paid 'on behalf of shareholders' is made by reference to the characterisation of the tax:

- In the paying entity's tax jurisdiction - in which case, there is the problem noted above that one jurisdiction's 'additional distribution tax' may be economically identical to another jurisdiction's 'withholding tax'.

Or

- In the receiving entity's tax jurisdiction - in which case there would be the problem that the tax on a dividend paid to one shareholder is a 'withholding tax' (because credit is given for it on the shareholder's tax return) but the tax on a dividend paid to another shareholder at the same time is not (because no credit is given for it on that shareholder's tax return).

This distinction is also relevant in accounting for dividend income that has been subject to withholding tax, as discussed in section 10.3.4 below.

10.3.3 Intragroup dividend subject to withholding tax

Where irrecoverable withholding tax is suffered on intragroup dividends, the withholding tax does not relate to an item recognised in equity in the consolidated financial statements (since the intragroup dividend to which it relates has been eliminated in those financial statements). The tax must therefore be accounted for in profit or loss for the period.

10.3.4 Incoming dividends

IAS 12 does not directly address the treatment of incoming dividends on which tax has been levied (i.e., whether they should be shown at the amount received, or gross of withholding tax together with a corresponding tax charge). As discussed in section 4.2 above, we believe that judgement is required to determine whether a tax deducted from investment income at the source of the income is a withholding tax in the scope of IAS 12.

As well as the considerations discussed in section 4.2 above, it is noted in section 10.3.2 above that an entity paying dividends that are subject to withholding tax would record the gross value of the distribution in equity, on the basis that the withholding tax is regarded as an amount paid to the tax authorities 'on behalf of shareholders'. [IAS 12.65A]. If it is determined from the point of view of the recipient of the dividend that a particular withholding tax is an income tax in the scope of IAS 12, it would therefore be consistent with this treatment for the recipient to show dividends (and other income subject to withholding taxes) gross of withholding taxes and to recognise any non-refundable portion of such withholding taxes as a tax expense in the statement of comprehensive income.

Some jurisdictions also give tax deductions for the 'underlying' tax suffered on dividends received. This is based on the concept that the dividend has been paid out of profits already subject to tax, so that to tax the full amount received again would amount to a punitive double taxation of the underlying profits.

How we see it

In our view, any underlying tax which would form part of the tax charge, not the dividend, of the paying company is not directly paid on behalf of the shareholder, and accordingly, incoming dividends must not be grossed up for underlying tax.

10.3.5 Tax benefits of distributions and transaction costs of equity instruments

IAS 32 as originally issued required distributions to shareholders and transaction costs of equity instruments to be accounted for in equity net of any related income tax benefit (see Chapter 43). However, as discussed below, the 'default' allocation for income tax on equity distributions is now to profit or loss, with the tax consequences of transaction costs relating to equity instruments still being taken to equity, provided that the related costs are also recognised in equity.

Annual Improvements to IFRSs 2009-2011 Cycle, issued in May 2012, amended IAS 32 so as to remove the reference to income tax benefit. This means that all tax effects of equity transactions are allocated in accordance with the general principles of IAS 12. Unfortunately, IAS 12 was not entirely clear as to how the tax effects of certain equity transactions must be dealt with, as demonstrated by Illustration 10-2 below.

Illustration 10-2: Tax deductible distribution on equity instrument

An entity paying tax at 25% has issued CU25 million 4% preference shares at par value that are treated as equity instruments for accounting purposes (because coupon payments are subject to an equity dividend blocker and are therefore discretionary). The preference shares are treated as debt for tax purposes (i.e., all coupon payments are deductible in determining taxable profit). The entity makes a payment of CU1 million and is able to claim a tax deduction of CU250,000. There are no restrictions on the recoverability of that deduction for tax purposes.

Some would have allocated the tax deduction to equity on the basis that it relates to the coupon payment, which was accounted for in equity. Others would have considered the distribution as being sourced from an accumulation of retained earnings originally accounted for in profit or loss and, therefore, have allocated the tax deduction for the dividend payment in profit or loss. The cause of this divergence was IAS 12.52B, which stated the following:

"In the circumstances described in IAS 12.52A, the income tax consequences of dividends are recognised when a liability to pay the dividend is recognised. The income tax consequences of dividends are more directly linked to past transactions or events than to distributions to owners. Therefore, the income tax consequences of dividends are recognised in profit or loss for the period as required by IAS 12.58 except to the extent that the income tax consequences of dividends arise from the circumstances described in IAS 12.58(a) and (b)." [IAS 12(2018).52A].

Those who believed that the tax deduction must be accounted for in equity argued that IAS 12.52B only applies 'in the circumstances described in paragraph 52A' and the example does not include differential tax rates for retained and distributed profits. Those who argued that the tax deduction must be credited to profit or loss considered that the reference in IAS 12.52A to taxes 'payable at a higher or lower rate', must be interpreted as including a higher or lower effective rate, as well as a higher or lower headline rate.

The IFRS IC observed that the circumstances to which the requirements in IAS 12.52B apply were unclear and decided that a limited amendment to IAS 12 was required to clarify that the requirements in IAS 12.52B apply to all payments on financial instruments classified as equity that are distributions of profits, and are not limited to the circumstances described in IAS 12.52A.³⁵

In December 2017, the IASB published *Annual Improvements to IFRS Standards - 2015-2017 Cycle*, which moves the text in IAS 12.52B to IAS 12.57A, thereby relating it more closely to the general requirements for the allocation of tax set out in section 10 above, and removes any reference to the specific circumstances when there are different tax rates for distributed and undistributed profits. Accordingly, the tax benefits of equity distributions will be recognised in profit or loss, unless it can be demonstrated that the profits being distributed were previously generated in transactions recognised in other comprehensive income or equity. These amendments are mandatory for annual periods beginning on or after 1 January 2019. When an entity first applies these amendments, it applies them to the income tax consequences of dividends recognised on or after the beginning of the earliest comparative period. [IAS 12.98I].

The Board concluded that entities would have sufficient information to apply the amendments in this way, which will enhance comparability of reporting periods. [IAS 12.BC70].

35 [IFRIC Update](#), March 2016, available on the IFRS Foundation's website.

10.3.5.A Tax benefits of payments on equity instruments

In its Basis for Conclusions, the Board noted that the amendments must not be interpreted to mean that an entity recognises in profit or loss the income tax consequences of all payments on financial instruments classified as equity. Rather, an entity would exercise judgement in determining whether payments on such instruments are distributions of profits (i.e., dividends). If they are, then the requirements in IAS 12.57A apply. If they are not, then the requirements of IAS 12.61A apply to the income tax consequences of those payments, meaning the related tax is recognised in equity. [IAS 12.BC67].

The Board considered and rejected the suggestion that it should provide guidance on how to determine if payments on financial instruments classified as equity are distributions of profits on the basis that:

- (a) Any attempt by the Board to define or describe distributions of profits could affect other IFRS accounting standards and IFRIC Interpretations, and risks unintended consequences.
- (b) The amendments do not change what is and is not a distribution of profits. They simply clarify that the requirements in IAS 12.57A apply to all income tax consequences of dividends.

Nevertheless, the Board concluded that finalising the amendments without adding specific guidance would eliminate the potential for inconsistent accounting that resulted from the ambiguity of the scope of the requirements that had existed previously. [IAS 12.BC69]. In our opinion, guidance will be needed ultimately on how to determine which payments on financial instruments classified as equity would not be regarded as distributions of profits.

How we see it

Whilst some payments in relation to equity instruments, such as the issue costs of equity shares, can clearly be regarded as a transaction cost rather than a distribution of profits, entities will have to exercise judgement in determining the appropriate treatment of other items. In making such a judgement, the legal and regulatory requirements in the entity's jurisdiction would also be relevant, for example if those local requirements stipulate whether a particular payment is, in law, a distribution.

10.4 Gains and losses reclassified ('recycled') to profit or loss

Several IFRS accounting standards (notably IAS 21 and IFRS 9) require certain gains and losses that have been accounted for outside profit or loss to be reclassified ('recycled') to profit or loss at a later date when the assets or liabilities to which they relate are realised or settled. Whilst IAS 12 requires any tax consequences of the original recognition of the gains or losses outside profit or loss also to be accounted for outside profit or loss, it is silent on the treatment to be adopted when the gains or losses are reclassified.

How we see it

In our view, any tax consequences of reclassified gains or losses originally recognised outside profit or loss must also be reclassified through profit or loss in the same period as the gains or losses to which they relate (refer section 10.12 below for recognition of tax impact arising from basis adjustment). Indeed, such reclassification is often an automatic consequence of the reversal of previously recognised deferred tax income or expense and its 're-recognition' as current tax income or expense, as shown in Illustration 10-3.

Illustration 10-3: Tax on reclassified ('recycled') items

An entity has an annual reporting period ending 30 September. On 1 January 20X3 an entity purchases for CU2,000 a debt security that it classifies under IFRS 9 as fair value through other comprehensive income ('FVOCI') with recycling. At 30 September 20X3 it restates the security to its fair value of CU2,400, which was also its fair value on 1 May 20X4. On 1 July 20X4 it disposes of the investment for CU2,100.

The entity's tax rate for the year ending 30 September 20X3 is 40% and for 20X4 35%. The change of rate was made in legislation enacted (without previous substantive enactment) on 1 May 20X4. The entity is subject to tax on disposal of the investment (based on disposal proceeds less cost) in the period of disposal.

The accounting entries for this transaction would be as follows:

1 January 20X3

Dr	Debt security	CU2,000	
	Cr Cash		CU2,000

30 September 20X3

Dr	Debt security (CU2,400 - CU2,000)	CU400	
	Cr Deferred tax (statement of financial position) (CU400 @ 40%)		CU160
	Cr Other comprehensive income ('OCI')		CU240

Recognition of increase in value of asset, and related deferred tax

1 May 20X4

Dr	Deferred tax (statement of financial position) (CU400 @ (35% - 40%))	CU20	
	Cr OCI		CU20

Remeasurement of deferred tax (no change in the fair value of the debt security since 30 September 20X3)

1 July 20X4

Dr	OCI (revaluation of CU300 less deferred tax of CU105)	CU195	
Dr	Deferred tax (statement of financial position)	CU105	
	Cr Debt security		CU300

Recognition of decrease in value of asset, and related deferred tax

Dr	Cash	CU2,100	
Dr	OCI (reclassification of CU100 (before tax) to income statement)	CU100	
	Cr Debt security		CU2,100
	Cr Profit on disposal of debt security (cash CU2,100 less original cost CU2,000)		CU100
Dr	Deferred tax (statement of financial position)	CU35	
	Cr Deferred tax income (OCI)		CU35
Dr	Current tax (profit or loss)	CU35	
	Cr Current tax (statement of financial position) (35% of CU100 pre-tax profit)		CU35

To record the sale of the debt security and related taxation

10.4.1 Debt instrument measured at fair value through OCI under IFRS 9

IFRS 9 requires an entity to recognise a loss allowance for expected credit losses (ECLs) on financial assets that are debt instruments measured at fair value through other comprehensive income (FVOCI).

[IFRS 9.5.5.1].

Under the general approach, at each reporting date, an entity recognises a loss allowance based on either 12-month expected credit losses or lifetime expected credit losses, depending on whether there has been a significant increase in credit risk on the financial instrument since initial recognition. [IFRS 9.5.5.3, IFRS 9.5.5.5].

The standard states that these expected credit losses do not reduce the carrying amount of the financial assets in the statement of financial position, which remains at fair value. Instead, an amount equal to the allowance that would arise if the asset was measured at amortised cost is recognised in other comprehensive income as the 'accumulated impairment amount'. [IFRS 9.4.1.2A, IFRS 9.5.5.2, IFRS 9 Appendix A].

The accounting treatment (ignoring the accounting for any tax) and journal entries for debt instruments measured at FVOCI are illustrated in Chapter 47 by the following Illustration, based on Illustrative Example 3 in the Implementation Guidance for the standard. [IFRS 9.IE Example 13, IFRS 9.IE78-IE81].

Illustration 10-4: Debt instrument measured at fair value through other comprehensive income

An entity purchases a debt instrument with a fair value of CU1,000 on 15 December 20X3 and measures the debt instrument at fair value through other comprehensive income (FVOCI). The instrument has an interest rate of 5% over the contractual term of 10 years and has a 5% effective interest rate. At initial recognition the entity determines that the asset is not purchased or originated credit-impaired.

Dr	Financial asset - FVOCI	CU1,000	
	Cr	Cash	CU1,000

To recognise the debt instrument measured at its fair value

On 31 December 20X3 (the reporting date), the fair value of the debt instrument has decreased to CU950 as a result of changes in market interest rates. The entity determines that there has not been a significant increase in credit risk since initial recognition and that ECLs must be measured at an amount equal to 12-month expected credit losses, which amounts to CU30. For simplicity, journal entries for the receipt of interest revenue are not provided.

Dr	Impairment loss (profit or loss)	CU30	
Dr	Other comprehensive income ^(a)	CU20	
	Cr	Financial asset - FVOCI	CU50

To recognise 12-month expected credit losses and other fair value changes on the debt instrument

(a) The cumulative loss in other comprehensive income at the reporting date was CU20. That amount consists of the total fair value change of CU50 (i.e., CU1,000 - CU950) offset by the change in the accumulated impairment amount representing 12-month ECLs that was recognised (CU30).

On 1 January 20X4, the entity decides to sell the debt instrument for CU950, which is its fair value at that date.

Dr	Cash	CU950	
	Cr	Financial asset - FVOCI	CU950
Dr	Loss (profit or loss)	CU20	
	Cr	Other comprehensive income	CU20

To derecognise the fair value through other comprehensive income asset and recycle amounts accumulated in other comprehensive income to profit or loss, i.e., CU20.

As noted in Chapter 47, this means that in contrast to financial assets measured at amortised cost, there is no separate allowance for credit losses but, instead, impairment gains or losses are accounted for as an adjustment of the revaluation reserve accumulated in other comprehensive income, with a corresponding charge to profit or loss (which is then reflected in retained earnings).

Assume that, for tax purposes, current tax does not arise until the asset is recovered. In Illustration 10-4 above, the asset revaluation creates a temporary difference as the carrying value is now different to its original cost (being its tax base). The asset revaluation is first accounted for in OCI, therefore, the related tax is recorded in OCI. [IAS 12.61A].

As regards the recognition of the ECLs, and as noted above, there is no further change to the carrying value of the asset. Impairment gains or losses are accounted for as an adjustment of the revaluation reserve accumulated in other comprehensive income, with a corresponding charge to profit or loss. Under the general principal in IAS 12, the entity would transfer the related deferred tax out of OCI and into profit or loss in respect of the ECLs reallocated out of OCI. A similar transfer would be made in respect of any earlier revaluation entries that are recycled to profit or loss on derecognition of the debt instrument. [IAS 12.61A]. Accordingly, if the applicable rate of tax is 20%, the tax-effected journals in Illustration 10-4 above would be as follows:

Illustration 10-5: Debt instrument measured at fair value through other comprehensive income - tax effect

When the entity recognises the reduction in fair value of the instrument from CU1,000 to CU950 and the 12-month ECLs:

Dr	Deferred tax asset (statement of financial position) ^(a)	CU10	
	Cr	Profit or loss - deferred tax	CU6
	Cr	Other comprehensive income - deferred tax	CU4

(a) The deferred tax asset arising from the deductible temporary difference on revaluation is CU10 (CU50 @ 20%), with related deferred tax credits in profit or loss and OCI at a rate of 20% applied to the amounts recognised in each of those statements of CU30 and CU20 respectively.

On 1 January 20X4, the entity decides to sell the debt instrument for CU950, which is its fair value at that date. The tax rate on a disposal is also 20% in this example. The related tax journals are as follows:

Dr	Profit or loss - deferred tax	CU6	
Dr	Other comprehensive income - deferred tax	CU4	
Dr	Current tax liability (statement of financial position)	CU10	
	Cr	Deferred tax asset (statement of financial position)	CU10
	Cr	Profit or loss - current tax	CU10

Being the reversal of the deductible temporary differences on disposal of the debt instrument and the recognition of current tax deduction on the taxable loss on sale.

10.4.2 Recognition of expected credit losses with no change in fair value

Consider an example where there has been no change to the asset's fair value since its acquisition, but an expected credit loss has been determined. Current tax is charged on realisation of the asset only.

As discussed above, the ECLs are accounted for as an adjustment (credit) to the revaluation reserve accumulated in other comprehensive income, with a corresponding charge to profit or loss. However, in this case, there is no change to the carrying amount of the asset. *Prima facie*, therefore, there is no temporary difference associated with the asset. However, the treatment discussed in section 7.2.4.D above would support a conclusion that this temporary difference of nil must in fact be analysed into:

- A deductible temporary difference arising on the ECLs that affect accounting profit
- A taxable temporary difference of an equal amount arising on the amount reflected in OCI, which is effectively an upward revaluation to restore the asset back to its fair value

This analysis indicates it would be appropriate to recognise a deferred tax asset for amounts recognised for ECLs in profit or loss [IAS 12.58] and to recognise the tax effect of the 'item that is recognised outside profit or loss' (i.e., the credit to OCI) in other comprehensive income. [IAS 12.61A].

This approach is applied in Illustration 10-6 below:

Illustration 10-6: Tax effect of expected credit losses with no change in fair value

An entity purchases a debt instrument with a fair value of CU1,000 and measures the debt instrument at fair value through other comprehensive income (FVOCI). The instrument has an interest rate of 5% over the contractual term of 10 years, and has a 5% effective interest rate. At initial recognition the entity determines that the asset is not purchased or originated credit-impaired. Current tax is charged or credited on realisation of the asset, at an enacted rate of 20%.

Dr	Financial asset - FVOCI	CU1,000	
	Cr	Cash	CU1,000

To recognise the debt instrument measured at its initial fair value

The entity determines that expected credit losses (ECLs) must be measured at an amount equal to 12-month expected credit losses, which amounts to CU30. However, the fair value of the debt instrument is still CU1,000.

Dr	Impairment loss (profit or loss)	CU30	
	Cr	Other comprehensive income	CU30

Dr	Financial asset - FVOCI ¹	Nil	
----	--------------------------------------	-----	--

To recognise 12-month expected credit losses on the debt instrument and (in OCI) its increase in fair value.

¹ The decrease in the carrying value of the financial asset by CU30 on account of ECLs is offset in the balance sheet by the CU30 increase in the fair value of the financial asset.

The entity determines that IAS 12.58 and 61A require the tax effect of amounts recognised in profit and loss to be recognised in profit or loss and for the tax effect of amounts recognised in other comprehensive income to be recorded in the same place.

Dr	Other comprehensive income - deferred tax	CU6	
	Cr	Profit or loss - deferred tax	CU6
Dr	Deferred tax asset (statement of financial position)	Nil	

The entity in Illustration 10-6 above could have determined that the recognition of the expected credit loss does not generate a temporary difference because neither the carrying amount nor the tax base of the asset has changed. However, this determination can have unwanted consequences as the debt instrument is later revalued and realised, in particular with respect to variability in the effective tax rate reported in both profit or loss and in other comprehensive income.

10.5 Gain/loss in profit or loss and loss/gain outside profit or loss offset for tax purposes

It often happens that a gain or loss accounted for in profit or loss can be offset for tax purposes against a gain or loss accounted for in other comprehensive income (or an increase or decrease in equity). This raises the question of how the tax effects of such transactions should be accounted for, as demonstrated by Illustration 10-7 below.

Illustration 10-7: Loss in other comprehensive income and gain in profit or loss offset for tax purposes

During the year ended 31 December 20X3, an entity that pays tax at 35% makes a taxable profit of CU50,000 comprising:

- CU80,000 trading profit less finance costs accounted for in profit or loss
- And
- CU30,000 foreign exchange losses accounted for in other comprehensive income ('OCI')

Should the total tax liability of CU17,500 (35% of CU50,000) be presented as either:

(a) A charge of CU17,500 in profit or loss?

Or

(b) A charge of CU28,000 (35% of CU80,000) in profit or loss and a credit of CU10,500 (35% of CU30,000) in OCI?

How we see it

In our view, (b) is the appropriate treatment, since the amount accounted for in OCI represents the difference between the tax that would have been paid absent the exchange loss accounted for in OCI and the amount actually payable. This indicates that this is the amount that, in the words of IAS 12.61A, 'relates to' items that are recognised outside profit or loss.

Similar issues may arise where a transaction accounted for outside profit or loss generates a suitable taxable profit that allows recognition of a previously unrecognised tax asset relating to a transaction previously accounted for in profit or loss, as demonstrated by Illustration 10-8 below.

Illustration 10-8: Recognition of deferred tax asset in profit or loss on the basis of tax liability accounted for outside profit or loss

An entity that pays tax at 30% has brought forward unrecognised deferred tax assets (with an indefinite life) totalling CU1 million, relating to trading losses accounted for in profit or loss in prior periods. On 1 January 20X3 it invests CU100,000 in government bonds, which it holds until they are redeemed for the same amount on maturity on 31 December 20X6. For tax purposes, any gain made by the entity on disposal of the bonds can be offset against the brought forward tax losses. The tax base of the bonds remains CU100,000 at all times.

The entity elects to account for the bonds as fair value through other comprehensive income and therefore carries them at fair value in the statement of financial position and amortised cost information is presented in profit or loss (see Chapter 46). Over the period to maturity the fair value of the bonds at the end of each reporting period (31 December) is as follows:

	Fair value	Amortised cost	Movement in OCI
	CU000	CU000	CU000
20X3	111	101	10
20X4	117	102	15
20X5	122	102	20
20X6	100	100	-

Under IFRS 9 the movements in fair value in excess of the amounts recognised in profit or loss (excluding any amounts received in cash, e.g., the coupon on a bond) would be accounted for in other comprehensive income ('OCI') - see Chapter 46. Taken in isolation, the valuation gains recorded in OCI in 20X3 to 20X5 would give rise to a deferred tax liability (at 30%) of CU3,000 (20X3), CU4,500 (20X4) and CU6,000 (20X5). However, these liabilities arise from taxable temporary differences that can be offset against the losses brought forward (see section 7.5 above), and accordingly, the (equal and opposite) deferred tax liability and deferred tax asset are offset in the statement of financial position (see section 13.1.1 below). This raises the question as to whether there should be either:

- (a) No tax charge or credit in either profit or loss or OCI in any of the periods affected
- Or
- (b) In each period, a deferred tax charge in OCI (in respect of the taxable temporary difference arising from valuation gains on the bonds) and deferred tax income in profit or loss (representing the recognition of the previously unrecognised deferred tax asset)

How we see it

In our view, the treatment in (b) above must be followed.

The fact that no deferred tax is presented in the statement of financial position arises from the offset of a deferred tax asset and deferred tax liability - it does not imply that there is no deferred tax. Moreover, although the recognition of the deferred tax asset is possible only as the result of the recognition of a deferred tax liability arising from a transaction accounted for in OCI, the asset itself relates to a trading loss previously accounted for in profit or loss. Accordingly, the deferred tax credit arising from the recognition of the asset is properly accounted for in profit or loss.

10.6 Discontinued operations

IAS 12 does not explicitly address the allocation of income tax charges and credits between continuing and discontinued operations. However, that some allocation is required is implicit in the requirement of IFRS 5.33(b)(ii) to disclose how much of the single figure post-tax profit or loss of discontinued operations disclosed in the statement of comprehensive income is comprised of 'the related income tax expense' (see Chapter 5). [IFRS 5.33(b)(ii)].

How we see it

In our view, the provisions of IAS 12 for the allocation of tax income and expense between profit or loss, other comprehensive income and equity also form a basis for allocating tax income and expense between continuing and discontinued operations, as demonstrated by Illustration 10-9 to Illustration 10-11 below.

Illustration 10-9: Profit in continuing operations and loss in discontinued operations offset for tax purposes

Entity A, which pays tax at 25%, has identified an operation as discontinued for the purposes of IFRS 5. During the period the discontinued operation incurred a loss of CU2 million and the continuing operations made a profit of CU10 million. The net CU8 million profit is fully taxable in the period, and there is no deferred tax income or expense.

How we see it

In our view, the tax expense must be allocated between continuing and discontinued operations. The tax allocated to the discontinued operation represents the difference between the tax that would have been paid absent the loss accounted for in discontinued operations and the amount actually payable.

Accordingly, the tax expense is allocated as follows:

	CU m	CU m
Dr Current tax expense (continuing operations) ¹	2.5	
Cr Current tax income (discontinued operation) ²		0.5
Cr Current tax liability ³		2.0

1 Continuing operations profit CU10m @ 25% = CU2.5m.

2 Discontinued operations loss CU2m @ 25% = CU0.5m.

3 Net taxable profit CU8m @ 25% = CU2.0m.

Illustration 10-10: Taxable profit on disposal of discontinued operation reduced by previously unrecognised tax losses

Entity B disposes of a discontinued operation during the current accounting period. The disposal gives rise to a charge to tax of CU4 million. However, this is reduced to zero by offset against brought forward tax losses, which relate to the continuing operations of the entity, and for which no deferred tax asset has previously been recognised.

How we see it

In our view, even though there is no overall tax expense, amounts must be allocated between continued and discontinued operations.

	CU m	CU m
Dr Current tax expense (discontinued operation)	4.0	
Cr Current tax income (continuing operations)		4.0

This allocation reflects that fact that, although the transaction that allows recognition of the brought forward tax losses is accounted for as a discontinued operation, the losses themselves arose from continuing operations. This is essentially the same analysis as is used in Illustration 10-8 above (where a deferred tax liability recognised in other comprehensive income gives rise to an equal deferred tax asset recognised in profit or loss).

Illustration 10-11: Taxable profit on disposal of discontinued operation reduced by previously recognised tax losses

Entity B disposes of a discontinued operation during the current accounting period. The disposal gives rise to a charge to tax of CU4 million. However, this is reduced to zero by offset against brought forward tax losses, which relate to the entity's continuing operations, and for which a deferred tax asset has previously been recognised.

How we see it

In our view, even though there is no overall tax expense, amounts must be allocated between continued and discontinued operations.

	CU m	CU m
Dr Current tax expense (discontinued operation)	4.0	
Dr Deferred tax expense (continuing operations)	4.0	
Cr Current tax income (continuing operations)		4.0
Cr Deferred tax asset (statement of financial position)		4.0

This allocation reflects that fact that, although the transaction that allows realisation of the brought forward tax losses is accounted for as a discontinued operation, the losses themselves arose from continuing operations. This is essentially the same analysis as is used in Illustration 10-10 above.

10.7 Defined benefit pension plans

IAS 19 requires an entity, in accounting for a defined benefit post-employment benefit plan, to recognise actuarial gains and losses relating to the plan in full in other comprehensive income ('OCI'). At the same time, a calculated current (and, where applicable, past) service cost and net interest on the net defined benefit liability or asset are recognised in profit or loss - see Chapter 31.

In many jurisdictions, tax deductions for post-employment benefits are given on the basis of cash contributions paid to the plan fund (or benefits paid when a plan is unfunded).

This significant difference between the way in which defined plans are treated for tax and financial reporting purposes can make the allocation of tax deductions for them between profit or loss and OCI somewhat arbitrary, as shown in Illustration 10-12 below.

Illustration 10-12: Tax deductions for defined benefit pension plans

At 1 January 20X3 an entity that pays tax at 40% has a fully-funded defined benefit pension scheme. During the year ended 31 December 20X3 it records a total cost of CU1 million, of which CU800,000 is allocated to profit or loss and CU200,000 to other comprehensive income ('OCI'). In January 20X4 it makes a funding payment of CU400,000, a tax deduction for which is received through the current tax charge for the year ended 31 December 20X4.

Assuming that the entity is able to recognise a deferred tax asset for the entire CU1 million charged in 20X3, it will record the following entry for income taxes in 20X3.

Dr	Deferred tax asset (CU1,000,000 @ 40%)	CU400,000	
	Cr	Deferred tax income (profit or loss) (CU800,000 @ 40%)	CU320,000
	Cr	Deferred tax income (OCI) (CU200,000 @ 40%)	CU80,000

When the funding payment is made in January 20X4, the accounting deficit on the fund is reduced by CU400,000. This gives rise to deferred tax expense of CU160,000 (CU400,000 @ 40%), as some of the deferred tax asset as at 31 December 20X3 is released, and current tax income of CU160,000 is recorded. The difficulty is how to allocate this movement in the deferred tax asset between profit or loss and OCI, as it is ultimately a matter of arbitrary allocation as to whether the funding payment is regarded as making good (for example):

- CU400,000 of the CU800,000 deficit previously accounted for in profit or loss.
- The whole of the CU200,000 of the deficit previously accounted for in OCI and CU200,000 of the CU800,000 deficit previously accounted for in profit or loss.

Or

- A *pro rata* share of those parts of the total deficit accounted for in profit or loss and OCI.

In the Illustration above, the split is of relatively minor significance, since the entity was able to recognise 100% of the potential deferred tax asset associated with the pension liability. This means that, as the scheme is funded, there will be an equal and opposite amount of current tax income and deferred tax expense. The only real issue is therefore one of presentation, namely whether the gross items comprising this net nil charge are disclosed within the tax charge in profit or loss or in OCI.

In other cases, however, there might be an amount of net tax income or expense that needs to be allocated. Suppose that, as above, the entity recorded a pension cost of CU1 million in 20X3 but determined that the related deferred tax asset did not meet the criteria for recognition under IAS 12. In 20X4, the entity determines that an asset of CU50,000 can be recognised in view of the funding payments and taxable profits anticipated in 20X4 and later years. This results in a total tax credit of CU210,000 (CU160,000 current tax, CU50,000 deferred tax) in 20X4, raising the question of whether it should be allocated to profit or loss, to OCI, or allocated on a *pro rata* basis. This question might also arise if, as the result of newly enacted tax rates, the existing deferred tax balance were required to be remeasured.

How we see it

In our view, these are instances of the exceptional circumstances envisaged by IAS 12 when a strict allocation of tax between profit or loss and OCI is not possible (see section 10 above). Accordingly, a reasonable method of allocation may be used, provided that it is applied on a consistent basis.

One approach might be to compare the funding payments made to the scheme in the previous few years with the charges made to profit or loss under IAS 19 in those periods. If, for example, it is found that the payments were equal to or greater than the charges to profit or loss, it might reasonably be concluded that the funding payments have 'covered' the charge recognised in profit or loss, so that any surplus or deficit on the statement of financial position is broadly represented by items that have been accounted for in OCI.

However, a surplus may also arise from funding the scheme to an amount greater than the liability recognised under IAS 19 (for example under a minimum funding requirement imposed by local legislation or agreed with the pension fund trustees). In this case, the asset does not result from previously recognised income but from a reduction in another asset (i.e., cash). The entity must assess the expected manner of recovery of any asset implied by the accounting treatment of the surplus - i.e., whether it has been recognised on the basis that it will be 'consumed' (resulting in an accounting expense) or refunded to the entity in due course. The accounting treatment of refunds is discussed further in Chapter 31, and in section 10.7.1 below.

The entity will account for the tax consequences of the expected manner of recovery implied by the accounting treatment. Where it is concluded that the asset will be 'consumed' (resulting in accounting expense), the entity will need to determine whether such an expense is likely to be recognised in profit or loss or in OCI in a future period.

10.7.1 Tax on refund of pension surplus

In some jurisdictions, a pension fund may be permitted or required to make a refund to the sponsoring employee of any surplus in the fund not required to settle the known or anticipated liabilities of the fund. It may be that such a refund is subject to tax. IFRIC 14 *IAS 19 The Limit on a Defined Benefit Asset, Minimum Funding Requirements and their Interaction* - requires any asset recorded in respect of such a refund to be shown net of any tax other than an income tax (see Chapter 31). In determining whether such a tax is an income tax of the entity, the general principles in section 4.1 above must be applied. Relevant factors may include:

- Whether tax is levied on the pension fund or the sponsoring entity
- Whether tax is levied on the gross amount of the refund in all cases, or has regard to the sponsoring entity's other taxable income, or the amount of tax deductions received by the sponsoring entity in respect of contributions to the fund

10.8 Share-based payment transactions

The accounting treatment of share-based payment transactions, some knowledge of which is required to understand the discussion below, is dealt with in Chapter 30.

In many tax jurisdictions, an entity receives a tax deduction in respect of remuneration paid in shares, share options or other equity instruments of the entity. The amount of any tax deduction may differ from the related remuneration expense, and may arise in a later accounting period. For example, in some jurisdictions, an entity may recognise an expense for employee services in accordance with IFRS 2 (based on the fair value of the award at the date of grant), but not receive a tax deduction until the share options are exercised (based on the intrinsic value of the award at the date of exercise).

As noted in section 6.1.4 above, IAS 12 effectively considers the cumulative expense associated with share-based payment transactions as an asset that has been fully expensed in the financial statements in advance of being recognised for tax purposes, thus giving rise to a deductible temporary difference.

[IAS 12.68A, IAS 12.68B].

If the tax deduction available in future periods is not known at the end of the period, it must be estimated based on information available at the end of the period. For example, if the tax deduction will be dependent upon the entity's share price at a future date, the measurement of the deductible temporary difference must be based on the entity's share price at the end of the period. [IAS 12.68B].

10.8.1 Allocation of tax deduction between profit or loss and equity

Where the amount of any tax deduction (or estimated future tax deduction) exceeds the amount of the related cumulative remuneration expense, the current or deferred tax associated with the excess must be recognised directly in equity. [IAS 12.68C]. This treatment is demonstrated by Illustration 10-13 below.

Illustration 10-13: Tax deductions for share-based payment transactions - allocation to profit or loss and equity

At the start of year 1, an entity with a tax rate of 40% grants options, which vest at the end of year 3 and are exercised at the end of year 5. Tax deductions are received at the date of exercise of the options, based on their intrinsic value at the date of exercise. Details of the expense recognised for employee services received and consumed in each accounting period, the number of options expected to vest by the entity at each year-end during the vesting period and outstanding after the end of the vesting period, and the intrinsic value of the options at each year-end, are as follows:

Year	IFRS 2 expense for period	Cumulative IFRS 2 expense	Number of options	Intrinsic value per option	Total intrinsic value
	CU	CU		CU	CU
1	188,000	188,000	50,000	5	250,000
2	185,000	373,000	45,000	8	360,000
3	190,000	563,000	40,000	13	520,000
4		563,000	40,000	17	680,000
5		563,000	40,000	20	800,000

The tax base of, and the temporary difference and deferred tax asset associated with, the employee services is calculated as follows. Since the book value of the employee services is in all cases zero, the temporary difference associated with the services is at all times equal to their tax base as set out below.

Year	Intrinsic value (see table above)	Expired portion of vesting period ¹	Tax base (and temporary difference)	Tax asset ²	Tax income ³
	CU		CU	CU	CU
	a	b	c = a × b	c @ 40%	
1	250,000	1/3	83,333	33,333	33,333
2	360,000	2/3	240,000	96,000	62,667
3	520,000	3/3	520,000	208,000	112,000
4	680,000	3/3	680,000	272,000	64,000
5	800,000	3/3	800,000	320,000	48,000

1 The expired portion of the vesting period is consistent with that used to calculate the cumulative charge employee costs under IFRS 2 (see Chapter 30).

2 Deferred tax asset in years 1 to 4 and current tax asset in year 5.

3 Year-on-year increase in asset.

By comparing the 'Cumulative IFRS 2 expense' column in the first table with the 'Tax base (and temporary difference)' column in the second table it can be seen that in years 1 to 3 the expected tax deduction is lower than the cumulative expense charged, and is therefore dealt with entirely in profit or loss. However in years 4 and 5 the expected (and in year 5 the actual) tax deduction is higher than the cumulative expense charged. The tax relating to the cumulative expense charged is dealt with in profit or loss, and the tax relating to the excess of the tax-deductible amount over the amount charged in profit or loss is dealt with in equity as follows:

Year 1

Dr	Deferred tax (statement of financial position)	CU33,333	
	Cr	Deferred tax (profit or loss)	CU33,333

Year 2

Dr	Deferred tax (statement of financial position)	CU62,667	
	Cr	Deferred tax (profit or loss)	CU62,667

Year 3			
Dr	Deferred tax (statement of financial position)	CU112,000	
	Cr	Deferred tax (profit or loss)	CU112,000
Year 4			
Dr	Deferred tax (statement of financial position)	CU64,000	
	Cr	Deferred tax (profit or loss) ¹	CU17,200
	Cr	Equity	CU46,800
Year 5			
Dr	Deferred tax (profit or loss)	CU225,200	
Dr	Deferred tax (equity)	CU46,800	
	Cr	Deferred tax (statement of financial position)	CU272,000
Dr	Current tax (statement of financial position)	CU320,000	
	Cr	Current tax (profit or loss) ²	CU225,200
	Cr	Current tax (equity)	CU94,800
1	Cumulative tax credit to profit or loss restricted to 40% of cumulative expense of CU563,000 = CU225,200. Amount credited in years 1 to 3 is CU(33,333 + 62,667 + 112,000) = CU208,000. Therefore, the amount recognised in profit or loss is CU(225,200 - 208,000) = CU17,200.		
2	Current tax credit in profit or loss is restricted to CU225,200 as explained in note 1 above. The CU48,000 net increase in total cumulative tax income since year 4 (CU320,000 - CU272,000) is dealt with entirely in equity (current tax income CU94,800 less deferred tax charge CU46,800).		

Illustration 10-13 above is based on Example 5 in the illustrative examples accompanying IAS 12 (as inserted by IFRS 2). However, the example included in IAS 12 states that the cumulative tax income is based on the number of options 'outstanding' at each period end. This would be inconsistent with the methodology in IFRS 2 (see Chapter 30), which requires the share-based payment expense during the vesting period to be based on the number of options expected to vest (as that term is defined in IFRS 2), not the total number of options outstanding, at the period end. It would only be once the vesting period is complete that the number of options outstanding becomes relevant. We assume that this is simply a drafting slip by the IASB.

IAS 12 asserts that the allocation of the tax deduction between profit or loss and equity shown in Illustration 10-13 is appropriate on the basis that the fact that the tax deduction (or estimated future tax deduction) exceeds the amount of the related cumulative remuneration expense 'indicates that the tax deduction relates not only to remuneration expense but also to an equity item'. [IAS 12.68C].

10.8.2 Determining the tax base

IAS 12 does not specify exactly how the tax base of a share-based payment transaction is to be determined. However, Example 5 in the illustrative examples accompanying IAS 12 (the substance of which is reproduced in section 10.8.1 above) calculates the tax base as:

- The amount that would be deductible for tax if the event triggering deduction occurred at the end of the reporting period; multiplied by
- The expired portion of the vesting period at the end of the reporting period

IFRS 2 treats certain share-based payment awards as, in effect, a parcel of a number of discrete awards, each with a different vesting period. This may be the case where an award is subject to graded vesting, has been modified, or has separate equity and liability components (see Chapter 30). In order to determine the tax base for such an award, it is necessary to consider separately the part, or parts, of the award with the same vesting period, as shown in Illustration 10-14 below.

Illustration 10-14: Tax deductions for share-based payment transactions - 'multi-element' awards

An entity awards 550 free shares to an employee, with no conditions other than continuous service. 100 shares vest after one year, 150 shares after two years and 300 shares after three years. Any shares received at the end of years 1 and 2 have vested unconditionally.

At the date the award is granted, the fair value of a share delivered in one year's time is CU3.00; in two years' time CU2.80; and in three years' time CU2.50.

Under IFRS 2, the analysis is that the employee has simultaneously received an award of 100 shares vesting over one year, an award of 150 shares vesting over two years and an award of 300 shares vesting over 3 years (see Chapter 30). This would be accounted for as follows (assuming that the award was expected to vest in full at each reporting date and did actually vest in full - see Chapter 30):

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	$(100 \text{ shares} \times \text{CU}3.00) + (150 \text{ shares} \times \text{CU}2.80 \times 1/2) + (300 \text{ shares} \times \text{CU}2.50 \times 1/3)$	760	760
2	$(100 \text{ shares} \times \text{CU}3.00) + (150 \text{ shares} \times \text{CU}2.80 \times 2/2) + (300 \text{ shares} \times \text{CU}2.50 \times 2/3)$	1,220	460
3	$(100 \text{ shares} \times \text{CU}3.00) + (150 \text{ shares} \times \text{CU}2.80 \times 2/2) + (300 \text{ shares} \times \text{CU}2.50 \times 3/3)$	1,470	250

The entity receives a tax deduction at 30% for the awards based on the fair value of the shares delivered. The fair value of a share at the end of years 1, 2 and 3 is, respectively, CU3.60, CU2.00 and CU6.00.

At the end of year 1, a current tax deduction of CU108 ($100 \text{ shares} \times \text{CU}3.60 @ 30\%$) is receivable in respect of the 100 shares that vest. The tax base of the shares expected to vest in years 2 and 3 is calculated by reference to the year-end share price of CU3.60 as:

- In respect of the 150 shares expected to vest at the end of year 2, CU270 ($150 \text{ shares} \times \text{CU}3.60 \times 1/2$). This will give rise to a deferred tax asset of CU81 ($\text{CU}270 @ 30\%$)
- In respect of the 300 shares expected to vest at the end of year 3, CU360 ($300 \text{ shares} \times \text{CU}3.60 \times 1/3$). This will give rise to a deferred tax asset of CU108 ($\text{CU}360 @ 30\%$)

The total deferred tax asset at the end of year is therefore CU189 (CU81 + CU108).

At the end of year 2, a current tax deduction of CU90 is receivable in respect of the 150 shares that vest ($150 \text{ shares} \times \text{CU}2.00 @ 30\%$). The tax base of the shares expected to vest in year 3 is calculated by reference to the year-end share price of CU2.00 as CU400 ($300 \text{ shares} \times \text{CU}2.00 \times 2/3$). This gives rise to a deferred tax asset of CU120 ($\text{CU}400 @ 30\%$).

At the end of year 3, a current tax deduction of CU540 ($300 \text{ shares} \times \text{CU}6.00 @ 30\%$) is receivable in respect of the 300 shares that vest.

When an award has multiple elements that vest at different times, the question arises as to whether the unit of account for applying the 'cap' on recognition of the tax benefit in profit or loss is the award as a whole or each element separately accounted for.

How we see it

In our view, the determination needs to be made for each element of the award separately. This is similar to our analysis in section 10.8.3 below (multiple awards outstanding) and section 10.8.4 below (awards for which a tax deduction is received on exercise which are exercised at different times).

Based on the information above, the total current and deferred tax income or expense (i.e., before allocation to profit or loss and equity) at the ends of years 1 to 3 would be as follows, assuming in each case that there is no restriction on the recognition of tax assets (see section 7.5 above).

Year	Current tax asset and income	Deferred tax asset	Deferred tax income/(expense)
	CU	CU	CU
1	108	189	189
2	90	120	(69)
3	540	-	(120)

The required accounting entries for income taxes are as follows:

Year 1

Dr	Current tax (statement of financial position)	CU108	
	Cr	Current tax (profit or loss)	CU90
	Cr	Current tax (equity) ¹	CU18
Dr	Deferred tax (statement of financial position)	CU189	
	Cr	Deferred tax (profit or loss) ² (CU63 + CU75 - see below)	CU138
	Cr	Deferred tax (equity) ² (CU18 + CU33 - see below)	CU51

1 The current tax deduction relates to the 100 shares vesting in year 1, for which the charge to profit or loss is CU300 (100 shares × CU3.00). The tax deduction accounted for in profit or loss is therefore restricted to 30% of CU300 = CU90. The balance of CU18 is credited to equity and relates to the CU0.60 difference between the grant date fair value of a 'Year 1' share at grant (CU3.00) and at vesting (CU3.60) - 100 shares × CU0.60 = CU60 @ 30% = CU18.

2 The total deferred tax income of CU189 represents:

- CU81 (see above) in respect of the 150 shares expected to vest in year 2, for which the charge to profit or loss is CU210 (150 shares × CU2.80 × 1/2). The tax deduction accounted for in profit or loss is restricted to 30% of CU210 = CU63, with the balance of CU18 credited to equity.
- And
- CU108 (see above) in respect of the 300 shares expected to vest in year 3, for which the expected charge to profit or loss is CU250 (300 shares × CU2.50 × 1/3). The tax deduction accounted for in profit or loss is therefore restricted to 30% of CU250 = CU75, with the balance of CU33 credited to equity.

Year 2

Dr	Current tax (statement of financial position)	CU90	
	Cr	Current tax (profit or loss) ³	CU90
Dr	Deferred tax (profit or loss) ⁴	CU18	
Dr	Deferred tax (equity) ⁴	CU51	
	Cr	Deferred tax (statement of financial position) ⁴	CU69

3 The current tax deduction relates to the 150 shares vesting in year 2, for which the cumulative charge to profit or loss is CU420 (150 shares × CU2.80). The cumulative tax deduction accounted for in profit or loss would therefore be restricted to 30% of CU420 = CU126. The entire amount of current tax deduction received (CU90) is therefore credited to profit or loss.

4 At the end of year 2, the deferred tax relates to the 300 shares expected to vest at the end of year 3, which has been measured based on the year end share price of CU2.00. This is lower than the share price on which the IFRS 2 charge has been based. Therefore, there is no requirement to allocate any deferred tax to equity, and the balance of deferred tax in equity is reduced to nil. The balance of the total CU69 movement in the deferred tax balance is allocated to profit or loss.

The net tax credit in profit or loss in year 2 of CU72 (current tax credit CU90, less deferred tax charge CU18) can be seen as representing:

Credit relating to IFRS 2 expense recognised in the period ⁵	105
Charge relating to remeasurement of prior year deferred tax ⁶	(33)
Total	<u>72</u>

5 In this case the tax credit recognised in profit or loss is not the 'expected' credit of CU138 (IFRS 2 charge of CU460 @ 30%). This is because the current tax deduction for the shares vesting in year 2 and the deferred tax deduction for the shares expected to vest in year 3 are based on the year-end share price of CU2.00, which is lower than the share values used to calculate the IFRS 2 charge (CU2.80 and CU2.50). During the year, an IFRS 2 expense has been recognised for 75 'whole share equivalents' in respect of the shares vesting in year 2 (150 shares × 1/2) and 100 'whole share equivalents' in respect of the shares expected to vest in year 3 (300 shares × 1/3), a total of 175 'whole share equivalents'. Accordingly, the credit for the year is CU105 (175 × CU2.00 × 30%).

6 In year 1 the deferred tax credit (based on the year 1 year-end share price of CU3.60) recognised in profit or loss in respect of the shares expected to vest in years 2 and 3 was CU138. If this had been based on the year 2 year-end share price of CU2.00 this would have been only CU105. $[150 \times 1/2 \times CU2.00] + [300 \times 1/3 \times CU2.00] = CU350 \times 30\% = CU105$. CU138 - CU105 = CU33.

Year 3

Dr	Current tax (statement of financial position)	CU540	
	Cr	Current tax (profit or loss)	CU225
	Cr	Current tax (equity) ⁷	CU315
Dr	Deferred tax (profit or loss)	CU120	
	Cr	Deferred tax (statement of financial position) ⁸	CU120

7 The current tax deduction relates to the 300 shares vesting in year 1, for which the cumulative charge to profit or loss is CU750 (300 shares × CU2.50). The tax deduction accounted for in profit or loss is therefore restricted to 30% of CU750 = CU225.

8 The deferred tax asset, all of which was - on a cumulative basis - recognised in profit or loss, is derecognised in profit or loss.

The net tax credit in profit or loss in year 3 of CU105 (current tax credit CU225, less deferred tax charge CU120) can be seen as representing:

Credit relating to IFRS 2 expense recognised in the period ⁹	75
Credit relating to remeasurement of prior year deferred tax ¹⁰	30
Total	105

9 CU250 @ 30%.

10 The opening balance deferred tax asset of CU120 is based on the year 2 share price of CU2.00. If this had been based on the year 3 share price of CU6.00 it would have been CU360. However, the amount recognised in profit or loss would have been restricted to CU150 - 30% of the cumulative expense at the end of year 2 of CU500 (300 shares × CU2.50 × 2/3). CU150 - CU120 = CU30.

10.8.3 Allocation when more than one award is outstanding

As noted above, IAS 12 requires that, “where the amount of any tax deduction ... exceeds the amount of the related cumulative remuneration expense, the current or deferred tax associated with the excess must be recognised directly in equity”. Some have therefore argued that, as drafted, IAS 12 requires the cumulative expense for all outstanding share schemes to be compared in aggregate with the aggregate tax deduction for all share schemes. Others argue that the comparison must be made for each scheme separately. The effect of each treatment is shown in Illustration 10-15 below.

Illustration 10-15: Tax deductions for share-based payment transactions - more than one award

An entity that pays tax at 30% has two outstanding share schemes, Scheme A and Scheme B. The entity receives tax deductions for share-based payment transactions based on their intrinsic value at the date of exercise.

At the end of the reporting period, the cumulative expense charged for each scheme is CU1 million. Scheme A has a negative intrinsic value at the end of the reporting period and is not expected to recover its value to the extent that employees will exercise their options. Accordingly, no deferred tax asset is recognised for Scheme A. Scheme B has an intrinsic value of CU1.5 million. The entity will therefore record a deferred tax asset of CU450,000 (30% of CU1.5 million), subject to the recognition criteria for deferred tax assets being satisfied.

Those who argue that comparison of share-based payment expense to tax deduction must be made on an aggregated basis would conclude that, because the cumulative potential tax deduction of CU1.5 million (which relates only to Scheme B) is lower than the cumulative aggregate expense for both Scheme A and Scheme B (CU2 million), the deferred tax income must be recognised entirely in profit or loss.

However, those who argue that comparison of share-based payment expense to tax deduction must be made on a discrete basis for each scheme would conclude that, because the cumulative tax deduction for Scheme B (CU1.5 million) is higher than the cumulative aggregate expense for Scheme B (CU1 million), only CU300,000 of the deferred tax income (30% of CU1 million) must be recognised in profit or loss, with the remaining CU150,000 recognised in equity.

How we see it

In our view, the comparison must be made on a discrete scheme-by-scheme basis. As noted in section 10.8.2 above, it is clear from IAS 12 and the Basis for Conclusions to IFRS 2 that the IASB's intention was to exclude from profit or loss any tax deduction that is effectively given for the growth in fair value of an award that accrues after grant date. This can be determined only on an award-by-award basis. Moreover, IAS 12 requires the amount of any tax deduction to be accounted for in equity when it 'exceeds the amount of the related cumulative remuneration expense' (emphasis added). In Illustration 10-15 above, the tax deduction on Scheme B cannot, in our view, be said to be 'related' to the remuneration expense for Scheme A. Accordingly, the expense relating to Scheme A is not relevant for determining the amount of tax income relating to Scheme B that is required to be accounted for in equity.

It may also be that what is regarded as a single scheme may need to be further sub-divided for the purposes of the comparison for reasons such as the following:

- Where the same award is made to regular employees and also to top management, the fair value of the options granted to each population may nevertheless be different for the purposes of IFRS 2 given different exercise behaviours (see Chapter 30)
- An award is made to employees which attracts tax deductions in more than one tax jurisdiction Or
- An award is made in the same tax jurisdiction to employees in different entities, not all of which are able to recognise a deferred tax asset

10.8.4 Staggered exercise of awards

The example in IAS 12, the substance of which is included in Illustration 10-13 in section 10.8.1 above, addresses a situation in which all vested awards are exercised simultaneously. In practice, however, vested awards are often exercised at different dates.

Once an award under a given scheme has vested, and different awards in that scheme are exercised at different times, the question arises as to whether the 'cap' on recognition of the tax benefit in profit or loss must be calculated by reference to the cumulative expense recognised in respect of the total number of awards vested, or in respect only of as yet unexercised vested awards.

How we see it

In our view, where a tax deduction is received on exercise, the calculation must be undertaken by reference to the cumulative expense recognised for outstanding unexercised options. This is demonstrated by Illustration 10-16 below.

Illustration 10-16: Tax deductions for share-based payment transactions - staggered exercise of award

At the start of year 1, an entity with a tax rate of 40% grants 20 options each to 5 employees. The options have a fair value of CU5 and vest at the end of year 2. The options vest in full. 25 are exercised at the end of year 3 and 75 at the end of year 6. The entity is able to support the view that any deferred tax asset arising before exercise will be recoverable, and may therefore be recognised in full.

Tax deductions are given in the year of exercise, based on the intrinsic value of the options at the date of exercise. The intrinsic value of options at the end of each reporting period is as follows:

Year	Intrinsic value per option
	CU
1	3
2	8
3	8
4	1
5	7
6	6

On the basis of the information above:

- There would be an IFRS 2 charge of CU250 in years 1 and 2 (20 options × 5 employees × CU5 × 1/2 (portion of vesting period))
- Current and deferred tax assets must be recognised at the end of each period as follows:

Current tax

Year	Number of options exercised	Intrinsic value per option	Total intrinsic value	Tax effect at 40%
		CU	CU	CU
3	25	8	200	80
6	75	6	450	180

Deferred tax

Year	Number of options outstanding	Temporary difference per option	Total temporary difference	Tax effect at 40%
		CU	CU	CU
1	100	1.5 ¹	150	60
2	100	8	800	320
3	75	8	600	240
4	75	1	75	30
5	75	7	525	210
6	-	6	-	-

1 Intrinsic value CU3 × 1/2 (expired portion of vesting period).

The required accounting entries for income taxes are as follows:

Year 1

Dr	Deferred tax (statement of financial position)	CU60	
Cr	Deferred tax (profit or loss) ¹		CU60

Year 2

Dr	Deferred tax (statement of financial position) ²	CU260	
Cr	Deferred tax (profit or loss) ³		CU140
Cr	Deferred tax (equity)		CU120

Year 3

Dr	Deferred tax (profit or loss) ⁴	CU50	
Dr	Deferred tax (equity)	CU30	
Cr	Deferred tax (statement of financial position) ⁵		CU80
Dr	Current tax (statement of financial position) ⁶	CU80	
Cr	Current tax (profit or loss) ⁴		CU50
Cr	Current tax (equity)		CU30

Year 4

Dr	Deferred tax (profit or loss) ⁷	CU120	
Dr	Deferred tax (equity)	CU90	
Cr	Deferred tax (statement of financial position) ⁸		CU210

Year 5

Dr	Deferred tax (statement of financial position) ⁹	CU180	
Cr	Deferred tax (profit or loss) ¹⁰		CU120
Cr	Deferred tax (equity)		CU60

Year 6

Dr	Deferred tax (profit or loss) ¹¹	CU150	
Dr	Deferred tax (equity)	CU60	
	Cr Deferred tax (statement of financial position)		CU210
Dr	Current tax (statement of financial position) ¹²	CU180	
	Cr Current tax (profit or loss) ¹³		CU150
	Cr Current tax (equity)		CU30

1 The cumulative tax income is based on expected deductions of CU150, which is less than the cumulative IFRS 2 charge of CU250 (see above).

2 Year 2 year-end balance of CU320 (see table above), less CU60 recognised at end of year 1 = CU140.

3 Cumulative deferred tax recognised in profit or loss must not exceed 40% × CU500 (cumulative IFRS 2 charge) = CU200. This limits the credit for year 2 to CU200 less the CU60 credited in year 1 = CU140.

4 Reversal of deferred tax income previously recognised in profit or loss for the 25 options exercised: 25 × CU5 [IFRS 2 charge per option] × 40% = CU50. This also represents the limit on the amount of current tax deduction that can be recognised in profit or loss.

5 Year 3 year-end balance of CU240 (see table above), less CU320 recognised at end of year 2 = CU80.

6 25 options × CU8 intrinsic value × 40% = CU80.

In years 4 to 6, the amount of tax recognised in profit or loss is restricted by the cumulative IFRS 2 expense of CU375 for the 75 options left outstanding (75 options × CU5).

7 Cumulative (maximum) tax deduction already recognised in profit or loss is CU375 @ 40% = CU150. This needs to be reduced to CU30 (year end deferred tax balance), giving rise to a charge of CU150 - CU30 = CU120. This can be seen as representing the fact that, at the start of the period a cumulative potential tax deduction of CU5 per award had been recognised in profit or loss. At the end of the period it is expected that deductions of only CU1 per award will be available. Therefore, there is a loss to be recognised in profit or loss of 75 awards × (CU5 - CU1) × 40% = CU120.

8 Year 4 year-end balance of CU30 (see table above), less CU240 recognised at end of year 3 = CU(210).

9 Year 5 year-end balance of CU210 (see table above), less CU30 recognised at end of year 4 = CU180.

10 Cumulative maximum tax deduction that can be recognised in profit or loss is CU150 (see note 7). CU30 cumulative deduction is brought forward, so that credit for period is limited to CU150 - CU30 = CU120.

11 Reversal of deferred tax previously recognised. The amount previously taken to profit or loss was limited to CU150 (see notes 7 and 9).

12 75 options × CU6 × 40% = CU180.

13 Deduction restricted to CU375 [IFRS 2 charge] × 40% = CU150.

It will be noted that the cumulative effect of the above entries in profit or loss is as follows (tax income in brackets):

Year	Deferred tax	Current tax	Total
	CU	CU	CU
1	(60)		(60)
=2	(140)		(140)
3	50	(50)	-
4	120		120
5	(120)		(120)
6	150	(150)	-
		Total	(200)

The cumulative effect of the above entries in equity is as follows (tax income in brackets):

Year	Deferred tax	Current tax	Total
	CU	CU	CU
1			-
2	(120)		(120)
3	30	(30)	-
4	90		90
5	(60)		(60)
6	60	(30)	30
		Total	(60)

The overall effect is to take credit in profit or loss for the lower of total tax deductions actually received of CU260 (CU80 in year 3 and CU180 in year 6) and the tax deductions on the IFRS 2 expense of CU200 (40% of CU500). The excess tax deductions of CU60 are recognised in equity.

10.8.5 Replacement awards in a business combination

IFRS 3 contains some detailed provisions on the treatment of share-based payment awards issued by an acquirer to replace awards made by the acquired entity before the business combination occurred. These are discussed in Chapter 30.

IFRS 3 amended IAS 12 to include an illustrative example for the treatment of tax deductions on such replacement awards, the substance of which is reproduced as Illustration 10-17 below. [IAS 12.IE Example 6].

Illustration 10-17: Deferred tax on replacement share-based awards in a business combination

On 1 January 20X3 Entity A acquired Entity B. A paid cash consideration of CU400 million to the former owners of B. At the acquisition date B had outstanding fully-vested employee share options with a fair value of CU100 million. As part of the business combination B's outstanding share options are replaced by fully vested share options of A (replacement awards) with a market-based measure of CU100 million and an intrinsic value of CU80 million. In accordance with IFRS 3, the replacement awards are part of the consideration transferred for B (see Chapter 30).

A tax deduction will be given only when the options are exercised, based on the intrinsic value of the options at that date. A's tax rate is 40%.

A recognises a deferred tax asset of CU32 million (intrinsic value of CU80m × 40%) on the replacement awards at the acquisition date (see section 10.8.1 above). IAS 12 does not indicate the calculation if only part of the fair value of the award were regarded as part of the consideration transferred. However, it would be consistent with the general approach indicated in section 10.8.2 above to calculate the tax base of the award by adjusting the intrinsic value by the ratio of the expired vesting period at acquisition to the total vesting period of the award (as determined for the purposes of IFRS 3 see Chapter 30).

A measures the identifiable net assets obtained in the business combination (excluding deferred tax assets and liabilities) at CU450 million, with a combined tax base of CU300 million, giving rise to a taxable temporary difference at the acquisition date of CU150 million, on which deferred tax at 40% of CU60 million is recognised. Goodwill is calculated as follows:

	CU m
Cash consideration	400
Replacement options	100
Total consideration	500
Identifiable net assets (excluding deferred tax)	(450)
Deferred tax asset	(32)
Deferred tax liability	60
Goodwill	78

Reductions in the carrying amount of goodwill are not deductible for tax purposes. In accordance with the initial recognition exception in IAS 12 (see section 7.2 above), A recognises no deferred tax liability for the taxable temporary difference associated with the goodwill recognised in the business combination. The accounting entry for the business combination is therefore as follows:

	CU m	CU m
Dr Goodwill	78	
Dr Identifiable net assets	450	
Dr Deferred tax asset	32	
Cr Cash		400
Cr Equity		100
Cr Deferred tax liability		60

On 31 December 20X3 the intrinsic value of the replacement awards is CU120 million, in respect of which A recognises a deferred tax asset of CU48 million (CU120 million at 40%). This gives rise to deferred tax income of CU16 million (CU48 million recognised at 31 December 20X3 less CU32 million arising on acquisition).

IAS 12 notes, somewhat redundantly, that this amount is credited to 'deferred tax income', but with no indication as to whether the amount must be recognised in profit or loss or in equity.

How we see it

In our view, the general principles of IAS 12 regarding tax deductions on share-based payment transactions suggest that the entire amount is recognised in equity. This is because the replacement awards are equity-settled and because they were fully-vested as at the acquisition date and as a result the consolidated financial statements of A have never recognised any expense for the award in profit or loss (since it is attributed fully to the consideration transferred). Therefore, none of the tax deductions can be recognised in profit or loss either.

10.8.5.A Implications if the replacement awards are cash-settled

Illustration 10-18 below demonstrates the implications where the replacement awards in a business combination are cash-settled.

Illustration 10-18: Deferred tax on replacement share-based awards in a business combination

If the replacement awards in Illustration 10-17 above were cash-settled, the accounting as at the acquisition date would be the same as above, except only that the fair value of the replacement award of CU100 is recognised as a liability rather than as a credit to equity.

	CU m	CU m
Dr Goodwill	78	
Dr Identifiable net assets	450	
Dr Deferred tax asset	32	
Cr Cash		400
Cr Liability - cash-settled awards		100
Cr Deferred tax liability		60

In the case of a cash-settled replacement award, the liability is remeasured for changes to its fair value up to the settlement date. As all changes in the liability related to a cash-settled share-based payment transaction are recognised in profit or loss for the period (see Chapter 30), the related movement in the deferred tax asset (of CU16 million in Illustration 10-17 above) is also recognised in profit or loss. [IAS 12.58].

10.8.6 Share-based payment transactions subject to transitional provisions of IFRS 1 and IFRS 2

IFRS 1 and IFRS 2 provide, respectively, first-time adopters and existing IFRS preparers with some transitional exemptions from accounting for share-based payment transactions. The accounting treatment of the tax effects of transactions to which these exemptions have been applied is discussed in Chapter 6. Whilst that discussion specifically addresses the tax effects of transactions subject to the exemption for first-time adopters of IFRS accounting standards, it is equally applicable to the tax effects of transactions subject to the exemptions in IFRS 2 for existing IFRS preparers.

10.9 Change in tax status of entity or shareholders

Sometimes there is a change in an entity's tax assets and liabilities as a result of a change in the tax status of the entity itself or that of its shareholders. SIC-25 clarifies that the effect of such a change must be recognised in profit or loss for the period except to the extent that it involves a remeasurement of tax originally accounted for in other comprehensive income or in equity, in which case the change must also be dealt with in, respectively, other comprehensive income or equity. [SIC-25.4].

SIC-25 does not specifically address when the effect of a change in tax status must be recognised except to state that a change in tax status is included in the profit or loss 'for the period'. The effect of change in tax status is recognised when such a change is effective, and the entity has complied with all the criteria imposed by the legislation. However, in situations where an entity has complied with all the criteria for a change in tax status earlier than its effective date and as such the timing of the change is under the control of the entity or otherwise determined, the entity might need to assess whether it is appropriate to recognise the effect of such change in tax status prior to the effective date.

How we see it

In our view, where an entity has complied with all the substantive criteria required by the legislation as at the end of the reporting period and the change in tax status is wholly under the control of the entity or otherwise merely a matter of the passage of time, it would be appropriate to recognise the effect of change in tax status prior to the effective date when the substantive criteria is met.

10.10 Previous revaluation of PP&E treated as deemed cost on transition to IFRS

IFRS 1 requires full retrospective application of standards effective at the end of a first-time adopter's first IFRS reporting period, unless a specific exemption is provided therein. [IFRS 1.7]. In some cases, IFRS 1 allows an entity, on transition to IFRS accounting standards, to treat the carrying amount of property, plant, and equipment (PP&E) revalued under its pre-transition GAAP as a deemed cost for the purposes of IFRS accounting standards (see Chapter 6).

Where an asset is carried at deemed cost on transition to IFRS accounting standards, but the tax base of the asset remains at original cost (or an amount based on original cost), the pre-transition revaluation will give rise to a temporary difference (often, a taxable temporary difference) associated with the asset. While the deemed cost provisions in IFRS 1 establish an appropriate measurement base for the carrying amount of previously revalued assets in the financial statements at the date of transition, they have no impact on whether a temporary difference exists. IFRS 1 does not provide an exemption from applying IAS 12, which requires deferred tax to be recognised on any such temporary difference at transition.

If, after transition, the deferred tax is required to be remeasured (e.g., because of a change in tax rate, or a re-basing of the asset for tax purposes), and the asset concerned was revalued outside profit or loss under pre-transition GAAP, the question arises as to whether the resulting deferred tax income or expense should be recognised in, or outside, profit or loss. A literal interpretation of IAS 12 would require changes relating to the past revaluation of the PP&E to be reflected in other comprehensive income, because that is where such an earlier revaluation would have been recorded under IFRS accounting standards (see section 10.2 above). However, where an entity elects to apply the cost model of IAS 16, the subsequent accounting treatment of the asset is the same, regardless of whether the 'deemed cost' of the asset on transition to IFRS was an earlier valuation, a revaluation as at the date of transition or original cost less depreciation and impairment up to that date. In all cases, subsequent depreciation and impairments are charged to profit or loss. In these circumstances, it could be argued that the deemed cost exemption on transition requires the asset to be treated in all respects as if its original cost had been the carrying value as at the transition date. In this way, any backward tracing of deferred tax in relation to past revaluations of an asset carried at 'deemed cost' must also be ignored and the effect of subsequent measurement must also be recognised in profit or loss.

How we see it

In our view, either approach is acceptable provided that it is applied consistently.

10.11 Disposal of an interest in a subsidiary that does not result in a loss of control

Under IFRS 10 *Consolidated Financial Statements* - a decrease in a parent's ownership interest in a subsidiary that does not result in a loss of control is accounted for in the consolidated financial statements as an equity transaction, i.e., a transaction with owners in their capacity as owners. [IFRS 10.23]. In these circumstances, the carrying amounts of the controlling and non-controlling interests are adjusted to reflect the changes in their relative interests in the subsidiary. "The entity shall recognise directly in equity any difference between the amount by which the non-controlling interests are adjusted and the fair value of the consideration paid or received, and attribute it to the owners of the parent." [IFRS 10.B96]. In other words, no changes in a subsidiary's assets (including goodwill) and liabilities are recognised in a transaction in which a parent increases or decreases its ownership interest in a subsidiary that it already controls. [IFRS 10.BC2173]. Increases or decreases in the ownership interest in a subsidiary do not result in the recognition of a gain or loss. Accounting for disposals of interests that do not result in a loss of control is discussed in Chapter 8.

As the transaction is accounted for as an equity transaction, which does not affect profit or loss in the consolidated financial statements, one might assume that the full amount of any tax effect must also be recognised in equity. [IAS 12.58(a)]. However, this is not the case to the extent that any adjustment to non-controlling interests relates to the post acquisition profit of the subsidiary, which was previously recognised in the consolidated income statement, as shown in Illustration 10-19 below.

Illustration 10-19: Tax effect of a disposal of an interest in a subsidiary that does not result in a loss of control

A parent owns 100% of the equity shares of a subsidiary and presents the investment at a cost of CU1,000,000 in its separate financial statements. At the end of the reporting period, the subsidiary's post acquisition profit and net asset value recognised in the parent's consolidated financial statements are CU500,000 and CU1,500,000 respectively. Previously, the parent had not recognised deferred taxation, as it considered it probable that the temporary difference would not reverse in the foreseeable future. The parent disposes of a 20% interest in the subsidiary for a cash consideration of CU1,400,000 (the 'Transaction').

It is assumed that the tax base of the investment in the subsidiary is the same as its original cost of CU1,000,000. The taxable gain is calculated on the same basis as the gain recognised in the separate financial statements and the applicable tax rate is 25%.

The parent recognises a gain of CU1,200,000 (i.e., CU1,400,000 - [CU1,000,000 × 20%]) in its separate financial statements and is liable for a current tax of CU300,000 (i.e., CU1,200,000 × 25%).

The Transaction does not result in the parent losing control of the subsidiary and it is accounted for in equity in the consolidated financial statements of the parent. The parent recognises non-controlling interests of CU300,000 (i.e., CU1,500,000 × 20%) and credits equity for CU1,100,000, being the difference between the consideration of CU1,400,000 and the non-controlling interests of CU300,000, in the consolidated financial statements of the parent.

What are the current and deferred tax effects in the consolidated financial statements if:

(a) The transaction, although expected, is not completed until after the end of the reporting period?

Or

(b) The transaction is completed at the end of the reporting period?

If the transaction is not completed until after the end of the reporting period, no current tax is recognised. However, as the parent intends to recover 20% of its investment in the subsidiary through sale, it must recognise a deferred tax liability in the consolidated financial statements for the temporary difference associated with its investment in the subsidiary that is expected to reverse in the foreseeable future. [IAS 12.39]. Its carrying value in the consolidated financial statements is CU1,500,000 and its tax base is CU1,000,000. Accordingly, deferred tax of CU25,000 (i.e., [CU1,500,000 - CU1,000,000] × 20% × 25%) must be recognised in profit or loss in the consolidated financial statements. This deferred tax would reverse through profit or loss upon disposal, because it relates to the post acquisition profit recognised in an earlier period. [IAS 12.58].

If the transaction is completed at the end of the reporting period, the consolidated financial statements would include a current tax charge of CU300,000 on the taxable gain on sale recorded by the subsidiary. Whilst the transaction is recorded in equity in the consolidated financial statements, because there is no loss of control, only CU1,100,000 out of the total taxable gain of CU1,200,000 was taken to non-controlling interests in equity. [IAS 12.58(a)]. CU275,000 (i.e., CU1,100,000 × 25%) of the current tax charge relates to the amount that is recognised directly in equity (CU1,100,000) and is, therefore, recognised directly in equity. [IAS 12.61A(b)]. The remaining CU25,000 (i.e., [CU1,500,000 - CU1,000,000] × 20% × 25%) is recognised as a current tax expense in profit or loss in the consolidated financial statements, as it does not relate to an amount directly recognised in equity, but to the crystallisation of part of the outside basis temporary difference arising from the post-acquisition profits of the subsidiary.

10.12 Cash flow hedge accounting - tax impact arising from basis adjustments

Applying the requirements in IFRS 9, if a hedged forecast transaction subsequently results in the recognition of a non-financial asset or liability, or a hedged forecast transaction for a non-financial asset or liability becomes a firm commitment for which fair value hedge accounting is applied, the entity shall remove the amount that is accumulated in the cash flow hedge reserve and include it directly in the initial cost or other carrying amount of the asset or liability. This is often referred to as a 'basis adjustment'. It is not a reclassification adjustment and hence it does not affect the statement of OCI for the period. Rather, it is presented as a separate item in the statement of changes in equity. [IFRS 9.6.5.11(d), IAS 1.96, IFRS 18.B89].

See Chapter 49 for further guidance on basis adjustment. Questions regarding the application of IAS 12 that arise in the context of basis adjustments relate to the application of initial recognition exception and the presentation of the tax impact when the amount accumulated in the cash flow hedge reserve is removed and included in the carrying value of the non-financial asset or liability.

10.12.1 Deferred tax application

Refer to section 7 above for guidance regarding the initial recognition exception and section 7.2.4 above that specifically deals with changes to temporary difference after initial recognition of an asset or liability. In situations where a basis adjustment is made to a non-financial asset or liability, temporary difference arise as the carrying value of the asset or liability changes whilst the tax base remains the same. This raises a question regarding the application or otherwise of initial recognition exception.

How we see it

We believe the initial recognition exception does not apply to temporary difference arising from the basis adjustment and therefore, deferred tax asset or liability must be recognised applying the general principles in IAS 12. This is because the basis adjustment impacts the carrying value of the non-financial asset or liability and the temporary difference arise from the difference in the carrying value of that asset or liability and its tax base. Such temporary difference arises after the initial recognition of the non-financial asset or liability. Consequently, the criteria required to apply IRE is not satisfied.

Additionally, one could consider that the tax on the hedging instrument is closely linked with the hedged item and, that the hedging instrument is already subjected to tax accounting removing the fundamental issue the IRE is seeking to alleviate.

10.12.2 Presentation of the tax impact

As explained above, the basis adjustment does not impact the statement of OCI. Consequently, the following issues related to presentation of tax impact arise:

- Presentation of the reversal of deferred tax recognised in cash flow hedge reserve in the statement of changes in equity.
- Presentation of current tax related to the settlement of the hedging instrument.

The following Illustration describes an approach regarding the presentation of the reversal of deferred tax when an entity recognises the basis adjustment as required by IFRS 9 and the presentation of current tax arising from the settlement of the hedging instrument.

Illustration 10-20: Tax impact on the basis adjustment arising from cash flow hedge

On 2 April 20X6, an entity has a forecast purchase transaction of an equipment in December 20X6 for CU100,000 from a foreign supplier with a functional currency different from that of the entity. The entity enters into a foreign currency forward contract that is eligible for cash flow hedge accounting as required by IFRS 9. In December 20X6, the entity pays CU112,000 at the current spot rate when the equipment is delivered. The entity settles the forward contract at its fair value and receives CU12,000.

The entity has accumulated fair value changes in the statement of changes in equity in the cash flow hedge reserve. The tax impact is also accumulated in the cash flow hedge reserve applying the requirements in paragraph 61A of IAS 12.

The tax rate in the jurisdiction is 25%. In the jurisdiction fair value gains (losses) are taxable (deductible) when settled.

The accounting and presentation of current and deferred tax is described below:

Dr. Derivative financial asset	CU12,000	
Cr. Statement of changes in OCI		CU12,000
<i>To recognise the fair value change in the forward contract</i>		
Dr. Deferred tax expense (statement of changes in OCI)	CU3,000	
Cr. Deferred tax liability		CU3,000
<i>To recognise the tax impact related to the fair value gain on the forward contract</i>		

Dr. Cash	CU12,000	
Cr. Derivative financial asset		CU12,000
<i>To recognise cash received on settlement of the forward contract</i>		
Dr. Current tax expense (income statement)	CU3,000	
Cr. Current tax liability		CU3,000
<i>To recognise current tax payable on the gain from settlement of forward contract</i>		
Dr. Deferred tax liability	CU3,000	
Cr. Deferred tax income (statement of Changes In OCI)		CU3,000
<i>To recognise unwinding of deferred tax liability on the settlement of forward contract</i>		
Dr. Property, plant and equipment	CU112,000	
Cr. Cash		CU112,000
<i>To recognise payment for the cost of the equipment acquired translated at the spot rate</i>		
Dr. Cash flow hedge reserve	CU12,000	
Cr. Property, plant and equipment		CU12,000
<i>To recognise the removal of fair value changes accumulated in the statement of changes in equity and adjust it with the cost of equipment (basis adjustment)</i>		
Dr. Deferred tax asset	CU3,000	
Cr. Deferred tax income (income statement)		CU3,000
<i>To recognise deferred tax arising from the temporary difference created from the basis adjustment</i>		

How we see it

In our view, the approach described above is one way of reflecting the current and deferred tax consequences of the basis adjustment. An entity is not precluded from adopting another suitable approach provided that it is applied consistently.

Additional considerations may apply in selecting a suitable approach in different fact patterns, for example, where the deferred tax asset arising from the basis adjustment is irrecoverable.

11 Consolidated tax returns and offset of taxable profits and losses within groups

In some jurisdictions, one member of a group of companies may file a single tax return on behalf of all, or some, members of the group. Sometimes this is a mandatory requirement for a parent entity and its eligible subsidiaries operating in the same tax jurisdiction; and sometimes adoption is elective. In other jurisdictions, it is possible for one member of a group to transfer its tax losses to one or more other members of the group in order to reduce their tax liabilities. In some groups a company whose tax liability is reduced by such an arrangement may be required to make a payment to the member of the group that pays tax on its behalf, or transfers losses to it, as the case may be. In other groups no such charge is made.

Such transactions raise the question of the appropriate accounting treatment in the separate financial statements of the group entities involved - in particular, whether the company benefiting from such an arrangement must reflect income (or more likely a capital contribution) from another member of the group equal to the tax expense mitigated as a result of the arrangement.

Some argue that the effects of such transactions must be reflected in the separate financial statements of the entities involved, as is required by some national standards (e.g., those of the US and Australia). Others argue that, except to the extent that a management charge is actually made (see section 11.1 below), there is no need to reflect such transactions in the separate financial statements of the entities involved. Those that take this view point out that it is inconsistent to require companies to show a capital contribution for tax losses ceded to them without charge, unless all other intragroup transactions are also restated on arm's-length terms - which would be somewhat radical. Moreover, IAS 24 *Related Party Disclosures* merely requires disclosure of the actual terms of such transactions, not that they be remeasured, either for financial reporting or disclosure purposes, on the same basis as a similar notional arm's length transaction (see Chapter 35).

How we see it

IAS 12 is silent on the issue and, in our view, no single approach can be said to either be prohibited or required. Accordingly, a properly considered approach may be adopted, provided that it is applied on a consistent basis and the related judgements are disclosed where their impact is believed to be material. In arriving at an appropriate judgement, the discussion in sections 4.1 and 4.4 above is relevant in considering whether entities must apply IAS 12 or another standard (such as IAS 37). Any judgement must be based on the particular facts and circumstances relating to the legislation giving rise to tax-consolidation, the nature of the obligations and rights of entities in the group and local company law. As noted in section 4.4 above, where there is a predominant local consensus in evidence or specific guidance issued by regulators in the relevant tax jurisdiction, then we believe that the entity must apply this consensus or guidance.

11.1 Examples of accounting by entities in a tax-consolidated group

In a typical tax-consolidation arrangement, a single consolidated annual tax return is prepared for the tax-consolidated group as a whole. Transactions between the entities in the tax-consolidated group are eliminated, and therefore ignored for tax purposes. A single legal entity in the group (usually the parent) is primarily liable for the current income tax liabilities of that group. Each entity in the group would be jointly and severally liable for the current income tax liability of the group if the parent entity defaults. There might also be a legally binding agreement between the entities in the group which establishes how tax assets and liabilities are allocated within the group.

As noted above, IAS 12 is silent on the issue and there is diversity in practice where these arrangements exist. Some entities apply IAS 37 principles to the recognition, measurement and allocation of current tax assets and liabilities to individual entities in the group, on the basis that tax is determined on the basis of the taxable profits of the group as a whole and not on the profits of the individual entities themselves. In that case current tax assets and liabilities are allocated on the basis of each entity's legal or constructive obligations to the tax authorities (for example, where joint and several liability is determined to exist) or to other entities in the tax-consolidated group (including where formal agreements are implemented for the funding and sharing of tax liabilities and assets). Deferred tax is not accounted for in separate financial statements in these circumstances. Other entities apply the recognition and measurement principles of IAS 12 on the basis that tax is still determined on the basis of the taxable profits of each entity in the group on the obligations of each entity to the tax authorities. When IAS 12 is deemed to apply, entities will account for both current and deferred tax in their separate financial statements. Various approaches may

be acceptable under IFRS accounting standards for the determination of how current and deferred tax is allocated between entities in the tax-consolidated group. In Australia, where entities apply a standard virtually identical to IAS 12 in separate financial statements, three alternative approaches are suggested as examples of acceptable allocation methods:³⁶

- A 'stand-alone taxpayer' approach for each entity, as if it continued to be a taxable entity in its own right.
- A 'separate taxpayer within group' approach for each entity, on the basis that the entity is subject to tax as part of the tax-consolidated group. This method requires adjustments for transactions and events occurring within the tax-consolidated group that do not give rise to a tax consequence for the group or that have a different tax consequence at the level of the group.
- A 'group allocation' approach, under which the income tax amounts for the tax-consolidated group are allocated among each entity in the group.

Nevertheless, there may be other methods that are also appropriate.

11.2 Payments for intragroup transfer of tax losses

Where one member of a group transfers tax losses to another member of the group, the entity whose tax liability is reduced may be required, as matter of group policy, to pay an amount of compensation to the member of the group that transfers the losses to it. Such payments are known by different terms in different jurisdictions, but are referred to in the discussion below as 'tax loss payments'.

Tax loss payments are generally made in an amount equal to the tax saved by the paying company. In some cases, however, payment may be made in an amount equal to the nominal amount of the tax loss, which will be greater than the amount of tax saved. This raises the question of how such payments must be accounted for.

The first issue is whether such payments must be recognised:

- In total comprehensive income
- Or
- As a distribution (in the case of a payment from a subsidiary to a parent) or a capital contribution (in the case of a payment from a parent to a subsidiary)

The second issue is, to the extent that the payments are accounted for in total comprehensive income, whether they must be classified as:

- Income tax allocated between profit or loss, other comprehensive income or equity (see section 10 above). The argument for this treatment is that the payments made or received are amounts that would otherwise be paid to or received from (or offset against an amount paid to) a tax authority.
- Or
- Operating income or expense in profit or loss (on the grounds that, as a matter of fact, the payments are not made to or received from any tax authority).

How we see it

IAS 12 is silent on these issues. However, there is a long-standing practice in many jurisdictions that such payments are treated as if they were income taxes. We believe that this practice is appropriate to the extent that the intragroup payment is for an amount up to the amount of tax that would otherwise have been paid by the paying company. Where a tax loss payment is made in excess of this amount, we consider that it is more appropriate to account for the excess not as an income tax but as either:

- A distribution or capital contribution (as applicable)
- Or
- Operating income or expense (as applicable)

In considering the applicable treatment, the legal and regulatory requirements in the entity's jurisdiction would also be relevant, for example if those local requirements stipulate whether the excess payment is, in law, a distribution. The chosen treatment must be applied consistently.

³⁶ Urgent Issues Group Interpretation 1052 - Tax Consolidation Accounting, AASB, as amended June 2010.

11.3 Recognition of deferred tax assets where tax losses are transferred in a group

The ability of one member of a group to transfer its tax losses to another member of the group that expects to have taxable profits against which those losses can be utilised is an example of a tax planning opportunity 'that will create taxable profit in appropriate periods'. [IAS 12.29(b)]. Accordingly, it would be appropriate to recognise in the entity's consolidated financial statements a deferred tax asset in respect of unused tax losses and unused tax credits that are expected to be utilised in this way. [IAS 12.29].

In the separate financial statements of the member of the group that holds the unused losses and tax credits, it would only be appropriate to recognise an asset to the extent that this entity expects to benefit itself from any transfer. Such benefits might be in the form of payment for losses as discussed in section 11.1 above, or as a result of taxable profits otherwise created in the surrendering entity as a result of the transfer. If the surrendering entity is not expected to receive any benefit in relation to the unused losses and tax credits given up, then an asset must not be recognised in the separate financial statements of that entity.

12 Business combinations

Additional deferred tax arises on business combinations as a result of items such as:

- The application of IAS 12 to the assets and liabilities of the acquired business in the consolidated financial statements, when it has not been applied in the separate financial statements of that business.
- Where the acquired entity already applies IAS 12 in its own financial statements, the recognition in the fair value exercise of deferred tax in respect of assets and liabilities of the acquired entity where no deferred tax is provided in those financial statements. This may be the case where a temporary difference arose on initial recognition of an asset or liability in the acquired entity's own financial statements. Deferred tax would then be recognised in the acquirer's consolidated financial statements, because, in those statements, the difference arises on initial recognition in a business combination (see section 7.2 above).
- Adjustments made to measure the assets and liabilities of the acquired business fair value, with consequential changes in the temporary differences associated with those assets and liabilities.

Any deferred tax assets or liabilities on temporary differences that arise on a business combination affect the amount of goodwill or bargain purchase gain. [IAS 12.66]. Illustration 7-23 in section 7.6.1 above demonstrates the application of this principle.

12.1 Measurement and recognition of deferred tax in a business combination

IFRS 3 generally requires assets acquired and liabilities assumed in a business combination to be:

- Recognised only to the extent that they were assets or liabilities of the acquired entity at the date of acquisition. [IFRS 3.10].
- And
- Measured at fair value. [IFRS 3.18].

These provisions of IFRS 3 are discussed in more detail in Chapter 10. As exceptions to this general principle, IFRS 3 requires an acquirer to:

- Recognise and measure a deferred tax asset or liability arising from the assets acquired and liabilities assumed in a business combination "in accordance with IAS 12". [IFRS 3.24].
- And
- Account for the potential tax effects of temporary differences and carryforwards of an acquiree that exist at the acquisition date or arise as a result of the acquisition "in accordance with IAS 12". [IFRS 3.25].

There are essentially two reasons underlying these exceptions. The first is that IAS 12 does not purport to measure future tax at fair value, but at an amount based on a prescribed model that takes no account of the time value of money. Secondly, and more subtly, IAS 12 requires a number of questions of both recognition and measurement to be resolved by reference to management's plans and expectations - in particular, the expected manner of recovery of assets (see section 8.4 above) or the likelihood of recovering deferred tax assets (see section 7.5 above). The expectations and plans of the acquirer may well differ from those of the acquired entity. For example, the acquired entity might have assessed, for the purposes of IAS 12, that an asset would be recovered through use, whereas the acquirer assesses it as recoverable through sale. The exceptions made by IFRS 3 allow the deferred tax recognised in a business combination to reflect the expectations of the acquirer rather than those of the acquiree.

Areas that give rise to particular difficulties of interpretation are:

- Determining the manner of recovery of assets and settlement of liabilities at the date of the business combination (see section 12.1.1 below)
- Deferred tax assets (see section 12.1.2 below)

12.1.1 Determining the manner of recovery of assets and settlement of liabilities

As discussed in section 8.4 above, IAS 12 requires deferred tax to be measured at an amount that reflects the tax consequences that would follow from the manner in which the entity expects to recover its assets or settle its liabilities. The expected manner of recovery or settlement may affect both the tax base of an asset or liability and the tax rate to be applied to any temporary difference arising.

How we see it

As further noted above, the acquirer's assessment of the manner of recovery for the purposes of IAS 12 may well differ from that of the acquired entity. For example, the acquired entity might have intended to recover an asset through use, whereas the acquirer intends to sell it. In such a case, in our view, the requirement of IFRS 3 to recognise and measure deferred tax in accordance with IAS 12 has the effect that the expectations of the acquirer are used to determine the tax base of an item and the measurement of any deferred tax associated with the item.

12.1.1.A Changes in tax base consequent on the business combination

In some jurisdictions, a business combination may provide the opportunity to revise the tax base of an asset to an amount equal to the fair value assigned to it in accounting for the business combination. Most significantly, this may include the ability to create a tax base for an intangible asset or goodwill which may have had no tax base at all for the acquiree.

In some cases, the increase (as it generally is) in tax base may be more or less automatic. In others, the taxpayer may be required to make a formal claim or election for the increase to the tax authority. Sometimes further restructuring may be required - for example, it may be necessary for the business of the acquired entity to be transferred to another entity in the acquirer's group in the same tax jurisdiction.

An increase in a tax base that requires action by the relevant entity after the acquisition (such as making a claim or election or undertaking a restructuring) occurs after the business combination. However, some hold the view that the ability to increase a tax base following a business combination is a benefit that is taken into account by an informed buyer in negotiating the purchase price. Accordingly, it is argued, the increase is most appropriately reflected by adjusting the tax base of assets acquired as at the date of the business combination as if the increase had occurred at that date. This reduces any deferred tax liability and, therefore, reduces any goodwill (or increases any 'bargain purchase' gain).

Those who support this view note that, if the increase in tax base is accounted for only when it legally occurs in the post-combination period, the net effect is to increase goodwill and reduce post-combination tax expense when in reality the entity may have done little more than fill in a form. It might also be difficult to sustain the higher carrying amount of goodwill arising from this treatment.

How we see it

We believe that it is generally appropriate to anticipate an increase to a tax base that legally occurs following a business combination in accounting for the business combination where the increase:

- Is automatic or requires only a notification to the tax authority
- Requires an application to the tax authority that is not normally refused for transactions of a comparable nature
- Or
- Is contingent on some post-acquisition restructuring, where this can be done without substantial difficulty

Conversely, we believe that it would not generally be appropriate to account for an increase in a tax base until it occurs where the increase:

- Relies on 'bespoke' tax planning that may be challenged by the tax authority
- Requires an application to the tax authority that in practice is frequently and successfully challenged for transactions of a comparable nature
- Or
- Is contingent on some post-acquisition restructuring, where this will involve a substantial process, such as obtaining approval from regulators, unions, pension fund trustees etc.

12.1.2 Deferred tax assets arising on a business combination

12.1.2.A Assets of the acquirer

Extract from IAS 12

67 As a result of a business combination, the probability of realising a pre-acquisition deferred tax asset of the acquirer could change. An acquirer may consider it probable that it will recover its own deferred tax asset that was not recognised before the business combination. For example, the acquirer may be able to utilise the benefit of its unused tax losses against the future taxable profit of the acquiree. Alternatively, as a result of the business combination it might no longer be probable that future taxable profit will allow the deferred tax asset to be recovered. In such cases, the acquirer recognises a change in the deferred tax asset in the period of the business combination, but does not include it as part of the accounting for the business combination. Therefore, the acquirer does not take it into account in measuring the goodwill or bargain purchase gain it recognises in the business combination.

Therefore, when the acquiring entity is able to recognise a previously unrecognised tax asset of its own (e.g., unused tax losses), the recognition of the asset is accounted for as income in the period of the business combination, and not as part of the accounting for the business combination. Accordingly, the acquirer does not take it into account in measuring the goodwill or bargain purchase gain it recognises in the business combination. [IAS 12.67].

As noted in section 7.5.4 above, the change in probability is not anticipated, i.e., an acquirer does not recognise the effect (positive or negative) relating to a target entity being acquired until the period in which the business combination is accounted for.

12.1.2.B Assets of the acquiree

It may be the case that deferred tax assets of an acquired entity do not meet the recognition criteria of IAS 12 from the perspective of the acquired entity, but do meet the criteria from the perspective of the acquirer. In such cases, the general principles of IAS 12 require the acquirer's perspective to be applied as at the date of the business combination. Accordingly, a deferred tax asset would be recognised, with a corresponding reduction in goodwill. [IAS 12.66].

The potential benefit of the acquiree's income tax loss carryforwards or other deferred tax assets may not satisfy the criteria for separate recognition when a business combination is initially accounted for but may be realised subsequently. Any changes in recognised deferred tax assets of an acquired entity are accounted for as follows:

- Acquired deferred tax benefits recognised within the measurement period (see Chapter 10) that result from new information about facts and circumstances that existed at the acquisition date are applied to reduce the carrying amount of any goodwill related to that acquisition. If the carrying amount of that goodwill is zero, any remaining deferred tax benefits are recognised in profit or loss.
- All other acquired deferred tax benefits realised are recognised in profit or loss (or outside profit or loss if IAS 12 so requires - see section 10 above). [IAS 12.68].

12.1.3 Deferred tax liabilities of acquired entity

IAS 12 contains no specific provisions regarding the recognition of a deferred tax liability of an acquired entity after the date of the original combination. The recognition of such liabilities must therefore be accounted for in accordance with the normal rules of IAS 12 (i.e., in the period in which the liability arises), unless either:

- The recognition of the liability occurs within the provisional measurement period for the business combination and reflects new information about facts and circumstances that existed at the acquisition date, in which case the acquisition date value of the liability is retrospectively adjusted - see Chapter 10
- Or
- The failure to recognise the liability at the time of the combination was an error, in which case the provisions of IAS 8 must be applied - see Chapter 3

12.1.4 Tax deductible goodwill of the acquiree

An entity acquired in a business combination may have recognised goodwill, arising from its own previous business combinations, that is deductible for tax purposes. A question that arises is, how does the new acquirer reflect the tax consequences of such tax-deductible goodwill upon acquisition and subsequently in its consolidated financial statements? The deferred tax accounting of the tax-deductible goodwill ('old goodwill') depends on its relationship with the goodwill recognised by the acquirer upon acquisition ('new goodwill'). The considerations involved in assessing the extent of any relationship between the old and the new goodwill are described in section 12.1.4.A below. The Illustrations below describe two approaches to reflect tax consequences of the tax-deductible goodwill that is based on establishing relationship between the two.

Illustration 12-1: No relationship is established - a DTA is recognised for the old goodwill

Entity A, operating in country A, has two business units (A1 and A2) that are also cash generating units. Entity A acquired Subsidiary A2 on 1 January 20X4 for CU1,000, when subsidiary A2 had separable net assets with a fair value of CU700. Entity A recognised goodwill amounting to CU300 that is entirely attributable to A2. This goodwill is tax deductible over a period of 20 years. Entity A has never recognised an impairment loss on the goodwill to date. As at 31 December 20Y3, this goodwill has a carrying value of CU300 and a tax base of CU150. Accordingly, Entity A carried a deferred tax liability of CU30 (300-150 @20%) on its balance sheet.

On 1 January 20Y4, Entity X, operating in country X, acquires Entity A for a total consideration of CU2,500. The acquisition is treated as a business combination under IFRS 3. The fair value of the separable net assets of Entity A was CU1,600 (excluding the value of the future tax deductions on previously recognised goodwill). The resulting goodwill of CU900 is not tax deductible. However, Entity A is still entitled to claim tax deductions on its previously recognised goodwill and expects to have sufficient taxable profits available (either from existing deferred tax liabilities or future taxable profits) to utilise those deductions in future periods.

For the purpose of the Illustration, any taxable or deductible temporary differences arising on fair value adjustments in relation to the separable net assets acquired have been ignored. The tax rate assumed is 20% in both countries.

Management of Entity X have concluded that there is no relationship between the old and the new goodwill. The consequence of this conclusion is that the tax base of the new goodwill is zero because the new goodwill has arisen independently of the old goodwill. The carrying value of the new goodwill upon acquisition is CU900. This results in a taxable temporary difference of CU900. However, Entity X would not recognise the deferred tax liability of CU180 because it must apply the initial recognition exception in paragraph 15 of IAS 12.

Although the tax base of new goodwill is zero, there exists a tax base of CU150 related to the old goodwill, that does not have a corresponding carrying value in the consolidated balance sheet of Entity X. This tax base arises from the fact Entity A is entitled to the benefit of future tax deductions in relation to its previously recognised goodwill. Having determined that there are sufficient probable taxable profits available, Entity X recognises a deferred tax asset amounting to CU30 as part of its acquisition accounting and as a result the carrying value of the new goodwill is reduced to CU870. Under paragraph 24 of IAS 12, there is no initial recognition exception for such deductible temporary difference.

In the subsequent years, Entity X will continue to benefit from the tax deduction in Country A. Accordingly, when the current tax deduction of CU15 is claimed each year, a deferred tax expense of CU3 will be recognised by crediting the deferred tax asset. The deferred tax expense will offset the current tax credit from claiming the deduction. At the end of the remaining 10 years, the deferred tax asset of CU30 recognised upon acquisition will unwind to zero.

Illustration 12-2: A relationship is established - No deferred tax asset or liability is recognised

The facts are the same as in Illustration 12-1 above. However, in this scenario the management of Entity X have concluded that there is a relationship between the old and the new goodwill. The consequence of this conclusion is that the tax base of the new goodwill is CU150. The carrying value of the new goodwill upon acquisition is CU900, resulting in a taxable temporary difference of CU750. However, Entity X would not recognise a deferred tax liability of CU150 because it must apply the initial recognition exception in paragraph 15 of IAS 12.

In the subsequent years, Entity X will continue to benefit from the tax deduction in Country A. Accordingly, when the tax deduction of CU15 is claimed each year, a taxable temporary difference arises. Entity X will recognise a deferred tax expense of CU3 and a deferred tax liability of CU3. The deferred tax expense will offset the current tax credit from claiming the deduction. At the end of the remaining 10 years, Entity X will have accreted a deferred tax liability of CU30 that will reverse upon impairment and/or disposal of the CGUs comprising of associated goodwill.

How we see it

Establishing a relationship between the new goodwill and any old goodwill involves the exercise of judgement. In our view, it would be acceptable to adopt either of the approaches illustrated above provided that it is applied consistently in similar facts and circumstances. A key consideration in accounting for the tax consequences of tax-deductible goodwill is the extent to which there is any relationship between the old and the new goodwill and therefore the answer may not be binary.

Whether a relationship is established or not, the impact on the income statement after the business combination is the same. However, goodwill from the acquisition will be lower to the extent that no relationship is established (by virtue of the DTA recognised in relation to the acquiree's old goodwill). Both goodwill and any deferred tax asset are subject to impairment testing in accordance with the requirements in IAS 36 and IAS 12 respectively.

12.1.4.A A Establishing the extent of any relationship between the old and the new goodwill

As noted above, establishing a relationship between new goodwill in a business combination and any old goodwill involves the exercise of judgement. Goodwill represents the future economic benefits arising from other assets acquired in a business combination that are not individually identified and separately recognised. Considering the new goodwill is a residual asset, a key consideration, as stated above, in accounting for tax consequences of tax-deductible goodwill is, whether there is any relationship between the old and the new goodwill. Entities would need to consider all relevant factors before concluding whether the old and new goodwill are related. Such relevant factors could include, but are not limited, to:

- The timing of the acquisitions creating the old and the new goodwill. If the previous acquisition is recent, it might appear that the new goodwill arose from similar factors as the old goodwill. As the length of the period between the two transactions increases, the factors giving rise to the new goodwill could become different.
- The extent of any differences between the first and second acquirer's expectations regarding the likely synergies from integrating the business that had generated the old goodwill.
- The extent to which the previously acquired business is intact. A greater degree of reorganisation and integration of the previously acquired business with that of its first parent might suggest a weaker relationship between the old goodwill and new goodwill.
- The difference in the value of old and new goodwill could give an indication of their relationship. A large difference between the old and the new goodwill could imply the two are arising from different factors, hence they are unrelated.
- Allocation of goodwill between different CGUs of the consolidated group may provide an indication of relationship. Allocating the new goodwill arising from the second acquisition to a CGU that includes business acquired in the first acquisition might suggest a stronger relationship between the old goodwill and new goodwill.

12.2 Tax deductions for replacement share-based payment awards in a business combination

IFRS 3 contains some guidance on the treatment of tax deductions for share-based payment transactions made by an acquirer as a replacement for awards made by the acquired entity before the business combination. This is discussed in more detail in section 10.8.5 above.

12.3 Apparent immediate impairment of goodwill created by deferred tax

The requirement of IAS 12 to recognise deferred tax on all temporary differences arising on net assets acquired in a business combination leads to the creation of goodwill which, on a literal reading of IAS 36 may then be required to be immediately impaired, as shown in Illustration 12-3 below.

Illustration 12-3: Apparent 'day one' impairment arising from recognition of deferred tax in a business combination

Entity A, which is taxed at 40%, acquires Entity B for CU100m in a transaction that is a business combination. The fair values and tax bases of the identifiable net assets of Entity B are as follows:

	<i>Fair value</i> CU m	<i>Tax base</i> CU m
Brand name	60	-
Other net assets	20	15

This will give rise to the following consolidation journal:

		CU m	CU m
Dr	Goodwill (balance)	46	
Dr	Brand name	60	
Dr	Other net assets	20	
	Cr Deferred tax ¹		26
	Cr Cost of investment		100

1 40% of (CU[60m + 20m] - CU15m)

The fair value of the consolidated assets of the subsidiary (excluding deferred tax) and goodwill is now CU126m, but the cost of the subsidiary is only CU100m. Clearly CU26m of the goodwill arises solely from the recognition of deferred tax. However, IAS 36.50 explicitly requires tax to be excluded from the estimate of future cash flows used to calculate any impairment. This raises the question of whether there must be an immediate impairment write-down of the assets to CU100m. In our view, this is unlikely to have been the intention of IAS 36 (see the further discussion in Chapter 21).

12.4 Tax deductions for acquisition costs

Under IFRS 3 transaction costs are required to be expensed. However, in a number of jurisdictions, transaction costs are regarded as forming part of the cost of the investment for tax purposes, with the effect that a tax deduction for them is given only when the investment is subsequently sold or otherwise disposed of, rather than at the time that the costs are charged to profit or loss.

In such jurisdictions, there will be a deductible 'outside' temporary difference (see section 7.6 above) between the carrying value of the net assets and goodwill of the acquired entity in the consolidated financial statements (which will exclude transaction costs) and tax base of the investment in the entity (which will include transaction costs). Whether or not a deferred tax asset is recognised in respect of such a deductible temporary difference will be determined in accordance with the general provisions of IAS 12 for deductible temporary differences (see section 7.6.3 above).

In the separate financial statements of the acquirer, there may be no temporary difference where the transaction costs are, under IAS 27, included in the cost of the investment.

12.5 Temporary differences arising from the acquisition of a group of assets that is not a business

Although the acquisition of an asset or a group of assets that do not constitute a business is not within the scope of IFRS 3, in such cases the acquirer has to identify and recognise the individual identifiable assets acquired (including intangible assets) and liabilities assumed. The cost of the group is allocated to the individual identifiable assets and liabilities on the basis of their relative fair values at the date of purchase. These transactions or events do not give rise to goodwill. [IFRS 3.2(b)]. Temporary differences may therefore arise because the new carrying value of each acquired asset and liability could be changed without any equivalent adjustment for tax purposes.

However, in these circumstances the acquirer cannot account for any deferred tax assets or deferred tax liabilities, resulting from temporary differences identified. Since the acquisition does not constitute a business combination, the initial recognition exception applies as discussed in section 7.2 above. Indeed, the application of the IRE would mean that no deferred tax is recognised by an acquiring entity, either on initial recognition or subsequently, for any temporary differences related to the 'tax history' of the related assets and liabilities (i.e., in relation to differences between their carrying values before their transfer and their tax base). Furthermore, an entity does not recognise subsequent changes in the unrecognised deferred tax liability or asset as the asset is depreciated. [IAS 12.22(c)].

The requirements of IFRS 3 in relation to the acquisition of an asset or a group of assets that does not constitute a business is discussed in Chapter 10.

13 Presentation

13.1 Statement of financial position

Tax assets and liabilities must be shown separately from other assets and liabilities and current tax must be shown separately from deferred tax on the face of the statement of financial position. Where an entity presents current and non-current assets and liabilities separately, deferred tax must not be shown as part of current assets or liabilities. [IAS 1.54, IAS 1.56]. The extent to which deferred tax assets and liabilities are classified within a disposal group under IFRS 5 is discussed in Chapter 5.

13.1.1 Offset

13.1.1.A Current tax

Current tax assets and liabilities must be offset if, and only if, the entity:

- Has a legally enforceable right to set off the recognised amounts.
- And
- Intends either to settle them net or simultaneously. [IAS 12.71].

These requirements are based on the offset criteria in IAS 32 for financial instruments. The phrase 'if and only if' means that offset is required if both the above conditions are met, but prohibited if they are not both met. Accordingly, while entities in many jurisdictions have a right to offset current tax assets and liabilities, and the tax authority permits the entity to make or receive a single net payment, IAS 12 permits offset in financial statements only where there is a positive intention for simultaneous net settlement. [IAS 12.72].

The offset requirements in IAS 12 also have the effect that, in consolidated financial statements, a current tax asset of one member of the group is offset against a current tax liability of another, if and only if the two group members have a legally enforceable right to make or receive a single net payment and a positive intention to recover the asset or settle the liability simultaneously. [IAS 12.73].

13.1.1.B Deferred tax

Deferred tax assets and liabilities must be offset if, and only if:

- The entity has a legally enforceable right to set off current tax assets against current liabilities
- And
- The deferred tax assets and liabilities concerned relate to income taxes raised by the same taxation authority on either:
 - The same taxable entity.
 - Or
 - Different taxable entities which intend, in each future period in which significant amounts of deferred tax are expected to be settled or recovered, to settle their current tax assets and liabilities either on a net basis or simultaneously. [IAS 12.74].

The phrase 'if and only if' means that offset is required if both the above conditions are met, but prohibited if they are not both met.

The position is that where in a particular jurisdiction current tax assets and current tax liabilities relating to future periods will be offset under the requirements set out in section 13.1.1.A above, deferred tax assets and liabilities relating to that jurisdiction and those periods must also be offset.

This requirement was adopted in order to avoid the need for detailed scheduling of the reversal of temporary differences that would otherwise have been necessary to determine whether taxable temporary differences and deductible temporary differences would reverse in the same periods (and therefore be eligible for offset in their own right). [IAS 12.75].

However, IAS 12 notes that, in rare circumstances, an entity may have a legally enforceable right of set-off, and an intention to settle net, for some periods but not for others. In such circumstances, detailed scheduling may be required to establish reliably whether the deferred tax liability of one taxable entity in the group will result in increased tax payments in the same period in which a deferred tax asset of a second taxable entity in the group will result in decreased payments by that second taxable entity. [IAS 12.76].

13.1.1.C No offset of current and deferred tax

IAS 12 contains no provisions allowing or requiring the offset of current tax and deferred tax. Also, as noted in section 13.1 above, IAS 1 requires tax assets and liabilities to be shown separately from other assets and liabilities and current tax to be shown separately from deferred tax on the face of the statement of financial position. [IAS 1.54(n), IAS 1.54(o)].

How we see it

Accordingly, in our view, current and deferred tax may not be offset against each other and must always be presented gross.

13.2 Statement of comprehensive income

The tax expense (or income) related to profit or loss from ordinary activities must be presented as a component of profit or loss in the statement of comprehensive income. [IAS 12.77].

The IFRS IC noted in July 2012 that the line item of 'tax expense' that is required by IAS 1.82(d) (see Chapter 3) is intended to require an entity to present taxes that meet the definition of income taxes under IAS 12. The IFRS IC also noted that it is the basis of calculation determined by the relevant tax rules that determines whether a tax meets the definition of an income tax and consequently its presentation as a tax expense in the statement of comprehensive income. Accordingly, it is not appropriate to include in the line item for 'tax expense' charges or credits related to taxes that do not meet the definition of an income tax in IAS 12.³⁷

The results of discontinued operations must be presented on a post-tax basis. [IFRS 5.33]. This is discussed further in Chapter 5.

The results of equity-accounted entities must be presented on a post-tax basis. [IAS 1.IG6]. Any income tax relating to a 'tax-transparent' equity-accounted entity (see section 7.7 above) forms part of the investor's tax charge. It is therefore included in the income tax line in profit or loss and not shown as part of the investor's share of the results of the tax-transparent entity. Similarly, any deferred tax recognised in respect of temporary differences arising from differences between the carrying value of the entity's interest in its equity-accounted entities and its tax base forms part of the investor's tax charge. It must not be offset against the carrying value of the investors' interest in its equity-accounted investees,

Entities are required to disclose the amount of income tax relating to each item of other comprehensive income, including reclassification adjustments, either in the statement of profit or loss and other comprehensive income or in the notes. [IAS 1.90]. Components of other comprehensive income may be presented either:

- Net of related tax effects.
- Or
- Before related tax effects with one amount shown for the total income tax effects relating to the items that might be reclassified subsequently to profit and loss and another amount shown for the total income tax effects relating to those items that will not be subsequently reclassified to profit and loss. [IAS 1.91].

IAS 12 notes that, whilst IAS 21 requires certain exchange differences to be recognised within income or expense, it does not specify where exactly in the statement of comprehensive income they must be presented. Accordingly, exchange differences relating to deferred tax assets and liabilities may be classified as deferred tax expense (or income), if that presentation is considered to be the most useful to users of the financial statements. [IAS 12.78]. IAS 12 makes no reference to the treatment of exchange differences on current tax assets and liabilities but, presumably, the same considerations apply.

However, the treatment of exchange differences related to both deferred tax assets and liabilities and current tax assets and liabilities has been clarified in IFRS 18 *Presentation and Disclosure in Financial Statements*, issued by the IASB in April 2024 that supersedes IAS 1 for reporting periods beginning on or after 1 January 2027 (with earlier application permitted).

³⁷ [IFRIC Update](#), July 2012, available on the IFRS Foundation's website.

IFRS 18 has introduced a separate category called 'The income taxes category'. Paragraph 67 of IFRS 18 requires an entity to classify in the income taxes category tax expense or tax income that is included in the statement of profit or loss applying IAS 12 including related foreign exchange differences, if any. [IFRS 18.67]. Accordingly, applying IFRS 18, an entity must classify exchange differences related to both deferred tax assets and liabilities and current tax assets and liabilities in the income taxes category of the profit and loss statement. Paragraph 78 of IAS 12 is consequentially amended upon the issuance of IFRS 18 to refer to, and require entities to apply, paragraph 67 of IFRS 18. See Chapter 4 for further guidance regarding the requirements in IFRS 18.

13.3 Statement of cash flows

Cash flows arising from taxes on income are separately disclosed and classified as cash flows from operating activities, unless they can be specifically identified with financing and investing activities. [IAS 7.35].

IAS 7 *Statement of Cash Flows* notes that, whilst it is relatively easy to identify the expense relating to investing or financing activities, the related tax cash flows are often impracticable to identify. Therefore, taxes paid are usually classified as cash flows from operating activities. However, when it is practicable to identify the tax cash flow with an individual transaction that gives rise to cash flows that are classified as investing or financing activities, the tax cash flow is classified as an investing or financing activity as appropriate. When tax cash flows are allocated over more than one class of activity, the total amount of taxes paid is disclosed. [IAS 7.36].

14 Disclosure

IAS 12 imposes extensive disclosure requirements as follows.

14.1 Components of tax expense

The major components of tax expense (or income) must be disclosed separately. [IAS 12.79, IAS 12.80].

Extract from IAS 12

- 80 Components of tax expense (income) may include:
- (a) current tax expense (income);
 - (b) any adjustments recognised in the period for current tax of prior periods;
 - (c) the amount of deferred tax expense (income) relating to the origination and reversal of temporary differences;
 - (d) the amount of deferred tax expense (income) relating to changes in tax rates or the imposition of new taxes;
 - (e) the amount of the benefit arising from a previously unrecognised tax loss, tax credit or temporary difference of a prior period that is used to reduce current tax expense;
 - (f) the amount of the benefit from a previously unrecognised tax loss, tax credit or temporary difference of a prior period that is used to reduce deferred tax expense;
 - (g) deferred tax expense arising from the write-down, or reversal of a previous write-down, of a deferred tax asset in accordance with paragraph 56; and
 - (h) the amount of tax expense (income) relating to those changes in accounting policies and errors that are included in profit or loss in accordance with IAS 8, because they cannot be accounted for retrospectively.

14.2 Other disclosures

The following must also be disclosed separately: [IAS 12.81]

- (a) The aggregate current and deferred tax relating to items that are charged or credited to equity.
- (b) The amount of income tax relating to each component of other comprehensive income.
The analysis in (b) can be provided either in the statement of profit or loss and other comprehensive income or in the notes. [IAS 1.90].
- (c) An explanation of the relationship between tax expense (or income) and accounting profit in either or both of the following forms:
 - (i) A numerical reconciliation between tax expense (or income) and the product of accounting profit multiplied by the applicable tax rate(s), disclosing also the basis on which the applicable tax rate(s) is (are) computed.
 - Or
 - (ii) A numerical reconciliation between the average effective tax rate (i.e., tax expense (or income) divided by accounting profit), [IAS 12.86], and the applicable tax rate, disclosing also the basis on which the applicable tax rate is computed.

This requirement is discussed further in section 14.2.1 below.
- (d) An explanation of changes in the applicable tax rate(s) compared to the previous accounting period.
- (e) The amount (and expiry date, if any) of deductible temporary differences, unused tax losses, and unused tax credits for which no deferred tax asset is recognised in the statement of financial position.
- (f) The aggregate amount of temporary differences associated with investments in subsidiaries, branches and associates and interests in joint arrangements, for which deferred tax liabilities have not been recognised.
This is discussed further in section 14.2.2 below.
- (g) In respect of each type of temporary difference, and in respect of each type of unused tax losses and unused tax credits:
 - (i) The amount of the deferred tax assets and liabilities recognised in the statement of financial position for each period presented.

And

- (ii) The amount of the deferred tax income or expense recognised in profit or loss, if this is not apparent from the changes in the amounts recognised in the statement of financial position.

The analysis in (ii) will be required, for example, by any entity with acquisitions and disposals, or deferred tax accounted for in other comprehensive income or equity, since this will have the effect that the year-on-year movement in the statement of financial position is not solely due to items recognised in profit or loss.

- (h) In respect of discontinued operations, the tax expense relating to:

- (i) The gain or loss on discontinuance.

And

- (ii) The profit or loss from the ordinary activities of the discontinued operation for the period, together with the corresponding amounts for each prior period presented.

- (i) The amount of income tax consequences of dividends to shareholders of the entity that were proposed or declared before the financial statements were authorised for issue, but are not recognised as a liability in the financial statements.

Further disclosures are required in respect of the tax consequences of distributing retained earnings, which are discussed in section 14.4 below.

- (j) If a business combination in which the entity is the acquirer causes a change in the amount of a pre-acquisition deferred tax asset of the entity (see section 12.1.2 above), the amount of that change.
- (k) If the deferred tax benefits acquired in a business combination are not recognised at the acquisition date, but are recognised after the acquisition date (see section 12.1.2 above), a description of the event or change in circumstances that caused the deferred tax benefits to be recognised.

The requirement at (e) and (f) above is to disclose the amount of the relevant temporary differences that have not been recognised (i.e., gross) whereas at (g) and (i) above, the requirement is to disclose the tax amount.

Tax-related contingent liabilities and contingent assets (such as those arising from unresolved disputes with taxation authorities) are disclosed in accordance with IAS 37 (see section 9.6 above and Chapter 27).

[IAS 12.88].

Significant effects of changes in tax rates or tax laws enacted or announced after the reporting period on current and deferred tax assets and liabilities are disclosed in accordance with IAS 10 (see Chapter 34).

[IAS 12.88].

14.2.1 Tax (or tax rate) reconciliation

IAS 12 explains that the purpose of the tax reconciliation required by (c) above is to enable users of financial statements to understand whether the relationship between tax expense (or income) and accounting profit is unusual and to understand the significant factors that could affect that relationship in the future. The relationship may be affected by the effects of such factors as:

- Revenue and expenses that are outside the scope of taxation.
- Tax losses.
- Foreign tax rates. [IAS 12.84].

Accordingly, in explaining the relationship between tax expense (or income) and accounting profit, an entity must use an applicable tax rate that provides the most meaningful information to the users of its financial statements.

Often, the most meaningful rate is the domestic rate of tax in the country in which the entity is domiciled. In this case, the tax rate applied for national taxes must be aggregated with the rates applied for any local taxes which are computed on a substantially similar level of taxable profit (tax loss). However, for an entity operating in several jurisdictions, it may be more meaningful to aggregate separate reconciliations prepared using the domestic rate in each individual jurisdiction. [IAS 12.85]. Where this latter approach is adopted, the entity may need to discuss the effect of significant changes in either tax rates, or the mix of profits earned in different jurisdictions, in order to satisfy the requirement of IAS 12 to explain changes in the applicable tax rate(s) compared to the previous accounting period - see item (d) in section 14.2 above.

Illustration 14-1 demonstrates how the selection of the applicable tax rate affects the presentation of the numerical reconciliation.

Illustration 14-1: Alternative presentations of tax reconciliation

In 20X3 an entity has accounting profit of CU3,000m (20X2: CU2,500m) comprising CU1,500m (20X2: CU2,000m) in its own jurisdiction (country A) and CU1,500m (20X2: CU500m) in country B. The tax rate is 30% in country A and 20% in country B. In country B, expenses of CU200m (20X2: CU100m) are not deductible for tax purposes. There are no other differences between accounting profit and profit that is subject to current tax, or on which deferred tax has been provided for under IAS 12.

Thus, the accounting tax charge in the financial statements for each period will be as follows:

	20X3	20X2
	CU m	CU m
<i>Country A</i>		
CU1,500m/CU2,000m @ 30%	450	600
<i>Country B</i>		
CU(1,500 + 200)m/CU(500 + 100)m @ 20%	340	120
Total tax charge	790	720

Reconciliation based on A's domestic tax rate

If the entity presents a tax reconciliation based on its own (i.e., country A's) domestic tax rate, the following presentation would be adopted.

	20X3	20X2
	CU m	CU m
Accounting profit	3,000	2,500
Tax at domestic rate of 30%	900	750
Effect of:		
Expenses not deductible for tax purposes ¹	60	30
Overseas tax rates ²	(170)	(60)
Tax expense	790	720

1 CU200m/CU100m @ 30%

2 B's taxable profit CU1,700m/CU600m @ (20% - 30%)

Reconciliation based on each jurisdiction's tax rate

If the entity presents a tax reconciliation based on each jurisdiction's domestic tax rate, the following presentation would be adopted.

	20X3	20X2
	CU m	CU m
Accounting profit	3,000	2,500
Tax at domestic rates applicable to individual group entities ¹	750	700
Effect of:		
Expenses not deductible for tax purposes ²	40	20
Tax expense	790	720

14.2.2 Temporary differences relating to subsidiaries, associates, branches and joint arrangements

IAS 12 requires an entity to disclose the gross temporary differences associated with subsidiaries, associates, branches and joint arrangements for which a deferred tax liability is not recognised, as opposed to the unrecognised deferred tax on those temporary differences - see (f) under 14.2 above.

IAS 12 clarifies that this approach is adopted because it would often be impracticable to compute the amount of unrecognised deferred tax. Nevertheless, where practicable, entities are encouraged to disclose the amounts of the unrecognised deferred tax liabilities because financial statement users may find such information useful. [IAS 12.87].

14.3 Reason for recognition of particular tax assets

Separate disclosure is required of the amount of any deferred tax asset that is recognised, and the nature of the evidence supporting its recognition, when:

- (a) Utilisation of the deferred tax asset is dependent on future profits in excess of those arising from the reversal of deferred tax liabilities.

And

- (b) The entity has suffered a loss in the current or preceding period in the tax jurisdiction to which the asset relates. [IAS 12.82].

In effect these disclosures are required when the entity has rebutted the presumption inherent in the recognition rules of IAS 12 that tax assets will not normally be recognised in these circumstances (see section 7.5 above).

14.4 Dividends

As discussed in section 8.5 above, where there are different tax consequences for an entity depending on whether profits are retained or distributed, tax must be measured at the rates applicable to retained profits except to the extent that there is a liability to pay dividends at the end of the reporting period, where the rate applicable to distributed profits must be used.

Where such differential tax rates apply, the entity must disclose the nature of the potential income tax consequences that would arise from a payment of dividends to shareholders. It must quantify the amount of potential income tax consequences that is practicably determinable and disclose whether there are any potential income tax consequences that are not practicably determinable. [IAS 12.82A]. This will include disclosure of the important features of the income tax systems and the factors that will affect the amount of the potential income tax consequences of dividends. [IAS 12.87A].

The reason for this rather complicated requirement is that, as IAS 12 acknowledges, it can often be very difficult to quantify the tax consequences of a full distribution of profits (e.g., where there are a large number of overseas subsidiaries). [IAS 12.87B]. Moreover, IAS 12 concedes that there is a tension between, on the one hand, the exemption from disclosing the deferred tax associated with temporary differences associated with subsidiaries and other investments (see section 14.2.2 above) and, on the other hand, this requirement to disclose the tax effect of distributing undistributed profits. [IAS 12.87C].

However, to the extent that any liability can be quantified, it must be disclosed. This may mean that consolidated financial statements will disclose the potential tax effect of distributing the earnings of some, but not all, subsidiaries, associates, branches and joint arrangements.

IAS 12 emphasises that, in an entity's separate financial statements, this requirement applies only to the undistributed earnings of the entity itself and not those of any of its subsidiaries, associates, branches and joint arrangements. [IAS 12.87B].

14.5 International tax reform-Pillar Two model rules

See sections 4.6.2.C, 4.6.2.D and 4.6.2.E above for the disclosure requirements related to Pillar Two Income Taxes introduced by the amendments to IAS 12 in May 2023.

14.6 Examples of disclosures

14.6.1 Components of tax expense and reconciliation of the tax charge

In Practical example 14-1 below, Shell plc sets out the components of the tax expense and provides a reconciliation of the tax charge in the income statement. [IAS 12.79, IAS 12.80, IAS 12.81(c)].

Practical example 14-1: Shell plc (2023)

United Kingdom

Annual Report and Accounts [extract]

Financial Statements and Supplements [extract]

Consolidated Financial Statements [extract]

Notes to the Consolidated Financial Statements [extract]

22. Taxation [extract]

Taxation charge

	2023	2022	\$ million 2021
Current tax:			
Charge in respect of current period	13,066	16,383	7,254
Adjustments in respect of prior periods	(422)	(947)	(719)
Total	12,644	15,436	6,535
Deferred tax:			
Relating to the origination and reversal of temporary differences, tax losses and credits	(305)	5,196	2,971
Relating to changes in tax rates and legislation	242	785	10
Adjustments in respect of prior periods	410	524	(317)
Total	347	6,505	2,664
Total taxation charge	12,991	21,941	9,199

Adjustments in respect of prior periods relate to events in the current period and reflect the effects of changes in rules, facts or other factors compared with those used in establishing the current tax position or deferred tax balance in prior periods.

Adjustments in respect of changes in tax rates and legislation in 2022 principally relate to the introduction of the UK Energy Profits Levy Act 2022 (EPL) on July 14, 2022.

On December 20, 2021, the OECD/G20 Inclusive Framework on BEPS released the Pillar Two Model Rules aimed to address the tax challenges of the digitalisation of the economy. The Pillar Two rules are designed to ensure large multinational enterprises (meeting certain conditions) pay a minimum level of tax on the income arising in each jurisdiction where they operate. On June 20, 2023, the UK substantively enacted Pillar Two. Shell has established a Group-wide Pillar Two Project, with oversight from senior executives, to prepare and implement these new tax rules.

Shell has applied the exception, as set out in the amendments to IAS 12, to recognising and disclosing information about deferred tax assets and liabilities related to Pillar Two income taxes. The adoption of Pillar Two by the jurisdictions in which Shell operates is not expected to have a significant impact (see also Note 2).

Reconciliation of applicable tax charge at statutory tax rates to taxation charge

	2023	2022	\$ million 2021
Income before taxation	32,627	64,815	29,829
Less: share of profit of joint ventures and associates	(3,725)	(3,972)	(4,097)
Income before taxation and share of profit of joint ventures and associates	28,902	60,843	25,732
Applicable tax charge at standard statutory tax rates	11,921	22,170	10,097
Adjustments in respect of prior periods	(12)	(424)	(1,036)
Tax effects of:			
Expenses not deductible for tax purposes	1,225	849	893
Incentives for investment and development	(553)	(1,388)	(467)
Derecognition/(recognition) of deferred tax assets	243	(457)	(113)
Changes in tax rates and legislation	242	785	10
Income not subject to tax at standard statutory rates	(213)	234	90
Disposals	(113)	39	(328)
Exchange rate differences	89	(102)	53
Other reconciling items	162	235	—
Taxation charge	12,991	21,941	9,199
Weighted average of statutory tax rates [A]	41%	36%	39%
Effective tax rate based on income before taxation [B]	40%	34%	31%
Effective tax rate based on income before taxation excluding share of profit of joint ventures and associates [C]	45%	36%	36%

[A] The weighted average of statutory tax rates is calculated by dividing the applicable tax charge at standard statutory tax rates by Income before taxation and share of profit of joint ventures and associates.

[B] The effective tax rate based on income before taxation is calculated by dividing Taxation charge by Income before taxation.

[C] The effective tax rate based on income before taxation excluding share of profit of joint ventures and associates is calculated by dividing Taxation charge by Income before taxation and share of profit of joint ventures and associates.

Post-retirement obligations	209	203	(30)	(19)	179	184
Provisions	396	300	(9)	(13)	387	287
Other items	320	153	(210)	(211)	110	(58)
Tax losses carried forward	854	348	—	—	854	348
Tax assets/(liabilities)	2,526	1,631	(3,447)	(3,151)	(921)	(1,520)
Set-off of tax	(1,234)	(1,013)	1,234	1,013	—	—
Net tax assets/(liabilities)	1,292	618	(2,213)	(2,138)	(921)	(1,520)

In 2023, HEINEKEN approved a corporate restructuring plan to optimize the legal structure of Heineken Brazil, and part of the plan was executed in 2023. As a result of this restructuring, previously unrecognised deferred tax assets were recognised, amounting to €751 million. These assets mainly relate to tax losses carried forward. The measurement of these deferred tax assets takes into account the recent tax law changes in Brazil, effective from 2024, which are expected to lead to higher taxable profits in future years. Furthermore, a number of mergers are planned in future years resulting in a tax depreciable base, amounting to €403 million. No deferred tax asset was recorded for this tax depreciable base in 2023 awaiting the respective mergers. Reassessment will take place at the end of each reporting period.

Of the total net deferred tax assets of €1,292 million as at 31 December 2023 (2022: €618 million), €72 million (2022: €84 million) is recognised in respect of subsidiaries in various countries where there have been losses in the current or preceding period. Management's projections support the assumption that it is probable that the results of future operations will generate sufficient taxable income to utilise these deferred tax assets. This judgement is performed annually and based on budgets and business plans for the coming years, including planned commercial initiatives.

No deferred tax liability has been recognised in respect of undistributed earnings of subsidiaries, joint ventures and associates, with an impact of €743 million (2022: €573 million). This is because HEINEKEN is able to control the timing of the reversal of the temporary differences, and it is probable that such differences will not reverse in the foreseeable future.

Tax losses carried forward

HEINEKEN has tax losses carried forward of €4,011 million as at 31 December 2023 (2022: €3,802 million), out of which €294 million (2022: €389 million) expires in the following five years, €162 million (2022: €158 million) will expire after five years and €3,555 million (2022: €3,255 million) can be carried forward indefinitely. Deferred tax assets have not been recognised in respect of tax losses carried forward of €1,076 million (2022: €2,470 million) as it is not probable that taxable profit will be available to offset these losses. Out of this €1,076 million (2022: €2,470 million), €142 million (2022: €276 million) expires in the following five years, €13 million (2022: €37 million) will expire after five years and €921 million (2022: €2,157 million) can be carried forward indefinitely.

14.6.3 Tax-related contingent liabilities

In Practical example 14-3 below, Hochschild Mining PLC describes the general nature of its tax-related contingent liabilities relating to fiscal periods that are still open to review by the tax authorities and quantifies its estimate of the possible total exposure to tax assessments. [IAS 12.88].

Practical example 14-3: Hochschild Mining PLC (2023)

United Kingdom

Annual Report and Accounts 2023 [extract]

Financial Statements 2023 [extract]

NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS [extract]

37 Contingencies [extract]

(a) Taxation

Fiscal periods remain open to review by the tax authorities for four years in Peru, five years in Argentina and Mexico, ten years in Brazil and three years in Chile, preceding the year of review. During this time the authorities have the right to raise additional tax assessments including penalties and interest. Under certain circumstances, reviews may cover longer periods.

Because a number of fiscal periods remain open to review by the tax authorities, coupled with the complexity of the Group and the transactions undertaken by it, there remains a risk that significant additional tax liabilities may arise. As at 31 December 2023, the Group had exposures totalling US\$19,885,000 (2022: US\$20,713,000).

When the Tax authority challenges the deductibility of certain expenses the Group reassesses the case internally and externally, with the support of a third party professional to determine the probability of success and, depending on the result, makes the decision whether or not to continue with the claim. Notwithstanding this risk, the Directors believe that management's interpretation of the relevant legislation and assessment of taxation is appropriate and that it is probable that the Group's tax and customs positions will be sustained in the event of a challenge by the tax authorities. Consequently, the Directors consider that no tax liability is required to be recognised in respect of these claims or risks.

14.6.4 Information regarding temporary differences for which no deferred taxes are recognised

The disclosures in Practical example 14-4 below include information about deductible temporary differences, unused tax losses and unused tax credits in respect of which no deferred tax asset has been recognised, together with details of the aggregate amount of temporary differences associated with its investments in subsidiaries and equity-accounted entities for which deferred tax liabilities have not been recognised. [IAS 12.81(e), IAS 12.81(f)].

9. Taxation [extract]

Deferred Tax [extract]

...

A summary of temporary differences, unused tax credits and unused tax losses for which deferred tax has not been recognized is shown in the table below.

	\$ billion	
At 31 December	2023	2022
Unused US state tax losses ^a	2.1	2.1
Unused tax losses – other jurisdictions ^b	5.6	5.4
Unused tax credits	31.3	28.6
of which – arising in the UK ^c	27.3	24.6
– arising in the US ^d	4.0	4.0
Deductible temporary differences ^e	20.7	22.7
Taxable temporary differences associated with investments in subsidiaries and equity-accounted entities	0.7	0.7

^a For 2023 the majority of these losses expire in the period 2024-2043 with applicable tax rates ranging from 3% to 9%.

^b 2023 and 2022 mainly relate to the UK, Brazil and Canada. The majority of the unused tax losses have no fixed expiry date.

^c The UK unused tax credits arise predominantly in overseas branches of UK entities based in jurisdictions with higher statutory corporate income tax rates than the UK. No deferred tax asset has been recognized on these tax credits as they are unlikely to have value in the future; UK taxes on these overseas branches are largely mitigated by double tax relief in respect of overseas tax. These tax credits have no fixed expiry date.

^d The US unused tax credits predominantly comprise foreign tax credits. No deferred tax asset has been recognized on these tax credits as they are unlikely to have value in the future. For 2023 these tax credits expire in the period 2025-2033.

^e 2023 and 2022 mainly comprise fixed asset temporary differences in overseas branches of UK entities. Substantially all of the temporary differences have no expiry date.

	\$ million		
Impact of previously unrecognized deferred tax or write-down of deferred tax assets on tax charge	2023	2022	2021
Current tax benefit relating to the utilization of previously unrecognized deferred tax assets	360	492	331
Deferred tax benefit arising from the reversal of a previous write-down of deferred tax assets	3	—	773
Deferred tax benefit relating to the recognition of previously unrecognized deferred tax assets	332	792	820
Deferred tax expense arising from the write-down of a previously recognized deferred tax asset	54	—	29

14.6.5 Evidence supporting recognition of deferred tax assets

In Practical example 14-5 below, Energean plc discloses the nature of the evidence supporting its recognition of deferred tax assets in excess of its taxable temporary differences, including where entities in the group have recently incurred losses. [IAS 12.82].

Practical example 14-5: Energean plc (2023)

United Kingdom

2023 Annual Report [extract]

Financial Statements [extract]

CONSOLIDATED FINANCIAL STATEMENTS [extract]

Notes to the Consolidated Financial Statements [extract]

14 Net deferred tax (liability)/asset [extract]

...

(\$'000)	2023	2022
Deferred tax liabilities	(122,785)	(56,114)
Deferred tax assets	217,504	242,226
	94,719	186,112

At 31 December 2023 the Group had gross unused tax losses of \$907.4 million (as of 31 December 2022: \$1,093.8 million) available to offset against future profits and other temporary differences. A deferred tax asset of \$144.9 million (2022: \$197.0 million) has been recognised on tax losses of \$571.5 million, based on the forecasted profits. The Group did not recognise deferred tax on tax losses and other differences of total amount of \$655.1 million.

In Greece, Italy and the UK, the net DTA for carried forward losses recognised in excess of the other net taxable temporary differences was \$77.8 million, \$19.6 million and \$10.8 million (2022: \$69.2 million, \$33.4 million and \$15.1 million) respectively. An additional DTA of \$109.3 million (2022: \$124.6 million) arose primarily in respect of deductible temporary differences related to property, plant and equipment, decommissioning provisions and accrued expenses, resulting in a total DTA of \$217.5 million (2022: \$242.2 million). During the period, Italy recognised a DTA of \$19.6 million on tax losses of \$81.6 million in accordance with its latest tax losses utilisation forecast.

Greek tax losses (Prinos area) can be carried forward without limitation up until the relevant concession agreement expires (by 2039), whereas the tax losses in Israel, Italy and the United Kingdom can be carried forward indefinitely. Based on the Prinos area forecasts (including the Epsilon development), the deferred tax asset is fully utilised by 2032. In Italy, deferred tax asset of \$94.6 million recognised on decommissioning costs scheduled up to the year the Italian assets expect to enter into a declining phase assuming that there still be available profits from Cassiopea asset and other long-lived assets. Finally, in the UK, decommissioning losses is expected to be tax relieved up until 2028 in accordance with the latest taxable profits forecasts.

14.6.6 Impact of amendment to IAS 12 related to Pillar Two income taxes

In Practical example 14-6 below, BHP Group Limited discloses the adoption of the amendment to IAS 12 which introduced a mandatory exception to recognising and disclosing information about deferred tax assets and liabilities related to Pillar Two income taxes [IAS 12.88A].

Practical example 14-6: BHP Group Limited (2024)	Australia
Annual Report 2024 [extract] Financial Statements [extract] 1 Consolidated Financial Statements [extract] Notes to the Financial Statements [extract] 6. Income tax expense [extract] International Tax Reform – Pillar Two Model Rules <p>The Organisation for Economic Co-operation and Development (OECD)/G20 Inclusive Framework on Base Erosion and Profit Shifting previously published the Pillar Two model rules designed to address the tax challenges arising from the digitalisation of the global economy, including the implementation of a global minimum tax. The Group has a presence in jurisdictions that have enacted or substantively enacted legislation in relation to the OECD/G20 BEPS Pillar Two model rules.</p> <p>The enacted or substantively enacted rules apply to income years commencing on or after 1 January 2024 and, on this basis, there is no current tax impact for the income year ended 30 June 2024. The temporary exception to recognising and disclosing information about deferred tax assets and liabilities related to Pillar Two income taxes has been applied at 30 June 2024, pursuant to the amendments to IAS 12 issued on 23 May 2023 and 27 June 2023 by the IASB and AASB respectively.</p> <p>The Group continues to monitor and evaluate the domestic implementation of the Pillar Two rules in the jurisdictions in which it operates. The Group's potential exposure to Pillar Two taxes, based on legislation that is enacted or substantively enacted, is not expected to be material.</p>	

14.7 Discontinued operations - interaction with IFRS 5

IFRS 5 requires the post-tax results of discontinued operations to be shown separately on the face of the statement of comprehensive income (and any separate income statement presenting the components of profit or loss). This may be done by giving the results of discontinued operations after those of continuing operations. This is discussed further in Chapter 5.

The definitions of income tax, tax expense and taxable profit in IAS 12 (see section 3 above) do not distinguish between the results of continuing and discontinued operations, or the tax on those results. Thus, as drafted, IAS 12 applies not only to the tax income or expense on continuing operations (i.e., the amount shown in the 'tax line' in the income statement) but also to any tax income or expense relating to the results of discontinued operations separately disclosed after those of continuing operations.

The extent to which deferred tax assets and liabilities are classified within a disposal group under IFRS 5 is discussed in Chapter 5.

Appendix B - Index of Frequently asked questions

Question 4-1:	Which taxes are in the scope of IAS 12?	2423
Question 4-2:	How do you determine whether interest and penalties related to income taxes are in the scope of IAS 12?	2428
Question 7-1:	How, in its consolidated financial statements, does an entity account for a transaction in which it acquires all the shares of another entity that has an investment property as its only asset?	2469
Question 7-2:	How does an entity justify the recognition of deferred tax assets on the basis of taxable temporary differences as at the reporting date, when it expects to incur tax losses in the future?	2486
Question 8-1:	How do you determine the tax base of an asset under IAS 12, when for tax purposes no deductions are available through use; but its cost is fully deductible when sold?	2504
Question 8-2:	How do you determine the expected manner of recovery for an intangible asset that is not being amortised because it has an indefinite useful life?	2506
Question 8-3:	When an investee operates in a jurisdiction where profits are only taxed when distributed, how does its investor determine whether to recognise deferred tax related to its investment in a subsidiary and, if it does, on what basis is it measured?	2509
Question 8-4:	When determining the expected manner of recovery of an asset for the purposes of IAS 12, can an entity have regard to the fact that an asset held by a 'single asset' entity can be disposed of by selling the shares of the entity rather than the asset itself?	2510
Question 8-5:	How does a group account in its consolidated financial statements for an intragroup transfer of goodwill when the tax base is retained by the transferor entity?	2516
Question 9-1:	Is an entity required to present uncertain tax liabilities as current (or deferred) tax liabilities or, instead, can such liabilities be presented within another line item such as provisions?	2523
Question 9-2:	Can an asset be recognised for the amount paid to settle a tax assessment arising from a tax examination when the entity is still challenging the charge and expects, but is not certain, to recover some, or all, of the amount paid?	2524
Question 10-1:	When the tax bases of an entity's non-monetary assets are determined in a currency that is different from its functional currency, where must deferred tax be recognised?	2527

Appendix C - Defined terms

Extract from IFRS accounting standards - Definitions

accounting profit	Accounting profit is profit or loss for a period before deducting tax expense. <i>[IAS 12.5].</i>
current tax	Current tax is the amount of income taxes payable (recoverable) in respect of the taxable profit (tax loss) for a period. <i>[IAS 12.5].</i>
deferred tax assets	Deferred tax assets are the amounts of income taxes recoverable in future periods in respect of: <ul style="list-style-type: none"> (a) deductible temporary differences; (b) the carryforward of unused tax losses; and (c) the carryforward of unused tax credits. <i>[IAS 12.5].</i>
deferred tax liabilities	Deferred tax liabilities are the amounts of income taxes payable in future periods in respect of taxable temporary differences. <i>[IAS 12.5].</i>
income taxes	For the purposes of this Standard, income taxes include all domestic and foreign taxes which are based on taxable profits. Income taxes also include taxes, such as withholding taxes, which are payable by a subsidiary, associate or joint arrangement on distributions to the reporting entity. <i>[IAS 12.2].</i>
taxable profit (tax loss)	Taxable profit (tax loss) is the profit (loss) for a period, determined in accordance with the rules established by the taxation authorities, upon which income taxes are payable (recoverable). <i>[IAS 12.5].</i>
taxation authority	In this interpretation: <ul style="list-style-type: none"> (a) ... (b) 'taxation authority' refers to the body or bodies that decide whether tax treatments are acceptable under tax law. This might include a court. (c) ... <i>[IFRIC 23.3].</i>
tax base	The tax base of an asset or liability is the amount attributed to that asset or liability for tax purposes. <i>[IAS 12.5].</i>
tax expense (tax income)	Tax expense (tax income) is the aggregate amount included in the determination of profit or loss for the period in respect of current tax and deferred tax. <i>[IAS 12.5].</i>
tax treatments	In this interpretation: <ul style="list-style-type: none"> (a) 'tax treatments' refers to the treatments used by an entity or that it plans to use in its income tax filings. (b) ... <i>[IFRIC 23.3].</i>
temporary differences	Temporary differences are differences between the carrying amount of an asset or liability in the statement of financial position and its tax base. Temporary differences may be either: <ul style="list-style-type: none"> (a) taxable temporary differences, which are temporary differences that will result in taxable amounts in determining taxable profit (tax loss) of future periods when the carrying amount of the asset or liability is recovered or settled; or (b) deductible temporary differences, which are temporary differences that will result in amounts that are deductible in determining taxable profit (tax loss) of future periods when the carrying amount of the asset or liability is recovered or settled. <i>[IAS 12.5].</i>

uncertain tax treatment

In this interpretation:

- (a) ...
- (c) an 'uncertain tax treatment' is a tax treatment for which there is uncertainty over whether the relevant taxation authority will accept the tax treatment under tax law. For example, an entity's decision not to submit any income tax filing in a tax jurisdiction, or not to include particular income in taxable profit, is an uncertain tax treatment if its acceptability is uncertain under tax law.

[IFRIC 23.3].

Chapter 30

Share-based payment

Contents

Overview	2591
1 Introduction	2593
1.1 Background	2593
1.2 Development of IFRS 2 and amendments to the standard	2593
1.2.1 IFRS 2 research project	2594
1.3 Scope of the chapter and referencing convention	2595
1.4 Overall approach of IFRS 2	2595
1.4.1 Classification differences between IFRS 2 and IAS 32/IFRS 9	2596
2 The objective and scope of IFRS 2	2597
2.1 Objective	2597
2.2 Scope	2598
2.2.1 Definitions	2598
2.2.2 Transactions within the scope of IFRS 2	2599
2.2.2.A Group schemes and transactions with group shareholders: scope issues	2599
2.2.2.B Transactions with employee benefit trusts and similar vehicles	2604
2.2.2.C Transactions where the identifiable consideration received appears to be less than the consideration given	2605
2.2.2.D 'All employee' share plans	2605
2.2.2.E Vested transactions	2606
2.2.3 Transactions not within the scope of IFRS 2	2607
2.2.3.A Transactions with shareholders in their capacity as such	2607
2.2.3.B Transfer of assets in group restructuring arrangements	2607
2.2.3.C Business combinations	2607
2.2.3.D Common control transactions and formation of joint arrangements	2608
2.2.3.E Transactions in the scope of IAS 32 and IFRS 9	2608
2.2.3.F Transactions in financial assets outside the scope of IAS 32 and IFRS 9	2608
2.2.4 Some practical applications of the scope requirements	2608
2.2.4.A Remuneration in non-equity shares and arrangements with put rights over equity shares	2609
2.2.4.B Equity-settled award of subsidiary with put option against the parent - treatment in consolidated accounts of parent	2609
2.2.4.C Increase in ownership interest with no change in number of shares held	2610
2.2.4.D Awards for which the counterparty has paid 'fair value'	2611
2.2.4.E Cash bonus dependent on share price performance	2611
2.2.4.F Cash-settled awards based on an entity's 'enterprise value' or other formula	2611

2.2.4.G	Awards with a foreign currency strike price	2612
2.2.4.H	Holding own shares to satisfy or 'hedge' awards	2612
2.2.4.I	Shares or warrants issued in connection with a loan or other financial liability	2613
2.2.4.J	Options over puttable instruments classified as equity under specific exception in IAS 32	2613
2.2.4.K	Special discounts to certain categories of investor on a share issue	2613
2.2.4.L	Acquisitions involving a listed shell entity	2614
3	General recognition principles	2617
3.1	Vesting conditions	2617
3.1.1	'Malus' clauses and clawback conditions	2619
3.1.2	Vesting conditions based on an employee's performance rating	2620
3.1.3	Environment Social and Governance ('ESG') related conditions	2620
3.2	Non-vesting conditions (conditions that are neither service conditions nor performance conditions)	2621
3.2.1	Background	2621
3.2.2	Defining a non-vesting condition	2622
3.2.3	Non-compete agreements	2624
3.3	Vesting period	2625
3.4	Vesting and non-vesting conditions: issues referred to the IFRS IC and the IASB	2626
4	Equity-settled transactions - overview	2627
4.1	Summary of accounting treatment	2627
4.2	The credit entry	2628
5	Equity-settled transactions - cost of awards	2629
5.1	Cost of awards - overview	2629
5.2	Transactions with employees	2630
5.2.1	Who is an 'employee'?	2630
5.2.2	Basis of measurement	2631
5.3	Grant date	2631
5.3.1	Determination of grant date	2632
5.3.2	Communication of awards to employees and services in advance of grant date	2633
5.3.3	Exercise price or performance target dependent on a formula or future share price	2634
5.3.4	Exercise price paid in shares (net settlement of award)	2634
5.3.5	Award of equity instruments to a fixed monetary value	2635
5.3.6	Awards over a fixed pool of shares (including 'last man standing' arrangements)	2635
5.3.7	Awards with multiple service and performance periods	2636
5.3.8	Awards subject to modification by entity after original grant date	2637
5.3.8.A	Significant equity restructuring or transactions	2638
5.3.8.B	Interpretation of general terms	2638
5.3.8.C	Discretion to make further awards	2639
5.3.9	'Good leaver' arrangements	2639
5.3.9.A	Provision for 'good leavers' made in original terms of award	2639
5.3.9.B	Discretionary awards to 'good leavers'	2640
5.3.9.C	Automatic full or <i>pro rata</i> entitlement on leaving employment	2641
5.3.10	Special purpose acquisition companies ('SPACs')	2641

5.4	Transactions with non-employees	2642
5.4.1	Effect of change of status from employee to non-employee (or <i>vice versa</i>)	2642
5.5	Determining the fair value of equity instruments	2643
5.5.1	Reload features	2644
6	Equity-settled transactions - allocation of expense	2645
6.1	Overview	2645
6.1.1	The continuous estimation process of IFRS 2	2645
6.1.2	Vesting and forfeiture	2646
6.1.3	Accounting after vesting	2647
6.2	Vesting conditions other than market conditions	2647
6.2.1	Awards with service conditions and non-market vesting conditions	2647
6.2.1.A	Awards with service conditions	2647
6.2.1.B	Non-market vesting conditions	2648
6.2.2	Equity instruments vesting in instalments ('graded' vesting)	2649
6.2.3	Transactions with variable vesting periods due to non-market vesting conditions	2650
6.2.4	Transactions with variable number of equity instruments awarded depending on non-market vesting conditions	2652
6.2.5	Transactions with variable exercise price due to non-market vesting conditions	2653
6.3	Market conditions	2654
6.3.1	What is a 'market condition'?	2654
6.3.2	Summary of accounting treatment	2655
6.3.3	Transactions with market conditions and known vesting periods	2657
6.3.4	Transactions with variable vesting periods due to market conditions	2657
6.3.5	Transactions with multiple outcomes depending on market conditions	2659
6.3.6	Transactions with independent market conditions, non-market vesting conditions or non-vesting conditions	2659
6.3.6.A	Independent market and non-market vesting conditions	2659
6.3.6.B	Independent market conditions and non-vesting conditions	2660
6.3.7	Transactions with hybrid or interdependent market conditions and non-market vesting conditions	2661
6.3.8	Awards with a condition linked to flotation price	2661
6.4	Non-vesting conditions	2661
6.4.1	Awards with no conditions other than non-vesting conditions	2662
6.4.2	Awards with non-vesting conditions and variable vesting periods	2662
6.4.3	Failure to meet non-vesting conditions	2662
7	Equity-settled transactions - modification, cancellation and settlement	2663
7.1	Background	2663
7.1.1	Determining the date of the modification	2664
7.2	Valuation requirements when an award is modified, cancelled or settled	2665
7.3	Modification	2665
7.3.1	Modifications that increase the value of an award	2666
7.3.1.A	Increase in fair value of equity instruments granted	2666
7.3.1.B	Increase in number of equity instruments granted	2667
7.3.1.C	Removal or mitigation of non-market vesting conditions	2667

7.3.2	Modifications that decrease the value of an award	2668
7.3.2.A	Decrease in fair value of equity instruments granted	2669
7.3.2.B	Decrease in number of equity instruments granted	2670
7.3.2.C	Additional or more onerous non-market vesting conditions	2670
7.3.3	Modifications with altered vesting period	2670
7.3.4	Modifications that reduce the number of equity instruments granted but maintain or increase the value of an award ('value for value' exchanges and 'give and take' modifications)	2672
7.3.5	Modification of award from equity-settled to cash-settled (and <i>vice versa</i>)	2674
7.4	Cancellation and settlement	2674
7.4.1	Distinction between cancellation and forfeiture	2674
7.4.1.A	Termination of employment by entity	2675
7.4.1.B	Surrender of award by employee	2675
7.4.2	Distinction between cancellation and modification	2675
7.4.3	Calculation of the expense on cancellation	2676
7.4.4	Replacement awards	2677
7.4.4.A	Designation of award as replacement award	2677
7.4.4.B	Incremental fair value of replacement award	2678
7.4.4.C	Replacement of vested awards	2680
7.5	Replacement and <i>ex gratia</i> awards on termination of employment	2681
7.6	Entity's plans for future modification or replacement of award - impact on estimation process at reporting date	2683
7.7	Two awards running 'in parallel'	2684
7.8	Share splits and consolidations	2685
8	Equity-settled transactions - valuation	2686
8.1	Introduction	2686
8.2	Options	2686
8.2.1	Call options - overview	2686
8.2.2	Call options - valuation	2687
8.2.3	Factors specific to employee share options	2688
8.2.3.A	Non-transferability	2688
8.2.3.B	Continued employment requirement	2689
8.2.3.C	Vesting and non-vesting conditions	2689
8.2.3.D	Periods during which exercise is restricted	2689
8.2.3.E	Limited ability to hedge option values	2689
8.2.3.F	Dilution effects	2689
8.3	Selection of an option-pricing model	2689
8.3.1	The Black-Scholes-Merton formula	2690
8.3.2	The binomial model	2692
8.3.2.A	Lattice models - number of time steps	2695
8.3.3	Monte Carlo Simulation	2695
8.4	Adapting option-pricing models for share-based payment transactions	2696
8.4.1	Non-transferability	2696
8.4.2	Treatment of vesting and non-vesting conditions	2697
8.4.2.A	Market-based performance conditions and non-vesting conditions	2697
8.4.2.B	Non-market vesting conditions	2697

8.5	Selecting appropriate assumptions for option-pricing models	2697
8.5.1	Expected term of the option	2698
8.5.1.A	Expected term under the Black-Scholes-Merton formula	2699
8.5.2	Exercise and termination behaviour	2700
8.5.2.A	Grouping employees with homogeneous exercise behaviour	2701
8.5.2.B	Post-vesting termination behaviour	2701
8.5.3	Expected volatility of share price	2701
8.5.3.A	Newly listed entities	2702
8.5.3.B	Unlisted entities	2703
8.5.3.C	Listed entities that have undergone significant restructuring	2703
8.5.3.D	Expected volatility under the Black-Scholes-Merton formula	2703
8.5.3.E	Expected volatility under lattice models	2703
8.5.4	Expected dividends	2703
8.5.4.A	Expected dividends under the Black-Scholes-Merton formula	2704
8.5.4.B	Expected dividends under the binomial model and other lattice models	2704
8.5.5	Risk-free interest rate	2704
8.5.5.A	Risk-free interest rate under the Black-Scholes-Merton formula	2705
8.5.5.B	Risk-free interest rate under binomial and other lattice models	2705
8.6	Capital structure effects and dilution	2705
8.7	Valuation of equity-settled awards other than options	2705
8.7.1	Shares	2706
8.7.2	Non-recourse loans	2706
8.7.3	Share appreciation rights (SARs)	2706
8.7.4	Performance rights	2706
8.8	Awards whose fair value cannot be measured reliably	2707
8.8.1	Intrinsic value method - the basic accounting treatment	2707
8.8.2	Modification, cancellation and settlement	2709
8.9	Awards with reload features	2709
8.10	Awards of equity instruments to a fixed monetary value	2710
9	Cash-settled transactions	2711
9.1	Scope of requirements	2711
9.2	What constitutes a cash-settled award?	2711
9.2.1	Formal and informal arrangements for the entity to purchase illiquid shares or otherwise settle in cash (awards to be treated as cash-settled, including unlisted company schemes)	2712
9.2.2	Market purchases of own equity used to satisfy awards	2712
9.2.3	Market purchases of own equity following equity-settlement of award	2713
9.2.4	Arrangements to sell employees' shares including 'broker settlement'	2713
9.3	Cash-settled transactions: required accounting	2715
9.3.1	Basic accounting treatment	2715
9.3.2	Application of the accounting treatment	2715
9.3.2.A	Determining the vesting period	2717
9.3.2.B	Periodic allocation of cost	2717
9.3.2.C	Non-market vesting conditions	2717
9.3.2.D	Market conditions and non-vesting conditions	2718
9.3.2.E	Modification, cancellation and settlement	2719

9.4	Modification of award from equity-settled to cash-settled or from cash-settled to equity-settled	2719
9.4.1	Equity-settled award modified to cash-settled award	2719
9.4.2	Cash-settled award modified to equity-settled award	2725
10	Transactions with equity and cash alternatives	2726
10.1	Transactions where the counterparty has choice of settlement in equity or in cash	2727
10.1.1	Transactions in which the fair value is measured directly	2728
10.1.2	Transactions in which the fair value is measured indirectly - including transactions with employees	2728
10.1.3	Accounting treatment	2729
10.1.3.A	During vesting period	2729
10.1.3.B	Settlement	2730
10.1.4	Transactions with cash-settlement alternative for employee introduced after grant date	2731
10.1.5	'Backstop' cash settlement rights	2732
10.1.6	Convertible bonds issued to acquire goods or services	2732
10.2	Transactions where the entity has choice of settlement in equity or in cash	2733
10.2.1	Transactions treated as cash-settled	2733
10.2.1.A	Entity choice has no substance due to economic or other compulsion for cash settlement (including unlisted entity awards with a presumption of cash settlement)	2734
10.2.2	Transactions treated as equity-settled	2734
10.2.3	Change in entity's settlement policy or intention leading to change in classification of award after grant date	2735
10.3	Awards requiring cash or equity settlement in specific circumstances (awards with contingent cash or contingent equity settlement)	2736
10.3.1	Approach 1 - Treat as cash-settled if contingency is outside entity's control	2736
10.3.2	Approach 2 - Treat as cash-settled if contingency is outside entity's control and probable	2737
10.3.3	Application of Approach 1 and Approach 2 to awards requiring cash settlement on a change of control	2737
10.3.4	Accounting for change in manner of settlement where award is contingent on future events outside the control of the entity and the counterparty	2738
10.3.4.A	Distinction between re-assessment of settlement method and modification of terms of award	2738
10.3.5	Manner of settlement contingent on future events: discussions by the IASB and the IFRS IC	2739
10.4	Cash settlement alternative where cash sum is not based on share price or value	2740
11	Replacement share-based payment awards issued in a business combination	2741
11.1	Background	2741
11.2	Replacement awards in business combinations accounted for under IFRS 3	2741
11.2.1	Awards that the acquirer is 'obliged' to replace	2742
11.2.1.A	Illustrative examples of awards that the acquirer is 'obliged' to replace	2743
11.2.2	Acquiree awards that the acquirer is not 'obliged' to replace	2744
11.2.3	Accounting for changes in vesting assumptions after the acquisition date	2745
11.3	Acquiree award not replaced by acquirer	2746
11.4	Financial statements of the acquired entity	2747

12 Group share schemes	2748
12.1 Typical features of a group share scheme	2748
12.2 Accounting treatment of group share schemes - summary	2749
12.2.1 Background	2749
12.2.2 Scope of IFRS 2 for group share schemes	2750
12.2.3 Entity receiving goods or services	2750
12.2.4 Entity settling the transaction	2751
12.2.5 Transactions settled in equity of the entity or its parent	2751
12.2.5.A Awards settled in equity of subsidiary	2751
12.2.5.B Awards settled in equity of the parent	2752
12.2.6 Cash-settled transactions not settled by the entity receiving goods or services	2752
12.2.7 Intragroup recharges and management charges	2753
12.2.7.A Timing of recognition of intercompany recharges: discussion by the IFRS IC	2754
12.3 Employee benefit trusts ('EBTs') and similar arrangements	2755
12.3.1 Background	2755
12.3.2 Accounting for EBTs	2755
12.3.3 Illustrative Examples - awards satisfied by shares purchased by, or issued to, an EBT	2757
12.3.4 Separate financial statements of sponsoring entity	2759
12.3.5 Financial statements of the EBT	2760
12.4 Illustrative example of group share scheme - equity-settled award satisfied by market purchase of shares	2760
12.4.1 Consolidated financial statements	2761
12.4.2 Parent	2762
12.4.2.A Accounting by parent where subsidiary is the employing entity and EBT is treated as separate entity	2762
12.4.2.B Accounting by parent where subsidiary is the employing entity and EBT is treated as extension of the parent	2763
12.4.2.C Parent company as employing entity	2764
12.4.3 Employing subsidiary	2765
12.5 Illustrative example of group share scheme - equity-settled award satisfied by fresh issue of shares	2765
12.5.1 Consolidated financial statements	2766
12.5.2 Parent	2767
12.5.2.A Accounting by parent where subsidiary is the employing entity and EBT is treated as separate entity	2767
12.5.2.B Accounting by parent where subsidiary is the employing entity and EBT is treated as extension of parent	2768
12.5.2.C Parent as employing entity	2769
12.5.3 Employing subsidiary	2770
12.6 Illustrative example - cash-settled transaction not settled by the entity receiving goods or services	2771
12.6.1 Consolidated financial statements	2771
12.6.2 Parent	2772
12.6.3 Employing subsidiary	2773
12.7 Employee transferring between group entities	2773
12.8 Group reorganisations	2774

12.9	Share-based payments to employees of joint ventures or associates	2774
12.9.1	Financial statements of the associate or joint venture	2775
12.9.2	Consolidated financial statements of the investor	2776
12.9.3	Separate financial statements of the investor	2777
13	Disclosures	2778
13.1	Nature and extent of share-based payment arrangements	2778
13.2	Valuation of share-based payment arrangements	2779
13.3	Impact of share-based payment transactions on financial statements	2780
13.4	Example of IFRS 2 disclosures	2781
14	Taxes related to share-based payment transactions	2783
14.1	Income tax deductions for the entity	2783
14.2	Employment taxes of the employer	2783
14.2.1	Applicable standard	2783
14.2.1.A	IAS 37	2783
14.2.1.B	IFRS 2	2784
14.2.1.C	IAS 19	2784
14.2.2	Recovery of employer's taxes from employees	2784
14.2.3	Holding of own shares to 'hedge' employment tax liabilities	2786
14.3	Sale or surrender of shares by employee to meet employee's tax liability ('sell to cover' and 'net settlement')	2786
14.3.1	Share-based payments with a net settlement feature for withholding tax obligations (net settlement where IFRS 2 exception applies)	2788

Overview

This chapter discusses the requirements of IFRS 2 *Share-based Payment* (IFRS 2 or the standard), that provides accounting requirements when an entity enters into a share-based payment transaction that includes an entity receiving goods or services from a supplier of those goods or services in a share-based payment arrangement or incurs an obligation to settle the transaction with the supplier in a share-based payment arrangement when another group entity receives the goods or services. Where the supplier of the goods or services receives; cash or assets of an entity for amounts that are based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity, or equity instruments (including shares or share options) of the entity or another group entity, when vesting conditions are met, such an arrangement would be in scope of IFRS 2.

IFRS 2 is applied in accounting for all share-based payment transactions, whether or not an entity can identify specifically some or all of the goods or services received. Share-based payment transactions include equity-settled share-based payments, cash-settled share-based payments and those transactions where the entity or the supplier has a choice of settlement in cash or equity instruments.

The standard is also applied to share-based payment transactions where the transaction is settled by another group entity (or a shareholder), in such instances the standard applies to the recipient group entity of the goods or services and the group entity (or shareholder) settling the transaction.

The recognition rules in IFRS 2 are based on a so-called 'service date model'. In other words, IFRS 2 requires the goods or services received or acquired in a share-based payment transaction to be recognised when the goods are acquired or the services rendered. However, for awards to employees (or others providing similar services), the measurement rules require a share-based payment transaction to be measured at the date on which the transaction was entered into (grant date model), whereas a transaction with non-employees, is measured at the service date.

The point at which the cost is recognised for goods or services in a share-based payment arrangement depends on the concept of 'vesting'. A share-based payment arrangement vests when the counterparty's entitlement is no longer conditional on the satisfaction of any vesting conditions (service condition or performance condition). The cost is recognised during the vesting period, which is the period that all vesting conditions for the share-based payment arrangement are to be satisfied.

IFRS 2 contains detailed accounting requirements for vesting conditions and non-vesting conditions, in addition to accounting requirements for modification and cancellation of share-based payment transactions. The modification and cancellation accounting requirements equally apply to the replacement of awards in a business combination applying IFRS 3 *Business Combinations*.

IFRS 2 is in many respects a rules-based 'anti-avoidance' standard, which often requires an expense to be recorded for transactions that either have no ultimate value to the counterparty or to which, in some cases, the counterparty actually has no entitlement at all.

Most share-based payment transactions undertaken by entities are awards of shares and options as remuneration to employees, in particular senior management and directors. In a number of countries, shares and options now comprise the greatest element of the total remuneration package of senior personnel, a trend encouraged by the consensus that it is a matter of good corporate governance to promote significant long-term shareholdings by senior management, so as to align their economic interests with those of shareholders. For this reason, the main focus of this chapter is accounting for share-based payment transactions with employees. Other forms of employee benefits that are not share-based payment transactions would fall within the scope of IAS 19 *Employee Benefits*, as discussed in Chapter 31.

What you need to know

- An entity applies IFRS 2 when the entity receives goods or services in a share-based payment transaction that is settled by the entity itself, another group entity or shareholder.
- An entity settling a share-based payment transaction when another group entity receives the goods or services is in scope of IFRS 2.
- IFRS 2 applies whether or not an entity can identify specifically some or all of the goods or services received.
- Awards to employees and others providing similar services are measured using the 'grant date model', whereas services provided by others and goods acquired are measured using the 'service date model' for the share-based payment arrangement.
- The cost is recognised over the vesting period, which is the period that all vesting conditions are satisfied.
- Vesting conditions include service conditions or performance conditions. Share-based payment arrangements can also contain non-vesting conditions.
- IFRS 2 contains specific rules on accounting for modification and cancellation of share-based payment transactions.
- IFRS 2 in many respects is a rules-based 'anti-avoidance' standard, which often requires an expense to be recorded for transactions that either have no ultimate value to the counterparty or to which, in some cases, the counterparty actually has no entitlement at all.

1 Introduction

1.1 Background

Most share-based payment transactions undertaken by entities are awards of shares and options as remuneration to employees, in particular senior management and directors. In a number of countries, shares and options now comprise the greatest element of the total remuneration package of senior personnel, a trend encouraged by the consensus that it is a matter of good corporate governance to promote significant long-term shareholdings by senior management, so as to align their economic interests with those of shareholders.

One advantage of shares and options as remuneration is that they need not entail any cash cost to the entity. If an executive is entitled under a bonus scheme to a free share, the entity can satisfy this award simply by printing another share certificate, which the executive can sell, so that the cash cost of the award is effectively borne by shareholders rather than by the entity itself. However, this very advantage was the source of the controversy surrounding share-based remuneration.

Investors became increasingly concerned that share-based remuneration was resulting in a significant cost to them, through dilution of their existing shareholdings. As a result, there emerged an increasing consensus among investors that awards of shares and share options should be recognised as a cost in the financial statements.

The opposing view, held by most entities, was that the financial statements were simply reflecting the economic reality that such awards are ultimately a cost to other shareholders and not to the entity. Another powerful argument for those opposed to expensing options was to point out that some clearly successful companies, particularly in the new technology sector at that time, would never have shown a profit if they had been required to book an accounting expense for options.

1.2 Development of IFRS 2 and amendments to the standard

In November 2002, the IASB issued an exposure draft ED 2 *Share-based Payment* - proposing that share-based payments for goods and services should be expensed. The exposure draft proved highly controversial. Those who supported it in principle nevertheless had concerns about nearly every detail of the accounting treatment proposed, in particular the fact that it did not permit any 'truing up', i.e., reversing any expense previously charged for an award that never actually crystallises. More fundamentally, many questioned whether there yet existed a methodology sufficiently robust for valuing shares and share options subject to the restrictions and performance conditions typically associated with employee share awards. There also remained a significant minority who still questioned the whole principle of expensing options and other share awards.

Despite these comments, the IASB finalised its proposals with the publication of IFRS 2 *Share-based Payment* - on 19 February 2004, although some significant changes had been necessary to the prohibition on 'truing up' in the ED. In particular, IFRS 2 requires an expense to be recognised only for awards that vest (or are considered by IFRS 2 to vest), but (in the case of awards settled in shares) based on their fair value at the date of grant. Nevertheless, IFRS 2 remains contentious: for example, there is still only limited provision for 'truing up', with the result that significant costs can potentially be recognised for awards that ultimately have no value to their recipients, and give rise to no dilution of the interests of other shareholders. Some commentators continue to question whether existing option valuation models can produce a reliable valuation of employee share awards.

The IASB has issued the following amendments to the original version of IFRS 2:

- *Vesting Conditions and Cancellations*,¹ issued in January 2008 ('the January 2008 amendment'). [IFRS 2.62].
- *Group Cash-settled Share-based Payment Transactions*,² issued in June 2009 ('the June 2009 amendment'). [IFRS 2.63].
- *Improvements to IFRSs*, issued in April 2009 ('the April 2009 amendment'). This made a minor amendment to the scope of IFRS 2.
- *Annual Improvements to IFRSs 2010-2012 Cycle*, issued in December 2013, which made amendments to the definitions in Appendix A of IFRS 2 relating to vesting conditions.
- *Classification and Measurement of Share-based Payment Transactions*,³ issued in June 2016 ('the June 2016 amendments'). [IFRS 2.63D].

There have also been two interpretations of IFRS 2 by the IFRS IC, *IFRIC 8 Scope of IFRS 2 and IFRIC 11 IFRS 2 Group and Treasury Share Transactions*, but these were incorporated into IFRS 2 as part of the June 2009 amendment and the separate interpretations withdrawn. [IFRS 2.64].

Revision of, and amendments to, IFRS 3 in 2008 and 2010 respectively, led to consequential amendments to IFRS 2. The revised and amended IFRS 3 provides guidance on the replacement of share-based payment awards in a business combination (see section 11 below).

The revision of the *Conceptual Framework* in 2018 led to a minor consequential amendment to IFRS 2 as part of the *Amendments to References to the Conceptual Framework in IFRS Standards*.⁴ The revision amended the footnote to the definition of an equity instrument in Appendix A (see section 1.4.1 below).

IFRS 2 is also supplemented by implementation guidance.

Some but not all differences between IFRS 2 and US GAAP guidance on this topic are mentioned in this chapter, as the accounting standards are not converged. Therefore, differences between IFRS 2 and US GAAP may exist that are not discussed in this chapter.

1.2.1 IFRS 2 research project

In May 2015, the IASB announced a research project into certain aspects of IFRS 2.⁵ In November 2015, the IASB considered a staff report which observed that, on the basis of research and outreach performed, the complexity of applying IFRS 2 in practice has two main causes: the complexity of share-based payment arrangements themselves and use of the grant date fair value measurement model.⁶ In May 2016, the IASB decided not to perform further research on this topic.⁷

The IASB published a summary of the research findings in October 2018, confirming that the main sources of complexity in accounting for share-based payments include: the variety and complexity of the terms and conditions of share-based payments and use of grant date fair value measurement. The project summary also comments on criticism of excessive disclosures in the standard.⁸

The IASB confirmed in the Project Summary, that the terms and conditions of share-based payments are varied and complex which contributes significantly to the complexity in accounting for transactions involving share-based payments. Subsequently, IFRS accounting standards cannot remove the complexity arising from the variety and complexity of terms and conditions of share-based payments.

1 Amendment to International Financial Reporting Standards: IFRS 2 *Share-based Payment* - Vesting Conditions and Cancellations, IASB, January 2008 ('January 2008 amendment').

2 *Group Cash-settled Share-based Payment Transactions*, Amendments to IFRS 2, IASB, June 2009 ('June 2009 amendment').

3 *Classification and Measurement of Share-based Payment Transactions*, Amendments to IFRS 2, IASB, June 2016 ('June 2016 amendments').

4 *Amendments to References to the Conceptual Framework in IFRS Standards*, IASB, March 2018.

5 [IASB Update](#), May 2015, available on the IFRS Foundation's website.

6 [IASB Staff Paper 16](#): Project: IFRS 2 Share-based Payment research project, Paper topic: Report on research so far, IASB Meeting, November 2015, available on the IFRS Foundation's website.

7 [IASB Update](#), May 2016, available on the IFRS Foundation's website.

8 [Project Summary](#): Share-based payment-research on sources of accounting complexity, IASB, 31 October 2018, available on the IFRS Foundation's website.

In considering the complexity of the grant date fair value measurement model used for equity-settled share-based payments, the IASB confirmed in the Project Summary the application issues covered three areas:

- Difficulty in understanding why changes in share price do not affect the accounting for equity-settled share-based payments: the research found that the treatment is consistent with the accounting for other obligations that must be settled by issuing equity instruments in payment; and reflects the fact that the value of services received is unlikely to change after the grant date.
- Complexity in classifying conditions of share-based payments as vesting or non-vesting: the research found that reducing that complexity significantly would require fundamental changes that would negate the advantages of the grant-date fair value measurement model and could be inconsistent with the distinction made between liabilities and equity in accounting for other obligations that must be settled by issuing equity instruments in payment.
- The apparently counterintuitive results for some actions that change equity-settled share-based payments, for example continuing to recognise expense for cancelled share-based payments and not reversing expense for 'negative' modifications of share-based payments: the staff research confirmed that the Basis for Conclusions on IFRS 2 provides for the approach to these items.

In addressing the criticisms that IFRS 2 leads entities to disclose excessive information in their financial statements, the research findings reminded preparers that IAS 1 *Presentation of Financial Statements* - provides appropriate flexibility in how entities can disclose information about share-based payments. Therefore, entities need to exercise judgement in deciding which information is material and must be disclosed.

1.3 Scope of the chapter and referencing convention

This chapter generally discusses the requirements of IFRS 2 for accounting periods beginning on or after 1 January 2026 and reflects those amendments to the original version of IFRS 2, referred to in section 1.2 above. This amended version of IFRS 2 is referred to as 'IFRS 2' throughout the chapter.

1.4 Overall approach of IFRS 2

IFRS 2 is a complex standard, in part because its overall accounting approach is something of a hybrid. Essentially the total cost (i.e., measurement) of an award is calculated by determining whether the award is a liability or an equity instrument, using criteria somewhat different from those in IAS 32 *Financial Instruments: Presentation* (see section 1.4.1 below), but then applying the measurement principles generally applicable to liabilities or equity instruments under IAS 32 and IFRS 9 *Financial Instruments*. However, the periodic allocation (i.e., recognition) of the cost is determined using something closer to a straight-line accrual methodology, which would not generally be used for financial instruments. For convenience, throughout this chapter we refer to the recognition of a cost for share-based payments. In some cases, however, a share-based payment transaction may initially give rise to an asset (e.g., where employee costs are capitalised as part of the cost of PP&E or inventories).

This inevitably has the result that, depending on its legal form, a transaction of equal value to the recipient can result in several different potential charges in profit or loss for the entity, causing some to call into question the comparability of the information provided. Moreover, IFRS 2 is in many respects a rules-based 'anti-avoidance' standard, which often requires an expense to be recorded for transactions that either have no ultimate value to the counterparty or to which, in some cases, the counterparty actually has no entitlement at all.

IFRS 2 has an unusually long Basis for Conclusions - longer in fact than the standard and implementation guidance combined, highlighting some of the controversy in the development of the standard.

1.4.1 Classification differences between IFRS 2 and IAS 32/IFRS 9

As noted above, not only are there differences between the accounting treatment of liabilities or equity under IFRS 2 as compared with that under IAS 32 and IFRS 9, but the classification of a transaction as a liability or equity transaction under IFRS 2 may differ from that under IAS 32.

One of the most important differences between IAS 32 and IFRS 2 is that a transaction involving the delivery of equity instruments within the scope of IFRS 2 is always accounted for as an equity transaction, whereas a similar transaction within the scope of IAS 32 might well be classified as a liability if the number of shares to be delivered varies.

The IASB offers some (pragmatic rather than conceptual) explanation for these differences in the Basis for Conclusions on IFRS 2. First, it is argued that to apply IAS 32 to share option plans would mean that a variable share option plan (i.e., one where the number of shares varied according to performance) would give rise to a more volatile (and typically greater) cost than a fixed plan (i.e., one where the number of shares to be awarded is fixed from the start), even if the same number of shares was ultimately delivered under each plan, which would have 'undesirable consequences'. [IFRS 2.BC109J]. Second, it is argued that this is just one of several inconsistencies between IAS 32 and IFRS 2 to be addressed as part of the IASB's review of the definitions of liabilities and equity in the *Conceptual Framework*. [IFRS 2.BC110J].

The revision of the *Conceptual Framework* in 2018 led to a minor consequential amendment to the footnote to the definition of an equity instrument in Appendix A to IFRS 2. It is the definition of a liability within the footnote that has been revised rather than the definition of an equity instrument. In paragraph BC384 of the Basis for Conclusions on IFRS 2, the Board notes that the 2018 *Conceptual Framework* did not address classification of financial instruments with characteristics of both liabilities and equity and that the consequential amendments did not amend the guidance on classification of financial instruments in IFRS 2. Therefore, it does not expect the amendment to the footnote in IFRS 2 to have a significant effect on the application of the standard.

The boundary between liabilities and equity were further explored by the IASB in its research project on *Financial Instruments with Characteristics of Equity*.⁹ In November 2023, the IASB issued an Exposure Draft, *Financial Instruments with Characteristics of Equity - proposed amendments to IAS 32 Financial Instruments: Presentation, IFRS 7: Financial Instruments: Disclosures, IAS 1 Presentation of Financial Statements*.¹⁰ At the time of writing this chapter, the IASB are considering responses to the Exposure Draft (see Chapter 43). Until there are any further amendments resulting from this or other projects, there will continue to be differences between the accounting and classification treatment of liabilities and equity under IFRS 2, compared with that under IAS 32 and IFRS 9.

2 The objective and scope of IFRS 2

This section sets out the objective of IFRS 2 (see section 2.1 below) and then considers the scope of the standard in the following sub-sections:

- Definitions in IFRS 2 relevant to the scope of the standard (see section 2.2.1 below).
- Transactions and arrangements within the scope of IFRS 2 (see section 2.2.2 below) including arrangements within a group and with shareholders (see section 2.2.2.A below).
- Transactions outside the scope of IFRS 2 (see section 2.2.3 below).
- Application of the scope requirements to a number of situations frequently encountered in practice (see section 2.2.4 below).

Further details of the transactions and arrangements discussed are given at the start of each sub-section.

2.1 Objective

Extract from IFRS 2

Objective

- | | |
|---|--|
| 1 | The objective of this IFRS is to specify the financial reporting by an entity when it undertakes a share-based payment transaction. In particular, it requires an entity to reflect in its profit or loss and financial position the effects of share-based payment transactions, including expenses associated with transactions in which share options are granted to employees. |
|---|--|

[IFRS 2.1].

2.2 Scope

2.2.1 Definitions

The following definitions are relevant to the scope of IFRS 2. [IFRS 2 Appendix A].

Extract from IFRS 2

Appendix A IFRS 2

Defined terms

cash-settled share-based payment transaction	A share-based payment transaction in which the entity acquires goods or services by incurring a liability to transfer cash or other assets to the supplier of those goods or services for amounts that are based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity.
equity instrument	A contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities. ⁵
equity instrument granted	The right (conditional or unconditional) to an equity instrument of the entity conferred by the entity on another party, under a share-based payment arrangement .
equity-settled share-based payment transaction	A share-based payment transaction in which the entity (a) receives goods or services as consideration for its own equity instruments (including shares or share options), or (b) receives goods or services but has no obligation to settle the transaction with the supplier.
share-based payment arrangement	An agreement between the entity (or another group ⁷ entity or any shareholder of any group entity) and another party (including an employee) that entitles the other party to receive (a) cash or other assets of the entity for amounts that are based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity, or (b) equity instruments (including shares or share options) of the entity or another group entity, provided the specified vesting conditions, if any, are met.
share-based payment transaction	A transaction in which the entity (a) receives goods or services from the supplier of those goods or services (including an employee) in a share-based payment arrangement , or (b) incurs an obligation to settle the transaction with the supplier in a share-based payment arrangement when another group entity receives those goods or services.
share option	A contract that gives the holder the right, but not the obligation, to subscribe to the entity's shares at a fixed or determinable price for a specified period of time.

⁵ The *Conceptual Framework for Financial Reporting* issued in 2018 defines a liability as a present obligation of the entity to transfer an economic resource as a result of past events.

⁷ A 'group' is defined in Appendix A of IFRS 10 *Consolidated Financial Statements* as 'a parent and its subsidiaries' from the perspective of the reporting entity's ultimate parent.

A *group entity* in the definitions above means any parent, subsidiary, or subsidiary of any parent, of the entity and is based on the definition of 'group' in Appendix A to IFRS 10 *Consolidated Financial Statements* - as 'a parent and its subsidiaries'. [IFRS 2.63A, IFRS 2.BC22E].

It will be seen from these definitions that IFRS 2 applies not only to awards of shares and share options but also to awards of cash (or other assets) of a value equivalent to the value, or a movement in the value, of a particular number of shares. Such cash awards may arise in a number of situations. For example:

- An entity may wish to extend its share scheme to the employees of overseas subsidiaries in jurisdictions where it may be difficult, or even illegal, to trade in the entity's shares, or where delivering shares would not give the same tax benefits to employees as would apply in the parent's own jurisdiction.

Or

- The entity may not wish to dilute existing shareholdings by significant share awards to employees.

In such cases, the employees may instead be offered cash equivalent to the value of the shares that they would otherwise have obtained.

2.2.2 Transactions within the scope of IFRS 2

Subject to the exceptions noted in section 2.2.3 below, IFRS 2 must be applied to all share-based payment transactions, including:

- (a) Equity-settled share-based payment transactions (discussed in sections 4 to 8 below).
- (b) Cash-settled share-based payment transactions (discussed in section 9 below).
- (c) Transactions where either the entity or the supplier of goods or services can choose whether the transaction is to be equity-settled or cash-settled (discussed in section 10 below). [IFRS 2.2].

Whilst the boundaries between these types of transactions are reasonably self-explanatory, there may be transactions - as discussed in more detail in sections 9 and 10 below - that an entity may intuitively regard as equity-settled which are in fact required to be treated as cash-settled under IFRS 2.

Although IFRS 2 was primarily a response to concerns over share-based remuneration, its scope is not restricted to transactions with employees. For example, if an external supplier of goods or services, including another group entity, is paid in shares or share options, or cash (or other assets) of equivalent value, IFRS 2 must be applied. Goods include:

- Inventories
- Consumables
- Property, plant and equipment
- Intangibles
- Other non-financial assets [IFRS 2.5]

It will be seen that 'goods' do not include financial assets, which raises some further issues (see section 2.2.3.F below).

The scope of IFRS 2 extends to:

- Group share schemes and certain transactions with shareholders (see section 2.2.2.A below).
- Transactions with employee benefit trusts and similar vehicles (see section 2.2.2.B below).
- Transactions where the identifiable consideration received appears to be less than the consideration given (see section 2.2.2.C below).
- 'All employee' share plans (see section 2.2.2.D below).
- Vested transactions (see section 2.2.2.E below).

2.2.2.A Group schemes and transactions with group shareholders: scope issues

The definitions of 'share-based payment arrangement' and 'share-based payment transaction' in section 2.2.1 above have the effect that the scope of IFRS 2 is not restricted to transactions where the reporting entity acquires goods or services in exchange for its own equity instruments (or cash or other assets based on the cost or value of those equity instruments). Within a group of companies, it is common for one member of the group (typically the parent) to have the obligation to settle a share-based payment transaction in which services are provided to another member of the group (typically a subsidiary). This transaction is within the scope of IFRS 2 for the entity receiving the services (even though it is not a direct party to the arrangement between its parent and its employee), the entity settling the transaction and the group as a whole.

Accordingly, IFRS 2 requires an entity to account for a transaction in which it either:

- Receives goods or services when another entity in the same group (or a shareholder of any group entity) has the obligation to settle the share-based payment transaction
- Or
- Has an obligation to settle a share-based payment transaction when another entity in the same group receives the goods or services

Unless the transaction is clearly for a purpose other than payment for goods or services supplied to the entity receiving them. [IFRS 2.3A].

Moreover, the definitions of 'equity-settled share-based payment transaction' and 'cash-settled share-based payment transaction' have the effect that the analysis of the transaction as equity-settled or cash-settled (and its accounting treatment) may differ when viewed from the perspective of the entity receiving the goods or services, the entity settling the transaction and the group as a whole. [IFRS 2.43A].

We consider below seven scenarios, based on the simple structure in Figure 2-1 below. These scenarios are by no means exhaustive, but cover the situations most commonly seen in practice.

The scenarios considered in this section do not consider recharge arrangements between group entities. The accounting treatment of group share schemes, including those with recharge arrangements, is discussed in more detail in section 12 below.

Figure 2-1: Scope of IFRS 2

The scenarios assume that:

- The shareholder is not a group entity.
- The subsidiary is directly owned by the parent company (see section 12.2.1 below in relation to intermediate parent companies).

Scenario	Who grants the award?	Which entity receives the goods or services?	Who settles the award?	On which entity's shares is the award based?	Award settled in shares or cash?
1	Parent	Subsidiary	Parent	Parent	Shares
2	Shareholder	Subsidiary	Shareholder	Parent	Shares
3	Subsidiary	Subsidiary	Subsidiary	Parent	Shares
4	Subsidiary	Subsidiary	Subsidiary	Subsidiary	Shares
5	Parent	Subsidiary	Parent	Subsidiary	Shares
6	Parent	Subsidiary	Parent	Parent	Cash
7	Shareholder	Subsidiary	Shareholder	Parent	Cash

Scenario 1

Parent awards equity shares in Parent to employees of Subsidiary in exchange for services to Subsidiary. Parent settles the award with the employees of Subsidiary. [IFRS 2.43B, IFRS 2.43C, IFRS 2.B52(a), IFRS 2.B53, IFRS 2.B54].

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', "the entity [i.e., the Parent group] ... receives goods or services ... in a share-based payment arrangement ...". A share-based payment arrangement includes "an agreement between the entity ... and another party (including an employee) that entitles the other party to receive ... equity instruments ... of the entity ...".

The transaction is classified as an equity-settled transaction because it is settled in an equity instrument of the group.

Separate financial statements of Parent

Under the definition of 'share-based payment transaction', "the entity [i.e., the Parent as a single entity] ... incurs an obligation to settle the transaction with the supplier in a share-based payment arrangement when another group entity receives those goods or services".

The transaction is classified as an equity-settled transaction because it is settled in an equity instrument of Parent.

Subsidiary

Under the definition of 'share-based payment transaction', "the entity [i.e., Subsidiary] ... receives goods or services ... in a share-based payment arrangement ...". A 'share-based payment arrangement' includes "an agreement between ... another group entity [i.e., Parent] ... and another party (including an employee) that entitles the other party to receive ... equity instruments of ... another group entity".

The transaction is classified as an equity-settled transaction because Subsidiary 'has no obligation to settle the transaction with the supplier'.

Even if Subsidiary is not a party to the agreement with its employees, it nevertheless records a cost for this transaction. In effect, the accounting treatment is representing that Subsidiary has received a capital contribution from Parent, which Subsidiary has then 'spent' on employee remuneration. This treatment is often referred to as 'push-down' accounting - the idea being that a transaction undertaken by one group entity (in this case, Parent) for the benefit of another group entity (in this case, Subsidiary) is 'pushed down' into the financial statements of the beneficiary entity.

Scenario 2

Shareholder awards equity shares in Parent to employees of Subsidiary in exchange for services to Subsidiary. Shareholder settles the award with the employees of Subsidiary. [IFRS 2.B48(b)].

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', "the entity [i.e., the Parent group] ... receives goods or services ... in a share-based payment arrangement". A 'share-based payment arrangement' includes "an agreement between ... any shareholder ... and another party (including an employee) that entitles the other party to receive ... equity instruments (including shares or share options) of the entity...".

The transaction is classified as an equity-settled transaction, because the Parent group 'has no obligation to settle the transaction with the supplier'.

Separate financial statements of Parent

Scenario 2 is not within the scope of IFRS 2 for the separate financial statements of Parent, because Parent (as a separate entity) receives no goods or services, nor does it settle the transaction.

Subsidiary

Under the definition of 'share-based payment transaction', "the entity [i.e., Subsidiary] ... receives goods or services ... in a share-based payment arrangement". A 'share-based payment arrangement' includes "an agreement between ... any shareholder of any group entity [i.e., Shareholder] ... and another party (including an employee) that entitles the other party to receive equity instruments of ... another group entity [i.e., Parent]".

The transaction is classified as an equity-settled transaction, because Subsidiary 'has no obligation to settle the transaction with the supplier'.

IFRS 2 does not explicitly address the accounting treatment for such a transaction within the financial statements of a shareholder that is not a group entity. [IFRS 2.BC22GJ]. We discuss in section 12.9 below the accounting treatment of such transactions in the financial statements of a shareholder that is an investor in a joint venture or associate.

Scenario 3

Subsidiary awards equity shares in Parent to employees of Subsidiary in exchange for services to Subsidiary. Subsidiary settles the award with the employees of Subsidiary. [IFRS 2.43B, IFRS 2.B52(b), IFRS 2.B55].

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', "the entity [i.e., the Parent group] ... receives goods or services ... in a share-based payment arrangement". A 'share-based payment arrangement' includes "an agreement between the entity ... and another party (including an employee) that entitles the other party to receive ... equity instruments (including shares or share options) of the entity".

The transaction is classified as an equity-settled transaction, because the Parent group 'receives goods or services as consideration for its own equity instruments (including shares or share options) ...'.

Separate financial statements of Parent

Scenario 3 is not within the scope of IFRS 2 for the separate financial statements of Parent, because Parent (as a separate entity) receives no goods or services, nor does it settle the transaction.

Subsidiary

Under the definition of 'share-based payment transaction', "the entity [i.e., Subsidiary] ... receives goods or services ... in a share-based payment arrangement". A 'share-based payment arrangement' includes "an agreement between ... [a] group entity [i.e., Subsidiary] ... and another party (including an employee) that entitles the other party to receive equity instruments of ... another group entity [i.e., Parent]".

The transaction is classified as a cash-settled transaction because Subsidiary has the obligation to settle the award with equity instruments issued by Parent - i.e., a financial asset in Subsidiary's separate financial statements - rather than with Subsidiary's own equity instruments.

However, for the approach in this Scenario to apply, it must be the case that Subsidiary grants the award as a principal rather than as agent for Parent and Subsidiary has the obligation to settle. If Subsidiary appears to be granting an award but is really doing so only on the instructions of Parent, as will generally be the case in certain jurisdictions, then the approach in Scenario 1 above is more likely to apply. This is discussed in more detail in section 12.2.5.B below.

Scenario 4

Subsidiary awards equity shares in Subsidiary to employees of Subsidiary in exchange for services to Subsidiary. Subsidiary settles the award with the employees of Subsidiary. [IFRS 2.43B, IFRS 2.B49].

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', "the entity [i.e., the Parent group] ... receives goods or services ... in a share-based payment arrangement". A share-based payment arrangement includes "an agreement between the entity ... and another party (including an employee) that entitles the other party to receive ... equity instruments ... of the entity ...".

The transaction is classified as an equity-settled transaction, because it is settled in an equity instrument of the group. In the consolidated financial statements of Parent, shares of Subsidiary not held by Parent are a non-controlling interest, classified as equity (see Chapter 8).

Separate financial statements of Parent

Scenario 4 is not within the scope of IFRS 2 for the separate financial statements of Parent, because Parent (as a separate entity) receives no goods or services, nor does it settle the transaction.

Subsidiary

Under the definition of 'share-based payment transaction', "the entity [i.e., Subsidiary] ... receives goods or services ... in a share-based payment arrangement".

The transaction is classified as an equity-settled transaction, because it is settled in an equity instrument of Subsidiary.

Scenario 5

Parent awards equity shares in Subsidiary to employees of Subsidiary in exchange for services to Subsidiary. Parent settles the award with the employees of Subsidiary. [IFRS 2.43B, IFRS 2.43C, IFRS 2.B50].

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', "the entity [i.e., the Parent group] ... receives goods or services ... in a share-based payment arrangement". A share-based payment arrangement includes "an agreement between the entity ... and another party (including an employee) that entitles the other party to receive ... equity instruments of the entity ...".

The transaction is classified as an equity-settled transaction, because it is settled in an equity instrument of the group. In the consolidated financial statements of Parent, shares of Subsidiary not held by Parent are a non-controlling interest, classified as equity (see Chapter 8).

Separate financial statements of Parent

Under the definition of 'share-based payment transaction', "the entity [i.e., the Parent as a single entity] ... incurs an obligation to settle the transaction with the supplier in a share-based payment arrangement when another group entity [i.e., Subsidiary] receives those goods or services". The transaction is a share-based payment arrangement for Subsidiary (see below) and the consolidated financial statements of Parent (see above).

For Parent, the transaction is classified as a cash-settled transaction, because it is settled not in an equity instrument issued by Parent, but in an equity instrument issued by a subsidiary and held by Parent - i.e., a financial asset in Parent's separate financial statements.

Subsidiary

Under the definition of 'share-based payment transaction', "the entity [i.e., Subsidiary] ... receives goods or services ... in a share-based payment arrangement". A 'share-based payment arrangement' includes "an agreement between ... another group entity [i.e., Parent] ... and another party (including an employee) that entitles the other party to receive equity instruments of the entity...".

The transaction is classified as an equity-settled transaction, because Subsidiary "has no obligation to settle the transaction with the supplier".

Scenario 6

Parent awards cash based on the value of shares in Parent to employees of Subsidiary in exchange for services to Subsidiary. Parent settles the award with the employees of Subsidiary. [IFRS 2.43C, IFRS 2.B56, IFRS 2.B57, IFRS 2.B58].

Consolidated financial statements of Parent

Under the definition of 'share-based payment transaction', "the entity [i.e., the Parent group] ... receives goods or services ... in a share-based payment arrangement". A 'share-based payment arrangement' includes "an agreement between the entity ... and another party (including an employee) that entitles the other party to receive ... cash ... of the entity ... based on the price (or value) of equity instruments ... of the entity ...".

The transaction is classified as a cash-settled transaction, because it is settled in cash of the group.

Separate financial statements of Parent

Under the definition of 'share-based payment transaction', "the entity [i.e., the Parent as a single entity] ... incurs an obligation to settle the transaction with the supplier in a share-based payment arrangement when another group entity [i.e., Subsidiary] receives those goods or services".

The transaction is classified as a cash-settled transaction, because it is settled in cash of Parent.

Subsidiary

IFRS 2 contains detailed guidance for the accounting treatment of such transactions by the employing subsidiary (see section 12 below), from which it may reasonably be inferred that the IASB intended them to be in the scope of IFRS 2 for the subsidiary.

However, this is strictly not the case when the drafting of IFRS 2 is examined closely. In order to be a share-based payment transaction (and therefore in the scope of IFRS 2) for the reporting entity, a transaction must also be a share-based payment arrangement. A share-based payment arrangement is defined as one in which the counterparty receives (our emphasis added):

- Equity of the entity *or any other group entity*
- Or
- Cash or other assets *of the entity*

As drafted, the definition has the effect that a transaction settled in equity is in the scope of IFRS 2 for a reporting entity, whether the equity used to settle is the entity's own equity or that of another group entity. Where a transaction is settled in cash, however, the definition has the effect that a transaction is in the scope of IFRS 2 for a reporting entity only when that entity's own cash (or other assets) is used in settlement, and not when another group entity settles the transaction.

How we see it

Given the guidance in IFRS 2, referred to above, on the accounting treatment for the reporting entity of transactions settled in cash by another group entity, we believe that the exclusion of such transactions from the definition of 'share-based payment arrangement' must be ignored. We see it as a drafting slip.

The transaction is classified as an equity-settled transaction by Subsidiary, because Subsidiary 'has no obligation to settle the transaction with the supplier'.

Scenario 7

Shareholder awards cash based on the value of shares in Parent to employees of Subsidiary in exchange for services to Subsidiary. Shareholder settles the award with the employees of Subsidiary.

For the reasons set out in Scenario 6 above, this transaction might also be seen as not strictly in the scope of IFRS 2 as drafted either for the consolidated or separate financial statements of Parent or for the individual financial statements of Subsidiary. As noted in Scenario 6 above, the definition of 'share-based payment arrangement' as drafted excludes any arrangement that is settled in cash by a party other than the reporting entity. Moreover, whilst IFRS 2 gives detailed guidance that effectively appears to 'over-ride' the definition in respect of a transaction settled by another group entity (see Scenario 6 above), there is no such over-riding guidance in respect of a transaction settled in cash by a non-group shareholder.

How we see it

Nevertheless, we believe that the transaction is required to be treated as within the scope of IFRS 2 for the consolidated financial statements of Parent and the individual financial statements of Subsidiary. One of the original objectives of the project that led to the issue of the June 2009 amendment to IFRS 2 was to address a concern that, as originally issued, IFRS 2 did not require an entity to account for a cash-settled share-based payment transaction settled by an external shareholder.

The transaction is not within the scope of IFRS 2 for the separate financial statements of Parent, because Parent (as a separate entity) receives no goods or services, nor does it settle the transaction.

In addition to the accounting treatment under IFRS 2, the group entities in this Scenario would need to consider the requirements of IAS 24 *Related Party Disclosures* - as any payments by a shareholder would potentially need to be disclosed (see Chapter 35).

2.2.2.B Transactions with employee benefit trusts and similar vehicles

In some jurisdictions, it is common for an entity to establish a trust to hold shares in the entity for the purpose of satisfying, or 'hedging' the cost of, share-based awards to employees. In such cases, it is often the trust, rather than any entity within the legal group, that actually makes share-based awards to employees.

A sponsoring employer (or its wider group) will need to assess whether it controls the trust in accordance with the requirements of IFRS 10 and therefore whether the trust is required to be consolidated (see section 12.3 below and Chapter 7).

Awards by employee benefit trusts and similar vehicles are within the scope of IFRS 2, irrespective of whether or not the trust is consolidated, since:

- Where the trust is consolidated, it is an award by a group entity.
- Where the trust is not consolidated, it is an award by a shareholder.

2.2.2.C Transactions where the identifiable consideration received appears to be less than the consideration given

A share-based payment transaction as defined (see section 2.2.1 above) involves the receipt of goods or services by the reporting entity or by another group entity. Nevertheless, IFRS 2 also applies to share-based payment transactions where no specifically identifiable goods or services have been (or will be) received. [IFRS 2.2].

IFRS 2 asserts that, if the identifiable consideration received (if any) appears to be less than the fair value of consideration given, the implication is that, in addition to the identifiable goods and services acquired, the entity must also have received some unidentifiable consideration equal to the difference between the fair value of the share-based payment and the fair value of any identifiable consideration received. Accordingly, the cost of the unidentified consideration must be accounted for in accordance with IFRS 2. [IFRS 2.13A].

For example, if an entity agrees to pay a supplier of services with a clearly identifiable market value of CU1,000 by issuing shares with a value of CU1,500, IFRS 2 requires the entity to recognise an expense of CU1,500. This is notwithstanding the normal requirement of IFRS 2 that an equity-settled share-based payment transaction with a non-employee be recognised at the fair value of the goods or services received (see sections 5.1 and 5.4 below).

This requirement was introduced by IFRIC 8 (since incorporated into IFRS 2). The reason for the change is alluded to in an illustrative example. [IFRS 2.IG5D, IFRS 2.IG Example 1]. As part of general economic reforms in South Africa, under arrangements generally referred to as black economic empowerment or 'BEE' (discussed further in section 15.5 below), various entities issued or transferred significant numbers of shares to bodies representing historically disadvantaged communities. Some took the view that these transactions did not fall within the scope of IFRS 2 as originally drafted because the entities concerned were not purchasing goods or services. Rather, BEE arrangements were simply meant to replicate a transfer of shares from one group of shareholders to another. Accordingly, it was argued, such transactions did not fall within the scope of IFRS 2, since it is intrinsic to the definition of a 'share-based payment transaction' (see section 2.2.1 above) that goods or services are received.

IFRS 2 rejects this argument. It effectively takes the view that, since the directors of an entity would not issue valuable consideration for nothing, something must have been received. [IFRS 2.BC18C]. IFRS 2 suggests that a transfer of equity under BEE and similar schemes is made 'as a means of enhancing [the entity's] image as a good corporate citizen'. [IFRS 2.IG Example 1].

There seems little doubt that this aspect of IFRS 2 is in part an 'anti-avoidance' measure. As discussed in sections 4 to 8 below, the general measurement rule in IFRS 2 is that share-based payment transactions with employees are measured by reference to the fair value of the consideration given and those with non-employees by reference to the fair value of the consideration received. We argue in section 5.2.2 below that the requirement to measure transactions with employees by reference to the consideration given is essentially an anti-avoidance provision. It prevents entities from recognising a low cost for employee share options on the grounds that little incremental service is provided for them beyond that already provided for cash-based remuneration. The changes introduced by IFRIC 8 removed the potential for a similar abuse in accounting for transactions with non-employees.

Nevertheless, the IASB acknowledges that there may be rare circumstances in which a transaction may occur in which no goods or services are received by the entity. For example, a principal shareholder of an entity, for reasons of estate planning, may transfer shares to a relative. In the absence of indications that the relative has provided, or is expected to provide, goods or services to the entity in exchange for the shares, such a transfer would be outside the scope of IFRS 2. [IFRS 2.BC18D].

See also the discussions in section 2.2.3.A below relating to transactions with shareholders in their capacity as such and in section 2.2.4.K below relating to dual pricing on a share issue.

2.2.2.D 'All employee' share plans

Many countries encourage wider share-ownership by allowing companies to award a limited number of free or discounted shares to employees without either the employee or the employer incurring tax liabilities which would apply if other benefits in kind to an equivalent value were given to employees. These share schemes are referred to in different jurisdictions by terms such as 'all-employee share plans', 'employee share purchase plans' and 'broad-based plans'.

Some national accounting standards exempt some such plans from their scope, to some extent as the result of local political pressures. Prior to issuing IFRS 2, the IASB received some strong representations that IFRS accounting standards should give a similar exemption, on the grounds that not to do so would discourage companies from continuing with such schemes. [IFRS 2.BC10].

The IASB concluded that such an exemption would be wrong in principle and difficult to draft in practice. By way of concession, the Basis for Conclusions hints that if the IFRS 2 charge for such schemes is (as asserted by some of the proponents of an exemption) *de minimis*, then there would be no charge under IFRS 2 anyway, since, like all IFRS accounting standards, it applies only to material items. [IFRS 2.BC8-17]. However, our experience is that, in many cases, the charge is material.

2.2.2.E Vested transactions

Once a transaction accounted for under IFRS 2 has vested in the counterparty (see section 3 below), it does not necessarily cease to be in the scope of IFRS 2 just because the entity has received the goods or services required for the award to vest. This is made clear by the numerous provisions of IFRS 2 referring to the accounting treatment of vested awards.

Once equity shares have been unconditionally delivered or beneficially transferred to the counterparty (e.g., as the result of the vesting of an award of ordinary shares, or the exercise of a vested option over ordinary shares), the holder of those shares will often be in exactly the same position as any other holder of ordinary shares and the shares will generally be accounted for under IAS 32 and IFRS 9 rather than IFRS 2.

If, however, the holder of a share or vested option enjoys rights not applicable to all holders of that class of share, such as a right to put the share or the option to the entity for cash, or holds a special class of share with rights that do not apply to other classes of equity, the share or option might still remain in the scope of IFRS 2 as long as any such rights continue to apply. The same is true of modifications made after vesting which add such rights to a vested share or option or otherwise alter the life of the share-based payment transaction. The special terms or rights will often be linked to the holder's employment with the entity but could also apply to an arrangement with a non-employee.

The significance of this is that issued equity instruments and financial liabilities not within the scope of IFRS 2 would typically fall within the scope of IAS 32 and IFRS 9, which might require a significantly different accounting treatment from that required by IFRS 2. See, for example:

- The discussion in section 2.2.4.B below of the treatment in consolidated financial statements of an award with a right to put the share to the parent entity.
- The discussion in section 2.2.4.G below which highlights that a share option with a foreign currency strike price is accounted for as an equity instrument under IFRS 2, but as a liability under IAS 32 and IFRS 9.
- The discussion in section 10.1.6 below of the treatment of convertible instruments issued in exchange for goods and services and accounted for under IFRS 2 rather than under IAS 32 and IFRS 9.

How we see it

To summarise the above, an equity-settled share-based payment transaction will remain in scope of IFRS 2 until the equity instruments have been unconditionally delivered or beneficially transferred to the counterparty (e.g., as the result of the vesting of an award of ordinary shares, or the exercise of a vested option over ordinary shares), and the counterparty enjoys rights that are applicable to all holders of ordinary shares. However, if the counterparty holds a special class of share with rights that do not apply to other classes of equity, the shares might still remain in the scope of IFRS 2 as long as any such rights continue to apply.

The above discussion on the life of a share-based payment transaction focuses on shares or share options awarded, however, the life of a cash-settled share-based payment transaction is within the scope of IFRS 2 for its entire life, i.e., until settlement. [IFRS 2.30].

2.2.3 Transactions not within the scope of IFRS 2

The following transactions are outside the scope of IFRS 2:

- Transactions with shareholders as a whole and with shareholders in their capacity as such (see section 2.2.3.A below).
- Transfers of assets in certain group restructuring arrangements (see section 2.2.3.B below).
- Business combinations (see section 2.2.3.C below).
- Combinations of businesses under common control and the contribution of a business to form a joint venture (see section 2.2.3.D below).
- Transactions in the scope of IAS 32 and IFRS 9 (see section 2.2.3.E below).

In addition, the scope exemptions in IFRS 2 combined with those in IAS 32 and IFRS 9 appear to have the effect that there is no specific guidance in IFRS accounting standards for accounting for certain types of investment when acquired in return for shares (see section 2.2.3.F below).

As noted in section 2.2.2.D above, there is no exemption from IFRS 2 for share schemes aimed mainly at lower- and middle-ranking employees, referred to in different jurisdictions by terms such as 'all-employee share schemes', 'employee share purchase plans' and 'broad-based plans'.

2.2.3.A Transactions with shareholders in their capacity as such

IFRS 2 does not apply to transactions with employees (and others) purely in their capacity as shareholders. For example, an employee may already hold shares in the entity as a result of previous share-based payment transactions. If the entity then raises funds through a rights issue, for example, whereby all shareholders (including the employee) can acquire additional shares for less than the current fair value of the shares, such a transaction is not a share-based payment transaction for the purposes of IFRS 2.

[IFRS 2.4].

2.2.3.B Transfer of assets in group restructuring arrangements

In some group restructuring arrangements, one entity will transfer a group of net assets, which does not meet the definition of a business, to another entity in return for shares. Careful consideration of the precise facts and circumstances is needed in order to determine whether, for the separate or individual financial statements of any entity affected by the transfer, such a transfer falls within the scope of IFRS 2.

How we see it

If the transfer is considered primarily to be a transfer of goods by their owner in return for payment in shares then, in our view, this is to be accounted for under IFRS 2. However, if the transaction is for another purpose and is driven by the group shareholder in its capacity as such, the transaction may be outside the scope of IFRS 2 (see section 2.2.3.A above).

Accounting for intra-group asset transfers in return for shares is considered further in Chapter 9.

2.2.3.C Business combinations

IFRS 2 does not apply to share-based payments to acquire goods (such as inventories or property, plant and equipment) as part of a business combination to which IFRS 3 applies.

Transactions in which equity instruments are issued to acquire goods as part of the net assets in a business combination are outside the scope of IFRS 2 but equity instruments granted to the employees of the acquiree in their capacity as employees (e.g., in return for continued service following the business combination) are within its scope, as are the cancellation, replacement or modification of a share-based payment transaction as a result of the business combination or other equity restructuring (see sections 11 and 12.8 below). [IFRS 2.5].

Thus, if a vendor of an acquired business remains as an employee of that business following the business combination and receives a share-based payment for transferring control of the entity and for remaining in continuing employment, it is necessary to determine how much of the share-based payment relates to the acquisition of control (which forms part of the cost of the combination, accounted for under IFRS 3) and how much relates to the provision of future services (which is a post-combination operating expense accounted for under IFRS 2). Guidance on this issue is given in IFRS 3 see Chapter 10 - and there is discussion of related issues in section 2.2.4.B below.

2.2.3.D Common control transactions and formation of joint arrangements

IFRS 2 also does not apply to a combination of entities or businesses under common control (see Chapter 11), or the contribution of a business on the formation of a joint venture as defined by IFRS 11 *Joint Arrangements* (see Chapter 13). [IFRS 2.5].

How we see it

However, contribution of non-financial assets (which do not constitute a business) to a joint venture in return for shares is within the scope of IFRS 2 for the joint venture and the assets must be accounted for at fair value in accordance with IFRS 2 (see section 2.2.2 above).

IFRS 2 does not directly address other types of transactions involving joint ventures or transactions involving associates, particularly arrangements relating to the employees of associates or joint ventures. These are discussed further in section 12.9 below.

2.2.3.E Transactions in the scope of IAS 32 and IFRS 9

IFRS 2 does not apply to transactions within the scope of IAS 32 and IFRS 9 (see Chapter 41). For example, if an entity enters into a share-based payment transaction to purchase a commodity surplus to its production requirements or with a view to short-term profit taking, the contract is treated as a financial instrument under IAS 32 and IFRS 9 rather than a share-based payment transaction under IFRS 2. [IFRS 2.6]. Some practical examples of scope issues involving IFRS 2 and IAS 32/IFRS 9 are discussed in section 2.2.4 below.

2.2.3.F Transactions in financial assets outside the scope of IAS 32 and IFRS 9

As noted in section 2.2.2 above, IFRS 2 applies to share-based payment transactions involving goods or services, with 'goods' defined so as to exclude financial assets, presumably on the basis that these fall within IAS 32 and IFRS 9. However, investments in subsidiaries, associates and joint ventures in the separate financial statements of the investing entity are financial assets as defined in IAS 32 (and hence outside the scope of IFRS 2) but are outside the scope of IFRS 9 where the entity chooses to account for them at cost (see Chapter 9 and Chapter 41).

Moreover, IFRS accounting standards has no general requirements for accounting for the issue of equity instruments. Rather, consistent with the position taken by the *Conceptual Framework* that equity is a residual rather than an item 'in its own right', the amount of an equity instrument is normally measured by reference to the item (expense or asset) in consideration for which the equity is issued, as determined in accordance with IFRS accounting standards applicable to that other item.

This means that, when (as is commonly the case) an entity acquires an investment in a subsidiary, associate or joint venture in return for the issue of equity instruments, there is no explicit guidance in IFRS accounting standards as to the required accounting in the separate financial statements of the investor, and in particular as to how the 'cost' of such an item is to be determined. This is discussed further in Chapter 9.

2.2.4 Some practical applications of the scope requirements

This section addresses the application of the scope requirements of IFRS 2 to a number of situations frequently encountered in practice:

- Remuneration in non-equity shares and arrangements with put rights over equity shares (see section 2.2.4.A below).
- The treatment in the consolidated accounts of the parent of an equity-settled award of a subsidiary with a put option against the parent (see section 2.2.4.B below).
- An increase in the counterparty's ownership interest with no change in the number of shares held (see section 2.2.4.C below).
- Awards for which the counterparty has paid 'fair value' (see section 2.2.4.D below).
- A cash bonus which depends on share price performance (see section 2.2.4.E below).
- Cash-settled awards based on an entity's 'enterprise value' or other formula (see section 2.2.4.F below).
- Awards with a foreign currency strike price (see section 2.2.4.G below).
- Holding own shares to satisfy or 'hedge' awards (see section 2.2.4.H below).

- Shares or warrants issued in connection with a loan or other financial liability (see section 2.2.4.I below).
- Options over puttable instruments classified as equity under the specific exception in IAS 32 in the absence of other equity instruments (see section 2.2.4.J below).
- Special discounts to certain categories of investor on a share issue (see section 2.2.4.K below).
- Acquisitions involving a listed shell entity (see section 2.2.4.L below).

The following aspects of the scope requirements are covered elsewhere in this chapter:

- Employment taxes on share-based payment transactions (see section 14 below).
- Instruments such as limited recourse loans and convertible bonds that sometimes fall within the scope of IFRS 2 rather than IAS 32/IFRS 9 because of the link both to the entity's equity instruments and to goods or services received in exchange. Convertible bonds are discussed in section 10.1.6 below and limited recourse loans in section 15.2 below.

2.2.4.A Remuneration in non-equity shares and arrangements with put rights over equity shares

A transaction is within the scope of IFRS 2 only where it involves the delivery of an equity instrument, or cash or other assets based on the price or value of an 'equity instrument', in return for goods or services (see section 2.2.1 above).

In some jurisdictions, there can be fiscal advantages in giving an employee, in lieu of a cash payment, a share that carries a right to a 'one-off' dividend, or is mandatorily redeemable, at an amount equivalent to the intended cash payment. Such a share would almost certainly be classified as a liability under IAS 32 (see Chapter 43). Payment in such a share would not fall in the scope of IFRS 2 since the consideration paid by the entity for services received is a financial liability rather than meeting the definition of an equity instrument (see the definitions in section 2.2.1 above).

How we see it

If the amount of remuneration delivered in this way were equivalent to the value of a particular number of equity instruments issued by the entity, then the transaction would be in scope of IFRS 2 as a cash-settled share-based payment transaction, since the entity would have incurred a liability (i.e., by issuing the redeemable shares) for an amount based on the price of its equity instruments.

Similarly, if an entity grants an award of equity instruments to an employee together with a put right whereby the employee can require the entity to purchase those shares for an amount based on their fair value, both elements of that transaction are in the scope of IFRS 2 as a single cash-settled transaction (see section 9 below). This is notwithstanding the fact that, under IAS 32, the share and the put right might well be analysed as a single synthetic instrument and classified as a liability with no equity component (see Chapter 43).

Differences in the classification of instruments between IFRS 2 and IAS 32 are discussed further in section 1.4.1 above.

Put options over instruments that are only classified as equity in limited circumstances (in accordance with IAS 32.16A-16B) are discussed in section 2.2.4.J below.

2.2.4.B Equity-settled award of subsidiary with put option against the parent - treatment in consolidated accounts of parent

It is sometimes the case that a subsidiary entity grants an award over its own equity instruments and, either on the same date or later, the parent entity separately grants the same counterparty a put option to sell the equity instruments of the subsidiary to the parent for a cash amount based on the fair value of the equity instruments. Accounting for such an arrangement in the separate financial statements of the subsidiary and the parent will be determined in accordance with the general principles of IFRS 2 (see section 2.2.2.A above). However, IFRS 2 does not explicitly address the accounting treatment of all such arrangements in the parent's consolidated financial statements.

How we see it

In our view, accounting for a put option to sell equity instruments in the subsidiary to the parent differs depending on whether the put option is granted during (including at grant date) or after the vesting period and whether it relates to ordinary shares or to share options. See the discussion that follows of the different accounting treatments.

If the put option is granted during the vesting period (whether at the same time as the grant of the equity instruments or later), the two transactions must be treated as linked and accounted for in the consolidated financial statements as a single cash-settled transaction from the date the put option is granted. This reflects the fact that this situation is similar in group terms to a modification of an award to add a cash-settlement alternative - see section 10.1.4 below.

If the put option is only granted once the equity instruments have vested, the accounting will depend on whether the equity instruments in the original share-based payment transaction are unexercised options or whether they are ordinary shares.

If they are unexercised options, the vested options remain within the scope of IFRS 2 until they are exercised (see section 2.2.2.E above) and, in this case, the put option is treated as a linked transaction. Its effect in group terms is to modify the original award from an equity- to a cash-settled transaction until final settlement date.

However, if the equity instruments are fully vested ordinary shares (whether free shares or shares from the exercise of options), rather than unexercised options, they are generally no longer within the scope of IFRS 2 as they are no different from any other ordinary shares issued by the subsidiary. In such cases, the parent entity will need to evaluate whether or not the grant of the put option, as a separate transaction which modifies the terms of certain of the subsidiary's equity instruments, falls within the scope of IFRS 2. For example, the addition of a condition that relates to one (non-controlling) shareholder of a subsidiary might indicate that it continues to be appropriate to account for the arrangement in accordance with the requirements of IFRS 2. By contrast, a modification to an entire class of ordinary shares would generally not be within the scope of IFRS 2.

A similar analysis is required in a situation where an individual sells a controlling interest in an entity for fair value and put and call options are granted over the individual's remaining non-controlling interest or over shares in the acquirer which have been given to the individual in return for the business acquired. To the extent that the exercise price of the call option depends on the fulfilment of a service condition in the period following the acquisition of the controlling interest, it is likely that the arrangement will fall within the scope of IFRS 2 with any payments contingent on future services recognised as compensation costs.

Put options over non-controlling interests that do not fall within the scope of IFRS 2 are addressed in Chapter 8.

2.2.4.C Increase in ownership interest with no change in number of shares held

An arrangement typically found in entities with venture capital investors is one where an employee (often part of the key management) subscribes initially for, say, 1% of the entity's equity with the venture capitalist holding the other 99%. The employee's equity interest will subsequently increase by a variable amount depending on the extent to which certain targets are met. This is achieved not by issuing new shares but by cancelling some of the venture capitalist's shares.

How we see it

In our view, such an arrangement falls within the scope of IFRS 2 as the employee is rewarded with an increased equity stake in the entity if certain targets are achieved. The increased equity stake is consistent with the definition in Appendix A of IFRS 2 of an equity instrument as "a contract that evidences a residual interest ..." notwithstanding the fact that no additional shares are issued.

In such arrangements, it is often asserted that the employee has subscribed for a share of the equity at fair value. However, the subscription price paid must represent a fair value using an IFRS 2 valuation basis in order for there to be no additional IFRS 2 expense to recognise (see section 2.2.4.D below).

2.2.4.D Awards for which the counterparty has paid 'fair value'

In certain situations, such as where a special class of share is issued, the counterparty might be asked to subscribe a certain amount for the share which is agreed as being its 'fair value' for taxation or other purposes.

How we see it

This does not mean that such arrangements fall entirely outside the scope of IFRS 2, either for measurement or disclosure purposes, if the arrangement, or a portion thereof, meets the definition of a share-based payment transaction. In many cases, the agreed 'fair value' will be lower than a fair value measured in accordance with IFRS 2 because it will reflect the impact of service and non-market vesting conditions which are excluded from an IFRS 2 fair value.

This is addressed in more detail in section 15.4.5 below.

2.2.4.E Cash bonus dependent on share price performance

An entity might agree to pay its employees a CU100 cash bonus if its share price remains at CU10 or more over a given period. Intuitively, this appears to be within the scope of IAS 19 rather than that of IFRS 2 because the employee is not being given cash of equivalent value to a particular number of shares. However, it could be argued that it does fall within the scope of IFRS 2 on the basis that the entity has incurred a liability, and the amount of that liability is 'based on' the share price (in accordance with the definition of a cash-settled share-based payment transaction) - it is nil if the share price is below CU10 and CU100 if the share price is CU10 or more.

How we see it

Either interpretation mentioned above is acceptable.

2.2.4.F Cash-settled awards based on an entity's 'enterprise value' or other formula

As noted in section 2.2.1 above, IFRS 2 includes within its scope transactions in which the entity acquires goods or services by incurring a liability "based on the price (or value) of equity instruments (including shares or share options) of the entity or another group entity". Employees of an unquoted entity may receive a cash award based on the value of the equity of that entity. Such awards are typically, but not exclusively, made by venture capital investors to the management of entities in which they have invested and which they aim to sell in the medium term. Further discussion of the accounting implications of awards made in connection with an exit event may be found in section 15.4 below.

More generally, where employees of an unquoted entity receive a cash award based on the value of the equity, there is no quoted share price and an 'enterprise value' has therefore to be calculated as a surrogate for it. This begs the question of whether such awards are within the scope of IFRS 2 (because they are based on the value of the entity's equity) or that of IAS 19.

How we see it

In order for an award to be within the scope of IFRS 2, any calculated 'enterprise value' must represent the fair value of the entity's equity. Where the calculation uses techniques recognised by IFRS 2 as yielding a fair value for equity instruments (as discussed in section 8 below), we believe that the award is considered to be within the scope of IFRS 2.

Appendix B of IFRS 2 notes that an unquoted entity may have calculated the value of its equity based on net assets or earnings (see section 8.5.3.B below). In our view, this is not intended to imply that it is always appropriate to do so, but simply to note that it could be appropriate in some cases.

Where, for example, the enterprise value is based on a constant formula, such as a fixed multiple of earnings before interest, tax, depreciation and amortisation ('EBITDA'), in our view it is unlikely that this will represent a good surrogate for the fair value of the equity on an ongoing basis, even if it did so at the inception of the transaction.

Possible scenarios in which an enterprise value based on EBITDA would not be a good surrogate for the fair value of the equity on an ongoing basis include one in which the fair value of the equity of an entity could be affected with no significant change in EBITDA, for example as a result of changes in interest rates and effective tax rates, or a significant impairment of assets. Alternatively, there might be a significant shift in the multiple of EBITDA equivalent to fair value, for example, if the entity were to create or acquire a significant item of intellectual property.

For an award by an individual entity, there is unlikely to be any significant difference in the cost ultimately recorded under IFRS 2 or IAS 19. However, the disclosure requirements of IFRS 2 are more onerous than those of IAS 19. In a group situation where the parent entity grants the award to the employees of a subsidiary, the two IFRS accounting standards could result in different levels of expense in the books of the subsidiary because IAS 19, unlike IFRS 2, does not require the employing subsidiary to recognise an expense for a transaction which it has no direct obligation to settle and for which the parent does not allocate the cost (see Chapter 31).

The accounting treatment of awards based on the 'market price' of an unquoted subsidiary or business unit - where there is no actual market for the shares - raises similar issues about whether an equity value is being used, as discussed further in section 15.6 below.

2.2.4.G Awards with a foreign currency strike price

Many entities award their employees options with a foreign currency strike price. This will arise most commonly in a multinational group where employees of overseas subsidiaries are granted options on terms that they can pay the option strike price in their local currency. Such awards may also arise where an entity, which has a functional currency different from that of the country in which it operates (e.g., an oil company based in the United Kingdom with a functional currency of United States dollars), grants its UK-based employees options with a strike price in pounds sterling, which is a foreign currency from the perspective of the currency of the financial statements.

Under IAS 32, as currently interpreted, such an award could not be regarded as an equity instrument because the strike price to be tendered is not a fixed amount of the reporting entity's own currency (see Chapter 43). However, under IFRS 2, as discussed in section 2.2.1 above, equity instruments include options, which are defined as the right to acquire shares for a 'fixed or determinable price'. Moreover, it is quite clear from the Basis for Conclusions on IFRS 2 that an award which ultimately results in an employee receiving equity is equity-settled under IFRS 2 whatever its status under IAS 32 might be (see section 1.4.1 above).

How we see it

In our view, an option over equity with a foreign currency strike price is an equity instrument if accounted for under IFRS 2.

The fair value of an option with a foreign currency strike price must be assessed at grant date and, where the award is treated as equity-settled, must not subsequently be revised for foreign exchange movements (on the basis that the equity instrument is a non-monetary item translated using the exchange rate at the date when the fair value was measured). This applies to the separate financial statements of a parent or subsidiary entity as well as to consolidated financial statements. Where the award is treated as cash-settled, however, the periodic reassessment through profit or loss of the fair value of the award required by IFRS 2 will also need to take into account any exchange difference arising from the requirements of IAS 21 *The Effects of Changes in Foreign Exchange Rates*.

2.2.4.H Holding own shares to satisfy or 'hedge' awards

Entities often seek to hedge the cost of share-based payment transactions, most commonly by buying their own equity instruments in the market. For example, an entity could grant an employee options over 10,000 shares and buy 10,000 of its own shares into treasury at the date that the award is made. If the award is share-settled, the entity will deliver the shares to the counterparty. If it is cash-settled, it can sell the shares to raise the cash it is required to deliver to the counterparty. In either case, the cash cost of the award is capped at the market price of the shares at the date the award is made, less any amount paid by the employee on exercise. It could of course be argued that such an arrangement is not a true hedge at all. If the share price goes down so that the option is never exercised, the entity is left holding 10,000 of its own shares that cost more than they are now worth.

Whilst these strategies may cap the cash cost of share-based payment transactions that are eventually exercised, they will not have any effect on the charge to profit or loss required by IFRS 2 for such transactions. This is because purchases and sales of own shares are accounted for as movements in equity and are therefore never included in profit or loss (see section 4.1 below).

The illustrative examples of group share schemes in sections 12.4 and 12.5 below show the interaction of the accounting required for a holding of own shares and the requirements of IFRS 2.

2.2.4.I Shares or warrants issued in connection with a loan or other financial liability

As noted in section 2.2.3.E above, IFRS 2 does not apply to transactions within the scope of IAS 32 and IFRS 9. However, if shares or warrants are granted by a borrower to a lender as part of a loan or other financing arrangement, the measurement of those shares or warrants might fall within the scope of IFRS 2. The determination of the relevant standard is likely to require significant judgement based on the precise terms of individual transactions. If the shares or warrants are considered to be granted by the borrower in lieu of a cash fee for services provided by the lender then IFRS 2 is likely to be the appropriate standard, but if the shares or warrants are considered instead to be part of the overall return to the lender on the financing arrangement then IAS 32 and IFRS 9 are more likely to apply.

2.2.4.J Options over puttable instruments classified as equity under specific exception in IAS 32

Some entities, such as certain types of trusts, issue tradeable puttable instruments that are classified as equity instruments rather than as a financial liability because the entity has no other equity instruments. This classification is based on a specific exception in IAS 32 that makes it clear that such instruments are not equity instruments for the purposes of IFRS 2. [IAS 32.16A, IAS 32.16B, IAS 32.96C]. However, must options over such instruments granted to employees - and allowing them to obtain the instruments at a discount to the market price - be treated as cash-settled awards under IFRS 2 or are they outside the scope of IFRS 2 and within that of IAS 19?

The entity has no equity apart from the instruments classified as such under the narrow exception in IAS 32 and, in the absence of equity, the entity cannot logically issue equity instruments in satisfaction of an award to employees nor can it pay cash based on the price or value of its equity instruments.

How we see it

In our view, IAS 32.96C is required to be interpreted as meaning that, for the purposes of IFRS 2, awards of instruments applying the exception in IAS 32 are not share-based payments and the appropriate standard is IAS 19 rather than IFRS 2.

Those who take the view that such options could be cash-settled share-based payments seem to rely more on the general IAS 32 definition of equity than on the more specific requirements of IAS 32.96C (that "The instrument shall not be considered an equity instrument under other guidance, for example IFRS 2"). We believe that the more specific guidance takes precedence over the general definition.

2.2.4.K Special discounts to certain categories of investor on a share issue

In the context of a flotation or other equity fundraising, an entity might offer identical shares at different prices to institutional investors and to individual (retail) investors. Should the additional discount given to one class of investor be accounted for under IFRS 2 as representing unidentified goods or services received or receivable?

The IFRS IC was asked to clarify the accounting treatment in this area. The request submitted to the IFRS IC referred to the fact that the final retail price could differ from the institutional price because of:

- An unintentional difference arising from the book-building process.
- Or
- An intentional difference arising from a retail discount given by the issuer of the equity instruments as indicated in the prospectus.

For example, a discount to the institutional investor price might need to be offered to encourage retail investors to buy shares in order to meet the requirements of a particular stock exchange for an entity to have a minimum number of shareholders.

The IFRS IC considered whether the discount offered to retail investors in the above example involves the receipt of identifiable or unidentifiable goods or services from the retail shareholder group and, therefore, whether the discount is a share-based payment transaction within the scope of IFRS 2.

IFRS 2 was specifically amended for situations where the identifiable consideration received by the entity appears to be less than the fair value of the equity instruments granted (see section 2.2.2.C above). [IFRS 2.2, IFRS 2.13A]. The IFRS IC noted that the application of this guidance requires judgement and consideration of the specific facts and circumstances of each transaction.

In the circumstances underlying the submission to the IFRS IC, they observed that the entity issues shares at two different prices to two different groups of investors for the purpose of raising funds. Any difference in price between the two groups appears to relate to the existence of different markets - one accessible only to retail investors and the other accessible only to institutional investors - rather than to the receipt of additional goods or services. The only relationships involved are those between the investors and the investee entity and the investors are acting in their capacity as shareholders.

The IFRS IC therefore observed that the guidance in IFRS 2 is not applicable because there is no share-based payment transaction.

A distinction was drawn between the example above and a situation considered by the IFRS IC in 2013 (accounting for reverse acquisitions that do not constitute a business - see section 2.2.4.L below). In the latter situation, a stock exchange listing received by the accounting acquirer was considered to be a service received from the accounting acquiree and to represent the difference between the fair value of the equity instruments issued and the identifiable net assets acquired. Hence an IFRS 2 expense would be required in order to recognise this difference. In the situation relating to retail and institutional investors considered above, however, there is no service element and the difference in prices for the two different types of investor is due solely to an investor-investee relationship rather than to unidentifiable goods or services received from the investors.

At its July 2014 meeting the IFRS IC decided not to add this matter to its agenda on the basis that sufficient guidance exists without further interpretation or the need for an amendment to a standard.¹¹

How we see it

An entity might voluntarily offer a discount to one class of investor, e.g., to an institution underwriting the share issue. In our view, this type of discount is likely to require an IFRS 2 expense to be recognised unless there is evidence that separate prices, and therefore different fair values, are required for each category of investor.

However, in some cases - such as the example above where an institution provides underwriting services - it might be possible to conclude that any additional cost under IFRS 2 is actually a cost of issuing the equity instruments and therefore is debited to equity rather than to profit or loss.

Similar considerations to those discussed in this section apply when, in advance of an IPO, a private company issues convertible instruments at a discount to their fair value in order both to attract key investors and to boost working capital. There is further discussion on convertible instruments in section 10.1.6 below.

2.2.4.L Acquisitions involving a listed shell entity

As noted above in section 2.2.3.C, IFRS 2 does not apply to share-based payments to acquire goods as part of a business combination to which IFRS 3 applies.

However, in 2013 the IFRS IC¹² has clarified that in a reverse acquisition involving an entity that does not constitute a business (i.e., an asset acquisition or the provision of a service), IFRS 2 rather than IFRS 3 is likely to apply. For example, a private operating entity may enter into a transaction to have itself 'acquired' by a listed shell (non-operating) entity, such as a special purpose acquisition company ('SPAC') as a means of obtaining a stock exchange listing.

The issue that was considered by the IFRS IC involved the former shareholders of a non-listed operating entity becoming the majority shareholders of the combined entity by exchanging their shares for new shares of a listed non-operating entity. The IFRS IC concluded that it is appropriate to apply the IFRS 3 guidance for reverse acquisitions by analogy, and the accounting acquirer is deemed to have issued shares to obtain control of the acquiree. The transaction is not a business combination, but a share-based payment

¹¹ [IFRIC Update](#), July 2014, available on the IFRS Foundation's website.

¹² [IFRIC Update](#), March 2013, available on the IFRS Foundation's website.

transaction which should be accounted for in accordance with IFRS 2 (i.e., an asset acquisition or provision of service). The IFRS IC concluded that any difference in the fair value of the shares deemed to have been issued by the accounting acquirer and the fair value of the accounting acquiree's identifiable net assets represents a service received by the accounting acquirer for obtaining a stock exchange listing (see Chapter 10). [IFRS 2.8, IFRS 2.13A].

The IFRS IC considered another request in 2022,¹³ on the accounting for warrants when acquiring a SPAC. The issue considered by the IFRIC IC in 2022 involved a private operating entity acquiring a SPAC by issuing new ordinary shares and warrants to the SPAC's founder shareholders and public investors in exchange for the SPAC's ordinary shares and the legal cancellation of the SPAC's warrants. The purpose of the acquisition is for the private operating entity to acquire the cash held by the SPAC (the SPAC has no assets other than cash) and the SPAC's listing on a stock exchange. This fact pattern is different to that discussed by the IFRS IC in 2013, as the operating entity (also referred to as the target) is identified as the acquirer for both accounting and legal purposes, whereas in the 2013 agenda decision the SPAC is identified as the legal acquirer and the operating entity as the accounting acquirer. The SPAC's founder shareholders and public investors are not SPAC employees nor will they provide services to the operating entity after the acquisition. In addition, the fair value of the instruments the operating entity issues to acquire the SPAC exceeds the fair value of the SPAC's identifiable net assets. The IFRS IC was asked to consider the accounting for the warrants at acquisition.

The IFRS IC concluded that, in applying IFRS 2, the operating entity receives a stock exchange listing service for which it has issued equity instruments as part of a share-based payment transaction, and it is measured as the difference between the fair value of the instruments issued to acquire the SPAC and the fair value of the identifiable net assets acquired. [IFRS 2.2, IFRS 2.13A].

When assessing what are the individual identifiable net assets acquired, the IFRS IC observed that the operating entity acquires the cash held by the SPAC and also considers whether it assumes the SPAC warrants as part of the acquisition and, consequently, whether it assumes a liability if those warrants are classified as financial liabilities. In assessing whether it assumes the SPAC warrants as part of the acquisition, the operating entity considers the specific facts and circumstances of the transaction, including the terms and conditions of all agreements associated with the acquisition. For example, the operating entity considers the legal structure of the transaction and the terms and conditions of the SPAC warrants and the new warrants the entity issues.

Depending on the specific facts and circumstances, the operating entity might conclude that it assumes the SPAC warrants as part of the acquisition (in this case, the entity issues ordinary shares to acquire the SPAC, assumes the SPAC warrants as part of the acquisition and then issues new warrants to replace the SPAC warrants assumed). Alternatively, the operating entity might conclude that the facts and circumstances are such that it does not assume the SPAC warrants as part of the acquisition, and in this case, the operating entity issues both ordinary shares and new warrants to acquire the SPAC.

The IFRS IC observed that IAS 32 applies to all financial instruments, with some exceptions including financial instruments, contracts and obligations under share-based payment transactions to which IFRS 2 applies. In addition, IFRS 2 applies to 'share-based payment transactions in which an entity acquires or receives goods or services. Goods includes inventories, consumables, property, plant and equipment, intangible assets and other non-financial assets'. [IFRS 2.5].

Therefore, the IFRS IC concluded that the operating entity applies IFRS 2 in the accounting for instruments issued to acquire the stock exchange listing service and IAS 32 in accounting for instruments issued to acquire cash and assume any liability related to the SPAC warrants given that these instruments were not issued to acquire goods or services and are not in the scope of IFRS 2.

To the extent it is determined that the operating entity assumes the SPAC warrants as part of the acquisition, the operating entity applies IAS 32 to determine whether the SPAC warrants assumed are financial liabilities or equity instruments, given that the SPAC's founder shareholders and public investors hold the SPAC warrants solely in their capacity as owners of the SPAC as they are not SPAC employees nor will they provide services to the combined entity after the acquisition (see Chapter 43). The operating entity then applies IAS 32 and IFRS 9 Financial Instruments to account for the replacement of the SPAC warrants with new warrants. However, because the operating entity negotiated the replacement of the SPAC warrants as part of the SPAC acquisition, it determines whether it accounts for any of the new warrants it issues as part of that acquisition. No IFRS accounting standard specifically applies in making this determination. Therefore, the operating entity applies paragraphs 10-11 of IAS 8 *Accounting Policies*,

13 [IFRIC Update](#), September 2022, available on the IFRS Foundation's website.

Changes in Accounting Estimates and Errors in developing and applying an accounting policy that results in information that is relevant and reliable.

To the extent that the operating entity does not assume the SPAC warrants as part of the acquisition (i.e., the entity issues both ordinary shares and new warrants to acquire cash and a stock exchange listing and does not assume the SPAC warrants), the operating entity determines to what extent it issued each type of instrument to acquire the cash and the stock exchange listing service. The issuance of shares and warrants in exchange for cash are accounted for under IAS 32 while those issued in exchange for the stock exchange listing service are accounted for under IFRS 2 as the acquisition of financial instruments falls outside the scope of a share-based payment transaction. No IFRS accounting standard specifically applies to this determination. Therefore, the operating entity applies paragraphs 10-11 of IAS 8 in developing and applying an accounting policy that results in information that is relevant and reliable. The IFRS IC observed that the operating entity could allocate the shares and new warrants to the acquisition of cash and the stock exchange listing service on the basis of the relative fair values of the instruments issued (i.e., in the same proportion as the fair value of each type of instrument to the total fair value of all issued instruments). For example, if 80% of the total fair value of the instruments issued comprises ordinary shares, the operating entity could conclude that 80% of the fair value of instruments issued to acquire cash also comprises ordinary shares. Other allocation methods could be used if they meet the requirements in paragraphs 10-11 of IAS 8. However, an accounting policy that results in the operating entity allocating all the new warrants issued to the acquisition of the stock exchange listing service solely to avoid the new warrants being classified as financial liabilities applying IAS 32 would not meet these requirements.

How we see it

To the extent that an operating entity issues both ordinary shares and new warrants to acquire cash and a stock exchange listing service and the new warrants are accounted for as part of the acquisition, the agenda decision concludes that the new warrants are allocated and accounted for in accordance with IAS 32 and IFRS 2, respectively. While this would not impact the measurement of the service listing expense, it would impact the subsequent accounting for these instruments post-acquisition. For example, warrants containing an obligation to deliver a variable number of shares would be accounted for as liability instruments in accordance with IAS 32 subject to fair value measurement subsequently, whereas such warrants could be equity instruments post-acquisition under IFRS 2. It is also observed that applying this allocation approach could present some practical challenges, such as tracking the exercise of warrants under different IFRS accounting standards post-acquisition.

In addition, the 2022 agenda decision identifies the operating entity (target) as both the legal and accounting acquirer, and replaces the SPAC as the entity listed on the stock exchange, we believe that the issue of whether the operating entity assumes the warrants is also relevant in other structures.

A target which is an accounting acquirer but not the legal acquirer in a SPAC acquisition (similar to the 2013 agenda decision fact pattern discussed above) is also required to apply IFRS 2 in accounting for the acquisition of goods or services (including a stock exchange listing) and IAS 32 in accounting for the acquisition/assumption of financial assets/liabilities included in the net assets of the SPAC.

The discussion above focuses on the scoping for the transaction, for further discussion on accounting considerations for SPAC transactions refer to our publication, [Applying IFRS: Accounting for SPACs](#).

3 General recognition principles

The recognition rules in IFRS 2 are based on a so-called 'service date model'. In other words, IFRS 2 requires the goods or services received or acquired in a share-based payment transaction to be recognised when the goods are acquired or the services rendered. [IFRS 2.7]. For awards to employees (or others providing similar services), this contrasts with the measurement rules, which normally require a share-based payment transaction to be measured as at the date on which the transaction was entered into, which may be some time before or after the related services are received - see sections 4 to 7 below.

Where the goods or services received or acquired in exchange for a share-based payment transaction do not qualify for recognition as assets they are recognised as expenses. [IFRS 2.8]. The standard notes that typically services will not qualify as assets and must therefore be expensed immediately, whereas goods will generally be recognised initially as assets and expensed later as they are consumed. However, some payments for services may be capitalised (e.g., as part of the cost of PP&E, intangible assets or inventories) and some payments for goods may be expensed immediately (e.g., where they are for items included within development costs written off as incurred). [IFRS 2.9].

The corresponding credit entry when goods are acquired or services are rendered is, in the case of an equity-settled transaction, an increase in equity and, in the case of a cash-settled transaction, a liability (or decrease in cash or other assets). [IFRS 2.7].

The primary focus of the discussion in the remainder of this chapter is the application of these rules to transactions with employees. The accounting treatment of transactions with non-employees is addressed further in sections 5.1 and 5.4 below.

3.1 Vesting conditions

Under IFRS 2, the point at which a cost is recognised for goods or services depends on the concept of 'vesting'. The following definitions in Appendix A to IFRS 2 are relevant. [IFRS 2 Appendix A].

Extract from IFRS 2

Appendix A IFRS 2**Defined terms****performance condition**

A **vesting condition** that requires:

- (a) the counterparty to complete a specified period of service (ie a **service condition**); the service requirement can be explicit or implicit; and
- (b) specified performance target(s) to be met while the counterparty is rendering the service required in (a).

The period of achieving the performance target(s):

- (a) shall not extend beyond the end of the service period; and
- (b) may start before the service period on the condition that the commencement date of the performance target is not substantially before the commencement of the service period.

A performance target is defined by reference to:

- (a) the entity's own operations (or activities) or the operations or activities of another entity in the same group (ie a non-market condition); or
- (b) the price (or value) of the entity's **equity instruments** or the equity instruments of another entity in the same group (including shares and **share options**) (ie a **market condition**).

A performance target might relate either to the performance of the entity as a whole or to some part of the entity (or part of the group), such as a division or an individual employee.

service condition

A **vesting condition** that requires the counterparty to complete a specified period of service during which services are provided to the entity. If the counterparty, regardless of the reason, ceases to provide service during the **vesting period**, it has failed to satisfy the condition. A service condition does not require a performance target to be met.

vest

To become an entitlement. Under a **share-based payment arrangement**, a counterparty's right to receive cash, other assets or **equity instruments** of the entity vests when the counterparty's entitlement is no longer conditional on the satisfaction of any **vesting conditions**.

vesting condition

A condition that determines whether the entity receives the services that entitle the counterparty to receive cash, other assets or **equity instruments** of the entity, under a **share-based payment arrangement**. A vesting condition is either a **service condition** or a **performance condition**.

An example of a service condition is one where an employee is granted a share option with a service requirement of remaining in employment with an entity for three years, the award vests three years after the date of grant if the employee is still employed by the entity at that date.

The definitions of 'vesting condition', 'service condition' and 'performance condition' reproduced above clarify the distinction between different types of conditions attached to a share-based payment.

The definition of a *market condition* is included in section 6.3 below.

In order for a condition to be a vesting condition - rather than a 'non-vesting' condition (see section 3.2 below) - there must be a service requirement and any additional performance target must relate to the entity or to some part of the entity or group, such as a division or an individual employee. Thus a condition that an award vests if, in three years' time, earnings per share has increased by 10% and the employee is still in employment, is a performance condition. If, however, the award becomes unconditional in three years' time if earnings per share has increased by 10%, irrespective of whether the employee is still in employment, that condition is not a performance condition but a non-vesting condition because there is no associated service requirement.

The different types of performance condition and the related accounting requirements are discussed more fully in section 6 below. The distinction between vesting and non-vesting conditions is discussed in section 3.2 below.

The accounting treatment in a situation where the counterparty fails to meet a service condition - a situation now explicitly covered by the definition of a service condition above - is considered in more detail in section 7.4.1.A below.

In addition to the general discussion throughout section 3, specific considerations relating to awards that vest on a flotation or change of control (or similar exit event) are addressed in section 15.4 below.

3.1.1 'Malus' clauses and clawback conditions

Whether as a result of an entity's own decision or in response to regulatory requirements, an increasing number of share-based payment awards include conditions in which the awards will only vest if there is no breach of any 'malus' clause on the part of the employee and/or the entity. Often these or other conditions are put in place to allow an entity to claw back awards from employees should any wrongdoing or underperformance be identified.

The impact of such clauses on the accounting treatment required by IFRS 2 depends on the precise terms of a particular arrangement. Aspects of arrangements that entities will need to consider include the following:

- Whether the terms are sufficiently clear at the inception of the arrangement that there can still be a grant in IFRS 2 terms (see section 5.3 below for further discussion of the requirements relating to grant date).
- Whether the malus clause relates only to the actions of the individual employee (so-called 'at fault' malus) and whether the relevant period for consideration of the condition is limited to the vesting period or extends over a longer period.
- Whether the malus clause relates only to the overall performance of the entity (so-called 'not at fault' malus) and, again, the applicable period during which the clause may be invoked.
- Whether the associated clawback arrangements are clear or depend on further decisions by the entity at the time the relevant 'malus' clause is invoked.

How we see it

It is likely to be the case that there will be a grant at inception provided the terms of the malus and clawback arrangements are sufficiently clear for there to be a shared understanding of the arrangements by both parties.

If the employee's ultimate entitlement to an award depends on an 'at fault' malus clause not being invoked, this is generally likely to be taken into account as part of any service vesting condition. If the condition extends beyond the usual vesting date of the award and the employee breaches the condition after the end of the vesting period, the vested awards will be treated as a cancellation under IFRS 2 (but there would be no impact on the expense already recognised for a vested award).

Depending on the precise terms, the assessment of a 'not at fault' malus clause is likely to require greater judgement. To the extent that the entity's overall performance formed part of the conditions on which the award would vest, it seems appropriate to treat the condition as part of a performance vesting condition. To the extent that a 'not at fault' malus clause could result in the clawback of an award after the end of the vesting period, there would need to be an assessment of how the identified fault or wrongdoing interacted with the position of the entity as previously determined at the end of the vesting period. The fault might relate solely to a situation that would have prevented the original vesting of the award (for example, a restatement of accounts relating to the vesting period) or it might be a more general condition relating to the ongoing performance of the entity subsequent to the vesting period. If the condition extended beyond the service period, the entity would need to consider whether the award may contain a non-vesting condition from inception (see section 3.2 below). However, given the nature of the condition, in our view if it was determined that a non-vesting condition existed, it would be unlikely that there would be a significant reduction, if any, in the fair value of the award as a consequence of the non-vesting condition.

How we see it

As noted above, an 'at fault' malus clause will likely be taken into account as part of the service vesting condition. A 'not at fault' malus clause requires greater judgement and consideration to whether it needs to be treated as part of the performance vesting condition, but if it extends beyond the service period, the entity would need to consider whether the award may contain a non-vesting condition from inception, and if it were determined to contain a non-vesting condition we believe it would not result in a significant reduction in the fair value of the award.

3.1.2 Vesting conditions based on an employee's performance rating

An entity may grant awards to employees that vest based on conditions that include the employee's performance rating. A performance rating would appear to meet the definition of a non-market performance condition in that it is a vesting condition that requires an employee to render service for a period of time and to achieve a specified performance rating while providing the service in employment of the entity (see section 3.1 above). Performance ratings can be influenced by the judgement of the individual(s) conducting an employee's evaluation, therefore, the question often arises whether the inherent subjectivity of a performance evaluation could delay the grant date for the award (see section 5.3 below). The impact of such condition on the accounting treatment required by IFRS 2 depends on the framework that is established by the entity to facilitate an employee's understanding of how their performance will be measured. A framework that clearly articulates criteria and includes more objective measures is more likely to result in a more predictive outcome and, thus likely a non-market performance condition. On the contrary, a framework that contains more subjective measures that provide less clarity and is less predictive of the outcome, would not. The following are aspects of the framework that should be considered in making the determination:

- Whether the criteria are sufficiently clear at the inception of the share-based payment arrangement such that there is a mutual understanding between the entity and the employee about how the performance rating will be measured.
- Whether the criteria relates only to the performance of the individual employee or the employee's performance relative to their peers, over the relevant measurement period.
- Whether the employee is able to predict the outcome under the related performance rating framework, given the set criteria.

In certain cases, the number of instruments underlying the award might vary depending on the employee's performance relative to the criteria in the framework. The entity will be required to estimate the potential outcome during the performance period and to recognise the cost for the number of instruments that the employee is expected to be entitled based on their performance rating (see section 6.2.4 below).

3.1.3 Environment Social and Governance ('ESG') related conditions

With the increase in focus by stakeholders of entities on ESG related matters, a growing number of share-based payment arrangements include conditions that require environmental, social and/or governance related targets to be met for the award to vest. An entity that grants such an award will need to assess if the ESG target is a vesting condition or non-vesting condition.

As noted in section 3 above, a vesting condition is either a service condition or performance condition, with the latter requiring the counterparty to complete a specified period of service and specified performance targets (such as a specified increase in the entity's profit over a specified period of time). A performance condition that is referenced to the entity's own operations (or activities) or the operations or activities of another entity in the same group, is a non-market vesting condition. A performance target might relate either to the performance of the entity as a whole or to some part of the entity (or part of the group), such as a division or an individual employee. IFRS 2 does not explicitly define a 'non-vesting condition' (see section 3.2.2 below), but uses the term to describe a condition that is neither a service condition nor a performance condition.

The identification of an ESG related target as a vesting condition is not always straightforward. One such area is conditions related to climate change. An entity may enter into a share-based payment arrangement with employees that vests on satisfying a service period and on achieving targets based on Scope 1, 2 and/or 3 GHG (greenhouse gas) emissions.¹⁴ In general, Scope 1 emissions arise from sources that are owned or controlled by the entity, while Scope 2 emissions occur indirectly from the generation of purchased energy consumed by the entity. If the service condition requirements in the definition of a performance condition are met, both Scope 1 and Scope 2 emissions targets would meet the definition of performance vesting conditions as they both relate to the performance of the entity's own operations or activities. Scope 3 emissions are all indirect emissions (not included in scope 2) that occur in the value chain (upstream and downstream) of an entity. Fifteen reporting categories¹⁵ exist for measuring an entity's Scope 3 emissions.

Determining whether a Scope 3 emissions target is a performance condition will require analysis of the conditions that has led to the emissions in determining if the definition of a performance condition is met or whether it represents a non-vesting condition. To meet the definition of a performance condition, the target is required to be referenced to the entity's own operations or activities. Whilst the service condition must not be for a period that is less than the period the Scope 3 target must be met, the following are some factors that could help in determining if the target is a performance condition:

- Whether an entity is able to influence if a target is met through its own actions. For example, when an entity grants a share-based payment award subject to a service condition and achieving a 20% reduction in Scope 3 Category 7 emissions (related to Employee Commuting emissions), as part of the entity's net zero commitment, and the entity has also put in place various policies to help meet the emission targets by providing employees hybrid working arrangements and incentives for carpooling. Another example may be an entity granting a share-based payment award subject to a service condition and achieving a 20% reduction in Scope 3 Category 1 emissions (related to Purchased Goods and Services emissions), as part of the entity's net zero commitment. The entity has introduced penalties into agreements with suppliers where suppliers have not met emission reduction targets agreed with the entity, has terminated some supplier agreements and entered into agreements with new suppliers in order to help meet the entity's emission targets.
- Whether the conditions are related to the entity's activities. For example, the target of achieving a 20% reduction in Scope 3 emissions in the examples in the previous bullet, is referenced to activities the entity is undertaking to meet its own target as part of its overall net zero commitment.

How we see it

Practice is evolving and there is always some judgement in determining if Scope 3 emission targets are performance conditions. However, in our view as long as the target is referenced to the entity's operations or activities, the achievement of a target does not need to be solely based on the actions of the entity to meet the definition of a performance condition. An example is when determining whether electric vehicle volume revenue target is met, such a target is also influenced by events outside an entity's direct control, such as consumer choice.

3.2 Non-vesting conditions (conditions that are neither service conditions nor performance conditions)

3.2.1 Background

Some share-based payment transactions, particularly those with employees, require the satisfaction of conditions that are neither service conditions nor performance conditions. For example, an employee might be given the right to 100 shares in three years' time, subject only to the employee not working in competition with the reporting entity during that time. An undertaking not to work for another entity does not 'determine whether the entity receives ... services' - the employee could sit on a beach for three years and still be entitled to collect the award. Accordingly, such a condition is not regarded as a vesting condition for the purposes of IFRS 2, but is instead referred to as a 'non-vesting condition'. The accounting treatment of non-vesting conditions is discussed in detail in section 6.4 below.

¹⁴ IFRS S2 Climate-related Disclosures, Appendix A Defined terms, available on the IFRS Foundation's website.

¹⁵ [Greenhouse Gas Protocol](#), *Corporate Value Chain (Scope 3) Accounting and Reporting Standard*, available from the Greenhouse Gas Protocol website.

IFRS 2 does not explicitly define a 'non-vesting condition' (see section 3.2.2 below), but uses the term to describe a condition that is neither a service condition nor a performance condition. Sometimes the condition will be wholly within the control of the counterparty and unconnected with the delivery of services, such as a requirement to save (see below). However, the identification of such conditions is not always straightforward.

The concept of a 'non-vesting condition', like much of IFRS 2 itself, had its origins as an anti-avoidance measure. It arose from a debate on how to account for employee share option schemes linked to a savings contract. In some jurisdictions, options are awarded to an employee on condition that the employee works for a fixed minimum period and, during that period, makes regular contributions to a savings account, which is then used to exercise the option. The employee is entitled to withdraw from the savings contract before vesting, in which case the right to the award lapses.

Entities applying IFRS 2 as originally issued almost invariably treated an employee's obligation to save as a vesting condition. If the employee stopped saving this was treated as a failure to meet a vesting condition and accounted for as a forfeiture, with the reversal of any expense so far recorded (see sections 6.1 and 6.2 below).

Some saw in this a scope for abuse of the general principle of IFRS 2 that, if a share-based payment transaction is cancelled, any amount not yet expensed for it is immediately recognised in full (see section 7.4 below). The concern was that, if such a plan were 'out of the money', the employer, rather than cancel the plan (and thereby trigger an acceleration of expense) would 'encourage' the employee to stop saving (and thereby create a reversal of any expense already charged).

The broad effect of the January 2008 amendment to IFRS 2 (see section 1.2 above) was to remove this perceived anomaly from the standard.

However, following the publication of the January 2008 amendment, it became apparent that the concept of the 'non-vesting' condition was not clear. This resulted in differing views on the appropriate classification of certain types of conditions depending on whether or not they were considered to be measures of the entity's performance or activities and hence performance vesting conditions.

The IFRS IC took a number of the above issues onto its agenda as part of a wider project on vesting and non-vesting conditions. Where the issues were not addressed through the IASB's *Annual Improvements to IFRSs 2010-2012 Cycle*, there is further discussion in section 3.4 below.

3.2.2 Defining a non-vesting condition

As noted in section 3.1 above, IFRS 2 defines a vesting condition as a condition that determines whether the entity receives the services that entitle the counterparty to receive payment in equity or cash. Performance conditions are those that require the counterparty to complete a specified period of service and specified performance targets to be met (such as a specified increase in the entity's profit over a specified period of time).

The Basis for Conclusions on IFRS 2 adds that the feature that distinguishes a performance condition from a non-vesting condition is that the former has an explicit or implicit service requirement and the latter does not. [IFRS 2.BC171A].

In issuing its *Annual Improvements to IFRSs 2010-2012 Cycle* in December 2013 the IASB considered whether a definition of 'non-vesting condition' was needed. It decided that "the creation of a stand-alone definition ... would not be the best alternative for providing clarity on this issue". [IFRS 2.BC364]. Instead, it sought to provide further clarification in the Basis for Conclusions on IFRS 2, as follows:

"...the Board observed that the concept of a non-vesting condition can be inferred from paragraphs BC170-BC184 of IFRS 2, which clarify the definition of vesting conditions. In accordance with this guidance it can be inferred that a non-vesting condition is any condition that does not determine whether the entity receives the services that entitle the counterparty to receive cash, other assets or equity instruments of the entity under a share-based payment arrangement. In other words, a non-vesting condition is any condition that is not a vesting condition." [IFRS 2.BC364].

Although it is stated that the Basis for Conclusions does not form part of IFRS 2, the IASB nonetheless appears to rely on users of the standard referring to the Basis for Conclusions in order to 'infer' the definition of a non-vesting condition.

A performance metric may be a non-vesting condition rather than a vesting condition in certain circumstances. For a condition to be a performance vesting condition, it is not sufficient for the condition to be specific to the performance of the entity. There must also be an explicit or implied service condition that extends to the end of the performance period. For example, a condition that requires the entity's profit before tax or its share price to reach a minimum level, but without any requirement for the employee to remain in employment throughout the performance period, is not a performance condition but a non-vesting condition.

Specific examples of non-vesting conditions given by IFRS 2 include:

- A requirement to make monthly savings during the vesting period.
- A requirement for a commodity index to reach a minimum level.
- Restrictions on the transfer of vested equity instruments.
- An agreement not to work for a competitor after the award has vested - a 'non-compete' agreement (see section 3.2.3 below). [IFRS 2.BC171B, IFRS 2.IG24].

The IASB has also clarified in the Basis for Conclusions on IFRS 2 that a condition related to a share market index target (rather than to the specific performance of the entity's own shares) is a non-vesting condition because a share market index reflects not only the performance of an entity but also that of other entities outside the group. Even where an entity's share price makes up a substantial part of the share market index, the IASB confirmed that this would still be a non-vesting condition because it reflects the performance of other, non-group, entities. [IFRS 2.BC353-BC358].

Thus, whilst conditions that are not related to the performance of the entity are always, by their nature, non-vesting conditions, conditions that relate to the performance of the entity may or may not be non-vesting conditions depending on whether there is also a requirement for the counterparty to render service.

As noted in section 3.1 above, the definition of a performance vesting condition was clarified and expanded in the IASB's *Annual Improvements*. The amended definition includes wording intended to clarify the extent to which the period of achieving the performance target(s) needs to coincide with the service period and states that this performance period:

(a) Shall not extend beyond the end of the service period.

And

(b) May start before the service period on the condition that the commencement date of the performance target is not substantially before the commencement of the service period.

During the process of finalising the amended definition, the IASB moved away from a requirement for the duration of the performance condition to fall wholly within the period of the related service requirement. In response to comments on the draft version of the *Annual Improvements*, the Board decided to make a late adjustment to clarify that the start of the performance period may be before the start of the service period, provided that the commencement date of the performance target is not substantially before the commencement of the service period. As stated in the definition above, however, the performance period may not extend beyond the end of the service period.

FASB differences

It is interesting to note that, in the US, the EITF also considered the question of non-coterminous service and performance conditions but, unlike the IASB, reached the conclusion that a performance target that affects the vesting of a share-based payment and that could be achieved after the requisite service period is a performance condition and does not need to be reflected in the fair value of the award at grant date.¹⁶ This was on the premise that the original definition of a performance condition in ASC 718 *Compensation - Stock Compensation* - requires only a specified period of service. Before finalising the amendments to IFRS 2, the IASB specifically reconfirmed its own decision against the background of the US decision.¹⁷ This is therefore an area of difference between IFRS accounting standards and US GAAP.

¹⁶ Accounting Standards Update 2014-12, FASB, *Accounting for Share-Based Payments When the Terms of an Award Provide That a Performance Target Could Be Achieved after the Requisite Service Period (Topic 718)*.

¹⁷ [IASB Update](#), November 2013, available on the IFRS Foundation's website.

The late adjustment by the IASB goes some way towards removing an issue that is extremely common in practice, particularly with awards made to employees under a single scheme but at various times. The IASB gives the example of an earnings per share target as one of the areas in which respondents to the draft definitions observed that there could be a problem in practice, noting that the measure of earnings per share growth set as a performance target could often be that between the most recently published financial statements at grant date and those before the vesting date. [IFRS 2.BC341]. However, notwithstanding the amended definition, there clearly remains an element of judgement in the interpretation of 'substantially' as used in the definition.

There is further discussion of the accounting treatment of non-vesting conditions in section 6.4 below.

3.2.3 Non-compete agreements

In some jurisdictions it is relatively common to have a non-compete clause in share-based payment arrangements so that if the counterparty starts to work for a competitor within a specified timescale, i.e., he breaches the non-compete provision, he is required to return the shares (or an equivalent amount of cash) to the entity. Generally, a non-compete provision is relevant once an individual has ceased employment with the entity and so no future service is expected to be provided to the entity. However, the non-compete provision is often found in share-based payment awards entered into while the individual is still an employee of the entity and when there is no current intention for employment to cease. There are two divergent views on how such non-compete arrangements are required to be accounted for under IFRS 2.

The Basis for Conclusions on IFRS 2 states that "a share-based payment vests when the counterparty's entitlement to it is no longer conditional on future service or performance conditions. Therefore, conditions such as non-compete provisions and transfer restrictions, which apply after the counterparty has become entitled to the share-based payment, are not vesting conditions." [IFRS 2.BC171B].

One view is that, under the current definitions in the standard, this means that all non-compete agreements must be treated as non-vesting conditions with the condition reflected in the grant date fair value. Another reading of IFRS 2.BC171B is that in some situations such arrangements meet the definition of a vesting condition and this allows any IFRS 2 expense to be reversed should the condition not be met. This view is explained further below. The lack of clarity in the standard as currently drafted means that there is diversity in practice.

Those who take the view that a non-compete arrangement is not always a non-vesting condition read IFRS 2.BC171B as distinguishing between non-compete clauses which apply after the counterparty has become entitled to an award (a non-vesting condition) and those that, by implication, apply before the counterparty has become entitled to an award (a vesting condition). Broadly, therefore, if an employee has been given shares at the start of a non-compete period he is entitled to them (a non-vesting condition), but if the shares are retained by the entity or held in escrow, the employee is not entitled to the shares until the end of the non-compete period (a vesting condition).

This view may be difficult to reconcile with IFRS 2 as currently drafted because:

- It requires the reference to 'entitlement' to an award to be read as including a contingent obligation to forfeit the share, which is not in accordance with the general approach of IFRS 2.
- And
- It requires the words 'which apply after the counterparty has become entitled to the share-based payment' to be read with an implied emphasis on the word 'after', so as to distinguish it from an implied (unstated) alternative scenario in which the conditions apply before the counterparty becomes entitled to the share-based payment. A more natural reading is to consider these words as describing all non-compete agreements and transfer restrictions.

How we see it

In summary, as noted above, there is diversity in practice on how non-compete agreements are treated. They are treated as non-vesting conditions or in some situations, as vesting conditions, with the latter view being more difficult to reconcile with the requirements of the standard as currently drafted.

The classification of a non-compete provision is a matter that had been referred to the IFRS IC and to the IASB (see section 3.4 below).

3.3 Vesting period

IFRS 2 defines the vesting period as follows: [IFRS 2 Appendix A]

Extract from IFRS 2

Appendix A Defined terms

vesting period

The period during which all the specified **vesting conditions** of a **share-based payment arrangement** are to be satisfied.

The vesting period is not the same as the exercise period or the life of the option, as demonstrated by Illustration 3-1 below.

Illustration 3-1: Meaning of 'vesting period' - award with vesting conditions only

An employee is awarded options that can be exercised at any time between three and ten years from the date of the award, provided the employee remains in service for at least three years from the date of the award. For this award, the vesting period is three years; the exercise period is seven years; and the life of the option is ten years. However, as discussed further in section 8 below, for the purposes of calculating the fair value of the award under IFRS 2, the life of the award is taken as the period ending with the date on which the counterparty is most likely actually to exercise the option, which may be some time before the full ten year life expires.

It is also important to distinguish between vesting conditions and other restrictions on the exercise of options and/or trading in shares, as demonstrated by Illustration 3-2 below.

Illustration 3-2: Meaning of 'vesting period' - award with vesting and non-vesting conditions

An employee is awarded options that can be exercised at any time between five and ten years from the date of the award, provided the employee remains in service for at least three years from the date of the award. In this case, the vesting period remains three years as in Illustration 3-1 above, provided that the employee's entitlement to the award becomes absolute at the end of three years - in other words, the employee does not have to provide any services to the entity in years 4 and 5. The restriction on exercise of the award in the period after vesting is a non-vesting condition, which would be reflected in the original valuation of the award at the date of grant (see sections 4, 5 and 8 below).

The accounting implications of vesting conditions, non-vesting conditions and vesting periods for equity-settled transactions are discussed in sections 4 to 7 below and for cash-settled transactions in section 9 below.

3.4 Vesting and non-vesting conditions: issues referred to the IFRS IC and the IASB

In January 2010 the IFRS IC added to its agenda a request for clarification of the following:

- The basis on which vesting conditions, especially performance conditions, can be distinguished from non-vesting conditions, especially the distinction between a service condition, a performance condition and a non-vesting condition.
- The interaction of multiple conditions.

The amendments to IFRS 2 published in December 2013 as part of the IASB's *Annual Improvements to IFRSs 2010-2012 Cycle* were intended to address the first bullet point together with related application issues that had been raised with the IFRS IC (see sections 3.1 and 3.2 above).

In addition to considering matters subsequently addressed by the IASB in the *Annual Improvements*, the IFRS IC tentatively decided at its meetings in July and September 2010¹⁸ that a non-compete provision should be presumed to be a 'contingent feature' - a term not defined in IFRS 2.¹⁹

The IFRS IC subsequently concluded that the classification of a non-compete provision and the question of how to account for the interaction of multiple vesting conditions should be referred to the IASB.²⁰ In September 2011 the IASB agreed that these issues should be considered as future agenda items.²¹

The IASB launched and concluded a research project into IFRS 2 (see section 1.2.1 above). The IASB decided in May 2016 not to perform further research and published a summary of the research findings in October 2018 - even though the issues continue to result in some diversity in practice (see also section 3.2.3 above and sections 6.3.6 to 6.3.7 below).²²

4 Equity-settled transactions - overview

4.1 Summary of accounting treatment

The detailed provisions of IFRS 2 are complex, but their key points can be summarised as follows:

- (a) All equity-settled transactions are measured at fair value. However, transactions with employees are normally measured using a 'grant date model' (i.e., the transaction is recorded at the fair value of the equity instrument at the date when it is originally granted), whereas transactions with non-employees are normally measured using a 'service date model' (i.e., the transaction is recorded at the fair value of the goods or services received at the date they are received). As noted in section 3 above, all transactions, however measured, are recognised using a 'service date model' (see section 5 below).
- (b) Where an award is made subject to future fulfilment of conditions, a 'market condition' (i.e., one related to the market price (or value) of the entity's equity instruments) or a 'non-vesting condition' (i.e., one that is neither a service condition nor a performance condition) is taken into account in determining the fair value of the award. However, the effect of conditions other than market and non-vesting conditions is ignored in determining the fair value of the award (see section 3 above and section 6 below).
- (c) Where an award is made subject to future fulfilment of vesting conditions, its cost is recognised over the period during which the service condition is fulfilled (see section 3 above and section 6 below). The corresponding credit entry is recorded within equity (see section 4.2 below).
- (d) Until an equity instrument has vested (i.e., the entitlement to it is no longer conditional on future service) any amounts recorded are in effect contingent and will be adjusted if more or fewer awards vest than were originally anticipated to do so. However, an equity instrument awarded subject to a market condition or a non-vesting condition is considered to vest irrespective of whether or not that market or non-vesting condition is fulfilled, provided that all other vesting conditions are satisfied (see section 6 below).
- (e) No adjustments are made, either before or after vesting, to reflect the fact that an award has no value to the employee or other counterparty e.g., in the case of a share option, because the option exercise price is above the current market price of the share (see sections 6.1.1 and 6.1.3 below).
- (f) If an equity instrument is cancelled, whether by the entity or the counterparty (see (g) below) before vesting, any amount remaining to be expensed is charged in full at that point (see section 7.4 below). If an equity instrument is modified before vesting (e.g., in the case of a share option, by changing the performance conditions or the exercise price), the financial statements must continue to show a cost for at least the fair value of the original instrument, as measured at the original grant date, together with any excess of the fair value of the modified instrument over that of the original instrument, as measured at the date of modification (see section 7.3 below).
- (g) Where an award lapses during the vesting period due to a failure by the counterparty to satisfy a non-vesting condition within the counterparty's control, or a failure by the entity to satisfy a non-vesting condition within the entity's control, the lapse of the award is accounted for as if it were a cancellation (see (f) above and section 6.4.3 below).
- (h) In determining the cost of an equity-settled transaction under IFRS 2, whether the entity satisfies its obligations under the transaction with a fresh issue of shares or by purchasing own shares in the financial markets is completely irrelevant to the charge in profit or loss, although there is clearly a difference in the cash flows. Where own shares are purchased, they are accounted for as treasury shares under IAS 32 (see section 2.2.4.H above and Chapter 43). [IFRS 2.BC330, IFRS 2.BC331, IFRS 2.BC332, IFRS 2.BC333].

The requirements summarised in (d) to (g) above can have the effect that IFRS 2 requires a cost to be recorded for an award that ultimately has no value to the counterparty, because the award either does not vest or vests but is not exercised. These rather counter-intuitive requirements of IFRS 2 are in part 'anti-abuse' provisions to prevent entities from applying a 'selective' grant date model, whereby awards that increase in value after grant date remain measured at grant date while awards that decrease in value are remeasured. This is discussed further in the detailed analysis in sections 5 to 7 below.

4.2 The credit entry

As noted at (c) in the summary in section 4.1 above, the basic accounting entry for an equity-settled share-based payment transaction is: debit profit or loss for the period (often classified as employee costs), credit equity (classified as a transaction with owners in their capacity as owners rather than as part of other comprehensive income).

IFRS 2 does not prescribe the component of equity to which the credit is required to be taken. The IASB presumably adopted this non-prescriptive approach so as to ensure there was no conflict between, on the one hand, the basic requirement of IFRS 2 that there is a credit in equity and, on the other, the legal requirements of various jurisdictions as to exactly how that credit is allocated within equity. Depending on the requirements of the particular jurisdiction, it might be appropriate to take the credit to retained earnings or to a separate component of equity or entities may be able to make a policy choice.

Occasionally there will be a credit to profit or loss (see for instance Illustration 6-7 in section 6.2.4 below) and a corresponding reduction in equity.

In some arrangements the share-based payment transaction will be settled in equity instruments of a subsidiary of the reporting entity. This is most commonly the case where the subsidiary is partly-owned with traded shares held by external shareholders. In the consolidated financial statements, the question arises as to whether the credit entry for such transactions is required to be presented as a non-controlling interest or as part of the equity attributable to the shareholders of the parent. This is discussed further in Chapter 8.

5 Equity-settled transactions - cost of awards

5.1 Cost of awards - overview

The general measurement rule in IFRS 2 is that an entity must measure the goods or services received, and the corresponding increase in equity, directly, at the fair value of the goods or services received, unless that fair value cannot be estimated reliably. If the fair value of the goods or services received cannot be estimated reliably, the entity must measure their value, and the corresponding increase in equity, indirectly, by reference to the fair value of the equity instruments granted. [IFRS 2.10].

IFRS 2 defines 'Fair value' as: [IFRS 2 Appendix A]

Extract from IFRS 2

Appendix A

Defined terms

fair value

The amount for which an asset could be exchanged, a liability settled, or an **equity instrument granted** could be exchanged, between knowledgeable, willing parties in an arm's length transaction.

IFRS 2 has its own specific rules in relation to determining the fair value of share-based payments which differ from the more general fair value measurement requirements in IFRS 13 *Fair Value Measurement* (see section 5.5 below). [IFRS 2.6A].

On their own, the general measurement principles of IFRS 2 would suggest that the reporting entity must determine in each case whether the fair value of the equity instruments granted or that of the goods or services received is more reliably determinable. However, IFRS 2 goes on to clarify that:

- In the case of transactions with employees, the fair value of the equity instruments must be used (see section 5.2 below), except in those extremely rare cases where it is not possible to measure this fair value reliably, when the intrinsic value of the equity instruments may be used instead (see section 5.5 below).
- But in the case of transactions with non-employees, there is a rebuttable presumption that the fair value of the goods or services provided is more reliably determinable (see section 5.4 below).

Moreover, transactions with employees are measured at the date of grant (see section 5.2 below), whereas those with non-employees are measured at the date when goods or services are received (see section 5.4 below).

The overall position can be summarised by the following matrix.

Counterparty	Measurement basis	Measurement date	Recognition date
Employee	Fair value of equity instruments awarded	Grant date	Service date
Non-employee	Fair value of goods or services received	Service date	Service date

The Basis for Conclusions addresses the issue of why the accounting treatment for apparently identical transactions must, in effect, depend on the identity of the counterparty.

The main argument put forward to justify the approach adopted for transactions with employees is essentially that, once an award has been agreed, the value of the services provided pursuant to the transaction does not change significantly with the value of the award. [IFRS 2.BC88-BC96]. However, some might question this proposition, on the grounds that employees are more likely to work harder when the value of their options is rising than when it has sunk irretrievably.

As regards transactions with non-employees, the IASB offers two main arguments for the use of measurement at service date.

The first is that, if the counterparty is not firmly committed to delivering the goods or services, the counterparty would consider whether the fair value of the equity instruments at the delivery date is sufficient payment for the goods or services when deciding whether to deliver the goods or services. This suggests that there is a high correlation between the fair value of the equity instruments at the date the goods or services are received and the fair value of those goods or services. [IFRS 2.BC126]. This argument is clearly vulnerable to the challenge that it has no relevance where (as would more likely be the case) the counterparty is firmly committed to delivering the goods or services.

The second is that non-employees generally provide services over a short period commencing some time after grant date, whereas employees generally provide services over an extended period beginning on the grant date. This leads to a concern that transactions with non-employees could be entered into well in advance of the due date for delivery of goods or services. If an entity were able to measure the expense of such a transaction at the grant date fair value, the result, assuming that the entity's share price rises, would be to understate the cost of goods and services delivered. [IFRS 2.BC126, IFRS 2.BC127].

The true reason for the IASB's approach may have been political as much as theoretical. One effect of a grant date measurement model is that, applied to a grant of share options that is eventually exercised, it 'freezes' the accounting cost at the (typically) lower fair value at the date of grant. This excludes from the post-grant financial statements the increased cost and volatility that would be associated with a model that constantly remeasured the award to fair value until exercise date. The IASB might well have perceived it as a marginally easier task to persuade the corporate sector of the merits of a 'lower cost, zero volatility' approach as opposed to a 'fair value at exercise date' model (such as is used for cash-settled awards - see section 9 below).

The price to be paid in accounting terms for the grant date model is that, when an award falls in value after grant date, it continues to be recognised at its higher grant date value. It is therefore quite possible that, during a period of general economic downturn, financial statements will show significant costs for options granted in previous years, but which are currently worthless. This could well lead to (in fact, sometimes groundless) accusations of rewarding management for failure.

5.2 Transactions with employees

These will comprise the great majority of transactions accounted for under IFRS 2, and include all remuneration in the form of shares, share options and any other form of reward settled in equity instruments of the entity or a member of its group.

5.2.1 Who is an 'employee'?

Given the difference between the accounting treatment of equity-settled transactions with employees and with non-employees, it is obviously important for IFRS 2 to define what is meant by employees. In fact, IFRS 2 strictly refers to 'employees and others providing similar services' who are defined as: [IFRS 2.11, IFRS 2 Appendix A]

Extract from IFRS 2

Appendix A

Defined terms

employees and others providing similar services

Individuals who render personal services to the entity and either (a) the individuals are regarded as employees for legal or tax purposes, (b) the individuals work for the entity under its direction in the same way as individuals who are regarded as employees for legal or tax purposes, or (c) the services rendered are similar to those rendered by employees. For example, the term encompasses all management personnel, ie those persons having authority and responsibility for planning, directing and controlling the activities of the entity, including non-executive directors.

The implication of (a) and (b) above is that it is not open to an entity to argue that an individual who is not an employee as a matter of law is therefore automatically a non-employee for the purposes of IFRS 2.

The implication of (b) and (c) above is that, where a third party provides services pursuant to a share-based payment transaction that could be provided by an employee (e.g., where an external IT consultant works alongside an in-house IT team), that third party is treated as an employee rather than a non-employee for the purposes of IFRS 2.

Conversely, however, where an entity engages a consultant to undertake work for which there is not an existing in-house function, the implication is that such an individual is not regarded as an employee.

How we see it

In our view, the reference in (c) to ‘services ... similar to those rendered by employees’ is to services rendered by employees that the entity actually has, rather than to employees that the entity might have if it were to recruit them. Otherwise, the distinction in IFRS 2 between employees and non-employees would have no effect, since it would always be open to an entity to argue that it could employ someone to undertake any task instead of engaging a contractor.

Exceptionally there might be cases where the same individual is engaged in both capacities. For example, a director of the entity might also be a partner in a firm of lawyers and be engaged in that latter capacity to advise the entity on a particular issue. It might be more appropriate to regard payment for the legal services as made to a non-employee rather than to an employee.

Related questions of interpretation arise where an award is made to an employee of an associate or a joint venture (see section 12.9 below).

The effect of a change of status from employee to non-employee (or *vice versa*) is addressed in section 5.4.1 below.

5.2.2 Basis of measurement

As noted above, IFRS 2 requires equity-settled transactions with employees to be measured by reference to the fair value of the equity instruments granted at ‘grant date’ (see section 5.3 below). [IFRS 2.11]. IFRS 2 asserts that this approach is necessary because shares, share options and other equity instruments are typically only part of a larger remuneration package, such that it would not be practicable to determine the value of the work performed in consideration for the cash element of the total package, the benefit-in-kind element, the share option element and so on. [IFRS 2.12].

In essence, this is really an anti-avoidance provision. The underlying concern is that, if an entity were able to value options by reference to the services provided for them, it might assert that the value of those services was zero, on the argument that its personnel are already so handsomely rewarded by the non-equity elements of their remuneration package (such as cash and health benefits), that no additional services are (or indeed could be) obtained by granting options.

5.3 Grant date

As noted above, IFRS 2 requires equity-settled transactions with employees to be accounted for at fair value at grant date. IFRS 2 defines grant date as follows: [IFRS 2 Appendix A]

Extract from IFRS 2

Appendix A Defined terms

grant date

The date at which the entity and another party (including an employee) agree to a **share-based payment arrangement**, being when the entity and the counterparty have a shared understanding of the terms and conditions of the arrangement. At grant date the entity confers on the counterparty the right to cash, other assets, or **equity instruments** of the entity, provided the specified **vesting conditions**, if any, are met. If that agreement is subject to an approval process (for example, by shareholders), grant date is the date when that approval is obtained.

The determination of grant date is critical to the measurement of equity-settled share-based transactions with employees, since grant date is the date at which such transactions must be measured (see section 5.2.2 above).

In practice, it is not always clear when a mutual understanding of the award (and, therefore, grant date) has occurred. Issues of interpretation can arise as to:

- How precise the shared understanding of the terms of the award must be.
- Exactly what level of communication between the reporting entity and the counterparty is sufficient to ensure that there is the appropriate degree of agreement and 'shared understanding'.

As a consequence, the determination of the grant date is often difficult in practice. We discuss the following issues in more detail in the sections below:

- Basic determination of grant date (see section 5.3.1 below).
- The communication of awards to employees and the rendering of services in advance of grant date (see section 5.3.2 below).
- Awards where the exercise price or performance depends on a formula or on a future share price (see section 5.3.3 below).
- Awards where the exercise price is paid in shares (net settlement of award) (see section 5.3.4 below).
- An award of equity instruments to a fixed monetary value (see section 5.3.5 below).
- Awards over a fixed pool of shares (including 'last man standing' arrangements) (see section 5.3.6 below).
- Awards with multiple service and performance periods (see section 5.3.7 below).
- Awards subject to modification or discretionary re-assessment by the entity after the original grant date (see section 5.3.8 below).
- Mandatory or discretionary awards to 'good leavers' (see section 5.3.9 below).
- Shares issued by special purpose acquisition companies (see section 5.3.10 below).

The grant date for 'matching' awards (i.e., arrangements where an additional award of shares is granted to match an initial cash bonus or award of shares) is discussed in section 15.1 below.

5.3.1 Determination of grant date

IFRS 2 and the accompanying implementation guidance emphasise that a grant occurs only when all the conditions are understood and agreed by the parties to the arrangement and any required approval process has been completed. Thus, for example, if an entity makes an award 'in principle' to an employee of options whose terms are subject to review or approval by a remuneration committee or the shareholders, 'grant date' is the later date when the necessary formalities have been completed. [IFRS 2 Appendix A, IFRS 2.IG1, IFRS 2.IG2, IFRS 2.IG3].

The implementation guidance to IFRS 2 emphasises that, "the word 'agree' is used in its usual sense, which means that there must be both an offer and an acceptance of that offer...". Therefore, there cannot be a grant unless an offer by one party has been accepted by the other party. The guidance notes that agreement will be explicit in some cases (e.g., if an agreement has to be signed), but in others it might be implicit, such as when an employee starts to deliver services for the award. [IFRS 2.IG2].

The counterparty's agreement to an offer might be particularly difficult to determine when it is implicit rather than explicit. For example, if an award required both the rendering of service and a subscription payment (other than a minimal one) by the employee, it is likely that the employee's agreement, and hence the grant date of the award, would coincide with the payment date - provided this occurs shortly after the offer date. If, however, the employee had the choice at the offer date of deferring payment until a much later date and could therefore decide whether the entity's subsequent performance justified their payment, then it is more likely that grant date would be the date on which the services commenced.

How we see it

Determination of when the counterparty has agreed to an offer will often be an area of judgement that depends on the precise facts and circumstances of a particular situation.

The implementation guidance to IFRS 2 further notes that employees may begin rendering services in consideration for an award before it has been formally ratified. For example, a new employee might join the entity on 1 January and be granted options relating to performance for a period beginning on that date, but subject to formal approval by the remuneration committee at its next quarterly meeting on 15 March. In that case, the entity would typically begin expensing the award from 1 January based on a best estimate of its fair value, but would subsequently adjust that estimate so that the ultimate cost of the award was its actual fair value at 15 March. [IFRS 2.IG4]. This reference to formal approval could be construed as indicating that, in fact, IFRS 2 requires not merely that there is a mutual understanding of the award (which might well have been in existence since 1 January), but also that the entity has completed all processes necessary to make the award a legally binding agreement.

In practice, many situations are much less clear-cut than the examples given in the implementation guidance. For example, if a remuneration committee has discretion over some aspects of an award and whether it vests, does that mean that there is not a shared understanding until the vesting date? Similarly, does the counterparty need to have full quantification of every aspect of an award (performance targets, exercise price, etc.) or would an understanding of the formula for calculating performance or price be sufficient?

Some of these practical interpretation issues are considered further in the sections below.

5.3.2 Communication of awards to employees and services in advance of grant date

As discussed in section 5.3.1 above, the implementation guidance to IFRS 2 indicates that, in order for a grant to have been made, there must not merely be a mutual understanding of the terms - including the conditions attached to the award as discussed further in the sections that follow - but there must also be a legally enforceable arrangement. Thus, if an award requires board or shareholder approval for it to be legally binding on the reporting entity, for the purposes of IFRS 2 it has not been granted until such approval has been given, even if the terms of the award are fully understood at an earlier date. However, if services are effectively being rendered for an award from a date earlier than the grant date as defined in IFRS 2, the cost of the award is required to be recognised over a period starting with that earlier date. An estimate of the grant date fair value of the award is used (e.g., by estimating the fair value of the equity instruments at the end of the reporting period), for the purposes of recognising the services received during the period between service commencement date and grant date. [IFRS 2.IG4].

How we see it

In some situations, the employee will have a valid expectation of an award, and the entity will have a corresponding obligation, based on an earlier commitment by the entity. However, it might be the case that not all of the precise terms and conditions have been finalised. In our view, provided it is possible to estimate the fair value of the arrangement, an estimated cost for services is to be recognised in advance of grant date in such cases as well as in those situations where formal approval does not take place until a later date.

In situations where the entity estimates at the reporting date the grant date fair value of an award for services received in advance of grant date, the estimate is revised at subsequent reporting periods until the date of grant has been established. Once grant date has been established the entity revises the earlier estimate so that the amounts recognised for services received in respect of the grant are ultimately based on the grant date fair value of the equity instruments awarded.

The implications of IFRS 2.IG4 requirements are demonstrated in Illustration 5-1 below for a situation where formal approval of an award is delayed. It is important, however, to retain a sense of proportion in considering the overall impact on the financial statements. For example, in cases where the share price is not particularly volatile, whether the grant date is, say, 1 January or 1 April may not make a great difference to the valuation of the award, particularly when set beside the range of acceptable valuations resulting from the use of estimates in the valuation model.

Illustration 5-1: Determination of grant date

Scenario 1

On 1 January an entity advises employees of the terms of a share award designed to reward performance over the following three years. The award is subject to board approval, which is given two months later on 1 March. Grant date is 1 March. However, the cost of the award would be recognised over the three year period beginning on 1 January, since the employees would have effectively been rendering service for the award from that date.

Scenario 2

On 1 January an entity's board resolves to implement a share scheme designed to reward performance over the following three years. The award is notified to employees two months later on 1 March. Grant date is again 1 March. *Prima facie*, in this case, the cost of the award would be recognised over the period of two years and ten months beginning on 1 March, since the employees could not be regarded as rendering service in January and February for an award of which they were not aware at that time.

However, if a similar award is made each year, and according to a similar timescale, there might be an argument that, during January and February of each year, the employees are rendering service for an award of which there is high expectation, and that the cost is therefore, as in Scenario 1, recognised over the full three year period. The broader issue of the accounting treatment for awards of which there is a high expectation is addressed in the discussion of matching share awards in section 15.1 below.

Scenario 3

On 1 January an entity advises employees of the terms of a share award designed to reward performance over the following three years. The award is subject to board approval, which is given two months later on 1 March. However, in giving such approval, the board makes some changes to the performance conditions as originally communicated to employees on 1 January. The revised terms of the award are communicated to employees a month later on 1 April. Grant date is 1 April. However, the cost of the award would be recognised over the three year period beginning on 1 January, since the employees would have effectively been rendering service for the award from that date.

Examples of situations where an employee might render service in advance of the IFRS 2 grant date because the precise conditions of an award are outstanding are considered in sections 5.3.3 to 5.3.7 and in sections 15.1 and 15.4.1 below.

5.3.3 Exercise price or performance target dependent on a formula or future share price

Some share plans define the exercise price not in absolute terms, but as a factor of the share price. For example, the price might be expressed as:

- A percentage of the share price at exercise date.
- Or
- A percentage of the lower of the share price at grant date and at exercise date.

The effect of this is that, although the actual exercise price is not known until the date of exercise, both the entity and the counterparty already have a shared understanding of how the price will be calculated and it is possible to estimate the outcome on an ongoing basis without the need for additional approval or inputs.

A similar approach might be applied in the setting of performance targets i.e., they are set by reference to a formula rather than in absolute terms and so do not require further input by the entity or its remuneration committee, for example.

In order for there to be a shared understanding and a grant date, the formula or method of determining the outcome needs to be sufficiently clear and objective to allow both the entity and the counterparty to make an estimate of the outcome of the award during the vesting period. Where there is subjectivity in determining the formula or method of determining the outcome there can be no shared understanding and a grant date (see scenario 2 in Illustration 5-2 in section 5.3.7 below).

How we see it

In our view, grant date is the date on which the terms and conditions (including the formula for calculating the exercise price or performance target) are determined sufficiently clearly and agreed by the entity and the counterparty, subject to the matters discussed in section 5.3.2 above.

5.3.4 Exercise price paid in shares (net settlement of award)

Some share awards allow the exercise price to be paid in shares. In practical terms, this means that the number of shares delivered to the counterparty will be the total 'gross' number of shares awarded less as many shares as have, at the date of exercise, a fair value equal to the exercise price.

How we see it

The above situation is analogous to that in section 5.3.3 above in that, whilst the absolute 'net' number of shares awarded will not be known until the date of exercise, the basis on which that 'net' number will be determined is established in advance. Accordingly, in our view, grant date is the date on which the terms and conditions (including the ability to surrender shares to a fair value equal to the exercise price) are determined and agreed by the entity and the counterparty, subject to the matters discussed in section 5.3.2 above.

Such a scheme could be analysed as a share-settled share appreciation right (whereby the employee receives shares to the value of the excess of the value of the shares given over the exercise price), which is treated as an equity-settled award under IFRS 2.

Awards settled in shares net of a cash amount to meet an employee's tax obligation are considered further in section 14.3 below.

5.3.5 Award of equity instruments to a fixed monetary value

Some entities may grant employees awards of shares to a fixed value. For example, an entity might award as many shares as are worth CU100,000, with the number of shares being calculated by reference to the share price as at the vesting date. The number of shares ultimately received will not be known until the vesting date. This begs the question of whether such an award can be regarded as having been granted until that date, on the argument that it is only then that the number of shares to be delivered - a key term of the award - is known, and therefore there cannot be a 'shared understanding' of the terms of the award until that later date.

How we see it

The above situation is analogous to those in sections 5.3.3 and 5.3.4 above. Although the absolute number of shares awarded will not be known until the vesting date, the basis on which that number will be determined is established in advance in a manner sufficiently clear and objective to allow an ongoing estimate by the entity and by the counterparty of the number of awards expected to vest. Accordingly, in our view, grant date is the date on which the terms and conditions are determined sufficiently clearly and agreed by the entity and the counterparty, subject to the matters discussed in section 5.3.2 above.

The measurement of such awards raises further issues of interpretation, which we discuss in section 8.10 below.

5.3.6 Awards over a fixed pool of shares (including 'last man standing' arrangements)

An award over a fixed pool of shares is sometimes granted to a small group of, typically senior, employees. Such awards might involve an initial allocation of shares to each individual but also provide for the redistribution of each employee's shares to the other participants should any individual leave employment before the end of the vesting period. This is often referred to as a 'last man standing' arrangement.

The accounting requirements of IFRS 2 for such an arrangement are unclear. In the absence of specific guidance, several interpretations are possible and we believe that an entity may make an accounting policy choice, provided that choice is applied consistently to all such arrangements.

The first approach is based on the view that the unit of account is all potential shares to be earned by the individual employee and that, from the outset, each employee has a full understanding of the terms and conditions of both the initial award and the reallocation arrangements. This means that there is a grant on day one with each individual's award being valued on the basis of:

- That employee's initial allocation of shares.
- Plus, an additional award with a non-vesting condition relating to the potential reallocation of other participants' shares.

Under this approach, the departure of an employee will be accounted for as a forfeiture and any cost reversed as the service condition will not have been met (see section 6.1.2 below), but the redistribution of that individual's shares to the other employees will have no accounting impact. This approach is likely to result in a total expense that is higher than the number of shares awarded multiplied by the grant date price per share.

The second approach, which we believe is consistent with US GAAP, also considers the individual employee's award to be the unit of account. Under this approach, there is an initial grant to all the employees and it is only these awards for which the fair value is measured at the date of the initial grant. Any subsequent reallocations of shares are to be accounted for as a forfeiture of the original award and a completely new grant to the remaining employees, measured at the new grant date. This approach accounts only for the specific number of shares that have been allocated to the individual employee as at the end of each reporting period. No account is taken in this approach of shares that might be allocated to the individual employee in the future due to another employee's forfeiture, even though the reallocation formula is known to the individual employees at the initial grant date.

A third view, which takes a pragmatic approach in the light of the issues arising from the two approaches outlined above, is to account for the award on the basis of the total pool of shares granted rather than treating the individual employee as the unit of account. In our view this approach is likely to be materially acceptable for many arrangements where the pool of shares relates to the same small number of participants from the outset. Under this approach, the fair value of the total pool of shares is measured at the grant date (day one) with the non-vesting condition effectively ignored for valuation purposes. Subsequent forfeitures and reallocations would have no effect on the accounting.

How we see it

To summarise, in the absence of specific guidance in IFRS 2, any one of the three approaches mentioned above provides an acceptable accounting policy so long as the choice is applied consistently to all arrangements.

There is a distinction between the 'last man standing' arrangement described above and a situation where an entity designates a fixed pool of shares to be used for awards to employees but where the allocation of leavers' shares is discretionary rather than pre-determined. In this situation, the valuation of the initial award would not take account of any potential future reallocations. If an employee left employment during the vesting period, that individual's award would be accounted for as a forfeiture and any reallocation of that individual's shares would be accounted for as a new grant with the fair value determined at the new grant date (i.e., a similar accounting treatment to that in approach two above).

A further type of award relating to a fixed pool of shares is one where an entity makes an award over a fixed number or percentage of its shares to a particular section of its workforce, the final allocation of the pool being made to those employed at the vesting date. In such an arrangement, some employees will typically join and leave the scheme during the original vesting period which will lead to changes in each employee's allocation of shares. Although employees are aware of the existence, and some of the terms, of the arrangement at the outset, the fact that there is no objective formula (see sections 5.3.3 to 5.3.5 above) for determining the number of shares that each individual will ultimately receive means that there is no grant under IFRS 2 until the date of final allocation. However, because the employees render service under the arrangement in advance of the grant date - either from day one or from a later joining date - the entity is required to estimate the fair value of the award to each individual from the date services commence and subsequently update it at each reporting period. The fair value estimated is expensed over the full service period of the award with a final truing up of the expense to the fair value of the award at the eventual grant date (see section 5.3.2 above).

This has the effect that, where an entity decides to set aside a bonus pool of a fixed amount of cash, say CU1 million, with the allocation to individual employees to be made at a later date, there is a known fixed cost of CU1 million. However, where an entity decides to set aside a bonus pool of a fixed number of shares, with the allocation to individual employees to be made at a later date, the final cost is not determined until the eventual grant date.

5.3.7 Awards with multiple service and performance periods

Entities frequently make awards that cover more than one reporting period, but with different performance conditions for each period, rather than a single cumulative target for the whole vesting period. In such cases, the grant date may depend on the precision with which the terms of the award are communicated to employees, as demonstrated by Illustration 5-2 below.

Illustration 5-2: Awards with multiple service and performance periods

Scenario 1

At the beginning of year 1, an entity enters into a share-based payment arrangement with an employee. The employee is informed that the maximum potential award is 40,000 shares, 10,000 of which will vest at the end of year 1, and 10,000 more at the end of each of years 2 to 4. Vesting of each of the four tranches of 10,000 shares is conditional on:

- (a) The employee having been in continuous service until the end of each relevant year
- And
- (b) Revenue targets for each of those four years, as communicated to the employee at the beginning of year 1, having been attained

In this case, the terms of the award are clearly understood by both parties at the beginning of year 1, and this is therefore the grant date under IFRS 2 (subject to issues such as any requirement for later formal approval - see sections 5.3 to 5.3.2 above). The cost of the award would be recognised using a 'graded' vesting approach - see section 6.2.2 below.

Scenario 2

At the beginning of year 1, an entity enters into a share-based payment arrangement with an employee. The employee is informed that the maximum potential award is 40,000 shares, 10,000 of which will vest at the end of year 1, and 10,000 more at the end of each of years 2 to 4. Vesting of each of the four tranches of 10,000 shares is conditional on:

- (a) The employee having been in continuous service until the end of each relevant year
- And
- (b) Budgeted revenue targets for each of those four years, to be communicated to the employee once management establish the budget at the beginning of each relevant year in respect of that year only, having been attained

In this case, in our view, at the beginning of year 1 there is a clear shared understanding only of the terms of the first tranche of 10,000 shares that will potentially vest at the end of year 1. There is no clear understanding of the terms of the tranches potentially vesting at the end of years 2 to 4 because their vesting depends on attaining budgeted revenue targets for those years which have not yet been set. The revenue targets remain subjective until management establish the budget for the relevant year and communicate the target to employees.

Accordingly, each of the four tranches of 10,000 shares has a separate grant date (and, therefore, a separate measurement date) - i.e., the beginning of each of years 1, 2, 3 and 4, and a vesting period of one year from the relevant grant date.

In this type of situation, the entity would also need to consider whether, in the absence of a grant date, the employee was nonetheless rendering services in advance of the grant date. However, if targets are unquantified and do not depend on a formula, for example, then it is likely to be difficult to estimate an expense in advance of the grant date (see section 5.3.2 above).

A variation on the above two scenarios which is seen quite frequently in practice is an award where the target is quantified for the first year and the targets for subsequent years depend on a formula-based increase in the year 1 target. The formula is set at the same time as the year 1 target.

Whether the accounting treatment for scenario 1 above or scenario 2 above is the more appropriate in such a situation is, in our view, a matter of judgement depending on the precise terms of the arrangement (see section 5.3.3 above).

How we see it

To summarise the above, where an award is made over more than one reporting period but with different performance conditions, rather than a single cumulative target, grant date will depend on the precision with which the terms of the award are communicated to employees. If the terms are clearly understood by both parties at the start of the award for all periods (i.e., scenario 1 above), grant date is established. If the performance conditions are set at a later date for subsequent periods, grant date is established when the terms are understood by both parties, which would result in different grant dates for each tranche (i.e., scenario 2 above). The entity would also need to consider whether, in the absence of a grant date, the employee was nonetheless rendering services in advance of the grant date.

5.3.8 Awards subject to modification by entity after original grant date

As noted in section 5.3.1 above, some employee share awards are drafted in terms that give the entity discretion to modify the detailed terms of the scheme after grant date. Some have questioned whether this effectively means that the date originally determined as the 'grant date' is not in fact the grant date as defined in IFRS 2, on the grounds that the entity's right to modify means that the terms are not in fact understood by both parties in advance.

How we see it

The above, in our view, is very often not an appropriate analysis. If it were, it could also mean that, in some jurisdictions, nearly all share-based awards to employees would be required to be measured at vesting date, which clearly was not the IASB's intention.

The assessment of whether or not an intervention by the entity after grant date constitutes a modification is often difficult. Some situations commonly encountered in practice are considered in the sections below. See also the discussion in section 3.1.1 above relating to the clawback of awards.

5.3.8.A Significant equity restructuring or transactions

Many schemes contain provisions designed to ensure that the value of awards is maintained following a major capital restructuring (such as a share split or share consolidation - see section 7.8 below) or a major transaction with shareholders as a whole (such as the insertion of a new holding company over an existing group (see section 12.8 below), a major share buyback or the payment of a special dividend). These provisions will either specify the adjustments to be made in a particular situation or, alternatively, may allow the entity to make such discretionary adjustments as it sees fit in order to maintain the value of awards. In some cases the exercise of such discretionary powers may be relatively mechanistic (e.g., the adjustment of the number of shares subject to options following a share split). In other cases, more subjectivity will be involved (e.g., in determining whether a particular dividend is a 'special' dividend for the purposes of the scheme).

In our view, where the scheme rules specify the adjustments to be made or where there is a legal requirement to make adjustments in order to remedy any dilution that would otherwise arise, the implementation of such adjustments would not result in the recognition of any incremental IFRS 2 fair value. This assumes that the adjustment would simply operate on an automatic basis to put the holders of awards back to the position that they would have been in had there not been a restructuring and hence there would be no difference in the fair value of the awards before and after the restructuring (or other specified event).

However, where there is no such explicit requirement in the scheme rules or under relevant legislation, we believe that there must be a presumption that the exercise of the entity's discretionary right to modify is a 'modification' as defined in IFRS 2. In such a situation, the fair values before and after the modification may differ and any incremental fair value is required to be expensed over the remaining vesting period (see section 7.3 below).

How we see it

In summary, as noted above, no incremental fair value would arise where the adjustment would simply operate on an automatic basis to put the holders of awards back to the position that they would have been in had there not been a restructuring, if the scheme rules or relevant legislation require an adjustment to remedy any dilution. Where there is no explicit requirement in the scheme rules or relevant legislation the exercise of the entity's discretionary right to modify is a 'modification' as defined in IFRS 2.

5.3.8.B Interpretation of general terms

More problematic might be the exercise of any discretion by the entity or its remuneration committee to interpret the more general terms of a scheme in deciding whether performance targets have been met and therefore whether, and to what extent, an award should vest. Suppose, for example, that an entity makes an award to its executives with a market condition based on total shareholder return (TSR) with a maximum payout if the entity is in the top quartile of a peer group of 100 entities (i.e., it is ranked between 1 and 25 in the peer group).

It might be that the entity is ranked 26 until shortly before the end of the performance period, at which point the entity ranked 25 suddenly announces that it is in financial difficulties and ceases trading shortly afterwards. This then means that the reporting entity moves up from 26 to 25 in the rankings. However, the entity might take the view that, in the circumstances, it could not be considered as having truly been ranked 25 in the peer group, so that a maximum payout is not justified.

In this case, the entity's intervention might be considered to be a modification. However, as the effect would be to reduce the fair value of the award, it would have no impact on the accounting treatment (see section 7.3.2 below).

If such an intervention were not regarded as a modification, then the results might be different depending on the nature of the award. Where an award is subject to a market condition, as here, or to a non-vesting condition, an expense might well have to be recognised in any event, if all the non-market vesting conditions (e.g., service) were satisfied - see sections 6.3 and 6.4 below.

However, suppose that the award had been based on a non-market performance condition, such as an EPS target, which was met, but only due to a gain of an unusual, non-recurring nature, such as the revaluation of PP&E for tax purposes, giving rise to a deferred tax credit. The remuneration committee concludes that this must be ignored, with the effect that the award does not vest. If this is regarded as the exercise of a pre-existing right to ensure that the award vests only if 'normal' EPS reaches a given level, then there has been no modification. On this analysis, the award has not vested, and any expense previously recognised would be reversed. If, however, the committee's intervention is regarded as a modification, it would have no impact on the accounting treatment in this particular case, as the effect would not be beneficial to the employee and so the modification would be ignored under the general requirements of IFRS 2 relating to modifications (see section 7.3.2 below).

5.3.8.C Discretion to make further awards

Some schemes may give the entity the power to increase an award in circumstances where the recipient is considered to have delivered exceptional performance, or some such similar wording.

How we see it

In our view, unless the criteria for judging such exceptional performance are so clear as to be, in effect, performance conditions under IFRS 2, the presumption is that any award made pursuant to such a clause is granted, and therefore measured, when it is made.

We note in section 15.1 below that there may be circumstances where an award described as 'discretionary' may not truly be so, since the entity has created an expectation amounting to an obligation to make the award. However, we believe that it would be somewhat contradictory to argue that such expectations had been created in the case of an award stated to be for (undefined) exceptional performance only.

5.3.9 'Good leaver' arrangements

In some jurisdictions it is common for awards to contain a so-called 'good leaver' clause. A 'good leaver' clause is one which makes provision for an employee who leaves employment before the end of the full vesting period of the award to receive some or all of the award on leaving (see section 5.3.9.A below).

In other cases, the original terms of an award will either make no reference to 'good leavers' or will not be sufficiently specific to allow the accounting treatment on cessation of employment to be an automatic outcome of the original terms of the scheme. In such cases, and in situations where awards are made to leavers on a fully discretionary basis, the approach required by IFRS 2 differs from that required where the original terms are clear about 'good leaver' classification and entitlement (see section 5.3.9.B below).

In some jurisdictions awards are structured in a way which allows the majority of participants, rather than just a few specified categories of 'good leaver', to retain all or part of an award if they leave employment during the vesting period (see section 5.3.9.C below).

We refer throughout this section on 'good leavers' to an employee leaving employment, but similar considerations apply when an individual automatically becomes entitled to an award before the end of the original vesting period due to other reasons specified in the terms of the agreement, e.g., attaining a certain age or achieving a specified length of service, even if the individual remains in employment after the relevant date. In these situations, the date of full entitlement is the date on which any services - and therefore expense recognition - cease for IFRS 2 purposes.

Arrangements for a good leaver to receive all, or part, of an award on leaving employment must be distinguished from a situation where an employee leaves with no award and where forfeiture accounting is likely to apply (see section 7.4.1.A below).

5.3.9.A Provision for 'good leavers' made in original terms of award

In some cases the types of persons who are 'good leavers' may be explicitly defined in the original terms of the arrangement (common examples being persons who die or reach normal retirement age before the end of the full vesting period, or who work for a business unit that is sold or closed during the vesting period). In other cases, the entity may have the discretion to determine on a case-by-case basis whether a person should be treated as a 'good leaver'.

In addition, some schemes may specify the entitlement of a 'good leaver' on leaving (e.g., that the leaver receive a portion of the award *pro rata* to the extent that the performance conditions have been met), whereas others leave the determination of the award to the entity at the time that the employee leaves.

Whichever situation applies, any expense relating to an award to a good leaver must be fully recognised by the leaving date because, at that point, the good leaver ceases to provide any services to the entity and any remaining conditions attached to the award will be treated as non-vesting rather than vesting conditions (see section 3.2 above).

How we see it

In our view, an award which vests before the end of the original vesting period due to the operation of a 'good leaver' clause is measured at the original grant date only where, under the rules of the scheme as understood by both parties at the original grant date, the award is made:

- To a person clearly identified as a 'good leaver'.
- And
- In an amount clearly quantified or quantifiable.

Where, as outlined above, the rules of the scheme make clear the categories of 'good leaver' and their entitlement, the entity must assess at grant date how many good leavers there are likely to be and to what extent the service period for these particular individuals is expected to be shorter than the full vesting period. The grant date fair value of the estimated awards to good leavers must be separately determined, where significant, and the expense relating to good leavers recognised over the expected reduced vesting period between grant date and leaving employment. In this situation the entity would re-estimate the number of good leavers and adjust the cumulative expense at each reporting date. This would be a change of estimate rather than a modification of the award as it would all be in accordance with the original terms and would require no discretionary decisions on the part of the entity. We would not generally expect an entity to have significant numbers of good leavers under such an arrangement.

It is important to draw a clear distinction between the IFRS 2 accounting on a straight-line basis over a reduced vesting period in the above case and that on a graded vesting basis in a situation of broader entitlement as outlined in section 5.3.9.C below.

5.3.9.B Discretionary awards to 'good leavers'

In section 5.3.9.A above we discuss awards where the arrangements for leavers are clear as at the original grant date of the award. However, where - as is more usually the case - the entity determines only at the time that the employee leaves either that the employee is a 'good leaver' or the amount of the award, grant date or modification date (see further below) must be taken as the later of the date on which such determination is made or the date on which the award is notified to the employee. This is because the employee had no clear understanding at the original grant date of an automatic entitlement to equity instruments other than through full vesting of the award at the end of the full service period.

How we see it

In our view, an entity is required to assess the appropriate accounting treatment for discretionary awards to 'good leavers' based on the particular facts and circumstances and the extent to which the discretionary award is linked to the original award.

A discretionary award at the time of leaving is considered to be either a modification of an original award in the employee's favour (for example, where vesting conditions are waived to allow an individual to keep an award) or the forfeiture of the original award and the granting of a completely new award on a discretionary basis (see sections 7.3 and 7.5 below).

In some cases, a good leaver will be allowed, on a discretionary basis, to keep existing awards that remain subject to performance conditions established at the original grant date. In this situation, any conditions that were previously treated as vesting conditions will become non-vesting conditions following the removal of the service requirement (see sections 3.1 and 3.2 above). This will be the case whether the discretionary arrangement is accounted for as the forfeiture of the old award plus a new grant or as a modification of the original award.

The non-vesting conditions will need to be reflected in the measurement of the fair value of the award as at the date of modification or new grant (although the non-vesting conditions alone will not result in any incremental fair value). Any fair value that is unrecognised as at the date of the good leaver ceasing employment will need to be expensed immediately as there is no further service period over which to recognise the expense.

There is further discussion of modifications in section 7.3 below and of replacement and *ex gratia* awards granted on termination of employment in section 7.5 below.

5.3.9.C Automatic full or *pro rata* entitlement on leaving employment

In some jurisdictions entities establish schemes where a significant number of the participants will potentially leave employment before the end of the full vesting period and will be allowed to keep a *pro rata* share of the award. This gives rise to a much broader category of employee than the small number of good leavers that one would generally expect under a scheme where 'good leaver' refers only to employees who die, retire or work for a business unit that is sold or closed (see section 5.3.9.A above).

The substance of an arrangement where significant numbers of employees are expected to leave with a *pro rata* entitlement is that the entire award to all participants vests on a graded basis over the vesting period as a whole. So, for example, an arrangement that gives employees 360 shares at the end of three years but, whether under the rules of the scheme or by precedent, allows the majority of leavers to take a *pro rata* share - based on the number of months that have elapsed - at their date of departure, must be treated as vesting at the rate of 10 shares per month for all employees. Such an arrangement is required to be accounted for using the graded vesting approach illustrated in section 6.2.2 below.

Some take the view that the situation outlined in the previous paragraph does not require graded vesting and that a straight-line approach may be taken because the award only vests *pro rata* if an employee leaves employment. Supporters of this view argue that the requirement to leave employment in order to receive the award before the end of the full vesting period is itself a substantive condition over and above the requirement to provide ongoing service. If an employee remains in employment the award only vests on completion of three years' service and there is no earlier entitlement on a *pro rata* basis.

How we see it

Although the straight-line approach has some appeal, in our view, it is difficult to reconcile to the standard and is not therefore an appropriate alternative accounting treatment to the graded vesting approach outlined above.

In other cases, rather than just a *pro rata* apportionment, any good leaver will be allowed to keep the entire award regardless of when they leave employment. If this is the case, and in substance there is no required minimum service period attached to the award, then the award is required to be treated as immediately vested in all employees and fully expensed at the grant date.

5.3.10 Special purpose acquisition companies ('SPACs')

IPOs and trade sales may be achieved through the medium of special purpose acquisition companies ('SPACs'). The detailed features of SPACs may vary, but common features tend to be:

- The SPAC is established by a small number of founders, typically with expertise in selecting attractive targets for flotation or sale. The founder shares contain a term to the effect that, if a target is eventually identified and floated or sold, the holders of the founder shares will receive a greater proportion of any proceeds than other shareholders at the time of flotation.
- At a later date, other (non-founder) shareholders invest. This is frequently achieved by an IPO of the SPAC. It is typically the case that, if a specific target is not identified and agreed by a required majority of non-founder shareholders, within a finite timescale, the other (non-founder) shareholders will have their funds returned.
- The SPAC seeks a target which is then approved (or not, as the case may be) by the required majority of non-founder shareholders.

The three stages outlined above have given rise to three interpretations as to the grant date for IFRS 2 purposes.

The first view is that there is no shared understanding until the specific target is identified and agreed (the third stage above). Holders of this view argue that the substance of the founder shareholders' interest is economically equivalent to an award of shares in any target finally approved. Therefore, until the target is finally approved, there is no clarity as to the nature and value of the award to the founder shareholders.

The second view is that a shared understanding occurs at the point at which the non-founder shareholders invest (i.e., the second stage above). Holders of this view argue that a share-based payment can only occur when there has been a transfer of value from the non-founder shareholders to the founder shareholders and this cannot occur until there are some non-founder shareholders in place. However, once those non-founder shareholders are in place, there is a shared understanding that - if a transaction is subsequently approved - there will be a benefit for founder shareholders.

The third view is that a shared understanding occurs on the issue of the founder shares (i.e., the first stage above). Holders of this view argue that at that point there is a shared understanding that there will be a benefit for founder shareholders if non-founder shareholders are subsequently introduced and a transaction is subsequently approved. The benefit for founder shareholders consists both in seeking further investors and in identifying a suitable target. The founder shareholders will be actively rendering service towards these goals from the outset.

The IFRS IC conducted some initial outreach research into how SPACs are treated in practice, but the question has not been formally discussed to date.

How we see it

Until such time as additional guidance is given, it seems that the diversity in practice outlined above will remain and entities must use judgement to determine an appropriate grant date based on the specific terms of the arrangement.

5.4 Transactions with non-employees

In accounting for equity-settled transactions with non-employees, the entity must adopt a rebuttable presumption that the value of the goods or services received provides the more reliable indication of the fair value of the transaction. The fair value to be used is that at the date on which the goods are obtained or the services rendered. [IFRS 2.13]. This implies that, where the goods or services are received on a number of dates over a period, the fair value at each date must be used, although in the case of a relatively short period there may be no great fluctuation in fair value.

If 'in rare cases' the presumption is rebutted, the entity may use as a surrogate measure the fair value of the equity instruments granted, but as at the date when the goods or services are received, not the original grant date. However, where the goods or services are received over a relatively short period where the share price does not change significantly, an average share price can be used in calculating the fair value of equity instruments granted. [IFRS 2.13, IFRS 2.IG5, IFRS 2.IG6, IFRS 2.IG7].

FASB differences

This contrasts with US GAAP²³ which requires the fair value of goods or services received from non-employees to be measured at grant date of the equity-instruments to be received, rather than based on the fair value at the date the goods are obtained or services are rendered.

5.4.1 Effect of change of status from employee to non-employee (or vice versa)

IFRS 2 does not give specific guidance on how to account for an award when the status of the counterparty changes from employee to non-employee (or vice versa) but, in all other respects, the award remains unchanged. In our view, the accounting following the change of status will depend on the entity's assessment of whether or not the counterparty is performing the same or similar services before and after the change of status.

If it is concluded that the counterparty is providing the same or similar services before and after the change of status, the measurement approach remains unchanged.

23 FASB Accounting Standard Update 2018-07, *Improvements to Nonemployee Share-Based Payment Accounting (Topic 718)*.

However, if the services provided are substantially different, the accounting following the change of status will be determined by the counterparty's new status, as follows:

- For a change from non-employee to employee status, the expense for periods following the change must be measured as if the award had been granted at the date of change of status. This revised measurement only applies to the expense for the portion of the award that vests after the change of status and there is no effect on the expense recognised in prior periods.
- For a change from employee to non-employee status, the expense for periods following the change must be measured on the basis of the fair value of the counterparty's services as they are received - if this is reliably determinable. Otherwise, the fair value used is that of the equity instruments granted but measured at the date the services are received (see section 5.4 above). There is no effect on the expense recognised in prior periods.

If the status of the counterparty changes and the terms of the award are modified in order to allow the award to continue to vest, the modification and change of status must be assessed in accordance with the general principles in IFRS 2 relating to the modification of awards (see section 7.3 below).

How we see it

As noted above, the accounting depends on facts and circumstances and judgement thereof whether the counterparty is performing the same or similar services after the change in status as were being provided prior to the change in status. If same or similar services are being provided, there is no change in the measurement approach. If substantially different services are being provided, the measurement approach is determined based on the counterparty's new status.

5.5 Determining the fair value of equity instruments

As discussed in sections 5.2 and 5.4 above, IFRS 2 requires the following equity-settled transactions to be measured by reference to the fair value of the equity instruments issued rather than that of the goods or services received:

- All transactions with employees (except where it is impossible to determine fair value - see below).
- Transactions with non-employees where, in rare cases, the entity rebuts the presumption that the fair value of goods or services provided is more reliably measurable.

There will also be situations where the identifiable consideration received (if any) from non-employees appears to be less than the fair value of consideration given. In such cases, the cost of the unidentifiable goods or services received, if any, must be accounted for in accordance with IFRS 2 by determining the fair value of the equity instruments. This requirement is discussed in section 2.2.2.C above.

For all transactions measured by reference to the fair value of the equity instruments granted, IFRS 2 requires fair value to be measured at the 'measurement date' - i.e., grant date in the case of transactions with employees and service date in the case of transactions with non-employees. [IFRS 2 Appendix A]. Fair value must be based on market prices if available. [IFRS 2.16]. In the absence of market prices, a valuation technique must be used to estimate what the market price would have been on the measurement date in an arm's length transaction between informed and willing parties. The technique used is required to be a recognised technique and incorporate all factors that would be taken into account by knowledgeable and willing market participants. [IFRS 2.17].

Appendix B to IFRS 2 contains more detailed guidance on valuation, which is discussed in section 8 below. [IFRS 2.18]. IFRS 2 also deals with those 'rare' cases where it is not possible to value equity instruments reliably, where an intrinsic value approach may be used. This is more likely to apply to awards of options than to awards of shares and is discussed further in section 8.8 below.

IFRS 2 rather confusingly states that the fair value of equity instruments granted must take into account the terms and conditions on which they were granted, but this requirement is said to be 'subject to the requirements of paragraphs 19-22'. [IFRS 2.16]. When those paragraphs are consulted, a somewhat different picture emerges, since they draw a distinction between:

- Non-vesting conditions (i.e., those that are neither service conditions nor performance conditions).
- Vesting conditions which are market conditions (i.e., those related to the entity's share price).
- Other vesting conditions (i.e., service and non-market performance conditions).

These are discussed in more detail in sections 6.2 to 6.4 and in section 8 below, but the essential difference is that, while non-vesting conditions and market conditions must be taken into account in any valuation, other vesting conditions must be ignored. [IFRS 2.19, IFRS 2.20, IFRS 2.21, IFRS 2.21A]. As we explain in the more detailed discussion later, these essentially arbitrary distinctions originated in part as anti-avoidance measures.

The 'fair value' of equity instruments under IFRS 2 therefore takes account of some, but not all, conditions attached to an award rather than being a 'true' fair value.

The approach to determining the fair value of share-based payments continues to be that specified in IFRS 2 and share-based payments fall outside the scope of IFRS 13 which applies more generally to the measurement of fair value under IFRS accounting standards (see Chapter 15). [IFRS 2.6A].

5.5.1 Reload features

A 'reload feature' is a feature in a share option that provides for an automatic grant of additional share options (reload options) whenever the option holder exercises previously granted options using the entity's shares, rather than cash, to satisfy the exercise price. [IFRS 2 Appendix A]. IFRS 2 requires reload features to be ignored in the initial valuation of options that contain them. Instead any reload option must be treated as if it were a newly granted option when the reload conditions are satisfied. [IFRS 2.22]. This is discussed further in section 8.9 below.

6 Equity-settled transactions - allocation of expense

6.1 Overview

Equity-settled transactions, particularly those with employees, raise particular accounting problems since they are often subject to vesting conditions (see section 3.1 above) that can be satisfied only over an extended vesting period. This raises the issue of whether a share-based payment transaction is recognised:

- When the relevant equity instrument is first granted
- When it vests
- During the vesting period
- Or
- During the life of the option

An award of equity instruments that vests immediately is presumed, in the absence of evidence to the contrary, to relate to services that have already been rendered, and is therefore expensed in full at grant date. [IFRS 2.14]. This may lead to the immediate recognition of an expense for an award to which the employee may not be legally entitled for some time, as demonstrated in Illustration 6-1.

Illustration 6-1: Award with non-vesting condition only

An entity grants a director share options, exercisable after three years provided the director does not compete with the reporting entity for a period of at least three years. The 'non-compete' clause is considered to be a non-vesting condition (see sections 3.2 above and 6.4 below). As this is the only condition to which the award is subject, the award has no vesting conditions and therefore vests immediately. The fair value of the award at the date of grant, including the effect of the 'non-compete' clause, is determined to be CU150,000. Accordingly, the entity immediately recognises a cost of CU150,000.

This cost can never be reversed, even if the director goes to work for a competitor and loses the award. This is discussed more fully in section 3.2.3 above and in sections 6.1.2 and 6.4 below.

Where equity instruments are granted subject to vesting conditions (as in many cases they will be, particularly where payments to employees are concerned), IFRS 2 creates a presumption that they are a payment for services to be received in the future, during the 'vesting period', with the transaction being recognised during that period, as demonstrated in Illustration 6-2. [IFRS 2.15].

Illustration 6-2: Award with service condition only

An entity grants a director share options on condition that the director remain in employment for three years. The requirement to remain in employment is a service condition, and therefore a vesting condition, which will take three years to fulfil. The fair value of the award at the date of grant, ignoring the effect of the vesting condition, is determined to be CU300,000. The entity will record a cost of CU100,000 a year in profit or loss for three years, with a corresponding increase in equity.

In practice, the calculations required by IFRS 2 are unlikely to be as simple as that in Illustration 6-2. In particular:

- The final number of awards that vest cannot be known until the vesting date (because employees may leave before the vesting date, or because relevant performance conditions may not be met).
- The length of the vesting period may not be known in advance (since vesting may depend on satisfaction of a performance condition with no, or a variable, time-limit on its attainment).

In order to deal with such issues, IFRS 2 requires a continuous re-estimation process as summarised in section 6.1.1 below.

6.1.1 The continuous estimation process of IFRS 2

The overall objective of IFRS 2 is that, at the end of the vesting period, the cumulative cost recognised in profit or loss (or, where applicable, included in the carrying amount of an asset), must represent the product of the following two items:

- The number of equity instruments that have vested, or would have vested, but for the failure to satisfy a market condition (see section 6.3 below) or a non-vesting condition (see section 6.4 below).
- The fair value (excluding the effect of any non-market vesting conditions, but including the effect of any market conditions or non-vesting conditions) of those equity instruments at the date of grant.

It is essential to appreciate that the 'grant date' measurement model in IFRS 2 seeks to capture the value of the contingent right to shares promised at grant date, to the extent that that promise becomes (or is deemed by IFRS 2 to become - see section 6.1.2 below) an entitlement of the counterparty, rather than the value of any shares finally delivered. Therefore, if an option vests, but is not exercised because it would not be in the counterparty's economic interest to do so, IFRS 2 still recognises a cost for the award.

In order to achieve this outcome, IFRS 2 requires the following process to be applied:

- (a) At grant date, the fair value of the award (excluding the effect of any service and non-market performance conditions, but including the effect of any market conditions or non-vesting conditions) is determined.
- (b) At each subsequent reporting date until vesting, the entity calculates a best estimate of the cumulative charge to profit or loss at that date, being the product of:
 - (i) The grant date fair value of the award determined in (a) above.
 - (ii) The current best estimate of the number of awards that will vest (see section 6.1.2 below).
 - (iii) The expired portion of the vesting period.
- (c) The charge (or credit) to profit or loss for the period is the cumulative amount calculated in (b) above less the amounts already charged in previous periods. There is a corresponding credit (or debit) to equity. [IFRS 2.19, IFRS 2.20].
- (d) Once the awards have vested, no further accounting adjustments are made to the cost of the award, except in respect of certain modifications to the award - see section 7 below.
- (e) If a vested award is not exercised, an entity may (but need not) make a transfer between components of equity - see section 6.1.3 below.

The overall effect of this process is that a cost is recognised for every award that is granted, except when it is forfeited, as that term is defined in IFRS 2 (see section 6.1.2 below). [IFRS 2.19].

6.1.2 Vesting and forfeiture

In normal English usage, and in many share scheme documents, an award is described as 'vested' when all the conditions needed to earn it have been met, and as 'forfeited' where it lapses before vesting because one or more of the conditions has not been met.

IFRS 2 uses the term 'forfeiture' in a much more restricted sense to mean an award that does not vest in IFRS 2 terms. This is a particularly complex aspect of IFRS 2, which is discussed in more detail in sections 6.2 to 6.4 below. Essentially:

- Where an award is subject only to vesting conditions other than market conditions, failure to satisfy any one of the conditions is treated as a forfeiture by IFRS 2.
- Where an award is subject to both:
 - Vesting conditions other than market conditions
 - Market conditions and/or non-vesting conditions

Failure to satisfy any one of the vesting conditions other than market conditions is treated as a forfeiture by IFRS 2. Otherwise (i.e., where all the vesting conditions other than market conditions are satisfied), the award is deemed to vest by IFRS 2 even if the market conditions and/or non-vesting conditions have not been satisfied.

- Where an award is subject only to non-vesting conditions, it is always deemed to vest by IFRS 2.

Where an award has been modified (see section 7.3 below) so that different vesting conditions apply to the original and modified elements of an award, forfeiture will not apply to the original award if the service and non-market performance conditions attached to that element have been met. This will be the case even if the service and non-market performance conditions attached to the modified award have not been met and so the modified award is considered to have been forfeited (resulting in the reversal of any incremental expense relating to the modification). Illustrations 7-6 and 7-7 below demonstrate this point.

As a result of the interaction of the various types of conditions, the reference in the summary in section 6.1.1 above to the 'best estimate of the number of awards that will vest' really means the best estimate of the number of awards for which it is expected that all service and non-market vesting conditions will be met.

In practice, however, it is not always clear how that best estimate is to be determined, and in particular what future events may and may not be factored into the estimate. This is discussed further in sections 6.2 to 6.4 and in section 7.6 below.

6.1.3 Accounting after vesting

Once an equity-settled transaction has vested (or, in the case of a transaction subject to one or more market or non-vesting conditions, has been treated as vested under IFRS 2 - see section 6.1.2 above), no further accounting entries are made to reverse the cost already charged, even if the instruments that are the subject of the transaction are subsequently forfeited or, in the case of options, are not exercised. However, the entity may make a transfer between different components of equity. [IFRS 2.23]. For example, an entity's accounting policy might be to credit all amounts recorded for share-based transactions to a separate reserve such as 'Shares to be issued'. Where an award lapses after vesting, it would then be appropriate to transfer an amount equivalent to the cumulative cost for the lapsed award from 'Shares to be issued' to another component of equity.

This prohibition against 'truing up' (i.e., reversing the cost of vested awards that lapse) is controversial, since it has the effect that a cost is still recognised for options that are never exercised, typically because they are 'underwater' (i.e., the current share price is lower than the option exercise price), so that it is not in the holder's interest to exercise the option. Some commentators have observed that an accounting standard that can result in an accounting cost for non-dilutive options does not meet the needs of those shareholders whose concerns about dilution were the catalyst for the share-based payment project in the first place (see section 1.1 above).

The IASB counters such objections by pointing out that the treatment in IFRS 2 is perfectly consistent with that for other 'contingent' equity instruments, such as warrants, that ultimately result in no share ownership. Where an entity issues warrants for valuable consideration such as cash and those warrants lapse unexercised, the entity recognises no gain under IFRS accounting standards. [IFRS 2.BC218-BC221].

6.2 Vesting conditions other than market conditions

6.2.1 Awards with service conditions and non-market vesting conditions

6.2.1.A Awards with service conditions

Most share-based payment transactions with employees are subject to explicit or implied service conditions. Illustrations 6-3 and 6-4 below demonstrate the application of the allocation principles discussed in section 6.1 above to awards subject only to service conditions. [IFRS 2.IG11].

Illustration 6-3: Award with no change in the estimate of number of awards vesting

An entity grants 100 share options to each of its 500 employees. Vesting is conditional upon the employees working for the entity over the next three years. The entity estimates that the fair value of each share option is CU15. The entity's best estimate at each reporting date is that 100 (i.e., 20%) of the original 500 employees will leave during the three year period and therefore forfeit their rights to the share options.

If everything turns out exactly as expected, the entity will recognise the following amounts during the vesting period for services received as consideration for the share options.

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period [‡] (CU)
1	50,000 options × 80%* × CU15 × 1/3 [†]	200,000	200,000
2	50,000 options × 80% × CU15 × 2/3	400,000	200,000
3	50,000 options × 80% × CU15 × 3/3	600,000	200,000

* The entity expects 100 of its 500 employees to leave and therefore only 80% of the options to vest.

† The vesting period is 3 years, and 1 year of it has expired.

‡ In each case the expense for the period is the difference between the calculated cumulative expense at the beginning and end of the period.

Illustration 6-4: Award with re-estimation of number of awards vesting due to staff turnover

As in Illustration 6-3 above, an entity grants 100 share options to each of its 500 employees. Vesting is conditional upon the employee working for the entity over the next three years. The entity estimates that the fair value of each share option is CU15.

In this case, however, 20 employees leave during the first year, and the entity's best estimate at the end of year 1 is that a total of 75 (15%) of the original 500 employees will have left before the end of the vesting period. During the second year, a further 22 employees leave, and the entity revises its estimate of total employee departures over the vesting period from 15% to 12% (i.e., 60 of the original 500 employees). During the third year, a further 15 employees leave. Hence, a total of 57 employees (20 + 22 + 15) forfeit their rights to the share options during the three year period, and a total of 44,300 share options (443 employees × 100 options per employee) finally vest.

The entity will recognise the following amounts during the vesting period for services received as consideration for the share options.

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	50,000 options × 85% × CU15 × 1/3	212,500	212,500
2	50,000 options × 88% × CU15 × 2/3	440,000	227,500
3	44,300 options × CU15 × 3/3	664,500	224,500

Note that in Illustration 6-4 above, the number of employees that leave during year 1 and year 2 is not directly relevant to the calculation of cumulative expense in those years, but would naturally be a factor taken into account by the entity in estimating the likely number of awards finally vesting.

6.2.1.B Non-market vesting conditions

It is common for entities to enter into share-based payment arrangements with employees subject to vesting conditions that include performance conditions (see section 3.1 above). A performance condition requires a specified period of service to be completed and the achievement of performance targets. Performance targets are either non-market vesting conditions (also referred to as 'non-market performance conditions'), further considered in this section of the chapter, or market conditions (see section 6.3 below). A performance target that is a non-market vesting condition is referenced to the entity's own operations (or activities) or the operations or activities of another entity in the same group. A performance target might relate either to the performance of the entity as a whole or to some part of the entity (or part of the group), such as a division or an individual employee.

Examples of non-market vesting conditions include achieving EPS, sales, profit or some Environmental, Social and Governance (ESG) targets. Examples of ESG targets include targets to reduce Scope 1, Scope 2 and possibly Scope 3 GHG emissions (see section 3.1.3 above), health and safety incidents of an entity or targets to increase employee engagement and workforce diversity.

IFRS 2 requires that an entity not take into account vesting conditions other than market conditions when estimating the fair value of equity instruments granted. Instead, vesting conditions, other than market conditions i.e., non-market vesting conditions, are taken into account by adjusting the number of equity instruments that are expected to vest. [IFRS 2.19, IFRS 2.20].

In determining the expected number of equity instruments that are expected to vest as a result of a non-market vesting condition, the cumulative charge during the vesting period would be based on the best estimate of which outcome will occur, and the final cumulative charge would be based on the grant date fair value of the actual outcome. For example, if an employee was granted 100 share options which vest if the employee remains in service for three years and on achieving an EPS target, if that employee is still in service at the end of the three years, either 100 options will vest if the EPS target is met or zero options will vest if the EPS target is not met. During the vesting period the entity would need to make an assessment of the number of options that are expected to vest at each reporting date. If the entity assesses at the end of year one the probability that the EPS target would be met is 70% and the service condition will be met, the year one expense would be based on the full 100 options expected to vest at the end of year three, which represents the best estimate of the most likely outcome. In this example, the outcome is binary, the employee will receive either 100 or zero options based on the achievement or not of the EPS target and service condition, they will never receive 70% of the options. Assuming the entity recognised an expense for the award in year one and year two based on the entity's best estimate of the most likely outcome (i.e., the EPS and service condition are expected to be met), but then in year three the service condition is met but the EPS target is not, the entity would reverse in year three any previous expense recognised due to the failure to satisfy the non-market vesting condition.

See the Illustrations in sections 6.2.3 to 6.2.5 below that set out the accounting when determining the number of equity instruments expected to vest when an award includes a number of possible outcomes linked to non-market vesting conditions.

6.2.2 Equity instruments vesting in instalments ('graded' vesting)

An entity may make share-based payments that vest in instalments (sometimes referred to as 'graded' vesting). For example, an entity might grant an employee 600 options, 100 of which vest if the employee remains in service for one year, a further 200 after two years and the final 300 after three years. In today's more mobile labour markets, such awards are often favoured over awards which vest only on an 'all or nothing' basis after an extended period.

IFRS 2 requires such an award to be treated as three separate awards of 100, 200 and 300 options, because each instalment has a different vesting period and therefore, the fair value of each instalment will likely differ (e.g., the length of the vesting period may affect the likely timing of cash flows arising from the exercise of options in determining the fair value). [IFRS 2.IG11]. This may well have the effect that compared to the expense for an award with a single 'cliff' vesting, the expense for an award vesting in instalments will be for a different amount in total and require accelerated recognition of the expense in earlier periods, as demonstrated in Illustration 6-5 below.

Illustration 6-5: Award vesting in instalments ('graded' vesting)

An entity is considering the implementation of a scheme that awards 600 free shares to each of its employees, with no conditions other than continuous service. Two alternatives are being considered:

- All 600 shares vest in full only at the end of three years.
- 100 shares vest after one year, 200 shares after two years and 300 shares after three years. Any shares received at the end of years 1 and 2 would have vested unconditionally.

The fair value of a share delivered in one year's time is CU3; in two years' time CU2.80; and in three years' time CU2.50.

For an employee that remains with the entity for the full three year period, the first alternative would be accounted for as follows:

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	600 shares × CU2.50 × 1/3	500	500
2	600 shares × CU2.50 × 2/3	1,000	500
3	600 shares × CU2.50 × 3/3	1,500	500

For the second alternative, the analysis is that the employee has simultaneously received an award of 100 shares vesting over one year, an award of 200 shares vesting over two years and an award of 300 shares vesting over 3 years. This would be accounted for as follows:

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	[100 shares × CU3.00] + [200 shares × CU2.80 × 1/2] + [300 shares × CU2.50 × 1/3]	830	830
2	[100 shares × CU3.00] + [200 shares × CU2.80 × 2/2] + [300 shares × CU2.50 × 2/3]	1,360	530
3	[100 shares × CU3.00] + [200 shares × CU2.80 × 2/2] + [300 shares × CU2.50 × 3/3]	1,610	250

At first sight, such an approach seems to be taking account of vesting conditions other than market conditions in determining the fair value of an award, contrary to the basic principle of IFRS 2.19 (see section 6.1.1 above). However, it is not the vesting conditions that are being taken into account *per se*, but the fact that the varying vesting periods will give rise to different lives for the award (which are required to be taken into account - see sections 7.2 and 8 below).

Provided all conditions are clearly understood at the outset, the accounting treatment demonstrated in Illustration 6-5 above would apply even if the vesting of shares in each year also depended on a performance condition unique to that year (e.g., that profit in that year must reach a given minimum level), as opposed to a cumulative performance condition (e.g., that profit must have grown by a minimum amount by the end of year 1, 2 or 3). This is because all tranches of the arrangement have the same service commencement date and so for the awards that have a performance condition relating to year 2 or year 3 there is a service condition covering a longer period than the performance condition. In other words, an award that vests at the end of year 3 conditional on profitability in year 3 is also conditional on the employee providing service for three years from the date of grant in order to be eligible to receive the award. This is discussed further in section 5.3.7 above.

A variant of Illustration 6-5, is one where a share-based payment transaction vests with employees in instalments and the service period is not at least as long as the duration of the non-market performance condition, for example, a flotation or sale condition. The flotation or sale condition will be treated as a non-vesting condition and be incorporated into the determination of fair value (see section 3.2 above). In contrast, when the service condition is the same duration as the flotation and sale condition, that condition will be treated as a non-market performance condition, see Illustration 15-7 in section 15.4.3 below.

The accounting treatment demonstrated in Illustration 6-5 is the only treatment for graded vesting permitted under IFRS 2 whether an arrangement just has a service condition or whether it has both service and performance conditions.

FASB differences

This contrasts with US GAAP²⁴ which permits, for awards with graded vesting where vesting depends solely on a service condition, a policy choice between the approach illustrated above and a straight-line recognition method.

6.2.3 Transactions with variable vesting periods due to non-market vesting conditions

An award may be made with a vesting period of variable length. For example, an award might be contingent upon achievement of a particular performance target (such as achieving a given level of cumulative earnings) within a given period, but vesting immediately once the target has been reached. Alternatively, an award might be contingent on levels of earnings growth over a period, but with vesting occurring more quickly if growth is achieved more quickly. Also some plans provide for 're-testing', whereby an original target is set for achievement within a given vesting period, but if that target is not met, a new target and/or a different vesting period are substituted.

In such cases, the entity needs to estimate the length of the vesting period at grant date, based on the most likely outcome of the performance condition. Subsequently, it is necessary continuously to re-estimate not only the number of awards that will finally vest, but also the date of vesting, as shown by Illustration 6-6. [IFRS 2.15(b), IFRS 2.IG12]. This contrasts with the treatment of awards with market conditions and variable vesting periods, where the initial estimate of the vesting period is prohibited from being revised (see section 6.3.4 below).

Illustration 6-6: Award with non-market vesting condition and variable vesting period

At the beginning of year 1, the entity grants 100 shares each to 500 employees, conditional upon the employees remaining in the entity's employment during the vesting period. The shares will vest:

- At the end of year 1 if the entity's earnings increase by more than 18%.
 - At the end of year 2 if the entity's earnings increase by more than an average of 13% per year over the two year period.
- Or
- At the end of year 3 if the entity's earnings increase by more than an average of 10% per year over the three year period.

The award is estimated to have a fair value of CU30 per share at grant date. It is expected that no dividends will be paid during the whole three year period.

24 FASB ASC 718 - *Compensation - Stock Compensation* (formerly FAS123(R), Share-Based Payment), FASB, December 2004.

By the end of the first year, the entity's earnings have increased by 14%, and 30 employees have left. The entity expects that earnings will continue to increase at a similar rate in year 2, and therefore expects that the shares will vest at the end of year 2. The entity expects, on the basis of a weighted average probability, that a further 30 employees will leave during year 2, and therefore expects that an award of 100 shares each will vest for 440 (500 - 30 - 30) employees at the end of year 2.

By the end of the second year, the entity's earnings have increased by only 10% and therefore the shares do not vest at the end of that year. 28 employees have left during the year. The entity expects that a further 25 employees will leave during year 3, and that the entity's earnings will increase by at least 6%, thereby achieving the average growth of 10% per year necessary for an award after 3 years, so that an award of 100 shares each will vest for 417 (500 - 30 - 28 - 25) employees at the end of year 3.

By the end of the third year, a further 23 employees have left and the entity's earnings have increased by 8%, resulting in an average increase of 10.67% per year. Therefore, 419 (500 - 30 - 28 - 23) employees receive 100 shares at the end of year 3.

The entity will recognise the following amounts during the vesting period for services received as consideration for the shares:

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	440 employees × 100 shares × CU30 × 1/2*	660,000	660,000
2	417 employees × 100 shares × CU30 × 2/3*	834,000	174,000
3	419 employees × 100 shares × CU30	1,257,000	423,000

* The entity's best estimate at the end of year 1 is that it is one year through a two year vesting period and at the end of year 2 that it is two years through a three year vesting period.

It will be noted that in Illustration 6-6, which is based on IG Example 2 in the implementation guidance to IFRS 2, it is assumed that the entity will pay no dividends (to any shareholders) throughout the maximum possible three year vesting period. This has the effect that the fair value of the shares to be awarded is equivalent to their market value at the date of grant.

If dividends were expected to be paid during the vesting period, this would no longer be the case. Employees would be better off if they received shares after two years rather than three, since they would have a right to receive dividends from the end of year two. In practice, an entity is unlikely to suspend dividend payments in order to simplify the calculation of its share-based payment expense, and it is unfortunate that IG Example 2 is not more realistic. [IFRS 2.IG Example 2].

One solution might be to use the approach in IG Example 4 in the implementation guidance to IFRS 2 (the substance of which is reproduced as Illustration 6-8 in section 6.2.5 below). That Example deals with an award whose exercise price is either CU40 or CU30, dependent upon various performance conditions. Because vesting conditions other than market conditions must be ignored in determining the value of an award, the approach is in effect to treat the award as the simultaneous grant of two awards, whose value, in that case, varies by reference to the different exercise prices. [IFRS 2.IG Example 4].

The same principle could be applied to an award of shares that vests at different times according to the performance conditions, by determining different fair values for the shares (in this case depending on whether they vest after one, two or three years). The cumulative charge during the vesting period would be based on a best estimate of which outcome will occur, and the final cumulative charge would be based on the grant date fair value of the actual outcome (which will require some acceleration of expense if the actual vesting period is shorter than the previously estimated vesting period).

Such an approach appears to be taking account of non-market vesting conditions in determining the fair value of an award, contrary to the basic principle of IFRS 2.19 (see section 6.1.1 above). However, it is not the vesting conditions that are being taken into account *per se*, but the fact that the varying vesting periods will give rise to different lives for the award (which are required to be taken into account - see sections 7.2 and 8 below). That said, the impact of the time value of the different lives on the fair value of the award will, in many cases, be insignificant and it will therefore be a matter of judgement as to how precisely an entity switches from one fair value to another.

Economically speaking, the entity in Illustration 6-6 has made a single award, the true fair value of which must be a function of the weighted probabilities of the various outcomes occurring. However, under the accounting model for equity-settled awards in IFRS 2, the probability of achieving non-market performance conditions are not taken into account in valuing an award. If this is required to be ignored, the only approach open is to proceed as in Illustration 6-6 above and treat the arrangement as if it consisted of the simultaneous grant of three awards.

Some might object that this methodology is not relevant to the award in Illustration 6-6 above, since it is an award of shares rather than, in the case of Illustration 6-8 (see section 6.2.5 below), an award of options. However, an award of shares is no more than an award of options with an exercise price of zero. Moreover, the treatment outlined in the previous paragraph is broadly consistent with the rationale given by IFRS 2 for the treatment of an award vesting in instalments (see section 6.2.2 above).

In Illustration 6-6 above, the vesting period, although not known, is at least one of a finite number of known possibilities. The vesting period for some awards, however, may be more open-ended, such as is frequently the case for an award that vests on a trade sale or flotation of the business. Such awards are discussed further in section 15.4 below.

How we see it

In summary, as noted above, where an equity-settled award has a variable vesting period on achieving a non-market vesting condition, the cumulative charge during the vesting period would be based on a best estimate of which outcome will occur, and the final cumulative charge would be based on the grant date fair value of the actual outcome (which will require some acceleration of expense if the actual vesting period is shorter than the previously estimated vesting period).

6.2.4 Transactions with variable number of equity instruments awarded depending on non-market vesting conditions

More common than awards with a variable vesting period are those where the number of equity instruments awarded varies, typically increasing to reflect the margin by which a particular minimum target is exceeded. In accounting for such awards, the entity must continuously revise its estimate of the number of shares to be awarded, as demonstrated in Illustration 6-7 below (which is based on IG Example 3 in the implementation guidance to IFRS 2). [IFRS 2.IG Example 3].

Illustration 6-7: Award with non-market vesting condition and variable number of equity instruments

At the beginning of year 1, an entity grants an option over a variable number of shares (see below), estimated to have a fair value at grant date of CU20 per share under option, to each of its 100 employees working in the sales department. The share options will vest at the end of year 3, provided that the employees remain in the entity's employment, and provided that the volume of sales of a particular product increases by at least an average of 5% per year. If the volume of sales of the product increases by an average of between 5% and 10% per year, each employee will be entitled to exercise 100 share options. If the volume of sales increases by an average of between 10% and 15% each year, each employee will be entitled to exercise 200 share options. If the volume of sales increases by an average of 15% or more, each employee will be entitled to exercise 300 share options.

By the end of the first year, seven employees have left and the entity expects that a total of 20 employees will leave by the end of year 3. Product sales have increased by 12% and the entity expects this rate of increase to continue over the next two years, so that 80 employees will be entitled to exercise 200 options each.

By the end of the second year, a further five employees have left. The entity now expects only three more employees to leave during year 3, and therefore expects a total of 15 employees to have left during the three year period. Product sales have increased by 18%, resulting in an average of 15% over the two years to date. The entity now expects that sales will average 15% or more over the three year period, so that 85 employees will be entitled to exercise 300 options each.

By the end of year 3, a further seven employees have left. Hence, 19 employees have left during the three year period, and 81 employees remain. However, due to trading conditions significantly poorer than expected, sales have increased by a 3 year average of only 12%, so that the 81 remaining employees are entitled to exercise only 200 share options.

The entity will recognise the following amounts during the vesting period for services received as consideration for the options.

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	80 employees × 200 options × CU20 × 1/3	106,667	106,667
2	85 employees × 300 options × CU20 × 2/3	340,000	233,333
3	81 employees × 200 options × CU20	324,000	(16,000)

This Example reinforces the point that, under the methodology in IFRS 2, it is quite possible for an equity-settled transaction to give rise to a credit to profit or loss for a particular period during the period to vesting.

Other types of awards seen where variable number of equity instruments are awarded depending on non-market vesting conditions include an employee receiving awards dependent on an individual's performance rating, the higher the rating the more equity-instruments are awarded (see section 3.1.2 above). When the vesting of a share-based payment arrangement is based on an individual's performance rating, for there to be a grant date of such an award the framework for determining the performance rating outcome needs to be sufficiently clear and objective to allow both the entity and the employee to make an estimate of the outcome of the award during the vesting period (see section 5.3.3 above). Consistent with Illustration 6-7 above, the entity must continuously revise its estimate of the number of equity instruments to be awarded, provided a grant date has been established for the award. However, if the framework for determining the performance rating outcome is not sufficiently clear and objective, the grant date may not occur until a later date, but the entity would need to consider if services are effectively being rendered for an award from a date earlier than the grant date as defined in IFRS 2 and the cost of the award recognised over a period starting with that earlier date (see section 5.3.2 above).

6.2.5 Transactions with variable exercise price due to non-market vesting conditions

Another mechanism for delivering higher value to the recipient of a share award so as to reflect the margin by which a particular target is exceeded might be to vary the exercise price depending on performance. IFRS 2 requires such an award to be dealt with, in effect, as more than one award. The fair value of each award is determined, and the cost during the vesting period based on the best estimate of which award will actually vest, with the final cumulative charge being based on the actual outcome. [IFRS 2.IG12, IFRS 2.IG Example 4].

This is demonstrated in Illustration 6-8 below.

Illustration 6-8: Award with non-market vesting condition and variable exercise price

An entity grants to a senior executive 10,000 share options, conditional upon the executive remaining in the entity's employment for three years. The exercise price is CU40. However, the exercise price drops to CU30 if the entity's earnings increase by at least an average of 10% per year over the three year period.

On grant date, the entity estimates that the fair value of the share options, with an exercise price of CU30, is CU16 per option. If the exercise price is CU40, the entity estimates that the share options have a fair value of CU12 per option. During year 1, the entity's earnings increased by 12%, and the entity expects that earnings will continue to increase at this rate over the next two years. The entity therefore expects that the earnings target will be achieved, and hence the share options will have an exercise price of CU30.

During year 2, the entity's earnings increased by 13%, and the entity continues to expect that the earnings target will be achieved. During year 3, the entity's earnings increased by only 3%, and therefore the earnings target was not achieved. The executive completes three years' service, and therefore satisfies the service condition. Because the earnings target was not achieved, the 10,000 vested share options have an exercise price of CU40.

The entity will recognise the following amounts during the vesting period for services received as consideration for the options.

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	10,000 options × CU16 × 1/3	53,333	53,333
2	10,000 options × CU16 × 2/3	106,667	53,334
3	10,000 options × CU12	120,000	13,333

At first sight this may seem a rather surprising approach. In reality, is it not the case that the entity in Illustration 6-8 has made a single award, the fair value of which must lie between CU12 and CU16, as a function of the weighted probabilities of either outcome occurring? Economically speaking, this is indeed the case. However, under the accounting model for equity-settled share-based payments in IFRS 2, the probability of achieving non-market performance conditions are not taken into account in valuing an award. If this is required to be ignored, the only approach open is to proceed as above (see section 6.2.1.B above).

6.3 Market conditions

6.3.1 What is a 'market condition'?

The following definitions in Appendix A to IFRS 2 are relevant.

Extract from IFRS 2

Appendix A IFRS 2

Defined terms

intrinsic value

The difference between the **fair value** of the shares to which the counterparty has the (conditional or unconditional) right to subscribe or which it has the right to receive, and the price (if any) the counterparty is (or will be) required to pay for those shares. For example, a **share option** with an exercise price of CU15,⁶ on a share with a fair value of CU20, has an intrinsic value of CU5.

market condition

A **performance condition** upon which the exercise price, vesting or exercisability of an **equity instrument** depends that is related to the market price (or value) of the entity's **equity instruments** (or the equity instruments of another entity in the same group), such as:

- (a) attaining a specified share price or a specified amount of **intrinsic value** of a **share option**; or
- (b) achieving a specified target that is based on the market price (or value) of the entity's **equity instruments** (or the equity instruments of another entity in the same group) relative to an index of market prices of **equity instruments** of other entities.

A market condition requires the counterparty to complete a specified period of service (ie a **service condition**); the service requirement can be explicit or implicit.

⁶ In this appendix, monetary amounts are denominated in 'currency units (CU)'.

A market condition is a type of performance condition and the above definition must be read together with the definition of a performance condition (see section 3.1 above). If there is no service requirement, the condition will be a non-vesting condition rather than a performance condition (see section 3.2 above).

[IFRS 2 Appendix A].

A performance condition based on the share price and one based on the intrinsic value of the option are effectively the same, since the values of each will obviously move in parallel.

An example of a market condition is a condition based on total shareholder return (TSR). TSR is a measure of the increase or decrease in a given sum invested in an entity over a period on the assumption that all dividends received in the period had been used to purchase further shares in the entity. The market price of the entity's shares is an input to the calculation.

However, a condition linked to a purely internal financial performance measure such as profit or earnings per share is not a market condition. Such measures will affect the share price, but are not directly linked to it, and hence are not market conditions.

A condition linked to a general market index is a non-vesting condition rather than a market condition (see section 3.2 above and section 6.4 below). For example, suppose that an entity engaged in investment management and listed only in London grants options to an employee responsible for the Far East equities portfolio. The options have a condition linked to movements in a general index of shares of entities listed in Hong Kong, so as to compare the performance of the portfolio of investments for which the employee is responsible with that of the overall market in which they are traded. That condition would not be regarded as a market condition under IFRS 2, because even though it relates to the performance of a market, the reporting entity's own share price is not relevant to the satisfaction of the condition.

However, if the condition were that the entity's own share price had to outperform a general index of shares of entities listed in Hong Kong, that condition would be a market condition because the reporting entity's own share price is then relevant to the satisfaction of the condition.

6.3.2 Summary of accounting treatment

The key feature of the accounting treatment of an equity-settled transaction subject to a market condition is that the market condition is taken into account in valuing the award at the date of grant, but then subsequently ignored, so that an award is treated as vesting irrespective of whether the market condition is satisfied, provided that all service and non-market performance conditions are satisfied. [IFRS 2.21, IFRS 2.IG13]. This can have rather controversial consequences, as demonstrated by Illustration 6-9.

Illustration 6-9: Award with market condition

An entity grants an employee an option to buy a share on condition of remaining in employment for three years and the share price at the end of that period being at least CU7. At the end of the vesting period, the share price is CU6.80. The share price condition is factored into the initial valuation of the option, and the option is considered to vest provided that the employee remains for three years, irrespective of whether the share price does in fact reach CU7.

Therefore, IFRS 2 sometimes treats as vesting (and recognises a cost for) awards that do not actually vest in the natural sense of the word. See also Illustration 6-11 in section 6.3.4 below.

This treatment is clearly significantly different from that for transactions involving a non-market vesting condition, where no cost would be recognised where the conditions were not met. The Basis for Conclusions indicates that the IASB accepted this difference for two main reasons:

- (a) It was consistent with the approach in the US standard FAS 123 *Accounting for Stock-Based Compensation*.
- (b) In principle, the same approach should have been adopted for all performance conditions. However, whereas market conditions can be readily incorporated into the valuation of options, other conditions cannot. [IFRS 2.BC183, IFRS 2.BC184].

The methodology prescribed by IFRS 2 for transactions with a vesting condition other than a market condition is therefore to determine the fair value of the option ignoring the condition and then to multiply that fair value by the estimated (and ultimately the actual) number of awards expected to vest based on the likelihood of that non-market vesting condition being met (see section 6.2 above). It is interesting to note, however, that the January 2008 amendment to IFRS 2 (see section 1.2 above) had the effect that certain conditions previously regarded as non-market vesting conditions (and therefore 'impossible' to incorporate in the determination of fair value) became non-vesting conditions (and therefore required to be incorporated in the determination of fair value).

One of the reasons for adoption of this approach under US GAAP (not referred to in the Basis for Conclusions on IFRS 2) was as an 'anti-avoidance' measure. The concern was that the introduction of certain market conditions could effectively allow for the reversal of the expense for 'underwater' options (i.e., those whose exercise price is higher than the share price such that it is not in the holder's interest to exercise the option) for which all significant vesting conditions had been satisfied, contrary to the general principle in US GAAP (and IFRS 2) that no revisions are to be made to the expense for an already vested option.

For example, when the share price is CU10 an entity could grant an employee an option, exercisable at CU10, provided that a certain sales target had been met within one year. If the target were achieved, IFRS 2 would require an expense to be recognised even if the share price at the end of the year were only CU8, so that the employee would not rationally exercise the option. If, however, the performance conditions were that (a) the sales target was achieved and (b) the share price was at least CU10.01, the effect would be (absent specific provision for market conditions) that the entity could reverse any expense for 'underwater' options.

It appears that it may be possible to soften the impact of IFRS 2's rules for market conditions relatively easily by introducing a non-market vesting condition closely correlated to the market condition. For instance, the option in Illustration 6-9 above could be modified so that exercise was dependent not only upon the CU7 target share price and continuous employment, but also on a target growth in earnings per share. Whilst there would not be a perfect correlation between earnings per share and the share price, it would be expected that they would move roughly in parallel, particularly if the entity has historically had a fairly consistent price/earnings ratio. Thus, if the share price target were not met, it would be highly likely that the earnings per share target would not be met either. This would allow the entity to show no cumulative cost for the option, since only one (i.e., not all) of the non-market related vesting conditions would have been met.

Similarly, entities in sectors where the share price is closely related to net asset value (e.g., property companies and investment trusts) could incorporate a net asset value target as a non-market performance condition that would be highly likely to be satisfied only if the market condition was satisfied (i.e., two separate conditions exist, one based on the market price/value of the shares and the other based on the net asset value).

The matrices below illustrate the interaction of market conditions and vesting conditions other than market conditions. Matrix 1 summarises the possible outcomes for an award with the following two vesting conditions:

- The employee remaining in service for three years ('service condition').
- The entity's total shareholder return ('TSR') relative to that of a peer group being in the top 10% of its peer group at the end of the period ('TSR target (market condition)').

Matrix 1

	Service condition met?	TSR target (market condition) met?	IFRS 2 expense?
1	Yes	Yes	Yes
2	Yes	No	Yes
3	No	Yes	No
4	No	No	No

It will be seen that, to all intents and purposes, the 'TSR target (market condition) met?' column is redundant, as this market condition is not relevant to whether or not the award is treated as vesting by IFRS 2. The effect of this is that the entity would recognise an expense for outcome 2, even though no awards truly vest.

Matrix 2 summarises the possible outcomes for an award with the same conditions as in Matrix 1, plus a requirement for earnings per share to grow by a general inflation index plus 10% over the period ('EPS target').

Matrix 2

	Service condition met?	TSR target (market condition) met?	EPS target (non-market vesting condition) met?	IFRS 2 expense?
1	Yes	Yes	Yes	Yes
2	Yes	No	Yes	Yes
3	Yes	Yes	No	No
4	Yes	No	No	No
5	No	Yes	Yes	No
6	No	No	Yes	No
7	No	Yes	No	No
8	No	No	No	No

Again, it will be seen that, to all intents and purposes, the 'TSR target (market condition) met?' column is redundant, as this market condition is not relevant to whether or not the award is treated as vesting by IFRS 2. The effect of this is that the entity would recognise an expense for outcome 2, even though no awards truly vest. However, no expense would be recognised for outcome 4, which is, except for the introduction of the EPS target, equivalent to outcome 2 in Matrix 1, for which an expense is recognised. This illustrates that the introduction of a non-market vesting condition closely related to a market condition may mitigate the impact of IFRS 2.

Examples of the application of the accounting treatment for transactions involving market conditions are given in sections 6.3.3 to 6.3.5 below.

6.3.3 Transactions with market conditions and known vesting periods

The accounting for such transactions is essentially the same as that for transactions without market conditions but with a known vesting period (including 'graded' vesting - see section 6.2.2 above), except that adjustments are made to reflect the changing probability of the achievement of the non-market vesting conditions only, as demonstrated by Illustration 6-10 below. [IFRS 2.19, IFRS 2.20, IFRS 2.21, IFRS 2.IG13, IFRS 2.IG Example 5].

Illustration 6-10: Award with market condition and fixed vesting period

At the beginning of year 1, an entity grants to 100 employees 1,000 share options each, conditional upon the employees remaining in the entity's employment until the end of year 3. However, the share options cannot be exercised unless the share price has increased from CU50 at the beginning of year 1 to more than CU65 at the end of year 3.

If the share price is above CU65 at the end of year 3, the share options can be exercised at any time during the next seven years, i.e., by the end of year 10. The entity applies a binomial option pricing model (see section 8 below), which takes into account the possibility that the share price will exceed CU65 at the end of year 3 (and hence the share options vest and become exercisable) and the possibility that the share price will not exceed CU65 at the end of year 3 (and hence the options will be treated as having vested under IFRS 2 but will never be exercisable - as explained below). It estimates the fair value of the share options with this market condition to be CU24 per option.

IFRS 2 requires the entity to recognise the services received from a counterparty who satisfies all other vesting conditions (e.g., services received from an employee who remains in service for the specified service period), irrespective of whether that market condition is satisfied. It makes no difference whether the share price target is achieved, since the possibility that the share price target might not be achieved has already been taken into account when estimating the fair value of the share options at grant date. However, the options are subject to another condition (i.e., continuous employment) and the cost recognised is required to be adjusted to reflect the ongoing best estimate of employee retention.

By the end of the first year, seven employees have left and the entity expects that a total of 20 employees will leave by the end of year 3, so that 80 employees will have satisfied all conditions other than the market condition (i.e., continuous employment).

By the end of the second year, a further five employees have left. The entity now expects only three more employees will leave during year 3, and therefore expects that a total of 15 employees will have left during the three year period, so that 85 employees will have satisfied all conditions other than the market condition.

By the end of year 3, a further seven employees have left. Hence, 19 employees have left during the three year period, and 81 employees remain. However, the share price is only CU60, so that the options cannot be exercised. Nevertheless, as all conditions other than the market condition have been satisfied, a cumulative cost is recorded as if the options had fully vested in 81 employees.

The entity will recognise the following amounts during the vesting period for services received as consideration for the options (which in economic reality do not vest).

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	80 employees × 1,000 options × CU24 × 1/3	640,000	640,000
2	85 employees × 1,000 options × CU24 × 2/3	1,360,000	720,000
3	81 employees × 1,000 options × CU24	1,944,000	584,000

6.3.4 Transactions with variable vesting periods due to market conditions

Where a transaction has a variable vesting period due to a market condition, a best estimate of the most likely vesting period will have been used in determining the fair value of the transaction at the date of grant. IFRS 2 requires the expense for that transaction to be recognised over an estimated expected vesting period consistent with the assumptions used in the valuation, without any subsequent revision.

[IFRS 2.15(b), IFRS 2.IG14].

This may mean, for example, that, if the actual vesting period for an employee share option award turns out to be longer than that anticipated for the purposes of the initial valuation, a cost is nevertheless recorded in respect of all employees who reach the end of the anticipated vesting period, even if they do not reach the end of the actual vesting period, as shown by Illustration 6-11 below, which is based on IG Example 6 in the implementation guidance in IFRS 2. [IFRS 2.IG Example 6].

Illustration 6-11: Award with market condition and variable vesting period

At the beginning of year 1, an entity grants 10,000 share options with a ten year life to each of ten senior executives. The share options will vest and become exercisable immediately if and when the entity's share price increases from CU50 to CU70, provided that the executive remains in service until the share price target is achieved.

The entity applies a binomial option pricing model, which takes into account the possibility that the share price target will be achieved during the ten year life of the options, and the possibility that the target will not be achieved. The entity estimates that the fair value of the share options at grant date is CU25 per option. From the option pricing model, the entity determines that the most likely vesting period is five years. The entity also estimates that two executives will have left by the end of year 5, and therefore expects that 80,000 share options (10,000 share options × 8 executives) will vest at the end of year 5.

Throughout years 1 to 4, the entity continues to estimate that a total of two executives will leave by the end of year 5. However, in total three executives leave, one in each of years 3, 4 and 5. The share price target is achieved at the end of year 6. Another executive leaves during year 6, before the share price target is achieved.

Paragraph 15 of IFRS 2 requires the entity to recognise the services received over the expected vesting period, as estimated at grant date, and also requires the entity not to revise that estimate. Therefore, the entity recognises the services received from the executives over years 1-5. Hence, the transaction amount is ultimately based on 70,000 share options (10,000 share options × 7 executives who remain in service at the end of year 5). Although another executive left during year 6, no adjustment is made, because the executive had already completed the expected vesting period of 5 years.

The entity will recognise the following amounts during the initial expected five year vesting period for services received as consideration for the options.

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	8 employees × 10,000 options × CU25 × 1/5	400,000	400,000
2	8 employees × 10,000 options × CU25 × 2/5	800,000	400,000
3	8 employees × 10,000 options × CU25 × 3/5	1,200,000	400,000
4	8 employees × 10,000 options × CU25 × 4/5	1,600,000	400,000
5	7 employees × 10,000 options × CU25	1,750,000	150,000

IFRS 2 does not specifically address the converse situation, namely where the award actually vests before the end of the anticipated vesting period.

How we see it

In our view, where the award vests before the end of the anticipated vesting period, any expense not yet recognised at the point of vesting is immediately accelerated. We consider that this treatment is most consistent with the overall requirement of IFRS 2 to recognise an expense for share-based payment transactions 'as the services are received'. It is difficult to regard any services being received for an award after it has vested.

Moreover, the prohibition in IFRS 2 on adjusting the vesting period as originally determined refers to 'the estimate of the expected vesting period'. In our view, the acceleration of vesting that we propose is not the revision of an estimated period, but the substitution of an estimate for a known vesting period.

Suppose in Illustration 6-11 above, the award had in fact vested at the end of year 4. We believe that the expense for such an award must be allocated as follows:

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	8 employees × 10,000 options × CU25 × 1/5	400,000	400,000
2	8 employees × 10,000 options × CU25 × 2/5	800,000	400,000
3	8 employees × 10,000 options × CU25 × 3/5	1,200,000	400,000
4	8 employees × 10,000 options × CU25 × 4/4	2,000,000	800,000

6.3.5 Transactions with multiple outcomes depending on market conditions

In practice, it is very common for an award subject to market conditions to give varying levels of reward that increase depending on the extent to which a 'base line' market performance target has been met. Such an award is demonstrated in Illustration 6-12 below.

Illustration 6-12: Award with market conditions and multiple outcomes

At the beginning of year 1, the reporting entity grants an employee an award of shares that will vest on the third anniversary of grant if the employee is still in employment. The number of shares depends on the share price achieved at the end of the three-year period. The employee will receive:

- No shares if the share price is below CU10.00
- 100 shares if the share price is in the range CU10.00-CU14.99
- 150 shares if the share price is in the range CU15.00-CU19.99
- 180 shares if the share price is CU20.00 or above

In effect the entity has made three awards, which need to be valued as follows:

- (a) 100 shares if the employee remains in service for three years and the share price is greater than CU10
- (b) 50 (150 - 100) shares if the employee remains in service for three years and the share price is greater than CU15

And

- (c) 30 (180 - 150) shares if the employee remains in service for three years and the share price is CU20.00 or more

Each award would be valued, ignoring the impact of the three-year service condition but taking account of the share price target. This would result in each tranche of the award being subject to an increasing level of discount to reflect the relative probability of the share price target for each tranche of the award being met. All three awards would then be expensed over the three-year service period, and forfeited only if the awards lapsed as a result of the employee leaving during that period.

It can be seen that the (perhaps somewhat counterintuitive) impact of this is that an equity-settled share-based payment where the number of shares increases in line with increases in the entity's share price may nevertheless have a fixed grant date value irrespective of the number of shares finally awarded.

6.3.6 Transactions with independent market conditions, non-market vesting conditions or non-vesting conditions

6.3.6.A Independent market and non-market vesting conditions

The discussion in section 6.3.2 above addressed the accounting treatment of awards with multiple conditions that must all be satisfied, i.e., a market condition and a non-market vesting condition. However, entities might also make awards with multiple conditions, only one of which need be satisfied, i.e., the awards vest on satisfaction of either a market condition or a non-market vesting condition. IFRS 2 provides no explicit guidance on the treatment of such awards, which is far from clear, as demonstrated by Illustration 6-13 below.

Illustration 6-13: Award with independent market conditions and non-market vesting conditions

An entity grants an employee 100 share options that vest after three years if the employee is still in employment and the entity achieves either:

- Cumulative total shareholder return (TSR) over three years of at least 15%.
- Or
- Cumulative profits over three years of at least CU200 million.

The fair value of the award, ignoring vesting conditions, is CU300,000. The fair value of the award, taking account of the TSR condition, but not the other conditions, is CU210,000.

In our view, the entity has, in effect, simultaneously issued two awards - call them 'A' and 'B' - which vest as follows:

- A On achievement of three years' service plus minimum TSR.

And

- B On achievement of three years' service plus minimum earnings growth.

If the conditions for both awards are simultaneously satisfied, one or other effectively lapses.

It is clear that award A, if issued separately, would require the entity to recognise an expense of CU210,000 if the employee were still in service at the end of the three year period. It therefore seems clear that, if the employee does remain in service, there must be a charge of CU210,000 irrespective of whether the award actually vests. It would be anomalous for the entity to avoid recording a charge that would have been recognised if the entity had made award A in isolation simply by packaging it with award B.

If in fact the award vested because the earnings condition, but not the market condition, had been satisfied, it would then be appropriate to recognise a total expense of CU300,000.

During the vesting period, we believe that the entity is required to make an assessment at each reporting date of the basis on which the award is expected to vest. It must assess whether, as at that date, the award is expected to vest by virtue of the earnings condition, but not the TSR condition, being satisfied. Assume (for example) that the entity assesses at the end of year 1 that the award is likely to vest by virtue of the TSR condition, and at the end of year 2 that it is likely to vest by virtue of the earnings condition, and that the award actually does not vest, but the employee remains in service. This would give rise to annual expense as follows:

Year	Calculation of cumulative expense	Cumulative expense (CU)	Expense for period (CU)
1	210,000 × 1/3	70,000	70,000
2	300,000 × 2/3	200,000	130,000
3	210,000 × 3/3	210,000	10,000

We believe that ongoing reassessment during the vesting period is most consistent with the general approach of IFRS 2 to awards with a number of possible outcomes (see section 10 below).

Of course, as for other awards, the accounting treatment would also require an assessment of whether or not the employee was actually going to remain in service.

A further question that arises is how the award must be accounted for if both conditions are satisfied. It would clearly be inappropriate to recognise an expense of CU510,000 (the sum of the separate fair values of the award) - this would be double-counting, because the employee receives only one package of 100 options. However, should the total expense be taken as CU210,000 or CU300,000? In our view, it is appropriate to recognise a cost of CU300,000 since the non-market vesting condition has been satisfied.

How we see it

As noted above, the entity has simultaneously issued two awards which vest on achievement of three years' service plus; minimum TSR or minimum earnings growth. If the conditions for both awards are simultaneously satisfied, one or other effectively lapses, we believe the higher of both expenses is recognised. We also believe that ongoing reassessment during the vesting period is most consistent with the general approach of IFRS 2 to awards with a number of possible outcomes.

Ultimately, this is an issue which only the IASB can solve, since it arises from the inconsistent treatment by IFRS 2 of awards with market conditions and those with non-market conditions. As noted in section 3.4 above, the IASB has concluded not to perform further research into IFRS 2.²⁵ Therefore we continue to believe that ongoing reassessment during the vesting period is most consistent with the general approach of IFRS 2 for awards with multiple possible outcomes.

6.3.6.B Independent market conditions and non-vesting conditions

Arrangements are also seen where a share-based payment transaction vests on the satisfaction of either a market condition or a non-vesting condition.

The fact that there are two alternative conditions on which the award might vest means that, unless the two conditions are perfectly correlated, the grant date fair value of such an award will be higher than that of an award where there is only one possible basis on which the award might vest. Irrespective of whether the market condition and/or the non-vesting conditions are met, the entity will recognise the grant date fair value provided all other service and non-market vesting conditions are met (i.e., the expense recognition is consistent with that of any award with market and/or non-vesting conditions).

²⁵ [Project Summary: Share-based payment-research on sources of accounting complexity](#), IASB, October 2018, available on the IFRS Foundation's website.

How we see it

In our view, an entity granting an award on the basis of a service condition (and any other non-market vesting conditions) plus either a market condition or a non-vesting condition is required to measure the fair value of the award at grant date taking into account the probability that either the market condition or the non-vesting condition will be met.

6.3.7 Transactions with hybrid or interdependent market conditions and non-market vesting conditions

Awards may sometimes have a performance condition which depends simultaneously on a market element and a non-market element, sometimes known as ‘hybrid’ conditions. Examples of such conditions include:

- A particular price-earnings (PE) ratio (calculated by reference to share price, a market condition, and earnings, a non-market vesting condition).
- A maximum level of discount of market capitalisation (a market condition) below net asset value (a non-market vesting condition).

Such awards are rather curious, in the sense that these ratios may remain fairly constant irrespective of the underlying performance of the entity, so that a performance condition based on them is arguably of limited motivational value.

How we see it

In our view, in contrast to our suggested treatment of awards with independent market and non-market vesting conditions discussed in section 6.3.6.A above, awards with interdependent market and non-market vesting conditions must be accounted for entirely as awards with market conditions. These awards contain at least one element that meets the definition of a market condition but which cannot be completely split from the non-market element for separate assessment. An indicator such as the PE ratio or discount of market capitalisation below net asset value, is a market condition as defined since it is “related to the market price ... of the entity’s equity instruments” (see section 6.3.1 above).

6.3.8 Awards with a condition linked to flotation price

Awards in an unlisted entity may be granted with a condition linked to the achievement of a specific price when the entity floats.

How we see it

On flotation there is a market and a market price for the entity’s equity instruments and the achievement of a specific price on flotation would, in our view, be a market condition when accompanied by a corresponding service requirement (see section 15.4 below).

6.4 Non-vesting conditions

The accounting treatment for awards with non-vesting conditions has some similarities to that for awards with market conditions in that:

- The fair value of the award at grant date is reduced to reflect the impact of the condition.
- An expense is recognised for the award irrespective of whether the non-vesting condition is met, provided that all vesting conditions (other than market conditions) are met. [IFRS 2.21A].

However, in some situations, the accounting for non-vesting conditions differs from that for market conditions as regards the timing of the recognition of expense if the non-vesting condition is not satisfied (see section 6.4.3 below).

6.4.1 Awards with no conditions other than non-vesting conditions

The effect of the treatment required by IFRS 2 is that any award that has only non-vesting conditions (e.g., an option award to an employee that may be exercised on a trade sale or IPO of the entity, irrespective of whether the employee is still in employment at that time) must be expensed in full at grant date. This is discussed further in section 3.2 above and in section 15.4 below, and demonstrated in Illustration 6-1 in section 6.1 above.

6.4.2 Awards with non-vesting conditions and variable vesting periods

IFRS 2 does not explicitly address the determination of the vesting period for an award with a non-vesting condition but a variable vesting period (e.g., an award which delivers 100 shares when the price of gold reaches a given level, but without limit as to when that level must be achieved, so long as the employee is still in employment when the target is reached).

How we see it

However, given the close similarity between the required treatment for awards with non-vesting conditions and that for awards with market conditions, we believe that entities must follow the guidance in the standard for awards with market conditions and variable vesting periods (see section 6.3.4 above).

6.4.3 Failure to meet non-vesting conditions

As noted above, the accounting for non-vesting conditions sometimes differs from that for market conditions as regards the timing of the recognition of expense if the non-vesting condition is not satisfied. The treatment depends on the nature of the non-vesting condition, as follows:

- If a non-vesting condition within the control of the counterparty (e.g., making monthly savings in an SAYE scheme or holding a specified number of shares in a matching share arrangement) is not satisfied during the vesting period, the failure to satisfy the condition is treated as a cancellation (see section 7.4 below), with immediate recognition of any expense for the award not previously recognised. [IFRS 2.28A, IFRS 2.IG24, IFRS 2.IG Example 9A].
- If a non-vesting condition within the control of the entity (e.g., continuing to operate the scheme) is not satisfied during the vesting period, the failure to satisfy the condition is treated as a cancellation (see section 7.4 below), with immediate recognition of any expense for the award not previously recognised. [IFRS 2.28A, IFRS 2.IG24]. But, if a non-vesting condition within the control of neither the counterparty nor the entity (e.g., a financial market index reaching a minimum level) is not satisfied, there is no change to the accounting and the expense continues to be recognised over the vesting period, unless the award is otherwise treated as forfeited by IFRS 2. [IFRS 2.BC237A, IFRS 2.IG24].

How we see it

The reference to the vesting period, when a non-vesting condition is not met that is not within the control of either party, would include any deemed vesting period calculated as described in section 6.4.2 above.

If an award is forfeited due to a failure to satisfy a non-vesting condition after the end of the vesting period (e.g., a requirement for an employee not to work for a competitor for a two year period after vesting), no adjustment is made to the expense previously recognised, consistent with the general provisions of IFRS 2 for accounting for awards in the post-vesting period (see section 6.1.3 above). This would be the case even if shares previously issued to the employee were required to be returned to the entity on forfeiture (see sections 3.1.1 and 3.2.3 above for further discussion of clawback arrangements and non-compete arrangements respectively).

7 Equity-settled transactions - modification, cancellation and settlement

7.1 Background

It is quite common for equity instruments to be modified or cancelled before or after vesting. Typically this is done where the conditions for an award have become so onerous as to be virtually unachievable, or (in the case of an option) where the share price has fallen so far below the exercise price of an option that it is unlikely that the option will ever be 'in the money' to the holder during its life. In such cases, an entity may take the view that the equity awards are so unattainable as to have little or no motivational effect, and accordingly replace them with less onerous alternatives. Conversely, and more rarely, an entity may make the terms of a share award more onerous (possibly because of shareholder concern that targets are insufficiently demanding). In addition, an entity may 'settle' an award, i.e., cancel it in return for cash or other consideration.

A target entity might modify existing share-based payment arrangements in the period leading up to a business combination. In this situation, it needs to be determined whether the guidance in IFRS 2 is applicable or whether the modification is being made for the benefit of the acquirer or the combined entity, in which case the guidance in IFRS 3 is likely to apply (see section 11.2 below).

IFRS 2 contains detailed provisions for modification, cancellation and settlement. Whilst these provisions (like the summary of them below) are framed in terms of share-based payment transactions with employees, they apply to transactions with parties other than employees that are measured by reference to the fair value of the equity instruments granted (see section 5.4 above). In that case, however, all references to 'grant date' must be taken as references to the date on which the third party supplied goods or rendered service. [IFRS 2.26].

In the discussion below, any reference to a 'cancellation' is to any cancellation, whether instigated by the entity or the counterparty. As well as more obvious situations where an award is cancelled by either the entity or the counterparty, cancellations include:

- A failure by the entity to satisfy a non-vesting condition (see section 6.4.3 above) within the control of the entity.
- A failure by the counterparty to satisfy a non-vesting condition (see section 6.4.3 above) within the control of the counterparty. [IFRS 2.28A, IFRS 2.IG24].

The discussion below is not relevant to cancellations and modifications of those equity-settled transactions that are (exceptionally) accounted for at intrinsic value (see section 8.8 below).

The basic principles of the rules for modification, cancellation and settlement, which are discussed in more detail in sections 7.3 and 7.4 below, can be summarised as follows:

- As a minimum, the entity must recognise the amount that would have been recognised for the award if it remained in place on its original terms. [IFRS 2.27].
- If the value of an award to an employee is reduced (e.g., by reducing the number of equity instruments subject to the award or, in the case of an option, by increasing the exercise price), there is no reduction in the cost recognised in profit or loss. [IFRS 2.27, IFRS 2.B42, IFRS 2.B44].
- However, where the effect of the modification, cancellation or settlement is to increase the value of the award to an employee (e.g., by increasing the number of equity instruments subject to the award or, in the case of an option, by reducing the exercise price), the incremental fair value must be recognised as a cost. The incremental fair value is the difference between the fair value of the original award and that of the modified award, both measured at the date of modification. [IFRS 2.27, IFRS 2.B43].

It might be thought that, when an award has been modified, and certainly when it has been cancelled altogether, it no longer exists, and that it is therefore not appropriate to recognise any cost for it. However, such a view would be consistent with a vesting date measurement model rather than with the grant/service date measurement model of IFRS 2. Under the IFRS 2 model, the value of an award at grant date or service date cannot be changed by subsequent events.

Another reason given for the approach in IFRS 2 is that if entities were able not to recognise the cost of modified or cancelled options they would in effect be able to apply a selective form of 'truing up', whereby options that increased in value after grant would remain 'frozen' at their grant date valuation under the general principles of IFRS 2, whilst options that decreased in value could be modified or cancelled after grant date and credit taken for the fall in value. [IFRS 2.BC222-237].

7.1.1 Determining the date of the modification

Determining the date of the modification is an important step in applying the rules for modification accounting. It is at that date that the entity must obtain a fair value not only for the modified award, but also for the original award updated to the date of modification, in order to determine any incremental fair value to be recognised. *[IFRS 2.27, IFRS 2.B43].*

How should an entity determine the date of the modification?

IFRS 2 does not contain explicit guidance on determining the date of the modification, unlike determination of grant date. Grant date is defined as, "the date at which the entity and another party (including an employee) agree to a share-based payment arrangement, being when the entity and the counterparty have a shared understanding of the terms and conditions of the arrangement... If that agreement is subject to an approval process (for example, by shareholders), grant date is the date when that approval is obtained."

[IFRS 2 Appendix A].

To determine the date of modification, we would expect an entity to first consider some of the existing principles in the standard on determining grant date. Not all these principles may be applicable in determining the date of the modification because grant date has already been established and the employees have either already provided or are currently providing services in return for the share-based payment award. The grant date principles that can be applied in establishing the date of modification include, there to be a shared understanding of the modified terms and conditions and the relevant approval for the modified award being obtained.

IG Examples 7, 9 and 12C of IFRS 2 refer to situations when the 'entity' modifies the award, for example, reprices share options, adds settlement alternatives or cancels and replaces awards. While these examples all refer to a 'modification date', there is no discussion on any principles used to determine this date. There may be instances where judgement is required in determining the date of the modification when other facts and circumstances indicate that the date of modification is different than the date employees are formally notified of a modification, especially when an entity has obtained relevant board approvals prior to employees being notified. Some of the factors to consider in addition to the grant date principles are as follows:

- A modification that is beneficial to employees approved by the board, for example removal of a non-market vesting condition or reducing the exercise price, where there is no subsequent further approval required (for example, by shareholders) and the communication to employees is shortly after that approval date, may indicate the date of the modification arises at the date of board approval. A factor that may further help to support the board approval date as the date of the modification is if there was some form of communication prior to the approval of a change in terms that created a valid expectation by the employees prior to the board approval that the award would be modified. Another factor to support the board approval date for the modification is that the communication to employees shortly after the board approval is considered an administrative task. If there was a substantive delay in communicating the amended award to employees, it is important to understand why there was such a delay and this could be a factor in determining that the date of the modification is when there is a shared understanding of the terms by both parties i.e., at the later date.
- Where an entity is permitted to amend certain terms and conditions of the original award that do not require approval by the employees, the date of modification is likely to be the date of board approval for the modified terms, provided the approval creates rights and obligations for both parties (the employee and entity). See discussion above in section 5.3.8, where an entity has discretion to modify the details of an award after grant date. If a modification requires the approval by employees or requires further services to be provided (for example, in a situation where the vesting period is extended), the date of modification is likely to be once a shared understanding of the terms has been reached.

The above are some of the factors to consider in addition to the grant date principles; there may be others and an entity will need to consider all facts and circumstances to establish the date of modification.

How we see it

There is no accounting policy choice to determine the date of modification, and we would expect an entity to first consider some of the principles in the standard on determining grant date, such as there being a shared understanding of the modified terms and conditions and the relevant approval for the modified award being obtained.

A mere intent by the entity's management to change the conditions of the award is not sufficient to determine a modification date as an intent would not create rights and obligations under the share-based payment arrangement. There is no basis in IFRS 2 for accounting for an anticipated future change to the terms of an award. The entity must account for those awards in issue at the reporting date (see section 7.6 below).

However, there could be instances where judgement is required in determining the date of the modification when other facts and circumstances indicate that the date of modification is different than the date employees are formally notified of a modification.

7.2 Valuation requirements when an award is modified, cancelled or settled

These provisions have the important practical consequence that, when an award is modified, cancelled or settled, the entity must obtain a fair value not only for the modified award, but also for the original award, updated to the date of modification. If the award had not been modified, there would have been no need to obtain a valuation for the original award after the date of grant.

Any modification of a performance condition clearly has an impact on the 'real' value of an award but it may have no direct effect on the value of the award for the purposes of IFRS 2. As discussed in sections 6.2 to 6.4 above, this is because market conditions and non-vesting conditions are taken into account in valuing an award whereas non-market vesting conditions are not. Accordingly, by implication, a change to a non-market performance condition will not necessarily affect the expense recognised for the award under IFRS 2.

For example, if an award is contingent upon sales of a given number of units and the number of units required to be sold is decreased, the 'real' value of the award is clearly increased. However, as the performance condition is a non-market vesting condition, and therefore not relevant to the original determination of the value of the award, there is no incremental fair value required to be accounted for by IFRS 2. If the change in the condition results in an increase in the estimated number of awards expected to vest, the change of estimate will however give rise to an accounting charge (see sections 6.1 to 6.4 above).

If an award is modified by changing the service period, the situation is more complex. A service condition does not of itself change the fair value of the award for the purposes of IFRS 2, but a change in service period may indirectly change the life of the award, which is relevant to its value (see section 8 below). Similar considerations apply where performance conditions are modified in such a way as to alter the anticipated vesting date.

The valuation requirements relating to cancelled and settled awards are considered further in section 7.4 below.

7.3 Modification

When an award is modified, the entity must as a minimum recognise the cost of the original award as if it had not been modified (i.e., at the original grant date fair value, spread over the original vesting period, and subject to the original vesting conditions). This applies unless the award does not vest because of failure to satisfy a vesting condition (other than a market condition) that was specified at grant date. [IFRS 2.27, IFRS 2.B42].

In addition, a further cost must be recognised for any modifications that increase the fair value of the award. This additional cost is spread over the period from the date of modification until the vesting date of the modified award, which might not be the same as that of the original award. Where a modification is made after the original vesting period has expired, and is subject to no further vesting conditions, any incremental fair value must be recognised immediately. [IFRS 2.27, IFRS 2.B42, IFRS 2.B43].

Whether a modification increases or decreases the fair value of an award is determined as at the date of modification, as demonstrated by Illustration 7-1. [IFRS 2.27, IFRS 2.B42, IFRS 2.B43, IFRS 2.B44].

Illustration 7-1: Does a modification increase or decrease the value of an award?

At the beginning of year 1, an entity granted two executives, A and B, a number of options worth CU100 each. At the beginning of year 2, A's options are modified such that they have a fair value of CU85, their current fair value being CU80. This is treated as an increase in fair value of CU5 (even though the modified award is worth less than the original award when first granted). Therefore, an additional CU5 of expense would be recognised in respect of A's options.

At the beginning of year 3, B's options are modified such that they have a fair value of CU120, their current fair value being CU125. This is treated as a reduction in fair value of CU5 (even though the modified award is worth more than the original award when first granted). However, there is no change to the expense recognised for B's options as IFRS 2 requires the entity to recognise, as a minimum, the original grant date fair value of the options (i.e., CU100).

This treatment ensures that movements in the fair value of the original award are not reflected in the entity's profit or loss, consistent with the treatment of other equity instruments under IFRS accounting standards.

IFRS 2 provides further detailed guidance on this requirement as discussed below.

7.3.1 Modifications that increase the value of an award

7.3.1.A Increase in fair value of equity instruments granted

If the modification increases the fair value of the equity instruments granted, (e.g., by reducing the exercise price or changing the exercise period), the incremental fair value, measured at the date of modification, must be recognised over the period from the date of modification to the date of vesting for the modified instruments, as demonstrated in Illustration 7-2 below. [IFRS 2.B43(a), IFRS 2.IG15, IFRS 2.IG Example 7].

Illustration 7-2: Award modified by repricing

At the beginning of year 1, an entity grants 100 share options to each of its 500 employees. Each grant is conditional upon the employee remaining in service over the next three years. The entity estimates that the fair value of each option is CU15.

By the end of year 1, the entity's share price has dropped, and the entity reprices its share options. The repriced share options vest at the end of year 3. The entity estimates that, at the date of repricing, the fair value of each of the original share options granted (i.e., before taking into account the repricing) is CU5 and that the fair value of each repriced share option is CU8.

40 employees leave during year 1. The entity estimates that a further 70 employees will leave during years 2 and 3, so that there will be 390 employees at the end of year 3 (500 - 40 - 70).

During year 2, a further 35 employees leave, and the entity estimates that a further 30 employees will leave during year 3, so that there will be 395 employees at the end of year 3 (500 - 40 - 35 - 30).

During year 3, 28 employees leave, and hence a total of 103 employees ceased employment during the original three year vesting period, so that, for the remaining 397 employees, the original share options vest at the end of year 3.

IFRS 2 requires the entity to recognise:

- The cost of the original award at grant date (CU15 per option) over a three year vesting period beginning at the start of year 1.
- Plus, the incremental fair value of the repriced options at repricing date (CU3 per option, being the CU8 fair value of each repriced option less the CU5 fair value of the original option) over a two year vesting period beginning at the date of repricing (end of year 1).

This would be calculated as follows:

Year	Calculation of cumulative expense		Cumulative expense (CU)	Expense for period (CU)
	Original award (a)	Modified award (b)	(a+b)	
1	390 employees × 100 options × CU15 × 1/3		195,000	195,000
2	395 employees × 100 options × CU15 × 2/3	395 employees × 100 options × CU3 × 1/2	454,250	259,250
3	397 employees × 100 options × CU15	397 employees × 100 options × CU3	714,600	260,350

In effect, IFRS 2 treats the original award and the incremental value of the modified award as if they were two separate awards.

A similar treatment to that in Illustration 7-2 above is adopted where the fair value of an award subject to a market condition has its value increased by the removal or mitigation of the market condition. [IFRS 2.B43(a), IFRS 2.B43(c)]. Where a vesting condition other than a market condition is changed, the treatment set out in section 7.3.1.C below is adopted. IFRS 2 does not specifically address the situation where the fair value of an award is increased by the removal or mitigation of a non-vesting condition.

How we see it

In our view, it seems appropriate to account for the increase in fair value by the removal or mitigation of a non-vesting condition in the same way as for a modification caused by the removal or mitigation of a market condition - i.e., as in Illustration 7-2 above.

7.3.1.B Increase in number of equity instruments granted

If the modification increases the number of equity instruments granted, the fair value of the additional instruments, measured at the date of modification, must be recognised over the period from the date of modification to the date of vesting for the modified instruments. If there is no further vesting period for the modified instruments, the incremental cost must be recognised immediately. [IFRS 2.B43(b)].

7.3.1.C Removal or mitigation of non-market vesting conditions

Where a vesting condition, other than a market condition, is modified in a manner that is beneficial to the employee, the modified vesting condition is required to be taken into account when applying the general requirements of IFRS 2 as discussed in sections 6.1 to 6.4 above - in other words, the entity would continuously estimate the number of awards likely to vest and/or the vesting period. [IFRS 2.B43(c)]. This is consistent with the general principle of IFRS 2 that vesting conditions, other than market conditions, are not taken into account in the valuation of awards, but are reflected by recognising a cost for those instruments that ultimately vest on achievement of those conditions. See also the discussion in section 7.2 above.

IFRS 2 does not provide an example that addresses this point specifically, but we assume that the intended approach is as in Illustration 7-3 below. In this example, the entity modifies an award in a way that is beneficial to the employee even though the modification does not result in any incremental fair value. The effect of the modification is therefore recognised by basing the expense on the original grant date fair value of the awards and an assessment of the extent to which the modified vesting conditions will be met.

Illustration 7-3: Modification of non-market vesting condition in employee's favour

At the beginning of year 1, the entity grants 1,000 share options to each member of its sales team, with exercise conditional upon the employee remaining in the entity's employment for three years, and the team selling more than 50,000 units of a particular product over the three year period. The fair value of the share options is CU15 per option at the date of grant.

At the end of year 1, the entity estimates that a total of 48,000 units will be sold, and accordingly records no cost for the award in year 1.

During year 2, there is so severe a downturn in trading conditions that the entity believes that the sales target is too demanding to have any motivational effect, and reduces the target to 30,000 units, which it believes is achievable. It also expects 14 members of the sales team to remain in employment throughout the three year performance period. It therefore records an expense in year 2 of CU140,000 ($\text{CU15} \times 14 \text{ employees} \times 1,000 \text{ options} \times 2/3$). This cost is based on the originally assessed value of the award (i.e., CU15) since the performance condition was never factored into the original valuation, such that any change in performance condition likewise has no effect on the valuation and does not result in any incremental fair value.

By the end of year 3, the entity has sold 35,000 units, and the share options vest as the modified performance condition has been met. Twelve members of the sales team have remained in service for the three year period. The entity would therefore recognise a total cost of CU180,000 ($12 \text{ employees} \times 1,000 \text{ options} \times \text{CU15}$), giving an additional cost in year 3 of CU40,000 (total charge CU180,000, less CU140,000 charged in year 2).

How we see it

Where a vesting condition, other than a market condition, is modified in a manner that is beneficial to the employee, the modified vesting condition is taken into account when applying the general requirements of IFRS 2, and the entity would continuously estimate the number of awards likely to vest and/or the vesting period.

The difference between the accounting consequences for different methods of enhancing an award could cause confusion in some cases. For example, it may sometimes not be clear whether an award has been modified by increasing the number of equity instruments or by lowering the performance targets, as demonstrated in Illustration 7-4.

Illustration 7-4: Increase in number of equity instruments or modification of vesting conditions?

An entity grants a performance-related award which provides for different numbers of options to vest after 3 years, depending on different performance targets as follows:

Profit growth	Number of options
5%-10%	100
10%-15%	200
over 15%	300

During the vesting period, the entity concludes that the criteria are too demanding and modifies them as follows:

Profit growth	Number of options
5%-10%	200
over 10%	300

This raises the issue of whether the entity has changed:

(a) The performance conditions for the vesting of 200 or 300 options.

Or

(b) The number of equity instruments awarded for achieving growth of 5%-10% or growth of over 10%.

In our view, the reality is that the change is to the performance conditions for the vesting of 200 or 300 options, and must therefore be dealt with as in section 7.3.1.C, rather than in section 7.3.1.B, above.

Suppose, however, that the conditions had been modified as follows:

Profit growth	Number of options
5%-10%	200
10%-15%	300
over 15%	400

In that case, there has clearly been an increase in the number of equity instruments subject to an award for a growth increase of over 15%, which would have to be accounted for as such (i.e., under section 7.3.1.B, rather than section 7.3.1.C, above). In such a case, it seems more appropriate also to deal with the changes to the lower bands as changes to the number of shares awarded rather than as changes to the performance conditions.

How we see it

The removal of the 'over 15%' performance condition is seen as a change in performance condition, whereas the increase in options for each profit growth target is seen as an increase in the number of equity instruments granted.

7.3.2 Modifications that decrease the value of an award

This type of modification does not occur very often, as the effect would be somewhat demotivating and, in some cases, contrary to local labour regulations. However, there have been occasional examples of an award being made more onerous - usually in response to criticism by shareholders that the original terms were insufficiently demanding.

The general requirement of IFRS 2 (as outlined in section 7.3 above) is that, where an award is made more onerous (and therefore less valuable), the financial statements must still recognise the cost of the original award. This rule is in part an anti-avoidance measure since, without it, an entity could reverse the cost of an out-of-the-money award by modifying it so that it was unlikely to vest (for example, by adding unattainable non-market performance conditions) rather than cancelling the award and triggering an acceleration of expense as in section 7.1 above.

7.3.2.A Decrease in fair value of equity instruments granted

If the modification decreases the fair value of the equity instruments granted (e.g., by increasing the exercise price or reducing the exercise period), the decrease in value is effectively ignored and the entity continues to recognise a cost for services as if the awards had not been modified. [IFRS 2.B44(a)]. This approach also applies to reductions in the fair value of an award by the addition of a market condition or by making an existing market condition more onerous. [IFRS 2.B44(a), IFRS 2.B44(c)].

How we see it

IFRS 2 notes the approach to apply to modifications of awards for market conditions that are not beneficial to employees (e.g., the decrease in fair value is effectively ignored) but has no specific guidance on how the above approach applies to non-vesting conditions. We assume that reductions in the fair value resulting from the addition or amendment of a non-vesting condition are similarly ignored.

Illustration 7-5 demonstrates the accounting for an award that is modified by replacing a non-market performance condition with a market condition:

Illustration 7-5: Award modified by replacing a non-market performance condition with a market condition

At the beginning of year 1, an entity grants 1,000 share options to each of its 10 employees, with exercise conditional upon the employee remaining in the entity's employment for three years, and an earnings per share (EPS) target (non-market performance condition) being met over the three-year period. The fair value of the share options is CU15 per option at the date of grant.

At the end of year 1, the entity estimates that all the employees will remain in service until the end of year 3 and that the EPS target will be met. It therefore records a cost of CU50,000 for the award in year 1 ($\text{CU15} \times 10 \text{ employees} \times 1,000 \text{ options} \times 1/3$).

During year 2, the entity reassesses the arrangement and replaces the EPS target with a share price target (market condition) that must be achieved by the end of year 3. At the date of modification, the fair value of the option with the market condition is CU12 and the fair value of the original option is CU17. Therefore, the fair value of the awards has decreased as a result of the modification but, under IFRS 2, this decrease is not accounted for and the entity must continue to use the original grant date fair value. An expense must be recognised based on this grant date fair value unless the award does not vest due to failure to meet a service or non-market performance condition specified at the original grant date. At the original grant date, the conditions were a service condition and a non-market performance condition. With the removal of the non-market performance condition, the only condition that has been in place since grant date is the service condition.

At the end of year 2 the entity estimates that nine employees will fulfil the service condition by the end of year 3. It therefore records a cumulative expense in year 2 of CU90,000 ($\text{CU15} \times 9 \text{ employees} \times 1,000 \text{ options} \times 2/3$) and an expense for the year of CU40,000 ($\text{CU90,000} - \text{CU50,000}$).

At the end of year 3 the share price target has not been met but eight employees have met the service condition. The entity therefore recognises a cumulative expense of CU120,000 ($\text{CU15} \times 8 \text{ employees} \times 1,000 \text{ options}$) and an expense for the year of CU30,000 ($\text{CU120,000} - \text{CU90,000}$).

It can be seen that the only expense reversal relates to those employees who have forfeited their options by failing to fulfil the employment condition. There is no reversal of expense for those employees who met the service condition but whose options did not vest (in real terms) because the market condition was not met. In IFRS 2 terms the options of those eight employees vested because all non-market conditions were met and so the entity has to recognise the grant date fair value for those awards. This is the case even though the original grant date fair value did not take account of the effect of the market condition (unlike an award with a market condition specified from grant date). This outcome is the result of the different treatment of market and non-market vesting conditions under IFRS 2 and the requirement to recognise an expense for an award with a market condition provided all other conditions have been met (see further discussion in section 6.3.2 above).

7.3.2.B Decrease in number of equity instruments granted

If the modification reduces the number of equity instruments granted, IFRS 2 requires the reduction to be treated as a cancellation of that portion of the award (see section 7.4 below). [IFRS 2.B44(b)]. Essentially this has the effect that any previously unrecognised cost of the cancelled instruments is immediately recognised in full, whereas the cost of an award whose value is reduced by other means continues to be spread in full over the remaining vesting period.

In situations where a decrease in the number of equity instruments is combined with other modifications so that the total fair value of the award remains the same or increases, it is unclear whether IFRS 2 requires an approach based on the value of the award as a whole or, as in the previous paragraph, one based on each equity instrument as the unit of account. This is considered further in section 7.3.4 below.

7.3.2.C Additional or more onerous non-market vesting conditions

Where a non-market vesting condition is modified in a manner that is not beneficial to the employee, again it is ignored and a cost recognised as if the original award had not been modified, as shown by Illustration 7-6 (which is based on IG Example 8 in the implementation guidance to IFRS 2). [IFRS 2.B44(c), IFRS 2.IG15, IFRS 2.IG Example 8].

Illustration 7-6: Award modified by changing non-market performance conditions or service conditions

At the beginning of year 1, the entity grants 1,000 share options to each member of its sales team, conditional upon the employee remaining in the entity's employment for three years, and the team selling more than 50,000 units of a particular product over the three-year period. The fair value of the share options is CU15 per option at the date of grant. During year 2, the entity believes that the sales target is insufficiently demanding and increases it to 100,000 units. By the end of year 3, the entity has sold 55,000 units, and the modified share options are forfeited. Twelve members of the sales team have remained in service for the three-year period.

On the basis that the original target would have been met, and twelve employees would have been eligible for awards, the entity would recognise a total cost of CU180,000 (12 employees × 1,000 options × CU15) in accordance with the minimum cost requirements of IFRS 2.27. The cumulative cost in years 1 and 2 would, as in the Illustrations above, reflect the entity's best estimate of the original 50,000 unit sales target being achieved at the end of year 3. If, conversely, sales of only 49,000 units had been achieved, any cost booked for the award in years 1 and 2 would have been reversed in year 3, since the original target of 50,000 units would not have been met.

It is noted in IG Example 8 that the same accounting result would have occurred if the entity had increased the service requirement rather than modifying the performance target. Because such a modification would make it less likely that the options would vest, which would not be beneficial to the employees, the entity would take no account of the modified service condition when recognising the services received. Instead, it would recognise the services received from the twelve employees who remained in service for the original three-year vesting period. Other modifications to vesting periods are discussed below.

7.3.3 Modifications with altered vesting period

As noted in section 7.3.1 above, where an award is modified so that its value increases, IFRS 2 requires the entity to continue to recognise an expense for the grant date fair value of the unmodified award over its original vesting period, even where the vesting period of the modified award is longer. This appears to have the effect that an expense may need to be recognised for awards that do not actually vest, as demonstrated by Illustration 7-7 (which is based on Illustration 7-2 above).

Illustration 7-7: Award modified by reducing the exercise price and extending the vesting period

At the beginning of year 1, an entity grants 100 share options to each of its 500 employees, with vesting conditional upon the employee remaining in service over the next three years. The entity estimates that the fair value of each option is CU15.

By the end of year 1, the entity's share price has dropped, and the entity reprices its share options. The repriced share options vest at the end of year 4. The entity estimates that, at the date of repricing, the fair value of each of the original share options granted (i.e., before taking into account the repricing) is CU5 and that the fair value of each repriced share option is CU7.

40 employees leave during year 1. The entity estimates that a further 70 employees will leave during years 2 and 3, and a further 25 employees during year 4, such that there will be 390 employees at the end of year 3 ($500 - 40 - 70$) and 365 ($500 - 40 - 70 - 25$) at the end of year 4.

During year 2, a further 35 employees leave, and the entity estimates that a further 30 employees will leave during year 3 and 30 more in year 4, such that there will be 395 employees at the end of year 3 ($500 - 40 - 35$) and 365 ($500 - 40 - 35 - 30 - 30$) at the end of year 4.

During year 3, 28 employees leave, and hence a total of 103 employees ceased employment during the original three-year vesting period, so that, for the remaining 397 employees, the original share options would have vested at the end of year 3. The entity now estimates that only a further 20 employees will leave during year 4, leaving 377 at the end of year 4. In fact, 25 employees leave, so that 372 satisfy the criteria for the modified options at the end of year 4.

In our view IFRS 2 requires the entity to recognise:

- The cost of the original award at grant date (CU15 per option) over a three-year vesting period beginning at the start of year 1, based on the ongoing best estimate of, and ultimately the actual, number of employees at the end of the original three-year vesting period.
- The incremental fair value of the repriced options at repricing date (CU2 per option, being the CU7 fair value of each repriced option less the CU5 fair value of the original option) over a three-year vesting period beginning at the date of repricing (end of year one), but based on the ongoing best estimate of, and ultimately the actual, number of employees at the end of the modified four-year vesting period.

This would be calculated as follows:

Year	Calculation of cumulative expense		Cumulative expense (CU)	Expense for period (CU)
	Original award	Modified award		
1	390 employees × 100 options × CU15 × 1/3		195,000	195,000
2	395 employees × 100 options × CU15 × 2/3	365 employees × 100 options × CU2 × 1/3	419,333	224,333
3	397 employees × 100 options × CU15	377 employees × 100 options × CU2 × 2/3	645,767	226,434
4	397 employees × 100 options × CU15	372 employees × 100 options × CU2	669,900	24,133

How we see it

It may seem strange that a cost is being recognised for the original award in respect of the 25 employees who leave during year 4, who are never entitled to anything. However, in our view, this is consistent with:

- The overall requirement of IFRS 2 that the minimum cost of a modified award is the cost that would have been recognised if the award had not been modified.
- IG Example 8 in IFRS 2 (the substance of which is reproduced in Illustration 7-6 above) where an expense is clearly required to be recognised to the extent that the original performance conditions would have been met if the award had not been modified.

As noted in Illustrations 7-6 and 7-7 above, the rule in IFRS 2 requiring recognition of a minimum expense for a modified award (i.e., as if the original award had remained in place) applies irrespective of whether the effect of the modification is that an award becomes less valuable to the employee (as in Illustration 7-6) or more valuable to the employee (as in Illustration 7-7).

Where a modified vesting period is shorter than the original vesting period, a question arises on when all of the expense relating to both the original and modified elements of the award must be recognised.

How we see it

In our view, the expense is recognised by the end of the modified vesting period as no services will be rendered beyond that point. In this type of modification - as distinct from a change of estimate where there is a variable vesting period (see section 6.2.3 above) - we believe that an entity has an accounting policy choice between retrospective and prospective adjustment of the vesting period as at the modification date.

The overall expense recognised between grant date and vesting date will be the same in both cases, but there will be timing differences in the recognition of the expense, with retrospective accounting resulting in a higher expense as at the modification date itself.

7.3.4 Modifications that reduce the number of equity instruments granted but maintain or increase the value of an award ('value for value' exchanges and 'give and take' modifications)

As discussed in section 7.3.2.B above, cancellation accounting has to be applied to a reduction in the number of equity instruments when a modification reduces both the number of equity instruments granted and the total fair value of the award. [IFRS 2.B44(b)]. This approach is consistent with the fact that part of the award has been removed without compensation to the employee. However, a modification of this kind is rarely seen in practice because of the demotivating effect and, in some jurisdictions, a requirement to pay compensation to the counterparty. An entity is more likely to modify an award so that the overall fair value remains the same, or increases, even if the number of equity instruments is reduced. These types of modification, sometimes known as 'value for value' exchanges or 'give and take' modifications, are considered below.

Where an entity reduces the number of equity instruments but also makes other changes so that the total fair value of the modified award remains the same as, or exceeds, that of the original award as at the modification date, it is unclear whether the unit of account for accounting purposes must be an individual equity instrument or the award as a whole. Illustrations 7-8 and 7-9 below demonstrate the two situations and the two approaches.

Illustration 7-8: Modification where number of equity instruments is reduced but total fair value of award is unchanged

At the beginning of year 1, an entity granted an employee 200 share options with a grant date fair value of CU9 and a vesting period of three years. During years 1 and 2, the entity recognises a cumulative expense of CU1,200 ($200 \times \text{CU}9 \times 2/3$). At the end of year 2 the exercise price of the options is significantly higher than the market price and the options have a fair value of CU5 per option. On this date, the entity modifies the award and exchanges the 200 underwater options for 100 'at the money' options with a fair value of CU10 each. The total fair value of the new awards of CU1,000 ($100 \times \text{CU}10$) equals the total fair value of the awards exchanged ($200 \times \text{CU}5$), as measured at the modification date.

View 1 is that the unit of account is an individual option. Taking this approach, the decrease in the number of options from 200 to 100 will be accounted for as a cancellation with an acceleration at the modification date of any unexpensed element of the grant date fair value of 100 options (i.e., recognition of an additional amount of CU300 ($100 \times \text{CU}9 \times 1/3$)). The grant date fair value of the remaining 100 options continues to be recognised over the remainder of the vesting period together with their incremental fair value following the modification. Therefore, in year 3, there would be an expense of CU300 (for the remaining grant date fair value) plus CU500 ($100 \times (\text{CU}10 - \text{CU}5)$) for the incremental fair value of 100 options. In total, therefore, an expense of CU2,300 is recognised.

View 2 is that the total number of options exchanged is the more appropriate unit of account. In this case, the cancellation of the original options and the grant of replacement options are accounted for as one modification. There would therefore be no acceleration of expense in respect of the reduction in the number of options from 200 to 100 and the grant date fair value of the original award would continue to be recognised over the vesting period. In this case, the total expense recognised would be CU1,800 ($200 \times \text{CU}9$).

Illustration 7-9: Modification where number of equity instruments is reduced but total fair value of award is increased

At the beginning of year 1, an entity granted to its employees 1,000 share options with an exercise price equal to the market price of the shares at grant date. There is a two-year vesting period and the grant date fair value is CU10 per option. The entity's share price has declined significantly so that the share price is currently significantly less than the exercise price. At the end of year 1, the entity decides to reduce the exercise price of the options and, as part of the modification, it also reduces the number of options from 1,000 to 800. At the date of modification, the fair value of the original options is CU7 per option and that of the modified options CU11 per option.

View 1 is that the unit of account is an individual option. Taking this approach, the decrease in the number of options from 1,000 to 800 will be accounted for as a cancellation of 200 options with an acceleration at the modification date of any remaining grant date fair value relating to those 200 options. The total expense recognised in year 1 is CU6,000 $((800 \times \text{CU}10 \times \frac{1}{2}) + (200 \times \text{CU}10))$. The grant date fair value of the remaining 800 options continues to be recognised over the remainder of the vesting period together with the incremental fair value of those options as measured at the modification date. In total the entity will recognise an expense of CU13,200 (original grant date fair value of CU10,000 $(1,000 \times \text{CU}10)$ plus incremental fair value of CU3,200 $(800 \times \text{CU}(11 - 7))$).

View 2 is that the unit of account is the total number of options as there are linked modifications forming one package. In this case, the incremental fair value is calculated as the difference between the total fair value before and after the modification. In total the entity will recognise an expense of CU11,800 (original grant date fair value of CU10,000 $(1,000 \times \text{CU}10)$ plus incremental fair value on modification of CU1,800 $((800 \times \text{CU}11) - (1,000 \times \text{CU}7))$).

In both Examples above, the first view is based on IFRS 2.B44(b) which states that "if the modification reduces the number of equity instruments granted to an employee, that reduction shall be accounted for as a cancellation of that portion of the grant, in accordance with the requirements of paragraph 28". This is perhaps further supported by IFRS 2.B43(a) which, in providing guidance on accounting for a modification that increases the fair value of an equity instrument, appears only to refer to individual equity instruments when it states that 'the incremental fair value granted' in a modification is "the difference between the fair value of the modified equity instrument and that of the original equity instrument, both estimated as at the date of modification". [IFRS 2.B43, IFRS 2.B44].

The second view is based on the overriding requirement in IFRS 2.27 for the grant date fair value of the equity instruments to be recognised unless the awards do not vest due to a failure to meet a vesting condition (other than a market condition) that was specified at grant date. This requirement is applicable even if the award is modified after the grant date. The same paragraph also requires an entity to recognise the effect of modifications "that increase the total fair value of the share-based payment arrangement or are otherwise beneficial to the employee". This reference to 'total fair value' supports the view that the total award is the unit of account and is reiterated in IFRS 2.B42 and B44 which provide guidance, respectively, for situations where the total fair value decreases or increases as a consequence of the modification of an award. Supporters of view 2 further consider that, in contrast to the cancellation accounting approach that is required in the very specific case where part of the award is, in effect, settled for no consideration (see section 7.3.2.B above), a modification that reduces the number of equity instruments but maintains or increases the overall fair value of the award clearly provides the counterparty with a benefit. As a consequence, it is considered that no element of the grant date fair value is required to be accelerated as a cancellation expense. [IFRS 2.27, IFRS 2.B42, IFRS 2.B44].

How we see it

Given the lack of clarity in IFRS 2, we believe that an entity could make an accounting policy choice as to whether it considers the unit of account to be an individual equity instrument or an award as a whole. However, once made, that accounting policy choice is applied consistently to all modifications that reduce the number of equity instruments but maintain or increase the overall fair value of an award. Whichever policy is chosen, the general requirements of IFRS 2 will still need to be applied in order to determine whether or not the amendments to the arrangement are such that it is appropriate to treat the changes as a modification (in IFRS 2 terms) rather than as a completely new award (see sections 7.4.2 and 7.4.4 below).

7.3.5 Modification of award from equity-settled to cash-settled (and vice versa)

Occasionally an award that was equity-settled when originally granted is modified so as to become cash-settled, or an originally cash-settled award is modified so as to become equity-settled. Such modifications are discussed in section 9.4 below.

7.4 Cancellation and settlement

Where an award is cancelled or settled (i.e., cancelled with some form of compensation), other than by forfeiture for failure to satisfy the vesting conditions:

- (a) If the cancellation or settlement occurs during the vesting period, it is treated as an acceleration of vesting, and the entity recognises immediately the amount that would otherwise have been recognised for services received over the remainder of the vesting period.
- (b) Where the entity pays compensation for a cancelled award:
 - (i) Any compensation paid up to the fair value of the award at cancellation or settlement date (whether before or after vesting) is accounted for as a deduction from equity, as being equivalent to the redemption of an equity instrument.
 - (ii) Any compensation paid in excess of the fair value of the award at cancellation or settlement date (whether before or after vesting) is accounted for as an expense in profit or loss.
 - (iii) If the share-based payment arrangement includes liability components, the fair value of the liability is remeasured at the date of cancellation or settlement. Any payment made to settle the liability component is accounted for as an extinguishment of the liability.
- (c) If the entity grants new equity instruments during the vesting period and, on the date that they are granted, identifies them as replacing the cancelled or settled instruments, the entity is required to account for the new equity instruments as if they were a modification of the cancelled or settled award. Otherwise, it accounts for the new instruments as an entirely new award. [IFRS 2.28, IFRS 2.29].

The treatment of the cancelled or settled award in (a) above is similar, in its effect on profit or loss, to the result that would have occurred if:

- The fair value of the equity instruments issued had been recorded in full at grant date with a corresponding debit to a prepayment for 'services to be rendered'
- The prepayment were written off on a periodic basis until cancellation or settlement
- Any remaining prepayment at the date of cancellation or settlement were written off in full

It should be noted that the calculation of any additional expense in (b) above depends on the fair value of the award at the date of cancellation or settlement, not on the cumulative expense already charged. This has the important practical consequence that, when an entity pays compensation on cancellation or settlement of an award, it must obtain a fair value for the original award, updated to the date of cancellation or settlement. If the award had not been cancelled or settled, there would have been no need to obtain a valuation for the original award after the date of grant.

These requirements raise some further detailed issues of interpretation on a number of areas, as follows:

- The distinction between 'cancellation' and 'forfeiture' (see section 7.4.1 below)
- The distinction between 'cancellation' and 'modification' (see section 7.4.2 below)
- The calculation of the expense on cancellation (see section 7.4.3 below)
- Replacement awards (see sections 7.4.4 and 7.5 below)

7.4.1 Distinction between cancellation and forfeiture

The provisions of IFRS 2 summarised in section 7.4 above apply when an award of equity instruments is cancelled or settled "...other than a grant cancelled by forfeiture when the vesting conditions are not satisfied". [IFRS 2.28]. The significance of this is that the terms of many share-based awards provide that they are, or can be, 'cancelled', in a legal sense, on forfeiture. IFRS 2 is clarifying that, where an award is forfeited (within the meaning of that term in IFRS 2 see section 6.1.2 above), the entity must apply the accounting treatment for a forfeiture (i.e., reversal of expense previously recognised), even if the award is legally cancelled as a consequence of the forfeiture.

7.4.1.A Termination of employment by entity

Based on the guidance in IFRS 2.28 referred to in section 7.4.1 above, it might not always be immediately clear whether cancellation or forfeiture has occurred, particularly where options lapse as the result of a termination of employment by the entity. For example, an entity might grant options to an employee at the beginning of year 1 on condition of his remaining in employment until at least the end of year 3. During year 2, however, economic conditions require the entity to make a number of its personnel, including that employee, redundant, as a result of which his options lapse. Is this lapse a forfeiture or a cancellation for the purposes of IFRS 2?

The uncertainty arises because it could be argued either that the employee will be unable to deliver the services required in order for the options to vest (suggesting a forfeiture) or that the options lapse as a direct result of the employer's actions (suggesting a cancellation).

The IASB addressed this question by amending the definition of 'service condition' in IFRS 2 (see section 3.1 above). The definition includes the following guidance:

"... If the counterparty, regardless of the reason, ceases to provide service during the vesting period, it has failed to satisfy the condition. ..." [IFRS 2 Appendix A].

Therefore, IFRS 2 requires the failure to satisfy a service condition as the result of any termination of employment to be accounted for as a forfeiture rather than as a cancellation.

7.4.1.B Surrender of award by employee

It is sometimes the case that an employee, often a member of senior management, will decide - or be encouraged by the entity - to surrender awards during the vesting period. The question arises as to whether the surrendered awards are to be treated as a cancellation or forfeiture for accounting purposes. IFRS 2 allows forfeiture accounting, and the consequent reversal of any cumulative expense, only in situations where vesting conditions are not satisfied. A situation where the counterparty voluntarily surrenders an award, and therefore the opportunity to meet the vesting conditions, is a decision within the control of the counterparty rather than a failure to satisfy a vesting condition and must be accounted for as a cancellation rather than as a forfeiture.

How we see it

In its amendment of IFRS 2 (as discussed in section 7.4.1.A above), we do not believe that the IASB's intention was to allow an employee to 'fail' to meet a service condition by voluntarily surrendering an award. Such an action therefore continues to be treated as a cancellation rather than as a forfeiture.

7.4.2 Distinction between cancellation and modification

One general issue raised by IFRS 2 is where the boundary lies between 'modification' of an award in the entity's favour and outright cancellation of the award. As a matter of legal form, the difference is obvious. However, if an entity were to modify an award in such a way that there was no realistic chance of it ever vesting (for example, by introducing a requirement that the share price increase 1,000,000 times by vesting date), some might argue that this amounts to a *de facto* cancellation of the award. The significance of the distinction is that, whereas the cost of a 'modified' award continues to be recognised on a periodic basis over the vesting period (see section 7.3 above), the remaining cost of a cancelled award is recognised immediately.

7.4.3 Calculation of the expense on cancellation

The basic accounting treatment for a cancellation and settlement is demonstrated in Illustration 7-10 below.

Illustration 7-10: Cancellation and settlement - basic accounting treatment

At the start of year 1 an entity grants an executive 30,000 options on condition that she remain in employment for three years. Each option is determined to have a fair value of CU10.

At the end of year 1, the executive is still in employment and the entity charges an IFRS 2 expense of CU100,000 ($30,000 \times \text{CU}10 \times 1/3$). At the end of year 2, the executive is still in employment. However, the entity's share price has suffered a decline which the entity does not expect to have reversed by the end of year 3, such that the options, while still 'in the money' now have a fair value of only CU6. Moreover, the entity is under pressure from major shareholders to end option schemes with no performance criteria other than continuing employment.

Accordingly, the entity cancels the options at the end of year 2 and in compensation pays the executive CU6.50 per option cancelled, a total payment of CU195,000 ($30,000 \text{ options} \times \text{CU}6.50$).

IFRS 2 first requires the entity to record a cost as if the options had vested immediately. The total cumulative cost for the award must be CU300,000 ($30,000 \text{ options} \times \text{CU}10$). CU100,000 was recognised in year 1, so that an additional cost of CU200,000 is recognised.

As regards the compensation payment, the fair value of the awards cancelled is CU180,000 ($30,000 \text{ options} \times \text{CU}6.00$). Accordingly, CU180,000 of the payment is accounted for as a deduction from equity, with the remaining payment in excess of fair value, CU15,000, charged to profit or loss.

The net effect of this is that an award that ultimately results in a cash payment to the executive of only CU195,000 (i.e., CU6.50 per option) has resulted in a total charge to profit or loss of CU315,000 (i.e., CU10.50 per option, representing CU10 grant date fair value + CU6.50 compensation payment - CU6.00 cancellation date fair value).

Illustration 7-10 demonstrates the basic calculation of the cancellation 'charge' required by IFRS 2. In more complex situations, however, the amount of the 'charge' may not be so clear-cut, due to an ambiguity in the drafting of IFRS 2.28(a), which reads as follows:

"the entity shall account for the cancellation or settlement as an acceleration of vesting, and shall therefore recognise immediately the amount that would otherwise have been recognised for services received over the remainder of the vesting period." [IFRS 2.28(a)].

There is something of a contradiction within this requirement as demonstrated by Illustration 7-11.

Illustration 7-11: Cancellation and settlement - best estimate of cancellation expense

At the beginning of year 1, entity A granted 150 employees an award of free shares, with a grant date fair value of CU5, conditional upon continuous service and performance targets over a 3-year period from grant date. The number of shares awarded varies according to the extent to which targets (all non-market vesting conditions) have been met, and could result in each employee still in service at the end of year 3 receiving a minimum of 600, and a maximum of 1,000 shares.

Halfway through year 2 (i.e., 18 months after grant date), A is acquired by B, following which A cancels all of its share awards. At the time of the cancellation, 130 of the original 150 employees were still in employment. At that time, it was A's best estimate that, had the award run to its full term, 120 employees would have received 900 shares each. Accordingly, the cumulative expense recognised by A for the award as at the date of takeover would, under the normal estimation processes of IFRS 2 discussed in sections 6.1 to 6.4 above, be CU270,000 ($900 \text{ shares} \times 120 \text{ employees} \times \text{CU}5 \times 18/36$).

How must A account for the cancellation of this award?

The opening phrase of IFRS 2.28(a) - "the entity shall account for the cancellation ... as an acceleration of vesting" - suggests that A must recognise a cost for all 130 employees in service at the date of cancellation. However, the following phrase - "[the entity] shall therefore recognise immediately the amount that would otherwise have been recognised for services received over the remainder of the vesting period" - suggests that the charge must be based on only 120 employees, the best estimate, as at the date of cancellation of the number of employees in whom shares will finally vest.

How we see it

In our view, either reading of IFRS 2.28(a) is possible. Recognise the cancellation cost, either based on the employees in service at the date of cancellation or based on the best estimate of the number of employees at the date of cancellation to whom the shares would vest.

There is then the issue of the number of shares per employee that is required to be taken into account in the cancellation charge. Is this the 1,000 shares per employee (the maximum number that could vest) or 900 shares per employee (the number expected by the entity at the date of cancellation actually to vest)?

How we see it

In our view, it is unclear from the standard whether the intention was that the cancellation charge is to be based on the number of shares considered likely, as at the date of cancellation, to vest for each employee (900 shares in this example) or whether it be based on the maximum number of shares (1,000 shares in this example). Given the lack of clarity, in our view an entity has to make an accounting policy choice.

In extreme cases, the entity's best estimate, as at the date of cancellation, might be that no awards are likely to vest. In this situation, no cancellation expense would be recognised. However, there would need to be evidence that this was not just a rather convenient assessment made as at the date of cancellation. Typically, the previous accounting periods would also have reflected a cumulative IFRS 2 expense of zero on the assumption that the awards would never vest.

An effect of these requirements is that IFRS 2 creates an accounting arbitrage between an award that is 'out of the money' but not cancelled (the cost of which continues to be spread over the remaining period to vesting) and one which is formally cancelled (the cost of which is recognised immediately). Entities might well prefer to opt for cancellation so as to create a 'one-off' charge to earnings rather than continue to show, particularly during difficult trading periods, significant periodic costs for options that no longer have any real value. However, such early cancellation of an award precludes any chance of the cost of the award being reversed through forfeiture during, or at the end of, the vesting period if the original vesting conditions are not met.

7.4.4 Replacement awards

The required accounting treatment of replacement awards, whilst generally clear, nevertheless raises some issues of interpretation. Most of this sub-section addresses the replacement of unvested awards but the treatment of vested awards is addressed in section 7.4.4.C below.

As set out in section 7.4 above, a new award that meets the criteria in IFRS 2.28(c) to be treated as a replacement of a cancelled or settled award is accounted for as a modification of the original award and any incremental value arising from the granting of the replacement award is recognised over the vesting period of that replacement award. Where the criteria are not met, the new equity instruments are accounted for as a new grant (in addition to accounting for the cancellation or settlement of the original arrangement). The requirements are discussed in more detail below.

7.4.4.A Designation of award as replacement award

Whether or not an award is a 'replacement' award (and therefore recognised at only its incremental, rather than its full, fair value) is determined by whether or not the entity designates it as such on the date that it is granted. In other words, the accounting treatment effectively hinges on declared management intent, notwithstanding the IASB's systematic exclusion of management intent from many other areas of financial reporting. The Basis for Conclusions does not really explain the reason for this approach, which is also hard to reconcile with the fact that the value of an award is unaffected by whether, or when, the entity declares it to be a 'replacement' award for the purposes of IFRS 2. Presumably, the underlying reason is to prevent a retrospective, and possibly opportunistic, assertion that an award that has been in issue for some time is a replacement for an earlier award.

Entities need to ensure that designation occurs on grant date as defined by IFRS 2 (see section 5.3 above). For example, if an entity cancels an award on 15 March and notifies an employee in writing on the same day of its intention to ask the remuneration committee to grant replacement options at its meeting two months later, on 15 May, such notification (although formal and in writing) may not strictly meet IFRS 2's requirement for designation on grant date (i.e., 15 May).

How we see it

In our view, what is important is that the entity establishes a clear link between the cancellation of the old award and the granting of a replacement award even if there is later formal approval of the replacement award following the communication of its terms to the counterparty at the same time as the cancellation of the old award.

As drafted, IFRS 2 gives entities an apparently free choice to designate any newly granted awards as replacement awards. In our view, however, such designation cannot credibly be made unless there is evidence of some connection between the cancelled and replacement awards. This might be that the cancelled and replacement awards involve the same counterparties, or that the cancellation and replacement are part of the same arrangement.

7.4.4.B Incremental fair value of replacement award

Where an award is designated as a replacement award, any incremental fair value must be recognised over the vesting period of the replacement award. The incremental fair value is the difference between the fair value of the replacement award and the 'net fair value' of the cancelled or settled award, both measured at the date on which the replacement award is granted. The net fair value of the cancelled or settled award is the fair value of the award, immediately before cancellation, less any compensation payment that is accounted for as a deduction from equity. [IFRS 2.28(c)]. Thus the 'net fair value' of the original award can never be less than zero (since any compensation payment in excess of the fair value of the cancelled award would be accounted for in profit or loss, not in equity - see Illustration 7-10 in section 7.4.3 above).

There is some confusion within IFRS 2 as to whether a different accounting treatment is intended to result from, on the one hand, modifying an award and, on the other hand, cancelling it and replacing it with a new award on the same terms as the modified award. This is explored in the discussion of Illustration 7-12 below, which is based on the same fact pattern as Illustration 7-2 in section 7.3.1.A above.

Illustration 7-12: Replacement awards - is there an accounting arbitrage between accounting for a modification and accounting for cancellation and a new grant?

At the beginning of year 1, an entity grants 100 share options to each of its 500 employees. Each grant is conditional upon the employee remaining in service over the next three years. The entity estimates that the fair value of each option is CU15.

By the end of year 1, the entity's share price has dropped. The entity cancels the existing options and issues options which it identifies as replacement options, which also vest at the end of year 3. The entity estimates that, at the date of cancellation, the fair value of each of the original share options granted is CU5 and that the fair value of each replacement share option is CU8.

40 employees leave during year 1. The entity estimates that a further 70 employees will leave during years 2 and 3, so that there will be 390 employees at the end of year 3 ($500 - 40 - 70$).

During year 2, a further 35 employees leave, and the entity estimates that a further 30 employees will leave during year 3, so that there will be 395 employees at the end of year 3 ($500 - 40 - 35 - 30$).

During year 3, 28 employees leave, and hence a total of 103 employees ceased employment during the original three-year vesting period, so that, for the remaining 397 employees, the replacement share options vest at the end of year 3.

The intention of the IASB appears to have been that the arrangement should be accounted for in exactly the same way as the modification in Illustration 7-2 above, since the Basis for Conclusions on IFRS 2 notes:

"...the Board saw no difference between a repricing of share options and a cancellation of share options followed by the granting of replacement share options at a lower exercise price, and therefore concluded that the accounting treatment should be the same." [IFRS 2.BC233].

However, it is not clear that this intention is actually reflected in the drafting of IFRS 2.28 which reads as follows:

"If a grant of equity instruments is cancelled or settled during the vesting period (other than a grant cancelled by forfeiture when the vesting conditions are not satisfied):

"(a) the entity shall account for the cancellation or settlement as an acceleration of vesting, and shall therefore recognise immediately the amount that otherwise would have been recognised for services received over the remainder of the vesting period.

"(b) any payment made to the employee on the cancellation or settlement of the grant shall be accounted for as the repurchase of an equity interest, i.e. as a deduction from equity, except to the extent that the payment exceeds the fair value of the equity instruments granted, measured at the repurchase date. Any such excess shall be recognised as an expense. ...

“(c) if new equity instruments are granted to the employee and, on the date when those new equity instruments are granted, the entity identifies the new equity instruments granted as replacement equity instruments for the cancelled equity instruments, the entity shall account for the granting of replacement equity instruments in the same way as a modification of the original grant of equity instruments, in accordance with paragraph 27 and the guidance in Appendix B...” [IFRS 2.28].

As a matter of natural construction, paragraph (a) requires the cancellation of the existing award to be treated as an acceleration of vesting - explicitly and without qualification. In particular there is no rider to the effect that the requirement of paragraph (a) is to be read as ‘subject to paragraph (c) below’.

Paragraph (c) requires any ‘new equity instruments’ granted to be accounted for in the same way as a modification of the original grant of equity instruments. It does not require this treatment for the cancellation of the original instruments, because this has already been addressed in paragraph (a).

Moreover, in order to construe paragraphs (a) and (c) in a manner consistent with the Basis for Conclusions on the standard, it would be necessary to read paragraph (c) as effectively superseding paragraph (a). However, for this to be a valid reading, it would also be necessary to read paragraph (b) as also superseding paragraph (a), and this would produce a manifestly incorrect result, namely that, if an award is cancelled and settled, there is no need ever to expense any part of the cancelled award not yet expensed at the date of cancellation.

The application of, firstly, the main text of IFRS 2 and, secondly, the Basis for Conclusions on IFRS 2 to the entity in Illustration 7-12 is set out below.

The main text in IFRS 2 appears to require the entity to recognise:

- The entire cost of the original options at the end of year 1 (since cancellation has the effect that they are treated as vesting at that date), based on the 390 employees expected at that date to be in employment at the end of the vesting period. This is not the only possible interpretation of the requirement of IFRS 2.28(a) - see below and the broader discussion in Illustration 7-11 in section 7.4.3 above.
- For the options replacing the 390 cancelled awards, the incremental fair value of the replacement options at repricing date (CU3 per option, being the CU8 fair value of each replacement option less the CU5 fair value of each cancelled option) over a two year vesting period beginning at the date of cancellation (end of year 1), based on the (at first estimated and then actual) number of employees at the end of year 3 (i.e., the final number could be less than the estimate of 390).
- For any additional replacement options (i.e., replacement options awarded in excess of the 390×100 options that were expected to vest at cancellation date), the full incremental fair value at repricing date (being the CU8 fair value of each replacement option) over a two-year vesting period beginning at the repricing date (end of year 1). The expense is based on the (at first estimated and then actual) number of employees in excess of 390 at the end of year 3.

This would be calculated as follows:

Year	Calculation of cumulative expense		Cumulative expense (CU)	Expense for period (CU)
	Original award	Replacement award		
1	390 employees \times 100 options \times CU15	-	585,000	585,000
2	390 employees \times 100 options \times CU15	390 employees \times 100 options \times CU3 \times 1/2 5 employees \times 100 options \times CU8 \times 1/2	645,500	60,500
3	390 employees \times 100 options \times CU15	390 employees \times 100 options \times CU3 7 employees \times 100 options \times CU8	707,600	62,100

By contrast, the accounting treatment implied by the Basis for Conclusions is as follows (see Illustration 7-2 above):

Year	Calculation of cumulative expense		Cumulative expense (CU)	Expense for period (CU)
	Original award (a)	Modified award (b)	(a+b)	
1	390 employees × 100 options × CU15 × 1/3	-	195,000	195,000
2	395 employees × 100 options × CU15 × 2/3	395 employees × 100 options × CU3 × 1/2	454,250	259,250
3	397 employees × 100 options × CU15	397 employees × 100 options × CU3	714,600	260,350

It will be seen that both the periodic allocation of expense and the total expense differ under each interpretation. This is because, under the first interpretation, the cost of the original award is accelerated at the end of year 1 for all 390 employees expected at that date to be in employment at the end of the vesting period, whereas under the second interpretation a cost is recognised for the 397 employees whose awards finally vest. The difference between the two total charges of CU7,000 (CU714,600 - CU707,600) represents 397 - 390 = 7 employees @ CU1,000 [100 options × CU10[CU15 + CU3 - CU8]] each = CU7,000.

How we see it

We believe that either interpretation is valid, and an entity adopts one or the other consistently as a matter of accounting policy.

In Illustration 7-12 above, we base the cancellation calculations on 390 employees (the number expected to be employed at the end of the vesting period as estimated at the cancellation date) rather than on 460 employees (the number in employment at the cancellation date). As discussed in Illustration 7-11 in section 7.4.3 above, either approach may be adopted but the selected approach must be applied consistently.

The illustrative examples above involve a relatively straightforward fact pattern where, as at the date of cancellation and replacement, there was an amount to accelerate in respect of the cancelled awards and an incremental fair value associated with the replacement awards. In other scenarios, the two accounting outcomes might result in greater divergence. For example, if the cancelled awards were expected never to vest, because performance conditions had become unachievable and this had been the conclusion for some time (see section 7.4.3 above), the cancelled awards might have a value of zero on a cancellation basis and the full value of the replacement awards would be recognised. If modification accounting were applied, however, the entity would have to recognise the grant date fair value of the cancelled awards plus any incremental value of the replacement awards over the fair value of the cancelled awards as at cancellation date. The latter approach might result in a significantly higher cost.

The discussion above relates to situations in which awards are cancelled and replaced for reasons other than expected, or actual, failure by the counterparty to meet a service condition. Changes to awards in contemplation, or as a consequence, of cessation of employment are considered in section 5.3.9.B above and in sections 7.5 and 7.6 below.

7.4.4.C Replacement of vested awards

The rules for replacement awards summarised in paragraph (c) in section 7.4 above apply “if a grant of equity instruments is cancelled or settled during the vesting period ...”. [IFRS 2.28]. However, if the original award has already vested when a replacement award is granted, there is no question of accelerating the cost of the cancelled award, as it has already been recognised in full during the vesting period. The issue is rather the treatment of the new award itself. IFRS 2 does not explicitly address this point but it appears that such a replacement award is treated in the same way as a completely new award. In other words, its full fair value is recognised immediately or, if there are any vesting conditions for the replacement award, over its vesting period.

By contrast, the rules for modification of awards discussed in section 7.3 above apply whether the award has vested or not. Paragraphs 26 and 27 of IFRS 2 (modifications) are not restricted to events ‘during the vesting period’ in contrast to paragraph 28 (cancellation and settlement, including replacement awards), which is restricted to events ‘during the vesting period’. [IFRS 2.26, IFRS 2.27, IFRS 2.28].

How we see it

This has the effect that the accounting cost of modifying an already vested award (i.e., the incremental fair value of the modified award) could, at first sight, appear to be lower than the cost of cancelling and replacing it, which requires the full fair value of the new award to be expensed. However, the full fair value of the new replacement award will be reduced by the fair value of the cancelled award that the employee has surrendered as part of the consideration for the new award. This analysis will, in many cases, produce an accounting outcome similar to that of the modification of an unvested award.

7.5 Replacement and *ex gratia* awards on termination of employment

When an employee's employment is terminated during the vesting period of an award of shares or options, the award will typically lapse in consequence, in other words applying IFRS 2 the award is 'forfeited' (see sections 6.1.2 and 7.4 above). It is common in such situations, particularly where the employee was part of the senior management, for the entity to make an alternative award, or to allow the employee to retain existing awards, as part of the package of benefits agreed with the employee on termination of employment.

Generally, such an award is an *ex gratia* award - in other words, it is a discretionary award to which the outgoing employee had no legal entitlement under the terms of the original award. However, a number of plan rules set out, in a 'good leaver' clause (see section 5.3.9 above), the terms on which any *ex gratia* award may be made, usually by applying a formula to determine, or limit, how much of the original award can be considered to have vested.

In many cases the award will be made on a fully vested basis, i.e., the employee has full entitlement without further conditions needing to be fulfilled. In other cases, however, an employee will be allowed to retain awards that remain subject to the fulfilment of the original conditions (other than future service).

Whichever form the award takes, in IFRS 2 terms it will be treated as vesting at the date of termination of employment because any remaining conditions will be accounted for as non-vesting conditions in the absence of an explicit or implied service condition (see section 3.2 above).

As discussed in section 7.4.1.A above, IFRS 2 requires an entity to apply forfeiture (rather than cancellation) accounting to awards that lapse if an employee is unable to satisfy a service condition for any reason. In amending the standard to make clear that forfeiture accounting applied to the termination of employment, the IASB did not specifically address the accounting for any replacement or *ex gratia* awards on termination of employment.

If the original award is accounted for as a forfeiture and any previously recognised cost reversed in anticipation of the employee's expected departure, it perhaps follows that any replacement award will be treated as a completely new award and recognised and measured based on its own grant date. However, the standard is not clear and there might be situations where entities consider it more appropriate to apply modification accounting (recognising the original grant date fair value of the award that would otherwise be forfeited on its original terms (because the service condition would not be met) plus the incremental value of the modified terms).

How we see it

In the absence of clarity in IFRS 2, we believe that judgement will be required based on the specific facts and circumstances and the extent to which the changes to the arrangements are considered to be a waiver of existing conditions in connection with the cessation of employment rather than the introduction of a discretionary replacement arrangement on completely new terms.

The impact on the IFRS 2 charge where the changes to the arrangements are considered to be a waiver of existing conditions in connection with the cessation of employment rather than the introduction of a discretionary replacement arrangement on completely new terms, are set out in Illustration 7-13 below.

Illustration 7-13: Replacement award on termination of employment

At the beginning of year 1, an executive is granted the right to 10,000 free shares on condition of remaining in service until the end of year 3. The fair value of the award at grant date is CU2.00 per share.

At the end of year 2, the executive's employment is terminated and he therefore loses his right to any shares. However, as *ex gratia* (voluntary) compensation, the remuneration committee awards him 6,667 shares vesting immediately. As at the end of year 2 the share price was CU4.00, and the fair value of the original award was CU3.60 per share. (This is lower than the current share price because the holder of a share is entitled to receive any dividends paid during year 3 whereas the holder of an unvested right to a share is not - see section 8.5.4 below.)

This raises the question of how the *ex gratia* award of 6,667 shares must be accounted for. The factors to be considered in determining the grant date in such cases are discussed further in section 5.3.9 above. For the purposes of this Example, it is assumed that the replacement award is treated as having been granted, or the original award is treated as having been modified, at the end of year 2 rather than the terms being in place as at the beginning of year 1.

Where the lapse is treated as a forfeiture, the entity:

- Reverses the cost already booked for the award of CU13,333 (10,000 shares × CU2 × 2/3)
- Recognises the cost of the *ex gratia* award (at the fair value at that award's grant date) of CU26,668 (6,667 shares × CU4)

This results in a net charge on termination of CU13,335.

If the lapse is treated as a modification of the original award, the entity:

- Accelerates the cost not yet booked for the original award of CU6,667 (10,000 shares × CU2 = CU20,000, less CU13,333 already recognised - see above) as there is no future service period
- Treats the *ex gratia* award as a replacement award at incremental value. The fair value of the replacement award of CU26,668 (6,667 shares × CU4 - see above) is compared to the fair value of the original award of CU36,000 (10,000 shares × CU3.60). Since the fair value of the replacement award is less than that of the original award, there is no incremental cost required to be recorded under IFRS 2

This results in a net charge on termination of CU6,667.

Illustration 7-13 assumes that the entity treats the entire award as the unit of account. An entity that has instead made a policy choice to base its modification accounting on an individual share or option as the unit of account (see further discussion in section 7.3.4 above) will have a different accounting outcome.

7.6 Entity's plans for future modification or replacement of award - impact on estimation process at reporting date

As discussed in sections 6.1.1 and 6.1.2 above, IFRS 2 requires an entity to determine a cumulative IFRS 2 charge at each reporting date by reference to the 'best available estimate' of the number of awards that will vest (within the special meaning of that term in IFRS 2).

In addition to the normal difficulties inherent in any estimation process, it is not entirely clear which anticipated future events must be taken into account in the IFRS 2 estimation process and which must not, as demonstrated by Illustration 7-14 below.

Illustration 7-14: Estimation of number of awards expected to vest - treatment of anticipated future events

At the beginning of year 1, an entity granted an award of 1,000 shares to each of its 600 employees at a particular manufacturing unit. The award vests on completion of three years' service. As at the end of year 1, the entity firmly intends to close the unit, and terminate the employment of employees, as part of a rationalisation programme. This closure would occur part way through year 2. The entity has not, however, announced its intentions or taken any other steps so as to allow provision for the closure under IAS 37 *Provisions, Contingent Liabilities and Contingent Assets* (see Chapter 27).

Under the original terms of the award, the award would lapse on termination of employment. However, the entity intends to compensate employees made redundant by changing the terms of their award so as to allow full vesting on termination of employment.

What is the 'best estimate', as at the end of year 1, of the number of awards expected to vest? Specifically, must the entity:

- (a) Ignore the intended closure altogether, on the grounds that there is no other recognition of it in the financial statements.
- (b) Take account of the impact of the intended closure on vesting of the current award, but ignore the intended future change to the terms of the award to allow vesting.

Or

- (c) Take account of both the intended closure and the intended change to the terms of the award?

In our view, there is no basis in IFRS 2 for accounting for an anticipated future change to the terms of an award. The entity must account for those awards in issue at the reporting date, not those that might be in issue in the future. Accordingly, we do not consider approach (c) above to be appropriate if any change to the issued awards was simply an intention.

Equally, we struggle to support approach (a) above. IFRS 2 requires the entity to use its 'best available estimate' and its best available estimate as at the end of year 1 must be that the unit will be closed, and the employees' employment terminated, in year 2. This view is supported by the fact that, unlike IAS 36 *Impairment of Assets* (see Chapter 21) and IAS 37 (see Chapter 27), IFRS 2 does not explicitly prohibit an entity from taking account of the consequences of reorganisations and similar transactions to which it is not yet committed.

Accordingly, we believe that approach (b) must be followed under IFRS 2.

The entity's best estimate at the end of year 1 must be that none of the awards currently in place will vest (because all the employees will be made redundant and so will not meet the service condition before the end of the vesting period). It therefore applies forfeiture accounting at the end of year 1 and reverses any cost previously recorded for the award.

When the terms of the award are changed (see section 7.1.1 above) in year 2 to allow full vesting on redundancy, the entity will either recognise the full cost of the new award (as all cost relating to the original award has been reversed) or will treat the revised arrangement as a modification of the original award that is beneficial to the employee. In effect, the modification approach is based on a view that the original award is not now going to lapse because it will be modified before employment ceases and the forfeiture crystallises. In our view, in the absence of clarity in IFRS 2, the entity is required to assess the more appropriate approach based on the particular facts and circumstances.

Either approach will have what many may see as the less than ideal result that the entity will recognise a credit in profit or loss in year 1 and an expense in year 2, even though there has been no change in management's best estimate of the overall outcome. This follows from the analysis, discussed above, that we do not believe that the entity can account in year 1 for the award on the basis of what its terms may be in year 2.

The best estimate is made as at each reporting date. A change in estimate made in a later period in response to subsequent events affects the accounting expense from that later period only (i.e., there is no restatement of earlier periods presented).

How we see it

In summary, as noted above, we believe there is no basis in IFRS 2 to account for an anticipated future change to the terms of an award. The entity must account for those awards in issue at the reporting date, not those that might be in issue in the future. The best estimate of the awards expected to vest at the end of the reporting date is based on the awards currently in place, in other words, at the end of year 1 none of the awards in place will vest. When the terms of the award are changed, it is then based on facts and circumstances, whether the change is accounted for as a new award or treat the revised arrangement as a modification of the original award.

7.7 Two awards running 'in parallel'

In some jurisdictions, it is not straightforward to cancel or modify an award. This may be because cancellation or modification triggers either a legal requirement for the entity to pay compensation to the holder, or adverse tax consequences for the holder. In such cases, where an award has become unattractive (for example, because it is 'out-of-the-money'), the entity may issue a second award rather than cancel or modify the original award. The second award cannot be designated as a replacement award, because the original award is still in place. The entity therefore has two awards running 'in parallel'.

However, a mechanism is then put in place to ensure that the employee can receive only one award. For instance, if the original award were 1,000 options, it might be replaced with a second award of 1,000 options, but on condition that, if options under one award are exercised, the number of options exercisable under the other award is correspondingly reduced, so that no more than 1,000 options can be exercised in total.

The accounting for such arrangements is discussed in Illustration 7-15 below.

Illustration 7-15: Two option awards running in parallel

At the beginning of year 1, an entity granted 1,000 A options to an employee, subject to non-market vesting conditions. The grant date fair value of an A option was CU50.

As at the beginning of year 2, the entity's share price is significantly below the exercise price of an A option, which now has a fair value of CU5. Without modifying or cancelling the A options, the entity awards the employee 1,000 new B options. The B options are subject to non-market vesting conditions different in nature from, and more onerous than, those applicable to the A options, but have a lower exercise price. The terms of the B options include a provision that for every A option that is exercised, the number of B options that can be exercised is reduced by one, and vice versa. The fair value of a B option at the beginning of year 2 is CU15.

Clearly, the employee will exercise whichever series of options, A or B, has the higher intrinsic value. There are four possible outcomes:

1. Neither the A options nor the B options vest.
2. Only the A options vest.
3. Only the B options vest.
4. Both the A options and B options vest and the employee must choose which to exercise. Rationally, the employee would exercise the B options as they have the lower exercise price.

How we see it

In our view, the B options are most appropriately accounted for as if they were a modification of the A options. In substance the A options have been modified by adding alternative non-market vesting conditions with a different option exercise price.

On the date of the substantive modification, the entity estimates the fair value of both the original and modified options and calculates the incremental fair value of the modification. As only one series of options can be exercised, we believe that the most appropriate treatment is to account for whichever award the entity believes, at each reporting date, is more likely to be exercised. This is analogous to the accounting treatment we suggest in Illustration 6-8 in section 6.2.5 above and in Illustration 6-13 in section 6.3.6 above.

If the entity believes that neither award will vest, any expense previously recorded would be reversed.

If the entity believes that only the A options will vest, it will recognise expense based on the grant date fair value of the A options (CU50 each).

If the entity believes that only the B options will vest, it will recognise expense based on:

- (a) The grant date fair value of the A options (CU50 each) over the original vesting period of the A options.
Plus
- (b) The incremental fair value of the B options, as at their grant date (CU10 each, being their CU15 fair value less the CU5 fair value of an A option), over the vesting period of the B options.

If the entity believes that both the A options and B options will vest, it follows the accounting treatment of outcome 3 above (i.e., vesting of the B options). This is because the employee will either choose the B options or, if the employee decides to choose the A options, the entity has to expense both the value of the A options and the incremental value of the B options because that incremental value relates to a vested award.

The entity revises the assessment at each reporting date and at the end of the vesting period when the actual outcome is known, so that the cumulative expense is based on the actual outcome.

Examples of other types of arrangements with multiple outcomes are illustrated in section 6.2.5 above and in sections 10.3 and 15.4 below.

7.8 Share splits and consolidations

It is common for an entity to divide its existing equity share capital into a larger number of shares (share splits) or to consolidate its existing share capital into a smaller number of shares (share consolidations). The impact of such splits and consolidations is not specifically addressed in IFRS 2, and a literal application of IFRS 2 could lead to some rather anomalous results.

Suppose that an employee has options over 100 shares in the reporting entity, with an exercise price of CU1. The entity undertakes a '1 for 2' share consolidation - i.e., the number of shares in issue is halved such that, all other things being equal, the value of one share in the entity after the consolidation is twice that of one share before the consolidation.

IFRS 2 is required to be applied to modifications to an award arising from equity restructurings.

[IFRS 2.BC24]. In many cases, a share scheme will provide for automatic adjustment so that, following the consolidation, the employee holds options over only 50 shares with an exercise price of CU2. As discussed in section 5.3.8.A above, all things being equal, it would be expected that the modified award would have the same fair value as the original award and so there would be no incremental expense to be accounted for.

However, it may be that the scheme has no such provision for automatic adjustment, such that the employee still holds options over 100 shares. The clear economic effect is that the award has been modified, since its value has been doubled. It could be argued that, on a literal reading of IFRS 2, no modification has occurred, since the employee holds options over 100 shares at the same exercise price before and after the consolidation. The IFRS IC discussed this issue at its July and November 2006 meetings but decided not to take it onto its agenda because it "...was not a normal commercial occurrence and ... unlikely to have widespread significance".²⁶ This decision was re-confirmed by the IFRS IC in March 2011.²⁷

How we see it

In our view, whilst it seems appropriate to have regard to the substance of the transaction, and treat it as giving rise to a modification, it can be argued that IFRS 2 as drafted does not require such a treatment, particularly given the decision of the IFRS IC not to discuss the issue further. In the absence of clear guidance in the standard, the accounting policy adopted must be applied consistently.

Sometimes, the terms of an award give the entity discretion to make modifications at a future date in response to more complex changes to the share structure, such as those arising from bonus issues, share buybacks and rights issues where the effect on existing options may not be so clear-cut. These are discussed further in section 5.3.8.A above.

8 Equity-settled transactions - valuation

8.1 Introduction

The IASB provides some guidance on valuation in Appendix B to the standard, which we summarise and elaborate upon below. The guidance is framed in terms of awards to employees which are valued at grant date, but many of the general principles are equally applicable to awards to non-employees valued at service date. [IFRS 2.B1].

As discussed in more detail in sections 4 to 7 above, IFRS 2 requires a 'modified grant-date' approach, under which the fair value of an equity award is estimated on the grant date without regard to the possibility that any service conditions or non-market performance conditions will not be met. Although the broad intention of IFRS 2 is to recognise the cost of the goods or services to be received, the IASB believes that, in the case of services from employees, the fair value of the equity instruments awarded is more readily determinable than the fair value of the services received.

As noted in section 5.1 above, IFRS 2 defines fair value as: [IFRS 2 Appendix A]

Extract from IFRS 2

Appendix A Defined terms

fair value	The amount for which an asset could be exchanged, a liability settled, or an equity instrument granted could be exchanged, between knowledgeable, willing parties in an arm's length transaction.
-------------------	--

IFRS 2 requires fair value to be based on the market price of the equity instruments, where available, or calculated using an option-pricing model. While fair value may be readily determinable for awards of shares, market quotations are not available for long-term, non-transferable share options because these instruments are not generally traded.

As discussed further in section 8.2.2 below, the fair value of an option at any point in time is made up of two basic components - intrinsic value and time value. Intrinsic value is the greater of (a) the market value of the underlying share less the exercise price of the option and (b) zero.

Time value reflects the potential of the option for future gain to the holder, given the length of time during which the option will be outstanding, and possible changes in the share price during that period. Because market price information is not normally available for an employee share option, the IASB believes that, in the absence of such information, the fair value of a share option awarded to an employee generally must be estimated using an option-pricing model. [IFRS 2.BC130]. This is discussed further in section 8.3 below.

The discussion below aims to provide guidance on the valuation of options and similar awards under IFRS 2; it is not intended to provide detailed instructions for constructing an option pricing model.

The approach to determining the fair value of share-based payments continues to be that specified in IFRS 2 as share-based payments fall outside the scope of IFRS 13 which applies more generally to the measurement of fair value under IFRS accounting standards (see Chapter 15). [IFRS 2.6A].

8.2 Options

8.2.1 Call options - overview

Before considering the features of employee share options that make their valuation particularly difficult, a general overview of call options may be useful.

Call options give the holder the right, but not the obligation, to buy the underlying shares at a specified price (the 'exercise' or 'strike' price) on, or before, a specified date. Share-based payments take the form of call options over the underlying shares.

Options are often referred to as American or European. American options can be exercised at any time up to the expiry date, whereas European options can be exercised only on the expiry date itself.

The terms of employee options commonly have features of both American and European options, in that there is a period, generally two or three years, during which the option cannot be exercised (i.e., the vesting period). At the end of this period, if the options vest, they can be exercised at any time up until the expiry date. This type of option is known as a Window American option or Bermudan option.

A grant of shares is equivalent to an option with an exercise price of zero and will be exercised regardless of the share price on the vesting date. Throughout the discussion below, any reference to share options therefore includes, to the extent applicable, share grants or zero strike price options. There is further discussion of grants of free shares in section 8.7.1 below.

8.2.2 Call options - valuation

As noted in section 8.1 above, option value consists of intrinsic value and time value. For a call option, intrinsic value is the greater of:

- The share price less the exercise price
- And
- Zero

Figure 8-1 below sets out the intrinsic value (or payoff) for a call option with an exercise price of CU5.00.

Figure 8-1: Intrinsic value of a call option

A call option is said to be 'in-the-money' when the share price is above the exercise price of the option and 'out-of-the-money' when the share price is less than the exercise price. An option is 'at-the-money' when the share price equals the exercise price of the option.

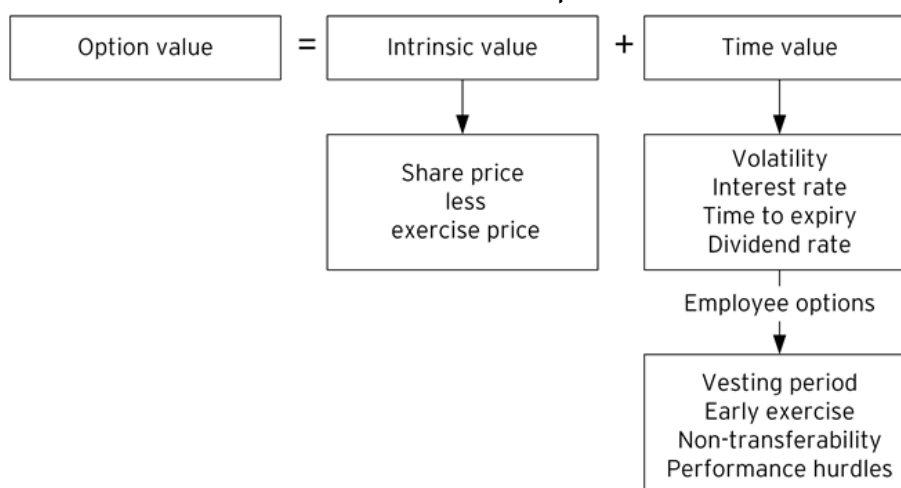

The time value of an option arises from the time remaining to expiry. As well as the share price and the exercise price, it is impacted by the volatility of the share price, time to expiry, dividend yield and the risk-free interest rate and the extent to which it is in- or out-of-the-money. For example, when the share price is significantly less than the exercise price, the option is said to be 'deeply' out-of-the-money. In this case, the fair value consists entirely of time value, which decreases the more the option is out-of-the-money.

The main inputs to the value of a simple option are:

- The exercise price of the option
- The term of the option
- The current market price of the underlying share
- The expected future volatility of the price of the underlying share
- The dividends expected to be paid on the shares during the life of the option (if any)
- The risk-free interest rate(s) for the expected term of the option

Their effect on each of the main components of the total value (intrinsic value and time value) is shown in Figure 8-2 below.

Figure 8-2: Determinants of the fair value of a call option

The effect of these inputs on the value of a call option can be summarised as follows:

If this variable increases,	the option value ...
Share price	Increases
Exercise price	Decreases
Volatility	Increases
Time to expiry	Usually increases*
Interest rate	Increases
Dividend yield/payout	Decreases

* In most cases the time value of an option is positive. Whilst an American option always has positive or zero time value, a European option may have a zero or negative time value when there is a high dividend yield and the option is considerably in-the-money. In this case, as the time to expiry increases, a European call option will reduce in value (negative time value) and an American call option will stay constant in value (zero time value).

The factors to be considered in estimating the determinants of an option value in the context of IFRS 2 are considered in more detail in section 8.5 below.

8.2.3 Factors specific to employee share options

In addition to the factors referred to in section 8.2.2 above, employee share options are also affected by a number of specific factors that can affect their true economic value. These factors, not all of which are taken into account for IFRS 2 valuation purposes (see sections 8.4 and 8.5 below), include the following:

- Non-transferability (see section 8.2.3.A below)
- Continued employment requirement (see section 8.2.3.B below)
- Vesting and non-vesting conditions (see section 8.2.3.C below)
- Periods during which holders cannot exercise their options - referred to in various jurisdictions as 'close', 'restricted' or 'blackout' periods (see section 8.2.3.D below)
- Limited ability to hedge option values (see section 8.2.3.E below)
- Dilution effects (see section 8.2.3.F below)

8.2.3.A Non-transferability

Holders of freely-traded share options (i.e., those outside a share-based payment transaction) can choose to 'sell' their options (typically by writing a call option on the same terms) rather than exercise them. By contrast, employee share options are generally non-transferable, leading to early (and sub-optimal) exercise of the option. This will lower the value of the options.

8.2.3.B Continued employment requirement

Holders of freely-traded share options can maintain their positions until they wish to exercise, regardless of other circumstances. In contrast, employee share options cannot normally be held once employment is terminated. If the options have not vested, they will be lost. If the options have vested, the employee will be forced to exercise the options immediately or within a short timescale, or forfeit them altogether, losing all time value. This will lower the value of the options.

8.2.3.C Vesting and non-vesting conditions

Holders of freely-traded share options have an unconditional right to exercise their options. In contrast, employee share options may have vesting and non-vesting conditions attached to them, which may not be met, reducing their value. This is discussed in more detail in section 8.4 below.

Although a non-market vesting condition reduces the 'true' fair value of an award, it does not directly affect its valuation for the purposes of IFRS 2 (see section 6.2 above). However, non-market vesting conditions may indirectly affect the value. For example, when an award vests on satisfaction of a particular target rather than at a specified time, its value may vary depending on the assessment of when that target will be met, since that may influence the expected life of the award, which is relevant to its fair value under IFRS 2 (see sections 6.2.3 and 8.2.2 above and section 8.5.1 below).

8.2.3.D Periods during which exercise is restricted

Holders of freely-traded American or Bermudan share options can exercise at any time during the exercisable window. In contrast, employees may be subject to 'blackout' periods in which they cannot exercise their options, for example to prevent insider trading. While this could conceivably make a significant impact if the shares were significantly mis-priced in the market, in an efficient market blackout periods will only marginally decrease the value.

8.2.3.E Limited ability to hedge option values

In the case of freely-traded share options, it is reasonable to justify the theoretical valuation on the basis that, for any other value, arbitrage opportunities could arise through hedging. In contrast, employee share options are usually awarded only in relatively small amounts, and the employees are usually subject to restrictions on share trading (especially short selling the shares, as would be required to hedge an option). When considered in combination with the non-transferability of the options (see section 8.2.3.A above), this means that exercising the options is the only way to remove exposure to fluctuations in value, which lowers the value of the options.

8.2.3.F Dilution effects

When third parties write traded share options, the writer delivers shares to the option holder when the options are exercised, so that the exercise of the traded share options has no dilutive effect. By contrast, if an entity writes share options to employees and, when those share options are exercised, issues new shares (or uses shares previously repurchased and held in treasury) to settle the awards, there is a dilutive effect as a result of the equity-settled awards. As the shares will be issued at the exercise price rather than the current market price at the date of exercise, this actual or potential dilution may reduce the share price, so that the option holder does not make as large a gain as would arise on the exercise of similar traded options which do not dilute the share price.

8.3 Selection of an option-pricing model

Extract from IFRS 2

B4 For share options granted to employees, in many cases market prices are not available, because the options granted are subject to terms and conditions that do not apply to traded options. If traded options with similar terms and conditions do not exist, the fair value of the options granted shall be estimated by applying an option pricing model.

The entity must consider all factors that would be considered by knowledgeable, willing market participants in selecting a model. [IFRS 2.B4, IFRS 2.B5].

The IASB decided that it was not necessary or appropriate to prescribe the precise formula or model to be used for option valuation. It notes that there is no particular option pricing model that is regarded as theoretically superior to the others, and there is the risk that any model specified might be superseded by improved methodologies in the future. [IFRS 2.BC131].

The three most common option-pricing methodologies for valuing employee options are:

- The Black-Scholes-Merton formula (see section 8.3.1 below).
- The binomial model (see section 8.3.2 below).
- The Monte Carlo Simulation (see section 8.3.3 below).

It is important to understand all the terms and conditions of a share-based payment arrangement, as this will influence the choice of the most appropriate option pricing model.

IFRS 2 names the Black-Scholes-Merton formula and the binomial model as examples of acceptable models to use when estimating fair value, [IFRS 2.BC152], while noting that there are certain circumstances in which the Black-Scholes-Merton formula may not be the most appropriate model (see section 8.3.1 below).

Moreover, there may be instances where, due to the particular terms and conditions of the share-based payment arrangement, neither of these models is appropriate, and another methodology is more appropriate to achieving the intentions of IFRS 2. A model commonly used for valuing more complex awards is Monte Carlo Simulation (often combined with the Black-Scholes-Merton formula or the binomial model). This can deal with the complexities of a plan such as one with a market condition based on relative total shareholder return (TSR), which compares the return on a fixed sum invested in the entity to the return on the same amount invested in a peer group of entities.

8.3.1 The Black-Scholes-Merton formula

The Black-Scholes-Merton methodology is commonly used for assessing the value of a freely-traded put or call option and allows for the incorporation of static dividends on shares. The assumptions underlying the Black-Scholes-Merton formula are as follows:

- The option can be exercised only on the expiry date (i.e., it is a European option).
- There are no taxes or transaction costs and no margin requirements.
- The volatility of the underlying asset is constant and is defined as the standard deviation of the continuously compounded rates of return on the share over a specified period.
- The risk-free interest rate is constant over time.
- Short selling is permitted.
- There are no risk-free arbitrage opportunities.
- There are log normal returns (i.e., the continuously compounded rate of return is normally distributed).
- Security trading is continuous.

The main limitation of the Black-Scholes-Merton methodology is that it only calculates the option price at one point in time. It does not consider the steps along the way when there could be a possibility of early exercise of an American option (although as discussed in section 8.4 below this can be partially mitigated by using an assumed expected term as an input to the calculation).

The Black-Scholes-Merton formula is an example of a closed-form model, which is a valuation model that uses an equation to produce an estimated fair value. The formula is as shown in Figure 8-3 below.

Figure 8-3: The Black-Scholes-Merton formula

$$C = S_0 e^{-qT} N(d_1) - K e^{-rT} N(d_2)$$

Where:

$$d_1 = \frac{\ln(S_0/K) + (r - q + \sigma^2/2)T}{\sigma \sqrt{T}}$$

$$d_2 = d_1 - \sigma \sqrt{T}$$

C = price of a written call

S₀ = price of the underlying share

N = the cumulative probability distribution function for a standardised normal distribution

q = dividend yield (continuously compounded)

K = call option exercise price

r = the continuously compounded risk-free rate

σ = annualised volatility of the underlying share

T = time to expiry (in years)

Note: 'e' represents the mathematical constant, the base of the natural logarithm (2.718282...), and 'ln' is the natural logarithm of the indicated value

Whilst the Black-Scholes-Merton formula is complex, its application in practice is relatively easy. It can be programmed into a spreadsheet, and numerous programs and calculators exist that use it to calculate the fair value of an option. As a result, the formula is used widely by finance professionals to value a large variety of options. However, a number of the assumptions underlying the formula may be better suited to valuing short-term, exchange-traded share options rather than employee share options.

The attributes of employee share options that render the Black-Scholes-Merton formula less effective as a valuation technique include:

- *Long term to expiry*
The formula assumes that volatility, interest rates and dividends are constant over the life of the option. While this may be appropriate when valuing short-term options, the assumption of constant values is less appropriate when valuing long-term options.
- *Non-transferability and early exercise*
The formula assumes a fixed maturity/exercise date. While IFRS 2 provides for the use of an 'expected term' in place of the contractual life to reflect the possibility of early exercise resulting from the non-transferability of employee share options or other reasons (see section 8.5 below), this may not adequately describe early exercise behaviour.
- *Vesting conditions and non-vesting conditions*
The formula does not take into account any market-based vesting conditions or non-vesting conditions.
- *Blackout periods*
As the formula assumes exercise on a fixed date, and does not allow earlier exercise, it does not take into consideration any blackout periods (see section 8.2.3.D above).

In summary, application of the Black-Scholes-Merton formula is relatively simple, in part because many of the complicating factors associated with the valuation of employee share options cannot be incorporated into it directly and, therefore, must be derived outside of the formula (e.g., the input of an expected term).

IFRS 2 states that the Black-Scholes-Merton formula may not be appropriate for long-lived options which can be exercised before the end of their life and which are subject to variation in the various inputs to the model over the life of the option. However, IFRS 2 suggests that the Black-Scholes-Merton formula may give materially correct results for options with shorter lives and with a relatively short exercise period. [IFRS 2.B5].

The development of appropriate assumptions for use in the Black-Scholes-Merton formula is discussed in section 8.5 below.

As noted above, the Black-Scholes-Merton formula is an example of a closed form model that is not generally appropriate for awards that include market conditions. However, in certain circumstances it may be possible to use closed form solutions other than the Black-Scholes-Merton formula to value options where, for example, the share price has to reach a specified level for the options to vest. These other solutions are beyond the scope of this chapter.

8.3.2 The binomial model

The binomial model is one of a subset of valuation models known as lattice models, which adopt a flexible, iterative approach to valuation that can capture the unique aspects of employee share options. A binomial model produces an estimated fair value based on the assumed changes in prices of a financial instrument over successive periods of time. In each time period, the model assumes that at least two price movements are possible. The lattice represents the evolution of the value of either a financial instrument or a market variable for the purpose of valuing a financial instrument.

The concepts that underpin lattice models and the Black-Scholes-Merton formula are the same, but the key difference between a lattice model and a closed-form model is that a lattice model is more flexible. The valuations obtained using the Black-Scholes-Merton formula and a lattice model will be very similar if the lattice model uses identical assumptions to the Black-Scholes-Merton calculation (e.g., constant volatility, constant dividend yields, constant risk-free rate, the same expected life). However, a lattice model can explicitly use dynamic assumptions regarding the term structure of volatility, dividend yields, and interest rates.

Further, a lattice model can incorporate assumptions about how the likelihood of early exercise of an employee share option may increase as the intrinsic value of that option increases, or how employees may have a high tendency to exercise options with significant intrinsic value shortly after vesting.

In addition, a lattice model can incorporate market conditions that may be part of the design of an option, such as a requirement that an option is only exercisable if the underlying share price reaches a certain level (sometimes referred to as 'target share price' awards). The Black-Scholes-Merton formula is not generally appropriate for awards that have a market-based performance condition because it cannot handle that additional complexity.

Most valuation specialists believe that lattice models, through their versatility, generally provide a more accurate estimate of the fair value of an employee share option with market conditions or with the possibility of early exercise than a value based on a closed-form Black-Scholes-Merton formula. As a general rule, the longer the term of the option and the higher the dividend yield, the larger the amount by which the binomial lattice model value may differ from the Black-Scholes-Merton formula value.

To implement the binomial model, a 'tree' is constructed the branches (or time steps) of which represent alternative future share price movements over the life of the option. In each time step over the life of the option, the share price has a certain probability of moving up or down by a certain percentage amount. It is important to emphasise the assumption, in these models, that the valuation occurs in a risk-neutral world, where investors are assumed to require no extra return on average for bearing risks and the expected return on all securities is the risk-free interest rate.

To demonstrate how the binomial model is used, Illustration 8-1 below constructs a simple binomial lattice model with a few time steps. The valuation assumptions and principles will not differ in essence from those in a Black-Scholes-Merton valuation except that the binomial lattice model will allow for early exercise of the option. The relevant difference between the two models is the specification of a very small number of time steps, for illustrative purposes, in the binomial lattice model (see also section 8.3.2.A below). We discuss below how the model can be augmented for a more complex set of assumptions.

Illustration 8-1: Binomial model

A share option is issued with an exercise price of CU10, being the share price on the grant date. This Example assumes a constant volatility (50%) and risk-free rate (5% continuously compounded) although, as discussed later, those static assumptions may not be appropriate when valuing a long-term share option. It is also assumed that: the grantor pays dividends with a yield of 2% (continuously compounded) on its shares; the term of the option is five years; and each branch of the tree represents a length of time of one year.

At $t = 0$ (the grant date), the model is started at the grant date share price (CU10 in this Example). At each node (the base of any price time step), two possible price changes (one increase and one decrease) are computed based on the volatility of the shares. The two new share prices are computed as follows:

The up-node price utilises the following formula:

$$u = e^{\sigma\sqrt{dt}} = e^{0.5\sqrt{1}} = 1.6487$$

Where:

σ = annualised volatility of the underlying share

dt = period of time between nodes

The down-node is the inverse of the up-node:

$$d = \frac{1}{u} = \frac{1}{1.6487} = 0.6065$$

The probability of each upward and downward price movement occurring is calculated from:

- the probability of an upward movement in price:

$$p = \frac{e^{(r-q)dt} - d}{u - d} = \frac{e^{(.05 - .02) \cdot 1} - 0.6065}{1.6487 - 0.6065} = 0.4068$$

Where:

e = represents the mathematical constant, the base of the natural logarithm (2.718282...)

r = continuously compounded risk-free rate

q = dividend yield (continuously compounded)

dt = period of time between nodes

- The probability of a downward movement in price:

$$= 1 - p = 1 - 0.4068 = 0.5932$$

Using the above price multiples, the price tree can then be constructed as shown diagrammatically below - each rising node is built by multiplying the previous price by 'u' and each falling node is similarly calculated by multiplying the previous price by 'd'.

To calculate the option value:

- The option payoffs at the final time node (time 5 above) must be calculated. This is the share price less the exercise price, or zero if the payoff is negative.
- Then the option values must be calculated at the previous time point (time 4 above). This is done by calculating the expected value of the option for the branch paths available to the particular node being valued discounted at the risk-free rate. For example, for $S_{4,4}$ in the chart above the option value is the probability of going to node $S_{5,5}$ multiplied by the option value at that node plus the probability of going to node $S_{5,4}$ multiplied by the option value at that node, all discounted at the risk-free rate):

$$= e^{-r \cdot dt} \{p \cdot 111.82 + (1 - p) \cdot 34.82\} = 0.95 \{0.4068 \times 111.82 + 0.5932 \times 34.82\} = 62.92$$

This would be the value at node $S_{4,4}$ if the option were European and could not be exercised earlier. As the binomial model can allow for early exercise, the option value at node $S_{4,4}$ is the greater of the option value just calculated and the intrinsic value of the option which is calculated the same way as the end option payoff. In this case, as the intrinsic value is CU63.89 (CU73.89 - CU10.00), the node takes the value of CU63.89.

- The previous steps are then repeated throughout the entire lattice (i.e., for all nodes at time 4, then all nodes at time 3, etc.) until finally the option value is determined at time 0 - this being the binomial option value of CU4.42.

Additionally, if there is a vesting period during which the options cannot be exercised, the model can be adjusted so as not to incorporate the early exercise condition stipulated in the previous point and allow for this only after the option has vested and has the ability to be exercised before expiry.

One of the advantages of a lattice model is its ability to depict a large number of possible future paths of share prices over the life of the option. In Illustration 8-1 above, the specification of an interval of 12 months between nodes provides an inappropriately narrow description of future price paths. The shorter the interval of time between each node, the more accurate will be the description of future share price movements.

Additions which can be made to a binomial model (or any type of lattice model) include the use of assumptions that are not fixed over the life of the option. Binomial trees may allow for conditions dependent on price and/or time, but in general do not support price-path dependent conditions and modifications to volatility. This may affect the structure of a tree making it difficult to recombine. In such cases, additional recombination techniques must be implemented, possibly with the use of a trinomial tree (i.e., one with three possible outcomes at each node).

For the first three assumptions above, the varying assumptions simply replace the value in the fixed assumption model. For instance, in Illustration 8-1 above $r = 0.05$; in a time-dependent version this could be 0.045 at time 1, 0.048 at time 2 and so on, depending on the length of time from the valuation date to the individual nodes.

However, for a more complicated addition such as assumed withdrawal rates, the equation:

$$= e^{-r \cdot dt} \{p \cdot 111.82 + (1 - p) \cdot 34.82\}$$

may be replaced with:

$$= (1 - g) \times e^{-r \cdot dt} \{p \cdot 111.82 + (1 - p) \cdot 34.82\} + g \times \max(\text{intrinsic value}, 0)$$

where 'g' is the rate of employee departure, on the assumption that, on departure, the option is either forfeited or exercised. As with the other time- and price-dependent assumptions, the rate of departure could also be made time- or price-dependent (i.e., the rate of departure could be assumed to increase as the share price increases, or increase as time passes, and so forth).

8.3.2.A Lattice models - number of time steps

When performing a lattice valuation, a decision must be taken as to how many time steps to use in the valuation (i.e., how much time passes between each node). Generally, the greater the number of time steps, the more accurate the final value. However, as more time steps are added, the incremental increase in accuracy declines. To illustrate the increases in accuracy, consider the diagram below, which values the option in Illustration 8-1 above as a European option. In this case, the binomial model has not been enhanced to allow for early exercise (i.e., the ability to exercise prior to expiry).

Whilst the binomial model is very flexible and can deal with much more complex assumptions than the Black-Scholes-Merton formula, there are certain complexities it cannot handle, which can best be accomplished by Monte Carlo Simulation - see section 8.3.3 below.

The development of appropriate assumptions for use in a binomial model is discussed in section 8.5 below.

In addition to the binomial model, other lattice models such as trinomial models or finite difference algorithms may be used. Discussion of these models is beyond the scope of this publication.

8.3.3 Monte Carlo Simulation

In order to value options with market-based performance targets where the market value of the entity's equity is an input to the determination of whether, or to what extent, an award has vested, the option methodology applied must be supplemented with techniques such as Monte Carlo Simulation.

A typical market condition is a TSR condition. TSR compares the return on a fixed sum invested in the entity to the return on the same amount invested in a peer group of entities. Typically, the entity is then ranked in the peer group and the number of share-based awards that vest depends on the ranking. For example, no award might vest for a low ranking, the full award might vest for a higher ranking, and a pro-rated level of award might vest for a median ranking.

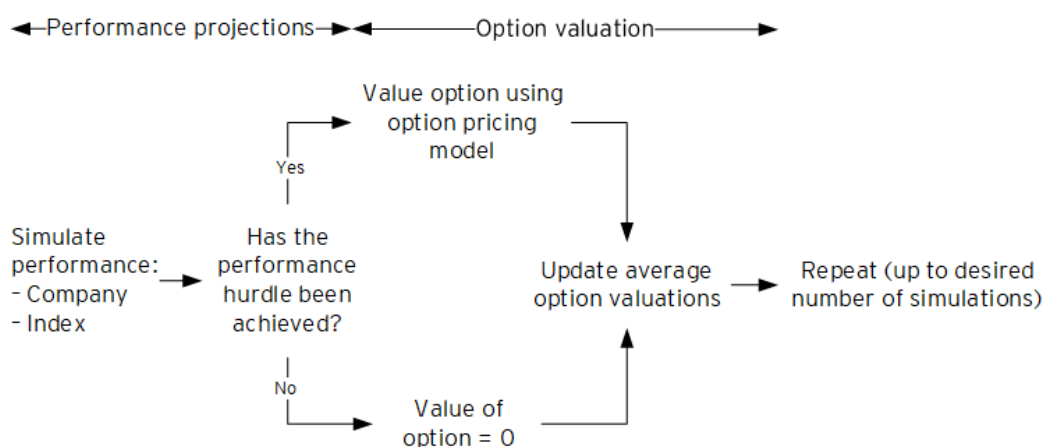

The following table gives an example of a possible vesting pattern for such a scheme, with a peer group of 100 entities.

Ranking in peer group	Percentage vesting
Below 50	0%
50	50%
51-74	50% plus an additional 2% for each increase of 1 in the ranking
75 or higher	100%

Figure 8-4 below summarises the Monte Carlo approach.

Other market conditions may have the form of share price targets, absolute share price growth or share price growth in excess of a pre-defined index growth. These types of market conditions are valued using techniques such as Monte Carlo simulation.

Figure 8-4: Monte Carlo Simulation approach for share-based payment transactions

The valuation could be performed using either:

- A binomial valuation or the Black-Scholes-Merton formula, dependent on the results of the Monte Carlo Simulation.
- Or
- The Monte Carlo Simulation on its own.

The framework for calculating future share prices uses essentially the same underlying assumptions as lie behind Black-Scholes-Merton and binomial models - namely a risk-neutral world and a log normal distribution of share prices.

For a given simulation, the risk-neutral returns of the entity and those of the peer group or index are projected until the performance target is achieved and the option vests. At this point, the option transforms into a 'vanilla' equity call option that may be valued using an option pricing model. This value is then discounted back to the grant date so as to give the value of the option for a single simulation.

When the performance target is not achieved and the option does not vest, a zero value is recorded. This process is repeated thousands or millions of times. The average option value obtained across all simulations provides an estimate of the value of the option, allowing for the impact of the performance target.

8.4 Adapting option-pricing models for share-based payment transactions

Since the option-pricing models discussed in section 8.3 above were developed to value freely-traded options, a number of adjustments are required in order to account for the restrictions usually attached to share-based payment transactions, particularly those with employees. The restrictions not accounted for in these models include:

- Non-transferability (see section 8.4.1 below).
- Vesting conditions, including performance targets, and non-vesting conditions that affect the value for the purposes of IFRS 2 (see section 8.4.2 below).

8.4.1 Non-transferability

As noted in section 8.2.3.A above, employee options and other share-based awards are almost invariably non-transferable, except (in some cases) to the employee's estate in the event of death in service. Non-transferability often results in an option being exercised early (i.e., before the end of its contractual life), as this is the only way for the employee to realise its value in cash. Therefore, by imposing the restriction of non-transferability, the entity may cause the effective life of the option to be shorter than its contractual life, resulting in a loss of time value to the holder. [IFRS 2.BC153-169].

One aspect of time value is the value of the right to defer payment of the exercise price until the end of the option term. When the option is exercised early because of non-transferability, the entity receives the exercise price much earlier than it otherwise would. Therefore, as noted by IFRS 2, the effective time value granted by the entity to the option holder is less than that indicated by the contractual life of the option.

IFRS 2 requires the effect of early exercise as a result of non-transferability and other factors to be reflected either by modelling early exercise in a binomial or similar model or by using expected life rather than contractual life as an input into the option-pricing model. This is discussed further in section 8.5.1 below.

Reducing the time to expiry effectively reduces the value of the option. This is a simplified way of reducing the value of the employee stock option to reflect the fact that employees are unable to sell their vested options, rather than applying an arbitrary discount to take account of non-transferability.

8.4.2 Treatment of vesting and non-vesting conditions

Many share-based payment awards to employees have vesting and non-vesting conditions attached to them which must be satisfied before the award can be exercised. It must be remembered that a non-market vesting condition, while reducing the 'true' fair value of an award, does not directly affect its valuation for the purposes of IFRS 2 (see section 6.2 above). However, non-market vesting conditions may indirectly affect the value. For example, when an award vests on satisfaction of achieving a particular operational target rather than at a specified time, its value may vary depending on the assessment of when that target will be met, since that may influence the expected life of the award, which is relevant to its fair value under IFRS 2 (see sections 6.2.3 and 8.2.2 above and section 8.5 below).

8.4.2.A Market-based performance conditions and non-vesting conditions

As discussed in sections 6.3 and 6.4 above, IFRS 2 requires market-based vesting conditions and non-vesting conditions to be taken into account in estimating the fair value of the options granted. Moreover, the entity is required to recognise a cost for an award with a market condition or non-vesting condition if all the non-market vesting conditions attaching to the award are satisfied regardless of whether the market condition or non-vesting condition is satisfied. This means that a more sophisticated option pricing model may be required.

8.4.2.B Non-market vesting conditions

As discussed in section 6.2 above, IFRS 2 requires non-market vesting conditions to be ignored when estimating the fair value of share-based payment transactions. Instead, such vesting conditions are taken into account by adjusting the number of equity instruments included in the measurement of the transaction (by estimating the extent of forfeiture based on failure to vest) so that, ultimately, the amount recognised is based on the number of equity instruments that eventually vest.

8.5 Selecting appropriate assumptions for option-pricing models

IFRS 2 notes that, as discussed in section 8.2.2 above, option pricing models take into account, as a minimum:

- The exercise price of the option
- The life of the option (see sections 8.5.1 and 8.5.2 below)
- The current price of the underlying shares
- The expected volatility of the share price (see section 8.5.3 below)
- The dividends expected on the shares (if appropriate - see section 8.5.4 below)
- The risk-free interest rate for the life of the option (see section 8.5.5 below) [IFRS 2.B6]

Of these inputs, only the exercise price and the current share price of a listed entity are objectively determinable. The others are subjective, and their development will generally require significant analysis. The discussion below addresses the development of assumptions for use both in a Black-Scholes-Merton formula and in a lattice model.

IFRS 2 requires other factors that knowledgeable, willing market participants would consider in setting the price to be taken into account, except for those vesting conditions and reload features that are excluded from the measurement of fair value - see sections 5 and 6 above and section 8.9 below. Such factors include:

- Restrictions on exercise during the vesting period or during periods where trading by those with inside knowledge is prohibited by securities regulators.

Or

- The possibility of the early exercise of options (see section 8.5.1 below). [IFRS 2.B7, IFRS 2.B8, IFRS 2.B9].

However, the entity must not consider factors that are relevant only to an individual employee and not to the market as a whole (such as the effect of an award of options on the personal motivation of an individual). [IFRS 2.B10].

The objective of estimating the expected volatility of, and dividends on, the underlying shares is to approximate the expectations that would be reflected in a current market or negotiated exchange price for the option. Similarly, when estimating the effects of early exercise of employee share options, the objective is to approximate the expectations about employees' exercise behaviour that would be developed by an outside party with access to detailed information at grant date. Where (as is likely) there is a range of reasonable expectations about future volatility, dividends and exercise behaviour, an expected value should be calculated, by weighting each amount within the range by its associated probability of occurrence.

[IFRS 2.B11, IFRS 2.B12].

Such expectations are often based on past data. In some cases, however, such historical information may not be relevant (e.g., where the business of the entity has changed significantly) or even available (e.g., where the entity is unlisted or newly listed). An entity should not base estimates of future volatility, dividends or exercise behaviour on historical data without considering the extent to which they are likely to be reasonably predictive of future experience. [IFRS 2.B13, IFRS 2.B14, IFRS 2.B15].

8.5.1 Expected term of the option

IFRS 2 allows the estimation of the fair value of an employee share award to be based on its expected life, rather than its maximum term, as this is a reasonable means of reducing the value of the award to reflect its non-transferability.

Option value is not a linear function of option term. Rather, value increases at a decreasing rate as the term lengthens. For example, a two year option is worth less than twice as much as a one year option, if all other assumptions are equal. This means that to calculate a value for an award of options with widely different individual lives based on a single weighted average life is likely to overstate the value of the entire award. Accordingly, assumptions need to be made as to what exercise or termination behaviour an option holder will exhibit. Considerations include:

- Vesting period - the expected term of the option must be at least as long as its vesting period. The length of time employees hold options after they vest may vary inversely with the length of the vesting period.
- Past history of employee exercise and termination patterns for similar grants (adjusted for current expectations) - see section 8.5.2 below.
- Expected volatility of the underlying share - on average, employees tend to exercise options on shares with higher volatility earlier.
- Periods during which exercise may be precluded and related arrangements (e.g., agreements that allow for exercise to occur automatically during such periods if certain conditions are satisfied).
- Employee demographics (age, tenure, sex, position etc.).
- Time from vesting date - the likelihood of exercise typically increases as time passes.

As discussed in section 8.4 above, IFRS 2 notes that the effect of early exercise can be reflected by either:

- Treating the expected, rather than the contractual, life of the option as an input to a pricing model, such as the Black-Scholes-Merton formula (see section 8.5.1.A below).
- Using contractual life as an input to a binomial or similar model. [IFRS 2.B16, IFRS 2.B17].

8.5.1.A Expected term under the Black-Scholes-Merton formula

An estimate of expected term based on the types of inputs described above can be used in the Black-Scholes-Merton formula as well as a lattice model. However, the formula requires only a single expected term to be used. This is one of the reasons why the Black-Scholes-Merton formula may provide a higher valuation for the same options than a lattice model.

The difference in value that arises from using only a single expected term results, in part, from the convex shape of a typical option valuation curve, as illustrated below.

It is assumed, for the purposes of this illustration, that an at-the-money option on a CU10 share with a 10-year contractual term is equally likely to be exercised at the end of each year beginning with year two. An average expected term of six years $[(2+3+4+\dots+10)/9]$ would be used in a Black-Scholes-Merton calculation giving a fair value of CU3.10 for the option. If, instead, nine separate valuations were performed, each with a different expected term corresponding to each of the possible terms (from two to ten years), the average of those valuations (also calculated using the Black-Scholes-Merton formula) would be CU2.9854. The latter amount is lower than CU3.10 because of the convex shape of the valuation curve, reflecting the fact that the value increases at a decreasing rate as the term lengthens. Therefore, the value of the share option with an average expected term of six years will exceed the value derived from averaging the separate valuations for each potential term.

In a lattice model, exercise can occur at any time based on the rules specified in the model regarding exercise behaviour. The lattice model can therefore be thought of as analogous to the calculation in the above example in which the fair value was calculated as the average of the valuations from periods two to ten. In contrast, the Black-Scholes-Merton valuation allows only a single expected term to be specified. Therefore, it is analogous to the valuation described in the above example based on a single average expected term of six years.

Therefore, even if the expected term derived from a lattice model were used as an input in the Black-Scholes-Merton formula (and all other inputs were identical), the two models would give different values.

To mitigate the impact of the convex shape of the valuation curve, an entity with a broad-based share option plan might consider stratifying annual awards into different employee groups for the purposes of estimating the expected option lives (see section 8.5.2 below).

Determining a single expected term can be quite challenging, particularly for an entity seeking to base its estimate on the periods for which previously granted options were outstanding, which would have been highly dependent on the circumstances during those periods. For example, if the entity's share price had increased significantly during the option period (as would be the case for share options granted by certain entities at the beginning of a bull market), it is likely that employees would have exercised options very soon after vesting. Alternatively, if options were granted at the end of a bull market and the share price declined significantly after the grant date, it is likely that the options would be exercised much later (if at all). These relationships would exist because, as discussed previously, the extent to which an option is in-the-money has a significant impact on exercise behaviour. Accordingly, deriving a single expected term in these situations involves considerable judgement.

8.5.2 Exercise and termination behaviour

IFRS 2 notes that employees often exercise options early for a number of reasons, most typically:

- Restrictions on transferability mean that this is the only way of realising the value of the option in cash.
- Aversion to the risk of not exercising 'in the money' options in the hope that they increase in value.
- In the case of leavers, a requirement to exercise, or forfeit, all vested options on or shortly after leaving (see section 8.5.2.B below).

Factors to consider in estimating early exercise include:

- (a) The length of the vesting period, because the share option cannot be exercised until the end of the vesting period. Hence, determining the valuation implications of expected early exercise is based on the assumption that the options will vest.
- (b) The average length of time similar options have remained outstanding in the past.
- (c) The price of the underlying shares. Experience may indicate that employees tend to exercise options when the share price reaches a specified level above the exercise price.
- (d) The employee's level within the organisation. For example, experience might indicate that higher-level employees tend to exercise options later than lower-level employees (see also section 8.5.2.A below).
- (e) The expected volatility of the underlying shares. On average, employees might tend to exercise options on highly volatile shares earlier than on shares with low volatility. [IFRS 2.B18].

In addition, the pattern of terminations of employment after vesting may be relevant (see section 8.5.2.B below).

How we see it

In our view, past exercise behaviour generally serves as the starting point for determining expected exercise behaviour. That behaviour must be analysed, correlated to the factors above, and extrapolated into the future. However, significant changes in the underlying share price or in other salient characteristics of the entity, changes in option plans, tax laws, share price volatility and termination patterns could indicate that past exercise behaviour is not indicative of expected exercise behaviour. The expected life may also be estimated indirectly, by using a modified option pricing model to compute an option value, an input to which is an assumption that the options will be expected to be exercised when a particular share price is reached.

Some entities, including recently listed entities, or entities for which all outstanding grants have been out-of-the-money for a long period, may simply not be able to observe any exercise behaviour or may not possess enough history to perform a reasonable analysis of past exercise behaviour.

How we see it

In these cases, in our view, entities could look to the exercise history of employees of similar entities to develop expectations of employee exercise behaviour. At present there is only limited publicly-available information about employee exercise patterns, but valuation professionals and human resource consultants may have access to relevant data, based on which they may have articulated specific exercise patterns. In such circumstances, considerable judgement is required in assessing the comparability and appropriateness of the historic data used (including whether the data is current).

In the absence of extensive information regarding exercise behaviour, another solution could be to use a midpoint assumption - i.e., selecting as the expected date of exercise the midpoint between the first available exercise date (the end of the vesting period) and the last available exercise date (the contracted expiry date). However, this must be undertaken only when the entity is satisfied that this does not lead to a material misstatement. It is also plausible to assume exercise at the earliest possible time or to undertake a reasonable analysis of past behaviour and set up the amount of intrinsic value which, when exceeded, will trigger exercise of the option.

8.5.2.A Grouping employees with homogeneous exercise behaviour

IFRS 2 emphasises that the estimated life of an option is critical to its valuation. Therefore, where options are granted to a group of employees, it will generally be necessary to ensure that either:

- (a) All the employees are expected to exercise their options within a relatively narrow time-frame.
- (b) If not, that the group is divided into sub-groups of employees who are expected to exercise their options within a similar relatively narrow time-frame.

IFRS 2 suggests that it may become apparent that middle and senior management tend to exercise options later than lower-level employees, either because they choose to do so, or because they are encouraged or compelled to do so as a result of required minimum levels of ownership of equity instruments (including options) among more senior employees. [IFRS 2.B19, IFRS 2.B20, IFRS 2.B21].

8.5.2.B Post-vesting termination behaviour

Most employee share options provide that, if employment is terminated, the former employee typically has only a short period (e.g., 90 days from the date of termination of employment) in which to exercise any vested options, the contractual expiry of which would otherwise be some years away. Accordingly, an entity must look at its prior termination patterns, adjust those patterns for future expectations and incorporate those expected terminations into a lattice model as expected early exercises.

Patterns of employee turnover are not necessarily linear and may be a non-linear function of a variety of factors, such as:
